The victims of SARS are representative of our society. Some were ordinary working people, some were doctors and nurses, some were retired and some were immigrants trying to build new lives. Their stories can be grouped as those who died, the families of the dead, those who survived and their families, and the hidden victims who did not get SARS but saw their lives affected by it. Forty-four people died of SARS in 2003 and many thousands were affected, as victims who survived, or relatives and friends or those who had to face the isolation, discomfort, fear and stigmatization of quarantine.
Their stories say much about our health system and ourselves. Some reveal specific systemic failures, like the failure to have any consistent policy for hospital visitors during SARS. This is illustrated by the family whose father died after open-heart surgery. They were told by the hospital’s cardiac coordinator that they could visit him before the surgery, but the decision was reversed by a nursing supervisor who the family felt was too arbitrary. The family did not get to see the father before he died. The problem here does not rest with any individual but with the lack of a system to assist families and visitors to navigate the visitor restrictions imposed by SARS.

Some of the worst stories come from the earliest days of the outbreak in March and April, before the system learned anything about SARS. However, many of the systemic weaknesses continued, and even in an improved system, nothing can take away the devastation caused by the deaths and the serious illness.

All the stories reflect the pain inflicted by SARS on many families. In many cases, some of the pain could have been avoided had the health system been more effective. The individual hospital could have done nothing more for the family of the mother and father with SARS who shared a hospital room. After the father died and hospital orderlies wheeled away his body, the mother remained for 20 days, visited only one hour a day by her family because SARS required visitor restrictions. The hospital did nothing wrong and can’t be blamed for restrictions that left the dying woman unable to see her family the other 23 hours of the day. What was wrong was a hospital system inadequately protected against the onslaught of a deadly disease.

Some stories tell of courageous selflessness of those who became afflicted because they chose to help, such as the nurses’ aide who volunteered to visit a friend’s elderly mother because she was ill at home and needed nursing help when her daughter was at work. Unknown to anyone, the elderly woman’s illness was SARS. She passed it to the Good Samaritan nurses’ aide, who carried it to the Philippines during a vacation, where she infected her father. SARS killed both her and her father.

Or the hospital clerical worker who was asked by a nurse to help lift a patient. It wasn’t her job, but she wanted to help. It was discovered later that the patient had SARS. The clerical worker infected her 62-year-old father, who died of SARS.

Many health workers became seriously ill from SARS and some died. Their stories are told later on in this section and in other parts of this report.

The stories of non-SARS patients, their families and their friends, who suffered because SARS interrupted the delivery of normal, day-to-day medical treatment for
other diseases and conditions, are told in the section called “The Wider Impact.” These are the stories of citizens who entered the health care system for a variety of reasons, caught SARS and died.

The stories of the victims, their families and their friends follow a pattern. First the confusion, fear and lack of information surrounding initial treatment. Then conflicting information about quarantine, and confusion, stress and heartbreak of hospital visitation restrictions. Then not knowing for sure what your relative died of, or hearing through the media that he or she died of SARS. And the heartbreaks of a funeral process thrown into chaos because those who needed to be there were too sick to attend, or because public health authorities imposed restrictions, or because people were just too frightened to attend.

The victims’ stories tell of individual misery but grouped together they show some common themes:

- **Poor communication with families.** Different people in authority seemed unable to provide consistent answers. People were not always told directly that their relative had SARS. They sometimes learned from the media or other sources.

- **Lack of clear and consistent visitation rules.** The inability to regularly visit their sick relatives, even to be with them and to say “I love you” before they died.

- **Inability to have a traditional funeral.** In some cases, funeral visitations were forbidden or restricted. Mourners had to stand off at a distance at one burial. For some, there was no closure.

- **Stigma of being associated with SARS.** One family that lived through hell because of SARS was told by a school that their children could not return to classes even after they successfully passed through the public health quarantine period. One daughter missed her final exams because her school refused to let her return to class.

In all of this we must remember that everyone who fought SARS, from hospitals to public health workers to high officials in government, were also victims in one sense because they had the misfortune to work in a system profoundly unprepared and starved by successive governments of the right resources to meet a crisis that no one expected and for which no one had planned. These administrators and front-line
workers had to cope with what they had. They cannot be blamed personally for the confusion and frustration and problems suffered by the victims of SARS. Instead of assigning blame, we must build systems and safety cultures that prevent what happened during SARS.

The Commission tried to contact all the families directly affected by SARS in Ontario. It was not successful in reaching them all. People moved, or in some cases the families contacted said they did not want to talk to the Commission or anyone about SARS.

The victims’ stories that follow are as told to the Commission by the victims, their families and their friends. They suffered awfully from SARS and might recall events differently from someone seeing the outbreak from a different perspective. The Commission has not tried to corroborate details of the victims’ stories. The purpose of telling the stories is to try to reflect the overall horror that smothered these peoples’ normal lives during SARS, and not to confirm every detail.

A Descent into Horror

They were a family of four generations, well educated, intelligent and close to each other, until SARS arrived and placed them on a descent into madness. Only two generations emerged from the madness, shell-shocked survivors of a horror none of them could have imagined.

Like some other SARS stories, theirs began with seeking medical attention for a non-contagious medical complaint, in this case a broken hip. The elderly matriarch of the family fell and was taken to hospital for surgery. This was the second week of May, several days after the World Health Organization had lifted the SARS travel advisory for Toronto.

The surgery went well and the matriarch was well cared for by her daughter and son, both in their 60s. She also had the support of others, including a grandson we’ll call Mr. U, in his 40s, his wife, Mrs. U, and their children. However, later during the week of surgery, the matriarch fell into a coma and died.

A small funeral was held but that night both the matriarch’s son and daughter became ill with flu symptoms. Grandson U also reported feeling ill. All three had spent time with the grandmother during her hospital stay.
Mr. U’s wife (Mrs. U) decided that all three needed to be checked, so she took them to hospital. There they were told they were probably SARS patients and they needed to go to the hospital handling SARS.

Mr. U recalled that a doctor told them there were only two beds left in the SARS ward. One of the sick people would have to go home. Mr. U decided that his mother and uncle were in worse shape than he and that they should get the beds. He had a high temperature but was sent home in a taxi, an unmasked threat to the taxi driver.

Public Health already had quarantined his wife and five children at home, but he worried about being too close to the children. So he moved to his mother-in-law’s place because she was out of the country for two weeks. He and his family kept in contact by telephone as his condition deteriorated. The wife and children did not develop any symptoms.

Mr. U became so sick that he called an ambulance to take him to hospital.

In the midst of this, his wife received a telephone call from the funeral home that had handled the matriarch. The person on the line demanded to know why Mrs. U had not revealed to them that the matriarch had died of SARS. Mrs. U said no one had ever mentioned that the matriarch had SARS and that everyone assumed the three other family members simply got it from the hospital. She then called the hospital to ask if it was true. She said:

And that’s how we were notified that [Mr. U’s grandmother] died of SARS.

The nightmare worsened. Mr. U’s mother died at North York General. Mr. U had arrived there by ambulance and the hospital administration insisted that he be told of his mother’s death. Mrs. U said it would kill him but the hospital insisted and she had a doctor stand in the doorway while she delivered the news. Mr. U was so sick at the time he was given only a 20 per cent chance of living.

While trying to cope with all of this, Mrs. U received a call from Public Health, who wanted a list of everyone at the matriarch’s funeral. She said the names would be in a memorial book at the matriarch’s apartment but no one could go to get it because they were either in hospital or in quarantine. Public Health told Mrs. U to drive to the apartment and get the book, but to wear a mask.
Mrs. U drove to the matriarch’s apartment building but the people she encountered were hostile and she left without going into the apartment:

If not for the fact that they were afraid to come near me, I honestly, I’m convinced that they would have mobbed me. The maintenance people, the people around the elevator. This was not pleasant. So I went back. I was shaking, Public Health called: “Did you get the list?” I told them no. I told them get it yourselves, and take some cops.

Another funeral was held, this one for Mr. U’s mother. It was small because Mr. U, his uncle and his uncle’s wife all were battling SARS in hospital. Then the uncle died. Only five people attended his funeral because he was a known SARS death.

Mr. U eventually pulled through, but his life and the lives of others in his family are changed forever. Five of them got SARS, three died and those left behind carry indelible scars.

The children will remember being confined to home and their mother asking friends to send their children to stand on the lawn outside the window and perform skits, wave signs and sing songs to cheer them up.

Their mother, Mrs. U, remembers the panic and the confusion:

That’s what bothers me, is they allowed fear and panic to take over, and fear and panic is indicative of a lack of knowledge, not about the disease itself, but about procedure. And then right into the community, that people don’t understand that a quarantined home is not a house of plague, there is a difference … lack of information results in extreme responses that only makes the situation worse for everyone involved, and that’s when you watch everything break down. The school systems break down in terms of response, public health breaks down in terms of what it can handle.

Mr. U will remember the fear:

I tell you, the fear, the gripping fear, that’s what I will remember about SARS. Not so much that I was afraid. Sure I was afraid. It was the fear on the part of others, particularly the medical personnel. They were scared out of their minds. And as much as I can appreciate them being
scared, what I cannot appreciate is that they still had to do the job, although they were scared. Some could, some could not.

He sums up the SARS tragedy in four words:

It’s a horror story.

Not Being Able to Say Goodbye

Mrs. J\textsuperscript{808} suffered the torture of not being able to be with her husband when he died in hospital of SARS. As if that was not enough, she was unable to locate his body for 10 days and had no say in determining his final rites.

Her husband was 68 when he suffered a stroke in late February 2003. He was treated in hospital, then sent March 20 to a rehabilitation hospital where he later developed respiratory problems and a fever. He was transferred to hospital on May 13.

Mrs. J visited him daily until the third week in May, when the hospital was closed because of SARS. She never saw him again because he died of SARS on June 16. Her husband’s body was taken away for autopsy, but no one told her:

He died the 16\textsuperscript{th} and I did not know what had happened with him to the 26\textsuperscript{th}. Because they told me that he died and he is going to be cremated and I made arrangements with the funeral home and I told them, you know that you have to find out where is my husband’s body.

She couldn’t find out what happened to the body so she called a funeral home, where the operators made some calls and located her husband’s remains. She said:

It was terrible. I called everywhere I can call and they did not tell me anything. That is the truth. They did not tell me that he died of SARS, they did not tell me where he was taken, they did not tell me that they were going to send him to the crematorium or whatever, they did not tell me nothing. I just found out from the funeral home that he was at the crematorium on the 26\textsuperscript{th}.

\textsuperscript{808}. As noted earlier, the initials of SARS victims have been changed. In this case, the initial J does not correspond to the victim’s name and is not related to the J family whose story is told in the Scarborough Grace chapter.
After telling the Commission her story, she broke into tears:

I was a piece of glass; they looked through me.

**Who Will Look After the Children?**

The strained health system, stretched medical staff and a general lack of preparedness created special hardships for families with young children where one or more family members became ill.

One such family, the Ps, gave a detailed account of their ordeal to the Commission. It took four trips to emergency before Mr. P was diagnosed with SARS. The family are members of the Bukas Loob Sa Diyos (BLD) religious community, whose members came in contact with SARS. The BLD story is told elsewhere in this report.

Mr. and Mrs. P had two children, five and 11 years of age at the time. There were no provisions for the children in place when quarantine was ordered and when both parents contracted SARS and required lengthy hospital stays. The children were symptomatic but did not get SARS. Both parents did and survived. The children spent the critical period of their parents’ illness in hospital. The parents had to deal with heart-wrenching anxieties, including the possibility of having to turn the children over to Children’s Aid.

The Commission drew attention to this problem in its second interim report:

> Whatever legal authority there is for quarantine, it will only work if emergency response plans provide the resources and machinery to help those who must go into quarantine … For those individuals with children at home, the hardship and stress of quarantine proved to be even more overwhelming.\(^{809}\)

Mr. P became ill on April 1, 2003. He was not feeling well at work and came home with a high temperature. After a couple of days, he phoned his family doctor, who asked him whether he got his flu shot. Mr. P hadn’t, and the doctor prescribed anti-flu medication over the phone and advised Mr. P to drink lots of fluids. Mr. P did not
get any better and his wife called an ambulance to take him to hospital. He was diagnosed with pneumonia. He made two more trips by ambulance to the emergency room. Each time he was put in isolation, x-rayed, diagnosed with pneumonia and sent home.

Mrs. P sensed that something was drastically wrong and on the third trip tried to get the doctors to admit him:

For the third time he ended up in the hospital after I called the paramedics … he was examined, put in the isolation, just following the usual routine, being placed in the isolation room and being examined again. And this his third time visit the emergency …

When the doctor came to examine him, he was told that he’s experiencing pneumonia and he was prescribed sleeping pills. He was given a sleeping pill … I was concerned when he called me and I decided that I wanted to speak with that physician who examined him at the emergency.

I got a hold of the attending physician … I pleaded with him that this was his third time at the hospital and being told that he only got pneumonia … I told the doctor that I’m only a housewife and I don’t know what to do with him anymore, and I’m very, very much concerned about his condition, having the high fever and all the flu-like or pneumonia-type symptoms. And I pleaded with the doctor that they have to keep him for further tests or whatsoever for further examination.

But then I was told that I should come down and pick up my husband so that they could attend to other patients at the hospital. My plea to that doctor was ignored. I could not do anything but go to pick him up … we just went straight home. We just prayed to God that being told three times by different doctors that it was pneumonia, we’ll just take it from there.

Mrs. P became exhausted taking care of her husband at home. She booked off work and kept her kids home from school. She became more desperate until a nurse friend suggested taking Mr. P back to the hospital. She called the paramedics again and took him to hospital:

I was saying to the nurse that that’s his fourth time in the emergency and – and he already finished his antibiotic by that time and his condition
was really, really worse … About three or four hours later I was told that they’re keeping him in for further tests. I should go home.

The next day Mrs. P was advised by the doctor in the infectious disease department:

that I should quarantine myself and the children and it’s already been confirmed by them, after doing numerous tests, that he is a probable SARS patient … and I was advised to stay in the house and that we’re all being quarantined and that I would be hearing from public health to advise me what to in that situation.

Mrs. P developed a high fever and her daughter, too, was showing symptoms:

But then my daughter woke up maybe around 1:00 or 1:30 and crying about the pain on her ankle area. I was aware that one of the symptoms is feeling the fatigue and having joint or muscle pain, being associated with a high fever. I was very concerned about that and she’s flushed with rosy cheeks and the high fever … I decided that we have to call in for paramedics.

When the paramedics arrived, Mrs. P told them that the instructions from public health were to take them to the hospital where her husband had been admitted. But the rules called for the ambulance crew to take them to the nearest hospital, which they did.

Mrs. P and the children were kept in an isolation room well into the next day. She kept asking that her husband’s hospital be contacted. She managed to reach her husband on a cellphone. He said the hospital had been looking for her and the children. A bulletin about the BLD congregation and its contact with SARS had now gone out to hospitals. Arrangements were made to admit her and the children to hospital:

They were taken in a separate ambulance directly to [hospital], accompanied by a nurse … a female nurse. She was very, very good with my daughter, carrying my daughter. And of course we all cried.

Mrs. P, who was now admitted to hospital, started telephoning to get information on the kids:
I got a hold of the emergency department to inquire about my children. And I was only told that they’re okay and someone will get a hold of me later that evening.

The parents were able to speak to the children by telephone. Friends and relatives visited the children, who were in separate but adjoining rooms.

Mrs. P took a turn for the worse. She was transferred to the intensive care unit, intubated and treated for two weeks until she recovered. The doctors wanted to intubate Mr. P as well, but he pleaded with them to hold off so he could continue talking to the children on the telephone. Mr. P said:

I pleaded with the doctor, I said, give me a couple of more days. If I don’t improve, okay, go ahead but right now I have to talk to my kids and my wife and make sure that they’re okay. I was already having problems breathing, just a few steps walking around a few steps, I would grab something. I was already huffing and puffing and was getting dizzy already. And then my wife got worse. She was taken to ICU before me. She was intubated and, I mean, the, she was already intubated, she was taken for ICU intubation and that made me even worse now because now my wife that, won’t be able to contact my kids.

I told my kids that they are taking my wife to another room with no telephone but she’s okay and that the doctors just decided to separate us now rather than put us in the same room. So I lied to them just to prevent them from worrying. I called them every time and every time it’s very hard, emotionally because they’re pretty young kids and I was already thinking about what would happen if something happens to my wife and then something happens to me. Where are they going to go?

The children spent a month in hospital. So did the parents. All recovered.

The Pain of Visitor Restrictions

Two other families who lost relatives to SARS told of how hospital visiting restrictions made dealing with the deaths so much more difficult.

One family had organized hospital visitation shifts to be with their father who was dying of cancer. SARS then forced hospitals to impose restrictions. A doctor wrote a
letter that the family was to show to hospital security staff. The letter noted that because the father was dying, one family member at a time could be at his bedside. When the man’s son arrived to take his shift, a security guard took the doctor’s letter and threw it in the trashcan.

A daughter-in-law told the Commission about what happened next:

   My husband got very upset and tried to explain that his father was upstairs dying and he had to be there. But the security officer took it upon himself to disregard the special permission letter. My husband had a verbal argument with the security officer and they were about to phone the police and have him arrested for causing a disturbance until I happened to intervene and calm everyone down. With our insistence the security officer called upstairs to the nursing station to find out if indeed we were allowed in and sure enough we were.

   You can imagine what my husband went through knowing that he may not be able to be with his father in the last moments. All because of what we judged was a security officer who thought his shoulders were a little too big and let a bit of power go to his head. Unfortunately, though, he had no compassion or common sense.

   Perhaps in the future the security personnel who are hired should be a little more experienced in dealing with the public rather than just night patrolmen who really can’t handle such extreme circumstances.

The Commission notes again that these stories are told entirely from the victims’ perspective. This story and others, however, confirm the need to establish workable systems that in future outbreaks will help hospital staff do their jobs while assisting visitors to connect with those who are ill.

One Daughter’s Loss

Mr. I was a 62-year-old family patriarch who succumbed to SARS. The outbreak turned the life of his family upside down and left many of its members traumatized. How it happened and the events leading up to his death contain elements of nearly everything that went wrong during the outbreak in Toronto.
There was a wrong diagnosis, bad communication, misleading or inadequate information, fear and stigma.

The story begins not with Mr. I, but with his adult daughter. She was a part-time clerical worker in a hospital, and was asked on a Saturday in March 2003 to help a nurse lift a patient out of his bed. It was not her job, but as a part-timer who wanted to keep her job, she was accommodating. Unknown to anyone, the patient had been in contact with SARS in the hospital’s emergency room.

Several days later, she developed a fever but didn’t think too much of it and so went to work. When she returned home she told her family that she still was not feeling well and that she still had a temperature. Her family and her parents shared a home. She called the hospital’s health and safety department several times and left messages, but never received a response.

A couple days after that, she went to see a general practitioner who told her she had sinusitis and prescribed an antibiotic. Her condition worsened and by early Sunday morning, around 4 a.m., she went to another hospital, where she was x-rayed and again told that she had sinusitis.

Not feeling better by Monday, she telephoned public health. After a brief conversation, the public health worker asked to speak to her mother and said: “I think your daughter is having symptoms of SARS.”

The health worker arranged for the woman to be admitted to the hospital where she worked part-time, but she was transferred to another hospital. The husband delivered her to hospital and when he returned home two or three hours later learned that the whole household would have to be quarantined and that they would have to clean her room and wash anything she may have touched.

Toronto Public Health sent them N95 respirators to wear and they settled into a routine of using one set of dishes and cutlery per person, washing everything with bleach for 20 minutes. The family had no dishwasher.

After five days, the family patriarch showed no symptoms and returned to work. The family said he thought he had finished his quarantine. His wife, who was keeping track of everyone’s temperature, checked his, and it was 36.3°C, within the normal range. Mr. I worked a 12-hour shift and when he got back home, his temperature began to climb. It rose to 38 and an hour later was 38.2. He had no other symptoms and said he was feeling fine.
His condition worsened during the weekend and into the following week. He lost his appetite and was experiencing shortness of breath and coughing. His son-in-law was showing symptoms too. The two drove to a newly opened SARS clinic. The clinic admitted Mr. I. The son-in-law returned home. To the family’s surprise, he rang the doorbell rather than using his key. He said:

They told me to be in strict isolation.

His mother-in-law cleared out a room for him. As she shut the door after him, she wondered why they sent him back home.

Mr. I’s return to work after five days of quarantine turned out to be a big mistake. He had infected a co-worker and his place of employment had to quarantine everyone and shut down. The infected co-worker recovered.

The co-worker’s illness and the economic impact on the enterprise weighs heavily on the surviving family. The media reported that Mr. I had broken his quarantine. However, the family maintains that they misunderstood how long the quarantine should last. The family told the Commission that on the day Mr. I went to work, he had a normal temperature and showed no symptoms.

Following Mr. I’s trip to work, Public Health kept close check on the family’s quarantine. They sent inspectors to the door and telephoned frequently.

It took a long time to get word to the family about Mr. I’s condition after he was admitted. Hours into the night after the son-in-law’s return, there was no word to Mr. I’s wife about what was happening. There was no further word from the hospital into the next day. Mr. I’s wife slept with her phone by her bedside, waiting for word, but the hospital never called. Her niece called the hospital, pretending to be Mr. I’s daughter. She was told that he was in the intensive care unit and that he had a chest tube to drain fluids from the lungs.

It was more than two weeks before Mrs. I was allowed to see her husband. He was getting worse. She had to ask permission from the hospital and Public Health. The rules were that a person had to face imminent death before relatives were admitted. In fact, he lived several weeks longer. He was admitted on April 3 and died on May 25.

His wife went to see him every day. But his children were less frequent visitors. They had gone back to work and visits to the hospital did not go over well with their bosses and co-workers. One was even afraid of being fired after her quarantine ended.
SARS or its symptoms played havoc with various members of the family: Mr. I's wife, his two daughters, his son-in-law and one of the daughter's two children. Their temperatures were continuously checked during the quarantine period and when the six-year-old's went up suddenly and he lost his appetite, the family took him to a SARS clinic for a checkup.

The clinic decided to send him to hospital. They would not allow the mother to ride with him in the ambulance. She was near the end of her 10-day quarantine, still wearing a mask. The hospital would not let her in. Another relative had to bring some clothes for the child. The boy spent seven days in the hospital by himself. He had no visitors but he was in almost constant telephone contact with his mother. He even went to bed with the phone. Fortunately, he did not have SARS.

The family members are upset about the lack of information that was given them during the crisis. They have gotten on with their lives. But the widow still takes her own temperature every day and writes it down. “It's for my own peace of mind,” she is reported to have said.

The point of this tragic story is not whether the father knowingly broke quarantine, and nothing would be gained at this time by an investigation into the issue. The story shows how the quarantine system depends on voluntary cooperation and systemic supports that encourage voluntary compliance.

The One Left Behind

He's not 50 yet, but Mr. K already is talking about having a shorter than usual life expectancy. But he considers himself lucky because he has a life after surviving a SARS cluster within his family. He survived, but his mother and younger brother didn't.

It began in early May 2003, when his mother, in her early 80s, broke her hip at home and was admitted to hospital. She was there for two or three weeks, and Mr. K and his younger brother took turns visiting her. She developed a fever and so did the two brothers.

The younger brother died of SARS June 19, followed by the mother two days later. Mr. K could not attend the funerals because he was in hospital fighting for his life.

Their deaths were part of the second SARS outbreak and it is Mr. K's personal belief that hospital precautions were relaxed too soon.
When his mother was first admitted to hospital, Mr. K said security and precautions were tight and visitors had to wash their hands and wear masks. Later security began to loosen:

I firmly believe that the loosening up has something to do with Toronto trying to say SARS is behind us and so on. I think the hospital was under pressure to loosen up so that it won’t be seen as “we still have the virus around.” I think if the hospital did not relax precautions my brother might not get sick and I might not get sick.810

Mr. K had pretty much recovered from the effects of SARS. He is thankful that when he returned to work he had the full support of his employer and colleagues:

When I walked into the office no one avoided me, which is important. Being accepted back into society is important. I’m not sure everyone was that lucky.

The scars of SARS remain on his family, however. He has lost close contact with his brother’s widow:

My sister-in-law definitely does not want to talk about that and doesn’t want any people to know about it. I think she went through a prolonged period of denial. Even now she doesn’t want to talk to me or my family.

Missing Mementos

Sometimes things that might appear less significant in the broader picture are the memories most remembered by the victims. Little things can provide some comfort in times of grief. Or like a drop of water in a dam that is on the verge of overflowing, little things can tilt the balance.

A 77-year-old woman went to hospital suffering from diverticulitis. While in hospital, she contracted SARS and later was transferred to another hospital, where she later died. On arrival, paramedics placed her personal effects, stored in a plastic bag, under

---

810. This perception, not uncommon, is discussed elsewhere in this report in the context of the relaxation of precautions through the Ontario system.
the bed. The bag contained her wedding rings, glasses, credit cards and false teeth. Somehow, it went missing and was never found.

Her daughter told the Commission:

So we ended up burying her without her teeth, without her wedding rings, without her glasses. She was buried with my sister's glasses and stuff like that. It was very difficult.

Added another daughter:

That was the final indignity. I keep hoping that I will wake up soon.

Secrecy, Insensitivity and Stigma

Victims often perceived the lack of information about SARS to be secrecy imposed by the medical establishment. They could not get clear answers they felt they needed to help them deal with radical changes in their lives. For instance, a man was in hospital dying of cancer and became exposed to SARS. His wife developed a slight fever and was admitted so she could be monitored and be with her dying husband. The husband died and the family wanted to plan his funeral but could not get an answer on when their mother would be released. She had been in hospital for more than three weeks but never displayed any signs of sickness other than fever. As one family member told the Commission:

They had already observed her for so long and she hadn't displayed any sickness of any kind except for a broken heart.

During the funeral planning, the funeral home called and said the father had died of SARS. There would have to be special handling of the body and a glass enclosure for the coffin. The family felt the father died of cancer and did not want the stigma of a SARS funeral. They were plunged into a frustrating search to get a definitive answer on the cause of death.

The coroner's office said an autopsy had not revealed SARS. A second autopsy test determined the same. However, Public Health authorities said there had to be a SARS funeral because they didn't know what they were dealing with.

The hospital discharged the mother, but she still could not attend the funeral because
she was quarantined. As the family told the Commission, the loss of their father was compounded by what followed his death:

What should have been a huge Italian funeral with several hundred people turned out to be a funeral with little more than 50 people in attendance. Nobody wanted to come to a SARS funeral and those that did kept their distance.

Nobody would answer any questions that we had. Nobody would tell us if my father-in-law or mother-in-law had SARS or what their suspicions were.

You can imagine my mother-in-law, who barely speaks any English and doesn't believe that she was sick in the first place, watching her husband’s funeral on television and wondering why these people made her go through this.

All she wanted was a little bit of honour for her husband as she was not only robbed of that but also robbed of the closure to his death. She lives daily with questions that have no answers and no faith whatsoever in our health care system.

My family has gone through such a traumatic and horrific ordeal. In the end there is nobody to comfort us. There is a stigma that we are only now beginning to overcome. There are lifelong scars that we will go to our graves with.

In another case, the daughter of a woman who died of SARS said she and her sisters never did get official confirmation that SARS was responsible for her death:

We would often ask if someone could confirm the SARS diagnosis; we were told that it could take a couple of weeks and someone else said that it could take a couple of months, so we really just stopped asking. We thought when we heard, or we saw in the paper that she was one of the SARS statistics, that maybe the coroner had made the determination but … someone from professional standard, I believe with EMS, said that they had it down as confirmed SARS for the transport so I guess it was confirmed, but we were not told.

Another family told about living with the stigma of a “SARS house.”
Ms. Tecla Lin, a nurse who worked at West Park Hospital and whose story is told earlier in the report, lived with her husband in their family home. When both Ms. Lin and her husband contracted SARS and passed away, Ms. Lin's son found himself trying to settle his mother's affairs, including selling her house, which was mortgaged and costing him heavy monthly expenses. However, selling it for fair market price was hampered by the stigma of being the house of SARS patients:

In order to remove the stigma of the house, I had to do many things. I had to completely remove all of the personal belongs, possessions, furnishings completely, which meant selling everything, and I did that. Now it is very difficult just because there was so much stuff. There is a lot of stuff and I had to get new furniture, full furniture, and refurnish the house. And I did that and I put it up for sale this week. And it looks great and from the inside, the stigma is completely removed and that was a lot of work and cost a fortune, a small fortune, but that is the price of selling a house with a stigma attached to it.

A Simple Procedure, Then Death

Mr. L was no stranger to hospitals. He had health problems stretching back at least a decade. He had had a liver transplant, a triple bypass and prostate surgery, and he had diabetes. He may have been sickly and not young at 74 but his family did not expect him to die. His visit to the hospital was to get his nails clipped, a medical procedure for diabetics.

The story of Mr. L and his family, as told to the Commission, reflects the confusion in the early days of the outbreak and ends with their complaints about the lack of information and stigmatization within their community.

After the procedure, Mr. L returned home and developed a high temperature. The family doctor suspected a urine infection. His family drove him to a hospital, where they noticed there were more people in emergency than usual. Mr. L was admitted and when his family visited him the next day, things were not going well. He had trouble breathing and a nurse said he had had a very bad night. His breathing got worse and around 11 a.m. the family was told he would be taken to the intensive care unit. At 4:30 p.m. they were told Mr. L must go to another hospital because there was

---

811 Because Ms. Lin's name is already in the public domain, her name is used in this report.
no room in intensive care. At the new hospital, he was taken directly to intensive care. A doctor there began asking the family about Mr. L’s liver, and his family recalls:

He had to go back and forth to the hospital so we are used to that. We said his breathing is what we were afraid of. There is talk about SARS going around. Do you think maybe he has it? We asked the doctor. He looked at us and said: “Do you think if he had SARS we would be like this? With no masks?”

During the night the family got a call that Mr. L was transferred to yet another hospital. Here he ended up in a closed room and the family had to wear masks, gloves and gowns. They were told they would not be able to go back. Hospital staff said they were not exactly sure if he had SARS.

Mr. L died while both his wife and his daughter were in the same hospital under quarantine. That is where they learned of his death:

We told my mom that my dad had died. I went to the bathroom. I just could not take it anymore. I was not crying. I was numb. I said to the nurse, “Can you bring me some Gravol?” I told her that my dad just died and she said, “Oh my God.” My 25-year-old son had to go and sign all the papers for my dad because he was the only one not in quarantine.

The community in which the family lives reacted by stigmatizing them. Newspaper clippings about SARS were sent to the home, and a bakery they had frequented for 30 years declined to send food for the funeral:

After I was out of quarantine, I was walking at the mall to get some shopping and people would walk away from me. We wanted an open funeral and everyone to come but we were hearing so many people saying we do not know what to do, we should not come, but I said everyone is out of quarantine … but there was an outbreak at a funeral home … and we finally said we will just have a private service, we will not put anyone at risk.

812. As with the stories of other victims, the family recollection is described as reported and without verification because nothing can be gained by adversarial inquiry into who said what when. The point is the degree of confusion and misunderstanding that prevailed during SARS.
At the time the family spoke to the Commission, they had not received official word from the hospital about Mr. L’s cause of death or his medical file.

Death While Waiting

SARS ended the life of a 79-year-old woman because she stayed in a hospital while waiting for a room in a long-term care facility. She lived alone and was taken to a hospital emergency room after she fell and injured her eye. Doctors said she was in good health, except for diabetes, high blood pressure and other health issues. They decided she should not live alone and would stay at the hospital while waiting for a long-term care opening.

She arrived at the emergency room March 6, 2003, and spent three days there before being admitted. Two weeks after Mrs. V was admitted, a public appeal was issued for people who had visited the hospital’s emergency room to contact Public Health. Family members who contacted Public Health recall being told since more than 10 days had passed, they were in no danger.

Family members visited Mrs. V on March 21 and 22 and wore no masks and no protective clothing, believing that SARS was contained on the 4th floor. A few days later there was a public announcement that anyone who had even “delivered a package” to the hospital must go into quarantine. They did, but they had no contact with Public Health, which they had called following their first visit. The family members showed no SARS symptoms and did not become ill.

Mrs. V died at the hospital on April 26, almost six weeks after she arrived there. Relatives were not allowed to visit but kept in daily contact by telephone. Near the end, they were told they could visit but they did not want to take a chance of getting SARS.

Said one of her daughters:

I really feel deprived of those last moments with her. It’s not like she was bedridden, sick and dying. I have not had closure.
Communicating Death by Telephone

One of the many horrible aspects of SARS was how relatives were told that someone close to them had died. Some people learned about the death of their relative while sick in hospital themselves. Others received telephone calls because SARS prevented them from being at the hospital.

The case of Mr. and Mrs. B illustrates the pain and confusion suffered by so many when SARS took a life.

Mrs. B was a healthy 89-year-old who lived with her husband, 87, in their own home. In May 2003, she fell and broke a hip. Doctors operated and successfully repaired the hip. Her daughter recalled:

> She came through with flying colors. They’d already had her up. They wanted to know about convalescent care.

However, one week later doctors reported Mrs. B had SARS and had her moved to intensive care. She died the next day.

The daughter and some other members of the family were vacationing in Las Vegas at the time. They had planned the trip for some time and went ahead with it when Mrs. B did so well following the hip surgery. They were told of Mrs. B’s death when they stepped off the plane on return:

> We were landing. We didn’t know. We get off the plane and my son-in-law and my grandson were there to meet us and, of course, looking at them I knew something was wrong and that is when they said that she had passed away.

The daughter and her husband had been at the hospital before their trip to sign papers related to Mrs. B’s convalescence. They were told they would have to go into quarantine and wear masks sent to the airport for their arrival.

Mr. B was on his own at home. The hospital had phoned him to tell him his wife had died. His daughter was unable to help him because she was in quarantine. She recalled for the Commission:

> There he was in the house, left alone, told of her death like that and told
that he had to stay in the house. The health department said he had to take his temperature each day. Nobody would go into the house, so they dropped off the thermometer at his doorstep for him to take his temperature. He had started at the time with some early dementia and I think the confusion was even worse.

He took his temperature one day and he phoned and said it was something like over 100. He was reading something 102, 104, and I said well, it can’t be. So I phoned the health department and they said just tell him to put his thermometer in the cover outside the door.

His daughter went to see him as soon as her quarantine ended. She found that he had lost a lot of weight and was very depressed.

The family’s troubles did not end there. Mrs. B’s grandson, the daughter’s son, was also quarantined. He did not tell people in his office why he was away until his quarantine was over. She said:

They almost threw him out and said, how could you do that when there were other people at risk who had families.

The family had problems finding out exactly how Mrs. B died. The doctor involved was not available. A nurse whom the daughter reached could offer no help. The phone call informing the grandson that she had died said only that a nurse found she had died during the night:

I have a real problem with that because I have no idea how she passed away. Was she looked after properly? I got no answers. To me, that is so wrong. Nobody should die alone.

Compassion in the Midst of Horror

These stories are painful to read, let alone to experience. However, not all was gloom and hurt for those who suffered through SARS and survived. There were stories of courage, hope and kindness. Some are reported elsewhere, but the following two are noted because they relate directly to victims and their families.
One involves a widow who was quarantined in hospital after her husband died of SARS. She was alone and frightened, and hospital staff avoided her because of their fear. They entered her room only to take her temperature – except one nurse who went every day to her room for 10 to 15 minutes, and talked and comforted her.

There is also the story of another widow comforted by another nurse. During the crazy days of her husband's illness, the woman met a nurse who pressed a piece of paper into her hand. The nurse said to call if she needed help. After her husband's death the widow did call. The nurse came to her house and took her out for lunch.
Nearly one-half of Ontario’s SARS victims in Ontario were health workers, doctors, nurses, lab technicians, cleaners, ambulance drivers and others who daily walked into the face of SARS. Unlike the rest of us, they had little choice. SARS was where they worked and they couldn’t run away from it, even if they wished.

The experiences of the health workers who became ill with SARS are especially chilling because they are so unexpected. We don’t expect our doctors and nurses and other health staff to get ill, even though this is an unreasonable expectation. We particularly don’t expect them to get ill because of their work. We like to see them only as the knowledgeable professionals who try to keep us safe from disease and who look after us when it does strike us. When they begin dropping ill, we realize we are in a health crisis in which we are all at risk.

Because they are so important to us, we often view them as if they are not subject to vulnerabilities. But they are humans. They are people like us who worried, became tired and watched their personal lives suffer from putting in brutally long hours in the fight against SARS. They lived in constant fear that they might infect their families. Hundreds of them were quarantined, which often meant forced separations from their families. Many faced ostracism by colleagues and neighbours and, whether quarantined or not, had severely limited contact with family and friends. At times the fear and ostracism lasted for months after SARS finally ended.

Some of the saddest stories are from those who saw their colleagues suffer, and in some cases die, from SARS. One doctor who lost a member of her team told the Commission:

When Tecla Lin died it was the worst … I do not think I was very well for a while. I did not want to go anywhere, I just wanted to be home. I was tired … it was like I had been through an earthquake …

Working conditions were difficult for doctors and nurses treating SARS patients, and for their support staff. The experiences of many nurses during SARS have been
related elsewhere in this report, particularly in the Nurses' Survey section. One doctor told the Commission of one of the most difficult effects of treating SARS patients, was being shunned.

We were not allowed to go the cafeteria they were sending sandwiches to us, because we could not go to the cafeteria. If we walked in the corridor and somebody saw us, they would turn around. It was not only my experience, it was the experience of a lot of people ... It took me a while to understand the ones that had been nasty to me.

I will let it go. I have to work with them anyway. But something I feel, feel that there are two kinds of people, those who will and those who will not ... when they tell you are not welcome here in this room. You cannot be here, you are not responsible by coming in this room ... it is a stigma ... it is not nice. I mean, they are all physicians for goodness’ sakes, and health care workers, and they are behaving like old maids.

The same doctor had praise for many who did pitch in:

I can tell you that the people who worked in that unit were all extremely dedicated people, that I will work with them any time, because it was a risky situation.

Being a medical worker did not seem to help those who were unfortunate enough to become infected with SARS. No one can say that they received preferential treatment. The experience of one hospital nurse illustrates that. It also shows the difficulty some doctors had in diagnosing SARS.

One nurse who worked in a hospital that had SARS patients answered a call from a patient in a special unit and became ill over the following days:

I wanted somebody to admit me at the hospital. So I went to hospital ... and then I waited there for seven hours and the doctor there sent me home. He said I only have a urinary tract infection. I asked him, should I have a chest x-ray. He said no.

During her seven-hour stay, she didn’t get anything to eat. Just water. Ten days after her contact with the infected patient, she was admitted to hospital. She was sent home after four days.
No one from her own hospital called her to tell her about the SARS outbreak there. She found out from colleagues that one of her co-workers had died and seven people on her floor were sick. She recovered and tried to resume work but found she was too tired, and retired from nursing.

Hospital settings were familiar to the health workers who became ill. Sometimes that made their hospital stay more difficult since most had been in contact with death during the course of their work. One hospital lab technician had been in quarantine at home when she experienced SARS symptoms and was admitted to hospital.

She recalled that one nurse refused to make up her bed:

I know that some of them didn’t really want to be in the room. So she refused to make my bed. She just threw my stuff. I said, “You don’t understand, I need to clean the bed, I’ve been sweating a lot, I need to change the bed right down and make a clean bed.” And she just refused to do it and she said I have to do it myself. And I could hardly stand up. I was really upset over that ... I had other nurses who came in the morning and changed the bed. I didn’t have to ask them.

This and a handful of similar stories stand in stark contrast to the compassion demonstrated by the majority of nurses and other health workers.

As Dr. Avandano of West Park Hospital told the Commission, there were many health workers from all areas of the hospital who worked very hard to contain SARS:

I suppose we were enough, or maybe at times we were not enough, but I can tell you that the people who worked in that unit were all extremely dedicated people, that I will work with them any time, because it was a risky situation. The staff that cleaned, the housekeeping, did not want to go either. So we had a woman that was absolutely amazing, she was always there working, washing and cleaning. And at one point, [something spilled on her] and she was in a panic, and we just washed her. The pharmacist was all the time there, from eight o’clock until eight o’clock at night. The infection control nurse … was all day there, the ward clerk in the TB unit worked there with his mask because there were so many papers coming and going.

By far the greatest fear among health professionals was the fear of bringing SARS home to family. What could be worse than infecting the people you love the most? As one health worker said:
I was more frightened of taking it to my family. I did not see anybody, did not touch anybody for almost two months. It was the hardest. You do not realize what it is to look at people's faces and to shake hands and to touch. You do not realize until you do not have it … for instance, we were not to go to any stores, so we could not go to a store, we could not go anywhere, and yet we were working in quarantine. So you go home, and work, home and work, you do not go anywhere, no social life, nothing, nothing, nothing …

I have two grandchildren that are very, very young. My daughter would pass with them on the front sidewalk when I was home so that I could see them … I did not want to infect anyone. I was terrified of infecting somebody else.

Another doctor described for the Commission how hard it was to deal with precautions and protective equipment. Those treating SARS patients or suspected SARS patients started by using a surgical mask, gloves and a gown. Later the mask was replaced by the N95 respirator, headdress and goggles when examining or treating patients:

… And we realized how difficult it was to maintain those precautions, so once you came out of the room, and you disrobed, what happened then? Should you take your mask off? What happens with contact with your hands? I mean doorknobs, hand railings, how about charts, paper, pens, I mean everything and anything. It was so hard to know exactly what to do. So, again eventually we simply donned another gown, started keeping the mask on, we didn't wear gloves … but that was a huge question. We were more certain what to do at bedside … But the big questions, even to this day continues to be is what should the team members do when they leave the room? You know, they are still on the same floor, you know, the rooms of the patients are 10 feet away, what do you do at the nursing station, I still think that is a big issue.

Like others who treated SARS patients, he experienced fear from friends and acquaintances, in one case months after the SARS wave had ended:

I was in a restaurant. We were having a gathering. There could have been 14, 15, or 16 people. It was someone’s birthday. A close friend of mine … we were sitting relatively close together … By mistake, they gave him mine [food dish], and I got his, well, I didn't realize this so I took a
morsel, a single morsel off his plate, with one of the vegetables, and you should have seen the reaction when I said, “Here’s your plate.” His wife and his sister said, “You can’t touch that.”

I just looked aghast, I said what are you crazy? It’s a month later, you know my wife, my kids, my mother, a lot of friends … I’ve shaken hands, I’ve hugged, I’ve kissed, you know, it’s not a big deal, it’s gone, forget it, and you know what? He, he would have been okay had it just been him and me, but I think it was everybody else around him. It was a silly little thing, but I couldn’t believe that eight or nine months later I was still a bit of an outcast … I think if had I used my fingers, I would have understood, but with a fork?

Another nurse became ill with SARS after she looked after a patient in her hospital’s SARS unit. The illness played havoc with her personal life and she still suffers some effects. Although her story has a terrible beginning, it does have a happy ending.

She was saving up to go to the Philippines to be married when the illness struck. As she told the Commission:

We planned to get married there, to have the ceremony there, since our family and my husband’s family are all there. We planned to have the ceremony in 2003, the summer 2003, but since I got sick, we changed our plans. We let him come here, use his visa, but I wasn’t recovering well yet, so instead of coming here to Toronto, he went to Vancouver for a month so that his visa would not expire. But at that time it was so sad because I had SARS so we have a problem with his family, of course I cannot blame his family, they were discouraging him from coming over because they learned that I was sick. [They feared that] he might get infected too.

I was so scared that the wedding would not be realized. But he really proved to them that he loves me and no matter what he said he would still come to marry me. He actually wanted to come to look after me because even though I was sick already … My mom was the one doing the household chores for me since I was so sick. I was always tired, so that’s why he wanted to come over. I asked him to stay in Vancouver for one month, because I needed some time. Then in August 2003, he came [to Toronto] and then we got married on September 25th.
The couple waited two years to have a child because she was prescribed the anti-viral
drug ribavirin, which is deemed to be unsafe during pregnancy:

So, to make it safe, we did it after two years. I got pregnant after two
years. It was so scary still. Maybe I was just paranoid, but I know that I
had that medication, I was sick. I don't know what the long-term effect
of that will be. Even now, I have severe headaches. Sometimes I am so
short of breath and still last year, my blood was not normal. And when I
got pregnant and I had my ultrasound, …they said that I am carrying a
Downs syndrome baby. So it scared me … but when I gave birth, [the
baby] was healthy

When a health worker gets sick, the effects on his or her family can be profound. One
nurse worked at a Toronto hospital but lived in a city out of Toronto. She became
infected while helping to admit a patient. The hospital did not know he had SARS.

She was admitted to a Toronto hospital and her husband and her three school-age
children had to go into quarantine in their home city. She recalled her experience in
an interview with the Commission, explaining what was going through her mind:

Just the dread of possibly infecting my family was the first thing that
went through my mind. This fear for my family and then just the anxiety
of not knowing whether or not I was going to have it … And it's very
tense trying to explain it to my husband and my kids. Wondering how it
could happen. I don't think that kind of feeling, that kind of resentment
hit until I was actually hospitalized.

The husband set up school for the children at home. As she told the Commission:

You know they would sit in our family room and he would ring the
school bell and sit them down to do their homework from nine o'clock
and then they would have recess when they usually had recess and lunch
when they usually had lunch and then at three o'clock they were allowed
to watch cartoons like usual.

The neighbourhood kids were not so understanding:

There were some kids that were just targeting the house. You know
teenagers, what else is there to do, I guess. So they were throwing bottles
at the house and trash on the lawn and stuff like that.
For the most part I truly believe most had no idea what was going on. Locally it wasn’t big news so I guess most people, if they heard about it, didn’t really associate it with something [there]. I had one neighbour who was very, very helpful who brought supplies to the family.

She said her husband faced some shunning after his quarantine:

He went into the bank and they were covering their faces or some silly thing like that. You have to expect that kind of thing because people are not sure what to do and they want to protect themselves so I didn’t really hold that against them. It wasn’t that bad.

The nightmare of passing SARS on to family came true for one doctor who contracted SARS and infected his 15-year-old daughter. Both survived. The dramatic impact on the family was relived on the first anniversary of the Toronto SARS outbreak on the TV Ontario program Studio 2.813

The doctor noted that anesthetists sometimes resuscitate people and this has never been a problem for him, even when he had to try to resuscitate a woman with leprosy using the mouth-to-mouth method. But SARS was different:

We had an elderly man who was quite ill in the intensive care unit whose breathing was getting quite distressed. I happened to be the first available anesthetist that morning that entered hospital so I was asked to go and help out in the situation. And you have to bend down and look within a few inches of the patient’s mouth. And even just that few seconds it took to do that I guess I was right in the stream of the virus being breathed in and out and I got quite a wallop of it. So even with the mask I had and that, I got I guess enough of it around the edges of the mask to become ill myself.

It happened so fast. I guess I was more like one of the sort of front-line border troops in a war that just got sort of mowed over by the initial blitz.

When symptoms appeared, he went to the emergency department. Several other medical staff were showing up with similar symptoms and all were sent to a newly

---

opened SARS ward at another hospital. He lost 20 to 25 pounds and became jaundiced from the side effects of the drugs, and anemic. He became extremely weak. As he said:

> And it got worse when I found out my 15-year-old daughter had gotten sick and was admitted and probably had SARS as well.

> When she got sick, I really felt somehow that maybe I should have, you know, immediately just put myself into isolation as soon as that – as soon as I was in contact with that patient. So yes, I certainly did feel a lot of guilt there.

His daughter also spoke on the TV program:

> I never was angry. I was never upset at him. I didn’t want him to feel guilty. It made me sad that he felt that way.

> It all happened in a matter of hours. I started to feel really fluey, got into the shower and within half an hour I was feeling really bad. It was like a flu but it was, I would say, ten times worse. When you breathe, you feel pain in your chest and when you try to cough it’s just like fire coming out your throat.

> The ambulance came and all of a sudden these guys come out in these outfits that looked like space suits and it sounded like Darth Vader and it was like the scene from *E.T.* when the people come in and take him away. It was like that. And just the sound, everything was really strange and really scary and frightening. I could not stop crying.

> There were a few moments when I thought to myself, I’m gonna die. I knew that it was really serious and there was a woman down the hall from me in the isolation ward and she was really sick, and she was screaming and really disoriented and crying. And then I found out a few days later that she died.814

The daughter recovered and was in quarantine for about two months and, of course, missed two months of school but she said the experience changed her:

---

I was just sitting in my room alone and didn’t know what was going to happen. I had a lot of time to reflect and to think about the way I was living previous to this. I had really, really negative self-esteem, really bad image. And throughout that time, I just only had myself and God and just my thoughts and I had to sort everything out. And I came out feeling just completely more connected with myself and had this really good relationship with myself. I was really happy. I was really positive. I thought, wow, I’m really a survivor of something this dangerous, this scary.

It was a wake-up call. Whether or not you admit it, everybody takes everybody for granted, you know. Your family is always there. When somebody almost dies or somebody is really sick, when you get better you’re that much more thankful for it.

What gives me comfort is to know that believe it or not you cannot control many things. And sometimes you just have to take it a day at a time and see what happens. Just live your life and follow your goals and dreams.  

The doctor also fully recovered. As he said:

I was lucky. I got over the physical stuff pretty promptly. By the time the quarantine was over I was actually basically sick of being sick. I found that first going out, even just walking, it felt like a walk around the block was a several-mile brisk hike. But within a month I was right back to where I had been before.

But his daughter worried about her dad when he went back to work:

I thought that maybe new diseases would come back. If something like that happens, well, what else? There are probably millions of other diseases we don’t know about.
The Case of Dr. X

Early in SARS a nasty public controversy erupted over whether a health professional knowingly put hundreds of people at risk when he attended a funeral while sick with SARS-like symptoms. An estimated 150 people were quarantined because of what a public health official painted as an irresponsible action that could possibly spread SARS throughout the community. The media jumped on the story and many people became anxious that the SARS outbreak, already a terrifying situation, was about to get worse.

Dr. Hanif Kassam, acting York Regional Medical Officer of Health when SARS broke out in the spring of 2003, revealed this potential exposure at a news conference the day after Easter. He said the health professional had put “hundreds of individuals at risk” by exercising bad judgment. He went so far as to threaten to have the person charged by police if he did not stay isolated. The Toronto Star reported:

He should have known about the symptoms and taken the necessary measures to ensure that other people were not put at risk, Dr. Kassam told the news conference. He clearly doesn’t know the gravity of the situation.818

This scathing denouncement was made publicly despite the doctor’s evidence that he had no symptoms before the funeral.

The health professional, Dr. X, was a resident doctor at a Toronto hospital at the time and vigorously denied the accusation. He had admitted himself into hospital with SARS-like symptoms after the funeral but protested that he had been symptom free before going to the funeral home and a church. At the time that Dr. Kassam made the accusations, the doctor had been isolated in hospital for almost two days.

Dr. X responded to the public attack and the two doctors fired back and forth at each other in the media, leaving the public trying to sort out the facts. There is much more to this story than contained in this brief summary and the Commission cannot make a finding of fact in this particular case. It can, however, note that the incident is an example of how easily things can escalate in times of crisis. It shows the need for those

in authority to keep a cool head and measure their response when emergencies occur. Provocative personal attacks by those in authority are not helpful.

The public fight between Dr. Kassam and Dr. X was unfortunate and unnecessary. It caused considerable apprehension among the public, who were left with the impression that even the medical community, their best defence against SARS, was slipshod. If anything was learned from the incident it is the need for reasoned approaches and calm communication by those in positions of authority during times of public crisis. What was missing in this case was a measure of official restraint and non-provocative language, especially when the battleground of the dispute was the news media.
The Wider Impact

The stories of SARS victims, their families and friends are as plentiful as they are painful and are told in detail in this report. There were other victims who did not contract the disease but who nonetheless suffered from its spin-off effects. These are the hidden SARS victims, those who suffered stress and emotional pain resulting from disruptions in health care, and from the systemic lack of preparation, policies and simple systems to encourage consistent and fair handling of those who needed access to their sick relatives. These systemic failures resulted in great stress and anxiety.

Many hidden victims were members of vulnerable populations: the elderly, the physically and mentally impaired, and those who could not speak English. They had difficulty navigating through a health care environment that is complicated at the best of times but was especially confusing and frightening during SARS. Hidden victims were those who stood by as people close to them died alone because of visiting restrictions. They were people forbidden from accompanying a relative or friend to medical assessments or treatments. In some cases they were people who needed treatments but had to wait because SARS had turned the system upside down.

It is easy now to forget just how disrupted and confused the health care system was during the SARS outbreak. This was a new disease, and the system was unsure how it was spread, how it might be controlled and, in fact, whether it could be controlled completely. It was highly infectious and deadly and it seemed reasonable at the time that health care facilities and their staff do whatever was needed to stop it.

Most people understood the seriousness of SARS and the need for precautions at hospitals and other health care facilities. Many of the hidden victims felt, however, that the health care system was too rigid, cold and uncaring to people struggling with life and death issues. The daughter of a cancer patient, noting a no-visitor policy at a cancer treatment hospital, put it this way:
I know that this was all for safety precautions. I understand all that but you know when someone in your family is all alone there, then you feel angry at a certain point. You would wait outside and you don't know what he's doing in there.

There were many stories of people being handled with less sensitivity than might be expected. However, in these cases it wasn't simply health care staff being uncaring or mean. Systemic failures, not individual care facilities or staff, are behind what went wrong in the stories of the hidden victims. Lurking in the background of each case are signs of lack of preparedness, lack of policies and lack of simple administrative machinery that could have helped to avoid these horror stories.

The lessons from these stories are: Be better prepared for infectious outbreaks, build better systems to handle effectively all aspects of the crisis, be clear about who is in charge, and above all, communicate regularly and clearly with those affected.

Here are some of the hidden victim stories as told to the Commission.

**A Case of Inconsistent Rules**

Ms. K recalled how her elderly father became a bystander victim in the management of SARS. He was a patient at a Toronto hospital where he spent five weeks isolated from his family because of visiting restrictions introduced to curb the potential spread of SARS. He was paralyzed from the neck down with ALS, Lou Gehrig’s disease. His physician refused the family visiting rights on the basis of hospital policy. The family tried to appeal the no-visitor decision. They called the hospital CEO and its Chief Medical Officer but did not hear back from either. They tried contacting Dr. Colin D’Cunha, Ontario’s Chief Medical Officer of Health, and Dr. Sheela Basrur, the Toronto Medical Officer of Health. These offices referred them back to the father’s physician, who had refused visiting permission in the first place. Ms. K said:

I was at the end of my tether. Nobody had explained to us why we couldn’t see my father. It was like living in a pressure cooker. I could not
believe I was still living in Canada. It seemed as if [the hospital] and its physicians had become a law unto itself.819

The daughter turned to the media for help. She emailed the Toronto Star begging for assistance. A reporter called the hospital community relations department and on May 5 the patient’s wife received permission to see her husband. She had not seen him for 40 days. He died two weeks later.

