Indicates year in which, similar to OPCD's exa
closest to 30%. As Fiscal 2016/17 is a partial y
month the GA deferral begins.

Actuals are subject to actual prices and actual interest rates.
- The highest debt accumulation (at 5% interest rate) is expected to be approximately $20-24 billion, peaking in 2028 and
- Compared to a 5% interest rate, at 3.5%, the highest fiscal exposure will occur in 2017-18, decreasing by approximately

[1] Based on an interest rate of 5%.
[2] Fiscal exposure based on equal monthly drawdown of debt.
[3] Fiscalized based on 75/25 split of annual numbers provided by Energy. Actual fiscalization would vary based on GA actu
decision on accounting treatment.

Indicates year in which, similar to OPCD's exa
closest to 30%. As Fiscal 2016/17 is a partial y
month the GA deferral begins.

Actuals are subject to actual prices and actual interest rates.
- The highest debt accumulation (at 5% interest rate) is expected to be approximately $20-24 billion, peaking in 2028 and
- Compared to a 5% interest rate, at 3.5%, the highest fiscal exposure will occur in 2017-18, decreasing by approximately

[1] Based on an interest rate of 5%.
[2] Fiscal exposure based on equal monthly drawdown of debt.
[3] Fiscalized based on 75/25 split of annual numbers provided by Energy. Actual fiscalization would vary based on GA actu
decision on accounting treatment.

DRAFT

GA Financing Scenario
Option 1a/1b

Corporate and Electricity Finance Division
January 30, 2017

Overview

- In a draft Ministry of Energy deck, Energy considers a number of electricity price mitigation options, including deferring the pass-through to ratepayers of some generation supply costs by partially debt financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments.
  - The amount of GA paid by ratepayers would be set at a value lower in the early years than the costs of supply, and would be increased over time according to a pre-defined formula until the debt has been paid off.
  - Without a favourable outcome on the discussions and implementation of the accounting treatment of the GA-related debt financing, the accumulated debt would potentially represent fiscal exposure to the Province.
- Based on the two Energy options below, each at a 25-year amortization period and at a 30-year amortization period, there are a total of four scenarios considered:
  - Option 1a: Moderate GA financing - The amount of GA paid by ratepayers in 2017 is lowered by $3.2 and $3.4 billion below the annual supply costs, with the GA increasing by 2% thereafter, with limits on deferred amounts to be recovered annually to be no more than $2 billion above the annual cost of generation supply
  - Option 1b: Moderate GA financing with delayed increase - The starting GA payment from all ratepayers in 2017 is lowered by $1.1 and $1.4 billion, reducing ratepayer payments more in the short term to keep residential bills relatively flat, then increases at 3% each year with limits of no more than $2 billion above the annual cost of generation supply
- Energy scenario modelling was provided on a calendar year basis, and assumed to be starting as at January 1, 2017. Actual costs and timing may differ.
- Energy assumed a 5% interest cost. Actually borrowing costs may differ, depending on source of financing, structure of the entity including financial risks borne, and general financial market conditions.
  - Internal modelling that follows is based on GA data provided by Energy and assumes monthly GA amounts to be financed and interest expense accumulating from that point. Energy modelling may make different assumptions.