As Ms. K told the Commission:

I should not have had to depend on the media call to see my father. My own call should have been enough.820

She said her mother still is unable to handle the fact of not having been with her husband in the final weeks before his death:

She is still traumatized that she could not fulfill her cultural and religious obligations to the full.

She is haunted by the memories of those five weeks and what she saw as the cold indifference of physicians in power. She says this cruelty must never happen again.821

What was missing was a system through which families who felt unfairly dealt with could appeal to a senior hospital official or team of senior staff. Different health care staff had different views about access or visiting during SARS. Patients and their families should have had recourse to review such decisions without going to the news media.

The Man Who Died Alone

Similarly, a 96-year-old man who had been living with his disabled grandson was taken to a hospital in the Greater Toronto Area, where he was diagnosed as requiring chronic care. The man’s daughter and his grandson visited regularly but one day

arrived to find the hospital closed because of SARS. The elderly man’s condition was classified as chronic, but not critical; still he was not permitted visitors. The daughter tried unsuccessfully to have her dad’s condition changed to critical from chronic so visits could resume; however, calls to the attending physician and the man’s family doctor were not returned. The hospital said that when the man’s condition became grave they would call her and she could visit just before he died. The only call she received was that her father had passed away.

Fifteen Minutes Too Late

One man told of trying to visit his 56-year-old mother at hospital outside the Toronto area. She was admitted just after Mother’s Day, right at the height of the spring 2003 outbreak. She needed surgery on some toes affected by diabetes and he went to visit her before the operation. He told the Commission he was physically removed from the hospital by security staff despite his understanding that his mother had placed his name on a list of visitors and that this was all that was required to secure a visit.

Later he received a call from a nurse saying he should come to the hospital because his mother had had a heart attack. When he arrived he was allowed to go to the intensive care unit without any SARS screening. He talked with a doctor who said he was 15 minutes too late. His mother had passed away.

He described himself as “emotionally wrecked.”

This is one more example of the misunderstandings that can lead so easily to a tragic sense of loss when there is no preparedness and no systems to ensure reasonable policies and sensitive communications.

High Anxiety and Nightmares

Enforced separations also created anxiety and pain for people in long-term chronic care facilities and their families. One woman told the Commission how she could not visit and care for her disabled mother for 29 days during the SARS crisis. The facility did not have any SARS cases but imposed visitor bans as a precaution. The mother had suffered a serious brain injury more than two decades earlier. She had been in long-term care since, receiving almost daily care from the daughter:
I promised her that I would remain at her side for as long as she needed me … I have managed to be at her bedside every day or second day for the last 21 years. I am there to give my mother her personal care, to feed her, to assess her health and to advocate on her behalf.

The visitor bans caused her mother much distress because “I could not prepare her for the sight of staff in their space suits hidden behind their visors, goggles, masks, gowns and gloves.” The daughter said:

My mother will never be able to tell me what her experience was of those 29 days. For me there was high anxiety, nightmares.

The daughter told the Commission that she watched with interest as the Hospital for Sick Children allowed one family member to be with each patient during SARS. A parent was allowed to be with a sick kid, but adult children were not allowed to be with their parent at this long-term care facility:

I and others feel that we are the parent and our loved ones the child, regardless of our blood relationship.

The daughter also said that the facility used the SARS experience to impose what she called greatly altered, reduced and awkward split visiting hours.

She said:

The administration has, by their actions, said that we were not needed during the crisis and that we are needed even less now, post-SARS. Of course, if our loved ones could, they would tell them differently. To me it feels like a hijacking. A hijacking of mine and my mother’s rights or as if Big Brother has come along and taken over and only when Big Brother says I can will I see my dear mother.

She said long-term care facilities should distinguish between visitors and hands-on family caregivers when deciding visiting hours.

822. The Commission is not saying or suggesting that the Hospital for Sick Children did anything wrong. They were following the directives and allowing parents to accompany ill children, as the directives permitted. The point is not that they did anything wrong, but that consideration ought to have been given for the needs of elderly patients.
This woman’s criticism of her mother’s long-term care facility is understandable. So are the restrictions placed by the home, when seen from an infection control perspective. The key is that these facilities should work with families so that policies blend the need for infection control and the needs of patients and their families. There is need here for discussion and explanation, not simply arbitrary restrictions. Perhaps there is something in the Hospital for Sick Children’s approach that could be applied to other facilities.

**Impact on the Elderly**

Another woman told of how her family suffered trauma when access to her father was denied at both a hospital and his long-term care home. The 81-year-old father lived in a long-term care facility where visiting was restricted then cancelled because of SARS. She said:

>This had a devastating impact on all seniors, both emotionally as well as physically. They might as well have been in prison. Tuck shops were closed. All activities run by the volunteers were suspended.

The father was suffering foot infections related to diabetes and was admitted to hospital. Doctors decided that his legs must be amputated. The day of the scheduled surgery the daughter arrived at the hospital and was denied entrance. The hospital had been closed to visitors because of SARS. She and her sister sat from 6:30 a.m. to 4:00 p.m. in the space between two sets of doors at the hospital main entrance. The father suffered amputations that were more extensive than planned without seeing his family before surgery or after. Both legs were removed at mid-thigh.

He returned to his long-term care home, where he coped but had trouble sitting in a wheelchair without legs as a counterbalance. He developed an infected bedsore. He was admitted to hospital again, this time another one, which was closed because of SARS a few days after he arrived. He was discharged after eight days, but he and his family were put into quarantine because of their connection with the hospital, which had active SARS patients. He had to cope without family help, and when his daughter telephoned a nurse to ask her to look in on him, she was told:

>We are trying to go into his room as little as possible as we are afraid of catching something and spreading it to the other residents.
The daughter told the nurse the quarantine was only a precaution and nurses at the home had been issued protective equipment in the form of masks, gowns and gloves.

The father died unexpectedly on June 22. His daughter said that the next time hospitals are shut down by a medical emergency, seniors should be given the same considerations as children:

Seniors are much like children. Any change in routine causes extreme anxiety, stress and confusion. Seniors need to be able to have someone there with them during peak times of 7:30 a.m. and 9:00 p.m. Someone to speak for them when needed, to help understand medical diagnosis and treatment, and to help with medical histories. Someone to help them with the simplest task like raising or lowering their bed, with their meals, their personal hygiene and to reassure them, just to be there with them. These are all the things a family member would have been doing for them. To deny seniors this basic right is simply wrong.

Another case involving the elderly shows how SARS impacted the quality of life of many older citizens who came into contact with it. One gentleman went into hospital for a hip operation, contracted SARS, and infected his wife. Rehabilitation exercises are critical in recovering from hip surgery, but he could not complete his rehabilitation program because of SARS. Now he has difficulty walking.

The family was interviewed by the Commission. His daughter described what happened:

When you have a hip replacement, you've got to be up the next day. Well, he was. I remember the phone call after the hip replacement because he was about four days with therapy. He was so excited that he could walk so much better now, and I remember they were making him do the stairs and he was so happy. And then he got taken with SARS to another hospital and that was it for the therapy. For five weeks he lay in the bed with no therapy.

No therapist would go in with nobody knowing anything about SARS, nobody would even go in the room except the doctor. And even though he was well after one week, they wouldn't take him out of isolation because, well, they would release him to me but I'm untrained. But even if he went home, I tried two different nursing companies, private nurses, nursing companies and the second I said he's going to be in quarantine from SARS, that was it. They said no.
So I said to the hospital, if trained professionals won’t come in because they don’t know anything about SARS, I certainly am not a medical professional and able to protect myself or my daughter for him to come into my home or my brother’s home. You know, they have children. And they said that’s our only option. And it was a big fight with administration.

The daughter enlisted her MPP to get her father released to another facility, where he finished his quarantine in a private room. But it was too late for rehab.

The system, unprepared, could not cope with this man’s pressing medical need. A system better prepared is required to prevent this kind of medical damage.

**Shifting Policies and Practices**

The Commission heard much about the lack of consistency and clarity of rules and restrictions put into place during SARS. A woman told the Commission her family’s story of trying to navigate conflicting hospital policies and practices. On March 27, 2003, her father was in such pain from cancer that his wife and son brought him to a hospital in Greater Toronto Area. Only his wife was allowed to accompany him into the emergency department.

The next day, the wife went to visit him but was told by a nurse that visits were not allowed because of SARS. Later, the hospital said they would allow one visitor for one hour per day. Then they said someone would have to telephone ahead and provide the name of the visitor.

Said the daughter:

> And so it went. Each day the rules seemed to change with respect to visitors. Not only with respect to the number of visitors but also when it came to washing our hands, having our temperatures taken or completing the sign-in sheet on the door where my father was staying. Sometimes these tasks were monitored and other times they seemed to be forgotten. It also seemed that some staff members seemed to enforce the rules more than others.

Four days after the man’s admittance, the family was told that patient visits were suspended. The family called the hospital ombudsman, their MPP and some other
public officials. On April 1, the hospital said it would allow one visitor a day if the name was provided in advance. This policy created a problem when the man’s 91-year-old mother wanted to visit. She was blind and hearing impaired and needed someone in the family to escort her through the hospital. The hospital at first allowed this, then changed its mind. The elderly woman had to find her way own way to her dying son’s room. Later the man asked to be discharged so he could die at home.

His daughter told the Commission:

I truly believe that the quality of my father’s life during his final days was affected by being kept isolated from his family. He needed our support and we were not allowed to be with him.

What difference would it have made if there was more than one visitor at a time? Or if the visitor stayed for more than one hour per day? Would that really put the hospital at greater risk? I don’t think the health care administrators thought about the impact of those restrictions on patients in palliative care. Patients who had nothing left to hang on for, except seeing their loved ones.

Once again it is hard to fault the individual hospital and its staff. They were forced to make up visiting policies as they went along. The health system must understand the vital human importance of visits to the sick. Advance planning is needed to create systems and policies to ensure a safe, humane and sensitive health system during infectious outbreaks.

Hospitals Under Stress

Another woman’s story illustrates the tension among hospital staff during SARS and how it reduced quality of care for patients who did not contract SARS. Her story is another example of the tremendous stress under which hospital staff, from doctors and nurses to cleaners and security staff, had to labour.

She told of how her father was in a Toronto-area hospital for hernia surgery in May 2003. The man was 85 years old and did not do well after the surgery, and his stay was extended. At first the family was allowed to visit frequently, then two SARS patients were brought to the hospital and visits were limited to one person at a time for five minutes:
This [admission of SARS patients] seemed to put the fear of death into the staff. Nurses didn’t want to discuss the fact that two SARS patients were in their unit.

The father died in that hospital during the second week of June. Visiting was restricted when he died. His son and a granddaughter who had travelled from overseas were not allowed in to see him before he passed away. The daughter said:

For the last 17 days of Dad’s life he never felt human contact. For a man who always reached for someone’s hand to hold, whether it was his daughter’s or one of his 10 grandchildren, all he got was a latex glove. The grandchildren are left with this awful image of not being allowed to be with their precious grandfather for the last week of his life.

The coroner’s office ordered an autopsy. The daughter told the Commission that five months after the autopsy they still did not have the results, although they had been told he did not die of SARS:

We still don’t have closure. A lifetime of love and caring that ended with neglect and loneliness.

Quarantine: Confusion, Controversy and Hardships

There had been no widespread use of quarantine in Ontario for 50 years, so it is not surprising that quarantine during SARS caused confusion, controversy and stress. By one official estimate, 15,000 to 20,000 Ontarians entered quarantine during the outbreak. But there is some confusion about how many people were under home quarantine, how many under work quarantine, how many were actually contacted by public health and how many quarantined themselves voluntarily without ever speaking to public health authorities.

It is likely that somewhere around 30,000 people observed quarantine during the outbreak in Ontario. Virtually all of those entered quarantine voluntarily. Sixty-five persons were issued Section 22 orders during SARS; one was served with a Section 35 order, and the latter was a matter of some controversy. Section 22 of Ontario’s Health Protection and Promotion Act allows a medical officer of health to require a person to

take (or refrain from taking) any action specified in the order regarding a communica-
able disease. Action under the order can include directing a person to remain at home
while a danger to others. Section 35, used for people who refuse to comply, allows the
Ontario Court of Justice to issue an order directing compliance, and may also require
police to help to enforce it by taking the person into custody and admitting the person
involuntarily to hospital.

The glaring inadequacy of Ontario’s antiquated Health Protection and Promotion Act is
described in the Commission’s Second Interim Report.824

The term “quarantine” is often misconstrued, and sometimes confused with isolation.
Both are defences during infectious disease outbreaks. Public health officials must
have the power to isolate those who are infected, and to quarantine those who might
have been exposed to infection and might be infectious to others. The U.S. Centers
for Disease Control and Prevention defines both:

Isolation refers to the separation of persons who have a specific infectious
illness from those who are healthy and the restriction of their movement
to stop the spread of that illness. Isolation allows for the focused delivery
of specialized health care to people who are ill, and it protects healthy
people from getting sick. People in isolation may be cared for in their
homes, in hospitals, or in designated healthcare facilities.

Quarantine refers to the separation and restriction of movement of
persons who, while not yet ill, have been exposed to an infectious agent
and therefore may become infectious. Quarantine of exposed persons is
a public health strategy, like isolation, that is intended to stop the spread
of infectious disease.825

Ontario was not the only jurisdiction to use quarantine during the 2003 outbreak
period. China, Taiwan, Singapore and Hong Kong were the main areas of Asia
affected by SARS and they also responded with quarantine. However, the approaches
to quarantine in Asia and Ontario were quite different. Some Asian jurisdictions set
up police checkpoints, cordoned off entire villages, and even threatened to execute
anyone who broke quarantine.826 In Ontario, public authorities used voluntary quar-

826. Article by Brian Friel, National Journal Group Inc, October 21, 2005.
antine and in some cases provided food and supplies needed during isolation.

Ontario’s quarantine involved staying at home for 10 days, after which the risk of having been infected was considered over. Quarantined individuals slept separately from other people in the home, wore masks when near others and were not to share personal items.

Toronto used work quarantine for health workers exposed to SARS but who remained healthy. These health workers continued at their jobs but stayed in home quarantine after working hours. They were expected to travel to work in isolation (i.e., not using public transit) and were asked to closely monitor themselves for signs and symptoms of SARS, including twice daily temperature checks. The idea of work quarantine was to ensure that there were enough health care workers available. If every health worker exposed to SARS had to remain in home quarantine, there would have been a tremendous, and perhaps impossible, strain on health facilities because of worker shortages.

Quarantine was discussed in the Commission’s interim reports. The purpose of raising it here is to illustrate how quarantine disrupted the working and home lives of thousands of Ontarians who suffered considerable emotional and psychological strain because of SARS.

Public hearings and private interviews produced many individual stories of the hardships and stress caused by quarantine. People told the Commission of the stress of being isolated from family and friends, plus the anxiety they developed from fear that they might have SARS and pass it on to their children or other family members.

The Ontario Nurses’ Association presented this collage of quotations from nurses who were quarantined because of possible contact with SARS at work:

Quarantine was very difficult. Not being near my family, not being able to touch them.

I was sleepless, stressed, feeling despair every time I went to work. I felt depressed, angry at how it was mishandled, especially isolated, suffered from insomnia and had a tremendous fear of bringing a deadly disease home to my children. The babysitter refused to babysit my child. Friends, family and parents of my child’s classmates did not want their kids to play or contact my family.
I had several vivid nightmares during outbreaks that my children were ill with SARS. One night I woke and ran to the bed of my youngest who was clutching her forehead, convinced she was burning with a high fever. My youngest child was teased and isolated by her peers because her mother was a nurse at a SARS hospital.

My husband and children moved out for 12 days. Grandparents changed schedules to care for the children. There was stigma from friends outside of work. I suffered nightmares.

I was very much isolated from loved ones. My family thought I was going to die.

Just last week a number of ONA members who developed SARS after caring for SARS patients told me they continue to suffer severe emotional and physical repercussions of a disease that we still don’t know that much about.827

Roughly 7,000 persons were sent into home or work quarantine because they had a connection to North York General Hospital, the epicentre of the SARS II outbreak. Some 4,000 were hospital staff. Bonnie Adamson, president and CEO of the hospital, told the public hearings of the tremendous hardships caused by quarantine:

For many of them the situation made them feel like pariahs in their own community. We heard reports of neighbours crossing the street to avoid houses where our staff lived and even an eviction notice to one of our staff members by nervous roommates ... Many were unable to attend important family milestones: weddings, graduations and even the funeral of parents, and these are events that could never, ever come back.828

Many of the stories of hardships during quarantine are anecdotal. However, hard evidence of the effects is found in a study by researchers in Toronto and New York. It found that of 129 quarantined persons studied, 28.9 per cent showed symptoms of

post-traumatic stress disorder (PTSD). Symptoms of depression were observed in 31.2 per cent:829

All respondents described a sense of isolation. The mandated lack of social and, especially, the lack of any physical contact with family members were identified as particularly difficult. Confinement within the home or between work and home, not being able to see friends, not being able to shop for basic necessities of everyday life, and not being able to purchase thermometers and prescribed medications enhanced their feeling of distance from the outside world. Infection control measures imposed not only the physical discomfort of having to wear a mask but also significantly contributed to the sense of isolation.

This study said that just making temperature checks caused anxiety in some people. It quoted two people as illustrations:

Taking temperatures was mentally difficult, said one.

Said another:

Taking my temperature made my heart feel like it was going to pound out of my chest each time.

Following quarantine, 51 per cent of respondents had experiences that made them feel that people were reacting differently to them: avoiding them, 29 per cent; not calling them, 8 per cent; not inviting them to events, 8 per cent; and not inviting their families to events, 8 per cent.830

929
Individual Stories

One of the most serious effects of quarantine was that it kept people apart when they needed to be near family and friends. In so many cases, a family member was ill, or dying of SARS, and those close to him or her were unable to provide normal care and comfort to the patient or each other.

Said one man who lost both parents to SARS:

Nobody could see each other. Finally I was able to get permission to go visit Mom because she was dying but I couldn't go next door to visit my sister or two doors down to visit the girls [his nieces].

When a death did occur, some people were not able to pay their last respects or attend funeral services because they were under quarantine. More is said about this under the section on funerals.

Quarantine affected many people who had no risk of exposure to SARS until they had to visit a medical facility for treatment of an existing condition, or for examination and tests. A kidney dialysis patient told of how he had to take treatment three times a week at a hospital. He complained about confusion over SARS quarantine. After one treatment, public health authorities called him and said he must be in quarantine, which included wearing a mask at home and not sleeping with his wife. Other dialysis patients told him they were not quarantined. However, every time he went for dialysis he was placed under a new ten-day quarantine. He complained to public health that he could be in quarantine for the rest of his life and maintained that only people sick with SARS should have been quarantined.

Shunning of people possibly exposed to SARS in some cases continued after a person ended the quarantine period and was symptom free. One woman told of how her adult son gave up a business connection, partly because the people with whom he worked found out he had been in quarantine:

… when this happened [quarantine] he had to stay home and he chose not to tell the other people in the office why he was home because people were very skeptical about being around people and whatever. When his time was finished with the isolation [quarantine] he did tell them why he had been off and things didn’t go very well. They almost threw him out and said how could you do that when there was other people at risk who
had families that he worked with and it just got worse and worse … I’m not saying that this was a whole result of this but this was kind of the icing on the cake … they were very irate.

One woman whose family suffered three SARS deaths told of the effects on her children. Their father was in hospital desperately ill with SARS and they were quarantined at home:

My daughter missed her play, the school play that they’ve been working on all year, and I couldn’t get the school to put it off for a week. She missed it. My kids were just so isolated and the school wasn’t doing anything, and they were sending homework home. That’s what they were doing, they were sending homework and leaving it on the porch.

To help ease the strain and break the boredom, the mother called friends and asked them to bring children over to hold signs, sing and perform skits while the quarantined kids watched from inside:

And they did and it made such a difference. I was so angry that my children’s mental health was left to me. Like, where are all, where’s public health, where are the schools, where’s the school boards, you’ve got mental health issues going on here in quarantined homes, and nothing, nothing in the system.

The problems did not end when quarantine did. A daughter was not allowed to return to her high school after quarantine. She missed her Grade 11 final exams and was penalized 30 per cent of her marks for not being able to take the exams. Her mother said:

That’s what my daughter’s dealing with now. So, in Grade 12, she has to maintain an average over and above, aside from the fact that they didn’t make up the materials she missed, they kept her out of school for a fair bit of that last term.

The schools didn’t know how to respond or react, they had parents panicking … The absurdity became that my kids, although not in quarantine, weren’t in school, they were at the mall, because they weren’t quarantined anymore …
Another woman had to get public health to help her fight a principal who banned her daughter from school. No one in the family was ill or quarantined but the principal had heard that the woman’s mother worked at an infected hospital. She said:

I knew the principal quite well at the school and he tried to ban my child going to school and then again I had to phone public health and she … phoned over to the school and also faxed a letter to him that he could not do that.

Some schools were closed and students and staff ordered into home quarantine when officials feared students had been exposed to SARS. Quarantine affected 1,700 students at one school in the Greater Toronto Area.

One student told the media he was upset because he missed his girlfriend’s prom night because he was in quarantine:

It’s so hard for me right now, because I’m 19 years old, and whenever I’m not in school, I’m out. So for me to be stuck in my house is the hardest thing.

Mixed in with all the stories of hardships caused by quarantine were some stories of human kindness. Like the friends who gathered outside the home of the quarantined kids to perform skits, and the people who assembled outside a hospital to cheer on the work-quarantined staff.

Toronto Emergency Medical Services told this story to the public hearings:

We got a phone call from someone who said “my nine-year-old son’s birthday is Friday. My whole family is in quarantine. Can someone please go buy a birthday present for my son?” And we took care of that …

This last story is so typical of those health workers who went the extra mile to help the sick. The story of SARS quarantine, with all its problems, is the story of magnificent work by health workers and magnificent voluntary support from the public. As noted in the Commission’s interim reports, systems are required to support and encourage this magnificent cooperation by health workers and the public.

No Chance to Provide Support

One woman told of the difficulties of not being with her companion when he went for cancer treatments. On April 8, 2003, she took him to a cancer clinic. She was not allowed to enter the hospital and sat between the double doors at the entrance while he sat in the waiting room for three hours. Another time he had a doctor’s appointment at and the results were expected to be grim, but she was not allowed in to give him support. In May he was very sick and she took him to hospital, where she was told she would have to wait in the car. She went home and eight hours later the hospital called and told her to come and pick up her companion. The man succumbed to his cancer not long after.

Critical Treatment Delays

One doctor told the Commission of a study her hospital did of cancer patients requiring treatment during SARS. The study showed that when SARS screening measures were first introduced, there was confusion because “we didn’t know what we were doing”:

We were dealing with sobbing patients, husbands threatening to bomb us because we wouldn’t allow them in with their wives [newly diagnosed with cancer].

The doctor said directives relating to SARS were so frequent that information didn’t get passed along in a timely fashion to staff and patients. One man was told he could bring his wife when he came for his treatment. When they got there she was turned away and had to wait in the car. Another man diagnosed with cancer was scheduled for treatment as SARS began. The treatment was delayed three months and of course he was distressed because the delay could give the cancer more time to spread.

SARS made hospital visits especially difficult for new patients. They were already traumatized by recent cancer diagnosis and were confused and even frightened by hospital systems and routine.

Said one patient:

For me my experience is so scary because the first day you come to hospital you know the diagnosis was cancer and there was no visitor with me.
That is something missing, the support. When I step into the hospital and I just get crying.

Said another whose husband had a brain tumour:

There is no reason a spouse can’t be with them. He was unable to go anywhere without me. I could not leave him at all so why can’t I come? There’s no difference in SARS exposure information for either of us.

Her point is understandable considering that some brain injury patients are unable to record properly what doctors are telling them. Some are unable to take notes, like many patients do. Even patients without any brain impairment have difficulty absorbing and accurately recording what health care professionals tell them about diagnosis and treatment.

What is required is a system that plans ahead to minimize as much as possible the collateral impact of infectious outbreaks on necessary medical treatments.

Common Threads

A common thread in all these stories is the lack of someone to turn to for appeal. Most of these hidden victims could have found comfort in being able to approach one person at a hospital or other care facility who could have provided facts and explanations, and even overturned any access decisions that might have been made in the heat of battle. SARS was confusing and health workers under extreme stress made judgment calls that they thought best. In the absence of preparedness and consistent policies, they were often forced to make it up as they went along. For the hidden victims there was no one to turn to for explanation or discussion of those judgment calls. No person should have had to turn to the daily newspaper to gain access to a dying relative, as did the woman in the first story related above.

These stories also show what was seen in other aspects of the SARS outbreak: not being prepared. The health system needed simple policies and practices to meet the needs of not only victims, but family and friends and other innocent bystanders. Bad things always happen in times of crisis. That is part of life. However, policies thought out in advance, strengthened through staff training and applied consistently, would have prevented at least some of the grief suffered by these hidden victims.
Impact on the Chinese and Southeast Asian Communities

No ethnic group was more affected by the SARS outbreak than Toronto’s 400,000-strong Canadian Chinese and Southeast Asian community. It was widely reported that the outbreak originated in Asia. The stigma was immediate, especially in those parts of the Greater Toronto Area where Chinese and other Asian restaurants and businesses are concentrated.

Citizens and tourists avoided people of Chinese background for fear that they carried the new disease. They avoided them on the streets, at work and at their places of business. Normally jammed with customers, these areas were deserted. Not only did tourists and restaurant customers stay away, but the Chinese Canadian residents stayed home as well.

The Chinese-Canadian National Council (CCNC) estimated the loss of income to businesses in the “Chinatown” areas at 40 per cent to 80 per cent, depending on the type and location of the business. The loss was substantially worse than that suffered generally by businesses across Toronto.

Politicians and public officials took notice of Chinatown’s plight. Prime Minister Jean Chrétien and Ontario’s Lieutenant Governor James K. Bartleman made photo-op dining visits to Chinese restaurants. Some Chinese Canadians said these gestures did not make a big difference, but others applauded the intervention.

The impact of SARS on individual Chinese and Southeast Asians Canadians went beyond business loss. Many service workers, including live-in caregivers and restaurant waiters, lost their jobs.

Members of the Chinese and Southeast Asian communities felt they were stigmatized unfairly, and were wrongly blamed for the emergence of SARS. They felt racism was at play. The Chinese-Canadian National Council’s report blames the media, which always raises the spectre of the “shoot the messenger” exercise. But the problem was widely recognized and as noted earlier, public health stressed to the public that it was not easy to contract SARS and that race had nothing to do with getting it.832

Chinese Canadians noted that people moved away from them on subway trains and their children were sometimes shunned at school.

Hospitality workers felt the effects most directly. When customers avoided Chinese restaurants, waiters were sent home. Live-in caregivers caring for children and the elderly were especially vulnerable. About 70 to 80 per cent of them come from the Philippines under a government program. SARS had a great impact on their lives since, unlike health professionals, they have few guaranteed rights and little job protection.

Coco Diaz of Intercede, an organization for the live-ins, told the CCNC researchers:

There were many cases of unfair termination of employment during SARS. They were dismissed as if they were already carriers of the disease. Employers were most concerned with the elderly or children in the family and yet showed little concern for their employees.

She told of a live-in who contracted SARS by taking the elderly person in her care to the hospital. The live-in spent three months in a coma and had to undergo many months of rehabilitation.

Ms. Diaz reported that unfair dismissals intensified in April 2003 when the media reported the links of several new SARS cases to members of a Filipino Catholic group:

Immediately, some employers started to think that just because the workers are Filipino, then no, they cannot come and work.

Some who employed live-ins worried that their employees would get exposed to SARS during their days off and bring it back to the household. In some cases, live-in employees were quarantined for 10 days after returning from their days off, then were dismissed anyway when the quarantine ended.

To a live-in caregiver, the loss of a job also means the loss of a home, since they usually live with their employers. To lose a job is to jeopardize immigration status.

The Metro Toronto Chinese and Southeast Asian Legal Clinic told the Commission’s public hearings that, ironically, Chinese and Filipino Canadians were the ones who fought on the front line as nurses, doctors, and other health care workers. Nursing is one of the few professions where Asians, particularly people of Chinese and Filipino descent, are well represented, the clinic said:
So while Asian Canadians on the street were being targeted, Asian Canadian health care workers were risking their lives for the people who were inflicted, inflicted with the disease. It is not a coincidence that the two nurses and the doctor who died from SARS, were persons of either Chinese or Filipino descent.833

The clinic noted that anti-Chinese sentiment has always been present in Canada, notably when Chinese labourers were brought to Canada to build the early railways. When the SARS outbreak occurred and was reported to have originated from Asia, racism based on fear of Chinese carrying the disease emerged again:

Images of Chinese Canadians wearing masks began to appear in mainstream media reports and this new fear the Chinese Canadian Community, while never spoken was certainly felt by members of the Canadian public … It was also around that time that our clinic began to receive calls from individuals who became the casualty of SARS, although not in the medical sense.

While some workers lost their jobs in restaurants and other workplaces from the economic impact of SARS, others reported discrimination based on the idea that SARS was a Chinese or Asian illness:

We received a number of complaints from tenants who got kicked out by their landlord because they were Chinese. Some of them were new immigrants or recent immigrants from China but one of these tenants who called us was, in fact, a Canadian-born Chinese who had never set foot in China or in Hong Kong and who actually lived in Guelph outside of the epidemic centre of SARS. She was told by her landlord to move out …

The clinic also heard from many workers of Chinese descent who were terminated or told to say home because of perceived fear from their non-Chinese colleagues:

There was a nursing home which served primarily Chinese Canadian seniors where some nurses refused to work because of a totally unfounded rumour that the nursing home residents had contacted SARS.

Hundreds of workers were left out in the cold. Especially hard hit were “undocumented workers,” workers in Canada illegally.

While they were out of a job, they had no access to unemployment insurance or other governmental benefits. They also could not or would not complain to the authority when their rights were being violated.

The clinic filed a formal complaint against the Immigration and Refugee Board, where staff started wearing masks at hearings for Chinese or other Asian claimants. These claimants had been in Canada for at least a year, since that is how long it takes for a claim to heard, and were not recent arrivals. The practice was dropped after the protest.

Such experiences left many Chinese and Southeast Asians stigmatized and humiliated. This simply should not happen. Communication and education are the keys to avoiding such stigmatization. Intelligent people who have been communicated the real facts know better than to participate in such shameful shunning. Time and again the Commission has seen that preparation in communicating clearly and effectively could have avoided many of the problems that arose during SARS.834

---

Funerals and the Suffering of the Families

The case histories of families who lost members to SARS are horror stories. Losing someone is bad enough, but with SARS there was fear of contagion throughout the entire family. There was the shocking reality of loss and the prospect of more losses. The bereaved were faced with trying to make funeral arrangements while they worried how deeply the virus had penetrated their family. Who would come down with the illness next?

Here is the recollection of one person who buried a family member who died of SARS:

> They opened the casket just for the immediate family. We had to wear masks and gloves. Nobody came to the funeral home or the funeral; a lot of people were scared.

Another story illustrates the extreme ugliness of the SARS outbreak.

A man in his 70s experienced heart irregularities in early March and went to hospital. It was his wife’s birthday. He was released the next day and when he got home he began having flu-like symptoms. He became sicker and his family doctor diagnosed double pneumonia. Eight days after first being released from hospital he was returned by ambulance.

While he was in hospital on a respirator, his wife was not feeling well. She was taken to the emergency department but nothing serious was diagnosed. The man died two weeks after his first visit to the hospital. The day after his death, the widow was admitted to hospital. Soon after, a daughter was admitted with flu-like symptoms. The family originally had been told the father had atypical pneumonia, some type of mysterious illness. The son told the Commission:

> For the first two weeks we weren’t allowed to see my mother … The hospitals were all closed down.
Everybody was in quarantine. I had my sister’s youngest, she’s 14 years old, and was staying alone in my parents’ house because her mom was in the hospital.

The family learned their father died of SARS when they went to the funeral home to make arrangements. While they were discussing the arrangements at the funeral home, Toronto Public Health called. After the call, the funeral director gave the family the news that SARS had killed their father. Toronto Public Health also had advised the funeral home personnel that the family should leave the building and enter into quarantine.

The funeral home held the body for 48 hours, then took the body to the cemetery for a graveside service. Public Health had told the family there could be no public funeral service. Only a half dozen people attended the burial of a man who had hundreds of friends. More than 500 people attended a memorial service a couple of months later.

Various family members who either had the virus or were thought to have it recovered, except for the mother. She died three weeks after the father. She also had a graveside funeral, which meant bypassing many of her Jewish faith rituals, including sitting shiva and tahara, traditional washing of the body. The bodies of both the father and the mother were left sealed in plastic bags in their coffins. The son said:

… it was a real horror story. One of our Jewish rituals is sitting shiva, which is like a mourning period. We weren’t able to do that for my dad. We barely had enough pallbearers at the funeral to bury him. We had to drive ourselves to the cemetery.

The son also recalled the desperation of trying to find out what was happening to his family:

My two nieces, this was my older sister who was in hospital with SARS, her two older daughters were taken to [the hospital] and when they took them in there it was almost impossible for me to keep track of what was going on. I’ve lost both my parents and you’ve got my sisters and my nieces here … I need to know what’s going on …

Another nightmare involved a widow whose husband was shipped out for autopsy and cremation without her involvement. She had visited him in hospital one night but then she had to go into quarantine for 10 days. When she finished quarantine the
hospital was closed to visitors. Her husband died and was cremated without her knowledge, and she never got to say goodbye.

Importance of Funerals

The end of a life, although shocking, also is the start of a grieving and healing process in which the living begin to accept their loss and the need to carry on. With SARS, however, this process was often short-circuited, and in some cases completely blocked. Relatives and friends were denied normal bereavement and spiritual comfort because of fears about the spread of the disease. Some of these fears were based on misinformation or simple lack of information because our public health systems were overwhelmed. They had no prepared plan to deal with funerals and burials, and were unable to respond quickly and decisively.

Funeral homes, where comfort and healing is supposed to begin, found themselves disconnected from the public health and health care systems. More will be said later about the organization of the funeral industry and its role in public emergencies. The industry struggled with the effects of quarantines, contradictory information from government and the additional anguish of families unable to achieve proper closure. Quarantined families found it difficult to make funeral arrangements from home. Funerals were delayed, sometimes cancelled, and burials were conducted without mourners.

As one senior public health official told the Commission:

There were so many tragedies in this outbreak.

One heartbreaking image from the SARS outbreak was a burial scene in which a lone limousine delivered a victim’s coffin to an open grave attended by two cemetery workers in “space suits,” the term a funeral director used for the protective gear worn by the grave handlers. Another is the scene of family members standing afar in another section of the cemetery as a coffin is lowered into its grave. One cemetery manager told a funeral director the family would not be permitted to attend the burial because they had had contact with the deceased during his illness, but the director ignored this.

Throughout history, pandemics and epidemics have set up conflicts between dealing with the dead and protecting the living from the spread of disease. The need to restrict public gatherings often clashes with the human desire to pay final respects to
the dead. In the 1664–1665 Great Plague of London, city officials tried to stop public funerals, but people refused to obey and flocked to graveside services by the dozens.

Widespread deadly outbreaks also strain society’s services for handling the dead. During the Spanish flu pandemic of 1918, which killed 50,000 Canadians, one Toronto undertaker reported stacking 23 bodies in his garage because there was no room inside the funeral home and help was difficult to get because of fear of the disease.835

In a health emergency such as SARS, funeral rites obviously must carry lower priority than the need to contain the virulent public health threat. However, there is evidence that more planning and much better communication could ensure that fighting a pandemic and burying the dead with dignity can be carried out without one seriously compromising the other. Fixing some underlying problems of where the funeral industry fits in the health care and public health systems and how it is regulated also would help funeral directors better carry out their important role. More will be said about that later.

SARS deaths confirmed the importance of the funeral process in our society. A death brings out high emotions. The rituals and ceremonies of funerals help people support each other and try to deal with those emotions. Visitations and body viewing bring reality and some comfort to mourners.836

The Ontario Funeral Service Association reinforced for the Commission this view of the importance of funerals and, for those who choose it, the viewing of the body:

> It has been proven time and time again by psychologists and grief counsellors that having an opportunity to see the deceased is a big part of the grieving process. The embalming and the visiting play such a huge part in the process though it might be a small issue. In the SARS situation many

836. The powerful need for a funeral process is dramatically illustrated by a bizarre Ontario historical event, the death of landscape painter Tom Thomson. Thomson drowned mysteriously in Algonquin Park in 1917. His body was found after nine days in the water and because it was decomposing, his friends buried him immediately. When the Thomson family in Owen Sound was informed, they ordered the body exhumed and shipped home for another funeral and burial. This caused much controversy and added to the mystery surrounding the death. However, the fact was that the Thomson family felt it could not accept the death and grieve properly without witnessing a funeral and burial themselves.
families were not allowed in the hospital. The concept of seeing the body for many people shows them that the person is dead.

In SARS some victims entered hospital and were never seen again. Religious rites were bypassed in some cases. Those left behind had no opportunity to confront the reality of death and to honour the life of the deceased. Last wishes could not be fulfilled. The relative of one victim said:

I am very upset over the way the burials were handled … they seemed to have made it so hard for us to pay our respects.

Said the widow whose husband’s SARS-infected body was shipped out for autopsy then cremated without her knowing it:

I went through Hell. If they told me the truth and said he had to be cremated because of the sickness I would say okay, but they never asked me … they never told me. Nobody asked me nothing.

Body Transfers

Complications for burying those who died of SARS began with transfers, the process of picking up a body at hospital, taking it to another hospital for autopsy and eventually on to a funeral home. Funeral home staff encountered significant challenges in trying to complete transfers, mainly because hospitals had no standard procedures for removing the bodies of SARS victims. Rules and practices for body transfers during SARS varied from hospital to hospital.

Uncertainties created by lack of preparedness and misinformation, or lack of information, appeared to cause much of the confusion over body transfers. Early on it was not known how SARS was spread or even how long the virus might live after death. Some hospitals therefore became cautious of funeral home transfer people arriving for normal body pickups but who might have picked up SARS bodies from other hospitals.

The uncertainties about whether SARS might be spread by funeral home workers led hospitals to institute some procedures for body pickups, including donning of protective gear. However, because there was no overall prepared plan supported by policies, protocols and memoranda of agreement, the policies and practices varied from hospi-
tal to hospital. There was no consistency, and this made work difficult for the funeral industry.

These inconsistencies included the following:

- Some hospitals screened funeral workers at the front doors before allowing them in. At least one hospital required them to go to the emergency department for screening. However, others refused them entry, and hospital staff delivered paperwork and in some cases bodies for transfer to funeral home staff waiting outside.

- Some hospitals questioned funeral home employees about what other hospitals they had visited. If they had done SARS pickups at other hospitals, they were turned away.

- One hospital required funeral workers to wear protective gear when entering offices where body transfer documentation was to be picked up. For others, screening was enough. For still others, staff delivered paperwork to funeral home workers waiting outside.

- Funeral home workers found procedures used at a hospital on earlier pickups suddenly changed. Procedures for entering the hospital one week were different another week.

- Practices varied, even inside the same hospital. For instance, one funeral worker noted that medical staff wore protective gear but security staff didn’t.

- When SARS appeared to be waning, one funeral operation continued to dress its workers in protective gear as a precaution. At least one hospital asked them to remove it.

- Post-SARS, some hospitals still required funeral home personnel to wear masks, while many did not.

One funeral home executive told the Commission:

They were tripping over themselves … Hospitals started to say that if our personnel were in a SARS hospital to pick up a body then they wouldn’t be allowed in other hospitals to pick up bodies.
It took a bit of time but they realized that we would run out of players to come to the hospitals.

In one case a hospital refused a funeral home employee access to pick up a body because the media had reported that someone in contact with SARS had attended a visitation at the funeral home.

Before SARS, the typical pickup procedure involved funeral home staff arriving at the hospital, presenting a permission slip, completing paperwork, obtaining the death certificate and meeting security to collect the body. When SARS arrived, procedures became confused because there were no effective planning or preparation, no standard systems, and no universal precautions for picking up a SARS body. As already mentioned, procedures varied from hospital to hospital and sometimes changed, leaving funeral home workers confused about exactly what they should do. Most hospitals required funeral staff to wear protective gear such as masks, gloves and coats. In one case, paperwork exchanges were done in a tent outside the hospital.

One funeral support service involved in body transfers told the Commission:

The rules changed at nearly every hospital, they were never the same and just when you thought you had the routine down, they changed the rules… . Different hospitals did different things.

Lack of communication helped to create confusing situations. For instance, workers from a funeral home transferred two bodies from one hospital in one day. The next day they heard through the media that the hospital had been closed because of SARS and anyone who had attended the hospital must go into quarantine. The funeral home operators decided to cancel the funerals and to store the bodies until after the quarantine period. They were upset that they had not been told of the closure and quarantine by the hospital or by anyone in authority.

The Toronto and District Funeral Directors Inc., an association of 60 Toronto-area funeral homes, advised its members in a faxed memo that:

Funeral homes will be made aware of SARS deaths from the Medical Officer of Health, prior to family contact.

Although every effort was made to make this happen, some cases inevitably fell through the fingers of a system that was unprepared and overwhelmed.
Embalming

Once a SARS body was at the funeral home there were other complications. Embalming, because it involved handling SARS-infected fluids, presented possible risks of spreading the disease. Also, the bodies of people suspected of dying of SARS likely would be partially autopsied. The dangers of working with SARS-infected bodies were confirmed later by a study of SARS autopsies that showed the coronavirus continued to live in the dead. Autopsies of 19 patients who succumbed to SARS in Toronto showed the virus was present in the lungs of all of them.

Opening the body created exposure to airborne pathogens and required what the medical community calls taking universal precautions. In general terms, universal precautions involves using protective gear, including gowns, masks, gloves and shoe covers, to shield workers against spraying blood and gases during embalming. Surgical-type masks normally used by funeral homes were replaced by N95 respirators during the SARS outbreak. However, the Commission’s investigations found only one funeral home that actually fit tested the N95 respirator before use.

Advice from public health on embalming was not always clear. One funeral director spoke with a local coroner’s office, which advised him that it was okay to embalm as long as universal precautions were used. A letter from Toronto Public Health advised that embalming should be done using full respiratory precautions, including gloves, gowns, masks and goggles. However, the letter added:

Although we have no evidence of risk to staff who are using these precautions, it may be prudent to avoid embalming the body if possible.

Some people in the funeral industry found this advice too vague to be helpful. They thought there should be specifics, especially considering that some other countries prohibited the embalming of SARS victims.

838. April 2, 2003 letter to Toronto and Area Funeral Directors Inc.
Screening Measures

The risks for funeral home operators and staff did not come only from handling bodies. There also were the risks of contracting the disease from family and friends who had contact with the victim while alive. This latter risk also applied to funeral home visitors.

In one highly publicized case, a doctor who had been working with SARS patients showed up at a funeral home for a visitation and later for the actual funeral. After the funeral he felt unwell, found he had an elevated temperature and admitted himself to hospital, where he was isolated. Controversy erupted when the acting York Region Medical Officer of Health denounced the doctor in scathing terms for attending the funeral despite the doctor’s evidence that he was not symptomatic until after the funeral. That controversy is addressed earlier in this report, but the upshot was that 150 people who might have had contact with the doctor were quarantined.

This kind of incident led to funeral screening measures. These measures included questions about possible contact with SARS, posting notices and establishing hand-washing stations. But screening of any sort is never completely effective. The experience of one funeral home illustrates this. One family went to a funeral home and passed the SARS screening tests. A visitation was held in the evening. The next day the family called the funeral home and said they had learned from public health that their relative had died of SARS and that the family was possibly exposed along with anyone at the visitation.

The home had to provide a list of names of everyone who attended the visitation so they could be quarantined. Four funeral home staff were quarantined.

As recounted earlier, one family learned of their father’s death from SARS while at the funeral home making arrangements for his service, when public health called and told the operators to get the family out of the building because he had died of SARS:

We were making the arrangements for them and the phone rang. It was the Board of Health. They were saying that it was SARS and to get the family out of the building. They said that the family should be in quarantine and not together.

However, the Coroner’s Office understood it was not a SARS death. It took two to three hours to confirm that the death was indeed from SARS. The managing director of the home told of the chaos resulting from the situation:
We had conflicting information from public health and the coroner. There were so many phone calls that day. It was the day from Hell.

Three staff had to be quarantined, leaving only two funeral directors to handle the business.

In some cases when funeral directors and families met to make arrangements, everyone wore gloves and masks. In others, arrangements were made over the telephone. In still others, there were no usual arrangements, as bodies were taken directly to a crematorium or cemetery for burial.

**Quarantines**

Quarantines disrupted funeral home operations significantly. Staff quarantines required split shifting to prevent overlapping staff from infecting each other, borrowing staff from affiliated homes and in at least one case shutting down operations for a short period.

The same rules did not appear to apply to everyone. The funeral home that made the two normal pickups from a hospital then learned that the hospital was shut down cancelled the two funerals, which did not sit well with one of the families. A competing funeral home was in a similar situation but did not follow quarantine and went ahead with funerals. The family wanted to know why the rules were not applied uniformly.

Other awkward situations were created when funeral homes had to explain surcharges for infectious disease body handling. One family complained to the Board of Funeral Services about extra charges, but the Board held that the charges were proper. Handling the bodies of those who have died of an infectious disease does involve additional costs. Funeral employees must have personal protective equipment (PPE), more time must be spent disinfecting, and bodies sometimes need to be put in special bags. There also is the extra expense of staff time lost to quarantine and the costs for screening measures.

Funeral homes received no government compensation or relief for SARS expenses but the health care industry did. One operator said that quarantine of staff had cost $14,000.

Funeral directors had the choice of passing on these costs to customers or absorbing
them. One funeral director said he made a deliberate decision not to absorb surcharges to demonstrate that special precautions were being taken. This he hoped would boost public confidence that his operation was doing what it could to prevent any spread of SARS. However, passing along costs risked creating an image of funeral operations profiting from disaster.

Public confidence certainly was an issue, as evidenced by the experience of a funeral home caught in the media spotlight early in the SARS outbreak. Some funeral home staff and people who attended a visitation were quarantined and the case was much reported by the media. A manager at the funeral home told of how the media exposure affected business:

> Everyone knows the quarantine period was 10 days. So Canada Post informed us they would not deliver mail for two weeks. Our suppliers were concerned whether or not they should be sending their delivery people out. That’s the reaction that we got.

The 2003 SARS outbreak was the first time Ontario had used quarantine in 50 years.\(^{839}\) A post-SARS study concluded that quarantine can cause considerable psychological distress and depression and that support should be available for persons at risk for adverse psychological and social consequences of quarantine.\(^{840}\)

Said one man whose family was quarantined after attending the funeral home without knowing his father had died of SARS:

> Then the whole thing … dealing with the whole fear that everybody had.
> We had friends that treated us like we were lepers.

In the end, most funeral homes and their clients simply coped as best they could. They watched television news, surfed the Web and talked to coroners and anyone else who could provide information. Experience gained in handling AIDS deaths was helpful. One of their most important jobs was to maintain public confidence that funeral homes were safe when precautions were being properly followed. As with other parts of the SARS story, impressive individual efforts were what got them through problems that were systemic.

---

Associations

Funeral homes should be networked reasonably well through regulatory agencies and their own associations. All Ontario funeral establishments are regulated by the Board of Funeral Services, which is governed by the Ministry of Consumer and Business Services. There also are a variety of provincial and regional funeral associations that individual homes can choose to join. None of these connections, however, provided a lot of detailed and clear instructions for operating during the SARS outbreak.

The industry had mixed views on the effectiveness of the Board of Funeral Services (BFS) in its response to the crisis.

The Board of Funeral Services told the Commission that it first learned about SARS through the media. During March, April and May of 2003 it sent four communiqués to funeral establishments. Most of this information concerned universal precautions. The Board said it did not receive any communications from the provincial government, Toronto Public Health or any other health department.

Toronto Public Health provided some direction helpful to funeral establishments, but distributed it through Toronto and District Funeral Directors Inc. Membership in this association is voluntary and therefore only those who belong to the organization received the information.

Leadership seemed to be an issue throughout SARS, with more than one funeral home director saying that there was not enough leadership from the provincial government, public health or the funeral industry professional organizations.

The Funeral Issues

The SARS outbreak of 2003 killed 44 persons in Ontario. What if it had been a pandemic like the Spanish flu of 1918-19, which killed 20 to 50 million people worldwide, 50,000 in Canada? The 44 SARS fatalities produced enough disturbing stories about after-death care that one has to wonder about the extent of social disruption we would see with thousands of deaths.

Several critical after-death issues have been raised by the SARS experience. They are preparedness, leadership, communication and the role of the funeral industry in epidemics. By studying them, perhaps we can avoid some of the problems encoun-
tered in SARS and be better equipped to deal with the next serious public health threat.

As noted in the Commission’s first interim report and other sections of this report, lack of preparedness seriously hampered the fight to contain SARS. Ontario was unprepared to deal with a major infectious outbreak. That failing spread beyond the primary health care system to become an issue in post-mortem arrangements. Better preparation would have helped the funeral industry to do its job without so much unnecessary distress to families who lost relatives to SARS. Better preparation could have helped to alleviate some of the hardship and additional grief suffered by the families and friends of the 44 killed by SARS.

When all is said and done, everyone got through the crisis. SARS was contained. Those who died of SARS were looked after. After-death precautions were taken to avoid spreading the virus. However, it wasn’t easy and it wasn’t pleasant and it was clearly more difficult than it should have been and produced unnecessary confusion and anguish. Some families will carry forever the scars of not having been able to arrange the proper final arrangements that their deceased relatives deserved.

Throughout its work the Commission heard complaints of lack of strong leadership in the SARS crisis.

One funeral director told the Commission:

There seemed to be no leadership anywhere. The Province was quiet. The Minister was quiet. The Board [of Funeral Services] was quiet. Everybody was quiet. There just was no leadership.

Another funeral service person noted:

There was very limited positive direction from health care. I had to go and seek it out. It was like pulling teeth.

One public health official cited the strong leadership of Bukas Loob Sa Diyos (BLD), the Roman Catholic charismatic group. Toronto Public Health quarantined 500 BLD members over the Easter weekend of 2003 because of SARS exposure.

Easter is their most important religious day and some might have been expected to break quarantine to attend services. However, Easter services were broadcast over cable TV, home delivery of Communion was arranged and one of their religious lead-
ers told them it was their religious duty to stay at home.

Better communication and networking throughout the primary health care system and the funeral industry could have lessened the problems seen in SARS after-death care. The Commission heard story after story of communication failure and of lack of networking that could have made a difference.

A pre-planned response involving the funeral industry, the Ministry of Health, public health, the hospital community, Emergency Measures Ontario and the office of the Chief Coroner, supported by agreed policies, procedures, protocols, memoranda of understanding and tabletop drill exercises would go a long way to prevent the problems that arose during SARS.

One funeral director told of a public health hotline that funeral homes could call for information, but he said that often no one answered and if they did he had no confidence in the information provided:

We had a hotline number to call if we had any concern with a deceased that we were supposed to pick up from the hospital to find out what the protocols were and what we were supposed to do. We were told that it was a 24-hour number but needless to say 90 per cent of the time no one answered.

Another noted that his operation had to turn to the World Health Organization website to get SARS information:

I got most of my information from the WHO website. A lot of what I received we obtained ourselves and disseminated it through Canada. The Health Canada website, I looked at it once.

The following quotation from one director seems to sum up the feelings of many in the industry:

It was frustrating that there was a lack of concrete information and there were a lot of maybes and third-party information and we needed clarity.

One front-line public health worker cited duplicated efforts by various government agencies seriously undermined effective communication:

We were required to provide the same information to four or five people. It drove us crazy.
Workers in health care and the funeral industry cited the case of conflicting information from different agencies. The example most often used was one office saying “don’t embalm” SARS corpses, another saying it is okay. Another was conflicting information on whether coffins should be closed.

Information was communicated during SARS but in many cases it was hedged and sometimes contradicted. Certainly there was not much information from the Province, the Coroner’s Office or medical officers of health that boosted the confidence of people in the funeral industry. As one funeral service director said:

No government stepped up and provided information. I had to watch the news to get information.

There was not enough information that, as one funeral director put it, “you could sink your teeth into.”

Funeral directors needed very specific information from public health authorities, especially early in the crisis, to questions such as: Is embalming allowed and if so under what conditions? Should there be an open or closed casket? Should there be a funeral at all? Should staff be quarantined? One said:

The press releases that went out were frightening. We needed to know how safe we were, how secure the public was, i.e., hand washing, tell us what the real risks are.

The breakdowns in communication resulted in additional stress for the bereaved. Funeral homes trying to cope with miscommunication or lack of communication were not able to supply confident answers to the families of victims. And of course, there were the cases in which lack of proper communication directly affected those trying to deal with a loss. One of the most dramatic of these was the daughter who didn’t know her mother had died of SARS until it was announced in the news media. The family was never told by anyone in the health system.

The Commission heard much from the funeral industry about how it feels it was left out of the loop during SARS. There were concerns that the industry is not well represented in pandemic planning. As the Ontario Funeral Service Association said:

During the SARS outbreak, we were not part of the inner circle and we should be because during a man-made catastrophe we deal with the end result of any epidemic or pandemic.
They told the Commission that anything that happened after death appeared to be an afterthought:

Funeral homes hold an odd place in society. They are ignored and neglected. This has to stop.

The Association said:

We are the first line of defence with doctors and nurses but we are not treated as if we are. Someone could die of pneumonia but the hospital, nursing home, the coroner does not have to tell us that the person had AIDS. Universal precautions are used in an embalming room, but that extra piece of information [knowledge of AIDS] may assist us in keeping our people secure.

Although regulation of the funeral industry is not within the Commission’s terms of reference, many in the industry thought that structural problems in funeral home regulation contributed to the problems encountered during SARS. The industry is comprised of independent business people who offer a service to the public. Because of the importance of this service to society and the complications that can arise from it, the industry is regulated by the provincial government.

The ministry responsible for the funeral industry until 1991 was Health, for the obvious reason that many health issues are involved in handling the dead. Then the government placed regulation of the industry under Business and Consumer Services. The Commission heard many recommendations for placing funeral services back under the Ministry of Health because they are so closely linked to health care. One director said the move from Health was the worst thing that had ever happened to the industry and added:

We are in the health care business. We deal with the dead and the living and their health. We are now in an industry of dollars and cents [in reference to being under Business and Consumer Services].

Another funeral director suggested that governments and the health system should re-evaluate the importance of funeral workers. Still another said public health should recognize the funeral industry as a resource.