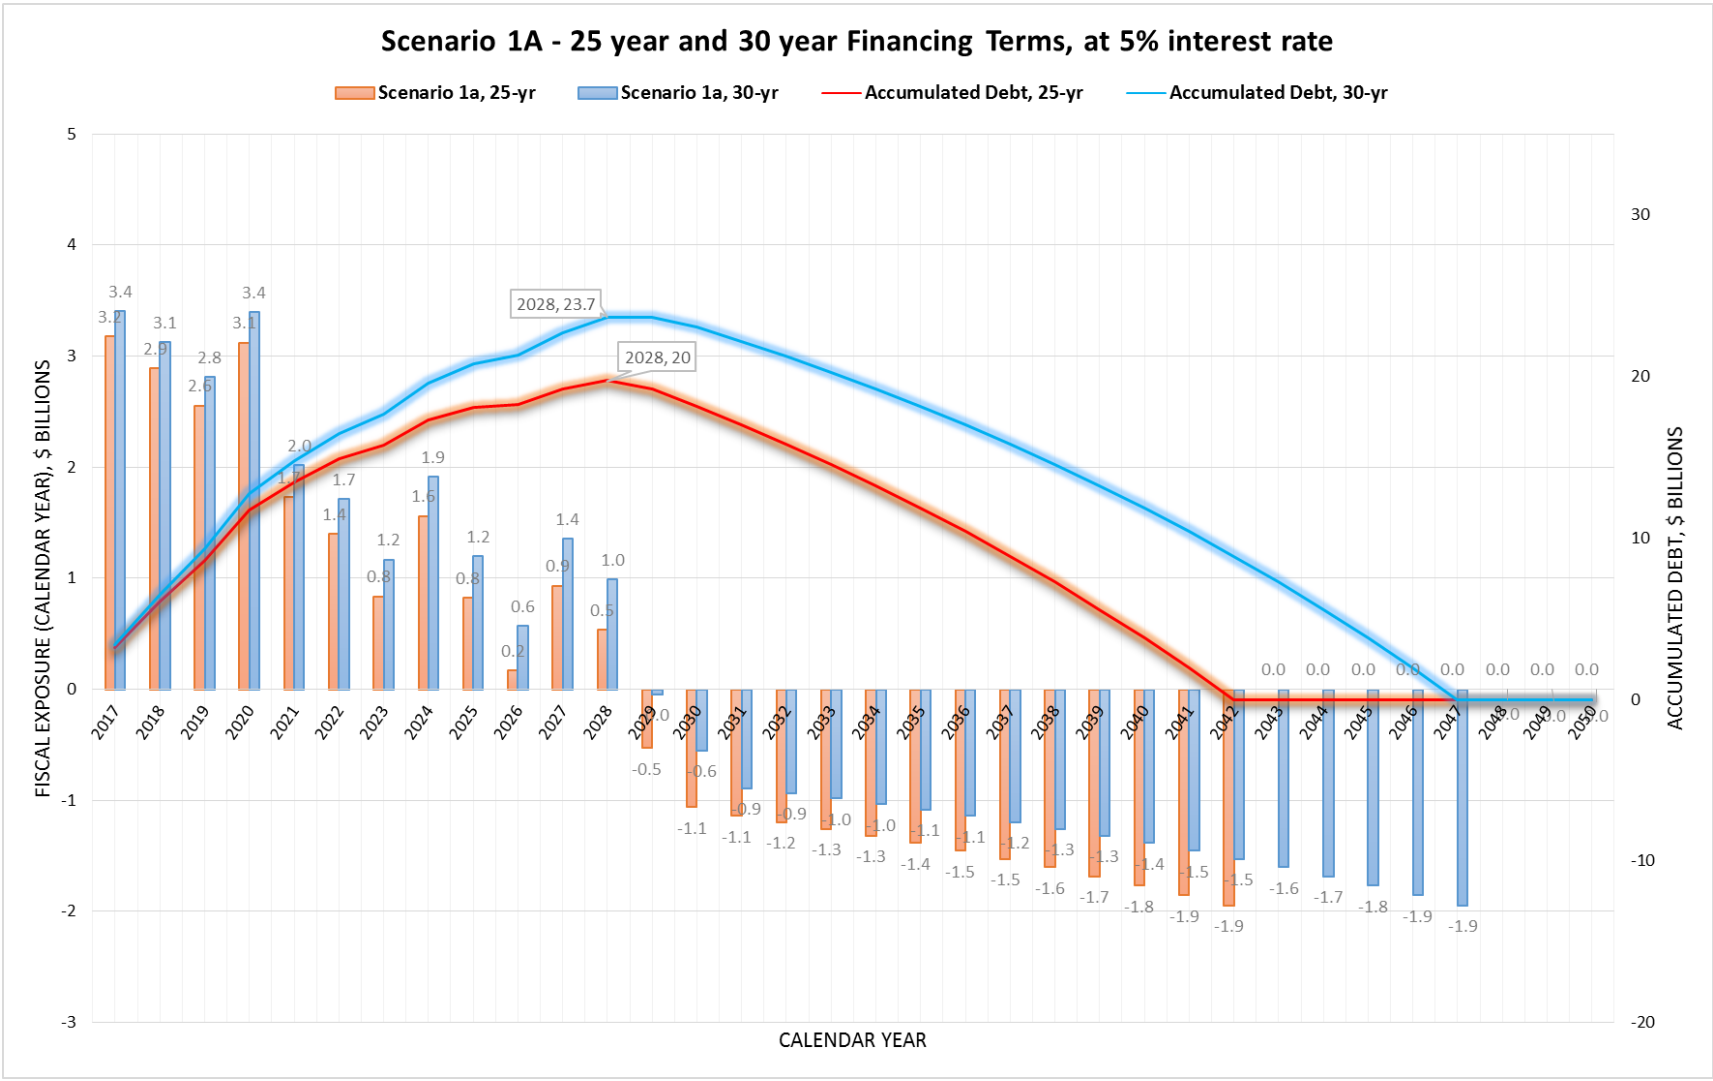
Scenario 1A *(Calendar Year Basis)*



DRAFT

Scenario 1A *(Calendar Year Basis)*

- Scenario 1a: Moderate GA financing: Initially paying in a year up to $3.2 and $3.4 billion below the true cost of GA. Then limits, when consumers start to "pay down", of paying no more than $2 billion per year above the true cost of GA.
  - On a calendar year basis, annual interest cost peaks at $1 billion ($1.2 billion) , with cumulative interest costs of about $15 billion ($22 billion), under a 25-year (or 30-year) financing term

Actuals are subject to actual prices and actual interest rates.
- The highest debt accumulation (at 5% interest rate) is expected to be approximately $20-24 billion, peaking in 2028 and $17-21 billion (at 3% interest rate), peaking in 2028.
- At 3.5%, the highest fiscal exposure will occur in 2017-18, decreasing by approximately $33-$36 million compared to that at 5% interest rate.

1 Based on an interest rate of 5%.
2 Fiscal exposure based on equal monthly drawdown of debt.
3 Fiscalized based on 75/25 split of annual numbers provided by Energy. Actual fiscalization would vary based on GA actuals per month based on month of the year. Actuals may also depend on decision on accounting treatment.

DRAFT

GA Financing Scenario
Option 1a/1b

Corporate and Electricity Finance Division
January 30, 2017

Overview

- In a draft Ministry of Energy deck, Energy considers a number of electricity price mitigation options, including deferring the pass-through to ratepayers of some generation supply costs by partially debt financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments.
  - The amount of GA paid by ratepayers would be set at a value lower in the early years than the costs of supply, and would be increased over time according to a pre-defined formula until the debt has been paid off.
  - Without a favourable outcome on the discussions and implementation of the accounting treatment of the GA-related debt financing, the accumulated debt would potentially represent fiscal exposure to the Province.
- Based on the two Energy options below, each at a 25-year amortization period and at a 30-year amortization period, there are a total of four scenarios considered:
  - Option 1a: Moderate GA financing - The amount of GA paid by ratepayers in 2017 is lowered by $3.2 and $3.4 billion below the annual supply costs, with the GA increasing by 2% thereafter, with limits on deferred amounts to be recovered annually to be no more than $2 billion above the annual cost of generation supply
  - Option 1b: Moderate GA financing with delayed increase - The starting GA payment from all ratepayers in 2017 is lowered by $1.1 and $1.4 billion, reducing ratepayer payments more in the short term to keep residential bills relatively flat, then increases at 3% each year with limits of no more than $2 billion above the annual cost of generation supply
- Energy scenario modelling was provided on a calendar year basis, and assumed to be starting as at January 1, 2017. Actual costs and timing may differ.
- Energy assumed a 5% interest cost. Actually borrowing costs may differ, depending on source of financing, structure of the entity including financial risks borne, and general financial market conditions.
  - Internal modelling that follows is based on GA data provided by Energy and assumes monthly GA amounts to be financed and interest expense accumulating from that point. Energy modelling may make different assumptions.