Some recognition did come later. In August 2004, as Dr. Bonnie Henry, Associate Medical Officer of Health, Toronto Public Health, told the Ontario Standing
Committee on Justice Policy, studying the adequacy of Ontario’s emergency management statutes:

The funeral home association was an extremely valuable partner for us in SARS. The care of people who have died from an infectious disease is very tricky, and they’re very skilled at assisting us in things like that.841

The roles of individual funeral operations and their associations also were raised. Toronto-area funeral homes have 11 associations, including one federal, one provincial and nine district associations, to which they can choose to belong or not. When public health agencies pass along information to these volunteer associations, some funeral homes are likely to miss out because they don’t belong to them all.

The only mandatory membership is with the Board of Funeral Services, which regulates funeral homes. Questions about the Board’s role and effectiveness were also raised. Because it is a regulator, should it be expected to be an information network provider? Does it have the resources to carry out such a role?

Another issue cited was the fact that individual funeral operations made their own policies for handling SARS complications. There were no set standards for body transfers, body handling, visitations and body viewing. Some in the industry wondered if standards should be set and communicated by one entity within the industry. That way whatever messages had to be delivered to a grieving family – closed casket, no public funeral, no visitations – could be delivered with authority by one agency or association. As one funeral director said:

We need a central agency with authority to educate us and tell us what to do.

One funeral director told the Commission that during SARS:

There needed to be a front-line person with credibility to talk to the front-line people in the funeral end of things, telling them what they know, what they are recommending, and “here is what you go with.”

One cited the example of contradictory opinions over whether victims who die of SARS should be embalmed. As noted previously, funeral directors attributed the

coroner's office as saying embalming was not a problem while Toronto Public Health said perhaps it was best to avoid embalming. One director said the embalming direction from Toronto Public Health was so vague that he placed several calls for clarification. None were returned.

What funeral directors seemed to need during SARS was recognition of their role in the health crisis and leadership to help guide them through it. They wanted better leadership within their own industry and from their governments, right from the Ministry of Health through to local public health boards.

Certainly many in the industry also feel that they should once again be under the regulation of Health.

Lessons Learned

Bad experiences usually carry good lessons, and this was the case with SARS. Wrapped within all the things that went wrong are some lessons for next time. Many funeral directors said that because of SARS they are prepared for the next crisis. As one said:

We are well positioned now because of what we went through. We are ready for pandemic influenza.

That is the optimistic view, and optimism is good, but it must be backed by a plan for future outbreaks of infectious disease. There needs to be a plan that will overcome the lack of preparation that made the SARS outbreak of 2003 more difficult and more painful than it should have been. This plan should consider:

- The importance of funerals and how outbreaks can be effectively controlled while the dead are buried with dignity and without compromising either.

- How to include the funeral industry in planning for a pandemic that will require special funeral and burial procedures.

- Special attention to the possibility that the next outbreak might bring deaths far in excess of the 44 deaths in Ontario from SARS in 2003.

- What role funeral directors have or should have in the health care and public health systems.
• How to provide the funeral industry with clear-cut direction, communication and leadership that will help it do its job effectively.

• What procedures are needed for the safe, uncomplicated and efficient transfer of bodies from hospitals and other health care facilities to funeral homes.

• How public health can communicate effectively with the funeral industry and provide one authoritative information point where funeral directors can get answers to questions and concerns quickly and clearly.

• The roles of the Board of Funeral Services and the funeral industry’s numerous voluntary associations, and whether their effectiveness in keeping the industry informed can be improved.

One of the best lessons is how people summon their best abilities in times of crisis. Funeral service workers, despite concerns for themselves and their families and the lack of clear information, did a good job of protecting the public while carrying out their duties to grieving families.

One of the difficulties for funeral operations was trying to find out the cause of death. Public health either didn’t know immediately or was slow to say. Most funeral homes decided to take precautions no matter what:

We learned that what was prudent was necessary.

Funeral services learned to split their shifts to reduce exposure among all staff. There were extra costs involved, however, said one director:

When things like this happen, competition or not, public safety comes first.

One large funeral operation used red tags on body bags to indicate that a person died of SARS. This helped funeral workers to know they were handling an infected body and remind them of the precautions needed.
Recommendations

Better preparation and communication obviously are the keys to major improvements in after-death handling during any serious infectious disease outbreak. The funeral industry's problems and concerns during SARS flowed mainly from these two areas.

Although some efforts were made to communicate with the funeral industry, these proved inadequate for lack of a plan agreed to and tested in advance. The funeral industry was largely left out of the loop during the crisis. Funeral directors interviewed by the Commission noted that they still have not been included in post-SARS discussions, and have received no recognition for their efforts during the crisis.

It is not within the Commission's mandate to report on funeral home regulation. It is clear, however, that there are underlying problems with regulation and administration that impact on performance in crisis. The mix of regulatory agencies and volunteer associations that funeral directors deal with needs review, including a reopening of the discussion of what ministry or ministries are best equipped to regulate the industry. Until it is clear exactly how the funeral industry fits into, and is directed by, the health care and public health systems, it will be difficult to plan for a health care crisis that requires special funeral and burial procedures.

Specific recommendations from the funeral industry include the following:

- Hospitals should have documents and bodies together in one place, such as the morgue, so funeral home employees do not have to enter public areas of hospitals.

- Bodies should be red tagged to indicate death from infectious disease. This would let funeral home workers know what they are dealing with during body transfers.

Any planning at any level, especially in public health units and coroners’ offices, should involve the funeral industry. The Commission notes that the Canadian Pandemic Influenza Plan recommends that the Funeral Services Association of Canada and/or local funeral directors be involved in any mass fatality planning.

Only if the funeral industry is involved in planning will it be able to properly update its preparedness, which will include what policies and protocols are needed for body
pickups, embalming, visitations and other funeral arrangements, plus universal precautions and protective equipment.

As for communication, the best way to start improving it is to recognize up front that in any crisis it is always cited as a problem. Approaching the crisis acknowledging that is a start at dealing with it.

The industry should have a single voice during a crisis. This voice could play an important role in advising the public about how public health concerns might alter traditional funeral arrangements. A single voice would help strengthen public confidence.

The Commission recommends:

- That the underlying problems of regulation of the funeral industry should be addressed, including the questions of which ministry or ministries are best equipped to deal with the industry, and exactly how the industry fits into and is directed by the health care and public health and safety systems in relation to any public health problem or emergency that engages the need for special procedures for funerals and burials.

- That these problems be addressed by a lead ministry or agency selected by the Ontario government in conjunction with other affected ministries, the industry and local medical officers of health.

- That the funeral industry develop a single voice and communications point for dealing with government organizations such as public health, Emergency Measures Ontario, and the Ministry of Health and Long-Term Care, together with an internal communication system to ensure that one communication from government to one industry communications point will reach all members of the industry immediately.

- That a pre-planned response be developed for any public health or other emergency that engages the need for special procedures for funerals and burials; such planning to include the funeral industry, the Ministry of Health and Long-Term Care, public health, the hospital community, Emergency Measures Ontario and the Office of the Chief Coroner, supported by agreed policies, procedures, protocols,
memoranda of understanding and tabletop drill exercises, would go a long way to prevent the problems that arose during SARS.

• That Emergency Measures Ontario, in consultation with the Chief Medical Officer of Health, assume the initial responsibility as lead ministry for such planning.
Clergy and Spiritual Leaders

Spiritual comfort during an outbreak of a potentially fatal disease is an issue that deserves some comment. It was specifically raised by a Protestant clergyman, who asked the Commission:

What is the role of the clergy and spiritual leaders in the health care system of Ontario?

Because the issue is marginal to the Commission’s terms of reference and produced only one response, the Commission makes no recommendation other than to say it needs to be addressed by the health system, the chaplaincy community and those it serves.

The clergyman noted that during SARS, clergy were barred from visiting patients in some hospitals, long-term care facilities and nursing homes. One Toronto hospital declared its chaplain non-essential staff during the crisis and sent him home. This was part of the overall attempt to limit SARS exposure and lessen the chances of spreading the virus. Some hospitals did allow clergy visits if precautions were taken, but a clergyman who addressed the Commission complained of inconsistency and different interpretations of rules established by health officials.

He summed up the problem:

There exists a large percentage of the population for whom religious faith is important. They deserve spiritual care at crisis points in their lives and hospital admission is almost always a crisis point.

While it varied from hospital to hospital, during the recent SARS crisis many clergy were denied access to patients. I want to be clear that when professional clergy visit they do so primarily and almost exclusively to people of faith.

He said that throughout the SARS crisis his parish was prevented from bringing the sacraments to a nursing home. He felt there was no reason why professionally trained
clergy cannot follow the same basic hygienic and infection control practices as doctors and nurses.

The clergyman is not alone in his belief that spiritual care is important to medical care. A study at the University of Pennsylvania shows that 45 per cent of a study group reported that religious beliefs would influence their medical decisions if they become gravely ill.^842

Some medical practitioners feel that patients and the health system benefit from having clergy involved. A doctor writing in the New England Journal of Medicine said:

> Even as we ponder whether or how we should step inside the religious worlds of our patients, we should also ask whether members of the clergy should enter more deeply into our clinical sphere. There is a great imbalance of power between patient and doctor. Often, I have been insensitive to this imbalance and have taken a patient’s silence to represent tacit assent to my recommendations.

> A member of the clergy can speak to a doctor at eye level and act as an advocate for a patient who may be intimidated by a physician and reluctant to question or oppose his or her advice. A priest, a rabbi, or an imam can help patients to determine which clinical options are in concert with their religious imperatives and can give the physician the language with which to address the patient’s spiritual needs.^843

Clergy visits have been part of the hospital system since the beginning. Some hospitals have their own chaplains, whom they pay to provide spiritual care to anyone who desires it. Clergy from outside the institution visit when requested by patients, patients’ relatives or staff. They sometimes are asked by a hospital chaplain’s service to volunteer to handle spiritual matters many hours a week in certain parts of the institution.

Rules and practices related to clergy visits, however, have become confused and inconsistent, mainly because of privacy concerns. It used to be, and still is the case in some hospitals, that visiting clergy are given access to a patients’ list that includes religious

---

^842. Do Patients Want Physicians to Inquire About Their Spiritual or Religious Beliefs If They Become Gravely Ill? Archives of Internal Medicine; Vol. 159 No. 15, August 9, 1999.

denominations. Only clergy who have been pre-screened to ensure they have valid qualifications are allowed to see the list. An Anglican priest, for instance, is allowed to see the Anglican list, then proceeds to a nursing station and asks to visit the Anglican patients whom he or she has noted from the list. The practice, according to this clergyman, is to ask the patient if he or she would like the minister to stay and visit. If the answer is no, then the clergy person leaves:

They are not attempting to evangelize those who are weak and vulnerable but rather seek to bring comfort and support to people of faith.

The information on religious affiliation used to be collected by hospital admitting staff when patients arrive at the hospital. However, this clergyman told the Commission that very often the question of religious affiliation is not asked. Some staff think that asking for religious affiliation is a privacy issue, but he said the people being asked are free to note their religious tradition, or simply to say they have none.

He added:

For some reason the staff in the hospitals feel reluctant to put the question, thereby denying patients access to spiritual care. I would like to see a concerted effort by hospital staff to provide this information to community clergy. It’s a question that needs to be thoroughly discussed hospital by hospital.

An Anglican chaplain has noted publicly that in at least one Toronto hospital she is now forced to make “cold calls” on patients, walking door to door in the hospital looking for Anglican patients. Sometimes she relies on sympathetic staff to tell her which patients might wish to see her.

A nurse who contracted SARS on the job and was hospitalized raised the issue of patient privacy before the Commission. She complained that while in hospital she felt abandoned, not having been visited by any managerial staff and the chaplain with whom she had worked closely. Later, when she asked the chaplain why he had not contacted her during her illness, he said he tried but hospital managers cited confidentiality concerns and refused to give him a list of names.

She added:

And that was always something that was so special. that the chaplains were always there for the staff. They knew us. They knew what was going on in our lives.

A clergyman writing in the Anglican Journal said there is a concern among Ontario’s churches that new privacy legislation will limit pastoral care in hospitals. The article said churches have asked for changes that “clearly state that providing basic information to clergy and religious caregivers is not a violation of the Act.” and that chaplaincy be included in the definition of health care providers.

The clergyman who contacted the Commission expressed concerns about a climate of fear and mistrust, which had significant impact on the Toronto Asian community. He also noted that part of the SARS crisis occurred at Easter of 2003 and that warnings against large gatherings reduced church attendance. He said:

Fear is not a positive attitude. Faith can be an antidote to fear. People cut off from their spiritual traditions get unhealthy. People who find faith important find strength that helps them live their lives. We must guard against denying people their religious freedoms.

The Commission notes how one religious group managed to observe quarantine and still bring Easter services to its members. Bukas Loob Sa Diyos (BLD), Roman Catholic charismatic group, had its 500 members quarantined over Easter because of a SARS contact. Although there had been concern that some members might attend church despite the quarantine, the group’s leaders arranged to broadcast Easter services over cable TV, and set up home delivery of Communion.

The clergy concerns brought before the Commission raise some sensitive issues that should be addressed. Few people would deny that there is a role for clergy in hospitals in offering spiritual support to those who want it. There are, however, those who resent any religious intrusion on their personal privacy. However, there are no overall policies or protocols that would provide some clarity and consistency to the situation. In order to address this gap, the Commission recommends that the Ministry of Health and Long-Term Care and the Ontario Hospital Association and the chaplaincy community engage in multifaith consultations toward the development of the

policies and protocols required to address chaplaincy services during an outbreak of an infectious disease. These consultations could address the difficult questions of how to make chaplaincy service available to those who want it, without intruding on the privacy of those who do not.
CHAPTER SIX: The Nurses’ Survey

Preface
Nurses: ONA SARS Survey

In 2003, following the SARS outbreak, the Ontario Nurses Association sent out questionnaires soliciting the experiences of Ontario nurses during SARS. The ONA, founded in 1973, is the trade union representing 52,500 registered nurses and allied health professionals working in hospitals, long-term care facilities, public health, community agencies and industry.

The ONA received 1,536 completed questionnaires and provided them to the SARS Commission to help in its investigation. The questionnaires helped the Commission identify nurses who wished to be interviewed.

To analyze fully this rich mine of experience, the Commission needed outside help with the following mix of experience, expertise and reputation:

• the statistical expertise and experience to analyze, assess and interpret the information in the questionnaires;
• the capability and expertise to develop and implement an appropriate database;
• the capability and expertise to handle a large amount of raw data and accurately input the qualitative and quantitative answers into the database;
• sufficient experience and expertise to analyze issues arising from the SARS outbreak;
• the ability to safeguard the confidential information contained in the questionnaires;
• an in-depth understanding of the nature and characteristics of the Ontario health care system;
• a track record for meeting targets and objectives; and
• a sound reputation in the health care community.
The Commission retained the Hay Health Care Consulting Group, a Toronto-based subsidiary of the Hay Group, an international management consultant with world headquarters in Philadelphia. The Hay Group played a significant role in the report of the National Advisory Committee on SARS and Public Health, headed by Dr. David Naylor (“the Naylor Report”).

Nurses who responded to the ONA questionnaire provided a rich source of information on the experience of Ontario’s nurses during the SARS outbreak. They provide compelling observations on what went right during the SARS outbreak, what went wrong, what lessons we should learn. They give us a picture of the dangerous and frightening work of nurses on the front lines. The depth, scope and quality of the responses of these nurses give us a strong and candid insight into what actually happened.

This material is organized as follows:

1. Introduction
2. ONA SARS Survey: Hay Group Analysis
3. Data Analysis
4. Selected Quotations from Individual Nurses

Highlights of the report include:

- Two-thirds said the SARS outbreak changed their attitude to the nursing profession.
- More than half felt their SARS work was not adequately respected, or they were unsure if it was respected.
- Two-thirds said SARS affected their families through isolation, anxiety and fear.
- Almost two-thirds felt their health and safety had been compromised during the SARS outbreak.
- More than half were concerned about the adequacy of the protection they were given.
- More than three-quarters were unaware of any Ministry of Labour worker protection activity at their workplace.

These concerns are reflected in quotations such as:

I was torn between staying and quitting because my husband was scared.
One of our docs said you nurses are crazy to look after these people.

It was hard but we did it.

What happens the next time?

Nobody listens to nurses.

Fear … job not worth risk of dying. Lack of trust that nursing was being protected.

Totally devastating on family life.

Dozens more of these quotations are found in the section “Selected Quotations from Individual Nurses.” As the Hay Group analysis notes, the survey is not statistically representative of all nurses affected by SARS or of nurses in general. However, the responses provide invaluable insight into what it was like to be a nurse during the SARS outbreak.

1.0 Introduction

1.1 The SARS Commission

The independent Commission to Investigate the Introduction and Spread of Severe Acute Respiratory Syndrome (SARS) was established by the Government of Ontario as an investigation under section 78 of the Health Protection and Promotion Act. Mr. Justice Archie Campbell of the Ontario Superior Court of Justice was appointed Commissioner.

The Commission is investigating how the SARS virus came to the province, how the virus spread and how it was dealt with. It is looking at all aspects of the outbreak to provide a public report on what happened, what lessons have been learned and what improvements should be made.

1.2 The Survey

A survey conducted by the Ontario Nurses’ Association regarding the experience of nurses in Ontario during the SARS crisis

As part of its investigation, the Commission was provided with responses to a survey conducted by the Ontario Nurses’ Association regarding the experience of nurses in Ontario during the SARS crisis. The ONA conducted a survey of all its members in August 2003. This survey focused on the impact of the outbreak and spread of severe acute respiratory syndrome (SARS) on health care workers. The Commission has
now contracted with the Hay Health Care Consulting Group to assist in analyzing and interpreting the responses to these surveys.

1.3 **Findings from the Survey**

This report presents high-level results and key findings from the survey sent to Ontario nurses following the SARS crisis. The survey presented questions under the following headings:

- Background
- Impact Issues
- Protective Equipment
- Facilities Issues
- Health and Safety Committees
- Ministry of Labour
- Workplace Safety and Insurance Board
- Ministry of Health and Long-Term Care Directives
- Spread and Containment Issues
- Additional Feedback

1.4 **Defining SARS Hospitals**

According to the Ministry of Health and Long-Term Care (MOHLTC), the following hospitals treated at least one probable or suspected SARS case during either phase one or phase two of the SARS crisis in Toronto:

- Bridgepoint Hospital
- Credit Valley Hospital
- Hospital for Sick Children
- Humber River Regional Hospital
- Lakeridge Health Corporation
- Markham Stouffville Hospital
- North York General Hospital
- Rouge Valley Health System
- Southlake Regional Health Centre
- St. Joseph Health Care, Toronto
- St. Michael's Hospital
- Sunnybrook and Women’s College Health Sciences Centre
- The Scarborough Hospital
- Toronto East General Hospital
- Trillium Health Centre
- University Health Network
West Parry Sound Health Centre
• William Osler Health Centre
• York Central Hospital

For analytic and comparison purposes, these hospitals have been identified as SARS facilities in this report.

Two of these facilities, North York General Hospital and The Scarborough Hospital were forced to close as a result of the SARS crisis. These hospitals are known to be the most affected by SARS.

2.0 Background

Key Finding: Over half of respondents from SARS hospitals stated that they provided care to a suspect/probable SARS patient.

• The overall response rate was almost 10% of all nurses in GTA hospitals; therefore, the sample cannot be considered statistically representative of all nurses affected by SARS, or of nurses in general. The strength of the survey is in the quality and depth of responses by individual nurses and the insight it gives into their experience.
• The responses to the survey provide a perspective on nurses’ experience during the SARS crisis in the GTA.
• 85% of responses came from acute care hospitals, 15% from other facility types (e.g., rehab, nursing homes, Community Care Access Centres)
• 83% of responses came from institutions defined by the Ministry of Health and Long-Term Care (MOHLTC) as SARS hospitals.
• 55% of responses came from seven SARS acute care hospitals: University Health Network (UHN), St. Michael’s Hospital, Sunnybrook and Women’s College Health Sciences Centre (S&WCHSC), The Scarborough Hospital, William Osler Health Centre, Southlake Regional Health Centre and North York General Hospital.
• The response rate for these seven facilities was as follows:
60% of responses came from facilities within the GTA; 93% of these responses were from nurses in acute care hospitals.

Responses came from a very experienced group of nurses: 15% had >30 years’ experience, 31% had 21-30 years’ experience, 30% had 11-20 years’ experience, and 22% had ≤10 years’ experience.

### 3.0 Impact Issues

**Key Findings:** Two-thirds of respondents stated that the SARS outbreak changed their attitude toward the nursing profession. 54.5% of respondents did not feel that their work with respect to the SARS crisis was treated with adequate respect, or were unsure if it was respected. Overall, respondents from SARS hospitals felt more affected by the SARS crisis than did respondents from non-SARS hospitals.

- Two-thirds of respondents stated that the SARS outbreak changed their attitude toward the nursing profession. Rates were higher in SARS hospitals (68.6%) than in non-SARS hospitals (56.9%). Rates were highest in two SARS hospitals: North York General Hospital (81%) and The Scarborough Hospital (83%).
- Overall, 54.5% of respondents did not feel that their work with respect to the SARS crisis was treated with adequate respect, or were unsure if it was respected. More specifically, 42% did not feel their work was respected, while 12.5% were unsure. 45.5% felt their work was respected.
- Some of the respondents expressed concern over increased risk of being a front-line worker, desire to leave the field of nursing, an increased awareness of the dangers of the job, feelings that nurses are undervalued, a more acute awareness of infectious diseases, and intentions to use more precautions with patients.

• 7.6% of respondents reported experiencing SARS symptoms during or following the SARS outbreak. The two SARS hospitals with the highest rates of nurses reporting that they experienced SARS symptoms were North York General Hospital (18%) and The Scarborough Hospital (24%).

• At the time of the survey, 3.6% of respondents continued to feel residual symptoms that they personally associated with their exposure to the SARS illness, such as stress, anxiety, fear, fatigue and weakness; 32.4% said they did not feel residual symptoms, and 64% were unsure.

• Two-thirds of respondents felt that the SARS outbreak affected their family life. The most common themes for this impact were:
  — Isolation
  — Stress and/or anxiety
  — Fear for family’s health
  — Family and/or friends concerned for the respondent’s health
  — Quarantined, and friends and/or family quarantined
  — Emotional drain or depression

• 27% of respondents felt they were suffering post-traumatic stress as a result of the SARS outbreak (28% in SARS hospitals, 21% in non-SARS hospitals). North York General Hospital and The Scarborough Hospital had the highest rates: 57.1% and 47.0% respectively.

4.0 Safety Concerns

  **Key Finding: 58% of respondents felt that their health and safety were compromised at some time during the SARS outbreak.**

• 58% of respondents felt that their health and safety were compromised at some time during the SARS outbreak.

• 15% or respondents declined work as a result of the SARS outbreak.

• 5% of respondents refused to work as a result of SARS, although 34% considered refusing work.
5.0 Protective Equipment for Staff

Key Finding: The vast majority of respondents had not been fit-tested for or trained in the use of personal protective equipment (PPE) before SARS. Many respondents found the PPE to be difficult to use and fit properly, and most experienced some form of side effect from the use of PPE.

- 82% of all respondents were required to wear some form of personal protective equipment (PPE). The rate was higher in SARS hospitals (84%) than in non-SARS hospitals (71%).
- Examples of PPE that respondents were provided included gowns, gloves, protective eyewear, masks, Stryker suits and boots.
- 27% of respondents said that they were not provided PPE at the beginning of the SARS outbreak but were required to wear PPE at a later time. Some of these respondents said that they were instructed to wear PPE during the second wave of SARS, when dealing with suspected SARS patients, or at some point in the early stages of the outbreak.
- Of those who were provided masks (78% of respondents), nearly all (95.5%) were given N95 respirators or equivalent.
- Only 5% of respondents had been fit-tested and/or trained and instructed in the care, use and limitations of PPE before SARS. However, after the SARS outbreak over 67% of respondents were fit-tested and/or trained and instructed in the care, use and limitations of PPE.
- 23% of respondents did not feel they were given clear direction at all stages of the SARS outbreak as to what PPE they should have been wearing and in what circumstances. This rate was generally higher in the Toronto acute care SARS hospitals.
- When direction was provided, respondents indicated that it came from infection control, administration or management and other sources. Instructions came in many forms, including emails; verbal announcements in person; memos, bulletins or letters; staff meetings or announcements from management; daily updates and broadcasts.
- 54% of respondents expressed concern with the direction and/or the adequacy of the protection they were given. Those who provided details mentioned the following types of concerns:
  — Changing protocols
  — Concerns over proper mask fitting
  — Lack of communication
  — Lack of available adequate equipment
  — General confusion
— Timing of mask fitting
— Lack of proper instruction on mask type and use
— Insufficiently sterile conditions or risk of cross-infection

• 53% of respondents experienced confusion about which masks would provide the necessary protection.
• 44% of respondents indicated that they raised issues with management regarding availability, type or use of PPE. Rates were higher in designated SARS hospitals (46.5%) than in non-SARS hospitals (34%). The rate was substantially higher (57%) for respondents who worked in designated SARS units.
• 45.5% of respondents felt that the supply of masks and/or other PPE during the SARS crisis was inadequate; 43.5% felt there was adequate supply, and 11% didn’t know.
• Overall, 35.6% of respondents were told to save a mask for reuse. The rate was consistent between SARS and non-SARS acute care facilities (35% and 34.5% respectively), but 67.7% of respondents from non-acute non-SARS hospitals were told to reuse a mask.
• 26% of respondents were told at some point that the cost of masks and/or other PPE was an issue.
• 30% of respondents stated that concerns were expressed about the perception created among the public by staff wearing masks.
• 34% of respondents felt there was not enough training on the proper use of PPE; 56% felt the training was adequate, and 10% didn’t know.
• 34% of respondents did not know if Stryker suits (or other full body protection) were available for staff use in the facility; 38% felt there was adequate supply of full body protection, and 28% felt there was not.
• 54% of respondents were not trained in the use of full body protection; 28% were trained, and 18% did not know.
• Fewer than 10% of respondents used a Stryker suit or other full body protection during the SARS crisis. Most uses were for treating SARS or probable SARS patients, for intubation/extubation/bronchoscopy and in isolation units.
• Over 70% of respondents experienced some side effects from the use of PPE, including headaches, shortness of breath, facial rash, fatigue and dizziness.
• 50% of respondents experienced problems with masks not fitting properly, and 8% were told to return to work without a properly fitted mask.
• 67% of respondents were advised of the importance of wearing properly fitted masks.
• 26% of respondents indicated that risk assessments were conducted on their unit to identify SARS hazards and protection that was necessary; 46% said risk assessments were not conducted, and 28% didn’t know.
• 70 respondents identified themselves as having had suspect/probable SARS. 19 of
these individuals (27%) felt they had acquired the illness due to poor fit-testing for PPE.

6.0 Ministry of Labour

*Key Finding: Most respondents were unaware of any interaction between their facility and the Ministry of Labour (MOL), or of whether the MOL had come to inspect their facility.*

- 92% of respondents said neither they nor their family members contacted the MOL and that they were not aware of others who had contacted the MOL during the SARS outbreak for advice or to lodge a health and safety complaint; 8% said they had contacted the MOL or knew someone who had.
- 81% of respondents were not aware of whether the MOL issued any orders or provided any advice regarding the SARS outbreak; 15% of respondents said that the MOL had not provided advice, and 4% said it had.
- 77% of respondents did not know if the MOL had visited their facility at any time on any SARS-related matter; 19% of respondents said that the MOL had not visited, and 4% said it had.

7.0 Wage Loss

*Key Finding: Many respondents were quarantined, but few lost income as a result of experiencing potential SARS symptoms.*

- 29% of respondents were quarantined (either home or working quarantine) during the SARS outbreak. Rates were higher in SARS hospitals (30.7%) than in non-SARS hospitals (18.7%).
- Of respondents who were quarantined:
  - 57.5% were quarantined for 10 days or more.
  - Only 4.3% indicated that they experienced SARS symptoms while under quarantine; 48.5% were unsure whether or not they had SARS-like symptoms. The remaining 47.2% did not experience SARS symptoms while under quarantine.
- Only 9% of respondents lost hours or income as a result of experiencing SARS symptoms; 70% did not, while 21% were unsure.
- Of respondents who lost hours or income as a result of experiencing SARS symptoms:
— 10% stated that they lost hours but not income (as they received special “SARS pay”).
— 19% stated that they lost income because they were not allowed to work a second job or overtime during the crisis.

- The majority of respondents did not submit Workplace Safety and Insurance Board (WSIB) claims, and did not know whether their employers had interacted with the WSIB regarding SARS matters.

8.0 Spread and Containment Issues

Key Finding: Some respondents (12%) reported that they or other health care workers were not listened to when they reported possible SARS symptoms in patients.

- 18% of respondents reported that they were aware of instances where possible SARS patients were inappropriately handled. For example, respondents mentioned patients who were not put in negative pressure or isolation rooms, inadequate precautions taken for patient transfers, people not being treated as SARS patients and improper screening.
- 17% of respondents reported that they were aware of suspect or probable SARS patients who were not identified promptly.
- 12% of respondents reported that they were aware of circumstances where they or other nurses or health care workers were not listened to when they reported possible SARS symptoms in patients. The rate was higher in SARS hospitals (14.2%) than in non-SARS hospitals (8.8%). All of these respondents mentioned raising concerns regarding transfers of patients, hearing about other facilities (particularly North York General Hospital) through the media and having difficulty getting doctors to screen or assess patients.
- Respondents provided a broad range of suggestions regarding how the spread of SARS and the health risk created to workers could have been dealt with within their facilities:
  — More or better communication, information and/or instructions
  — PPE worn earlier and at all times
  — More attention by management and other leaders to what nurses and other front-line staff said
  — More or proper isolation or negative pressure rooms
  — Better infection control practices
  — More thorough screening
• 17% of respondents stated that their employer arranged for transportation for staff on working quarantine; 62% did not know if their employer did this.

9.0 Compliance with MOHLTC/Facility Directives

• 48% of respondents reported that they witnessed failures to comply with MOHLTC or facility directives during the SARS outbreak by physicians, screeners, visitors, patients, nonprofessionals or professional staff; 40% did not, and 12% were unsure.

10.0 Additional Feedback

• 66% of respondents identified sources from which they sought the latest information on SARS. Examples included:
  — Internet/computer/web (271 responses, 27.9%)
  — News/media (266 responses, 27.3%)
  — Newspapers (186 responses, 19.1%)
  — TV (175 responses, 18.0%)
  — Hospital email/intranet (164 responses, 16.9%)
  — Email (119 responses, 12.2%)
  — Ministry of Health and Long-Term Care (110 responses, 11.3%)
  — Bulletins/memos/postings (109 responses, 11.2%)
  — Management (77 responses, 7.9%)
  — Work/hospital (general) (61 responses, 6.3%)
  — Co-workers/word of mouth (48 responses, 4.9%)
  — Infection control (47 responses, 4.8%)
  — Radio (44 responses, 4.5%)
  — Meetings/forums/briefings (29 responses, 3.0%)
  — Hotline/telehealth/voicemail (26 responses, 2.7%)
  — World Health Organization (25 responses, 2.6%)
  — Ontario Nurses Association (21 responses, 2.2%)
  — Public Health (19 responses, 2.0%)
  — Communication/SARS binder (12 responses, 1.2%)

(Note that the question used to collect these responses was open-ended, and the answers were not mutually exclusive. For instance, “Internet” could be the ONA website, “bulletins” could be ONA bulletins, and “news/media” could include TV.)
SARS and Nurses

*Selected quotations from the Hay Group/ONA questionnaire*

**Introduction**

The ONA’s 2003 survey of nursing experiences during SARS garnered 1,536 completed questionnaires. These respondents replied to a series of questions ranging from impact on family life to experiences with personal protection equipment (PPE) to how health institutions addressed health and safety issues.

The thousands of comments supplied by ONA members are too many to include in this report. Following is a sampling of the answers given by the nurses in their responses. The complete list of questions and all replies can be found in the documents archived by the Commission.

**Q1.4 Do you still experience any residual symptoms that you associate with your exposure to SARS illness? Please explain.**

The fear of contracting SARS is still very strong. We see 60 patients/day in my unit, as well as assisting with bronchoscopies. Hopefully none will ever have SARS.

Fear of going to work sometimes. Anxious. Repeat tasks at work, easily frustrated at work and home. Want to be alone lots of times.

I hated to see my children upset because I wore a mask. They couldn’t … hug me. People in other cities were relieved I wasn’t going to see them.

I still have periods (especially when discussing SARS outbreak) when I am teary eyed and angry that as front line workers we were put at such a high risk to contract such a horrible disease.

Only stress related. Also I find after any type of activity my muscles are very sore but it is improving. My shortness of breath is improved greatly.
Still become fatigued easily. Short-term memory has been affected. Unable to do the physical things I did prior to SARS. Short of breath with exertion.

Q1.5 Describe the impact of SARS on you and your family: personally, medically, socially, emotionally.

While placed on work quarantine, being “trapped” at home alone was very hard and I felt a lot of sadness and loneliness.

Personally we were all stressed out because of little information and when information was received confusion with daily changing of directions and the fear of the unknown if I should bring something so serious to my family.

Personally and emotionally traumatic as classmates of my son were pulled out of school when he went. My ex-husband refused to care for his son during my quarantine to rule out SARS for fear of exposure.

Afraid of spreading SARS to family nightly depressed. Getting very hypoxic at work wearing N95 mask. Broke out with facial rash around mask. Friends did not want to meet us as healthcare workers.

Family worries about SARS and they don’t want to come to visit me. Not welcome to visit them.

Fear that I may contract illness and bring it home – spread it.

Fear. Job not worth risk of dying for. Lack of trust that nursing was being protected.

While no one at home got SARS, my children were very afraid that I would get it. They asked me every day if anyone at work had it. My children are 15 and 12.

Emotionally draining. There was fear, anxiety, a feeling the hospital may not be telling you everything. Then, we became one of four SARS designated hospitals and that was just thrust upon us with no input. I found out by watching TV news.

Made me realize the high risk involved in my career. We are so susceptible to these new viruses. Reinforced the good practices of good hand washing, the ease of spread of this disease.
There was not a lot of information or safety being a front line caregiver. I really feel that it was only luck that kept a lot of medical staff from dying.

I experienced stress and anxiety re working in critical care with full isolation. Precautions instituted throughout 12-hour shifts. This caused fatigue, headaches, difficulty concentrating. My family worried re risk of exposure to me and them.

My family was afraid for me and themselves. They also wouldn't tell anyone that I was a nurse.

For the time of the two outbreaks didn't attend any social functions, didn't visit grandchildren, cancelled a conference, limited contact with people in crowded areas ie: stores, grocery shopping etc. The neighbours, relatives would not visit from out of town …

My family were worried I would get sick. Friends reluctant to be exposed to me or my family. I already have a disease – well managed and stable. SARS could have changed that or could have been fatal because of my disease.

Wearing a mask, gown, gloves, and goggles for entire shifts for weeks on end was exhausting. I came home and slept for 1-2 hours after each eight-hour day for the first two weeks. Not seeing anyone smile because of the masks was depressing.

Every day there was anxiety about the uncertainty of possibly having contact with SARS and bringing it home.

Worried about bringing SARS home to family. My daughter was married end of April. Worried family would be quarantined, some guests cancelled.

Did not go out much – family worried I would bring home – didn't see my grandchildren for many weeks, forced isolation to protect my own.

Hesitant to say I was a nurse as some people in general public were afraid of nurses. Didn't go out much as we were advised not to mix with large crowds.

Workers from other parts of the hospital backed away from us once they found out that we work with SARS patients. Parents at my daughter's school weren't as friendly. My husband was fearful for me. Social activities were cancelled.
I absolutely hated my job. This did take a toll on my patient care, which only further increased my anxiety.

Totally devastating on family life.

It felt like being in a war because of the danger element. We were also shunned by others who were fearful of being contaminated by us because I am a nurse.

I was not prepared for how working with SARS patients would change my professional and personal life. The unit became like a war zone with fear: high anxiety amongst all the staff. Personally I was shunned from common places in my community ie the school my children attend.

Loss of shifts due to bed closures very frightening – fear of the unknown … did not want to tell people where you worked as felt shunned.

Being the single parent of two children, and their sole supporter it was quite frightening at first especially as more staff were contacting the disease. But I adjusted and learned to cope. I reassured the children and they believe in me.

My ill husband’s homecare nurses refused to care for him because SARS in my hospital. Moved him to relatives outside city for care. I was quarantined and barred from several hospitals when trying to take him for appointments. I was in physio for injury – treatments cancelled, impaired my recovery.

I hated going to work and putting me and my family at risk; I feel that I did not sign up for this. No choice in the matter.

I was mostly angry at the lack of info that we received from our hospital. I never knew whether there were ever any SARS patients in the hospital. Reading memos and info takes time and often we were too busy with patient care to read these in a timely fashion.

Slept in a separate room from spouse, family wore masks at home.

Socially, some friends afraid to have contact with me and my husband. Unable to visit elderly grandparents in nursing homes. They didn’t understand why.

I was on work quarantine once for 7 days. It was difficult to wear a mask at home when around family members, difficult to breathe, often just went to my room so
didn’t have to wear mask. Older son got groceries. Afraid my 12-year-old son would be alienated at school.

I am scared for next SARS. I will not work in SARS unit again!

My spouse was the most fearful that I would contract SARS. He was worried for my health and also for our family. When I got the call that I had to do quarantine, I’ll never forget those words “there has been a breach in the isolation technique” and that I may have been exposed. I burst into tears.

Barred from social family events. Husband insisted that I stay away from his children, grandchildren. I felt I had to conceal fact I was an RN from other acquaintances also. My doctor for 35 years insisted I stand outside his office building while I waited for consultation.

Very difficult and uncomfortable due to double gowned and gloves, shields, goggles, hand cover, hot inside the room, difficult to breathe due to mask on face. I tried hard to restrict social activities or no socialization at all, keep all clothes and things separated from the rest of the family.

I was isolated from my grandchildren for 6 months by my worried son. I missed them.

Very much isolated from loved ones. My family thought I was going to die. I was very drained physically and emotionally. In fact, I was asked by my spouse’s company to quit or spouse to quit for the company’s staff safety.

Very scary[,] not enough information given to us by hospital. Difficult to get the right mask. Unable to see family for a period of time. It has brought fear in me that has never gone away.

My family was apprehensive and frightened for me. They think that I should quit nursing – it’s unsafe. My social life was NIL. I felt emotionally drained and tired and lonely.

Terrible. Developed panic attacks. Went to physician for Ativan. Had fights with husband and teenagers.

Personally, many people did not want to see me at all. When encountered people on the street, people would move away as quick as possible when they heard I was a nurse at North York. Even my dermatologist couldn’t get out of the office quick enough.
I was stressed emotionally by the hospital’s attempt to bring in a specific SARS team and the miscommunication that was involved. I was “in charge” during this time and felt that I had all the responsibility and no control.

I experienced fear … and social isolation from family, friends and strangers. We weren’t provided with adequate education re: updates and SARS. Led to frustration, anger, resentment towards my hospital and profession. Morale was at a low. Isolation gear worn fit unwell and exhausted.

I was afraid for my life and that of my family. When in a charge nurse position I assisted at hospital-wide codes and did not feel we received the appropriate equipment needed for protection.

It gave me a different outlook on life and made me realize how hazardous our job really is, when I looked after SARS patients and when SARS patients were in our unit. Isolated myself from my family and very depressed and worried about being a victim and still have paranoia. Nursing will not be same.

It is indescribable. I felt scared, isolated, anxious. There was no leaving work at work. I dreamed of it. It was all anyone talked about. It was all over the TV. No getting away from it.

My best friend refused to have physical contact with me; I was refused a cab ride to hospital; I was shunned by a clinic to have a non-medical procedure performed; I can’t describe the magnitude of stress felt over my job and discrimination experienced.

Fear of family members. Felt like a leper. My children were not allowed near some other children. Nightmares 1st few days. Husband had anger towards me when my mask fitting failed after I worked on SARS unit.

Q1.6 Have you suffered post-traumatic stress as a result of the SARS outbreak (i.e., depression, anxiety, sleeplessness, fear tendency, nightmares)

Concerned about my future as a healthcare provider. Have no interest in providing “hands on” healthcare nursing.

What will be next? Will SARS or something worse return? I no longer feel safe going to work.
Afraid that SARS will return, afraid to get sick and die.

I feel mixed emotions daily about working in healthcare.

Fear of masks, hate my job now.

Anxiety has increased greatly. Very concerned (suspicious) with anyone with respiratory symptoms.

We all live in fear of the return of SARS and the threat of having to care for SARS patients with no training.

Anxiety. When will it occur again? What will be the next outbreak and will it be worse?

Yes. The whole experience was extremely stressful. Our unit was short staffed all the time because nurses could not work in other hospitals. I was asked to do overtime. Currently suffering depression and on antidepressants.

Depression, anxiety, sleeplessness, stress. I will not work in the nursing field again as we have to wear the isolation gear constantly. I don't get paid enough to die for my job or put my family at risk.

I feared for my life every day.

I've seen a psychiatrist due to feelings of insecurity, tensions, squabbling at work related to who should/should not be sent to work in the SARS unit. I was told because I was junior staff I would have to work there whether I wanted to or not. I've become adjusted to working in that area.

I have been off work since July 7. I have been diagnosed with depression, but I feel it may really be PTSD.

I went through a very emotional period this summer, where I would break down and cry for no reason. I am concerned about a career change.

I noticed my youngest child voiced concerns and appeared anxious when I was going to work. This always made me feel sad.
I experience sleepless nights in which I lie awake and wonder what if. What if I had gotten sick, what if it returns or something worse attacks us. What do we do?

Would like to leave the hospital and I'm distrustful.

I find I have become extremely nervous in dealing with the public. I don't want to speak to patients or visitors without wearing a mask.

I now hate my job, depression, not sleeping.

I quit my job and found a safer one. Feel much better now.

I feel isolated. Do more research for myself to look out for myself. The hospital only cares about money and how they look to the public and media.

Depression. Wondering what future of this profession holds.

Still have a little fear – which was brought back when having the mask fit testing done recently. Fear of it happening again and wondering if I will be lucky again.

I was depressed. Felt like I did not want to save lives anymore.

Never had a nightmare from work, except when wearing the mask. I was upset with my decision to become a nurse. I continue to reflect on my choice to be a nurse. I mean I could have been anything. Why did I choose a profession that put my life at risk with very little benefits?

Some days I feel extreme anger, other days, anxiety about being at the hospital, afraid to take off masks. Some nightmares of disasters.

Angry, agitated, argumentative at work. Became quite withdrawn at home. Felt that no one could understand it without going through the experience.

For the first month and a half my moods were very up and down. I cried a lot. I was unable to deal with my 3 children. Noise bothered me a lot. My sleep was very interrupted.

As well my partner was let go from his job because of association with me. He was told it was a restructuring but he was treated with such disrespect by his employer of 8 years.
It is often the subject of dreams. Fear of possible future exposures.

**Q1.9 Has SARS and the response to it changed your attitude towards the nursing profession? If so, please explain.**

It has made me prouder of my job. I have been happier in my job, mainly because the situation proved what nurses are made of. We pulled together as did other members of the healthcare team – that touched me deeply!

As front-line workers, we are at extreme risks, but often employers do not react quick enough to protect their employees, putting them at increased risks.

Thought about leaving the profession despite a usually positive attitude towards nursing. Still a thought if I feel like I will be forced into performing tasks/duties without adequate training.

Realize it’s every man for himself. Management took care of SARS but no one cared for the caregivers.

Do not want to provide “hands on” nursing care. No, little or any protection for healthcare providers dealing with the unknown.

It opened up my eyes again to the dangers that surround the nursing field and makes you really think more re: your profession as it is really not appreciated and recognized enough.

Since I trained in the 70’s, isolation techniques have not been taken as seriously by the new grads as they figure there’s a drug for everything.

Learn to look out for yourself and trust your instincts. When in doubt, be extra cautious.

SARS has helped the general public witness the importance of our profession and will help build more respect for it.

A wakeup call to return to better techniques – cleaning[,] housekeeping, infection control measures, swabs, keeping infection data etc.

I would not encourage someone to enter nursing.
There is no room for a casual attitude.

After 30 years of nursing, I feel the risks aren't worth it. This is not what I went into nursing for.

I feel that nurses were the front line workers and needed to be listened to more than they were.

Nursing has always been about caring for others. Nurses now have to speak up for themselves and not rely on administration to protect us.

It seems to me that we had become lax in isolation protocols and in general “clean” ideals over the years. Visiting hours and protocols seem non-existent and patients and relatives have a full run of hospital. Need to return to a more regulated policy of visiting.

Just to be more protective of my health. But I will still nurse and enjoy it.

Things do seem to be getting worse. I am beginning to feel like nursing is almost not worth the risk anymore. The pay we receive for working in these circumstances is very poor. I am not sure anymore whether being a nurse is worth risking myself or my family and friends.

I still enjoy my work. I find it fulfilling but I am very concerned what I will be potentially exposed to and or expose my family to in the future.

Who knew my work could kill me or my family?

If this is the new normal … I would have quit two years ago. Now money is really the reason I go to work.

Distrust of upper management. It felt like they were more worried about budget and public opinion then caring for their staff.

Aware that self-protection as well as good technique with patients is more important than ever. Even more devastating illnesses could come along. We’re either a “bridge” or a “defense wall” to their spread.

Nurses are devalued. Any other profession in the same situation would have received danger pay. We literally suffered; rebreathing our own carbon dioxide and soaking in
our own sweat – feeling like we would pass out. Many people got headaches from the masks.

I really hate wearing protective garb. It takes away the personal feelings with patients ie. speaking with patients in crisis, behind a mask.

If another outbreak, I would consider retiring.

For the most part I always felt I had the control to protect myself ie being vigilant, re needle stick TB exposure. But with new disease … the risk factor(s) in this career have increased significantly.

Have never seen anything like it in my 30 years of nursing. There is now a “new normal.” I'm managing for now. Not sure how long I want to continue to nurse.

Couldn't work through it again. Not enough staff. We are all burnt out[,] it was overwhelming. It was frightening[,] I was scared for my family.

I enjoy nursing however I feel that the upper management had no clue re: the care involved in nursing a SARS suspect/probably case.

Yes, I feel that nurses’ opinions need to be respected. ie. the situation at NYGH. I also felt that my hospital lessened the SARS restrictions too soon. I am proud of all the nurses who cared for SARS patient and I grieve the ones who lost their lives.

I feel very vulnerable to life threatening illness. I don't feel confident that we will be protected. I was planning a move out of the city. SARS just hastens my decision.

Despite the stress related to SARS I realized that this was a crisis, and this was my duty to be a nurse who could make a difference. My 82-year-old aunt sent me a thank you card that referred to me as a “hero.”

I was always aware that being in the profession could one day cause my death. But I never realized how easily my family’s health could be compromised [–] not even the police nor fire prevention departments have this concern.

We must not take things for granted. We must be vigilant. Rigid personal cleanliness specially when in close contact with clients. We need more counselling and info RE: SARS.
You can see the nurses who are dedicated and not nursing to “just make money.” I respected a few of the nurses more than I used to.

Each and every day I asked myself why am I exposing myself and my family to this. If I wasn’t so financially in debt I think I would have left.

If it happens again I will leave. I had to wear full gear daily for 6 months for my full 12-hour shifts. Too hard on my family. It is not worth potentially making my family sick or kill them.

I’m embittered that we worked so hard in emergency to protect everyone and were not appreciated by the rest of the staff in the hospital and in fact emergency was treated like a leper colony.

It brought out more sense of belongingness and great pride for the nursing profession for toughing out such exhaustive outbreak.

Nurses as front line workers are in more danger of being exposed to an illness or disease, but are not appreciated by the healthcare systems, or the media/public, as so. We expose our quality of health when at work, but it goes unrecognized.

Emphasizes the crisis in healthcare in this province. Nurses overworked, underpaid. Hospitals understaffed. The low pay, job stress, and heavy workload aren’t worth dying for.

I am so proud of myself and my colleagues who worked together and bravely faced our fears and still cared for our patients in spite of terrible discomfort – but I’m afraid of the next outbreak of whatever – can the system not break down?

I still love caring for patients. However I find administration and the public don’t seem as concerned. E.g. administration has all its policies in place to protect itself but when it comes to staff we’re on our own. Managers on call unable to answer questions.

Some people displayed selfishness that made me wonder why they are in the profession.

Don’t trust the hospital, patient or system to protect me. The masks we were forced to wear failed the “mask fit test.” Now 5 months later now I am to be fitted and tested in another way by Occupational Health.
It amazes me how inconsistent the occupational health is in different places — there was no standard procedure.

The poor morale and increasing anxiety/frustration is enough to make all of us find new careers. We never saw our CEO during the crisis, our director was not very helpful or supportive; but administration has done nothing more than pay lip service to show their appreciation.

Paradoxically, it has strengthened my resolve to stay in the profession.

Once again it was obvious how the system could not have succeeded without nurses, yet we have fallen back into the same scenario post SARS. We do work in a profession that can be life threatening but we are certainly not compensated for it.

I still love nursing and knowing what I know now I would still choose to be an RN but now there is a sense of danger that comes with being in this profession that wasn’t there before.

Do not wish to care for these patients. Training took place after SARS outbreak – way after outbreak occurred. Feel government and management dropped the ball too early – hence SARS II outbreak.

My attitude has become more negative. I feel the government views nurses as expendable. The “new normal” is acceptable only to those who don’t have to work in it. Nurses are generous giving people, put I don’t think we should have to “give” with our very lives.

I always knew this was coming – I thought perhaps we were better prepared. My fear is it will happen again. Are we really ever safe?

Q2.5 Did your facility have adequate isolation/negative pressure units throughout the SARS outbreak? If not, at what stage did they have adequate isolation/negative pressure units and do they still have them?

I don’t think it was always a question of adequate isolation/negative pressure rooms, but a break in compliance. People got tired of goggles they couldn’t see with or masks that bothered them and with no one supervising became non-compliant.

Never. Very poorly organized!! Infection Control Manager was terrified and did not know what to do.
There were NO windows in the doors of the rooms until SARS2 (only for ICU patients). How can you adequately care for someone if you can’t see them?

Q3.5 If you were not provided PPE at the beginning of the SARS outbreak, were you required to wear PPE at any subsequent time? If so, when?

Basically the masks were in poor supply. You had no choice. You had to cope with what was available. You had no choice. They were too big, very claustrophobic, itchy, irritating to the skin and very difficult to breathe in for any period of time.

It was the respirologist that expressed concern near the beginning of the outbreak that we were not adequately protected. Hospital provided the things when that MD made his suggestions. Did not happen as quickly when nurses voiced concerns.

Q3.8 Were you given clear direction at all stages of the SARS outbreak as to what PPE you should be wearing and in what circumstances? If so, by whom?

They kept changing the protocols. Everyone was going day to day because no one knew for sure.

Directions changed every shift. You really didn't know what could be happening.

Yes, but it was very confusing. Communication was not consistent throughout the hospital ie each unit seemed to be doing thing[s] different.

Nursing managers were very considerate in keeping us informed as to what to wear etc. As well the unit educator and the screening personnel.

Our infection control team was phenomenal in their efforts to ensure that we were protected and kept up to date on all changes and directions.

Not in the beginning and after 1st outbreak we were told to remove our PPE – even masks. Nurses were very confused. Those who kept our masks on were told by our medical director to take them off, they were no longer needed even though we had many patients in ER at the time with respiratory problems.

Yes but it was a constant changing learning as we went. Old principles that have for some reason been ignored over the years as being old and unnecessary.
The information was often slow to trickle down to our unit even though well designated the SARS area. Often the info took days to reach us via memo from the infection control department.

Q3.10 Explain any concerns you may have had with the directions and/or the adequacy of the protection you were given.

Goggles were too big, masks were very heavy. I found it hard to breathe at times, increasing headaches, skin irritations.

I had no concerns. I always felt protected at work and felt we were kept up to date even though the direction from the MOH changed sometimes daily, even hourly.

The hospital seemed to be deciding for the staff how much protection we needed.

There were long delays between when infection control and upper management held meetings about protection changes and when that information was passed on to staff caring.

Eye protection kept changing. No one seemed to know for sure. They handed out one kind and then said we had to share, then handed out another kind and said discard the first pair. A lot of wastage.

Most of my concerns arose because this was new to all of us. There had to be uncertainties and I preferred to be told “we just don't know” than receiving information or direction that proved inadequate. Was it airborne or not?

Masks were horrible and even after being test fitted, manager had trouble getting the proper ones for each individual. Memo book was overwhelming and no one had time to read it all.

The magnitude and potential exposures were not initially recognized or known. This was understandable given the lack of knowledge. I do believe the hospital did do things quickly when risks were identified.

Nobody really knew what they were doing. We were to believe whatever they told us with respect to what protected us. They could only base the information on what they were learning on a daily basis. The 2nd SARS outbreak proved it was all a guessing game.
Q3.11 Did you experience any confusion around which masks provided the necessary protection? If so, please explain.

Certain masks were causing headaches and breathing difficulties, and still other tolerable masks were not readily available.

Masks that irritated my eyes. I lost a few sets of contact lenses because of the fibres in the masks. Manager did little to resolve the problem.

We were [guinea] pigs. Our manager was our hero. She battled for us on a daily basis.

Q3.13 Do you know/did you witness anyone who raised concerns about PPE? If so, when; with whom and what was the response?

Doctors did not always wear their masks and were spoken to by nurses that everyone had to follow the rules re: PPE.

Many of our staff did … and we were belittled and shouted at.

There was questioning as to why everyone wasn't complying. We were told to do what we felt we should do.

Everyone hated them but we didn't get any response other than: this is the new normal.

Yes, many nurses raised concerns about PPE. However, I am one of the few nurses who believes that we were given the best information and equipment that was available at the time even though it changed from day to day as our understanding of this new virus became updated.

Basically all faces wore the same mask. Incorrectly sometimes.

Masks and gowns became very scarce and often we would have to recycle used ones.

People began to hoard masks when they became available and weren't considerate to others.
Q3.15 Were you ever told to reuse a mask (e.g., were you advised to save your mask in a baggy for use on another occasion)?

That made me so angry. The first two days we were asked to put masks in [a] baggy and bring them in a bag next day. I did not do this – I didn't want to carry that thing home to my family.

We wore them into the cafeteria but everyone did something different. Some hung them around neck, others put them on hands, tray or table, dirty side down.

I refused. I felt this practice was unsafe.

Q3.16 Were you ever told that the cost of masks and/or other PPE was an issue? If so, by whom?