GA Financing:
Interest Rate Base Scenario & Sensitivities
March 1, 2017, Energy Deck Case

March 2017

GA Financing *(Calendar Year Basis) – (**Effective January 1, 2017**)* March 1 Deck

- The interest cost estimates are based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred as per its modelling as at March 1, 2017.
  - GA deferral estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to reflect in-year interest costs. Energy's base case interest costs shown were an assumed 5%, compounded monthly, calculated in the following year, with a term of 30-years (2047).

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.879 billion in 2027	$12.6 billion	2042 (25-year term)
4.2%	$1.1 billion in 2027	$17.4 billion	2044 (27-year term)
5.0%	$1.4 billion in 2028	$25.1 billion	2047 (30-year term)

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario). If interest is paid and passed through in each period, more GA would have to be deferred to achieve the same net rate impact; however, there would be lower cumulative interest costs than modelled.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

GA Financing *(Calendar Year Basis) – (**Effective July 1, 2017**)*

March 1 Deck

- Ministry of Energy modelling estimates provided have been based on a full-year of GA deferral in 2017. Annual and cumulative interest and debt estimates would be sensitive to an in-year start date of, e.g., July 1, 2017, as below.
  - Otherwise, as before, modelling is based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred as per its modelling as at March 1, 2017.
  - GA deferral cost estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are adjusted from Ministry of Energy amounts, to reflect in-year interest costs and an assumed July 1, 2017 implementation date. Half-a-year of reduced deferred GA significantly reduces estimated cumulative interest costs.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.817 billion in 2027	$11 billion	2041 (24-year term)
4.2%	$1.0 billion in 2027	$14.9 billion	2042 (25-year term)
5.0%	$1.3 billion in 2028	$21.0 billion	2045 (28-year term)

Total GA deferral amount being financed is approximately $19.1 billion (plus deferred, capitalised interest, that can increase peak debt to about $26 bn under the 5% scenario). If interest is paid and passed through in each period, more GA would have to be deferred to achieve the same net rate impact; however, there would be lower cumulative interest costs than modelled.

1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period.

1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 To forecast the repayment of the remaining balance, a cap of $2.242 bn above the true cost of GA in any given year is applied. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the repayment would be extended to Year 2056.

1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. 1 Based on an interest rate of 6%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 To forecast the repayment of the remaining balance, a cap of $2.242 bn above the true cost of GA in any given year is applied. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. GA Financing *(Calendar Year Basis)*

March 1 Deck

- The following interest cost estimates are based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred in its submission. GA deferral and interest cost estimates are subject to updates from the Ministry of Energy.
  - Actual interest costs are very sensitive to actual borrowing costs. Table below is illustrative.
  - Sensitivities on lower interest rates shown assume faster debt paydown. Alternatively, pay down could be stretched out, but would result in higher cumulative interest costs.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to show amounts starting in 2017 on an assumed July 1, 2017 implementation (affects all years, due to interest capitalisation and compounding) and equal monthly debt drawdown. Energy's base case interest costs shown were an assumed 5%, compounded monthly, with annual drawdowns.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs
3.5%	$0.878 billion in 2027	$12.6 billion
4.2%	$1.1 billion in 2027	$17.3 billion
5.0%	$1.4 billion in 2028	$25.0 billion