They complained about the cost of the masks (maintenance man) in charge of getting them. He told us to wear them till they were wet with perspiration.

Certain masks were put away only to be used by staff with breathing issues because they were too expensive for all SARS staff to use.

Some masks were more expensive than others and therefore deterred from being used.

I'm not sure who actually said it but we just got word in the OR that the duck bill mask[s] for allergic people were too expensive, that’s why we were not getting the supply in the OR.

Management would send out weekly email indicating cost of SARS outbreak on the facility.

We were told gowns were expensive to use and not to use even if we wanted to.

Save the budget for the hospital was said. A much bigger priority than nurses’ lives and our families’ lives.

I was told by an infection control nurse that I was using too much hand gel and gloves and that I was costing them too much money.
We were told that we had to cut back because there were not enough supplies because all supplies had gone to the war effort USA and Iraq.

Q3.17 Were concerns expressed about the perception created amongst the public from staff wearing masks? If so, please explain.

We are not allowed to wear N95 in cafeteria. They said this would scare the customers.

Towards the end of the first outbreak hospital asking for staff to take masks off, wanted the public to think things are back to normal.

Difficult to deal with small children – they are scared of masks.

We were not allowed to exit the hospital with masks on.

Patient confusion. Poor communication as sounds muffled. Poor eye contact and increased anxiety. Misunderstand and verbal abuse from family.

Public was alarmed but accepted precaution. Public initially fairly informed about the spread and how transmitted.

General public were concerned if we were wearing masks that we must have [had] contact with SARS.

One elderly lady I knew in hospital was quite scared by all the “masked” people. They looked like ghosts to her.

Our patients are elderly and some confused/scared by masks. Couldn’t hear us or understand as couldn’t see expressions on our faces.

When in quarantine and forced to work I had to wear mask from my car, walk two blocks from parking to my hospital[,] was harassed on the stand[,] had a pop can thrown at me, taunted by teens pointing and screaming SARS at me on the street. Residents complained to superintendent when I was leaving for work.

It was scary and felt like a huge barrier to care.
Our manager wanted the masks off quickly after SARS I, and we were criticized if we wore one.

We felt like we were lepers, outcasts, especially when we had to still go to work with no time off.

The public was very frightened about SARS and seeing staff wearing protective gear made them more frightened.

We all felt ostracized already [-] that just contributed to it.

Our hospital places more emphasis on perceived public approval at expense of safety of patient, public and staff.

I was concerned that some staff wore their masks on the bus on the way home – the public should have been concerned about that!

Originally we were not allowed to wear masks in hallway – told that we may be creating a “panic.”

When we went on quarantine after a night shift … we were told to wear our mask in the car until we got home and my neighbours saw me and thought I had SARS.

Patients could not hear everything especially when they were hard of hearing or if they read lips.

The public treated anyone wearing a mask as a leper and would avoid us.

Q3.23 Did you ever experience any side/health effects from the use of PPE? If so, give the details.

Our unit is super busy. No such thing as a 5 minute break every hour! We got chest tightness with difficulty breathing, dizzy, sweating, raw hands from constant gloves, fogged glasses. Awful!

Our floor has inadequate ventilation (old wing) so the PPE made me very hot and increased my headaches and several times I came close to fainting. Red rash and excoriation from masks.
Confusion, headaches, skin peeling, cracks from washing – redness from solution, tired.

I found wearing the PPE for 12 hours exhausting and I found by the end of 8 hours your level of awareness and response decreased greatly.

It was a horrible experience, I could hardly see due to fogging and I was entirely soaked, my uniform under the Stryker suit was wet, my hair was wet and my hands were wrinkled like after a long bath. I could not leave the patient, since she was too unstable. There was nobody to relieve me.

Had panic attack when I could not breathe or see through my extremely foggy goggles and face shield.

My throat was constantly irritated wearing the N95 mask, I always had the sensation of a hair tickling my nose or little bugs crawling around my mouth and nose. Also fatigue from high CO2 levels.

Fatigue, moodiness, acne! I was pregnant and had a miscarriage. Could it be related? We will never know. Two other females in my area had miscarriages.

My doctor told me I had “mask-induced asthma.” I have no history of asthma but needed to be on steroid puffer while wearing the masks. That is why I tried to switch to latex-free.

I’m [a] claustrophobic person, so that I felt SOB [short of breath] all the time with mask (face shield). Also my face broke out rashes from the irritation of the mask. Dermatologist consult was not available until the whole outbreak was over.

A headache every night. For weeks, I felt very lightheaded at work and would become confused “hazy.” I required a lot more sleep. My skin totally broke out with acne.

I had terrible cankers/mouth ulcers after the first month of wearing the masks continually. Also, I have had terrible “bouts” with migraine headaches, which are new for me. Both of these issues have been treated by my family MD.

We checked our O2 saturation levels after having worn our N95 for over an hour. Our saturation levels were less than 94%, yet when the masks were off, we had saturation levels greater than 97-98%. That’s significant and helped explain our exhaustion for days after.
3.34 Did you raise any concerns with management regarding the side/health effects of using PPE? If so, what response did you receive?

We were told we would have to get used to it or consider working elsewhere.

Was given opportunity to try masks less irritating and they were made available for my use.

They apologized for the ill-fitting masks and employee health did manage to find more comfortable ones.

It was discussed. Nothing could be done except trying different masks.

We mentioned our decreased oxygen levels with masks on. We were encouraged to take frequent breaks in order to remove masks.

Not much was done because PPE were a necessity and there were not alternatives at that time.

One of the doctors suggested we should have an oxygen bar to go to on breaks – management just laughed!

Response: you’ve got to be kidding! We’re nurses we’re expected to do our jobs. We were actually told that if we couldn’t deal with the conditions and dangers involved in nursing we should not be in the profession.

I was treated rudely and made to feel that it might not have been ... mask related. I mean we could say 100% for sure but it was the only thing I had on my face and since it have not had any problems. Started wearing “duck bill mask.”

Nothing could be done – had to wear a mask. It was something I just lived with.

Q3.25 Did you need/receive any accommodation regarding the use of PPE? If so, provide the details and any problems you experienced.

Management provided good supply of bottled water to make us more comfortable and [kept] us updated.
We were told about the five-minute break per hour “take off mask,” but workload didn't allow it most of time.

Were given increased breaks away from the patient care area to remove masks and equipment.

I was assigned to a SARS patient without PPE instruction; I had to ask someone for instruction prior to going in room.

We were encouraged to take more breaks although staff was not available to do so, we were provided bottled water for our breaks.

Q3.26 Prior to the SARS outbreak, had you ever been formally fit tested and/or trained and instructed in the care, use and limitations of PPE?

Q3.27 After the SARS outbreak were you fit tested and/or trained and instructed in the care, use and limitations of PPE? If so when (i.e., first outbreak, second outbreak, or actual date if known)?

This was normal isolation procedure in the 1970’s. Things have become very different with less precaution in recent years.

We were fitted for N95 masks, but not until after the second outbreak was almost over.

Not fit tested. Took self-study course on isolation precautions and trained years ago on isolation.

In the USA but not here in Toronto.

After 2nd outbreak, but fitting was up to individual to have it done in a testing area.

I had my mask fitting on July 31/03. The mask I wore throughout the SARS was the wrong type.

My fit test was after the 2nd outbreak and after I was quarantined for exposure to SARS in June. Only was fit tested, no instructions on care/use or limitations.
It seemed that 1st group of people fit-tested were management, not the front-line bedside nurses.

Q3.31 Were you ever advised of the importance of wearing properly fitted masks? If so, when?

I was not personally told this but ignorance is bliss. Like I said, we wore masks for a weekend only to be tested Monday morn to fail.

From the start we were advised of importance. However no one was sure if they were fitting properly.

Q3.32 Did you have any discussions with management regarding fit testing? If so, what are the details?

I felt that it was too late! I guess we may be adequately protected for the next outbreak.

It was very discouraging to have mask fitting sessions after all was over. How unsafe were we from the beginning[,] did they care or didn't they know the importance.

I know SARS has been a huge learning experience, but there should have been previous fit-testing, and even now it’s the end of August, why have I not been fit-tested yet? Nurses should be fit-tested first.

She was upset because if she gets me a special mask “my budget goes through the roof.”

Many could not get a fit test done because the times were fully booked.

I was very upset that fit testing started many weeks after we had been potentially exposed. The masks I had been wearing prior to testing all failed.

It was difficult for emergency nurses to leave to get tested for 1-2 hours. Extra staff wasn't available to cover. Eventually, some fit testing had to be done in the ER to accommodate (during 2nd outbreak).

Why were we not fit tested prior to SARS?
Q3.33 Do you have any knowledge of and/or did you witness anyone having any discussions with management regarding fit testing? If so, what are the details?

When one nurse asked why she was not being sent home until proper masks were here, she was told: “Can’t afford to send you home! Too many people don’t pass the fit test.”

Staff that did not pass were 1st told not to report for duty, but then due to staff shortages did return.

One staff was sent to crisis intervention after she failed the fit test several times and became upset and concerned for her safety – inappropriate!

Every effort was made to protect our workers, as far as I could discern.

There were questions being asked by staff all [the] time and above answers were given. Above was written: We can’t afford it at the present, we are not on the list yet, we are at the bottom of the list, there are not enough fitters in the Toronto area.

Q4.2 Were you ever discouraged from treating SARS as a health and safety issue? If so, by whom?

When staff failed fit test at peak of 2nd outbreak still expected to work with the potential for exposure.

One of our staff physicians said “we nurses were crazy to look after these patients.”

Q4.3 Did you ever feel that your health and safety were compromised at any time during the SARS outbreak? Please explain.

Lack of effective and timely communication along with leadership led to confusion and improper infection control practices thus exposing staff to potential dangers.

The workload – not able take breaks – leads to exhaustion and carelessness regarding use of PPE.

There was no information about the disease or its transmission. It was not treated seriously at the beginning.
Who do you trust?

The hospital is dirty. I was afraid to touch everywhere.

An anesthetist provided an epidural for a labour patient during the outbreak without proper PPE in place and then informed staff she [had] just intubated a suspected SARS patient.

The entire time other healthcare professionals were constantly becoming ill and they were wearing same protective equipment?? Who was going to be next???

It was my opinion that the unit on which I worked “let down our guard” too early. We stopped wearing masks prematurely.

I was torn between staying and quitting because my husband was scared. I wasn’t eating very well, worried I might develop low immune response and get sick.

Who wouldn’t be scared when you see and hear how many healthcare workers got infected.

Physicians who did not comply with precautions despite being reminded to do so caused increased safety concerns.

Felt threatened at all times.

We had a constant running battle in terms of visitors. For a period of time they were not allowed. When they came we felt they should still have been kept out. SARS screening and PPE for them was not good enough. Visitors routinely wore PPE wrongly. Sometimes people would sneak in. They often lied about contacts.

Staff seemed to be getting sick no matter what precautions we were taking.

Isolation doors being left open! Discarded PPE on the floor! Patients with respiratory symptoms almost being sent to a retirement home until staff questioned the decision – patient was later found to have SARS!

I was exposed[,] visitors were sneaking in and the instructions as to what is safe [were] always changing.

We were told too many untruths by our medical support team.
No one seemed to really understand how the transmission occurred, therefore you felt vulnerable even wearing PPE.

When doctors removed their mask after they have been in emergency or other areas and they came to our unit.

Constantly. Many staff did not wear their masks on units so on phones etc. Managers walking all over the hospital without PPE.

**Q4.8 What hazards/concerns arising from SARS, if any, did you bring to the attention of management and/or the Joint Health and Safety Committee (JHSC)? What was the response?**

Some people not following procedure – management spoke to them.

There was reassurance but I detected they were or felt as helpless as I did.

Visitors not following instructions to stay away or limit their stay during visit. Some are very persistent to stay.

During the outbreaks, I was concerned of the limitless entry of visitors. Many hospitals up to this day do not let visitors in. Visitors must wait until patient is returned to their respective units.

On a couple of occasions, I informed my patient care manager of patients/visiting without being screened at the entrance or phone screened. My patient care manager immediately took action and changes/recommendations were implemented.

We were concerned about the stress of the whole situation. Fear of contacting SARS. Response was nothing really ’til the end we were given one day of relief.

At the beginning of the first outbreak when people who knew we were nurses or our children’s mothers were nurses – what we should do i.e. sending our children to school – not socializing or hugging anyone in case we were passing on SARS to them.

Physical exhaustion as well as mental – nothing done about it.

Public wearing the visitors tags were collected in a plastic bag, and handed out again – no sterilization, very receptive.
Paper towel dispensers are not proper for good infection control. Nothing yet has changed.

I constantly suggested that a few responsible managers should run the show so we know who was in charge but there were too many managers – no one truly responsible or accountable. Response to this … not appreciated.

Q4.9 Did the JHSC meet more frequently during the SARS outbreak? Did they communicate with you?

Sometimes little communication back to the staff nurses. We often felt like we were in the dark with most recent info.

It was like pulling teeth with a wrench!!

Q6.1 Were you quarantined (home or working quarantine)? If so, for how long and how often?

What the hell is working quarantine? You should either be quarantine[d] or not. I did not agree with this approach. How do you get to work and back without jeopardizing the public.

It was a joke! I had unprotected exposure which was not observed until 9 days after. I was then placed on home quarantine for 1 day. Then on day 14 I was called by public health saying my quarantine should have been 14 days instead of 1.

Working quarantine had to be the most stupid thing ever. Either you are quarantined or not. Too much opportunity to compromise the quarantine technique.

Q7.1 Were you regularly informed of the MOHLTC directives, including updates? If so, how?

Our administration was superb in doing this on a daily basis, updates came regularly.

Hospital email not easily accessible for most. I would check before going to work on my home computer because there is no time when you’re at work.

I believe information was withheld from time to time in the interest of panic.
Q7.2 Were the directives explained by your employer or anyone else? Please explain.

They were very good. I read all of them. I felt the communication was really important. It looked like the administration was being “on top of things.”

Staff were updated continually – at one point with daily staff meeting by unit director.

Regular open meetings were held weekly.

The employer/infection control explained directives. We never directly saw any directives – our unit manager also had talks with us daily at one point.

Occasionally – however the explanations were not consistent.

The email info was daily and we were to read and ask questions if we had some.

They were very good. I read all of them. I felt the communication was really important. It looked like the Admin was being “on top of things.”

Sometimes. Different resources had different answers.

To best of employees’ ability. Often employer was unsure exactly what was being directed.

Ministry of Health directives were posted where everybody can read regularly.

It was passed to management to pass to staff nurse. Often the info was skimpy and ambiguous by the time it reached the next shift, or the shift after that. Usually info was passed verbally.

We were regularly informed, but what we were told seemed to change, literally, by the hour so I don’t know if they were updates or incompetent communications.

Q7.4 If you were advised of/read the directives, did you find them confusing? Please explain.

Directives were confusing, cumbersome, changed daily if not more frequently. There was no way anyone could be certain they were doing the right thing.
I believe the entire situation was confusing and it didn’t matter what the directives said. Everyone was confused and nobody knew anything for sure.

Too long – more concise would have been better.

At times contradictory. It seemed filtered and possibly to suit CEO/management not staff.

There was no evidence base to support many of the measures. It is difficult to make intelligent people do things when you can’t explain why.

They changed so frequently, it was hard to stay current, especially when being off work for a few days.

Q7.6 To the best of your knowledge, did your facility follow the directives? If not, provide details.

They seemed to be scared to make any decisions, concerned to rock the boat – sent unit the directives via computer but did not enforce them all.

Many MDs were slack in their infection control practices.

Many service staff working in stores etc. not wearing PPE justifying it because they work in remote areas of hospital.

After the 2nd outbreak we were treated a little humanly, otherwise to administrators we nurses never exist.

Unsafe conditions, dangerous to patients. Could not get help quickly when patient crashes. Baby monitors infection for isolation room. Could not see monitor and gear on.

Visitors were the largest issue – the hospital totally abrogated responsibility.

I didn’t think they did. There was an air of arrogance, defensiveness by senior management.
Q7.7 How was the March 29, 2003, directive requiring PPE to be worn by “all staff when in any part of the facility” applied in your facility? Were you and staff members in your unit provided with PPE consistent with the latest MOHLTC directive?

MDs came thru wrong entrance to hospital and did not do SARS screening. We saw them enter through Emergency. We reported to our nurse manager. We never had unprotected exposure to any SARS point in our hospital. We were met at the door with the appropriate PPE for the area we worked in, along with a handout and signage.

MD’s refused to co-operate[,] only wore PPE if it was demanded by the nurse. On one occasion, I refused to assist MD because of safety for the patient and myself.

Q7.8 How was the May 31, 2003, directive requiring full SARS precautions (PPE) to be worn by facility staff “in all patient care areas” applied in your facility? Were you and staff members in your unit provided with PPE consistent with the latest MOHLTC directives?

This was not fully applied. That day was the only day I was told I did not need a mask. I had no mask on and guess what – I was exposed to a suspect SARS patient.

I felt like that we were “closing the barn door after the fire was started.”

It was very strict. Even when the government said the outbreak was over our hospital insisted we continue to use protective gear. I know of a few that didn’t and it turned out disastrous.

It was very hard to follow all directives but the fear of SARS drove us all to compliance.

Q7.9 Please provide any further comment about the directives.

The directives were hopelessly general and open to interpretation.

I just want to forget about that period.

On the whole it was all dealt as well as could be expected on such short notice. Everyone tried their best. Well done.
I felt that the people at the POC were not really aware of what was involved in hospital work and patient care, so the impact of directives was not always thought out in advance.

As nurses we need to be allowed to use some clinical judgment on when/where to wear PPE.

It is okay to have directives. Please ask the front line workers for inputs. Do not treat us like a cattle ranch and one kind of masks does not fit all. The MOHLC should try wearing an uncomfortable mask for 12 hours and then come and talk to me and tell me what to do. Treat us with RESPECT.

It was much too late, many of our staff were already sick with SARS by then.

Will it ever be over?

It seemed I learned more from TV or friends. No one ever seemed to know what the right thing to do was. Complete disorganization and utter lack of communication. Pitiful.

People are still wearing their PPE at times when caring for patients. I think they are still scared of the unknown.

They made a concerted effort. It was a learning experience for everyone. It wasn't perfect at the time but we learned from it and would be better now I think.

Nurses were compliant, physicians were vague and occasionally mocked our ideas, blaming ONA for being too fussy.

I was afraid of dying.

Q8.1 Are you aware of any situations where patients were exhibiting SARS symptoms and were not appropriately dealt with (e.g. not placed in adequate isolation, not reported to Public Health)? If so, please provide details.

Patients were not always screened properly or not at all. Placed in wardrooms only to find out two days later that they have possible symptoms.

Public health was impossible to contact. Very slow response.
I simply did as I was directed by the charge nurse; I never had time to look into the directives on my own. Patient care takes up all my time and energy.

Nobody listens to the nurses!

**Q8.3 Are you aware of any circumstances where you or other nurses/health care workers were not listened to when they reported possible SARS symptoms in patients? Please provide details.**

People at times felt we overreacted.

The MD’s opinions were more relevant to managers than the RN’s who worked daily at bedside.

The nurses were spoken to very badly and told they were overreacting and dismissed their concerns.

We really had to fight to get to be heard. Symptoms were not taken seriously at times.

**Q8.4 How could the spread of SARS and the risk that it posed to workers have been better dealt with within your facility?**

Hand washing was slack and workers weren’t properly trained.

Infection control measures could have been in place before the outbreak. We deal with communicable diseases all year.

Make the doctors accountable for ignoring the screening protocols.

Listen to the nurses.

All persons exhibiting symptoms should have been suspected until completely ruled out.

If we hadn’t let our guard down 1-2 weeks early, the second outbreak would not have occurred or been as severe.

Listen to nurses!!! We are the primary care giver. ID team was not listening.
Protocols were changing every 15 minutes by the same person. Doctors didn’t follow the protocols but the nurses did.

Never should have sacrificed healthcare safety for ministry of tourism. Nurses said that as long as we practiced safe measures we were safe. Once we relax – boom 2nd outbreak.

I think everyone was doing their best but because of the “unknowns” it was very difficult.

More communication, I am aware of the confusion, but I should not get my updates by the media; which is based on their interest.

Many of my colleagues who became “SARS” sick contracted the illness by going to another unit to help out. So the issue about staffing shortage is a contributing factor. Also at the ER level better infection control practices. Perhaps ER should have separate rooms for patients with fever.

They could have listened to the nurses sooner. We had valid concerns that fell on deaf ears.

I don’t know that it could have. After all this was new and unexpected. We learned from this and now would be better prepared for another situation like it.

Masks should never have been discontinued after the first outbreak.

The hospitals should have been locked down for all visitations and full protection should have been in place until the last patient went home or died.

It was kept a secret from nurses far too long and we should [have] been more aware immediately in regards to what kind of virus we were nursing with.

Q9.1 Did you witness any failure to comply with Ministry/facility directives during the SARS outbreak by any of the following persons? Physicians, screeners, visitors, patients, non-professional, professional staff?

Some patients and visitors became very abusive and angry and refused to comply.

Visitors were very non-compliant with masks and did not listen even with repeated reminders.
Visitors didn’t seem to understand the seriousness of the risk. Physicians had to be informed/asked to please comply.

Some physicians were angry they had to line up with the rest of the staff to go through the screening process during the 1st SARS and didn’t like to have their temperature taken and have to wash their hands.

Some physicians refused to wait in screening lines – bypassed screeners and security people.

Breaches everywhere: human error, forgetfulness, laziness, letting up guard, lack of enforcement.

I witnessed an emergency physician walk past the screeners handing out protection. The security guard told him he was required to wear N95 gloves, gown. He said “I know I’m the emergency on call” and kept walking. At this time our emergency was a SARS assessment clinic for the region.

Q10.2 If your facility was able to prevent the spread of SARS to health care workers, please share with us any details about health and safety/infection control measures and/or procedures etc. that you are aware of that protected the health and safety of your members during the SARS outbreak.

I’m sure if it returns we will hopefully be more aware and cautious.

We were just damn lucky!!

Q10.3 What sources did you seek for the latest SARS information?

Watching the news, the newspaper. They were more up to date than the nurses working with the patients.

We did regular updates on events posted on a “SARS” bulletin board; read different newspapers, website, listened to interviews with doctors, researchers on SARS.

I called our hospital’s SARS hotline, read memos, listened to the news etc.
The evening news on TV and newspapers and family. I learned more from the above sources than I did from my employer.

I called another community health centre almost daily. I went on websites. I attended some of the daily POC press conferences.

Most important aspect especially with this kind of outbreak; to always let all the staff know the situation … honestly … support them in whichever way they can. Improvement and more latest techniques re: Infection Control.

Infection Control – although early on I said to our person “I hear it’s a chronic virus” and she said – don’t listen to the media. The media was an important source of information to us.

I disagree that hospital administrators should have the power to police directives set by the MOH and that MOH should ensure that the directives are enforced.

Q10.4 Any additional comments (is there anything else that you would like to tell us or that you think we need to know)?

Be more involved, never assume others know, grapevine unreliable. Don’t just complain to other staff, ask management and go to the person and find out for yourself.

Healthcare is definitely not prepared for this type of emergency. Policies and procedures need to be in place. Listen to the nurses!!! They are the front line.

I believe we let guard down too soon after initial outbreak. Everything seemed to clam up after travel advisory. I felt biggest sense of distrust after this and began to look out for myself more so then because less info was forthcoming then.

Nurses worked in hot disgusting circumstances [with] inconsistent info and were poorly protected. It was like we were disposable.

I was proud of my facility; I felt they tried hard to protect staff and community. Everyone went out of their way, management worked odd hours side by side with other hospital employees to do whatever was necessary. Some even brought us coffee.

I think the outbreak was handled as best as the healthcare system could. We are short
staffed and stressed on the job regularly. The Ontario government needs to make healthcare a priority because there will be something else and a lot of the older nurses will just leave.

In our past experience we have never dealt with anything like this. I think overall we all did the best we could with what we knew. Now we know better. Needs to be set up permanently so that we never get caught off guard again. It will happen because now the spotlight is off.

I know personally that as a happy contented worker in ER my whole outlook changed. The face of nursing itself changed. When you only see eyes, can no longer touch with bare hands to assess skin temperature[,] tone etc.

This situation was very disruptive for clients with mental health problems. I wonder if anything could have been done to make this situation easier for them?

We were treated so poorly considering what we had to go through. We were not treated with respect. We were kept in the dark about everything. It was very upsetting.

SARS was totally mismanaged.

If SARS occurs again I’m sure you will see a big retirement [of] RNs in Ontario. Physically[,] emotionally we were exhausted. Not enough staff, no refreshments, poor communication, not enough isolation equipment.

What happens the next time?

Very important to listen to nurses’ concerns. Nurses often not taken seriously or respected. Morale on our unit is at an all time low.

Doesn’t surprise me that this has happened. It will happen again. I know how to protect myself at work re: unusual precautions – but SARS has put a new perspective on nursing for me.

A lot of nurses were afraid. Especially the ones with children. You could see that they wanted to cry or run off the unit when they found out they were caring for the SARS patients that day.

I can’t believe how nurses were so left out and they were the ones doing the actual screening and giving care.
Nursing has now become a very hazardous profession and ONA has an uphill battle ahead in negotiating a contract which will attract nurses to remain in the profession or to encourage anyone to enter the profession. We are headed for disaster. The exodus has started.

For the 1st time I was hiding the fact that I was a RN to avoid people shunning me. I felt very isolated. I resented people saying it’s my job to take the risks of SARS.

Don’t ever force us to do SARS again please! Have it as a voluntary job for staff who want to get paid more. We didn’t even get paid more.

It will happen again and we better be prepared. We will see an exodus of nurses unless the pay reflects the risk. The nursing shortage is already critical and will now be worse.

I felt very isolated and not informed quickly enough. Feel the Hospital is looking after itself first, staff second.

I feel that we took our guards down too soon. I expected the precautions to continue until Sept. with the first outbreak.

Nursing will never been the same anywhere. We are now careful and more aware and mask will also be a part of us.

Physicians need to be more accountable regarding precautions. They are the worst offenders.

Medical institutions were not ready and we became one big experiment to see what practices would work.

Management should have to communicate with staff. Staff was kept without proper information.

It was hard but we did it.

Our manager always wanted us to remove our masks after SARS I, for public relations.
I realistically think that you will see significant numbers of RN’s leaving the profession within the next 5 years. Many feel this problem is perhaps just the 1st of many to come, and while most of us have been “lucky” this time – who knows about the next one.

SARS has changed everything. I no longer feel safe at work. Friends have been lost. My family suffered much stress and anxiety. I feel there will be a large exit from nursing if SARS happens again.

They (hospitals) should stop worrying so much about business, if everyone is sick there won’t be any business and no one to care for them.

This was a terrible period to work in and has left me physically and emotionally exhausted. I still have anxiety thinking about it and how unrecognized the role health professionals played in SARS 1 and 2. I cannot even speak about it.

I feel that the disorganization, lack of leadership and education greatly put our unit at risk and it is purely by luck that we had no healthcare workers contract SARS.

SARS has changed the face of healthcare especially for me as a nurse. The joy of being a nurse is replaced by fear.

All I want is for hospital to admit they made a huge mistake in dealing with this. They need to do something for the families whose members died as a result.

Cleanliness in our hospital is way down on list of priorities. The priority in our hospital is “public relations.” Far removed from safety and what would be in the best interest of client and staff.

It is unforgivable that management and our infection control specialist doctors were not held accountable for their action.

We can learn a lot from the mistakes made this time. I hope we do.

I feel very angry and betrayed becoming so ill by just carrying out my job; I don’t know if I will ever be able to feel the same way about the hospital. I have worked for 26 years.

How can a mask that fits a 300-pound construction worker fit a 95-pound healthcare worker?? What were they thinking??
I feel the press did more harm than good. Our patients coming to the SARS Clinic for assessment were extremely upset with reporters and camera crews photographing them. It was a “Privacy Issue” as well as an issue of “Respect.”

Our cleaning staff is overwhelmed, I don't feel that they could follow infection protocols when [they] are overwhelmed (this I feel is the source of spreading germs).

Nurses are mercies of God. Do not let them run away! Provide money, support, love or you’ll have no nurses left!
CHAPTER SEVEN: Aftermath

Airport Screening

Airport screening was a controversial matter that, in the end, turned out to contribute little or nothing to the fight against SARS. When SARS was over, it was clear that airport screening was ineffective and that the most effective screening point was the first portal to the health system, whether it be advice from a family doctor or a trip to a hospital emergency room.

The screening measures were the subject of great bickering between the Ontario and federal governments, which regrettably showed the tendency of governments sometimes to fight rather than fix. The lesson learned is that in crisis governments must forgo political sniping and join together in the job of protecting the public.

Health Minister Tony Clement at one point wrote federal Health Minister Anne McLellan to complain that screening measures at Pearson International Airport in Toronto were not vigorous enough to prevent SARS from entering Ontario.846 Two and a half weeks later, the WHO issued a travel advisory against Toronto, and McLellan was accused in the House of Commons and elsewhere of bringing on the advisory by ignoring requests for better screening of people entering the country.

Medical professionals questioned the effectiveness of the airport screening. For example, Ontario’s then Commissioner of Public Safety and Security, Dr. James (Jim) Young, told the CBC that the chances of the screening process catching someone with the disease were slim:

The airport isn’t picking the cases up. People come in, and then they get sick and they go to hospital. We ask them questions if they’re sick and we pick them up there.847

Dr. Andrew Simor, a microbiologist at Sunnybrook, said the airport screening measures were put in place largely to try to satisfy the World Health Organization (WHO):

The reality is I don’t think it was really warranted and I think the costs used for airport screening could well have been spent on other sorts of control measures.848

On April 3, 2003, a WHO official described the Pearson Airport screening as an example of best practices.

SARS was not detected by any measure utilized by Health Canada at Canadian airports, as described in the Naylor Report:

As of August 27, 2003, an estimated 6.5 million screening transactions occurred at Canadian airports … None had SARS … The pilot thermal scanner project included most inbound and outbound international passengers at Toronto’s airport … and again none were found to have SARS.849

The federal government instituted airport screening on March 18 in hopes of decreasing the risks of travellers importing SARS from Southeast Asia. The initiative began with Health Alert Notices (HANs): posters directing arriving passengers to pick up information on signs and symptoms of SARS and to see a physician if the symptoms developed. This information was printed on 8” by 11” yellow cards and included key telephone numbers.

Vancouver and Toronto international airports received the yellow HANs first, then the initiative was expanded to 12 other airports that received international travellers who might have been in the Far East. Also included were 18 land border crossings to the United States.

On April 3, the federal government distributed “cherry cards” to passengers departing Toronto’s Pearson Airport on international flights. This was expanded on April 7 to include Toronto Island Airport and the train stations:

With the advent of SARS transmission in Toronto, Health Canada implemented similar HANs in a different color (cherry) to mitigate the risk of exporting SARS cases. The cherry-colored HANs were distributed to persons departing for international destinations from Toronto’s Pearson International Airport. Passengers with symptoms or signs of SARS were asked to self-defer their travel. In these instances, Health Canada requested airlines to waive their policies on non-refundable tickets, and while many did so, the refund and rescheduling policies and conditions were not uniform.850

Six days later, in-flight distribution of yellow cards and contact forms began on nine airlines with flights from Asia. The program underwent a series of expansions and revisions, the most significant being the implementation of thermal screening at airports. On May 23, six thermal scanners were set up in Toronto’s Pearson Airport for all incoming and outgoing international travellers. This followed a pilot study started May 8:

In parallel to these measures, Health Canada initiated a pilot study on May 8, 2003, on the use of infrared thermal scanning machines to detect temperatures >38°C in selected international arriving and departing passengers at Vancouver’s International and Toronto’s Pearson International airports. Thermal scanning complemented other measures in the overall screening process by helping to triage the large volume of passengers who transit airports. Any passenger with an elevated temperature reading was referred to the screening nurse for confirmation, completion of the screening protocol, and referral to hospital, if necessary.851

A study by the Public Health Agency of Canada (PHAC) provided statistical data regarding the number of travellers screened during SARS:

As of July 5, 2003, a total of 1,172,986 persons received either yellow or cherry HANs. A total of 2,889 persons answered yes to at least 1 screening question on the HAN and were referred to secondary screening according to protocol. None of the 411 outbound passengers who were

referred for secondary screening in Toronto were asked to defer their travel. All persons were cleared, and none were referred for additional medical examination.

In addition, 763,082 persons (467,870 inbound and 295,212 outbound) were screened by the thermal scanners. Only 191 persons had an initial temperature reading of 38°C and were referred for secondary evaluation. No data were collected systematically to correlate thermal scanner results with results of temperature taking by secondary screening nurses. Some of the persons arriving or departing Toronto and Vancouver airports were screened by both HAN and thermal scanning measures.852

It became apparent that airport screening did not work and that the best way to identify SARS cases was at the first point of entry to the health system, Dr. Young said on the CBC. Later studies supported what Dr. Young claimed at the time. The PHAC study concludes:

We suggest that in-country, acute-care facilities (hospitals, clinics, and physicians’ offices) are the de facto point of entry into the health care system for travelers with serious infectious diseases.

One of this study’s authors, Dr. Ron St. John, was quoted in another article as saying:

They didn't detect any SARS … Sometimes what seems like a reasonable thing to do doesn't turn out that way.853

Another study, from the U.K., reported in the *British Medical Journal*, has similar findings:

Entry screening is unlikely to be effective in preventing the importation of either SARS or influenza. The incubation period for SARS is too long to allow more than a small proportion of infected individuals to progress to symptomatic disease during flight to the UK from any destination.854

Dr. Naylor gave a presentation to the Standing Senate Committee on screening systems that were used during SARS. He stated that there is a need for information in people’s hands and for a good public health infrastructure to support the information being handed out:

Absent that, you have to focus on two things. One is information. You have to put masses of information in the hands of people. Assuming that most people are good, well intentioned and want to do the right thing, they will bring themselves to public notice quickly if they have suspicious symptoms and have been travelling. Second, you need a strong, local public health infrastructure so that when someone phones and says, “I have this information packet, I was just in wherever and I have the symptoms that match, I am worried that I may have X or Y,” there is an instant response. Someone is at the house in 30 minutes. They get the information about what to do on the phone. They are transported, with appropriate precautions, to an emergency room that has an isolation area. They go into hospital, if need be, and into a negative pressure room, if that is required.

There must be a local system that knows how to respond to the traveller who has concerns or suspicious symptoms. We believe, and we have recommended, as I think honourable senators will have read, that there is a need for a multilateral, international process to reconsider travel screening; but also that we need in Canada to take a sober and critical look at the results of our screening activities. Millions of people went through thermal scanners and card systems with no cases detected. Let us have a critical look at it and decide what we need to do as a country in terms of information for travellers and screening.

Quarantine officers are another issue that has been covered in the report in some detail. We need a proper set of quarantine officers at all ports. This is all there. The United States government has become increasingly concerned about global travel as a means for the spread of new or re-emerging communicable diseases … A National Response Guidelines Manual has been developed by the U.S. Department of Transportation which provides a “big picture” for those involved in both planning for and responding to a quarantinable, communicable disease incident at an airport.855

855. The Standing Senate Committee on Social Affairs, Science and Technology, chaired by Senator Michael Kirby, October 9, 2003.
The Commission agrees with Dr. Naylor’s observations, as set out in the Naylor Report:

Screening for a rare disease like SARS in a large population (i.e., millions of travelers) is both difficult and ineffective with an extremely low likelihood of actually detecting cases.

Also, travel screening fails to detect those who may be incubating the disease – these individuals would still be symptom-free. Screening healthy people for infectious diseases should be based on certain premises: that a disease is present in the general population, that it can be detected by screening measures, and that there is a high risk of transmission by asymptomatic individuals. None of these conditions were met by SARS. In the absence of such features, screening healthy people is expensive, possibly highly intrusive, and can create a false sense of security or needless anxieties.\(^{856}\)

The screening program was well intentioned and was somewhat helpful in that it provided some information to the public. However, it turned out in SARS to be an ineffective measure with the potential to divert resources from more effective work and can create needless anxiety in individuals and a false sense of public reassurance.

---

\(^{856}\) Naylor Report, p. 206. The Naylor Report made a series of recommendations to ensure that travel screening is imposed only when evidence suggests it will be effective, to improve quarantine officer resources, to improve communication of health risk to travellers and the travel industry and to develop cooperative intergovernmental protocols to these ends. The Commission endorses the thoughtful recommendations of Dr. Naylor, listed at p. 207 of his report.
The SARS Alliance

During the second SARS outbreak, the Ontario government decided to concentrate the treatment of SARS in four key hospitals that became known as the SARS Alliance. It was a decision made in an emergency, but one that was not widely acclaimed.

The SARS Alliance was a stopgap measure for a provincial or regional emergency plan that, as noted elsewhere in this report, Ontario did not have in place.

The hospitals designated were North York General Hospital, St. Michael’s Hospital, Scarborough General Hospital and the William Osler Health Centre. The idea behind the move was to concentrate the treatment of SARS to these four hospitals. This would pool the expertise that had developed and, it was hoped, would free up other health care facilities to carry out their normal functions without the heavy burden of dealing with SARS patients.

Tony Clement, Ontario’s Minister of Health at the time, said in a media release:

We are concentrating the treatment and expertise of SARS at four key sites around the Greater Toronto Area to ensure we quickly identify and contain the disease during this current wave of cases … This will help us protect the capacity of the health care system as well as ensure that the health care system in the GTA keeps running safely and efficiently.  

Mr. Clement said the four hospitals would work together:

… to develop a plan for moving patients in alternative levels of care, establish specialized units with dedicated staff, formalize agreement on staffing, resources and supplies, and ensure transfer protocols are in place.

People interviewed by the Commission and those who spoke at the public hearings praised those who volunteered to work at the Alliance hospitals, but generally the move received a lukewarm reception.

The most critical comment came from an emergency medicine physician who worked in various capacities during the outbreak. In a submission to the Commission, he said that the SARS Alliance provided minimal, if any, benefit:

NYGH, Scarborough General frequently did not have beds. Etobicoke General was not prepared until late to accept patients, and St. Michael’s Hospital appeared to limit its transfers to intubated patients. The cost was prohibitive as nurses and other were given 2x contract pay. The non-SARS hospitals still had to care for SARS patients while waiting for beds and were not being paid the same rates. This pay inequity led to tremendous anger with some staff taking leave of absence or resigning.859

In hindsight, the physician said, it would have been better to protect some hospitals that provide specialized care such as trauma, burns, surgery and oncology from accepting SARS patients.860

The additional pay at the SARS Alliance hospitals was clearly a contentious issue. The Naylor Report noted that it created inequities, as health workers at other hospitals who had treated SARS patients did not get the benefit of double-time pay. Dr. Naylor also noted that the Ministry of Health and Long-Term Care did not sanction the move:

The SARS Alliance hospitals chose to provide double-time pay to those individuals working in SARS affected areas/SARS units. The OMHLTCC did not sanction this action. It was heavily criticized from an equity perspective since other hospitals that treated SARS patients did not provide the same benefit to their staff. Further, staff were provided the additional salary whether or not the SARS unit they worked on actually treated SARS patients. As a result, in some cases staff treating SARS patients received no added compensation benefit, while others who did not treat SARS patients did receive additional compensation.861

859. Dr. Laurie Mazurik, submission to the SARS Commission, September 7, 2003, p. 2.
860. Dr. Laurie Mazurik, submission to the SARS Commission, September 7, 2003, p. 2.
The Ontario College of Family Physicians paid tribute to those who volunteered when North York General Hospital was asked to become a SARS Alliance hospital. The College's Executive Director and CEO, Jan Kasperski, told the Commission at its public hearings:

… they quickly stepped up to the plate. I can tell you that no one was thrilled with the idea, but it was their own colleagues, their co-workers, who had fallen ill, and they wanted to bring as many of them as possible back into their own institution so they could care for them … Several family physicians and our residents volunteered to act as the attending physicians on the SARS ward.862

The president and CEO of a Toronto-area hospital was not impressed with the SARS Alliance as a response to the crisis:

I think there needs to be much more focus on infection control so that you can handle these things … Designating a SARS hospital [is not enough]. Next week it’s some other disease.

She said she favoured a more general approach:

This was an outbreak. We didn't know what it was. So you're designating something [SARS Alliance] way after the fact. Its [success depends] on how you deal up front with something that you don't know about. My own view is that you have to, as much as possible, put in place mechanisms which control the possibility of those outbreaks occurring.

She told the Commission that such precautions should include universal precautions and building hospitals that can handle the virulent diseases that may be on the horizon:

I think what you need [is] to have hospitals that can deal with outbreaks of infectious diseases. You need hospitals where, when people come into an emergency department, it’s not like a cattle car and they’re all put together … I think somebody talked about the reality of coming into an emergency department with somebody sitting, or in the next cubicle, two

feet away. Hospitals aren’t designed to deal with these diseases, whether it’s emergency departments, intensive care units, etc.

But she said that newly constructed hospitals are taking these problems into account:

Hospitals are built now to handle the really virulent diseases that you get. If you look at the evolution, for instance, of intensive care units in the country, it used to be that an intensive care unit [ICU] was one big room and there’d be a nursing station at the front and you’d sit and watch all the patients … Over the years, new ICUs are built now where they’re all individual rooms. One of the reasons is that if you get [an outbreak], you have to shut down the whole ICU … If any hospital would have to shut down an intensive care unit, it would be a mess. So there is now a move towards having ICUs that are individual rooms with individual air pressure systems so if you have a patient in a room with a infectious disease, you could handle that through negative air pressure.

The SARS Alliance was a decision made in the middle of a crisis, and it is hard to fault the government for trying to get control over the situation. But it would have been much better to have an emergency plan in place that had already considered and resolved the issues that arose when the SARS Alliance hospitals were designated during SARS.
Ministry of Labour Investigations

The Ministry of Labour, pursuant to the *Occupational Health and Safety Act*, investigated the SARS deaths of nurses Tecla Lin and Nelia Laroza and of physician Nestor Yanga and conducted occupational illness and critical injury investigations into the illness from SARS of 146 health workers. Although these investigations and the legal decisions arising from them are not at the core of the Commission’s mandate, they do come within its outer margins and warrant brief comment here.

Investigations into the deaths of Ms. Laroza and Ms. Lin recommended the laying of charges under the *Occupational Health and Safety Act*. In the case of Dr. Yanga no such recommendation was made.

To guard against potential conflict of interest, the charge screening process was conducted outside the Ministry of Labour, by Crown counsel at the Ministry of the Environment. Following these reviews, decisions were made not to lay charges in connection with either the death of Ms. Laroza or the death of Ms. Lin.

The decision whether to lay charges as a result of any Labour investigation, including these investigations, is made in the end by Ministry legal advisors on the basis of investigation reports and of legal and quasi-judicial considerations, for example: Are there in law reasonable and probable grounds to believe that there has been a violation of the *Occupational Health and Safety Act*? Is there a reasonable prospect of conviction if charges are laid? Are defences open to the potential accused, such as due diligence or necessity? Is it in the public interest to proceed with charges in particular case? The basis of the legal decision not to lay charges in these cases is beyond the reach of the Commission because the legal opinions that underpin those decisions are the subject of a claim of solicitor-client privilege asserted by the Ministry of the Attorney General.

---

863. The names of Ms. Lin, Ms. Laroza and Dr. Yanga are used here because the circumstances of their illnesses and deaths are in the public domain.
None of the critical injury\textsuperscript{864} and occupational illness\textsuperscript{865} investigations into how 146 health workers contracted SARS recommended the laying of charges.

These investigations were seriously hampered by the fact that they did not begin until February 2004, leaving insufficient time for a full and thorough investigation before the expiry in March 2004 of the time for laying charges imposed by the one-year limitation period under the \textit{Occupational Health and Safety Act}.

In all, the Ministry received 146 occupational illness and critical injury notifications and three fatality notifications.\textsuperscript{866} Under the \textit{Occupational Health and Safety Act}, employers must notify the Ministry in writing of a critical injury within 48 hours of the occurrence\textsuperscript{867} and of an occupational illness within four days.\textsuperscript{868} This timely notification allows the Ministry the opportunity to quickly investigate the events that led to the critical injury or occupational illness and to prevent its recurrence.

\textsuperscript{864} A probable case of SARS was considered a critical injury.
\textsuperscript{865} A suspect case of SARS was considered an occupational illness.
\textsuperscript{866} There were major problems with the notification process. The Ministry told the Commission:

The majority of these notifications were received after employers were ordered to do so by MOL inspectors. (Ministry of Labour, submission to SARS Commission, March 15, 2006, p. 19)

\textsuperscript{867} Section 51. (1) of the Act states:

Where a person is killed or critically injured from any cause at a workplace, the constructor, if any, and the employer shall notify an inspector, and the committee, health and safety representative and trade union, if any, immediately of the occurrence by telephone, telegram or other direct means and the employer shall, within forty-eight hours after the occurrence, send to a Director a written report of the circumstances of the occurrence containing such information and particulars as the regulations prescribe.

\textsuperscript{868} Section 52. (2) of the Act states:

If an employer is advised by or on behalf of a worker that the worker has an occupational illness or that a claim in respect of an occupational illness has been filed with the Workplace Safety and Insurance Board by or on behalf of the worker, the employer shall give notice in writing, within four days of being so advised, to a Director, to the committee or a health and safety representative and to the trade union, if any, containing such information and particulars as are prescribed. R.S.O. 1990, c. O.1, s. 52 (2); 1997, c. 16, s. 2 (12).

Note that the Act defines “Director” as follows: “Director means an inspector under this Act who is appointed as a Director for the purposes of this Act; (‘directeur’).”
On February 24, 2004, teams of inspectors were assigned to begin investigations at Toronto Emergency Services, St. John’s Rehabilitation Centre, North York General Hospital, the Scarborough Grace and Scarborough General Division hospitals, and Mount Sinai Hospital. On March 3, 2004, another team was assigned to begin an investigation at Sunnybrook.

The investigations faced a time constraint because section 69 of the *Occupational Health and Safety Act* states that charges must be laid within a year of the event under investigation:

Limitation on prosecutions

69. No prosecution under this Act shall be instituted more than one year after the last act or default upon which the prosecution is based occurred.
R.S.O. 1990, c. O.1, s. 69.

The delay in starting the investigations meant that Ministry inspectors were pressed for time. Observers familiar with the investigation said the late start date did not leave the investigators enough time to do a proper investigation, that they basically ran out of time.

The problem was not the competence of the investigators or the quality of their investigation, both of which appeared to the Commission to be high, but the delay in giving the investigators the go-ahead to proceed.

In explaining why these investigations were not begun earlier, the Ministry said:

Investigations of the fatalities and preparation for the investigations into the occupational illnesses and critical injuries began prior to the receipt of the reports. The reports were received by MOL in early February 2004, and the MOL was then able to continue its investigations into all 146 occupational illness and critical injury notifications and the 3 fatality notifications.

The MOL carries out a significant number of highly complex investigations such as structural collapses, geological stability, and asbestos removal each year involving input from various experts and information from a wide variety of sources. For the most part, these investigations involve long standing generally accepted scientific, engineering and/or medical standards.
The SARS investigations, however, presented an even higher level of complexity. Information with respect to SARS continued to evolve from day one of the outbreak until well after the emergency was declared over. The criteria for a diagnosis of SARS changed during and after the outbreak as did the information with respect to its transmission. As a result, the MOL was required to analyse all of the POC [Provincial Operations Centre] directives issued during the outbreak as well as the evolving information from the WHO and other organizations involved in the ongoing monitoring of SARS.

Unlike the overwhelming majority of workplace hazards, SARS was not a hazard localized to one particular workplace or even one area within a workplace. Contact tracing with respect to each worker, as reported by Toronto Public Health, had to be followed up by the MOL to attempt to determine where a worker had contracted SARS (i.e., a workplace, a public gathering or location other than a workplace). The movement of workers diagnosed with SARS was tracked within hospitals as well as from one facility to another to determine what precautions had been taken to ensure the disease was not spread within a facility, to the public at large and to the facility where a worker may ultimately have ended up. Details such as where and in which order personal protective equipment was put on and removed was analyzed.869

The investigations were begun very late into the one-year window for the laying of charges. No matter what difficulties faced the Ministry, and whatever the validity may be of its reasons for starting the investigations so late, it does not generally enhance the reputation of any regulatory and enforcement body if investigations are launched so late that investigators do not have sufficient time to do their work properly.

Public confidence is vital for any regulatory and enforcement ministry. In the case of the Ministry of Labour, this means that investigations into critical injuries and occupational illnesses arising from a disaster of the magnitude of SARS must be commenced expeditiously.

Public confidence in the process of investigation and in the decision to prosecute also requires an element of openness. The system under which the SARS labour investigations proceeded, and under which the decision was made not to prosecute, lacks the degree of openness necessary to secure public confidence.

Whenever a worker safety charge is laid and then proceeds to court, the principle of open justice requires that the proceedings and any decision to terminate proceedings short of a trial take place in public.

The difficulty occurs in cases like this, where the investigation recommended that charges be laid in certain cases and not others, where there have been no court proceedings, and where the public and the families of the deceased and the affected health workers are left completely in the dark.

Public accountability and openness require a better system to inform the public and those affected by these important decisions.

Because this issue is at the outer margin of the Commission’s terms of reference, the Commission has no mandate to propose prescriptive solutions. Any prescriptive solution to this problem requires extensive consultation with health worker unions, the Ministry of Labour and the Crown law officers who bear the ultimate responsibility to decide whether charges of this nature will proceed. The solution is tangled up in a knot of laws that govern worker safety, privacy and freedom of information, and Crown privilege.870 It is time to cut that knot.

The Commission therefore recommends legislative amendments and policies in relation to the waiver of potential Crown privilege claims, that in such cases where charges do not result from Ministry of Labour and other investigations of deaths and critical injuries in health workplaces, the results of the investigation and the reasons for the decision not to prosecute be made public.

Another problem arose during the course of the worker safety investigations, and also in the investigation by the North York General Joint Health and Safety Committee, that requires comment. That problem has to do with the amenability of

870. These problems are not insurmountable even within the current state of the law, as seen by the extensive reasons given publicly by Attorney General Roy McMurtry for a number of decisions not to prosecute high-profile cases, including those of Dr. Henry Morgentaler and the Honourable Francis Fox.
doctors to the system that protects worker safety and investigates workplace deaths and injuries.

Difficulties arose during the Ministry of Labour death and critical injury investigations and the North York General Joint Health and Safety Committee investigation in respect of the status and obligations of hospital doctors under worker safety legislation. Doctors, by the nature of their work, are often obliged to give orders and directions to nurses and others that could affect their safety in the workplace. But every doctor is not an “employer” within the meaning of current safety legislation. Many doctors whose work has a profound effect on worker safety have arguably no obligations under safety legislation and arguably no obligation to cooperate with investigators who try to find out what happened in a worker’s death or critical injury.

The problem is clear; the solution, less so. Independent doctors will be concerned about any legislation or regulation that makes them look like hospital employees or employers of hospital staff. Any solution must take account of these legitimate concerns about physician independence.

But those concerns should not frustrate the ability of our worker safety systems to get to the bottom of what has happened in the death or critical injury of a health worker. It makes no sense that two doctors work side by side, a hospital administrator and an independent physician in the hospital, each of them with a profound effect on the safety of hospital employees – one of them within the worker safety regime and the other completely exempt from that protective framework.

Worker safety in hospitals and in other health care institutions requires reasonable legislative measures to include all physicians within the worker safety regime without interfering with the essential independence of the physician and without making her a hospital employee.

Such legislative measures may need to include not only the *Occupational Health and Safety Act* but also those statutes which govern the administration of health care institutions and the medical profession.

It would be presumptuous for the Commission to recommend a prescriptive solution at this time. That task will require a good measure of consultation and a thorough analysis of the complex professional and statutory framework within which doctors work in health care institutions.
The Commission recommends the amendment of worker safety, health care and professional legislation to ensure that physicians who affect health worker safety are not excluded from the legislative regime that protects health workers. Because the prescriptive solution will require consultation and analysis and time and patience, it is essential to start now.
Seven Oaks: A SARS Footnote

Introduction

In the fall of 2005, an outbreak of legionnaires’ disease\(^\text{871}\) swept the Seven Oaks Home for the Aged in Toronto, infecting 70 residents, 39 staff, 21 visitors and five other people who lived or worked nearby. Twenty-three residents died.\(^\text{872}\) The outbreak brought back memories of SARS and initially some talk about whether SARS was back.

Unlike SARS, legionnaires’ disease is not spread by person-to-person contact. Instead, people are infected when they inhale mist from a water source with high concentrations of the \textit{Legionella} bacteria. The source of the Seven Oaks outbreak was likely its cooling tower.\(^\text{873}\)

Seven Oaks brought back memories of SARS\(^\text{874}\) largely because of the mystery surrounding its causative agent, which was not identified until October 6, 2005, nearly two weeks after the first residents started getting sick.

The Ministry of Health commissioned an expert panel to investigate the response to the outbreak. The panel comprised two physicians who led the fight against SARS and another who had chaired an important SARS policy study.

---

871. A type of pneumonia caused by the \textit{Legionella pneumophila} bacteria, it was first identified in 1977 after causing 34 deaths at a 1976 American Legion convention in Philadelphia.
873. “Given the high attack rate in the Seven Oaks facility, it seems very likely the long-term care home’s cooling tower was the source, despite the fact that the home and its water and cooling systems were well maintained and that the maintenance program met current standards” (Seven Oaks Report., p. 28).
874. CNN sent a reporter to Toronto to cover the Seven Oaks outbreak. In a report broadcast on October 5, 2005, he said: “Keep in mind it was just two years ago there was a severe outbreak of Severe Acute Respiratory Syndrome, or SARS, right here in Toronto. Forty-four people died. There were certainly a lot of jitters in the community about that back then.”
The Seven Oaks report provides the Commission with an opportunity to comment on developments in the health system since SARS.

The report said:

The Legionnaires’ outbreak was the first time since SARS in 2003 that Ontario faced the threat of an illness that could not be easily or quickly identified. It was also the first opportunity to test the lessons learned from SARS.875

Seven Oaks and Worker Safety

As noted throughout this report, the Ministry of Labour was largely sidelined during the SARS outbreak. When the Centers for Disease Control and Prevention (CDC) sent a team to Toronto to investigate the infection of nine health workers at Sunnybrook on April 13, 2003, for example, no one thought to notify the Ministry of Labour that a worker safety investigation was being conducted at Sunnybrook.

Two years after SARS, the Seven Oaks panel investigated an outbreak in a workplace where nearly 30 per cent of the victims were workers, but the Ministry of Labour was not an integral partner in the investigation876 and the panel’s membership did not include a worker safety expert.