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

- The following interest cost estimates are based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred in its submission. GA deferral and interest cost estimates are subject to updates from the Ministry of Energy.
  - Actual interest costs are very sensitive to actual borrowing costs. Table below is illustrative.
  - Sensitivities on lower interest rates shown assume faster debt paydown. Alternatively, pay down could be stretched out, but would result in higher cumulative interest costs.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to show amounts starting in 2017 on an assumed July 1, 2017 implementation (affects all years, due to interest capitalisation and compounding). Energy's base case interest costs shown were an assumed 5%, compounded monthly.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs
3.5%	$0.878 billion in 2027	$12.6 billion
4.2%	$1.1 billion in 2027	$17.3 billion
5.0%	$1.4 billion in 2028	$25.0 billion

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

- The following interest cost estimates are based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred in its submission. GA deferral and interest cost estimates are subject to updates from the Ministry of Energy.
  - Actual interest costs are very sensitive to actual borrowing costs. Table below is illustrative.
  - Sensitivities on lower interest rates shown assume faster debt paydown. Alternatively, pay down could be kept the same (as the base scenario), but would result in higher cumulative interest costs.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to show amounts starting in 2017 on an assumed July 1, 2017 implementation ~~(affects all years, due to interest capitalisation and compounding)~~. Energy's base case interest costs shown were an assumed 5%, compounded monthly.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs
3.5%	$0.878 billion in 2027	$12.6 billion
4.2%	$1.1 billion in 2027	$17.3 billion
5.0%	$1.4 billion in 2028	$25.0 billion

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

GA Financing *(Calendar Year Basis)*

March 1 Deck

- The ~~following~~ interest cost estimates ~~on the following slides~~ are based on Ministry of Energy estimates, in its Cabinet submission, of the Global Adjustment cost amounts to be deferred. ~~in its submission.~~ GA deferral and interest cost estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates ~~scenarios~~ ~~shown~~ assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to reflect ~~show amounts starting in 2017 on~~ an assumed July 1, 2017 implementation date (affects all years, due to interest capitalisation and compounding). Energy's base case interest costs shown were an assumed 5%, compounded monthly.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs
3.5%	$0.878 billion in 2027	$12.6 billion
4.2%	$1.1 billion in 2027	$17.3 billion
5.0%	$1.4 billion in 2028	$25.0 billion

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

GA Financing *(Calendar Year Basis) – (**Effective January 1, 2017**)* March 1 Deck

- The interest cost estimates are based on Ministry of Energy estimates, in its Cabinet submission, of the Global Adjustment cost amounts to be deferred. GA deferral and interest cost estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to reflect in-year interest costs. Energy's base case interest costs shown were an assumed 5%, compounded monthly, calculated in the following year, with a term of 30-years (2047).

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.879 billion in 2027	$12.6 billion	2042 (25-year term)
4.2%	$1.1 billion in 2027	$17.4 billion	2044 (27-year term)
5.0%	$1.4 billion in 2028	$25.1 billion	2047 (30-year term)

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

DRAFT

GA Financing *(Calendar Year Basis) – (**Effective January 1, 2017**) March 1 Deck*

- The interest cost estimates are based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred, per its March 1 Cabinet submission.
  - GA deferral estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to reflect in-year interest costs. Energy's base case interest costs shown were an assumed 5%, compounded monthly, calculated in the following year, with a term of 30-years (2047).

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.879 billion in 2027	$12.6 billion	2042 (25-year term)
4.2%	$1.1 billion in 2027	$17.4 billion	2044 (27-year term)
5.0%	$1.4 billion in 2028	$25.1 billion	2047 (30-year term)

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

GA Financing *(Calendar Year Basis) – (**Effective July 1, 2017**)* *March 1 Deck*

- Ministry of Energy modelling estimates provided have been based on a full-year of GA deferral in 2017. Annual and cumulative interest and debt estimates would be sensitive to an in-year start date of, e.g., July 1, 2017, as below.
  - Otherwise, as before, modelling is based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred in its March 1, 2017, Cabinet Submission.
  - GA deferral cost estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are adjusted from Ministry of Energy amounts, to reflect in-year interest costs and an assumed July 1, 2017 implementation date. Half-a-year of reduced deferred GA significantly reduces estimated cumulative interest costs.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.817 billion in 2027	$11 billion	2041 (24-year term)
4.2%	$1.0 billion in 2027	$14.9 billion	2042 (25-year term)
5.0%	$1.3 billion in 2028	$21.0 billion	2045 (28-year term)

Total GA deferral amount being financed is approximately $19.1 billion (plus deferred, capitalised interest, that can increase peak debt to about $26 bn under the 5% scenario.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

DRAFT

GA Financing *(Calendar Year Basis) – (**Effective January 1, 2017**)* March 1 Deck

- The interest cost estimates are based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred, per its March 1 Cabinet submission.
  - GA deferral estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to reflect in-year interest costs. Energy's base case interest costs shown were an assumed 5%, compounded monthly, calculated in the following year, with a term of 30-years (2047).

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.879 billion in 2027	$12.6 billion	2042 (25-year term)
4.2%	$1.1 billion in 2027	$17.4 billion	2044 (27-year term)
5.0%	$1.4 billion in 2028	$25.1 billion	2047 (30-year term)

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

DRAFT

GA Financing *(Calendar Year Basis) – (**Effective July 1, 2017**)* *March 1 Deck*

- Ministry of Energy modelling estimates provided have been based on a full-year of GA deferral in 2017. Annual and cumulative interest and debt estimates would be sensitive to an in-year start date of, e.g., July 1, 2017, as below.
  - Otherwise, as before, modelling is based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred in its March 1, 2017, Cabinet Submission.
  - GA deferral cost estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are adjusted from Ministry of Energy amounts, to reflect in-year interest costs and an assumed July 1, 2017 implementation date. Half-a-year of reduced deferred GA significantly reduces estimated cumulative interest costs.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.817 billion in 2027	$11 billion	2041 (24-year term)
4.2%	$1.0 billion in 2027	$14.9 billion	2042 (25-year term)
5.0%	$1.3 billion in 2028	$21.0 billion	2045 (28-year term)

Total GA deferral amount being financed is approximately $19.1 billion (plus deferred, capitalised interest, that can increase peak debt to about $26 bn under the 5% scenario.

March 6, 2017

DRAFT

GA Financing *(Calendar Year Basis) – (**Effective January 1, 2017**)* March 1 Deck

- The interest cost estimates are based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred, per its March 1 Cabinet submission.
  - GA deferral estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to reflect in-year interest costs. Energy's base case interest costs shown were an assumed 5%, compounded monthly, calculated in the following year, with a term of 30-years (2047).

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.879 billion in 2027	$12.6 billion	2042 (25-year term)
4.2%	$1.1 billion in 2027	$17.4 billion	2044 (27-year term)
5.0%	$1.4 billion in 2028	$25.1 billion	2047 (30-year term)

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

DRAFT

GA Financing *(Calendar Year Basis) – (**Effective July 1, 2017**)* *March 1 Deck*

- Ministry of Energy modelling estimates provided have been based on a full-year of GA deferral in 2017. Annual and cumulative interest and debt estimates would be sensitive to an in-year start date of, e.g., July 1, 2017, as below.
  - Otherwise, as before, modelling is based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred in its March 1, 2017, Cabinet Submission.
  - GA deferral cost estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are adjusted from Ministry of Energy amounts, to reflect in-year interest costs and an assumed July 1, 2017 implementation date. Half-a-year of reduced deferred GA significantly reduces estimated cumulative interest costs.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.817 billion in 2027	$11 billion	2041 (24-year term)
4.2%	$1.0 billion in 2027	$14.9 billion	2042 (25-year term)
5.0%	$1.3 billion in 2028	$21.0 billion	2045 (28-year term)