This does not reflect on the qualifications and expertise of the three panel members, who are leaders in their fields and internationally recognized. It does show that worker safety is still not taken as seriously as it should be. It also meant that the panel, unfortunately, was not given the kind of worker safety expertise this type of investigation requires. That this would have been of value was demonstrated in a letter the Ministry of Labour sent to the Ministry of Health in February 2006. The letter identified issues that could have been better understood if the panel had had Ministry of Labour and worker safety representation.

The Seven Oaks report said:

875. Seven Oaks Report, p. 4.
876. The expert panel did interview one or more officials at the Ministry of Labour. See page 41 of the Seven Oaks Report for a list of organizations that were interviewed.
EMS workers were wearing a higher level protection, including N95 masks, as is the norm for their practice. EMS workers have a different standard for personal protective equipment because they regularly go into environments where the health risks are unknown. Their standard PPE is designed to protect them from toxins and chemical contaminants in the environment as well as infectious disease. Although the differences in PPE are based on science and practice, they are not well understood in the workplace.877

Labour responded:

In MOL’s view, based on “science and practice”, EMS workers would require a supplied air respirator or a self-contained breathing apparatus for suitable protection against “unknown” chemical hazards. An N95 respirator would not be suitable, for example, where the unknown risk was from carbon monoxide. The use of an N95 in the presence of carbon monoxide may result in serious disability or death to the EMS worker. In fact, EMS workers use N95 respirators for protection against unknown infectious agents and for protection during high-risk aerosol generating procedures such as intubation and pulmonary suctioning. An N95 respirator is not suitable for protection against unknown “toxins of chemical contaminants”. This report, in endorsing this incorrect use of N95 respirators, may lead to significant morbidity and mortality among EMS workers when exposed to unknown chemical health risks.878

The Seven Oaks report said:

Ontario does not have specific standards for environmental maintenance.879

Labour responded:

878. Appendix to February 22, 2006, letter from Virginia West, Deputy Labour Minister, to Ron Sapsford, Deputy Health Minister.
879. Seven Oaks Report, p. 29.
This statement is not correct. In fact, the Occupational Health and Safety Act and Regulation contains requirements to prevent Legionella growth in water and ventilation systems.\textsuperscript{880}

Any deficiencies in the Seven Oaks report do not reflect on its distinguished authors, who, unfortunately, were not provided with sufficient worker safety expertise. These deficiencies are, however, sadly reminiscent of problems during the SARS outbreak when the response to the outbreak lacked sufficient involvement of the Ministry of Labour and of independent Ontario worker safety experts.

Also reminiscent of SARS and the sidelining of the Ministry of Labour was the recommendation of the Seven Oaks report that Labour’s standard-setting powers regarding worker safety be given to the Ministry of Health.

The Seven Oaks report recommended:

\textit{3.2 Clarifying the responsibilities of different ministries and ensuring consistent messages (i.e., making the Ministry of Health and Long-Term Care responsible for establishing policy regarding the appropriate infection prevention and control measures in an outbreak and the Ministry of Labour responsible for enforcing and ensuring compliance with that science-based policy).}\textsuperscript{881}

SARS demonstrated that worker safety requires an independent regulator with two important roles. First, the regulator must be responsible for the development of worker safety standards that reflect the latest scientific research, occupational health and safety expertise and best practices, and the standards recommended by other agencies, such as the National Institute for Occupational Safety and Health (NIOSH). Second, once safety standards are set, the regulator must ensure that all workplaces are aware of and in compliance with those standards.

It would be improper for the Ministry of Health, as the Ministry that funds and oversees the health care delivery system, to regulate itself and the system for which it is responsible. This would place it in an untenable position.

\textsuperscript{880} Appendix to February 22, 2006, letter from Virginia West, Deputy Labour Minister, to Ron Sapsford, Deputy Health Minister.
\textsuperscript{881} Seven Oaks Report, p. 35.
The Seven Oaks report also argues against taking a precautionary approach to personal protective equipment:

While many may think that, in terms of infection prevention and control, “more is better” – that is not the case. There are serious and inherent risks – to health care providers, to patients and to the system – in using higher-level precautions when they are not required.\textsuperscript{882}

The report lists six risks related to what it called an inappropriate use of higher-level precautions:

- Personal protective equipment is uncomfortable and difficult to put on, so it is often misused or worn improperly
- Errors are more common
- Workers tend to become over confident in their equipment and neglect other key measures, such as hand hygiene
- Health care providers experience health problems (e.g., rashes, problems breathing)
- Patient care may suffer
- It is costly and uses supplies that may be required when the system is faced with diseases that require that level of protection\textsuperscript{883}

Representatives of health workers took issue with the report’s arguments against the precautionary principle:

On page 22, the report lists the “Risks of Inappropriate Use of Higher Level of Precautions.” We do not accept that any of the factors on this list offer a compelling argument against accepting the precautionary principle and providing better respiratory protection. The first risk cited is that “personal protective equipment is uncomfortable and difficult to put on, so it is often misused or worn improperly.” The work environment of an HCW [health care worker] is not known for its ease or comfort. It is our

\textsuperscript{882} Seven Oaks Report, p. 22.
\textsuperscript{883} Seven Oaks Report, p. 22.
experience arising from SARS that most workers are prepared to accept a certain level of discomfort if they believe it may save their lives. We have seen no evidence to support the statement that because the equipment is uncomfortable or difficult to put on that it is often misused or worn improperly. Our experience during SARS was that workers had never been fit-tested, nor had they received prior training about putting on and wearing N95s and other new PPE – consequently, they made errors. However, the problem was lack of training and experience, problems which can be readily addressed.

The next risk cited is that “errors are more common.” We have no idea of what kind of errors are being referred to, or what evidence there is of these “errors.”

Next, the report states that “workers tend to become over-confident in their equipment and neglect other key measures such as hand hygiene.” It is [a health workers’ union’s] experience that this is true in some instances, especially around the use of protective gloves and hand-washing. This has been documented in studies and anecdotally. However, no one has suggested that protective gloves should be abandoned because workers fail to wash their hands properly. The focus has been on developing guidelines on when gloves should be worn, what kind of gloves should be worn and ongoing training to ensure that workers wear gloves appropriately and practice good hand hygiene. Consequently, we do not find this a compelling argument to decide not to provide N95 respirators.

Another risk listed is that “health care providers experience health problems (e.g., rashes, problems breathing).” In the early 1990s when HCWs began to develop latex allergies that were in some cases life-threatening, no one suggested that HCWs should no longer be provided with gloves to protect them from infectious agents. Once the allergy was better understood, scientists and manufacturers worked to develop alternative gloves that would not make HCWs sick. Within less than 10 years, it was rare to find an HCW who could not be accommodated back into her workplace using a non-latex or low protein latex glove. It is simply unacceptable for the Panel to suggest that because some PPE may cause health problems that workers should not be offered proper respiratory protection. Most workers will be able to find an appropriate N95 respirator that will not cause a rash. Some workers may need other accommodations.
The report states that “patient care may suffer.” [A health worker union] does not know what evidence the Panel is using to support that statement. It is our position that in cases where workers are afraid of contracting an unknown illness and where they believe that their employer is not taking all reasonable precautions to protect them, it may have an effect on the quality of care they are able to deliver.

The final risk is that higher level precautions are “costly and uses supplies that may be required when the system is faced with diseases that require that level of protection.” If we believed that N95 respirators were unjustified, we would accept that statement. However, since it is our position that in cases where there is a risk of airborne infection, N95s should be used, we do not accept it.884

Other representatives of health workers also took issue with the Seven Oaks Report’s arguments:

A day in the life of a health care worker is replete with all varieties of discomfort. While health care workers (like all workers) would prefer not to wear respirators, they are prepared to adjust to discomfort when necessary to make the very air they breathe safe for themselves and safe to pass on to patients and family. Firefighters, steelworkers, chemical workers and others have for decades routinely crouched in cramped, confined spaces for hours at a time, dragged down by much heavier respiratory protection than the N95 respirators … Given information and training about hazards and the need for respiratory protection, all workers tolerate the discomfort.885

If the Commission has one single take-home message it is the precautionary principle that safety comes first: that reasonable efforts to reduce risk need not await scientific proof. The Ontario health system needs to enshrine this principle and to enforce it. It is the most important single lesson of SARS, and it is a lesson ignored only at our collective peril.

Conclusion

Seven Oaks showed the good side of Ontario’s response to SARS: the excellent worker safety approach taken at North York General Hospital, with the new infection control system under Dr. Kevin Katz in which health workers were enabled to choose the highest level of protection; the good communication between Toronto Public Health and the Ministry of Labour; and the fine leadership shown by Dr. David McKeown, the Medical Officer of Health for Toronto.

Seven Oaks also showed the bad side of Ontario’s response to SARS systemic problems that remain unfixed; the problems at the provincial laboratory; the two solitudes between infection control experts and worker safety experts; the exclusion of the Ministry of Labour from the centre of the investigation and the subsequent report; the occupation by the Ministry of Health of worker safety territory, where one would expect greater presence and collegial involvement by the Ministry of Labour; the failure to ensure effective consultation with safety officials from health worker unions; and the strong echo of the turf wars between the health system and the worker safety system that so bedevilled SARS.

Seven Oaks demonstrated that many worker safety lessons of SARS have not been learned.

The Ministry of Labour must be independent in setting workplace standards and in enforcing them. It must be an integral member of the response to any infectious disease outbreak. It must be directly involved in any post-event review of any infectious disease outbreak in which workers have gotten sick. Any post-event review of an infectious disease outbreak in which workers have gotten sick must include worker safety experts.

The Seven Oaks outbreak also demonstrates the continuing reluctance of the health system to fully accept the importance of the precautionary principle in worker safety. Until this precautionary principle is fully recognized, mandated and enforced in our health care system, nurses and doctors and other health workers will continue to be at risk from new infections like SARS.

---

886. North York General Hospital was one of seven hospitals that treated cases.
CHAPTER EIGHT: It’s Not About the Mask

Introduction

One of the biggest bones of contention during SARS was the N95, a respirator that protects much more than a surgical mask and that was mandated for health workers caring for SARS patients.

Although Ontario law since 1993 required that anyone using an N95 had to be properly trained and fit tested to ensure proper protection, few hospitals complied with this law. Some medical experts even denied the very existence of this legal requirement.

Fit testing was the subject of official confusion and heated debate.

887. Using highly efficient filtering materials, N95 respirators are one of the nine types of disposable particulate respirators that are independently tested and certified by the National Institute for Occupational Safety and Health in the United States, which is part of the Centers for Disease Control. “The N indicates that the respirator provides no protection against oils and the 95 indicates that it removes at least 95% of airborne particles during ‘worst case’ testing using a ‘most-penetrating’-sized particle.” (Yassi, Annalee MD, MSc, FRCPC et al., “Research Gaps in Protecting Health Workers from SARS,” Journal of Occupational and Environmental Medicine DOI: 10.1097/01.jom.0000150207.18085.41) (Yassi et al, “Research Gaps in Protecting Health Workers from SARS”).

888. In this chapter, respirator will refer to a respiratory protective device like the N95 that has been independently tested and certified. Masks will refer to any respiratory device like a surgical mask or the PCM 2000 that has not been independently tested and certified.

889. The N95 was sometimes required in other areas of hospital even when not caring for SARS patients. As noted below, the provincial directives for the use of the N95 changed throughout SARS and were not always clear or consistent.

890. Fit testing helps users select a respirator that best fits their faces and teaches them how to get a proper seal each time they use respirator, a procedure known as a seal check, and how to safely don and doff a respirator. A test verifies that the chosen respirator works properly. There are two types of tests. One is called a qualitative fit test and “relies on the user’s subjective response to taste odour or irritation.” The other is a quantitative fit test and “relies on an instrument to quantify the fit of a respirator.” (Healthcare Health and Safety Association, Respiratory Protection Programs (2nd edition [Toronto: Healthcare Health and Safety Association, 2000]).
This chapter outlines how fit testing and the N95 became lightning rods for all the underlying problems of worker safety in health care.

**Respiratory Protection: A Fundamental Worker Safety Issue**

The real problem during SARS was not the N95 respirator or fit testing but deep structural contradictions in worker safety in the health care system. This included both embedded resistance within the health care system to worker safety experts and to the Ministry of Labour and Ontario’s failure to recognize, as an aspect of health worker safety, the precautionary principle that reasonable action to reduce risk, such as the use of a fitted N95 respirator, need not await scientific certainty.

There were two solitudes during SARS: infection control and worker safety.

Infection control insisted that SARS was mostly spread by large droplets which do not travel far from an infectious person. Given that case, in their view, a surgical mask was sufficient to protect health workers in most situations. Worker safety experts said workers at risk should have the higher level of protection of an N95. They said not enough is known about how SARS is spread to rule out airborne transmission by much smaller particles, and besides, hospitals are dynamic places where unforeseen events and accidents can always happen. Infection control relied on its understanding of scientific research as it stood at the time. Worker safety experts relied on the precautionary principle that reasonable action to reduce risk should not await scientific certainty.

---

892. This is a good place to note that Dr. Sheela Basrur, Chief Medical Officer of Health, has taken steps to improve this situation. Only time will tell if these steps are effective. She notes in her letter of March 9, 2006, to Ms. Linda Haslam-Stroud, RN, President, Ontario Nurses’ Association:

> We recognize the need to ensure that the perspectives of occupational health and infection control receive consideration. In light of this, an occupational health physician is included in the membership of PIDAC and has been sitting on the committee since the inception of PIDAC in 2004. However, we see the importance in continuing to strengthen our links with the occupational health field and a physician delegate from the Ministry of Labour is now also sitting on PIDAC. This highlights our commitment to ensuring that occupational health and safety expertise is brought to the table during all PIDAC deliberations now and in the future. We are confident that building on this approach will assist in ensuring stronger linkages between occupational health and infection control on matters of science.

PIDAC refers to the Provincial Infections Diseases Advisory Committee.
A good illustration of their differences is the controversy over how far large droplets travel from an infectious person. Many infection control experts believe large droplets travel no more than one metre from the infectious person, and they use this one-metre rule as a guide for what respiratory protection to wear. Worker safety experts are critical of this rule both on a scientific basis and as a practical matter. They suggest that even if the one-metre rule could be proven scientifically, it is not realistic or safe in a workplace.

Dr. Diane Roscoe of Vancouver General said:

It is not an easy thing for health care workers to remember. This is a three-metre or this is a one-metre thing, and this is not. And what am I supposed to do.

As a result, said another expert at Vancouver General,

---

893. To take one of many references, one respiratory protection manual says: “It has been a generally accepted infection control notion, based on epidemiological observations, that diseases spread by large droplets typically are not spread to others via the respiratory tract when more than 1 meter from the source” (Healthcare Health and Safety Association of Ontario, “Respiratory Protection Programs, 2nd edition, p. 1).

One should be aware of the effects of droplet evaporation and the resultant diminution in size of ejected droplets. A 30 \( \mu \text{m} \) droplet dries to a 5 \( \mu \text{m} \) droplet within seconds under normal indoor air conditions. This means that a large droplet, as it evaporates, will not settle to the ground but become a free-floating entity. This has implications for the 3 foot rule, the basis for infection control precautionary measures, since it is commonly believed that large droplets ejected upon sneezing or coughing will follow Stoke's Law and fall to ground within a 3 foot distance from the person’s face. It is evident that it is commonly believed that the 3 foot rule is a division between an unsafe and safe distance.

There is no indication that the 3 foot rule takes into consideration the evaporation factor and the drift factor of airborne droplets, as discussed above. No scientific evidence is offered by WHO, DHHS-CDC, PCAH, or other medical authorities in explaining the rule. If large droplets quickly evaporate to free-floating small droplets, then the 3 foot rule applies only to droplets greater than about 50 – 100 \( \mu \text{m} \) in diameter for which there is insufficient time chance for evaporation to take effect before they fall to the ground from a height of 5–6 feet. Free floating small droplets readily go beyond the 3 foot radius. Therefore, if the majority of ejected droplets following a sneeze are evaporated to a size that is free-floating after only seconds in air, the 3 foot rule becomes illogical and not particularly helpful from a disease transmission perspective.
We always start with the highest level of precaution ... We don't use droplet precautions in our hospital, never have, because we've always believed that droplets have been aerosolized so we only have one category, that's airborne, and you always start with the highest level of precaution and then as the clinical situation becomes clearer, you step back on your precautions – and we have found that the easiest for workers to understand rather to try to figure out when to wear a surgical, when to wear an N95, you know, how close am I to the patient, do I need to put on a mask – it's just simpler for them to remember that this patient's got respiratory symptoms, yes, put on an N95, do the appropriate precautions.

Dr. Elizabeth Bryce of Vancouver General said:

Even if you did determine [the distance from the patient] ... like poof, you know you are this distance, you put on a mask and presto, and you step back a foot and you no longer need a mask ... [health workers] are moving in and out of the “danger zone” for sure for droplets. They are in and out when they are in a room. And it is just simply easier for everyone and safer for them to put on some sort of respiratory protection when they step into the room ... You've got the patients moving around and the staff moving around. It is very hard to keep the spatial separation and just – we just feel it is safer too.

The point is not who is right and who is wrong about airborne transmission, nor is it how far large droplets travel. The point is not science, but safety. Scientific knowledge changes constantly. Yesterday's scientific dogma is today's discarded fable. When it comes to worker safety in hospitals, we should not be driven by the scientific dogma of yesterday or even by the scientific dogma of today. We should be driven by the precautionary principle that reasonable steps to reduce risk should not await scientific certainty.

The debate about respiratory protection and fit testing can be understood only in the context of the heavy burden of disease that fell on hospital workers, paramedics and others who worked in Ontario’s health system during SARS. Two nurses and a doctor died from SARS. Almost half of those who contracted SARS in the health system were people who got the disease on the job.

Most of these workers were nurses whose jobs brought them into the closest and lengthiest contact with sick patients. And this does not show the full burden of SARS on nurses, paramedics and other health workers. Nurses sick with undetected SARS inadvertently brought illness, and in some cases death, home to their families.

Again and again nurses were told they were safe if they would only do what they were told by the health system. Again and again these scientific assurances, though well intentioned and issued in the best of good faith, turned out to be tragically wrong.

It is no wonder that nurses became alarmed when they saw their colleagues sicken and die. It is no wonder that they became angry when they saw such incidents recur again and again with no apparent improvement in their safety.

As SARS continued and more health workers fell ill, the resulting justified lack of confidence in health care safety systems fuelled a heated debate about the need for the N95 respirator and for the safety requirement that workers be fit tested and trained in its use.

Some infection control experts argued in good faith that the fit testing law was ill advised; that N95 respirators were not needed because SARS was droplet spread, not airborne; that the Provincial Operations Centre was wrong to require fitted N95s; and that nurses would be safe if they followed the advice of their employers instead of the safety procedures required by law.

Nurses pushed back with understandable heat, saying that hospitals should follow safety laws. Nurses took the reasonable position that if hospitals did not obey the law,

then the Ontario Department of Labour should fulfill its enforcement mandate and make them do so.

This is not the place to enter into that acrimonious debate. Nurses are angry, with good reason, that so many got sick and that safety laws were not respected or enforced. It must noted that the experts who campaigned against the N95 and fit testing undoubtedly acted in good faith, doing what they believed was in the best interests of health workers and the health system. It would be too easy to personalize this debate and point out that some of those who most vociferously oppose the N95 and fit testing, and who were most disdainful of nurses and independent safety experts who prefer precaution, were the very people on whose watch nurses became sick despite the assurances that they were safe. Whenever someone presides over a system that fails and then leads a campaign against greater precaution, it is easy to forget that there are bigger issues at stake, more important things than arguing over who is right and who is wrong.

Scientific uncertainty and scientific debate can go on forever. We do not need a personalized debate or further recriminations. What we do need is a common-sense approach to worker safety in hospitals coupled with a measure of scientific humility in light of the terrible and sometime fatal failures in scientific advice and hospital safety systems during the SARS outbreak. What we need to do is to follow the precautionary approach that reasonable steps to reduce risk need not await scientific certainty. It is better to be safe than sorry.

The only way to make nurses and other health workers safe is to transcend the turf wars that hampered the fight against SARS. These turf wars continue even after SARS proved that hospital safety systems failed to protect workers.

On the one hand, some experts believe that in the face of a still relatively unknown disease like SARS, you can avoid a precautionary approach, start with the lesser protection of a surgical mask and ramp up to an N95 if and when it’s needed.

On the other hand are independent safety experts like those in British Columbia, which stopped SARS in its tracks, like those from the Centers for Disease Control and NIOSH and like those from the Ontario Department of Labour say, who that experience dictates a common-sense precautionary approach, starting with a higher level of protection that is reduced as the clinical situation is clarified.

Until this precautionary principle is fully recognized, mandated and enforced in Ontario’s hospitals, workers will continue to be at risk.
Airborne and Droplet Transmission

At the heart of the mask debate is the question of airborne transmission. Is SARS spread mostly by large droplets? What is the risk of airborne transmission?

It is instructive to set the stage for the story of the N95 with a nutshell description of how SARS is transmitted from person to person.

Droplets from the breath of an infected person can contaminate surfaces and articles on which they land:

Viable organisms may survive long enough in droplets deposited on environmental surfaces to contaminate the hands of caregivers and then be further transmitted.896

Objects thus contaminated are called fomites. Fomite transmission occurs when an infectious droplet contaminates a fomite (the surface on which it lands) and is then spread by the hand of someone who touches it.897

A study of the Toronto outbreak looking at environmental contamination in SARS outbreak units detected SARS on frequently touched surfaces in rooms occupied by patients with SARS (including a bed table and television remote control) and in a nurses’ station used by staff (on a medication refrigerator door).898 SARS has been found to remain stable for 24 to 48 hours in urine, 36 hours on plastic surfaces, 72 hours on stainless steel and 96 hours on glass surfaces.899

Droplet transmission, the primary mechanism for the spread of SARS, occurs when

897. Fomites have been defined as “objects, such as clothing, towels, and utensils that possibly harbor a disease agent and are capable of transmitting it” (U.S. Army Medical Research Institute of Infectious Diseases, Medical Management of Biological Casualties Handbook, 4th edition: U.S. Army Medical Research Institute of Infectious Diseases, 2001), p. A-5; and as “articles that convey infection to others because they have been contaminated by pathogenic organisms. Examples include handkerchief, drinking glass, door handle, clothing and toys.” Last, John M. Last, A Dictionary of Epidemiology, p. 72.
large droplets are transmitted to a paramedic, nurse, doctor, visitor or family member from an infected person’s respiratory tract by coughing, sneezing or even normal breathing. They are too small to see but are heavy enough to fall quickly to the ground and can be breathed in by someone in close proximity to the infectious person. Close personal contact is thus required for droplet transmission.

At the smallest end of the scale are droplet nuclei, so tiny and light that, depending on the conditions, it is thought that they can remain suspended in the air for several hours, and can also:

travel considerable distances in the air and may be readily inhaled into the lung.

In some cases, it is believed that large droplets can themselves become droplet nuclei:

Larger droplets that are dispersed into fairly dry air can actually begin to “dry out” and become droplet nuclei.

Diseases spread by droplet nuclei or evaporated droplets are generally considered to infect others through airborne transmission.

Airborne transmission, associated with diseases like measles, chickenpox and smallpox, occurs when droplet nuclei or evaporated droplets from an infected person remain suspended in the air. These nuclei or droplets may remain in the air for a long time and may also travel through the air to be inhaled a distance away by someone who had no contact with the infected person.

900. “Droplets are ejected from the respiratory tract during coughing, shouting, sneezing, talking, and normal breathing. The size and number of droplets produced is dependant on which of these methods generated the particles” (Dr. Annalee Yassi and Dr. Elizabeth Bryce, Protecting the Faces of Health Workers: Knowledge Gaps and Research Priorities for Effective Protection Against Occupationally-Acquired Respiratory Infectious Diseases” [Occupational Health and Safety Agency for Healthcare in BC, April 30, 2004], p. 5.

901. Yassi et al, “Research Gaps in Protecting Health Workers from SARS”.

902. Yassi et al, “Research Gaps in Protecting Health Workers from SARS”.

904. “Airborne transmission: occurs by dissemination of either airborne droplet nuclei or evaporated droplets (sub micron particles) containing microorganisms that remain suspended in the air for long periods of time. These microorganisms can be widely dispersed by air currents and may be inhaled by persons even when standing a distance away from the source patient” Infection Control Standards Task Force, Final Report [Toronto: Infection Control Standards Task Force, December 2003], p. 5.
Research has shown that most viruses are spread through large droplets, only a few through airborne transmission:

… most viruses which cause respiratory and gastrointestinal disease in humans, must be contained in large droplets … in order to survive outside the body and transmit disease from person-to-person. This includes such common respiratory pathogens as influenza, respiratory syncytial virus (RSV) parainfluenza viruses, the common coronaviruses and others. The notable exceptions are measles, varicella zoster virus (chickenpox) and smallpox[,] which apparently can survive in small diameter droplets or droplet nuclei and can be transmitted by air over long distances.905

Although believed to be spread mostly by large droplets, SARS is also transmitted when the droplets become aerosolized through medical procedures like intubation, bronchoscopy906 or a type of assisted ventilation known as a BiPap, or bilevel positive airway pressure device.907

All these procedures and treatments were used during the SARS outbreak. Almost a quarter of SARS patients were intubated, a procedure that places a tube into the windpipe or trachea to open the airway for oxygen, medication or anesthesia. Because these aerosolizing events were so common in the treatment of SARS, it defies the evidence to dismiss it as simply a droplet-spread disease.

Some scientists say that a mere cough or sneeze can produce airborne viral particles. Dr. Annalee Yassi, one of the country’s foremost occupational medical experts, said researchers now know that there is always an airborne component of a cough or a sneeze. A cough or a sneeze never produces just large droplets. She told the Commission:

There is unquestionably some airborne spread even if it’s only when people are coughing or sneezing, never mind nebulized and ventilated

905. Protecting the Faces of Health Workers, p. 16.
906. “Bronchoscopy is a test to view the airways and diagnose lung disease. It may also be used during the treatment of some lung conditions” (MedLine Plus Medical Encyclopedia, http://www.nlm.nih.gov/medlineplus/ency/article/003857.htm).
907. “Bilevel positive airway pressure (BiPAP) delivers a higher pressure on inspiration, helping the patient obtain a full breath, and a low pressure on expiration, allowing the patient to exhale easily. BiPAP is a common choice for neuromuscular disease” Gale Encyclopedia of Surgery, http://www.answers.com/topic/mechanical-ventilation.
and so on. It’s always never purely droplet spread. It’s droplet spread that’s at least aerosolized in certain circumstances.

The jury is still out on the extent of airborne SARS. A strong current of scientific opinion suggests that the distinction between airborne and droplet transmission is not as clear-cut as some insisted during SARS. A recent study co-written by Dr. Allison McGeer of Mount Sinai concluded:

Accumulating evidence suggests that the distinction between droplet and airborne transmission may not be as clear-cut as previously thought.908

The Centers for Disease Control (CDC) agrees that airborne transmission of SARS cannot be ruled out and that N95 respirators should be used:

The transmission of SARS appears to occur predominantly by direct contact with infectious material, including dispersal of large respiratory droplets. However, it is also possible that SARS can be spread through the airborne route. Accordingly, CDC has recommended the use of N95 respirators, consistent with respiratory protection for airborne diseases, such as tuberculosis.909

The WHO takes the same position, that the risk of airborne transmission requires the use of the N95:

In view of the possibility of airborne transmission, current guidelines issued by the Centers for Disease Control and Prevention (CDC) and the World Health Organization (WHO) state that health workers should wear N95 masks or higher-level protection during all contact with suspected SARS patients.910

A Health Canada December 2003 draft agreed with the CDC and WHO, although reluctantly, because it resisted the evidence of airborne transmission:

Currently, N95 respirators or equivalent are recommended by Health Canada, WHO and the CDC for the care of SARS patients even though the evidence shows that SARS is spread by droplet transmission.911

Since SARS, a considerable body of research and scientific opinion suggests it was wise to take a cautious approach and require the N95 respirator.

As one CDC expert told the Commission, in a hospital you never know when one of those aerosol-generated events will happen. That is one of the reasons why the CDC recommends routine airborne protection for SARS:

But in health care facilities, when you have people in, you just don’t know sometimes when you’re going to have an aerosol-generating procedure happen, and it could happen precipitously. And because of those issues and because of issues like this, we’re going to continue to recommend airborne precautions.

Experts who opposed the use of the N95 and fit testing argued that because SARS is largely droplet-spread, the level of respiratory protection didn’t matter, as long as health workers wore some kind of respiratory device. Even a surgical mask would do.912

It is not contested that a great deal of evidence points to the fact that SARS is usually spread by large respiratory droplets. The important word here is “usually.” Highly contagious viruses spread by smaller aerosols have high reproduction numbers, or R0.913 Measles has an R0 of 15. Experts expect that a person with measles could pass the disease to roughly 15 others at the start of an outbreak in the absence of prevention measures. SARS’s R0 was about 3. A person with SARS could on average pass the disease to roughly three others at the start of an outbreak in the absence of prevention measures. There were, however, enough super-spreaders, people with a very high viral load who could spread SARS to more than 20 people in some cases,

913. The average number of people an infected person can be expected to pass the disease to at the start of an outbreak in the absence of prevention measures.
and super-spreading events like intubations, to prove that every case was not average and many were not.

The WHO consensus document on SARS said:

> A basic reproduction number (R0) of approximately 3 is consistent with a disease spread by direct contact or larger virus-laden droplets that travel only a few meters rather than by lighter airborne particles. By contrast, if a disease is transmitted by aerosols, a single person can infect an entire room by coughing, as can happen with measles and influenza.\textsuperscript{914}

On the worker safety side of the droplet vs. airborne transmission debate were those who took a more cautious approach. Yes, said experts who took this position, all signs point to the fact that SARS is usually spread by large droplets, but we don’t know enough about the disease to rule out airborne transmission. With this uncertainty, they suggested, let’s be cautious and use the N95.

The two sides were balanced well in the Naylor Report. First:

> Given that SARS was being spread primarily via droplets, some informants questioned whether N95 masks were necessary.\textsuperscript{915}

But then:

> Others stressed that the disease should be treated as airborne until more information was available.\textsuperscript{916}

A leader in the effort to contain SARS in Ontario told the Commission that, despite evidence that SARS was mostly spread by large droplets, he still supported a precautionary approach and the use of N95 respirators:

\textsuperscript{914} WHO, \textit{Consensus Document on the Epidemiology of Severe Acute Respiratory Syndrome (SARS)}, p. 12.
\textsuperscript{915} Naylor Report, p. 30.
\textsuperscript{916} Naylor Report, p. 30. The full quotation reads as follows:

A controversial directive was the requirement that health care workers wear fit tested N95 masks. Neither the fit testing (a complex operation requiring a subject to try various mask designs while a bitter-tasting gas circulates underneath a hood), nor the appropriateness of the N95 standard itself had been fully discussed by the SAC. Given that SARS was being spread primarily via droplets, some informants questioned whether N95 masks were necessary. Others stressed that the disease should be treated as airborne until more information was available.
There isn’t enough data reported yet from the SARS outbreaks to really know. There’s been some literature published to suggest that an N95 is no more effective with a SARS patient. Let’s for argument’s sake say, for a regular SARS patient not requiring a high-risk procedure, then a properly worn surgical mask [would be fine], and intuitively if it’s droplet, that should be the case.

I’m not comfortable with that yet and I’m not sure why. Maybe it’s because my colleagues got sick. Maybe it’s because I know the backlash from the providers and the unions. I’d rather from a strategic point of view say let’s just keep doing this until all the evidence is in, that we’re able to evaluate it properly and then we can back off. I’d rather … than say maybe we were wrong this time, let’s go back to the N95.

Three years after the outbreak, one physician who caught SARS and strongly supports the use of N95 respirators told the Commission that we still don’t know enough about SARS:

I mean there are still people who say they were just droplets and even surgical masks should stop the droplets. I am not sure how they got sick then. So it could be that there are things about SARS we don’t know.

It was largely on the basis of Toronto’s Sunnybrook disaster on April 13, when nine health workers caught SARS, that the CDC decided in favour of the precautionary approach and opted for airborne precautions.

One CDC expert told the Commission:

And it’s largely because of this event here, the Toronto cluster – not only this event though: there’s also clusters in Hong Kong and elsewhere where people have been wearing droplet-level precautions and still gotten sick.

Now, it’s usually an aerosol-generating infection as far as I’m aware. It’s always associated with some aerosol-generating procedure of some type. And in Hong Kong, it was the use of aerosized nebulized bronchodilator therapy medications and a bunch of medical students all got sick who were wearing masks.
When you look at the R0, it suggests it’s probably not airborne, it’s not airborne in the same sense as measles or anything like that. And when you look at epidemiologic links, people down the hallway, around the corner, they’re not getting sick. But, in health care facilities, when you have people in, you just don’t know sometimes when you’re going to have an aerosol-generating procedure happen, and it could happen precipitously. And because of those issues and because of issues like this, we’re going to continue to recommend airborne precautions.

Nothing brings home the point of airborne SARS risk better than the May 28 disaster at North York General, when workers caught SARS despite their use of the personal protective precautions they were told would keep them safe. As late as May 28, the lesson of airborne risk had not been learned. A scientific study of the incident said:

In this case, just as in previous cases, either contact, droplet, or airborne transmission might have occurred.\textsuperscript{917}

The CDC reported this incident in its journal \textit{Emerging Infectious Diseases}. The authors,\textsuperscript{918} some of them well-known figures in the SARS outbreak, concluded that the mechanism of transmission of the virus from patient to worker could have been airborne rather than droplet:

Two explanations may account for the transmission observed in this case: 1) an unrecognized breach in contact and droplet precautions occurred, or 2) an airborne viral load was great enough to overwhelm the protection offered by droplet precautions, including non–fit tested N95 disposable respirators. If the last form of transmission was responsible, airborne virus may have been generated by the coughing patient before her cardiopulmonary arrest or due to a “cough–like” force produced by the airway pressures created during asynchronous chest compressions and ventilations using the bag-valve-mask …

\textsuperscript{918} Michael D. Christian, Mona Loutfy, Clifford McDonald, Kenneth F. Martinez, Mariana Ofner, Tom Wong, Tamara Wallington, Wayne L. Gold, Barbara Mederski, Karen Green, and Donald E. Low.
The final line of protection against occupational exposure is protection equipment. The use of N95 respirators offers a level of protection against airborne transmission of SARS. However, for any form of respiratory protection to perform at the level of its full potential, it must be properly fitted to provide an adequate seal. The N95 disposable respirators used by health workers in this instance were not fit tested to ensure an adequate seal. Thus the exact level of protection afforded by the N95 respirators for each person in this case is unknown. Nonetheless, a higher level of respiratory protection should be considered in environments with a potentially very high SARS-CoV load, such as that associated with aerosol-generating procedures. [emphasis added]919

Nothing could show better the scientific reasons for the N95 and for fit testing.

The body of evidence and scientific opinion about airborne SARS is too extensive to discuss in detail here. Reference is made below to evidence that the original transmission of SARS in the Metropole Hotel on February 21, 2003, to Toronto’s index case and at least 15 others that may have been airborne,920 to disasters in other countries (like Amoy Gardens in Hong Kong) and to evidence of airborne SARS in a Toronto hospital.

Because of this risk of airborne transmission, Ontario during SARS required workers with close patient contact and sometimes those in other areas of hospital to wear fitted N95 respirators to protect against the risk.

In the context of this risk, the following issues arise:

- N95 respirators and surgical masks
- Ministry of Labour approval
- SARS decision to require N95s
- Confusing directives during SARS
- Failure to train
- Ministry of Labour sidelined
- Confusion: N95 “equivalent”

• Was the N95 necessary?
• Was fit testing necessary?

The Difference Between an N95 Respirator and a Surgical Mask

While surgical masks\(^{921}\) and their lower-standard cousins, procedure masks,\(^{922}\) have long been used to safeguard health workers, they were originally intended primarily to protect patients.

One study said:

Surgical masks were developed to prevent the wearer’s exhaled secretions from contaminating the operative field.\(^{923}\)

Surgical masks, which must meet far less stringent regulatory standards than respirators,\(^{924}\) are believed to offer the wearer some protection.\(^{925}\) But this protection is

\(^{921}\) “Surgical masks … are of two main types: (1) flat-pleated or duck-billed in shape, conforming to the bridge of the nose with a flexible piece, affixed to the head with two ties and (2) pre-molded conforming to the bridge of the nose with a flexible piece, adhering to the head with a single elastic” National Academy of Sciences, *Reusability of Face Masks During an Influenza Pandemic* [Washington, DC: National Academy of Sciences, April 2006], p. 16).

\(^{922}\) “Procedure masks are flat/pleated or duck-billed in shape and fasten to the head with ear loops. All procedure masks have some degree of fluid resistance, but they are not required to meet the same standards as surgical masks” (National Academy of Sciences, *Reusability of Face Masks During an Influenza Pandemic*, p. 16).

\(^{923}\) Yassi et al, “Research Gaps in Protecting Health Workers from SARS”.

\(^{924}\) The regulatory approval for surgical masks is far less stringent than that of independently certificated N95 respirators. There are no minimum standards or standardized testing methods for surgical mask filter efficiency. (WHO, *Avian Influenza, including Influenza A (H5N1), in Humans: WHO Interim Infection Control Guideline for Healthcare Facilities* [Geneva: WHO, February 9, 2006], p. 41).

The U.S. Food and Drug Administration, in approving surgical masks for sale, does not address the fit of the mask, or its effectiveness:

Food and Drug Administration’s regulatory requirements do not address the fit of medical masks, which can make the total filtration efficiency of questionable value. Masks approved by the FDA for medical use are designed to be worn by an infected person, health worker or member of the public to reduce transfer of body fluids that may spread infection. (National Academy of Sciences, *Reusability of Face Masks During an Influenza Pandemic*, p. 32).
limited because a surgical mask doesn’t create a tight seal around the mouth and nose of the wearer and always leaves gaps. As one study of respiratory protection explained:

The device is placed over the nose and mouth and held in place by straps placed behind the ears or around the head but more usually around the back of the head and neck. The device fits fairly loosely and a tight seal is not feasible where the outside edge of the mask meets the skin of the face. Most users in the healthcare industry tend to wear surgical masks rather loosely; considerable gaps are usually observed at the peripheral edges of the surgical mask along the cheeks, around the bridge of the nose and along the bottom edge of the mask below the chin.926

The problem with a surgical mask is that not all the air breathed in by a health worker passes through a surgical mask’s filtering materials, regardless of the filtering quality of those materials. A recent study by the Institute of Medicine of the National Academies, whose authors included Dr. Allison McGeer of Toronto’s Mount Sinai Hospital, said:

The loose fit of most medical masks [i.e., surgical and procedure masks] leaves gaps that could allow substantial contaminant leakage into and from the mask … Medical masks may be used as barriers against disease transmission by fluids, especially blood, and some large droplets, and they are designed to prevent release to the environment of large droplets generated by the wearer. They are not designed or approved for the

Standard surgical masks are considered a Class II device by the US federal Food and Drug Administration (FDA) which require pre-market sales approval. This means that to obtain approval as an item for sale, the manufacturer must demonstrate to the satisfaction of the FDA that the new device is substantially equivalent to similar masks currently on the market. There is no specific requirement to prove that the existing masks are effective and there is no standard test or set of data required supporting the assertion of equivalence. Nor does the FDA conduct or sponsor testing of surgical masks. Yassi and Bryce, Protecting the Faces of Health Workers, p. 17).

925. Health Canada’s Routine Practices and Additional Precautions for Preventing the Transmission of Infection in Healthcare says: “Masks are also worn to protect the HCW from acquisition of infections transmitted by large droplets. Surgical masks are considered adequate for this purpose. It appears logical to use a mask when within 1 metre of a coughing patient” (Vol. 25S4, July 1999, p. 27).
926. Yassi et al, “Research Gaps in Protecting Health Workers from SARS”.

1058
purpose of protecting the wearer against entry of infectious aerosolized particles potentially surrounding the wearer and his mask.927

A Toronto physician who was involved in treating SARS patients said:

The trouble with ordinary surgical masks are you lick them and you stick your nose in them and they have big holes in the outside part and so forth. Let’s face it, they’re a joke. But surgeons use them to this very day. They’re cheap and they’re comfortable. We still use them. Surgical masks protect mainly the patient.

Studies have shown that surgical masks, because of their inability to create a tight seal, are less effective against smaller droplets and droplet nuclei than N95 respirators. Even wearing as many as five surgical masks does not raise their ability to filter out smaller airborne particles to the level of an N95 respirator.928

Designed to create a tight seal around the mouth and nose of the wearer, an N95 respirator provides a far higher level of protection to the wearer than surgical masks. Respirators rely:

on the breathing action of the user to draw air through the filtering medium. On inhalation a negative pressure is created as the air is drawn through the medium. Respirators of this type are considered tight fitting because they rely on a good seal between the user’s face and the respirator itself in order to work properly.929

As one U.S. expert explained to the Commission, masks and respirators are designed for different purposes:

927. National Academy of Sciences, Reusability of Face Masks During an Influenza Pandemic, p. 32.
928. A recent study that examined whether wearing as many as five surgical masks was sufficient protection from the SARS virus concluded: “Our data confirm previous findings that the filtration of submicron-sized airborne particles by a single surgical mask is minimal ... Although greater filtration was afforded by multiple masks, with an approximate doubling in the filtration factor when five masks were worn compared with a single mask, the absolute filtration factor remained low and well below the minimum fit factor of 100 required for a respirator” Derrick et al., “Protecting healthcare staff from severe acute respiratory syndrome,” 365–68).
Masks are meant to protect something else, e.g., a surgical field, or someone else from getting whatever the wearer of the mask may have. They are not designed to protect the wearer of the mask from whatever is floating around in the air. Respirators, on the other hand, are designed to protect the wearer and that’s one of the reasons why they need to be form-fitted.

Ministry of Labour Approval

The N95 is part of a family of nine respirators introduced in July 1995 under a new NIOSH standard known as 42 CFR Part 84.930

NIOSH, the National Institute for Occupational Safety and Health, is part of the Centers for Disease Control and Prevention, the U.S. agency responsible for worker safety research, standards, evaluation and education.

Because there is no Canadian agency that tests and certifies respirators, the Ministry of Labour, in regulating workplace safety, often relies on NIOSH. A ministry official said this was the case with NIOSH’s new respirator standards:

And we essentially accepted these new [NIOSH respirator] approvals and – and we basically said these are the respirators that we want to see used.

The ministry began to phase in the new standards in 1995. The phase-in period expired in May 1999, after which only new NIOSH-tested respirators would be approved for use. As the phase-in period was expiring, the Ministry of Labour advised:

It is Ministry of Labour policy to continue to accept both the new approved respirators under Part 84 and the old respirators for dusts, mists and fumes, approved under the old Part 11, up until May 10, 1999, as long as the old respirators are in good physical condition and are appropriate for the type and concentration of an airborne contaminant.

After May 10, 1999, Inspectors will issue orders under clause 25(2)(h) of the *Occupational Health and Safety Act* to require the new respirators or filters.\(^{931}\)

Clause 25(2)(h) of the Act requires that an employer:

> take every precaution reasonable in the circumstances for the protection of a worker.

This change in the ministry’s respirator standards was also reflected in the Policy and Procedures Manual of the ministry’s Operations Division. Section 10.17 of the manual, dated April 1, 2000, said:

> In issuing orders for new non-powered air purifying filter/respirators the following wording is suggested:

> “Pursuant to section 25(2)(h) of the OSHA, the employer shall ensure that respirators used in the workplace meet the current standards to ensure the workers wearing air purifying particulate respirators for exposure (i.e. state hazard i.e., asbestos, welding fume, lead, silica, etc.) in the (state area or location) are adequately protected.”

The narrative of the report can provide explanatory material such as:

> “It is a reasonable precaution to provide respirators approved to the new NIOSH standard referred to as 42 CFR 84 since these new filters are tested to new and more demanding testing requirements than those tested under the old NIOSH approval system. The new testing provides better evidence of the filters’ ability to remove airborne particulates and thus the workers will receive better protection from the particulates.”

Before SARS, N95 respirators were not widely used in most Toronto hospitals. Some did stock N95 respirators for use in treating tuberculosis patients. At some other hospitals, however, health workers treating TB cases used respirators that the hospitals felt were equivalent to an N95 even though they were not independently tested and certified. (The issue of equivalency is discussed below.)

Regardless of what type of respirator their hospitals stocked, most health workers interviewed by the Commission said that before SARS they had never seen an N95 respirator, had never used one and had not been trained in its use either at school or on the job.

The Decision to Require N95s

On the evening of March 26, just hours after the provincial emergency was declared, a critical meeting was held at the Provincial Operations Centre (POC). With the outbreak gathering momentum, the men and women who led the fight against SARS decided what measures, including respiratory protection, were needed to contain the new disease.

The atmosphere among the attendees, who included Drs. Jim Young, Colin D’Cunha and Sheela Basrur, was understandably tense. One participant recalled the mounting concern over the worsening situation:

I got paged late Wednesday night and asked if I would come down to the emergency centre because they were going to, now the province was involved. People were very upset that things, we were hearing stories now not only about people coming back to Scarborough Grace Hospital unwell but people were arriving in other emergency departments around the city sick, so it was no longer confined to Scarborough Grace Hospital but now patients were showing up at Scarborough General, at North York, at Centenary, and so things were kind of … we did not have a handle on what was going on.

SARS was spreading so fast that it overwhelmed efforts to trace the contacts of SARS patients and find out where the infection was coming from and where it was going. No one knew how far it had spread in Toronto. No one knew where it was spreading. Dr. Don Low said:

We recognized that we had lost control, that we were not able to identify patients.932

Amid this uncertainty, it was clearly evident from the devastating outbreak at Scarborough Grace that health workers were terribly vulnerable to the new disease and that the health care system had failed thus far to protect them.

As Table 2 below indicates, of the initial 128 SARS cases at Scarborough Grace, 47, or 37 per cent, were staff at the hospital, and seven, or 6 per cent, were non-hospital health workers, including EMS personnel. At least eight members of health workers’ households were also infected. The disturbing bottom line: of the 128 cases, 62, or 48 per cent, were either staff at the hospital, other health care workers or members of health workers’ households.933

If health workers were this vulnerable, no one appeared to be safe.

The fact that SARS had infected so many health workers led those trying to contain the Scarborough Grace outbreak to conclude that more protection was needed. Heightened precautions implemented at Scarborough Grace in late March included the requirement that all health workers use N95 respirators:

Following the initial investigation, contact and droplet precautions were implemented for all patients in ICU on March 22, and the ICU and

933. Varia et al., “Investigation of a nosocomial outbreak of (SARS)”
934. Varia et al., “Investigation of a nosocomial outbreak of (SARS)"
emergency department were closed on March 23. On March 24, follow-
ing the identification of staff and patient cases not linked to the ICU or 
emergency department, the hospital was closed to admissions, outpatient 
clinics were closed, and discharged patients were placed into quarantine 
at home for 10 days. Along with an increased emphasis on hand-wash-
ing, additional precautions, including the use of gowns, gloves, N95 or 
equivalent masks, and eye protection, were implemented for all patient 
care, and single or negative-pressure rooms were used for all febrile 
patients. Dedicated equipment was used for all patients, and patients 
were restricted to their rooms except for medically necessary tests. Staff 
wore N95 masks at all times in the hospital.935

In the face of a new, unknown disease, and mindful of the experience of Scarborough 
Grace, provincial officials decided on March 26 that affected health workers outside 
of Scarborough Grace also needed the higher protection of N95 respirators.

Dr. James Young told the SARS Commission public hearings that the decision was 
taken from a precautionary approach:

We chose, for means of protection, to use the N95 mask. We believed 
from the beginning that it was droplet-spread, but we believed, until we 
were more certain, that we should use the more protective N95 mask.936

One expert told the Commission that officials decided to err on the side of caution:

Even then we started talking N95. If I remember correctly that 
Wednesday night, we started because we did not know how this thing 
was transmitted and we assumed the worst, which is the right thing to 
do, and that’s why N95s. Either that night or the next, the decision was 
made to buy every N95 in North America. We bought out the market by 
the weekend.

Dr. Low said:

In the early days, that’s what kept me awake at night: the thought that we 
would always be remembered as the epicentre for a new endemic disease

935. Varia et al., "Investigation of a nosocomial outbreak of SARS"
which eventually would find its way across North America. But early on, we didn’t know how it was transmitted. We couldn’t say that it wasn’t airborne-transmitted. And therefore we assumed the worst and made the decision. We were going to require that everybody in the city wear an N95 mask in a health care facility.  

N95s Were Hard to Wear

It quickly became evident that health workers would have a difficult time doing their jobs while using an N95.

Respirators were uncomfortable to wear, restricted human interaction (an important part of patient care) and added significantly to health workers’ workloads. One study of the experience of health workers during SARS said:

Wearing a mask was the precaution most frequently cited as most bothersome ... The most commonly cited difficulty with the mask was physical discomfort (92.9% [1588/1710] of respondents).

The ONA survey found:

Over 70% of respondents experienced some side effects from the use of PPE [personal protective equipment], including: headaches, shortness of breath, facial rash, fatigue, dizziness, and others.

The ONA and OPSEU told the Commission public hearings that wearing N95 respirators for a long time caused fatigue, probably because of reduced oxygen intake.

One health worker told the Commission:

We had it on for our whole 12-hour shift, right? We changed our masks, our gloves, our gowns, everything, but you were donned, except on break time, in this, and the thirst and the fatigue was phenomenal that we went

937. Dr. Low Biosecurity and Bioterrorism Interview.
through. We were so tired and so listless.

Another health worker said:

Question: So it was very hot?

Answer: It was very uncomfortable and I remember we had a cardiac arrest and I ended up being the one that was doing the chest compressions and I had never been so hot in my entire life, thinking, how did I manage to get this job?

A third health worker simply said:

I was very uncomfortable in it – you can't breathe through these fibre-glassy things.

The ONA and OPSEU told the Commission public hearings that pregnant workers especially noted fatigue because their breathing was already restricted by the pressure from the growing fetus:

The mask restricts breathing and increased carbon dioxide levels. The mask restricts successful exhalation because, as you exhale, the air containing carbon dioxide is trapped in the mask and then you breathe it in again.940

The Registered Nurses Association of Ontario told the Commission:

Nurses complained about a constant burning irritation of the throat, tightness in the upper chest, headaches, allergic skin reactions, swollen lips and tongue, dizziness, lethargy, sleep disorders and the exacerbation of other health problems such as asthma. Some nurses reported that they could taste and feel the fibres from the mask and were concerned about long-term implications of prolonged mask use.941

During and after SARS, some experts in and out of government used the discomfort of wearing an N95 as an argument against a precautionary approach.

In the words of one health workers’ union, these experts argued that “personal protective equipment is uncomfortable and difficult to put on” and that this was a reason not to use respirators. Representatives of health workers say their members accept the discomforts of wearing N95 respirators if it means they are protected. As one union stated:

A day in the life of a health care worker is replete with all varieties of discomfort. While health care workers (like all workers) would prefer not to wear respirators, they are prepared to adjust to discomfort when necessary to make the very air they breathe safe for themselves and safe to pass on to patients and family. Firefighters, steelworkers, chemical workers and others have for decades routinely crouched in cramped, confined spaces for hours at a time, dragged down by much heavier respiratory protection than the N95 respirators ... Given information and training about hazards and the need for respiratory protection, all workers tolerate the discomfort.942

It is hard to argue with the union’s point of view.

N95 Respirators and POC Directives

Comfortable to wear or not, the N95 respirator, with its recognizable, face-hugging shape and its frequent media use to illustrate the outbreak, came to symbolize the battle to contain SARS.

For health workers, along with being the source of much discomfort, the N95 respirator was also the subject of a great deal of confusion over who should wear an N95, where it should be worn and how it should be properly used. Unclear directives were a significant cause of this uncertainty.

Issued by the POC, directives were meant to ensure that measures to contain the outbreak were based on the best expert advice and were consistently applied. While there is no doubt that directives on N95 respirators were at times confusing, those who prepared the directives made a remarkable effort under pressure. From a standing
start they helped to create a system that in the end stopped SARS. The wonder is not that there were problems with the directives. The wonder is that these dedicated men and women were able to produce from nothing a system that did the job.

When the March 26 decision was made to mandate the use of N95 respirators, for example, experts like Dr. Low stayed up late into the night to craft appropriate directives. Dr. Low recalled:

That night we sat down and came up with policies and procedures that we sent to all the hospitals the next morning.943

Directives on N95 respirators were at times confusing because of the massive systemic weaknesses that hampered efforts and capabilities. Those preparing the directives did the best they could under difficult circumstances with insufficient resources, infrastructure and planning. One expert involved in preparing directives recalled:

Whatever information we had, we then issued new orders and directives as to how we thought hospitals should react. And the kinds of questions that were thrown at us, when the volume I likened to taking a shower in Niagara Falls. It was colossal, and we had to set rules as to how many people were allowed in to interrupt us … We were so short of infectious disease human intellectual resources, that the people who were in Toronto were either quarantined or were themselves struggling with maintaining their own hospitals.

Regardless of the reasons for the directives’ failings, reality is that on many occasions the directives did not provide sufficient advice to health workers, their supervisors or their employers.

Consider the first hospital directive issued by the POC on March 27. It required only staff in emergency departments and clinics to wear N95 respirators:

All staff in GTA [Greater Toronto Area] and Simcoe County hospital emergency departments and clinics to wear protective clothing (gloves, gown, eye protection and mask – N95 or equivalent).

943. Dr. Low Biosecurity and Bioterrorism Interview.
Yet, as ONA and OPSEU noted in their joint submission to the SARS Commission, workers in the rest of the hospital were not required to take any special precautions:

This distinction between what protection was recommended for which groups of workers in the same facilities arose again and again throughout the crisis. Both unions were constantly trying to establish which areas were required to wear what personal protective equipment (PPE) and why.944

Problems with the March 27 directives appeared to have been addressed in the next few days, when two new directives extended the use of respirators to all health workers in affected facilities. On March 29, 2003, a POC directive to acute care hospitals in the GTA and Simcoe County required the wearing of an N95 respirator or equivalent by “all staff when in any part of the hospital,” “for hospital staff who are required to visit a patient care unit” and “for direct patient contact.” And on March 31, 2003, the requirement was extended to long-term care facilities in a directive that said:

All GTA/Simcoe County staff must invoke gown, glove, N95 mask (or equivalent), and eye protection precautions and cohort nursing protocols, whether or not they have identified possible SARS patients.

In a matter of days, new directives had a different message.

Directives on April 1, 2003, and April 3, 2003, appeared to require health workers to wear N95 respirators only in SARS patients’ rooms and for direct contact with any patient in intensive/critical care units or emergency departments.

ONA and OPSEU noted in their joint submission to the SARS Commission:

One example of such a change is found in two consecutive Directives for Acute Hospitals. The March 29 Directive for All Acute Hospitals in the GTA/Simcoe County required that “All staff when in any part of the hospital … Use an N95 (or equivalent) mask (ensure mask is fit tested).” The April 1 and 3, 2003 Directives to All Ontario Acute Care Hospitals (which replaced the March 29 Directive above, and others) required staff to wear an N95 mask in SARS patients’ rooms, and for direct

contact with any patient in Intensive/Critical Care Units or Emergency Departments.\textsuperscript{945}

The April 1, 2003, POC directive to all Ontario acute care hospitals said:

All HCWs and staff entering the room of a SARS patient in ANY location …

Use an N95 mask

—

For direct contact with any patient in Intensive/Critical Care Units or Emergency Departments HCWs must …

Use an N95 mask

—

Patients with suspected or probable SARS must be placed in single isolation rooms, or cohorted with other SARS patients and treated using contact, and respiratory precautions. N95 masks, or equivalent, must be worn by anyone entering the room.

The April 3, 2003, POC directive to all Ontario acute care hospitals said:

All HCWs and staff entering the room of a SARS patient in ANY location …

Use an N95 mask

—

For direct contact with any patient in Intensive/Critical Care Units or Emergency Departments HCWs must …

\textsuperscript{945} OPSEU/ONA Joint Report, p. 8.
Use an N95 mask

Patients with suspected or probable SARS must be placed in single isolation rooms, or cohorted with other SARS patients and treated using contact, and respiratory precautions. N95 masks, or equivalent, must be worn by anyone entering the room.

Health workers undoubtedly felt like yo-yos, told one thing one day, another the next, by the people who, acting in good faith, were supposed to keep them safe in a dangerous workplace.

The ONA and OPSEU noted in their joint submission that the confusion caused by the directives helped to undermine the confidence of health workers in the system that was supposed to protect them:

If workers throughout a facility are required to wear certain personal protective equipment (PPE) one day, and the next day only workers in the Emergency department are required to wear this PPE, and there is no explanation or rationale offered, it is difficult to be confident that every precaution is being taken to protect the health of our members. 946

The uncertainty over who should wear an N95 and where they should wear them was exacerbated by the fact that the N95 was a completely new piece of protective equipment for most health workers.

An Ontario Nurses’ Association (ONA) survey of its members 947 found:

Only 5% of respondents had been fit tested and/or trained and instructed in the care, use and limitations of PPE (personal protective equipment) before SARS. 948

947. The independent Hay Group summarized the survey’s results for the Commission. The complete Hay Group report is available in Volume 2 of the Commission’s final report.
Since so few health workers had been taught how to properly use this new piece of protective equipment before SARS, health workers and their employers and supervisors were particularly reliant on the guidance of POC directives.

The directives were not only confusing, but during the early part of the outbreak they also lacked sufficient detail. For the first month and a half of the outbreak, the POC directives failed to explain in sufficient detail how to properly apply and remove an N95 respirator.

As the ONA and OPSEU said in their joint submission:

On April 20, for the first time detailed direction was given on matters such as ... procedures such as applying personal protective equipment, removing personal protective equipment ...

These directives offer the first concrete evidence that the POC had begun to recognize that employers, supervisors and workers did not understand how to implement the previous Directives. It is surprising that in an acute hospital setting accustomed to caring for patients with infectious diseases, that such detail was necessary.949

Directives issued on April 20, 2003, detailed procedures for applying and removing personal protective equipment.950 Directives issued a few days later, on April 24, 2006, provided more detailed instructions.951

---

950. Procedure for removing protective equipment on exit from the room:

While still inside the room:

• Remove gloves
• Remove gown (discard in linen hamper in a manner that minimizes air disturbance)
• Decontaminate hands with alcohol hand wash; do NOT use patient bathroom to wash hands
• Leave room, bag specimens, etc.

After leaving the room:

• Use alcohol hand wash again
• Remove face shield/fluid shield and discard
• Remove N95 mask. Remove hair cover
• Use alcohol hand wash again
• Put on new hair cover, N95 mask and gown
• At least once per hour, wash hands at nearest hand washing sink to remove residue from alcohol hand wash and reduce skin irritation
But by then, more than six weeks into the outbreak, dozens and dozens of health workers and members of their households had already contracted SARS, including two who were to die from it.

Confusing directives hindered the ability of health workers to protect themselves. Confusing directives hindered the ability of their employers and supervisors to know exactly what respiratory protections were needed to protect their employees. And confusing directives undermined the faith of health workers, their employers and their supervisors in the recommendations of those in charge of the fight to contain SARS.

An important lesson from SARS is that during a public health emergency, directives on respirator protective equipment need to be clear and complete. They need to be

---

951. Routine procedure for applying personal protective equipment prior to entering patient room:
- Wash hands (do NOT use patient washroom to wash hands)
- Put on a disposable hair cover
- Put on a face shield. Use either a surgical mask with attached face shield (“fluid shield”) over the N95 mask or a full-face plastic shield.
- Put on 2 pairs of gloves

While in the patient room:
- Remove first pair of gloves after providing direct patient care
- Keep second pair of gloves on for remainder of stay in the room

Routine Procedure for removing protective equipment on exit from the room:
While still inside the room:
- Specimens to be placed in a clean specimen bag using a two person transfer method
- Remove second pair of gloves
- Remove gown (discard in linen hamper in a manner that minimizes air disturbance)
- Use alcohol hand rinse; do NOT use patient bathroom to wash hands

Just prior to leaving or immediately after leaving the room:
- Use alcohol hand rinse again
- Remove face shield/fluid shield and discard
- Remove N95 mask and discard
- Remove hair cover and discard
- Use alcohol hand rinse again
- Put on new N95 mask or equivalent and gown
- At least once per hour, wash hands at nearest hand washing sink (but NOT in a patient washroom) to remove residue from alcohol hand wash and reduce skin irritation
developed before the emergency strikes and not made up from scratch after it begins. They need to be developed in concert with all workplace parties to ensure that they are accurate, are consistent with worker safety laws and best practices, can be understood and will work.

**Lack of Training**

It was bad enough that directives, at least during the first part of the outbreak, often lacked sufficiently detailed information. What made things worse was the lack of training.

The ONA members’ survey found that 44 per cent of respondents felt that during the SARS outbreak there either was not enough training on the proper use of personal protective equipment or they didn’t know.952

Many health workers interviewed by the Commission were not taught how to use N95 respirators when first required to use them. Often they were not properly taught until they were fit tested, which typically happened only long after the outbreak.

The following are representative of health workers’ comments to the Commission:

<table>
<thead>
<tr>
<th>Question:</th>
<th>And did anybody ever show you how to use it properly? Was there any training?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer:</td>
<td>No. I just looked at the box and put it on the way the box said to put it on.</td>
</tr>
</tbody>
</table>

—

I really did not receive any formal training on the use of the equipment. You were pretty well [told] there’s equipment there, you figure out yourself how to put it on. And certainly the missing piece with me was that I didn’t have any formal training in how to remove it properly.

There were no instructions on the memo [provided by the employer] for how to put on an N95 mask. Actually, I didn't know there was a way to put it on until after.

And I guess you didn't know that there was a way to take it off?

Right. The memos did say in what order to take your gear off, like one set of gloves and then the next, but it didn't say specifically how.

Were you – at some point were you fitted for your mask?

Yes, I was.

When was that, in the fall … Was it after the second outbreak, or after the hospital shut down?

After the hospital shut down.

And prior to your fitting, when you started wearing the N95 mask, did anyone give you training and education on how to properly apply the mask and how to make sure you get a proper seal?

No

But what we didn't have was – the first day [was] anybody [who] taught us how to really put those masks on. So we didn’t know whether we were putting them on properly or not.
Question: Did you get training on how to properly don the equipment, how to properly remove the equipment, how to properly put your masks on. Did you get any of that in the first part of SARS?

Answer: No.

Question: So, you just go in and get a mask and you're expected to figure out how to use it properly and that's the complete extent of the training of the personal protection equipment, really?

Answer: Until, yes.

Question: Until the fit test?

Answer: Well, no. Because I guess somebody shows you once, you start talking to people and they tell you, fit it here and somebody else you work with has been already been shown.

Question: Right. But was there a formal [training] – like someone come around that [provided formal instruction]?

Answer: No, there's a little pamphlet that came in the box of them when you got the first ones that basically told you what to do.

Question: And had you at that point [i.e., during the SARS outbreak] been given any instructions on how to properly wear a mask?

Answer: No.
Question: And were you given any in-service training on how to properly put the equipment on and take it off?

Answer: Oh, not till far, far later. Months after.

Question: You had said that you were not fit tested prior to that.

Answer: No.

Question: But you have been since?

Answer: Yes.

Question: And did someone show you [during the fit testing process] the proper way to put on that respirator, that mask?

Answer: Yes.

Question: During SARS, prior to you being fit tested, were you shown how to put it on?

Answer: No.

Question: How did you know how to put that N95 on initially?

Answer: It’s from colleagues.

Question: Prior to the fit testing taking place, did anybody ever give you training on how to properly apply your mask, how to get a proper seal.

Answer: Training? I don't remember any training.
We weren't given an official in-service until the middle of the second SARS.

And who did that for you?

You know what, I'm not really sure. Someone in regards to the education, like the nurse educator and stuff. We thought it was kind of ridiculous because, you know, at this point, we'd been through the first SARS and halfway through the second.

In cases where health workers were taught to use N95 respirators during SARS, health workers on day shifts in some cases appeared to have a greater chance of getting trained than their colleagues on nights.

One nurse said:

Professional practice leader came – it was the second day – came up to the unit, and they had signs, and it showed you the appropriate way to don and take off your garb, which we put outside the rooms. I said to her, this is great that we have this, but the staff’s coming on at 7:30 [in the evening], are you going to be able to come back and explain all this to them? And she said to me, oh no, can't you do that?

Another nurse had a similar experience:

So, there wasn’t an educator that came on the unit and [provided formal training]?

That’s my big issue. There is no education except for Monday to Friday. Basically 9:00 to 5:00, sometimes in the evening. So, if you do permanent night shift you have absolutely no education for off-hours.

Mostly occurred Monday to Friday during the day shifts?

Yes. And I brought it up over and over. Nursing is
24/7. They need to be accommodating, especially when most of the staff are nurses, for night shifts, somebody needs to be coming in at nights for in-services and education, and it just doesn’t happen.

Less attention also appeared to have been paid to training medical residents and fellows. One physician told the Commission:

There were no training sessions for the residents or the fellows. I think there were training sessions for the nurses and I think there were for the staff physicians, but there weren’t for the residents and the fellows, which is – the reason for that is because resident and fellows rotate between hospitals and it is harder for the infection control service to capture them, but at the same time, it is a bit of a deficiency because residents and fellows have a lot of hands-on with patients.

As an indication of the consequences of poor training, some health workers told the Commission they were not told a good seal could be jeopardized by facial hair or by inserting something between the skin and the respirator.

An occupational safety consultant told the Commission that respirators work properly only if there is direct contact between the face and the respirator:

What the intent is, you need to have a proper seal. And what is a proper seal? A proper seal is there can be nothing such as beard growth, or beard or, you know, even face deformities fall into this. You’ve got to be able to have skin-surface-to-respirator contact. So as long as you’ve got that contact and it allows you to feel the negative pressure within your respirator, then there’s absolutely no reason why it wouldn’t be safe.

One health worker with a beard who caught SARS despite his unfitted N95 had never been told that the N95 required a tight fit around the face. When asked if he had been given any instructions, he said no:

Answer: No, I was never given any instructions.

Question: Did you get that when you were fit tested?

Answer: Yes.
And was there anything that you learned that you weren’t doing at the time or …?

Yes. In regards to ensuring a seal between the mask and the face. I was not doing that at the time in 2003.

Facial hair can prevent a good seal between the skin and the respirator. Therefore, employees required to wear tight fitting respirators should be required to be clean-shaven where the respirator seals to the face unless there is a specific medical or religious reason for facial hair. In these cases, the employee can be reassigned to a position that does not require the use of a tight fitting respirator.

Another health worker who caught SARS more than two months into the outbreak placed facial tissue between her skin and her N95 because of an allergic reaction to the respirator. She told the Commission:

Do you know who you contracted SARS from?

I’m assuming it was [names patient].

And you recall wearing a mask with her.

I had to shove Kleenex in it so it wouldn’t touch my skin because I had an allergy to it. So I was wearing a mask, but I doubt it was in any way effective.

A hospital assistant who caught SARS in late May 2003 wore a surgical mask under his N95 respirator, unaware that inserting something between the respirator and the face can prevent a tight seal.

But with this particular patient, you said you had on two masks.

---

Answer: Two masks.

Question: Which one did you put on first?

Answer: First I put that one [surgical mask] and the second one I put that [N95].

Question: Indicating the surgical mask first and then the one that sticks out [N95]. Do you know what the second one was? Do you know what kind of mask that was?

Answer: They are two colours, one was white [surgical mask], one was grey like this [N95] … but I was using only white because it’s a little bit bigger and it would fit over my nose.

Question: Now, have you ever been fit tested for an N95 respirator?

Answer: No, I don’t remember that …

Question: And did anyone show you how to put on that top mask [N95]?

Answer: Yeah, the nurse told me that you have to put like this first [surgical mask] and then comes this [N95] and put it on. Or she will put it on for me because I was very attached with that nurse up to now.

Question: Prior to SARS, were there occasions where you would wear two masks?

Answer: If it is very serious, the patient. Otherwise it is usual we put the mask on like that.

Question: And would you always wear the surgical mask and then the other mask [N95] over the top?

Answer: Not always. When the patient is very serious and if they were … the patient was, then we wear two. Otherwise my one mask is fine.
To send a man like this into SARS without training does not reflect well on the way the health care system protected its workers.

Another health worker also told the Commission that she wore a surgical mask underneath her N95 until she found out that that ruined the seal. Luckily, she did not contract SARS.

Lack of training underlay most problems. Very few hospitals had a respiratory training program to ensure that workers when called upon to use the N95 were properly trained and fitted as required by law. Respirators can become hazards if not worn properly and can spread infection if not removed properly after contact with a sick patient.

Once SARS struck there was little time to correct years of neglect and bring training up to speed. But even then more could have been done to ensure that hospitals knew about the training and fit-testing requirements and did their best to train up quickly and efficiently.

An important lesson from SARS is that safety training needs to be in place before emergency strikes. Once an emergency strikes, the emergency response and directives should include a requirement for whatever training is urgently needed to protect responders.

Ministry of Labour and Respiratory Protection

No safety device will protect a worker if he or she does not know how to use it properly. A medical study has noted:

Previous efforts to improve infection control in the hospital and elsewhere have demonstrated that the efficacy of an intervention does not guarantee its success. The best respirator or medical mask will do little to protect the individual who refuses to wear it or who does not use it correctly.954

To ensure protection, Ontario law requires employers to train and supervise workers in the proper use of safety equipment.

---

Section 10 of Ontario Regulation 67/93 requires:

10. (1) A worker who is required by his or her employer or by this Regulation to wear or use any protective clothing, equipment or device shall be instructed and trained in its care, use and limitations before wearing or using it for the first time and at regular intervals thereafter and the worker shall participate in such instruction and training.

(2) Personal protective equipment that is to be provided, worn or used shall,

(a) be properly used and maintained;

(b) be a proper fit;

(c) be inspected for damage or deterioration; and

(d) be stored in a convenient, clean and sanitary location when not in use. O. Reg. 67/93, s. 10.

Section 27 (1) of the Occupational Health and Safety Act requires:

27. (1) A supervisor shall ensure that a worker,

(a) works in the manner and with the protective devices, measures and procedures required by this Act and the regulations; and

(b) uses or wears the equipment, protective devices or clothing that the worker’s employer requires to be used or worn.

During SARS, the health workers who wore a surgical mask underneath their respirator, stuffed facial tissue underneath their respirator or wore the respirator over a beard cannot be faulted. They had not been trained, as required by law, on the proper use of respirators. None of their supervisors, as required by law, appeared to notice that respirators were not worn properly. That so many health workers were not properly trained, supervised or equipped reflects a deep systemic problem in the health care sector. Before and during SARS, much of the health care sector were unaware of the personal protective equipment requirements of Ontario work safety laws.
As a senior health administrator with significant experience in other sectors told the Commission:

I can draw the conclusion from my 30-odd years of working in various industries, and I think that hospitals would be less aware of occupational health and safety at that time [i.e., during SARS] than what I found in other industries.

If there was a general lack of awareness of worker safety regulations among hospitals, provincial officials did little to remind them of hospitals’ legal obligations during much of the outbreak.

The March 29, 2003, and March 31, 2003, directives contained nonspecific references to fit testing (i.e., “ensure mask is fit tested,” and “masks must be fitted appropriately”), but these were insufficient for a health care system that was largely unaware of both fit testing and the fact that it was a legal requirement. It was not until May 13,

955. The March 29, 2003, POC directive to GTA and Simcoe County hospitals said:

For all staff when in any part of the hospital …
Use an N95 (or equivalent) mask (ensure mask is fit tested)

For hospital staff who are required to visit a patient care unit …
Use an N95 mask (ensure mask is fit tested)

For direct patient contact …
Use an N95 mask (ensure mask is fit tested)

956. The March 31, 2003, POC directive to GTA and Simcoe County long-term care facilities said:

All GTA/Simcoe County staff must invoke gown, glove, N95 mask (or equivalent), and eye protection precautions and cohort nursing protocols, whether or not they have identified possible SARS patients ...

Note: N95 masks must be fitted appropriately

POC directives to GTA and Simcoe County community care access centres:

Full protocol precautions for staff
Invoke gown, glove, N95 mask (or equivalent), and eye protection precautions and cohort nursing protocols, whether or not they have identified possible SARS patients.

Masks and gowns may be reused but must be changed:
- Following contact with a SARS patient
- When wet or soiled

N95 masks must be fitted appropriately
2003, that the POC first issued directives\textsuperscript{957} explicitly reminded health care institutions of their legal duties regarding N95 respirators and other personal protective equipment. All six directives issued that day contained the following language:

Personal protective equipment must be properly used and maintained consistent with the Occupational Health and Safety Act Reg. 67/93 s.10. N95 or equivalent masks must be qualitatively fit tested to ensure maximum effectiveness. (See NIOSH website at www.cdc.gov/niosh - Publication No.99-143).

These requirements had been in place as a feature of Ontario safety law since 1993, but many hospitals officials told the Commission they become aware of this only on May 13, 2003.

Provincial labour officials also did too little to ensure that worker safety regulations were enforced.

As noted elsewhere in this report, despite the large number of health workers who got SARS, the Ministry of Labour was largely on the sidelines. Reminders to employers of their worker safety obligations were not issued until late in the outbreak, and the Ministry of Labour, unlike its counterpart in B.C., did little during most of the SARS outbreak to ensure that employers were aware of and were meeting their statutory duties.

The Ministry of Labour conducted no proactive inspections of SARS hospitals in March 2003. During that month, nearly half of the SARS cases in the initial outbreak at Scarborough Grace were either health workers or members of their households, and six health workers at Mount Sinai also caught SARS.

Despite the events at Scarborough Grace and Mount Sinai in March 2003, the Ministry of Labour conducted no proactive inspections of health care settings with SARS patients in April 2003. Yet, during that month, the list of health workers contracting SARS grew. Affected hospitals included Mount Sinai, York Central, Sunnybrook and North York General.

\textsuperscript{957} On May 13, 2003, the POC issued six directives: Directive to Ontario Healthcare Providers in Community Settings and Community Healthcare Agencies (Excluding Community Care Access Centres); Directive to all Community Care Access Centres; Directive to all Ontario Non-Acute Care Facilities; Directives to all Ontario Acute Care Facilities; Directives to all Ontario Acute Care Hospitals for High-Risk Procedures Involving SARS Patients Critical Care Areas; Directives to all Ontario Prehospital Care Providers and Ambulance Communications Services.
Nor did the Ministry of Labour conduct proactive inspections in May 2003, when the second phase of the outbreak began. None was undertaken until June 12, 2003, in the face of a growing number of health worker complaints and work refusals. By that time virtually all 51 health workers who caught SARS during the second phase of the outbreak had become infected.

It cannot be proven that health workers caught SARS because of unclear and confusing directives, because they were not trained or because the Ministry of Labour did not enforce worker safety regulations.

But SARS did demonstrate the importance of meticulous attention to worker safety measures. As one study found:

> Experience from Hong Kong suggested that infection among “protected” health workers was related to how well the precautionary measures were used. In a case control survey, they found no infection in staff using complete precautionary measures, whereas infected staff had omitted at least one of the precautionary measures.959

A key lesson from SARS is that while health workers needed to pay meticulous attention to their respiratory protection, the lack of clear directives, the lack of training and the lack of enforcement found during SARS made that task difficult and sometimes impossible.

No hospital or nursing home can be totally safe. They cannot even begin to be safe if workers are not properly trained and supervised in their use of safety equipment and if the government does not enforce its own safety laws.

**Confusion over N95 Equivalent Respirators**

It should have been crystal clear to health workers what type of respirator would protect them against SARS. Instead, as the ONA nurses’ survey found, this was often not the case:

> 53% of respondents experienced confusion about which masks would provide the necessary protection.960

---

Part of this uncertainty was because instead of specifying that only N95 respirators were to be used, the directives required N95 or equivalent respirators. The term “equivalent” was open to interpretation.

To worker safety experts like Dr. Gabor Lantos, the term “equivalent” was puzzling. Dr. Lantos told the SARS Commission:

They are still talking about N95 masks or equivalent. As an engineer, I don't know what an equivalent is. It's either an N95 or it's better.961

Many in the health system interpreted “equivalent” to mean masks with the same manufacturer’s specifications as an N95 but which had not been independently tested and certified. One such device was the PCM 2000 mask. (As noted above, we will use the term respirator to describe only respiratory protective devices that have been independently tested and certified.)

A health worker who got SARS told the Commission that his hospital haphazardly provided a variety of respiratory protective devices, including N95s and PCM 2000s, without differentiating between them:

Question: … do you have a sense of what different kinds of respirators and masks were potentially used?

Answer: There were for sure many N95 masks but also duckbill masks [i.e., PCM 2000] as well and, unfortunately, it seems very haphazard what in fact is put outside each individual patient’s room. The little trolleys and dollies outside every room, and it’s really, as I say, an assortment of equipment but not always standardized …

This doctor noted the problem:

Question: What do you understand to be the difference between an N95 respirator and other forms, such as duckbilled or surgical mask?

Answer: Okay, so my understanding was that the N95 mask had been certified to filter out 95 per cent of the aerosol

1087
particles. The duckbill mask [i.e., the PCM 2000] is one step below that but better than the ordinary surgical mask and in, with tuberculosis for instance, if the patient wears a duckbill mask and the health practitioner wears a duckbill mask, the risk of transmission is almost zero. What is not known is with a viral infection whether the duckbill mask offers any protection or not. I must say at the time, my recollection is that [his health care institution] said, yeah, use the N95, but it wasn't like no, but the fact that there were duckbill masks available suggests that, you know, that may be good enough. You don't have to have an N95.

During SARS, there was a wide divergence of opinion over what constituted an N95-equivalent respirator.

On one side were Health Canada, the Ministry of Health and Long-Term Care and experts at some major Toronto teaching hospitals who believed that an N95-equivalent respirator did not need to be independently tested and certified.

This was Health Canada's position:

4. Health Canada recommends wearing an N95 mask or equivalent. What does “equivalent” mean?

It should be noted that NIOSH is an American agency, and there is no equivalent agency in Canada which certifies masks for industrial use. N95 masks have been tested and certified by NIOSH. For more information on NIOSH, testing and certification, visit http://www.cdc.gov/niosh/homepage.html

Health Canada recognizes that many institutions and other health settings may not use N95 masks that are NIOSH approved, and considers masks fulfilling the following requirements as the “equivalent” to NIOSH certified N95 masks:

- Filter particles one micron in size or smaller
- Have a 95% filter efficiency
- Provide a tight facial seal (less than 10% leak).

5. Are N95 masks considered an “equivalent” to the TB masks?
Yes, NIOSH approved N95 respirators/masks or equivalent meet and exceed the TB mask criteria.

If your health care facility masks meet the filter and fit criteria of #4 (above), they can be considered equivalent to TB masks.962

An April 11, 2003, document prepared by the Ministry of Health and Long-Term Care and entitled “Questions and Answers” took a similar position:

Q3. Are the PCM 2000, P-95 and R-95 masks equivalent to the N95 mask?
A3. Yes.963

An article by Toronto experts in the Canadian Journal of Anesthesia contained in a footnote the following description for a PCM 2000 mask:

N95-equivalent mask … 964

An article published in a British medical journal in June 2003 and written by three experts at a major Toronto teaching hospital also appears to suggest that the PCM 2000 is equivalent to an N95:

As a result of the transmission of SARS to health workers, N95 (or equivalent) masks are currently mandatory in Toronto for all medical personnel. They fulfill the filtering efficiency criteria of the National Institute for Occupational Safety and Health (NIOSH) N95 standard by protecting against droplet and airborne transmission of 95% of particles greater than 0.3 microns in size. These masks will offer a high degree of protection against the contact and droplet spread of the coronavirus. The N95 masks should be fit tested using an appropriate “fit test kit” according to the manufacturer’s instructions. The PCM 2000 Tuberculosis masks meet the N95 filtration criteria and fit the majority of wearers adequately. They do not require routine fit testing. N95 masks can be worn continuously for 8 h whereas PCM 2000 masks can only be worn continuously for 4 h.965

Experts at another major teaching Toronto hospital took a similar position, suggesting that PCM 2000 masks, even though they were not NIOSH approved, were the equivalent of N95s because they had the same technical specifications. One expert at this hospital told the SARS Commission:

… because we didn’t know what we were dealing with, so we went with an N95-equivalent mask, which had been our mask for TB … for decades. The brand is PCM 2000 masks, and they’re N95-equivalent. They’re not NIOSH-approved masks, but they have the same filtration … The manufacturer would tell us what filtration the mask has …

This infection control expert noted that PCM 2000 masks met Health Canada’s guidance:

We were confident in them, and they were widely used across Canada, and Health Canada had no problems with those masks.

The Ministry of Labour took a very different position on what was equivalent to an N95. It told the Commission that it accepted the term “equivalent” in directives because this allowed health workers to also use the protection of higher-rated NIOSH-approved respirators like the N99 or N100.966

One ministry official told the Commission:

Now, if somebody uses an N99 or an N100, they are equivalent and would provide even higher protection.

This approach was reflected in a document that the Ministry of Labour prepared for its staff, which appears to have been issued in early April:

Problem: Refusal to work with or serve a patient, client or inmate with possible SARS and symptoms e.g. fever, cough, history of travel or contact with confirmed SARS case, in healthcare setting or in corrections facilities.

Solution: Health care facilities and corrections facilities must implement the infection control measures required by MOHLTC and public health units. These include gloves, gowns, N95 or better respirators, eye protection, hand-washing facilities, plus the appropriate training and respirator fit testing.967 [emphasis added]

966. The minimum efficiency of each tested filter is to be greater than or equal to 99.97% for N100 filters and 99% for N99 filters.
967. Document entitled “SARS Scenarios” which was attached to a copy of the Ministry of Labour’s SARS protocol which it provided to the SARS Commission in the course of its submission at the public hearings.
Ministry of Labour officials told the Commission that they would have preferred to have seen the phrase “N95 or better” in the directives. But the directives continued to refer to “N95 or equivalent.”

The Ministry of Labour said it would not, without appropriate independent testing, accept the manufacturer’s specifications as being sufficient proof that a respirator was equivalent to one certified by NIOSH.

During SARS, the Ministry of Labour was asked whether a European-approved respirator was an N95 equivalent. At the time, there was concern about supplies of N95 respirators and officials wondered if there might be appropriate substitutes in Europe. A Ministry of Labour official consulted with NIOSH, learned that the European test was less rigorous than NIOSH’s and was told NIOSH would accept the European respirator only if it passed its own tests.

This official told the SARS Commission:

So the question is: Is that equivalent?

Now, certainly at the Ministry of Labour, we don’t have a laboratory that’s testing respirators, approving respirators. We don’t have people that are doing the research and so we’re going to rely on NIOSH.

And if NIOSH had said to us their professional opinion is it is equivalent, then we would have considered making a statement to say we’ve done some research, we consulted with an expert in the field and we have concluded that, you know, it is equivalent or it is adequate.

And NIOSH was being very, very careful. And the position that NIOSH was taking is that the efficiency is not the same and certainly the European respirator was less efficient.

Now the only way NIOSH would be willing to make a comment would be if [the manufacturer] would submit their respirator to NIOSH, have it go through the N95 approval testing and if it met the criteria then they would be issued, I guess, approval as an N95.

The debate over what was an equivalent respirator continued after SARS.
On March 3, 2004, one Toronto hospital wrote to the Ministry of Labour after it had issued an order requiring the hospital to provide health workers with NIOSH-approved respirators, and not the PCM 2000:

Further to our discussion, our Infection Prevention and Control department wanted to get clarification on the MOL order regarding change to “N95 or better” in our policies.

• Can you indicate the specific regulation or standard that is the basis for the MOL requirement that N95 is the minimum protection and other masks without the N95 under the NIOSH criteria are not acceptable e.g. PCM 2000

• Can you provide the evidence that supports the MOL’s requirement

On March 23, 2004, the Ministry responded:

The inspector’s order gives the regulatory requirement. The contravention is of the compliance order issued.

The CSA Standard Z94.4-02 Selection, Use and Care of Respirators G4.3.1, page 67, indicates there are three filter efficiencies for non-powered particulate removing respirators (95%, 99% and 99.97%) and one efficiency for powered air-purifying respirators (99.97%). A P100 respirator has better filter efficiency than an N95 and is acceptable for use. A powered air-purifying respirator with a 99.97% efficient filter also has better filter efficiency than a N95.

The CSA Standard Z94.4-02 Selection, Use and Care of Respirators 2.1, page 1, indicates an accepted respirator to be a respirator tested and certified by procedures established at testing and certification agencies recognized by the authority having jurisdiction. The Ministry of Labour, as that authority, recognizes NIOSH testing and certification. The N95 respirator or respirator with better filter efficiency must be tested and certified by NIOSH.

There are several reasons the Ministry of Labour recognizes NIOSH testing and certification:
1. Assurance that the respirator/filter has met a recognized standard of efficiency.
2. Assurance of consistent quality since manufacturers of NIOSH approved respirators must submit to NIOSH a quality assurance plan.
3. Assurance that in the event of a serious problem being identified NIOSH has the power to issue a stop sale order to the manufacturer.
4. For respirators that are not approved by a recognized testing and certification agency such as NIOSH, the Ministry does not have the same assurance of quality and performance.

While undoubtedly acting in the best of good faith and with the best of intentions, it is surprising that so many experts took the position during and after SARS that a PCM 2000 is equivalent to an N95. In an age when independent testing is the norm in so many product areas, from the crash worthiness of automobiles to the safety of household appliances, it seems remarkable that anyone in charge of health worker safety would be content to rely solely on the manufacturer’s specifications without independent certification.

By not providing NIOSH-certified and -tested respirators, employers accepted a lower standard of protection. Regrettably, they also appeared to place greater reliance on advice from Health Canada, a federal agency with no jurisdiction over Ontario workplaces, than on the higher standards of protection required by the provincial ministry in charge of worker safety in Ontario.

An important lesson from SARS is that in any health emergency, the Ministry of Labour must be actively engaged from the start to ensure adherence to safety standards and to ensure that there is no confusion in the workplaces over what equipment is required to protect workers.
Evidence of Airborne Transmission

During SARS, there were multiple episodes of transmission that could not be readily explained by droplet spread alone, and there were episodes and situations where airborne transmission appears to have been involved in transmission.

In the Amoy Gardens housing complex in Hong Kong, cases appeared rapidly in several different apartment buildings in manner atypical of contact or droplet transmission.\(^\text{968}\)

Spread to health workers in Toronto during aerosol-generating procedures, including endotracheal tube intubation or bronchoscopy,\(^\text{969}\) is another example where airborne transmission has been invoked during nosocomial spread.

The pattern of spread of SARS associated with sick patients travelling on aircraft suggests that airborne transmission could have occurred during the flights.\(^\text{970}\)

Another example is the super-spreader event at the Hotel Metropole, when at least 16 people, including the index cases in Toronto, Vancouver, Singapore, Hanoi and Hong Kong, were infected in February 2003.

According to the World Health Organization:

Professor LJL’s infected body fluids must have been aerosolized, as indicated by the traces on the inlet of the elevator lobby fan. Anyone who stepped out of the 9th floor lift [i.e. elevator] shortly after the event would have been exposed, while those who walked past room 911 [i.e.,

the index patient’s room] may have been at risk for a longer period. Presumably, by morning there was no longer any viable virus, or else staff had quickly disinfected the area without becoming exposed. It certainly appears that only those who were on the 9th floor that night were at risk. Thus, the “miracle” of none of the hotel staff getting SARS could simply have been due to their not having been exposed to the virus.

The rooms in the hotel, atypically, were pressurized; so infected aerosols could not have entered from the corridor. The WHO team dismissed theories that the virus was transmitted through elevators, door handles, or handrails. “In this hotel, these are unlikely scenarios,” the report [by the WHO team of Health Canada experts] said, “because other guests would have made similar contacts, and indeed, staff would have had intense exposure risk. Staff who served the subject floor did not get infected.”

The contamination occurred in the corridor of one wing of one floor, and never moved up or down the building or endangered people inside their rooms.971

The single most dramatic spread of SARS was the Amoy Gardens outbreak. More than 300 people in four separate Hong Kong buildings caught SARS. Airborne spread was at first dismissed as the likely transmission mechanism as opposed to:

- person-to-person spread, contamination of communal facilities (such as elevators) and thus indirect contact transmission, and problems with sewage disposal resulting in fecal-oral transmission.

A later study972 suggests airborne transmission as the likeliest explanation. This research says it is likely that the exhaust fan in bathroom of the index cases drew aerosols (generated by coughing or flushing virus-laden stool in toilets) from the bathroom into common building airshafts. These aerosols would rise with the warm humidified air currents and be transmitted to the residents in upper levels of the apartment complex. Natural wind currents likely then permitted the spread to other buildings as the contaminated air plume left the building of the index case. This

---

theory is supported in a mathematical model. On this basis, airborne transmission appears to provide the single best mechanism explaining the varied attack rates in the different floors and buildings within the Amoy Gardens complex.

Some experts regard this as a landmark study because it provides a fresh perspective on the droplet-versus-airborne debate. They suggest the initial Amoy Gardens investigation did not seriously consider airborne transmission because of the current bias in favour of the large-droplet theory.\footnote{“In the official investigation, airborne transmission was not seriously considered, because the current paradigm, as initially described by Charles Chapin in 1910, supports the belief that most communicable respiratory infections are transmitted by means of large droplets over short distances or through contact with contaminated surfaces” (Chad J. Roy and Donald K. Milton, “Airborne transmission of communicable infection – the elusive pathay,” \textit{New England Journal of Medicine} 350 [April 22, 2004], www.nejm.org) (Roy, and Milton, “Airborne transmission of communicable infection – the elusive pathay”)}

Noting that research into airborne transmission has been neglected, some researchers suggest SARS provides an opportunity to critically re-evaluate how respiratory diseases are spread:\footnote{Roy, and Milton, “Airborne transmission of communicable infection — the elusive pathay”:}

The SARS epidemic provides an opportunity for the critical reevaluation of the aerosol transmission of communicable respiratory diseases. Prevailing thought has focused on determining whether an infectious agent has “true” airborne transmission. We find it more useful to classify the aerosol transmission of diseases as obligate, preferential, or opportunistic, on the basis of the agent’s capacity to be transmitted and to induce disease through fine-particle aerosols and other routes ...

There are probably many diseases with opportunistically airborne transmission – infections that naturally cause disease through other routes

\footnote{What underlies the low repute of airborne transmission today? First, the two diseases whose aerosol transmission is most widely acknowledged, measles and tuberculosis, have been largely controlled through vaccination or drug therapy. As a result, the impetus to understand the aerobiology of infectious diseases has faded. Second, contamination of water, surfaces, and large-droplet sprays can be easily detected. It is difficult, however, to detect contaminated air, because infectious aerosols are usually extremely dilute, and it is hard to collect and culture fine particles. The only clear proof that any communicable disease is naturally transmitted by aerosol came from the famous experiment by William Wells, Richard Riley, and Creytl Mills in the 1950s, which required years of continual exposure of a large colony of guinea pigs to a clinical ward filled with patients who had active tuberculosis.}
(e.g., the gastrointestinal tract) but that can also initiate infection through the distal lung and may use fine-particle aerosols as an efficient means of propagating in favorable environments. For all three classes of diseases that are communicable through aerosols, the agent must be capable of initiating infection, with some reasonable probability, by means of a small dose delivered to the lung in a single airborne particle.

The current analysis of the outbreak at Amoy Gardens suggests that SARS has at least opportunistically airborne transmission.975 Two more recent studies also suggest the possibility of airborne spread in hospital wards. One examined a nosocomial outbreak in a Hong Kong hospital.976 The other detected the presence of the SARS virus in the air in the room of a SARS patient in Toronto:

Severe acute respiratory syndrome (SARS) is characterized by a risk of nosocomial transmission; however, the risk of airborne transmission of SARS is unknown. During the Toronto outbreaks of SARS, we investigated environmental contamination in SARS units, by employing novel air sampling and conventional surface swabbing. Two polymerase chain reaction (PCR)–positive air samples were obtained from a room occupied by a patient with SARS, indicating the presence of the virus in the air of the room. In addition, several PCR-positive swab samples were recovered from frequently touched surfaces in rooms occupied by patients with SARS (a bed table and a television remote control) and in a nurses’ station used by staff (a medication refrigerator door). These data provide the first experimental confirmation of viral aerosol generation by a patient with SARS, indicating the possibility of airborne droplet transmission, which emphasizes the need for adequate respiratory protection, as well as for strict surface hygiene practices.977

---

975. Roy, and Milton, “Airborne transmission of communicable infection — the elusive pathway.”
976. “The analysis of the temporal-spatial spread of SARS from the index case patient to other inpatients in the ward suggested that airborne spread through virus-laden aerosols possibly played an important role. Unlike other reports of airborne outbreaks, we were unable to document the existence of the infective agent in aerosols. Such documentation was simply impossible in early March 2003, when the infective agent was yet to be identified. SARS was unlikely a communicable disease with obligate airborne transmission, such as tuberculosis, but there was evidence to suggest that SARS could have at least opportunistically airborne transmission under special circumstances when virus-laden aerosols could be generated” (I.T.S.Yu et al., “Temporal-spatial analysis of severe acute respiratory syndrome among hospital inpatients,” Clinical Infectious Diseases 191 (2005):1472-77.
An editorial that accompanied the article noted:

Airborne transmission of the severe acute respiratory syndrome (SARS) coronavirus (CoV) has been the favored explanation for its transmission on an aircraft and appeared to explain a large community outbreak of SARS in the Amoy Gardens in Hong Kong. The article by Booth et al. in this issue of the *Journal of Infectious Diseases* suggests that airborne dissemination of SARS-CoV may also occur in the health-care setting. A patient with SARS who was breathing quietly but coughing occasionally in a hospital room contaminated the surrounding air with SARS-CoV, as shown by experiments conducted during the SARS outbreak in Canada in early 2003.

Several viruses and other pathogens, such as *Mycobacterium tuberculosis*, have been shown to be transmitted by airborne dissemination. However, the possibility of airborne dissemination of SARS-CoV has been controversial. The important work by Booth et al. has shown beyond doubt that SARS-CoV aerosol generation can occur from a patient with SARS …

Because none of the SARS-CoV cultures were found to be positive and host infection was not involved, the authors rightly avoided drawing a conclusion of airborne transmission of SARS-CoV. Definitive proof of transmission will need to come from experiments similar to those performed by Riley et al. in the 1950s, which involved exposure of guinea pigs to air shared by patients with active pulmonary tuberculosis. In vitro viral culture tests may not be sensitive enough for this purpose. However, if SARS-CoV is naturally airborne (produced by breathing and coughing), as was shown by Booth et al., then there is sufficient concern that it can be transmitted successfully by air …

---

Were N95 Respirators More Protective than Surgical Masks?

Despite the evidence of airborne SARS, and despite the fact the N95 was specified by Ontario and the CDC and the WHO for protection against SARS, doubts remained that these safety precautions had been proved necessary beyond a scientific doubt.

---

Health Canada said:

International SARS studies have not shown a difference in efficacy between surgical masks and N95 respirators in preventing transmission of the SARS coronavirus. Recommendations will be reviewed as further evidence emerges.979

Two studies of how health workers got SARS, one by a Hong Kong team led by Dr. W. Seto980 and another in Toronto led by Dr. Mark Loeb,981 suggest no substantial benefit to wearing a surgical mask over an N95 respirator.

Citing those studies, one expert told the SARS Commission:

You have to go back to the early days. So there’s some stuff from Hong Kong that were published in The Lancet in May. And there is some data out of the Scarborough Grace hospital from, particularly, in their intensive care unit from very early in the outbreak before they realized what they were dealing with. And it looks at nurses in the ICU there and what personal protective equipment they used and whether they were protected or infected. The things that fall out of that as being statistically significant are if you put on a mask consistently, and it did not matter much if it was an N95 mask or surgical mask, and did some hand hygiene consistently, and there is similar kind of data from Hong Kong.

Despite the opinion of this expert and others, there is no consensus on the conclusions that can be drawn from these two studies.

A Vancouver team of researchers who conducted a major study on respiratory protection commissioned by the Ontario Hospital Association’s Change Foundation acknowledged the importance of these two studies, but also pointed to their shortcomings:

---

980. Seto et. al., “Effectiveness of precautions against droplets and contact in prevention of nosocomial transmission of SARS”.
Seto and colleagues showed that wearing any mask was protective against SARS in a case-control study of 13 HCWs [health care workers] who developed SARS and 241 controls who did not. Regularly wearing gowns was protective in univariate analyses, but only mask (surgical or N95) use was significant in the multivariate analysis.

The conclusions from this study must be viewed with caution because of the small number of cases and because the study excluded HCWs from one hospital with a large outbreak where exposure to aerosolizing procedures was likely.

In another study, Loeb et al. constructed a retrospective cohort of 43 intensive-care unit nurses from Toronto. Eight of the 32 nurses who had direct contact with a patient with SARS laterly developed SARS themselves. Regular use of N95 respirators and surgical masks was associated with protection from SARS when compared with irregular or no mask or respirator use … There was a trend toward increased protection from the N95 respirators in comparison with surgical masks, but this was not statistically significant. Again, the number of cases limited the power of this study.\textsuperscript{982}

Experts who questioned the value of N95 respirators over surgical masks also pointed to the fact that SARS was controlled in Vietnam without their use:

Although a great deal of attention was focused on the need for N95 respirators or even respiratory protection with higher protection factors, it is also worth noting that in Vietnam, N95 respirators were not available until the third week of the outbreak. However, this did not prevent Hanoi from becoming the first affected jurisdiction to effectively control SARS; masks and barriers with spatial separation were thought to be the key control factors.\textsuperscript{983}

Vietnam did indeed control SARS despite an initial lack of N95 respirators. But as Table 3 indicates, Vietnam also had the highest percentage of health workers among its SARS cases.

The fact that N95s were not used at first in Vietnam, where 57 per cent of those who got SARS were health workers, hardly supports those who campaign against the N95.

The debate over whether N95 respirators were really necessary for routine patient care is actually two separate debates. The first is whether it was the right decision to require the N95 in late March 2003, during the difficult early days of the outbreak. The second is whether, in hindsight and with the benefit of all the scientific research to date, the decision can be seen in a different light.

It is difficult to fault the early decision to require the use of N95 respirators. The officials who led the response to SARS were taking a prudent approach in the face of a mysterious new disease. As Dr. James Young told the SARS Commission public hearings:

… we were dealing with an outbreak where we did not know for sure that it was a virus, we did not know for certainty what virus it was, we did not know what symptoms and what order of symptoms SARS presented with.

We had a vague idea that some of the symptoms might include fever and cough. We did not, for example, for some period of time, realize that

---

about 30 per cent of patients also could produce – present with diarrhea. We did not know how long it incubated for. We did not know with certainty whether it was droplet-spread or whether it was airborne. We did not know when it was infectious. We did not have a diagnostic test for it and still do not have an accurate diagnostic test. We had no way of preventing it, we had no vaccine and we had no treatment.

What we had was an illness with many unknowns and virtually no knowns.985

Knowledge about SARS was slow in coming, whether it was about how it spread or how far it had in fact spread.

Dr. Young told the SARS Commission’s public hearings:

…it’s not like a forest fire which, in and by itself, can be difficult enough to control, but if I want to know the size of a forest fire, I can get above the forest fire, see where it is and build a barrier so that the forest fire does not jump over that barrier, and even if it does, I may be able to have a series of smaller fires I can put out.

The theory in controlling something like SARS is the same, but the difficulty and the problem is, I have no idea where it is. I only know where it was 10 days ago and I have to not only catch up that 10 days, I must get further ahead.986

To take Dr. Young’s analogy further, if you don’t know where an outbreak currently is, you don’t know in real time if it’s expanding or contracting. You also don’t know in real time whether your current containment efforts, including levels of respiratory protection, are working.

Under these circumstances, and in view of the initial scientific uncertainty over SARS, provincial officials cannot be faulted for taking a better-safe-than-sorry approach to worker safety and respiratory protections by mandating the use of N95 respirators.

Now, with the benefit of post-SARS scientific research and the arguments of those

who opposed in good faith the use of the N95, can this decision still be questioned in hindsight?

Much remains unknown about SARS and about our understanding of how respiratory infections are spread. Research since the outbreak has shed some light on SARS and its mechanisms of transmission. The research shows how little was known during the outbreak and how much remains unknown even now about this new disease.

As noted above, knowledge about how SARS is transmitted has evolved significantly since the outbreak. Some recent studies suggest that it may be spread by airborne transmission. These studies lend further weight to taking a prudent precautionary approach to the protection of health workers against a new disease whose method of transmission is not fully understood.

In addition to all the research that suggests a risk from airborne transmission, there is another important reason to remain cautious about how SARS is transmitted and thus to require a higher level of protection than just a surgical mask.

One senior occupational medical expert suggested that the high number of health workers who got SARS is itself reason enough to use higher levels of respiratory protection:

Clearly the high morbidity and mortality associated with SARS – that’s another reason to utilize the N95. A lot of literature dealing with SARS tends to talk about contact and droplet transmission. There are some reports about Vietnam and about how they only wore surgical masks. So it’s still controversial in the literature about what would be appropriate from a transmission basis. However, there is reason to recommend airborne precautions and N95 due to the high morbidity and mortality associated with this disease.

Dr. Annalee Yassi told the Commission there was very little downside to using a higher level of protection:

Even if we don’t have strong evidence that the transmission of infection would have been different had there not been N95s, we do know that N95s do protect better than surgical masks. There was really no downside, other than some trivial cost factor. It is trivial in the bigger picture when you look at the billions and billions of dollars spent on the outbreak. The extra little cost of an N95 versus a surgical mask is more than made up for by the

1103
better degree of protection that it provides … If health workers felt more protected wearing an N95 when someone is coughing and sneezing, then why not. It was the right decision then and it still is the right decision.

Although scientific research into SARS transmission continues, it appears that the initial dogmatic statements dismissing the possibility of airborne transmission were premature. SARS demonstrated the importance of taking precautionary approach to transmission of a new respiratory disease and to requiring the best system of respiratory protection for hospital workers.

Setting aside the ongoing droplet-versus-airborne debate, the Commission heard other compelling arguments favouring a precautionary approach requiring higher levels of respiratory protection.

A number of witnesses remarked that unforeseen events and accidents happen in hospitals that might inadvertently generate aerosolized particles. Experts note that even if SARS is primarily droplet-spread, no one knows when an incident might happen in a hospital to cause the inadvertent generation of aerosols.

One CDC expert said:

… when you look at the R0 it suggests it’s probably not airborne in the same sense of measles or anything like that. When you look at epidemiologic links, people down the hallway, around the corner, they’re not getting sick. But in health care facilities, when you have people in, you just don’t know sometimes when you’re going to have an aerosol-generating procedure happen and it could happen precipitously, and because of those issues and because of issues like this, we’re going to continue to recommend airborne precautions.

Nora Maher, an occupational hygienist with the Occupational Health Clinics for Ontario Workers, told the SARS Commission’s public hearings:

In determining how to control a hazardous exposure, it is important to take into account the chance of human error. No worker wants to make a mistake; no one sets out to undertake a task with more risks than necessary. The best controls will be those that have a failsafe or backup mechanism built in and to evaluate.987

Opposition to Fit Testing

Fit testing\(^{988}\) was the most contentious safety issue during SARS.

Nurses and their unions were quite properly angry that hospitals were ignorant of the long-standing 1993 legal requirement for fit testing:\(^{989}\)

- One prominent hospital infection control director insisted in a June 2003 memo to health workers that “Canadian regulations have never required fit testing in the healthcare setting.” Nothing could have been more untrue. While no one questions the good faith of this person, there is something profoundly wrong with a system in which a person in this position can be so utterly wrong about worker safety in hospitals.

- An article by some Canadian experts in the *British Medical Journal* made the same point: “Fit testing had never been required in the Canadian health care setting.”\(^{990}\)

\(^{988}\). Fit testing helps users select a respirator that best fits their faces and teaches them how to get a proper seal each time they use respirator, a procedure known as a *seal check*, and how to safely don and doff a respirator. A test verifies that the chosen respirator works properly. There are two types of tests. One is called a *qualitative fit test* and “relies on the user’s subjective response to taste odour or irritation.” The other is a *quantitative fit test* and “relies on an instrument to quantify the fit of a respirator” (Healthcare Health and Safety Association, *Respiratory Protection Programs*).

\(^{989}\). Section 10 of the Ontario Regulation 67/93 requires:

10. (1) A worker who is required by his or her employer or by this Regulation to wear or use any protective clothing, equipment or device shall be instructed and trained in its care, use and limitations before wearing or using it for the first time and at regular intervals thereafter and the worker shall participate in such instruction and training.

    (2) Personal protective equipment that is to be provided, worn or used shall,

    (a) be properly used and maintained;

    (b) be a proper fit;

    (c) be inspected for damage or deterioration; and

    (d) be stored in a convenient, clean and sanitary location when not in use. O. Reg. 67/93, s. 10.

• Health Canada also seemed unaware of this Ontario requirement. A Canada Communicable Diseases Report on the April 13, 2003, intubation at Sunnybrook said: “In addition, at the time these exposures occurred, fit testing was not recommended by Canadian public health authorities; such testing has been mandated in the United States since 1972.”\textsuperscript{991}

Officials at a number of hospitals told the Commission that they only become aware of the legal requirement of fit testing when the May 13, 2003, directives\textsuperscript{992} were issued.

As a result, fit testing did not begin in most hospitals until May 2003. Most health workers who used N95 respirators were not fit tested until June 2003. Not surprisingly, the proper fit of a respirator was a problem for many health workers. The ONA survey found:

50\% of respondents experienced problems with the masks not fitting properly, and 8\% were told to return to work without a properly fitting mask.\textsuperscript{993}

Unions were angry that so many health workers had to go through SARS without being fit tested as required by law.

ONA and OPSEU said in their joint presentation at the public hearings:

Finally, fit testing began, sporadically due to union complaints and a nurse’s June 6th work refusal. The Ministry of Labour ordered that the

\begin{footnotesize}
\begin{enumerate}
\item All six directives issued that day contained the following language:

Personal protective equipment must be properly used and maintained consistent with the \textit{Occupational Health and Safety Act Reg. 67/93} s.10. N95 or equivalent masks must be qualitatively fit tested to ensure maximum effectiveness. (See NIOSH website at \url{www.cdc.gov/niosh} -Publication No.99-143.)

\item Hay Group, “Nurses’ Perspective on the Outbreak of SARS in Toronto” (March 2006), p. 10.
\end{enumerate}
\end{footnotesize}
nurse be fit tested before being required to work in a workplace that
required respiratory protection.994

Fit testing was a hot-button issue for the health system, but for different reasons. Many in the health care system questioned the scientific basis for fit testing and were angry at the logistical challenge of a procedure that, in their view, had limited value.

One prominent infection control practitioner said:

We want to point out that fit testing of masks, or the lack of fit testing of masks in Canada, we believe to be a red herring and was not part of the reason for transmission of the SARS virus.

The Ontario Medical Association told the SARS Commission public hearings:

At the time when mask fit testing was first proposed, we followed the directive but we did ask for the scientific evidence that this fit testing would make a difference.

In our own comprehensive literature search, we have not found any evidence to support mask fit testing as it is being proposed in Ontario. In fact, we have been instructed during the current planning of this massive project not to ask for the evidence.995

An infection control practitioner told the Commission in a confidential interview:

I think people in Canada did not see that this was a really big issue, the fit testing of the N95 masks, and I think a lot of experts in Canada still do not believe that it is a big issue. It may be a big issue in industry, where you are wearing N95 or N99, N100 masks for chemicals, where you are dealing with vaporized chemicals; that is probably or certainly is a whole different level of protection you require. But a lot of experts still believe that for biologic agents, there is not good evidence that you need to go through all of this; extra protection that is offered through the fit testing is not necessary for biologic agents.

Part of employers’ frustration over fit testing was that it meant they would have to carry many different types of respirators, at a time when there was much concern over respirator shortages. As was noted in the second interim report, getting enough supplies of N95 respirators was a widespread problem during SARS.

The Ministry of Health and Long-Term Care noted the problem of masks during its presentation to the Commission at public hearings:

> The lack of a domestic mask supplier and an insufficient inventory of masks to deal with the infection protocols as the emergency progressed was also problematic.\(^996\)

An article in *The Lancet* by some Toronto experts describes the particular challenge of getting enough masks:

> ... submicronfiltering masks (e.g., N95 masks) were in variable supply, because before SARS such masks were used only for patients with airborne infections and hence most facilities would have only kept a limited supply. With 211 hospitals in Ontario alone requiring these supplies, Canadian suppliers rapidly ran out of stock. There was no pre-existing supply stockpile, and our mask supplies were obtained from foreign manufacturers. Because SARS was a worldwide threat, there was great difficulty in acquiring masks from other countries, since foreign governments understandably wanted to keep such supplies for their own citizens.\(^997\)

St. Michael’s Hospital said at the public hearings:

> Supplies were particularly problematic as there is not enough masks available in the system for optimal safety. After fit testing having supplied the right type of mask for the right staff member complicated the issue. The requirement for mask fit testing was a significant challenge. St. Michael’s Hospital went to great lengths to comply with provincial directives with respect to fit testing.\(^998\)

---

996. SARS Commission Public Hearings September 30.
Some experts argued during SARS that fit testing was not necessary because it was sufficient to teach users to perform a seal check.