Total GA deferral amount being financed is approximately $19.1 billion (plus deferred, capitalised interest, that can increase peak debt to about $26 bn under the 5% scenario.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

DRAFT

GA Financing:
Interest Rate Base Scenario & Sensitivities
March 1, 2017, Energy Deck Case

Corporate and Electricity Finance Division
March 2017

DRAFT

GA Financing *(Calendar Year Basis) – (**Effective January 1, 2017**)* March 1 Deck

- The interest cost estimates are based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred, per its March 1 Cabinet submission.
  - GA deferral estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are slightly adjusted from Ministry of Energy amounts, to reflect in-year interest costs. Energy's base case interest costs shown were an assumed 5%, compounded monthly, calculated in the following year, with a term of 30-years (2047).

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.879 billion in 2027	$12.6 billion	2042 (25-year term)
4.2%	$1.1 billion in 2027	$17.4 billion	2044 (27-year term)
5.0%	$1.4 billion in 2028	$25.1 billion	2047 (30-year term)

Total GA deferral amount being financed is approximately $20.3 billion (plus deferred, capitalised interest, that can increase peak debt to about $28 bn under the 5% scenario.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

Actuals are subject to actual prices and actual interest rates.
1 Based on an interest rate of 5%. Interest Cost in 2017 adjusted to represent implementation in July 2017.
2 Higher interest rates results in extended the term of the financing. It is assumed that a cap of $2.242 bn above the true cost of GA in any given year is continued to be applied to repay any remaining debt. Thus, every year a maximum of $2.242 bn is recovered by ratepayers until the debt is paid down, with interest still accumulating over this period. In this Scenario, the term would be extended to Year 2056.

DRAFT

GA Financing *(Calendar Year Basis) – (**Effective July 1, 2017**)* *March 1 Deck*

- Ministry of Energy modelling estimates provided have been based on a full-year of GA deferral in 2017. Annual and cumulative interest and debt estimates would be sensitive to an in-year start date of, e.g., July 1, 2017, as below.
  - Otherwise, as before, modelling is based on Ministry of Energy estimates of the Global Adjustment cost amounts to be deferred in its March 1, 2017, Cabinet Submission.
  - GA deferral cost estimates are subject to updates from the Ministry of Energy.
  - Actual annual and cumulative interest costs are very sensitive to actual borrowing rates. Table below is illustrative.
  - Sensitivities shown on lower interest rates assume faster debt pay down. Alternatively, pay down could be stretched out, but would result in relatively higher cumulative interest costs than shown for that interest rate.
- Interest cost estimates are adjusted from Ministry of Energy amounts, to reflect in-year interest costs and an assumed July 1, 2017 implementation date. Half-a-year of reduced deferred GA significantly reduces estimated cumulative interest costs.

Interest Rate	Peak Annual Interest Cost	Total Life-cycle Accumulated Interest Costs	Term (Approximate)
3.5%	$0.817 billion in 2027	$11 billion	2041 (24-year term)
4.2%	$1.0 billion in 2027	$14.9 billion	2042 (25-year term)
5.0%	$1.3 billion in 2028	$21.0 billion	2045 (28-year term)

Total GA deferral amount being financed is approximately $19.1 billion (plus deferred, capitalised interest, that can increase peak debt to about $26 bn under the 5% scenario.

Base Scenario – *5% Interest Rate* with GA draw downs occurring on an equal monthly basis.

Fiscal Exposure

- Ministry of Energy provided data for two options under the GA financing scenario, Option 1a (30-year financing) and Option 1b (30-year financing with delayed increase in payments).
- Based on the data provided and assuming the debt drawdowns occur monthly at an annual interest rate of 5%, the maximum fiscal exposure expected would be:
    - Approx. $3.4 billion in 2017, under Option 1a
    - Approx. $4.0 billion in 2020, under Option 1b
- The highest debt accumulation would occur in 2028 of approximately $24 billion under both Option 1a and Option 1b.