An infection control expert who argues against the N95 and against fit testing told the SARS Commission in a confidential interview that a seal check is a good substitute for a fit test:

An N95 mask, the more important thing is the design of the mask rather than the fit testing. A well-designed N95 mask applied properly so the person knows to fit it around his face and does the test for the seal has a 93 per cent effective seal in terms of protection.

... if you fit test it, you could get that up to 95 per cent and that is a marginal difference, so the issue around fit testing these masks, to say that was a large issue in the middle of this outbreak I think was a huge mistake, and a huge disservice to those people taking care of the patients.

On the particular issue of whether a seal check is a substitute for a fit test, recent research indicates that "a seal check should not be used as a surrogate fit test." 999

On the overall value of fit testing, a study by the Institute of Medicine concluded:

By contrast, the ability of an individual wearer to obtain good face piece fits is far more varied and is a function of the facial dimensions of the wearer, the training received by users to ensure that the device is properly placed on the face each time the respirator is donned, and how closely the

999. "Guidelines issued by the Centers for Disease Control and Prevention and the World Health Organization state that health workers should wear N95 masks or higher-level protection during all contact with suspected cases of severe acute respiratory syndrome. Before use, the manufacturer recommends performing a user seal check to ensure that the mask is fitted correctly. This study aimed to test the ability of the user seal check to detect poorly fitting masks. This study is a retrospective review of a mask-fitting programme carried out in the intensive care unit of the Prince of Wales Hospital in Hong Kong. In this programme, all staff were tested with two types of N95 mask and one type of N100 mask. The results of the documented user seal check were then compared with the formal fit-test results from a PortaCount. Using a PortaCount reading of 100 as the criterion for a correctly fitted mask, the user seal check wrongly indicated that the mask fitted on 18-31% of occasions, and wrongly indicated that it did not fit on 21-40% of occasions. These data indicate that the user seal check should not be used as a surrogate fit test. Its usefulness as a pre-use test must also be questioned." J.L. Derrick, Y.F. Chan, C.D. Gomersall, S.F. Lui "Predictive value of the user seal check in determining half-face respirator fit," J Hosp Infect. 59 (2005): 152-55.
device matches the size and shape of the wearer’s face. Coffey et al. (2004) have demonstrated that subjects who wear most N95 filtering face pieces without prior fit testing fail to achieve the expected levels of protection, and that persons passing a qualitative or quantitative fit test will achieve the expected level of protection (Coffey et al., 2004).\footnote{1000. Institute of Medicine of the National Academies, “Reusability of facemasks during an influenza pandemic: facing the flu: report brief” (April 2006), http://222.nap.edu.}

One expert who campaigned heavily against the N95 and fit testing went so far as to say that because we got through SARS without fit testing, we therefore did not need fit testing:

We got through SARS I and managed it, controlled it, without fit testing for the N95 masks.

The logic of this confident assertion is not immediately apparent. Ontario certainly managed to get through SARS I without fit testing, but almost half of those who got SARS were health workers. The fact that we got through SARS without fit testing in an outbreak where 169 health workers caught it on the job is no argument against the evidence that fit testing provides a better level of protection.

Some who campaigned against the N95 and fit testing distorted the debate by setting up a straw man to knock down. They suggested inaccurately that the N95 and fit testing had been held up as the magic bullet against SARS. No one ever said the N95 and fit testing were magic bullets.

No one ever said that fit testing “is the answer.” Yet those who campaigned against fit testing did so on the inaccurate basis that those in favour of fit testing said it was the answer. One hospital expert who wrongly insisted that no Ontario law required fit testing put it like this:

In SARS, both myself and many of my colleagues believe that fit testing is not the answer to protecting health workers.\footnote{1001. Michael Gardam, Fit testing memo, June 2003.}

To the Commission’s knowledge, no expert in worker safety suggested that the N95 respirator or fit testing were the be-all and end-all to containing SARS. No expert in worker safety believed the N95 respirator or fit testing could, or should, be singled out as ends in themselves.
These attacks on the N95 and fit testing, this focus on one component only of the hierarchy of safety controls so absent from Ontario hospitals during SARS, is just one more piece of evidence that the health system during SARS lacked a basic understanding of worker safety principles.

Safety experts regarded N95 respirators and fit testing not as magic bullets but as simply one part of a respiratory protection system that should include:

- A hazard assessment of the workplace
- The selection of appropriate respiratory protection based on the hazard assessment
- Health assessment and ongoing surveillance of respirator users
- Fit testing
- Initial and ongoing training and education

Perhaps the most important respiratory protective lesson from SARS is the importance of focusing not just on one protective component, whether it’s the N95 respirator or fit testing. To return to the title of this chapter, it’s not about the mask; and it’s not about fit testing. It’s about a whole system of safety controls in which the respirator and other personal protective equipment are simply the last component, the final line of defence.

That bigger safety system, of which the respirator is just one small part, is known as the hierarchy of controls. It is a fundamental principle of the worker safety discipline of occupational hygiene. Among these controls, personal protective equipment is the last line of defence, not the first:

… all available options for controlling the hazard should be put into place and that when these controls are not possible or not sufficient to control the risk, personal protective equipment such as respirators should be implemented. The hierarchy of controls is as follows:

1003. Occupational hygiene, which is often called industrial hygiene in the U.S., is defined as follows: “The science and art of anticipating, recognizing, evaluating, and controlling chemical, physical, biological, ergonomic hazards that are in or originate from the workplace” (Salvatore R. DiNardi and William E. Luttrell, *Glossary of Occupational Hygiene Terms*, [Fairfax, VA: American Industrial Hygiene Association, 2000], p. 106).
1. Engineering controls
2. Administrative controls
3. Work practices
4. Personal protective equipment.

These controls are meant to address hazards through control at the source of a hazard, along the path between the worker and the hazard and lastly, at the worker.

Controls that are implemented at the source should be put into place first. These include using engineering controls such as enclosing the hazard or using local exhaust ventilation. An isolation room with negative pressure ventilation is an example of an engineering control aimed at the source of the hazard.

Controls that are implemented along the path should be put in place next. These include general exhaust ventilation or the use of shielding or barriers.

Administrative control and workplace practice controls are also critical. These controls include such program components as processes to ensure early recognition and appropriate placement of patients who are infectious, surveillance for detection of outbreaks, adequate cleaning and disinfection of patient care equipment and the environment and education programs for health care workers about identifying and managing risk.

If, after implementing controls at the source and along the path does not eliminate the worker's risk of exposure, then controls at the worker can be put in place. These include the use of personal protective equipment such as respirators and eye protection.

The essential point from the hierarchy of controls is that employers should not rely exclusively on personal protective equipment (PPE) to protect workers. All other means of control should be used to protect workers and PPE used only when other controls have not eliminated or reduced the hazard significantly.1004

Worker safety principles like the hierarchy of controls are not new. They had been developed long before SARS. Worker safety experts knew how to use these systems, these processes, these procedures and this equipment to protect nurses and other health workers.

As Health Canada noted in a worker safety manual issued in 2002, close cooperation between worker safety and infection control is essential for the safe operation of a health care facility. Health Canada’s *Prevention and Control of Occupational Infections in Health Care* says:

> A component of the [worker safety] program relates specifically to infection control and must be planned and delivered in collaboration with the Infection Control (IC) program of the workplace ... This document supports the close collaboration of OH personnel with those responsible for the IC program ... It notes the essential collaboration of both groups working together where responsibilities overlap, especially in the management of outbreaks.1005

Tragically, this knowledge was not used during SARS. This expertise was ignored.

As one hospital said in its submission to the Commission:

> It was interesting to note that an occupational hygienist was part of the CDC team called in to help review how SARS was being spread; earlier recognition and utilization of local professional resources (e.g. through the Canadian Registration Board of Occupational Hygienists, the University of Toronto graduate program in occupational hygiene, etc.), may have helped contain the problem much sooner.

It is time for Ontario to stop the turf wars and remove the barriers that prevented the use of this expertise during SARS to protect health workers.

---

Progress Since SARS

Some experts who campaigned during SARS against fit testing have come to accept that any worker required to wear an N95 respirator should be fit tested as required by law.

One infection control expert who opposed fit testing said after SARS:

… if you need an N95 mask, it should be fit tested and that’s one issue, and I don’t think anybody’s going to argue with that anymore.

A senior Ministry of Labour official who bore the brunt of the hospital establishment’s opposition to fit testing told the Commission that the climate has changed:

I think they have moved on. Now the question you get nowadays is when should you use the N95? One doesn’t have the same resistance to fit testing. The big question is when do we need N95s.

Part of the change of heart may be due to the large number of post-SARS studies in support of fit testing.

Representatives of health workers, however, have detected continuing resistance to fit testing. They have:

… participated in many government round tables that have discussed personal protective equipment during a response to an outbreak. We have been told the science of respirator fit testing is not perfect, and thus fit testing does not guarantee that a respirator will be completely effective in protecting against airborne hazards. While this seems to be news to the MOHLTC, the occupational health and safety community has long been well aware of this. The response of safety professionals and researchers is to strive to improve fit testing, not abandon it.1006

As noted earlier, the current Chief Medical Officer of Health has taken steps to try to bridge the wide gulf separating infection control and worker safety. However, only time will tell whether her efforts will bear fruit.1007

Conclusion

Those in charge of the system that failed to protect health workers during SARS undoubtedly acted in good faith. But during most of the outbreak they were regrettably unaware of their occupational safety obligations under Ontario law. They were unaware until reminded late in the outbreak that when health workers have to use N95 respirators, employers must ensure that the respirators fit properly and that health workers are trained in their limitations and safe use. This has been Ontario law since 1993.

The Ministry of Labour may have acted in good faith, but it did little until late in the SARS outbreak to proactively inspect health care workplaces to ensure that health workers were using the appropriate respiratory protection and were properly trained in its use. The absence of the Ministry of Labour was especially significant because the health care system had little experience or expertise in N95 respirators or the respiratory protection programs necessary to ensure that N95s safely provide their intended level of protection.

The fact that about 45 per cent of all SARS cases were health workers demonstrates how badly respiratory protection and other worker safety issues were handled.

The primary role of occupational health and safety laws, regulations and systems is solely to protect workers in many workplaces.

1007. Dr. Sheela Basrur notes in her letter of March 9, 2006, to Ms. Linda Haslam-Stroud, RN, President, Ontario Nurses’ Association:

We recognize the need to ensure that the perspectives of occupational health and infection control receive consideration. In light of this, an occupational health physician is included in the membership of PIDAC and has been sitting on the committee since the inception of PIDAC in 2004. However, we see the importance in continuing to strengthen our links with the occupational health field and a physician delegate from the Ministry of Labour is now also sitting on PIDAC. This highlights our commitment to ensuring that occupational health and safety expertise is brought to the table during all PIDAC deliberations now and in the future. We are confident that building on this approach will assist in ensuring stronger linkages between occupational health and infection control on matters of science.
In health care settings, occupational health and safety protections perform a double duty, safeguarding workers while also shielding patients and visitors.

As the Ontario Nurses’ Association and the Ontario Public Service Employees Union told the Commission in their joint submission:

Workplace health and safety is important in any workplace, but in a healthcare environment it’s doubly important. If workers are not protected from health and safety hazards, patients and the public are not protected either. It’s that simple.\textsuperscript{1008}

Scientific knowledge changes constantly. Yesterday’s scientific dogma is today’s discarded fable. When it comes to worker safety in health care, we should not be driven by scientific dogma. We should be driven by the precautionary principle that reasonable steps to reduce risk should not await scientific certainty.

Until this precautionary principle is fully recognized, mandated and enforced in our health care system, nurses and doctors and other health workers will continue to be at risk from new infections like SARS.

\textsuperscript{1008} SARS Commission Public Hearings, November 17, 2003.
Did Politics Intrude?

There is widespread suspicion that political and economic pressure affected Ontario’s response to SARS. Union officials, nurses, doctors, people who fell ill, families of those who died asserted again and again their feeling that someone, somewhere, somehow, exerted pressure to minimize or hide SARS, or not call a SARS case SARS, or declare SARS over because of its devastating effect on the economy.

Those who assert these suspicions point to the timing of the World Health Organization travel advisory imposed against Toronto on April 23, 2003. The advisory was lifted on April 30 only after high-level political intervention by the Minister of Health, who flew to Geneva with public health officials. That was followed in mid-May by the relaxation of precautions, the new normal, announcements that SARS appeared to be over and that the health system and the economy could return to business as usual. Those who assert this view point to the disastrous May 23 news conference where news of the second outbreak was pried out of officials only in the face of skilful cross-examination by the media. They also point to the patients at North York General who had SARS in April and May, although the hospital and public health officials failed to diagnose and disclose these cases as SARS.

The suspicions, with one exception, are unfocused and unspecific and they name no names or events or alleged events or conversations or documents. Some who hold these suspicions point to politicians or government in general terms; others point to hospitals or public health or physicians.

In all the interviews and documents and investigations, only one specific allegation of pressure emerged, not that there was pressure to hide SARS, but that there was pressure to back off an investigation into health worker safety. The allegation surfaced during the followup interview of a confidential source that the Ontario Cabinet Secretary, as the result of a phone call from the CEO of Mount Sinai Hospital, directed the Ministry of Labour to cancel a worker safety investigation scheduled for Mount Sinai on June 13, 2003. Immediately upon receipt of this late-breaking allegation, the Commission interviewed 13 witnesses, some more than once, and examined documents that included contemporary emails, memoranda and various government
and hospital paper trails obtained by way of subpoena. The results of this investigation are found in Chapter Three, under the heading “June 13 Cancellation at Mount Sinai,” and do not form part of this chapter.

As for the persistent yet vague suspicions of improper political and economic pressure, the Commission noted in its first, 2004, interim report that it had at the time of writing found no evidence of political influence on public health decisions:

The Commission on the evidence examined thus far has found no evidence of political interference with public health decisions during the SARS crisis. There is however a perception among many who worked in the crisis that politics were at work in some of the public health decisions. This perception is shared by many who worked throughout the system during the crisis. Whatever the ultimate finding may be once the investigation is completed, the perception of political independence is equally important. A public health system must ensure public confidence that public health decisions during an outbreak are free from political motivation. The public must be assured that if there is a public health hazard the Chief Medical Officer of Health will be able to tell the public about it without going through a political filter. Visible safeguards to ensure the independence of the Chief Medical Officer of Health were absent during SARS. Machinery must be put in place to ensure the actual and apparent independence of the Chief Medical Officer of Health in decisions around outbreak management and his or her ability, when necessary, to communicate directly with the public.1009

The first interim report also said:

... the Commission has not at this stage of its investigation found any evidence of political interference with public health decisions during the SARS crisis. There is however a perception among many who worked in the crisis that politics somehow played a part in some of the public health decisions. Whatever the ultimate finding may be on this issue, Dr. D’Cunha’s approach left too many colleagues with the perception that he was too much a political animal and too little an independent public health professional.

1009. SARS Commission first interim report, p. 56.
It is impossible to say, in the end result, that Dr. D'Cunha’s difficulties made any ultimate difference in the handling of the crisis. Although his colleagues were frustrated by his approach to things, the crisis was to a large extent managed around him. It is hard to say that the overall result of the SARS crisis would have been different with someone else at the helm.\textsuperscript{1010}

The Commission noted similarly in its second, 2005, interim report:

While the Commission has not, to date, found any evidence of political interference during SARS, the problem is that many people suspected political interference and many were convinced that politics were at work behind public health decisions. The mere perception of political interference, whether true or not, will sap public confidence and diminish public cooperation.\textsuperscript{1011}

This section will deal with:

- The nature and content of the suspicions;
- the evidence of key witnesses, such as the Premier and the Minister of Health, who would have been in a position to exert influence; and
- the evidence of key witnesses such as public health, hospital officials and physicians who would have been in a position to observe any influence.

The conditions that fostered such suspicions include:

- the timing of the travel advisory and its lifting, followed shortly by the relaxation of precautions and the “new normal”;
- the intense desire of everyone in the health system and the community, exhausted and weary of SARS and at the end of their tether, that SARS should be gone, and their fervent hope that it was in fact gone;

\textsuperscript{1010} SARS Commission first interim report, p. 55.
\textsuperscript{1011} SARS Commission second interim report, p. 17.
• The regrettable perceptions created by Mayor Mel Lastman’s outburst against the World Health Organization and the invocation by some officials in the office of the minister of health and the Chief Medical Officer of Health of the minister’s name and authority when requesting information from front-line public health and hospital workers;

• The Commission’s steps to investigate the suspicions of political and economic pressure; and

• The Commission’s analysis and findings.

These suspicions of political and economic pressure on public health and hospital decisions in order to protect the economy and hospital finances have two common elements. First, they are strongly held by those who hold them. Second, those who hold them are unable to point to any evidence to support their suspicions.

The suspicions were voiced by a health union leader in the context of the WHO travel advisory, its effect on the economy and the political effort to reverse it:

Answer: Quite clearly economic interests took over at an early stage. Quite clearly doctors put pressure on authorities to get back to normal … The business community started to get on board and economic interests took priority here and the whole health and safety of members took a back seat with the WHO advisory in April. The whole thrust of trying to get it reversed centred around economic factors.

The ball was dropped in the middle of May. [Minister Tony] Clement sent out the signal that the crisis was over and then we have the second outbreak. North York General, St. John’s and the Whitby wing of Lakeridge Hospital.

My concern is that the economic interests predominated at expense of health and safety of members.

Question: How does one prove it? … How can you prove it was linked to economic reasons?
Why was the whole thrust of the provincial government centred around getting that advisory lifted? That was the sole preoccupation of the Minister of Health. His job should have been to protect the health and safety of the people in the province and they didn’t do that.

The suspicions in the context of hospital’s finance were expressed by two nurses at North York General:

There was a lot of pressure from the media, from the politicians, from the business community, that the city was going to lose so much money and all I kept thinking was how much money will they lose if this gets out of control …

The whole thing was being kept hidden because they were afraid of a panic, afraid of the impact on the economy …

As noted elsewhere in the report, one North York General emergency room nurse said she thought there was tremendous pressure to downplay SARS:

… There was a tremendous pressure on the politicians from the business community, or perceived pressure, to downplay the danger of SARS. That the danger was to downplay it to the staff who were looking after the patients. And to put the staff at risk. And to put all of the community at risk because you’re not containing it strictly.

These suspicions were voiced at the public hearings by Dr. Jan Kasperski, Executive Director and CEO of the Ontario College of Family Physicians:

Bowing to political pressure, the new normal was put into place, mostly to reassure tourists that Toronto was open for business.1012

Dr. Kasperski continued with a thoughtful analysis of the lack of support given to frontline family physicians by the health system, but he pointed to no evidence to support a suspicion that the “new normal” resulted from political pressure to reassure tourists.

Although these witnesses were convinced that economic and political pressures were somehow at work, they were unaware of any actual evidence of such pressure. Also unaware of

such evidence was a doctor at North York General who held similar suspicions:

Question: Did you sense that SARS had gone away and wasn’t a problem?

Answer: I didn’t think it had gone away. There was, well, significant if you would political pressure to relax the protocols and restrictions, my personal opinion obviously, but with trying to get Toronto off the WHO travel advisory.

Question: What do you mean by political pressure?

Answer: If you were aware of the media, there was pressure because of the way it affected Toronto coming into the summer, to get Toronto off the WHO travel advisory because of the, if you will, the political, economic effect it was going to have. There was this will to have SARS go away and be declared resolved. And the impression that it started at a public health, governmental level rather than within a particular hospital …

Question: On the question of political pressure, which means different things to different people, we’re obliged to see if there was any actual evidence of political pressure. Do you know of any actual evidence of political pressure?

Answer: Exerted by politicians? No, I’m not aware of that. I know that there was a will, if you will, a general will in the community to have Toronto declared SARS-free, you know?

The doctor’s observations are significant for two reasons. First is the assumption that underlies most suspicion of pressure, the assumption that the relaxation of precautions and the new normal and the announcements that Toronto was open for business, because they followed so closely the economic disaster of the travel advisory and the political effort to have it lifted, must have been connected to them.

The second reason the doctor’s observations are significant is that as soon as he thought about what he meant by “political pressure,” he crystallized his suspicion into the proposition that there was a general will in the community to have SARS over
and to be SARS-free.

This doctor’s insight goes a long way to explain the widespread suspicion that there was political and economic pressure to say that SARS was over. The doctor is correct that there was a general will in the community to be SARS-free. Everyone wanted SARS to be over. Politicians, health officials, emergency officials, nurses, business people, doctors, hospital officials, paramedics, patients and everyone touched in any way by SARS wanted it to be over and gone.

Front-line workers were exhausted. The restrictions of masks, the constant changing of gowns and gloves, the inability to breathe easily through the N95 respirator, the total disruption of hospitals – indeed, the terrible disruption of every health system workplace and every health worker’s daily tasks – their inability to fulfill their professional calling and give patients the kind of personal care so disrupted by SARS, the inability to treat cancer and cardiac patients who needed medical care: All this and more created a profound sense of frustration and a strong desire for a SARS-free return to the normal work of caring for the sick.

There may for this reason be a sense in which the wish is fodder to the thought, a sense in which people throughout the system created in themselves their own pressure to believe that SARS was gone.

**Reasons for Suspicion**

The perception that SARS was politically driven arose principally from two circumstances:

- The trip by the Minister of Health and senior officials to Geneva to secure the reversal of the WHO travel advisory.

- The coincidence in time between the lifting of the WHO travel advisory on April 30 and the lifting of the emergency and the proclamation of the new normal in mid-May, based on the belief that SARS was gone.

The evidence that the Geneva trip and the lifting of the emergency and the proclamation of the new normal were not politically motivated is noted in this section. This evidence is uncontradicted and the reasons for considering it plausible are reviewed below.
There were also less prominent reasons for the perception, including:

- The perception that the office of the Chief Medical Officer of Health was within the political sphere of the Minister of Health, a perception fostered by the invocation of the Minister’s name by some officials when asking for operational information of a medical nature.

- The bizarre attack by the Mayor of Toronto on the World Health Organization, combined with the economic boosterism of some public announcements that SARS was over.

- The intergovernmental bickering, particularly the partisan-sounding attacks by the Ontario government on the federal government.

This is a convenient place, before turning to the major reasons for the perception, to deal with these issues.

The Minister’s trip to Geneva and his reasons for it were fully in accord with the thinking of the public health and public service professionals whose advice he accepted throughout the crisis. They were convinced that the WHO decision was wrong and was based on inadequate medical and scientific information. Because of the structure of the WHO, in one sense an international political organization, the only way to bring these scientific and professional concerns to its attention at the highest level was an intervention at the political level by the Minister of Health. There was nothing inappropriate in the Minister taking this step in accordance with the views of the public health and scientific leaders.

As for Mayor Lastman’s outburst against the WHO, little need be said except to emphasize that public communication during a public health crisis should be thoughtful, measured and nonpolitical.

As for the economic boosterism of some public announcements that SARS was over, it must be remembered that every level of government was properly concerned not only with the health problems posed by SARS but with its economic devastation. There is nothing wrong with economic recovery measures so long as they do not

influence public health decisions or public disclosure of an infectious risk. The remedy against any political interference that might flow from economic recovery measures is not to discourage such measures. The remedy is to ensure, as recommended, the scrupulous structural separation of politics and infectious outbreak management.

As for intergovernmental bickering, the Commission in its first interim report noted the bad provincial–federal communication that impaired our response to SARS and the need to avoid it the next time we are faced with such a crisis. The Ontario government never lost any opportunity to criticize the federal government on any issue, from airport screening to financial compensation. The provincial attacks seldom appeared constructive and smacked at times of gratuitous “fed-bashing.” Nothing displays this anti-federal bias more than a curious document received by the Commission at the beginning of October 2003, in the last days in office of the Eves government, purporting to be a brief submitted on behalf of the government of Ontario. It consists of a lengthy partisan attack on the federal government’s SARS activity. Although disavowed by the Premier and the Minister of Health as any reflection of the position of their government, it does reflect within the ranks of senior government advisors a deep hostility to the federal government and a reluctance to miss any opportunity to blame things on it.

Although an element of healthy tension is inevitable in Ontario’s relations with the federal government, there is no room during a health crisis to indulge in this ritualistic intergovernmental bickering. As noted in the Commission’s first interim report, it is essential for governments during a public health crisis to resist their natural temptation to criticize each other. It is imperative for governments in a crisis like SARS to rise above their traditional bickering and work together in the wider public interest.

The unnecessary invocation of the Minister’s name by some within the office of the Chief Medical Officer of Health, when asking for operational information or giving operational directions, created in some quarters a perception that the operational response to SARS was politically driven. While there is no evidence that this was the case, it does emphasize the importance of a clear line between what is public health and what is politics. The government has started to clarify this line in legislation according a measure of political independence to the Chief Medical Officer of Health. This important process will remain incomplete until the government imple-

1014. Although the document is marked “Confidential,” the Commission did not solicit the document in any way, did not receive it under any promise of confidentiality and acknowledges no basis on which this government submission should be considered confidential. It will form part of the Commission’s record of public documents transmitted to the Ontario Archives.
ments the balance of the Commission’s earlier recommendations in this respect and in respect of the independence of local medical officers of health.

One similar factor that may have contributed to a blurring of the lines between politics and public health was the special role of Michael McCarthy, a senior political aide to Health Minister Tony Clement. He was perceived to be very close to Dr. Colin D'Cunha, the Chief Medical Officer of Health, and to involve himself from time to time in operational matters. There is no suggestion of wrongdoing on his part and the Commission makes no criticism of Mr. McCarthy.

The problem was not so much the role of any particular person but that the dividing line between what is political and what is public health was not made as clear during SARS as it should have been. It would be wrong to treat any public health crisis as just one more “hot potato file” to be carried and managed politically by those in the Minister’s office in the same way as physicians’ fees or hospital funding. Public health crises, for all the reasons given above and in the Commission’s interim reports, require the utmost public confidence that no political consideration can or will interfere with medical public health considerations by the Chief Medical Officer of Health.

One way to ensure a bright line between politics and public health, so essential to public confidence, is to ensure that ministerial aides stay clearly on the Minister’s side of the line without appearing to become players in their own right in the operational response to a public health crisis. The government has taken steps in the right direction by giving the Chief Medical Officer of Health a large measure of independence. Further steps need to be taken in this direction, as recommended in the Commission’s interim reports in respect of the role of the Chief Medical Officer of Health and the local medical officers of health.

Evidence of Premier and Minister of Health

The question of economic motivation and political pressure were put to Premier Ernie Eves and Minister of Health Tony Clement.

Mr. Eves said that the government’s approach to SARS was to avoid politics and act on the advice of public health and public service professionals like Dr. James Young and Dr. D'Cunha and to back them up:

I made a decision rightly or wrongly at the outset that this was not, that people should not be playing politics with this issue. I felt that it was far
too important an issue. It went right to the safety and health of Ontarians. So I purposely took a role that was not in the limelight; I did not go to appear before TV cameras every day. I thought the best thing we could do is hire the best medical and scientific brains we had or obtain them from other jurisdictions if we did not have them and empower Dr. D'Cunha, Dr. Young and others to I regarded this as a medical and scientific problem and I would like to think that is the way that it was handled. I am sure in hindsight there are always things that we think of that human beings could have done better, but I really think that we approached this on that basis …

The Premier’s Chief of Staff said:

From day one, the first day was a Wednesday, I think, of SARS I, the message back to Drs. D'Cunha and Young was, whatever you need, you got.

And the Premier added that his message to take away was:

And the cost, we will sort out how we pay for it later.

Mr. Eves said that on May 17 he accepted with some reluctance the advice of public health officials to lift the emergency, and only after he asked repeatedly:

Are you absolutely positive that this is the right thing to do, that we are getting the right information, are you sure this is all right?

And only after he received repeated assurances from Dr. D'Cunha and Dr. Young that the absence of new cases and the advice of medical and science advisors warranted the lifting of the emergency:

I think that they really, from their best judgment, and from what they knew at the time, felt that it was the right thing to do. I have tremendous amount of respect for the abilities of both Dr. D'Cunha and Dr. Young. I cannot perceive either one of them ever doing something that was expeditious as opposed to appropriate or correct and I think that they acted in their best judgment.

In respect of his overall role as Minister of Health in the SARS crisis and his approach to it, Mr. Clement said:
Mr. Clement: Basically I was the point guy from the government of Ontario’s perspective and then had to create a management structure for Drs. Young and D’Cunha that would allow each of them to do what they had to do under their respective acts, and get the job done …

I believe that the Minister has to be very much involved with the organization of dealing with the medical emergency. Very much has to be involved in all major decisions, has to vet all major decisions, very much has to be involved with the communication to the public on a regular ongoing basis and has to be involved with ensuring that whatever is done, whatever is decided upon is implemented, that there is avenues by the stakeholders, the nurses, the doctors, the public health officials, all these avenues to, if there is something going wrong, they have to be able to talk to the Minister about it. It cannot just be the hierarchy. So that’s how I conceived my role and I believe that it was the appropriate definition of my role …

I was involved at all levels. I would be a frequent participant in the POC [Provincial Operations Centre] meetings. I would be an occasional participant with Dr. D’Cunha at his initial meetings and I was a frequent participant with the conference calls with the Premier’s office and the Cabinet office and that was just the formal meetings. Then there were informal meetings that took place throughout the day and night on an as-necessary basis where I was more often involved than not. I was up to my eyeballs in it. I believe that that is the appropriate role. In terms of the communications, I believe we had something like 47 press conferences, and I was involved in over a dozen of those, so I was not an intrusion but where and when necessary to put an elected, empathetic face that was not a doctor but was suffering with the rest of us, I was there. I was there to communicate major messages such as over the Easter weekend, when we were afraid of community spread, as well as interact frequently
with my federal counterpart, which fortunately was a very strong relationship, a very positive relationship. So, that’s the role that I played …

Question: Is there a risk here that the whole issue becomes too much of a political issue?

Mr. Clement: No I think we were quite at pains to make sure that did not happen, actually. I was conscious of that issue. There is an ingrained check and balance on that, which is if you are seen as exploiting this issue for political purposes, you are absolutely crucified and rightly so. That is an ingrained check and balance on that, and I was quite at pains to make this as nonpolitical as possible. I insisted that the Opposition health critics be briefed …

As for the decision to travel to Geneva to seek withdrawal of the WHO travel advisory, Mr. Clement said:

Can I just say one thing about the WHO on the politics front? The reason that I went along was because I wanted Dr. Brundtland, head of the WHO, Director General, a former Prime Minister, a former politician, I wanted her to see the whites of my eyes. It’s one thing for public health officials to go over there and say don’t worry, everyone is on side, we’ve got everything under control, we’ll do whatever you ask us to do. The public health officials can say that, but she would want to know that there is political will, that the politicians understand how serious this is, and that the politicians are willing to do what’s necessary to meet the concerns of the WHO, which as it turned out hinged on the borders. That was the only outstanding issue. We’ve convinced them that the disease was not being communicated in the community and we’ve convinced them that our infection control was working in the hospital setting such that our rate of new infections was radically down.

So the only issue we faced in Geneva really was in federal responsibility and we were able to give them the assurance because I had worked with Anne McLellan on the ground in Geneva to give them the best of assurances. I wanted her to see the whites of my eyes. I thought that it was important for her to know that the politicians were engaged and that we
knew that if we failed that, it was not only a failure in our own community, if this thing got exported to the Third World, this could be a potential catastrophe of unimaginable proportions, and I wanted her to know that I knew that. Because she had a responsibility to the world. She had the responsibility of making sure that this didn’t come to South Africa, or didn’t come to India, or didn’t come to some place that didn’t have the public health infrastructure that we have.

So that’s why that was important, but I did not make the argument based on politics. I made the argument based on facts. I said, here is our rate of infection, here is our rate of community spread, here is what we are going to do with the federal government when it comes to border crossings. Please make the decision based on the facts, Director General, don’t make the decision based on other extraneous factors, including politics. The facts were on our side, so this was not a political appeal, it was a factual appeal to the facts on the grounds on that day on April 30th rather than where they were on April 18th. Sorry, I wanted to get that point out because it was most definitely not a political gesture, it was a strategic gesture to convince her in the language that she would understand, factual language, and also as a former prime minister respecting that politicians have to be accountable and have to be part of the solution, and not just public health officials.

As for the government’s approach to public disclosure of SARS risk, Mr. Clement said:

Very early on, I decided, you have to make a decision, you have to make a decision how you’re going to treat this with the public, and there is always advice, and I did receive advice to play it down, there is no issue, there is no problem, we got a little problem at Scarborough Hospital, let’s not create a sense of panic in the public. I rejected that advice to this extent, I believed that what would create a greater sense of panic in the public is a lack of information given the fact that death was occurring.

And so very early on, even before the state of emergency was issued, I made a deliberate conclusion that we were going to give the public as much information as we had on a real-time basis, even on a daily basis, in order that they knew exactly what we knew, and Dr. [Richard] Schabas has been critical of that, but I think that it was the right thing to do.
And I would do it again, because the alternative is to hide information from the public, and I think that would actually create more of a problem. It would create a problem of credibility with the government and the public health officials, and it would create a problem of assuming far worse than potentially was the case, which would actually fan panic rather than actually contain the panic. So yes, guilty as charged, we communicated with the public at every available opportunity and I think that was the right thing to do.

The Commission asked Mr. Clement about his state of knowledge before the disastrous May 23 press conference where the facts of the North York General outbreak emerged only under media cross-examination of Dr. [Donald] Low. Mr. Clement said that going into the press conference, he was aware of a few cases but not of the magnitude disclosed by Dr. Low, who had arrived directly from the field a few minutes before the press conference without telling the Minister or the other government officials what he later told the media:

**Question:** So going in to the press conference, had you had any kind of a briefing from any of the officials as to what might be happening?

**Mr. Clement:** Well, we usually have a briefing before every press conference, and we did so in this case, but it was literally a couple of minutes of briefing, because he had just arrived in time, as I recall, this is my recollection now. And so he didn’t, he didn’t tell us any of this during the time before we were working on our speaking notes for the press conference. So it was news to us.

**Question:** And so do you recall what your understanding of the situation was prior to hearing him respond to the media question?

**Mr. Clement:** Well, we had a few cases, but not in the magnitude that he was expressing.

As for the existence of any pressure to declare SARS over prematurely, Mr. Clement said:
Question: Was there a pressure that you could feel that grew during April as far as the WHO travel advisory and the issues that arose out of that, to be able to declare this victory?

Mr. Clement: I am glad that you mentioned that. I never felt any pressure from inside the government. There was certainly pressure from the media, and I thought to myself as the cases declined, I thought, you know, they are going to start to ask me whether this is over, and I would be the craziest health minister alive to declare this as over. You could go through every single tape and interview I did of where I was asked probably a dozen times on TV, is this over? My response was exactly the same. In early May, which is after the travel advisory, I said no, this is not over; we have to continue to be vigilant.

There could be a recurrence, so our jobs continue to ensure that we have the right procedures in place in case there is another outbreak of this or any other communicable disease. I said that ad nauseam because I knew that if I ever declared it over and it wasn't over, I would be strung up from the nearest lamp post, I knew that as a politician, as well as a human being, I knew that. So, I never declared it over. Never, ever, ever, in my discussions with stakeholders, with the media, with the POC, with the Premier, I always said we have to be continually vigilant because this may not be over.

Question: Why do you think you were getting the sense that the media was putting pressure on you? Was it a new turn in the series of stories for them?

Mr. Clement: I think there is a notion to want to declare something, they wanted to get on to other things institutionally, so yes, they were waiting for somebody to declare it over, sure. But it wasn't me.
Did you get a sense that those who were working on the issue had the same view as you did? Were there people in there in that group that were also feeling pressure or creating pressure?

Mr. Clement: No, not at a senior management. No. Evidently, this is human nature, people on the ground wanted this, there is a normal human reaction to think that this is over and now we could get back to normal. My point to them always was we will never get back to normal, that is why I’m the one who coined the phrase “the new normal.” At a Science Committee meeting, I said we had to get a new normal because we were never going back to normal but we were in the midst of creating the new normal when the second outbreak obviously occurred, but I got a sense after the fact, after the second outbreak, that human nature did its thing again and there were some people potentially who may have let their guard down because they thought that it was over. But they never got that signal from me, or I never got that feeling from anyone in the senior management group.

Question: Now the senior management group is?

Mr. Clement: I mean the POC, Dr. Young, Dr. D'Cunha, Phil Hassen …

…

Did you sense pressure? You mentioned the media. What about the hospitals themselves, the doctors?

Mr. Clement: They were desperate to get back on track. Their queues were lengthening and that is how doctors get paid. The hospitals obviously wanted to get out of the situation where every hospital in the GTA [Greater Toronto Area] was in restricted access. Obviously we handled the second outbreak in a different way. Having learned a little bit, we learned that it is easy to
shut down a hospital but not so easy to boot them back up again. It is a very complicated task, actually. So I would say the hospitals and doctors wanted to get back to normal, as quickly as possible at which point I would say to them, remember, we are never going back to normal we’re going to a new normal of infection control, the likes of which we have never seen before but yes, sure we want to normalize the new normal as soon as possible.

Question: Was there a sense of pressure from the federal government?

Mr. Clement: No, to be fair, no I wouldn’t say that. They were not that close to the ground to even make that suggestion, I wouldn’t think.

Question: What about the city? Business community? Were you sensing anything coming?

Mr. Clement: I was sensing that everybody wanted this to be over as soon as possible but again, it is not as if I had a conversation or a meeting X on day Y where the mayor said to me, get on with it, nothing like that you could, I guess it was through the media that you got a sense that people wanted to be over this, and we all did, but we knew that there had been recurrences in other, a recurrence in Singapore, a recurrence in Taiwan, the situation in China wasn’t under control yet, so I made it pretty clear that we will not do anything in haste that we would regret later. I felt pretty clear about that.

Question: There is certainly concern expressed to us, and it often does not have specific genesis, but that it was economics that drove this from about the WHO travel advisory on.

Mr. Clement: Yes, that is not true.

Question: They will say that you sent the signal. You obviously
didn’t send a direct signal. I think that they are taking your participation in response to the WHO has been a signal, that it was the economics of it that drove you to take a higher public profile at that point in time?

Mr. Clement: No. I went there because they had to hear the facts from a combination of public health officials and elected officials and I wanted them to make a decision based on the facts, so no, that is not true.

When I say pressure, I was aware that people wanted this to be over, but it is like being aware of the weather. Just because they wanted it to be over does not mean that it is going to be over. I want to make that absolutely clear. It is not as if it had any influence in my decision making whatsoever. In fact, quite the opposite, because I saw the danger of declaring prematurely that it was over and I was absolutely committed to not declaring premature victory, so I want to make pretty clear that fact outlined and highlighted to me why we could not declare prematurely that the war against SARS was over.

This evidence from the Premier and the Minister of Health, as noted below, is uncontradicted. There is no evidence in any document or from any witness or confidential informant interviewed by the Commission to suggest the contrary of what they assert in respect of the lack of any political pressure to hide or downplay SARS or to say prematurely that it was over.

Their evidence is plausible because, for reasons expanded on below, it would be political suicide for anyone in their position to attempt to hide SARS or to exert influence to secure a premature declaration that SARS was over.

Evidence from Senior Officials

The Commission interviewed many senior officials with the Provincial Operations Centre, the Ministry of Health, the Science Committee, hospitals and Public Health who were in a position to see the exertion of political influence if it existed. Some of
them were quite properly irritated by the invocation of the Minister’s name by some of those associated with the Chief Medical Officer of Health when requesting information from the field. But not one of them recalled any form of political pressure to hide SARS or to say it was over when it was not. All of them said that their message from the Minister of Health and the Premier was that the government stood ready to do whatever was necessary and to commit whatever resources were necessary to assist the professional public health management of the SARS crisis. All say that there was no political pressure to minimize or hide SARS, to say that cases were not SARS, to say prematurely that SARS was over or to hide the second outbreak.

Their evidence is typified by this comment by one of the most senior government officials involved in SARS:

The politicians were amazing. They had not a minute of doubt or criticism of our work. When SARS II broke out they said it was “too bad” and “do what you have to do to get it under control.” The politicians led. The premier said, “Fix it. Do what you have to do. You have the resources.” They never second-guessed or made political decisions. The politicians got out of the way. They made exactly the right decision to let the professionals run it. We received nothing but encouragement and pats on the back.

This observation is typical of all responses by those who dealt with the political reaches of government, and these responses support the evidence of the Minister of Health and the Premier.

**Evidence from the Health System**

Typical of the evidence from hospitals is this account from one of the most senior administrative physicians at North York General in charge of the SARS response:

**Question:** Some have said that there may have been a combination at play provincially, that there was a disincentive to declare cases to be SARS because of economic impact, political impact. You recall the WHO travel advisory and a contingent of politicians and others off to Geneva to try to persuade them otherwise, and WHO in late April dissolved it. After that point in time, was there a disinclination at all levels to call
something SARS because of the potential consequences? Did you ever sense that was becoming a factor in decisions?

Answer: I never felt any pressures about that. I never felt indirectly any pressures on the part of anybody I interacted with about that. You know, the calls were being made and I didn't get a sense that Toronto Public Health was saying, look, it's bad for the economy. They just didn't have an epilink and they didn't meet the criteria and they actually didn't meet the criteria, as identified at the time. So it wasn't like they met the criteria but let's not call it SARS. They didn't meet the criteria and it turned out not to be as black and white as that in hindsight, but at the time, the knowledge said you need an epilink. And you needed all three and they didn't have all three so they weren't SARS.

Question: Did you ever sense that, at any level, your level included or above, that there was political pressure being brought to bear on anybody?

Answer: I wasn't aware of any political pressure being brought to bear in our institution. I wasn't aware of any.

Question: Nothing caused you to wonder about it?

Answer: I read the news and listened to the news like everybody else. You know, we were hoping that SARS was over, and it would have been nice if it was, but if it wasn't, then we needed to deal with it. So it wasn't about trying to call it quicker than it should be. The question more pertained when people were discussing it about whether or not WHO was calling it right in terms of the travel advisory given that it seemed to be a hospital-based phenomenon. But I don't even remember when that discussion occurred. That might have been in SARS II when it became more clear. So I might be merging thought processes from three years ago together too close in time in retrospect. So I just,
there wasn’t a sense, as I look back at it, I don’t have a sense that that really played into our interactions with the health care system, the ones that I’m aware of. I don’t have any sense. After the fact, in SARS II, I didn’t have a sense that that was the case either.

This evidence that there was no pressure to hide SARS or to say that SARS cases were not SARS or to declare SARS over prematurely is consistent with everything said by Ministry of Health and public health officials.

It is implausible to think that officials in the Ministry of Health would be able, even if they wanted to, to conceal a plan to hide SARS. This huge and complex ministry could not turn on a dime, and it was difficult enough for it to respond to the daily demands placed upon it by SARS, let alone to participate in some form of yet undetected secret pressure. It was all it could do to manage the systems and complex interactions with other levels of government, the federal government, the local public health agencies, the hospitals, and above all its many internal divisions, including the office of the Chief Medical Officer of Health and the hospitals branch. It is implausible to think that an organization so complex and so difficult to coordinate internally could successfully conceive, manage and successfully execute a conspiracy of silence to hide SARS or its return.

It was a frustrating time for many in the Ministry, and some of them expressed their frustration when dealing with front-line hospital people. One middle-level Ministry manager told a hospital official who contemplated closing a Toronto emergency ward in mid-April because of short-staffing due to SARS that “the Ministry has no appetite for more closings.” It is clear from the entire conversation, including the fact that the manager backed off immediately when challenged, that he was not reacting to political pressure or expressing Ministry policy but simply venting a personal frustration shared by many in government and on the front line. Although the line between political pressure and personal frustration is objectively clear, expressions of personal frustration can easily be taken by outsiders already suspicious of political pressure as a sign that political pressure is at work.

Another natural response of front-line managers was driven by their desire for clarity and bright lines in the diagnosis of SARS despite the lack of a reliable or timely clinical test. One thing to fall back on was the epilink requirement before a SARS diagnosis could be made. As noted often in this report, the case definition for SARS set by Health Canada in conjunction with the World Health Organization case definition required recent contact with a SARS patient or recent presence in a SARS-affected
area like Hong Kong or China. Recent presence or actual presence at the time of diagnosis in a SARS hospital with SARS patients did not qualify as an epilink. If you had been to China, you had the required epilink, but if you were in North York General Hospital one floor down from the SARS ward, you did not have the required epilink. In hindsight this sounds counterintuitive, but at the time it was not only the standard generally accepted by every expert in the field but indeed the only standard there was.

One senior scientist at the centre of the SARS response, devastating in his criticism of Ontario’s lack of preparedness, insisted nonetheless that it was science alone that drove Ontario’s response to SARS:

Science drove policy.

As noted in the section on North York General Hospital, the belief that SARS was over was not limited to North York General. The focus on recovery was universal. One Doctor, who held a prominent leadership role during SARS, agreed that although there was no pressure to say SARS was over, after the travel advisory there was a mindset that everyone wanted it over:

Question: When it comes to the question of the relaxation in precautions, in hindsight you get certain people who say that it must have been a political decision, the guard must have been let down for economic reasons, and people say this and I say, well, how can you prove this and they say that it must have happened.

Answer: No, there was no pressure that I ever saw to hurry things.

Question: But was there a mindset that everyone wanted this to be over?

Answer: Everybody wanted it to be over, and Carolyn Abramson in the Globe said that once they ... things changed once they lifted the travel advisory, the travel advisory was a sort of a shift in the whole psychology in the city and all of a sudden everybody now was together. When the travel advisory came down, there was the City, the Province, Health Canada, everybody
was outraged and fighting together, and then when they got the travel advisory turned back, everybody celebrated about that and once everybody were getting back to normal and everybody was ... that is part of why the lack of leadership. There should have been somebody who said ... nobody questioned it. [Dr.] Jim Young went off to China to talk about our successes and how we controlled it. [Dr.] Bonnie [Henry] went with him and [Dr.] Tony [Mazzulli] went with him and nobody said, “how do you know it is over?” including myself. None of us said “well, just because,” and it is such a simple question to ask and we blew it. It is just amazing everybody blew it.

The desire to see the end of SARS was natural. People had worked beyond the normal limits of endurance, it was a frightening experience, and everyone wanted to see the end of the spread of SARS. The fact that everyone on the front lines and throughout the system wanted it to be over may in hindsight suggest over-optimism, but it provides no evidence of political or economic pressure.

Inherent Problems of Proof and Disproof

How can one ever be satisfied beyond a reasonable doubt or even on a balance of probabilities that a thing like political pressure does not exist? Judicial experience shows that it is inherently difficult to prove a negative. This is particularly so with a thing as subtle and elusive as political or economic pressure. In the first place, those who improperly exert such pressure or improperly succumb to it are unlikely to admit it unless confronted with a document. In the second place, such matters are not typically committed to documents. In the third place, such pressure can be so subtle as to defy proof. In the fourth place, there may in fact be no such pressure but underlings may create self-imposed pressure to do what they think will please their masters.1015

How can an investigator be satisfied there was no improper pressure? Improper pressure is a hard thing to find and a harder thing to prove or disprove. Even if one interviewed every single Ontario politician and Ministry and Public Health and hospital employee, and everyone denied such pressure, that would not, because of the four problems of proof mentioned above, prove there was no improper pressure.

The only thing an investigator can do is to interview the key figures and a large
number of those who played a part in Ontario’s response to SARS and those affected by SARS, from the highest officials to the front-line workers, and test their evidence against the entire body of interviews with witnesses and confidential informants and documentary evidence and the logic and experience of human behaviour.

The Commission’s Investigation

The work of the SARS Commission was highly publicized in the media and by newspaper advertisements and the Commission website and the public hearings. Confidentiality was promised to anyone who wished to come forward. The Commission conducted hundreds of confidential interviews and examined thousands of documents without finding any evidence of such improper pressure.

Analysis

No one at the public hearings, not even those who were highly critical of government and public health and hospitals, was able to recall any evidence of such pressure.

All of the key figures, including the Premier, the Minister of Health, senior officials in the Ministry and in Public Health and hospitals, and doctors, denied and refuted the suspicions that anyone exerted or succumbed to improper pressure to minimize or hide SARS or to declare prematurely that it was over.

This evidence is uncontradicted by any evidence turned up in the Commission’s investigation described above. The evidence supports the assertion of the key figures that there was no such pressure.

These uncontradicted denials and refutations are plausible for the following reasons:

- It would be political suicide to try to hide SARS or suppress evidence of its return because it would be so difficult to hide such an explosive fact and the risk of exposure would be too high. As Health Minister

1015. An example of the latter two problems is furnished by the remark by King Henry II: “Will no one rid me of this turbulent priest” The king’s remark resulted in the murder, by four of his knightly hangers-on, of the Archbishop of Canterbury. Did the King order the murder? Did he hope the knights would fulfill his wish? Did the knights follow orders? Did the knights merely want to please their master by bringing about what they thought he wanted?
Clement said in response to questions by Mr. Hunt, Commission counsel:

I knew that if I ever declared it over and it wasn’t over, I would be strung up from the nearest lamp post, I knew that as a politician, as well as a human being, I knew that.

...

There is an ingrained check and balance on that, which is if you are seen as exploiting this issue for political purposes, you are absolutely crucified and rightly so. That is an ingrained check and balance...

- It would be political suicide to try to hide SARS or suppress evidence of its return because the conspiracy of silence required to achieve it would require the participation of so many people at so many levels that leaks and exposure and disgrace would be inevitable.

- To exert improper pressure effectively in a complex health system full of feisty independent professionals and potential whistleblowers would require not only the knowledge of a large number of people but also their continuing silence to this day. The fact that no one has come forward with any evidence or even any specific allegation of improper pressure makes it highly implausible that such evidence exists.

- The Commission asked hundreds of people in confidential interviews, many of whom distrust officialdom and those in authority, if they knew any evidence of such improper pressure. No one recalled any such evidence.

- The Commission from confidential informants and by way of subpoena obtained and examined thousands of contemporary emails and documents from government and hospitals and found no evidence of such pressure.

Finding

On the basis of this evidence and this reasoning, the Commission finds that there was no political or economic pressure brought to bear on the health system or Public
Health or hospitals in order to minimize or hide SARS or to say that a SARS case was not SARS or to declare prematurely that SARS was over.
Introduction

SARS raised serious questions. Thirteen of the most important ones are addressed here. Some answers are terribly clear. Were health workers adequately protected? Clearly not. Other answers are less obvious. Could SARS II have been prevented? If so, how? This section will summarize these answers as they emerge from the Commission’s evidence and findings.

It is too easy after a public health crisis to assign individual blame. This is not to say in hindsight that mistakes were not made or that systems should not be blamed. But honest mistakes are inevitable in any human system. There is always more than enough blame to go around if good faith mistakes made in the fog of crisis are counted in hindsight as blameworthy.

The approach of this Commission as set out in its mandate and as reflected in its approach is not to apportion blame but to find out what happened, to figure out how to fix the problems revealed by SARS, to learn from these tragedies and to give a legacy of betterment to those who died, those who fell ill, those who suffered so much and those who fought it with such courage.

1. Why Does SARS Matter Today?

It is fair to ask, in respect of this final report, after so many reports and investigations, the Naylor Report and the Walker Report and the Commission’s 2004 and 2005 interim reports, so what? What is gained now by telling in detail the story of SARS?

Why does SARS matter today, more than three years after the event, after the government and the media have moved on to other crises, after those who suffered from SARS have moved on as best as they can?
After every disaster like SARS the years recede and memories fade. There is always pain that has been forgotten, and things we choose not to recall. If we forget the suffering and courage seen in the SARS crisis we diminish the sacrifices of Tecla Lin, Nelia Laroza, Dr. Nestor Yanga and all those who died and those who suffered. Their suffering and courage should not be in vain.

We must remember SARS because it holds lessons we must learn to protect ourselves against future outbreaks, including a global influenza pandemic predicted by so many scientists. If we do not learn from SARS and we do not make the government fix the problems that remain, we will pay a terrible price in the next pandemic.

2. How Bad Was SARS?

The numbers, that 375 people contracted SARS and 44 died, do not tell the complete story of how bad SARS was. They do not reflect the unspeakable losses of families affected by SARS. They do not reflect the systemic failures that permitted these deaths and illnesses.

SARS had Ontario’s health system on the edge of a complete breakdown. The wonder is not that the health system worked so badly during SARS, but that it worked at all. SARS also badly hurt Ontario’s international reputation, setting up an unfortunate link in the minds of many in other countries between Toronto and a mysterious deadly disease.

Worst of all, SARS demonstrated how many earlier wake-up calls had been ignored, and how few of their warnings had been heeded. Many of the fault lines that appeared during SARS were identified by earlier investigations and commissions, notably the Krever Inquiry into tainted blood and the O’Connor Inquiry into tainted water.

SARS may be the last wake-up call we get before the next major outbreak of infection, whether it turns out to be an influenza pandemic or some other health crisis. That is why we cannot forget how bad SARS was, and how much terrible suffering and loss we must avoid the next time around. The tragedy of SARS, these stories of unbearable loss and systemic failure, give the public every reason to keep the government’s feet to the fire in order to complete the initiatives already undertaken to make us safer from infectious disease.
3. What Went Right?

Despite its deep flaws, the system was supported by people of extraordinary commitment. What pulled us through was the hard work and the courage of those who stepped up and fought SARS. What went right in a system where so much went wrong is their dedication in the midst of chaos and enormous workload pressures. It was a tireless fight in the fog of battle against a deadly and mysterious disease. We should be humbled by their efforts.

SARS produced so many heroes that it is impossible to identify them all and no attempt has been made to do so. Some happen to be mentioned in this report when their names are essential to the narrative.

One hero was the public, which rose magnificently to meet the challenge. Any fight against infectious disease depends above all on public cooperation. SARS could not have been contained in Toronto without the tremendous public cooperation and without the individual sacrifice of those who were quarantined. It is essential to ensure that the spirit of cooperation shown during SARS is not taken for granted. It must be nurtured and promoted.

4. What Went Wrong?

SARS took hold because of a confluence of systemic weaknesses in worker safety, infection control and public health. The Commission’s first interim report identified 21 deep systemic flaws in public health infrastructure. The second interim report identified serious shortcomings in health protection and emergency management laws. This final report identifies further areas of unresolved problems, particularly in the domain of health worker safety. Because of these systemic weaknesses, SARS was a disaster waiting to happen.

The public health system was broken, neglected, inadequate and dysfunctional. It was unprepared, fragmented, uncoordinated. It lacked adequate resources, was professionally impoverished and was generally incapable of fulfilling its mandate.

Ontario was not prepared for a public health crisis like SARS. It didn't even have a pandemic plan.
There was a grave lack of worker safety expertise, resources and awareness in the health system, a lack whose impact was compounded by a similar lack of infection control expertise and resources. Not only that, but infection control and worker safety operated as two solitudes, and public health and hospitals operated as separate silos. And the Ministry of Labour was sidelined.

Also missing were two key components of a safe workplace: Neither internal responsibility systems nor joint health and safety committees were, in general, fulfilling their intended roles and responsibilities.

The trust of health workers in the ability of government, safety laws, and their employers to safeguard them and their colleagues was broken. Health workers learned that those in charge were poorly informed and inadequately advised to make pronouncements on worker safety and personal protective equipment. A prime example was the lack of awareness throughout the health and hospital system of the legal requirement for respirator fit testing.

5. Were Precautions Relaxed Too Soon?

In May 2003, the government implemented a series of measures that led to the relaxation of precautions on May 13 and to the lifting of the provincial emergency four days later. But SARS had not gone away. How could victory over SARS have been declared when it was spreading undetected at North York General Hospital? Were precautions relaxed too soon?

Knowing when to announce the “all clear” is very difficult. There were similar instances during the Spanish flu pandemic of 1918–1919, when victory was declared too early. Decision makers are in a tough spot during a public health emergency. React too early in a preventive mode and they may be accused of having generated another “swine flu” problem. Lift precautions too early and they may be accused of recklessness and bowing to political pressure.

There is no easy answer to the question of whether precautions were lifted too soon. In hindsight it turned out to be a mistake because as soon as precautions were relaxed the SARS cases simmering undetected at North York General flared up into the second outbreak. But the decision was made at the time in good faith on the best medical advice available and after two incubation periods with no new detected cases did it appear appropriate to relax the precautions and institute the “new normal” with precaution levels higher than they were before SARS.
As noted in the report, one of the underlying reasons for the second outbreak was the lack of any system to ensure surveillance of the kind that would have detected the North York General cases before they spread. Although the relaxation of precautions triggered the second outbreak, its more underlying cause has more to do with the lack of systems to ensure adequate surveillance.

6. Who Is There to Blame?

No one. The evidence throws up no scapegoats. This will disappoint those who seek someone to blame.

It is too easy to seek out scapegoats. The blame game begins after every public tragedy. While those who look for blame will always find it, honest mistakes are inevitable in any human system. There is always more than enough blame to go around if good faith mistakes made in the heat of battle are counted in hindsight as blameworthy.

More important than blame is to find out what happened, to figure out how to fix the problems, to learn something from these tragedies, to give a legacy of betterment to those who died and those who fell ill and those who suffered so much.

This was a system failure. We were all part of it because we get the public health system and the hospital system we deserve. We get the emergency management system we deserve and we get the pandemic preparedness we deserve. The lack of preparation against infectious disease, the decline of public health, the failure of systems that should protect nurses and paramedics and doctors and all health workers from infection at work, all these declines and failures went on through three successive governments of different political stripes. We all failed ourselves, and we should all be ashamed because we did not insist that these governments protect us better.

It is also hard to find blame because blame requires accountability. Accountability was so blurred during SARS that it is difficult even now to figure out exactly who was in charge of what. Accountability means that when something goes wrong you know who to look for and you know where to find them. That kind of accountability was missing during SARS and remains blurred even today. What we need is a system with clear lines of authority and accountability to prepare us better for the next infectious outbreak.
7. Was Information Withheld?

There is no evidence that information was deliberately withheld. But there is much evidence of serious communication failure.

Bad communication is a steel thread throughout the story of SARS. Poor communication exacerbated a confusing and terrible time. This happened again and again. In February and early March 2003, health workers in Ontario, unlike their colleagues in B.C., were not alerted to the emergence of a mysterious new disease in China and Hong Kong. Until mid-May 2003, directives failed to remind employers of their worker safety legal obligations. And over and over when new hospital outbreaks were detected, there were inordinate delays before all workers who might have been exposed were contacted.

Bad communication between governments and agencies and hospitals is evidenced in many cases throughout this report. Although a real effort was made by government and public health to give the public timely and accurate information, performance was mixed. In some instances public communication was excellent, as in the work of Dr. Sheela Basrur, the Chief Medical Officer of Health for Toronto. In some instances, like the disastrous May 23 press conference, public communication was like a train wreck.

8. Did Politics Intrude?

The Commission finds on the basis of the evidence and analysis set out in this chapter that there was no political or economic pressure brought to bear on the health system or public health or hospitals in order to minimize or hide SARS or to say that a SARS case was not SARS or to declare prematurely that SARS was over.

9. Was SARS I Preventable?

There is an element of speculation in any attempt to say whether a disaster could have been prevented by this measure or that measure. History is full of what-ifs. Like every other historical what-if, there is an element of speculation in any attempt to say whether the SARS disaster could have been prevented, by earlier isolation and investigation, by a differently configured emergency room, by different infection control procedures, worker safety precautions or training or alertness.
The short answer is no, SARS I was not preventable. No country escaped SARS entirely. Vancouver certainly did better than Toronto. Although the presentation of the index cases was much different in each case, there are enough similarities to warrant comparison in terms of preparedness and worker safety systems. There was undoubtedly an element of good fortune that saved Vancouver from the devastation that SARS wrought on Ontario. But it must also be said that Vancouver made its own luck with better preparedness and systemic strengths.

It cannot be proven that SARS I could have been prevented if Ontario’s systemic weaknesses in preparedness, surveillance, worker safety, infection control and public health had been adequately addressed before SARS. It is likely that SARS I could have been contained more quickly and with less damage had the right systems been in place in Ontario.

In B.C., even if the province was luckier than Ontario in the presentation of its index case, SARS was, nonetheless, more effectively contained in a jurisdiction with better preparation and more robust and more collaborative worker safety, infection control and public health systems.

British Columbia provides a useful example of how well things can work and how well health workers can be protected when there is a strong safety culture. It provides an example of how things can and should work in Ontario.

10. Was SARS II Preventable?

We will never know if SARS II could have been prevented.

What can be said, for the reasons set out below, is that the opportunity was greater to prevent SARS II than to prevent SARS I, and that SARS II could have been caught earlier and its impact lessened had the right systems been in place.

First, as a mostly nosocomial outbreak, SARS spread primarily within the contained space of health workplaces. Unlike a flu pandemic, it did not spread uncontrollably in the community. Second, it spread precisely in the kind of workplaces that should be optimally prepared to protect patients, visitors and workers from infectious diseases. Third, it occurred more than two months after Mr. T presented at Scarborough Grace Hospital. It is one thing to be caught off guard, as Ontario was, at the start of SARS. It is another to have failed to learn enough over a two-month period to prevent a major recurrence.
The problem was that these factors, which should have made it easier to prevent and control SARS II, were undermined by the many systemic flaws revealed by SARS, including insufficient surveillance, inadequate infection control expertise and resources, a lack of worker safety resources and expertise, blurred accountability, and inadequate communication systems between hospitals and public health.

11. Were Health Workers Adequately Protected?

The answer is no. It is tragically clear that health workers were not adequately protected. This is demonstrated by the heavy burden of disease on hospital workers, paramedics and others who worked in Ontario’s health system during SARS. Two nurses and a doctor died from SARS. Other health workers fell ill, including paramedics, medical technicians and cleaners, and many of them unknowingly infected their families. Almost half of those who contracted SARS were health workers who got it on the job. It would have been one thing if all had been infected at the start of the outbreak when little was known about the disease. The full extent of worker safety failings during SARS is revealed by the fact that workers continued to get sick in April and up to the end of May, long after the Scarborough Grace outbreak.

Many factors contributed to this. There was a lack of worker safety resources and expertise in the health system heading into SARS. The health system generally did not understand its obligations under worker safety laws and regulations. There was a lack of understanding of occupational safety as a discipline separate from infection control. Infection control and occupational safety operated as two solitudes. The Ministry of Labour was largely sidelined during SARS; its ability to play a greater

enforcement and regulatory role as required by law to protect workers had been seri-
ously undermined by funding and resource cuts in the 1990s.

12. Are We Safer Now?

The short answer is yes, somewhat safer. The long answer that we are not yet as safe
as we should be.

The Commission’s first interim report, in April 2004, addressed the deep problems of
public health infrastructure in Ontario and what must be done to make us safer. The
Commission’s second interim report, in April 2005, addressed glaring deficiencies in
Ontario’s health protection and emergency response laws and what must be done to
correct them.

Although the Ontario government and individual hospitals have taken significant
steps to improve our level of protection from infectious outbreaks such as SARS, seri-
ous problems persist. Much remains to be done. What has been accomplished thus
far, though commendable, marks the beginning of the end of the effort to fix the
problems revealed by SARS. The end will not be reached until Ontario has a health
system with robust and collaborative infection control, worker safety and public
health functions.

As the Commission’s second interim report said:

After long periods of neglect, inadequate resources and poor leadership, it
will take years of sustained funding and resources to correct the
damage.1017

13. What Must Be Done?

SARS revealed a broad range of systemic failures: the lack of preparation against
infectious disease outbreaks, the decline of public health, the failure of systems that
should protect nurses and paramedics and others from infection at work, the inade-

quacy of infection control programs to protect patients and visitors to health facilities, and the blurred lines of authority and accountability.

SARS taught us lessons that can help us redeem our failures. These lessons are reflected in the Commission’s recommendations for change.

Perhaps the most important lesson of SARS is the importance of the precautionary principle. SARS demonstrated over and over the importance of the principle that we cannot wait for scientific certainty before we take reasonable steps to reduce risk. This principle should be adopted as a guiding principle throughout Ontario’s health, public health and worker safety systems.

If we do not learn this and other lessons of SARS, and if we do not make present governments fix the problems that remain, we will leave a bitter legacy for those who died, those who fell ill and those who suffered so much. And we will pay a terrible price in the face of future outbreaks of virulent disease, whether in the form of foreseen outbreaks like flu pandemics or unforeseen ones, as SARS was.

SARS taught us that we must be ready for the unseen. SARS taught us that new microbial threats like SARS have happened and can happen again. And it gave us a first-hand glimpse of the even greater devastation a flu pandemic could create.

There is no longer any excuse for governments and hospitals to be caught off guard, no longer any excuse for health workers not to have available the maximum reasonable level of protection through appropriate equipment and training, and no longer any excuse for patients and visitors not to be protected by effective infection control practices.

As the Commission warned in its first interim report:

Ontario … slept through many wake-up calls. Again and again the systemic flaws were pointed out, again and again the very problems that emerged during SARS were predicted, again and again the warnings were ignored.

The Ontario government has a clear choice. If it has the necessary political will, it can make the financial investment and the long-term commitment to reform that is required to bring our public health protection against infectious disease up to a reasonable standard. If it lacks the necessary political will, it can tinker with the system, make a token
investment, and then wait for the death, sickness, suffering and economic disaster that will come with the next outbreak of disease.

The strength of the government’s political will can be measured in the months ahead by its actions and its long-term commitments.1018
CHAPTER NINE: Recommendations

Introduction

The first interim report, *SARS and Public Health in Ontario*, focused on public health renewal. The Commission said:

Because government decisions about fundamental changes in the public health system are clearly imminent, this interim report on the public health lessons of SARS is being issued at this time instead of awaiting the final report … The fact that the Commission must address public health renewal on an interim basis is not to say it is more important than any other urgent issue such as the safety and protection of health care workers. It is simply a case of timing.\(^{1019}\)

The Commission set out 21 principles for reforming the shortcomings of the public health system demonstrated by SARS. It also made recommendations to address urgent problems that had to be corrected to prevent another tragedy like SARS, including a lack of provincial public health leadership, insufficient public health capacity and resources, inadequate provincial laboratory capacity, a lack of central public health coordination and expertise, an absence of public health emergency preparedness, and a lack of public health links with hospitals, health workers and others.

The second interim report, *SARS and Public Health Legislation*, focused on public health legislation. The Commission said:

This second interim report deals with legislation to strengthen the *Health Protection and Promotion Act* and to enact emergency powers for public health disasters like SARS or flu pandemics. It is produced now to respond to current government plans for further amendments to *Health Protection and Promotion Act*.

---

Protection and Promotion Act and radical changes to the Emergency Management Act. ¹⁰²⁰

The Commission made recommendations regarding Chief Medical Officer of Health independence and leadership, local public health governance, public health legal preparedness and emergency legislation, public health resources, and overhauling the Health Protection and Promotion Act, including strengthening health protection powers and clarifying infectious disease reporting requirements.

This third and final report makes recommendations arising from the story of how SARS devastated Ontario and was not contained until 375 people contracted the disease and 44 died. Not surprisingly in an outbreak where nurses, doctors and other health workers constituted the largest single group of SARS cases, many of the recommendations address worker safety issues. As the Commission noted in its second interim report:

Suggestions have been received for legislation to strengthen occupational health and safety protection for health workers. That issue will be dealt with in the final report. Occupational health and safety is a vital aspect of the Commission’s work. ¹⁰²¹

The Commission benefited greatly from written and oral submissions delivered during the course of the public hearings and in response to several calls for submissions from the beginning to the end of the investigation. Many submissions and presentations from the public hearings are on the Commission’s website.

The submissions from government, hospitals, unions and many sectors of the health community noted significant improvements since SARS and significant areas where more needs to be done. These submissions constitute just under a banker’s box of material. This material, together with all public records of the Commission’s work, have been transmitted to the Archives of Ontario²¹ and will be available to the public according to archival policy.

¹⁰²². The Commission has transmitted to the Archives of Ontario all non-confidential material. The Commission’s report is by its terms of reference subject to Ontario’s privacy and freedom of information legislation, in the sense that the report itself is publicly available and must respect the confidentiality of personal health information. Because the Commission is independent from government, its confidential work product is not subject to those statutes. Much of the
Precautionary Principle

In *The Commission of Inquiry on the Blood System in Canada*, Mr. Justice Krever said:

> Where there is reasonable evidence of an impending threat to public health, it is inappropriate to require proof of causation beyond a reasonable doubt before taking steps to avert the threat.\(^\text{1023}\)

The importance of the precautionary principle that reasonable efforts to reduce risk need not await scientific proof was demonstrated over and over during SARS. The need to apply it better is noted throughout this report.

One example was the debate during SARS over whether SARS was transmitted by large droplets or through airborne particles. The point is not who was right and who was wrong in this debate. When it comes to worker safety in hospitals, we should not be driven by the scientific dogma of yesterday or even the scientific dogma of today. We should be driven by the precautionary principle that reasonable steps to reduce risk should not await scientific certainty.

A precautionary approach also was in use at Vancouver General Hospital when it received B.C.’s first SARS case on March 7, 2003, the same day Ontario’s index case presented at Scarborough Grace Hospital. When dealing with an undiagnosed respiratory illness, health workers at Vancouver General automatically go to the highest level of precautions, and then scale down as the situation is clarified. While the circumstances at Vancouver General and the Grace were different, it is not surprising that SARS was so effectively contained at an institution so steeped in the precautionary principle.

In Ontario there was a systemic failure to recognize the precautionary principle in health worker safety, and in the identification and diagnosis of a respiratory illness that mimicked the symptoms of other, better-known diseases. Amid this systemic absence of the precautionary principle, it is not surprising that in Ontario, unlike in Vancouver, SARS caused such devastation, infecting 375 people, including 169 health workers, and killing 44, including two nurses and a physician.

---

Commission’s work product consists of confidential informant interviews, notes and documents produced or obtained under a promise of confidentiality that attracts in law.

1023. The Krever Report, p. 295; see also pp. 989–994.
The Commission therefore recommends:

- That the precautionary principle, which states that action to reduce risk need not await scientific certainty, be expressly adopted as a guiding principle throughout Ontario’s health, public health and worker safety systems by way of policy statement, by explicit reference in all relevant operational standards and directions, and by way of inclusion, through preamble, statement of principle, or otherwise, in the *Occupational Health and Safety Act*, the *Health Protection and Promotion Act*, and all relevant health statutes and regulations.

- That in any future infectious disease crisis, the precautionary principle guide the development, implementation and monitoring of procedures, guidelines, processes and systems for the early detection and treatment of possible cases.

- That in any future infectious disease crisis, the precautionary principle guide the development, implementation and monitoring of worker safety procedures, guidelines, processes and systems.

**Public Health System**

SARS showed that Ontario’s public health system is broken and needs to be fixed. Since then, while much progress has been made, after long periods of neglect, inadequate resources and poor leadership, much more remains to be done. Every recommendation to the Commission in respect of public health noted the need for more resources.1024

---

1024. One of the best examples is the July 19, 2006, submission by Dr. David McKeown, the Toronto Medical Officer of Health, who noted in particular these six problems:

1. The role and authority of Public Health with respect to non-reportable diseases must be strengthened.

2. The reporting capability of iPHIS [the integrated Public Health Information System] must be improved. In addition, the Ministry of Health and Long-Term Care (MOHLTC) must move forward more rapidly to enable electronic reporting of cases from laboratories, hospitals and physicians to local Public Health.

3. The MOHLTC and the College of Physicians and Surgeons of Ontario must develop mecha-
As the Commission’s second interim report said:

As the province moves into the latter stages of Operation Health Protection, stages when significant funding will be required, the challenge will be to provide the necessary resources to sustain the momentum for change despite the government’s other budgetary pressures.

The point has to be made again and again that resources are essential to give effect to public health reform. Without additional resources, new leadership and new powers will do no good. To give the Chief Medical Officer of Health a new mandate without new resources is to make her powerless to effect the promised changes. As one thoughtful observer told the Commission:

The worst-case scenario is basically to get the obligation to do this and not get the resources to do it. Then the Chief Medical Officer of Health would have a legal duty that [he or she] can’t exercise.

To arm the public health system with more powers and duties without the necessary resources is to mislead the public and to leave Ontario vulnerable to outbreaks like SARS.1025

SARS also disclosed many problems with the Health Protection and Promotion Act that

anisms to enable all licensed physicians in the province to receive urgent health alerts electronically.

4. The MOHLTC must clarify the role and authority of Public Health with respect to infection control in hospitals and other institutions.

5. Overall public health capacity must be strengthened. This requires an enhanced budget, not just a change in the cost-sharing formula. In addition the human resources issues are serious and growing, in particular with respect to Community Medicine physician specialists who are critical in an infectious disease emergency.

6. The full independence of the Chief Medical Officer of Health role is required. The current position combines this independent role, which may lead to conflict between government interests and health needs of the public.

1025. SARS Commission, second interim report, p. 303.
were the subject of extensive recommendations in the second interim report.1019 These included problems arising from the necessary use of a blunt instrument like the Code Orange status, and confusion about infectious disease reporting obligations.

The Commission therefore recommends:

- That the Government complete the process of fixing the public health system, including:
  - Conducting the major overhaul of the *Health Protection and Promotion Act* recommended in the Commission's second interim report to remove dangerous uncertainties like the confusion about infectious disease reporting obligations that occurred during SARS, and to provide authorities with the ability to provide a more tightly focused response than was possible under the blunt instrument of the Code Orange status;
  - Completing the review of the Mandatory Health Programs and Services Guidelines, and moving from a system of guidelines to a more accountable one based on performance-linked program standards;
  - Establishing the Ontario Health Protection and Promotion Agency;
  - Revitalizing the Central Public Health Laboratory; and
  - Providing sufficient and sustained funding for public health.

**Ontario Agency for Health Protection and Promotion, and the CMOH**

Although there is much wisdom in the proposal for an Ontario Agency for Health Protection and Promotion, the recommended structure1020 fails to take into account the major SARS problem of divided authority and accountability.

As the Commission noted in its second interim report:

... the SARS response was also hamstrung by an unwieldy emergency leadership structure with no one clearly in charge. A *de facto* arrangement whereby the Chief Medical Officer of Health of the day shared authority with the Commissioner of Public Safety and Security resulted in a lack of clarity as to their respective roles which contributed to hindering the SARS response.\(^\text{1021}\)

An important lesson from SARS is that the last thing Ontario needs, in planning for the next outbreak and to deal with it when it happens, is another major independent player on the block.

The first report of the Agency Implementation Task Force said:

A body at arm’s-length from the government was recommended in the Walker, Campbell and Naylor reports, was a commitment in *Operation Health Protection* and aligns with the successful experience of the INSPQ [L’Institut national de santé publique du Québec].\(^\text{1022}\)

The Commission in fact recommended a much different arrangement in its first interim report, and warned against creating another “silo,” another autonomous body, when SARS demonstrated the dangers of such uncoordinated entities:

First, the structure of the new agency or centre, which will combine advisory and operational functions, must reflect the appropriate balance between independence and accountability whether it is established as a Crown corporation or some other form of agency insulated from direct Ministerial control.

Second, it should be an adjunct to the work of the Chief Medical Officer of Health and the local Medical Officers of Health, not a competing body. SARS showed that there are already enough autonomous players on the block who can get in each other’s way if not properly coordinated. There is always a danger in introducing a semi-autonomous body into a

\(^{1021}\) SARS Commission, second interim report, p. 323.

system like public health that is accountable to the public through the
government. The risk is that such a body can take on a life of its own and
an ivory tower agenda of its own that does not necessarily serve the
public interest it was designed to support.\textsuperscript{1023}

Consequently, the Commission recommended that the Chief Medical Officer of
Health have a hands-on role at the agency, including a seat on the board.\textsuperscript{1024}

The Agency Implementation Task Force took a completely opposite approach,
recommending against giving the Chief Medical Officer of Health a seat as a voting
member of the board, and recommending a very autonomous role for the agency.

This proposed arrangement ignores important lessons from SARS.

The Commission, far from recommending a completely arm’s-length organization,
pointed out the need for the Chief Medical Officer of Health to be in charge with the
assistance of the agency, which should, albeit with a measure of policy independence,
be operationally accountable to the Chief Medical Officer of Health.

The Commission therefore recommends:

\begin{itemize}
  \item That the government reconsider in light of the lessons of SARS the
  Agency Implementation Task Force’s recommendation regarding the
  relationship between the Chief Medical Officer of Health and the
  agency.
\end{itemize}

\textsuperscript{1023} SARS Commission, first interim report, p. 19.
\textsuperscript{1024} The first interim report said:

To ensure that the new Ontario agency complements the service mandate of the public health
system, the relationship must be clear between the new Ontario agency and the Chief Medical
Officer of Health. Unless he or she has a clear say in the ongoing work and overall direction of
the agency, and the ability to mobilize the resources of the agency to meet a public health
problem when required, the agency will not fulfill its role as a source of support to public
health operations. The Chief Medical Officer of Health must have more than a token role in
the direction of any such agency. If the new agency is to have a Board of Directors, the Chief
Medical Officer of Health, if not its Chair, should be at least its Associate Chair. To the extent
the agency is operational as opposed to purely advisory, the Chief Medical Officer of Health
must, in the face of a public health problem, be able to direct the operational resources of the
agency so as best to meet the problem at hand, whether the resources are epidemiological,
laboratory, or other.

SARS Commission, first interim report, p. 188.
Emergency Plans for Orderly Hospital Closure

Before SARS no one was prepared for the possibility that a hospital might need to be closed to contain an infectious disease outbreak. Yet this is what happened on three occasions during SARS, at the Scarborough Grace Hospital, York Central Hospital and North York General Hospital. No one in Ontario had had to do this before. SARS demonstrated the immense difficulty of closing a hospital in the middle of an outbreak, when no one had done it before, when no one had planned for this possibility, and when no exercises and education had been conducted to train staff on how to do it. It is to the credit of all those involved in closing Scarborough Grace, York Central and North York General that they accomplished the task despite having never had the experience of and knowledge from doing so before.

The Commission therefore recommends:

- The development of emergency plans for orderly hospital closure to avoid problems of the kind that arose at the Grace, York Central and North York General, to cover all eventualities and in particular:

  — Effective means for immediately notifying staff at the institution of any potential risk.

  — Effective means for immediately notifying staff not on duty at the institution of any potential risk.

  — Systems for rapidly securing the names and tracing information of everyone at the hospital at the time including visitors to patients.

  — Amendment of the *Health Protection and Promotion Act* to ensure duty to identify for purpose of public health tracing.\(^\text{1025}\)

---

1025. The second interim report said:

A submission to the Commission from a group of experts, who were all closely involved in the SARS response, recommended that the reporting sections of the *Health Protection and Promotion Act* be amended to support the work of health units in tracing the contacts of patients with infectious diseases:

The current HPPA does not give specific reference to contacts of infectious cases. Release of information on the cases as well as contacts is essential for infectious disease control. This was a major obstacle during the management of the SARS outbreak. We believe that
— Prearranged, rehearsed protocols for police assistance.

— Immediate medical backup for those dependent on the hospital, such as obstetrics, dialysis and oncology.

— Effective means for immediately informing the public, families of patients and the wider hospital community.

• That hospital emergency closing plans be rehearsed and reviewed on a periodic basis to reflect lessons learned in training exercises and emergency management best practices.

Effective Distribution of Outbreak Alerts

When Mr. T presented to the Grace on March 7, 2003, health workers did not know to be on the lookout for unusual respiratory illnesses. Unlike their counterparts in B.C., they had not been alerted to the emergence of a mysterious new disease in China and Hong Kong. Three years after SARS, public health officials told the Commission there is still no means to communicate quickly and effectively with Ontario’s physicians. SARS demonstrated that alerts and other communications need to quickly reach all workplace parties, including employers, health workers, unions and Joint Health and Safety Committees.

The Commission therefore recommends:

• That the Ministry of Health develop and implement an effective

the requirement to report contacts referred to specifically in the legislation will allow practitioners to provide this information to their medical officer of health.

The amendments to Regulation 569, effected in Regulation 01/05, address this issue.

Contacts initially identified or later traced are included in most of the lists specifying additional information that must be reported to the medical officer of health. In particular, it is included in the case of SARS, TB, influenza and febrile respiratory illness. This means that those who have reporting obligations under the Act are now required to provide contact information.

Source: SARS Commission, second interim report, p. 199.
means to alert all workplace parties, including health workers, employers, unions and Joint Health and Safety Committees, in a timely manner about infectious disease threats.

- That in preparation for the possibility of a public health crisis like SARS or a pandemic, health institutions develop and implement effective means to communicate to their workers information regarding the outbreak, the health risk, the containment strategy, and measures to protect workers, patients and visitors.

**Directives**

Directives on N95 respirators and other worker safety issues were prepared without appropriate oversight by the Ministry of Labour, adequate input from worker safety experts, and sufficient participation by workplace parties including unions, employers and Joint Health and Safety Committees. The inadequacies of directives do not reflect on those who prepared them, and who deserve praise for their remarkable effort under difficult circumstances with insufficient resources, infrastructure or planning. Regardless of the reasons for the directives’ failings, the reality is that for most of the outbreak they failed to provide the detailed advice that health workers, their supervisors and their employers needed. Workplace parties also reported their continuing difficulties in providing feedback to the Provincial Operations Centre on issues that arose when implementing directives.

The Commission therefore recommends:

- That in any future infectious disease crisis, the preparation of directives involving worker safety be supervised, reviewed and approved by the Ministry of Labour in a process that is transparent and easily understood by all workplace parties.

- That in any future infectious disease crisis, directives involving worker safety be jointly prepared by infection control and worker safety experts to reflect their overlapping responsibilities and thereby ensure that patients, workers and visitors are kept safe.

- That in any future infectious disease crisis, directives involving worker safety be prepared with input from the workplace parties who have to implement them, including employers, health worker representatives
and Joint Health and Safety Committees.

• That in any future infectious disease crisis, directives and other communications involving worker safety reference the specific applicable sections of the *Occupational Health and Safety Act*, and its regulations, so that employers and workers are fully informed of worker safety legal requirements.

• That the Ministry of Labour and the Ministry of Health cooperate in developing and implementing an effective communication system for receiving timely feedback from workplace parties, including employers, unions and Joint Health and Safety Committees, regarding any problems encountered when implementing worker safety directives, policies, procedures and systems.

• That when issuing any communication affecting worker safety, the Ministry of Health consult with the Ministry of Labour, and ensure that there are clear, specific references to relevant worker safety laws, regulations, guidelines and best practices, and that employers are fully informed of their legal obligations to protect workers.

**Effective Crisis Communication**

There were many systemic problems with crisis communications during SARS. Workplace parties, including unions and the Ministry of Labour, told the Commission of their difficulties in receiving directives in a timely manner and in gaining access to Ministry of Health websites. Employers and workers’ representatives often had great difficulty in receiving timely responses to questions to the Provincial Operations Centre, Ministry of Health and the Ministry of Labour, on important issues, including work refusals, safety of pregnant workers, and safety of immunocompromised workers. Workers’ representatives also said they were not aware of such internal Ministry of Labour documents as the 1984 agreement with the Ministry of Health and the protocol dated April 2, 2003. In some cases, media reports were more informative on SARS than communications by health institutions to their workers.

The Commission therefore recommends:

• That the Ministry of Labour and the Ministry of Health cooperate in developing and implementing an effective communication system to
ensure that in the event of an infectious disease outbreak all workplace parties, including front-line health workers, employers, unions and Joint Health and Safety Committees, receive relevant communications, including directives, in a timely manner.

- That in the event of any future infectious disease crisis, the Ministry of Labour provide in a timely manner clear direction and information regarding guidelines for work refusals, pregnant workers and immunocompromised workers.

- That in the event of an infectious disease outbreak, any protocol regarding the Ministry of Labour’s response, such as the Ministry’s April 2, 2003, protocol, be communicated in a timely manner to employers, unions, Joint Health and Safety Committees and other workplace parties.

**Risk Communication**

The story of the psychiatric patients and the clusters of family illness in May at North York General demonstrates the importance of clear communication and a clear understanding of the respective roles and responsibilities in an outbreak investigation. Front-line nurses and physicians believed these patients had SARS. Public Health believed these patients, while not classified as having SARS, were being treated as persons under investigation and were being investigated and monitored. The hospital, in good faith, sincerely believed that SARS had been ruled out. In good faith, it also repeated this message to staff and tried to convince staff they were safe. This led to an important disconnect at North York General between what front-line nurses and physicians saw and what the hospital told its employees. The Commission accepts that everyone involved was doing what they thought was right. The problem was that staff in good faith were given assurances with a confidence that was not warranted in the circumstances.

The Commission therefore recommends:

- That the Ministry of Health ensure that the respective roles and responsibilities of public health and hospitals during an infectious disease outbreak are clarified and clearly understood by all parties.

- That public health and hospitals jointly develop processes to ensure that public health advice to hospitals regarding patient diagnosis in a
disease outbreak, especially with an infectious disease like SARS that is difficult to identify, clearly reflect all the attendant health risks.

- That risk communication to staff reflect a precautionary approach, that it is better to err on the side of caution, especially when dealing with a little-understood new disease like SARS.

**Listening to Front-Line Health Workers**

During SARS, front-line doctors, nurses and other health workers had the greatest clinical experience in diagnosing and treating SARS patients. Yet there was no process in place to ensure that their voices and experience were heard.

At North York General, for example, before the events of May 23, 2003, some nurses, doctors and other health workers worried that, despite what they were being told, SARS had not gone away. The hospital felt, based on consultations with outside experts, including Public Health, that the psychiatry patients and the family cluster of illness in May were not SARS. Hospital officials believed in good faith that staff concerns were unfounded and that they needed to convince staff that it was safe. What angered health workers was that their concerns, which turned out to be well founded, were dismissed, and the well-intentioned messages of the hospital were disconnected from front-line staff concerns.

The Commission therefore recommends:

- That effective processes and systems be established to provide a path for communication and consultation with front-line staff.

- That the health concerns of health workers be taken seriously, and that in the spirit of the precautionary principle health workers be made to feel safe, even if this means continuing with levels of heightened precautions that experts believe are no longer necessary.

**Listening to Unions**

Just as hospitals should listen more carefully to the concerns of nurses and other front-line health workers, the Ministry of Health would be well advised to listen more carefully to the reasonable concerns of health worker unions which have enormous
front-line experience in the actual problems of worker safety on the ground. Their expertise is reflected in the thoughtful and detailed presentations by unions that represent Ontario’s health workers, and in particular the joint work of the Ontario Nurses’ Association and the Ontario Public Service Employees Union. The problems of worker safety have been explicitly recognized by Minister of Health George Smitherman speaking to an audience of nurses in May 2005:

One of the things I was struck by … [was] the number of nurses that work in environments, hospital environments perhaps more particularly, that actually are unsafe … We have a lot of work to do on that.

It is important for Ministry officials to take this ministerial direction seriously. It is important for Ministry officials to avoid any impression that the Ministry has adopted an adversarial or dismissive attitude towards those who voice the legitimate concerns of those at risk on the front lines.1026

**Surveillance**

One of the most important systemic failures of SARS was the failure to quickly identify clusters of illness among staff and to convey that information to infection control practitioners at affected hospitals and to those leading the fight against SARS. These systemic failures prevented the timely identification of SARS cases at the Grace and at North York General, the sites of the two largest nosocomial outbreaks.

Before May 23, 2003, when it appeared that SARS had been contained, there was no system-wide surveillance in place to ensure that undetected cases were caught. Responsibility for surveillance for undetected cases of SARS was left to individual institutions and to front-line practitioners. Any system that might have identified clusters of illness or death could have been helpful. However, surveillance standards at individual hospitals in Ontario were insufficient and not mandated. Witnesses told the Commission that such surveillance is possible only with a sufficiently resourced infection control function.

---

1026. One example of this impression arose after a Ministry of Health official, responding to union concerns that safety issues had been ignored in pandemic planning, did not address the issue on the merits but dismissed the well-expressed union concerns by saying, “I am not sure we will ever meet the expectations of organized labour regarding health and safety…” This comment led the union to believe “that key bureaucrats in MOHLTC view occupational health and safety as a partisan issue, with occupational health and safety proponents as their adversaries.”
The Commission therefore recommends:

- That appropriate surveillance standards be established, mandated and funded in Ontario hospitals.

- That special care be paid to identifying clusters of illness among staff and to initiating immediate investigation.

- That where suspicious clusters of illness are identified, this be communicated to health workers, especially to those who might have been in contact with sick staff, or have worked in the same areas of the hospital.

- When an outbreak appears to be waning of a difficult-to-diagnose infectious disease like SARS, system-wide surveillance be implemented to ensure that undetected cases are identified.

- Infection control functions in Ontario hospitals and in public health be sufficiently resourced so that they could contribute to, and participate in, system-wide surveillance when an outbreak appears to be waning of a difficult-to-diagnose infectious disease like SARS.

**Infection Control**

Many witnesses have told the Commission that, since SARS, infection control standards and practices have improved at hospitals affected by SARS. It will be important to ensure that improvements occur across the health system. Witnesses voiced a concern that as memories of the SARS outbreak fade, so will attention to infection control. Part of that concern is over the lack of consistent system-wide policies on visitor access at hospitals. They also told the Commission that many Ontario hospitals are in older buildings whose structure does not lend itself to modern infection control practices.

The Commission therefore recommends:

- That the Ministry of Health ensure that all Ontario hospitals have infection control personnel, resources and program components, including surveillance, control and education, consistent with Canadian
recommendations and best practices.1027

- That consistent and clear visitor policies be developed across the health system to ensure that visitor access, while important in caring for the ill, does not overcome infection control standards.

- That the Ministry of Health and every health institution develop consistent, safe and humane policies to lessen the impact of infectious outbreaks on the vital priority for the sick to receive visitors, unless medically dangerous.

- That visitors be educated to their important role in keeping hospitals safe, and to the need to respect limits on the number of visitors, particularly where the illness is not serious or life-threatening.

- That the Ministry of Health help hospitals to incorporate leading practices in infection control standards into facility design and renovation.

Safety Culture in Health Workplaces

The heavy burden of disease that fell on nurses, doctors and other health workers demonstrated the lack of a safety culture1028 in the Ontario health system. A single event like the spread of SARS at the Grace was warning enough that a safety culture

---

1027. “It’s critical that all hospitals have specific human resources, in the form of ICPs (Infection Control Professionals) and support staff, for an effective infection prevention program,” says Dr. [Richard] Zoutman. Such programmes must include surveillance (counting infections), control (interventions to prevent them from occurring), and education components.

1028. A definition of safety culture suggested by the Health and Safety Commission in the U.K. is as follows:

The safety culture of an organisation is the product of the individual and group values, attitudes, competencies and patterns of behaviour that determine the commitment to, and the style and proficiency of, an organisation’s health and safety programmes. Organisations with a positive safety culture are characterised by communications founded on mutual trust, by shared perceptions of the importance of safety, and by confidence in the efficacy of preventative measures.
was lacking. The fact that health workers continued to get sick in April and May after the events at the Grace demonstrated the extent to which a safety culture was lacking. Nothing better demonstrates the absence of a safety culture than the inability to fix worker safety problems in a timely manner once they have been identified by a tragedy like the Grace.

The Vancouver experience demonstrated the value of a safety culture in health workplaces. Expressions of this safety culture included the close cooperation and mutual respect between infection control and worker safety, the emphasis on listening to health workers, and the deployment of joint teams of infection control and worker safety experts to Royal Columbian Hospital after a nurse contracted SARS.

In Ontario, infection control and worker safety disciplines generally operated as separate silos during SARS. Until this divide is bridged and infection control and worker safety disciplines begin to actively and effectively cooperate, it will be difficult to establish a strong safety culture in Ontario.

As a landmark study on worker safety in health care said:

… if the safety climate within healthcare was better and workers had more confidence in their employers’ commitment to worker health and safety, employees would have more confidence in the messages and direc-

A positive safety culture implies that the whole is more than the sum of the parts. The different aspects interact together to give added effect in a collective commitment. In a negative safety culture the opposite is the case, with the commitment of some individuals strangled by the cynicism of others. From various studies it is clear that certain factors appear to characterise organisations with a positive safety culture.

These factors include:

• The importance of leadership and the commitment of the chief executive
• The executive safety role of line management
• The involvement of all employees
• Effective communications and commonly understood and agreed goals
• Good organisational learning and responsiveness to change
• Manifest attention to workplace safety and health
• A questioning attitude and a rigorous and prudent approach by all individuals

1172
tives they received during a crisis situation such as SARS. The relatively low profile of occupational health and safety within healthcare is perhaps best reflected in the observation that very few focus groups, aside from those containing health and safety professionals, seemed to be aware of occupational health and safety professionals at all. Tasks such as fit-testing of respirators often fell to infection control practitioners, not to occupational health and safety professionals (although this appears to vary from facility to facility) as it would have in other industries.  

The study identified the following organizational factors that promote a safety culture:

- There is general agreement that the safety-related attitudes and actions of management play an important role in creating a good or bad safety climate.

- Studies of safety program effectiveness in non-healthcare settings have repeatedly shown that a positive or supportive safety climate is an important contributing factor to good safety performance. Specifically, it is known that as safe behaviours are adopted throughout an organization, increasing pressure is put on non-compliers to “come in line.”

- It has been shown that the safety climate has an important influence on the transfer of training knowledge.

While important research has been conducted on infection control standards, worker safety experts have noted that similar research has not been undertaken in occupational health and safety.

1031. See Zoutman et al., “The state of infection surveillance and control.”
The Commission therefore recommends:

• That the Ministry of Labour use its enforcement and standard-setting activities, and the Ministry of Health its funding and oversight activities, to promote organizational factors that give rise to a safety culture in health workplaces.

• That the Ministry of Labour and the Ministry of Health jointly promote a safety culture in health workplaces that emphasizes close cooperation and collaboration between infection control and worker safety experts, and reflects the principles and practices of their respective disciplines.

• That in preparation for the possibility of a future infectious disease outbreak, the Ministry of Labour and the Ministry of Health jointly establish teams of trained and equipped infection control experts, occupational physicians, occupational hygienists and Labour inspectors who could be rapidly deployed to sites of workplace outbreaks.

• That occupational health and safety standards, including optimal staffing levels for worker safety practitioners, be established, similar to the SENIC standards for infection control.\textsuperscript{1033}

• That once occupational health and safety standards are established,

\textsuperscript{1032} “Certainly more research on what levels or standards are needed to promote effectiveness in occupational health, similar to the SENIC studies for infection control, is needed.” Source: Dr. Annalee Yassi and Dr. Elizabeth Bryce, “Protecting the faces of healthcare workers: knowledge gaps and research priorities for effective protection against occupationally-acquired respiratory infectious diseases” (Occupational Health and Safety Agency for Healthcare in B.C., April 30, 2004), p. 67.

\textsuperscript{1033} The most important determinants of successful general nosocomial infection control programs in hospitals have been understood since the mid-1980s when the Study on the Efficacy of Nosocomial Infection Control (SENIC) was published. The following organizational factors were found to be important in determining effective infection control and lower rates of nosocomial-transmitted disease: having one infection control practitioner per 250 acute care beds, having at least one full-time physician interested in infection control, having an intensive surveillance program for nosocomial diseases and having intensive control policies and procedures. However, in a recent survey of 172 hospitals in Canada, only about 60 per cent of hospitals had evidence of compliance for each of the SENIC factors. The number of institutions who had all four factors was likely much less.
the Ministry of Health provide consistent and sustained funding and strategic planning to ensure that these requirements are achieved, and the Ministry of Labour ensure they are maintained through its enforcement and monitoring functions.

• That the best practices of worker safety disciplines and infection control be reflected in hospital accreditation standards.

• That additional resources be dedicated by the Ministry of Health for the training and certification of worker safety experts, including occupational physicians and occupational hygienists.

• That worker safety programs at health care institutions include training for workers, management, officers and directors on their roles and responsibilities with regard to worker safety laws and regulations.

• That the Ministry of Training, Colleges and Universities, in collaboration with the Ministry of Health, the Ministry of Labour and Ontario institutions that train health care professionals, establish baseline standards on occupational health and safety and infection prevention and control measures and procedures, to be incorporated into the curricula of medical and nursing schools and schools for the allied health professions in Ontario colleges and universities.

Regional Infection Control Networks

The Ministry of Health has helped to improve infection control standards in health care by establishing Regional Infection Control Networks. To promote a safety culture in health care, it will be important that these networks foster close cooperation and collaboration between infection control and worker safety.

The Commission therefore recommends:

• That Regional Infection Control Networks have, as integral
members, experts in occupational medicine and occupational hygiene, and representatives of the Ministry of Labour.

- That members of Regional Infection Control Networks be fully educated in the requirements of the *Occupational Health and Safety Act*, and its regulations.

- That regional Infection Control Networks, in dealing with worker safety issues, consult on an ongoing basis with the Ministry of Labour, workplace parties and worker safety experts.

**Role of the Ministry of Labour**

Despite its legal mandate to protect workers, the Ministry of Labour was largely sidelined during SARS. It was not given a role in the SARS response commensurate with its statutory duties. It was also not consulted before West Park Healthcare Centre’s old tuberculosis unit was opened to accept sick health workers from the Grace, even though its perspective would have been very germane to the decision. The outbreak at the Seven Oaks Home for the Aged demonstrated that issues still remain unresolved about the role of the Ministry of Labour during an infectious disease outbreak.

The Commission therefore recommends:

- That the Ministry of Labour have the lead responsibility for setting and enforcing work safety policies, procedures and standards in the health care sector, as it does in all workplaces.

- That the Ministry of Health, as the Ministry that funds and oversees the health care delivery system, not be placed in the position of acting as an independent worker safety watchdog over its own system.

- That the Ministry of Health have the lead responsibility for developing and implementing infection control measures in the health care sector to protect patients, residents and/or clients.

- That the Ministry of Labour and Ministry of Health develop protocols, processes and procedures to ensure effective and active cooperation and coordination where their respective worker safety and infection control responsibilities overlap.

- That in any future infectious disease crisis, the Ministry of Labour
have a clearly defined decision-making role on worker safety issues in a future Provincial Operations Centre, and that this role be clearly communicated to all workplace parties.

• That the role and authority of the Ministry of Labour be clearly defined during a declared emergency. Under the Emergency Management and Civil Protection Act, the Occupational Health and Safety Act prevails, and, as such, the Ministry of Labour’s mandate to communicate and enforce occupational health and safety standards for workplaces under provincial jurisdiction will remain during an emergency. How the designated lead ministry in any emergency will interact with the Ministry of Labour, so that the Ministry of Labour can continue to fulfill its mandate, should be established prior to an emergency.

• That in any future infectious disease crisis, the Ministry of Labour be consulted when health facilities that had previously been decommissioned, such as West Park’s old tuberculosis unit, are reopened in response to exigent circumstances.

• That the Ministry of Health and the Ministry of Labour work together to establish an agreement and mechanism, including information technology systems, to share information related to outbreaks of infectious diseases. Such information sharing should include information about Ontario’s health care facilities. The objective is to ensure compliance with the reporting of occupational illnesses to the Ministry of Labour under the Occupational Health and Safety Act, and to ensure that the Ministry of Labour has at its disposal all relevant information to appropriately address outbreaks of infectious diseases in health care and other workplaces.

• That the Ministry of Health and the Ministry of Labour work together to establish integrated enforcement strategies to improve compliance with occupational health and safety legislation and with legislation administered by the Ministry of Health.

• That the Ministry of Health establish a process, similar to the one available under the Occupational Health and Safety Act, to hold directors and officers of health care organizations accountable for compliance with provincial legislation. This may be accomplished by performance
specifications in contracts or service agreements that the Local Health Integration Networks will establish with health care organizations.

The Ministry of Labour and the 1984 Agreement

During SARS, the Ministry of Labour deferred its worker safety responsibilities to the health sector, believing the health sector had the expertise and capabilities to protect workers in a manner that was consistent with provincial laws and regulations. It did this, in part, because of a 1984 Memorandum of Understanding with the Ministry of Health that was unauthorized by statute, unclear, not disseminated to interested parties like the unions, and of questionable legal authority to the extent that it might require ministry personnel to fetter their discretion and so fail to fulfill their duties in workplaces affected by infectious diseases.

The Commission therefore recommends:

- That the 1984 agreement between the Ministry of Health and the Ministry of Labour be replaced by an agreement that ensures that the Ministry of Labour, in consultation and cooperation with the Ministry of Health, take the lead in investigating infectious disease outbreaks that affect workers in a workplace.

- That the existence of any agreement setting out the respective roles and responsibilities of the Ministry of Labour and the Ministry of Health in a public health emergency be fully communicated to unions, employers, Joint Health and Safety Committees and other workplace parties.

Ministry of Labour Investigations and Prosecutions

When the Ministry of Labour decided not to lay any charges in connection with the deaths of Tecla Lin, Nelia Laroza and Dr. Nestor Yanga it did not disclose the reasons for doing so.

After SARS, critical injury and occupational illness investigations were begun very late in the one-year window for instituting prosecutions, and investigators had a very limited period to complete their work.
The Commission therefore recommends:

- Legislative amendments and policies in relation to the waiver of potential Crown privilege claims, such that in such cases where charges do not result from Ministry of Labour and other investigations of deaths and critical injuries in health workplaces, the results of the investigation and the reasons for the decision not to prosecute be made public.

- That Ministry of Labour investigations into critical injuries and occupational illnesses arising from a disaster of the magnitude of SARS be commenced and completed expeditiously.

- That a review be undertaken of section 69 of the *Occupational Health and Safety Act*, as to whether the limit on the institution of a prosecution to no more than one year after the last act or default occurred be amended.

**Ministry of Labour Proactive Inspections**

For reasons set out in this report, the Ministry of Labour did not conduct any proactive inspections of SARS hospitals during virtually all the outbreak. Labour’s approach was vastly different from what occurred in British Columbia, where the workplace regulator began proactive inspections in early April 2003 and paid special regulatory attention to a hospital where a nurse contracted SARS. This was a missed opportunity in Ontario, although we will never know what impact that might have had on the SARS response.

The Commission therefore recommends:

- That in any future infectious disease outbreak, the Ministry of Labour take a proactive approach throughout the outbreak to ensure that health workers are protected in a manner that is consistent with worker safety laws, regulations, guidelines and best practices.

- That in any future infectious disease outbreak, the Ministry of Labour’s proactive approach be clearly communicated to all workplace parties, including the Ministry of Health, public health units, employers, workers’ representatives and Joint Health and Safety Committees.
That in preparation for the possibility of a future infectious disease outbreak, the Ministry of Labour prepare effective operational plans for playing a proactive role, including establishing and training teams of occupational physicians, hygienists and inspectors to spearhead any proactive effort.

Investigations Led by the Ministry of Health

During SARS, a team from the U.S. Centers for Disease Control (CDC) was invited by the province to investigate the incident at Sunnybrook on April 13, 2003, when nine health workers were infected. Because of systemic failings, no one thought to invite the Ministry of Labour to participate, or to advise it that such an investigation was taking place. Similarly, after the Seven Oaks outbreak of legionellosis in the fall of 2005, the Ministry of Labour was not invited to participate in a Ministry of Health investigation into the response to the outbreak. In addition, the Seven Oaks investigation also would have benefited from the inclusion of worker safety experts.

The Commission therefore recommends:

- That the Ministry of Labour play an integral role in any future Ministry of Health investigation into an infectious outbreak where workers were infected, such as occurred at Sunnybrook and Seven Oaks.

- That the Ministry of Labour be given the responsibility for ensuring that any worker safety–related findings in any future Ministry of Health investigation be consistent with worker safety laws and principles.

- That any investigation into an infectious outbreak where workers were infected, such as the investigations at Sunnybrook and Seven Oaks, include experts in occupational hygiene and other worker safety disciplines.
Ministry of Labour Physician Resources

Prior to SARS, the Ministry of Labour’s complement of inspectors and physicians had been sharply reduced. SARS also revealed that many Ministry of Labour inspectors lacked sufficient health care–related training. Since SARS, the Ministry of Labour has hired additional inspectors, including some dedicated to the health care sector, and increased its health care–related staff training. But it has not increased its occupational physician cadre, which had once had province-wide coverage but is now concentrated in Toronto.

The Commission therefore recommends:

- That the Ministry of Labour expand its internal resources of occupational physicians and ensure that their capabilities are available province-wide.

Worker Safety Laws and Regulations

The evidence reveals widespread, persistent and ingrained failures by the health system to understand and comply with Ontario’s safety laws including the Occupational Health and Safety Act and related regulations. Ontario’s worker safety laws are based on the Internal Responsibility System. SARS revealed an important structural problem when implementing the Internal Responsibility System in the health care sector: the fact that physicians often make worker safety decisions even though they may not be hospital employees.

The Commission therefore recommends:

1034. The Ministry of Labour described the Internal Responsibility System as follows:

Employers, workers and others in the workplace share the responsibility for occupational health and safety. Each party is responsible to act to the extent of the authority that they have in the workplace. This concept of the internal responsibility system is based on the principle that the workplace parties themselves are in the best position to identify health and safety problems and to develop solutions. This concept emerged from the Royal Commission into health and safety in mines in Ontario in 1976 and was soon adopted as the basis of the new Occupational Health and Safety Act in 1978.

Source: Ministry of Labour, presentation to the SARS Commission, November 17, 2003, p. 6.
• Worker safety in hospitals and other health care institutions requires reasonable legislative measures to include all physicians within the worker safety regime without interfering with the essential independence of physicians and without making them hospital employees. Such legislative measures may need to include not only the Occupational Health and Safety Act but also those statutes that govern the administration of health care institutions and the medical profession. It would be presumptuous for the Commission to recommend a prescriptive solution at this time. That task will require a good measure of consultation and a thorough analysis of the complex professional and statutory framework within which doctors work in health care institutions. The Commission recommends the amendment of worker safety, health care, and professional legislation to ensure that physicians who affect health worker safety are not excluded from the legislative regime that protects health workers. Because the prescriptive solution will require consultation and analysis and time and patience, it is essential to start now.

• That the Ministry of Labour conduct a meaningful review of the Occupational Health and Safety Act and related regulations in consultation with workplace parties and worker safety experts to examine how the Internal Responsibility System can better be implemented in the unique conditions of the health care system.

• That the Ministry of Labour and the Ministry of Health work together to harmonize requirements addressing health and safety in legislation and/or regulations administered by both ministries, which may overlap or conflict.

• That the Ministry of Labour and the Ministry of Health work together to review possible statutory or regulatory amendments to enhance the process for reporting, tracking and sharing of information, and removal of any barriers to information sharing related to outbreaks of infectious disease.
Joint Health and Safety Committees

The evidence reveals that Joint Health and Safety Committees, a fundamental component of Ontario’s worker safety regime, were often sidelined during SARS.

The Commission therefore recommends:

- That in any future infectious disease outbreak, the emergency response ensure the involvement of Joint Health and Safety Committees in a manner consistent with their statutory role in keeping workplaces safe.

- That worker safety programs at health care institutions include training for senior management on their roles and responsibilities with regard to Joint Health and Safety Committees.

- That management and worker representatives on Joint Health and Safety Committees be provided with appropriate training and sufficient time from their other duties to fulfill their JHSC obligations in a meaningful way, especially during public health crises.

Ontario Agency for Health Protection and Promotion, and Worker Safety

On June 22, 2004, Health Minister George Smitherman released a three-year public health action plan called Operation Health Protection. It indicated that the Ontario Health Protection and Promotion Agency and its new laboratory would begin operations in the 2006/7 fiscal year. It will be important for the Agency to play an active role in worker safety issues.

1035. The action plan said:

An Agency Implementation Task Force is being struck to provide technical advice on the development and implementation of the Agency. Together with the advice of international and national experts, the Ministry will establish the Agency by 2006/07.

Source: Ministry of Health and Long-Term Care, Operation Health Protection: An Action Plan to Prevent Threats to our Health and to Promote a Healthy Ontario (June 22, 2004), p. 23.
The Commission therefore recommends:

- That just as NIOSH, the main U.S. federal agency responsible for worker safety research and investigation,\textsuperscript{1036} is part of the Centers for Disease Control (CDC), so the Ontario Agency for Health Protection and Promotion should have a well-resourced, integrated section that is focused on worker safety research and investigation, and on integrating worker safety and infection control.

- That any section of the Ontario Agency for Health Protection and Promotion involved in worker safety have, as integral members, experts in occupational medicine and occupational hygiene, and representatives of the Ministry of Labour, and consult on an ongoing basis with workplace parties.

- That the Ontario Agency for Health Protection and Promotion serve as a model for bridging the two solitudes of infection control and worker safety.

- That the Ontario Agency for Health Protection and Promotion ensure that it become a centre of excellence for both infection control and occupational health and safety.

- That the mandate of the Ontario Agency for Health Protection and Promotion include research related to evaluating the modes of transmission of febrile respiratory illnesses and the risk to health workers.

\textsuperscript{1036} The duties of NIOSH (the National Institute for Occupational Safety and Health) include:

- Investigating potentially hazardous working conditions as requested by employers or employees.
- Evaluating hazards in the workplace, ranging from chemicals to machinery.
- Creating and disseminating methods for preventing disease, injury, and disability.
- Conducting research and providing scientifically valid recommendations for protecting workers.
- Providing education and training to individuals preparing for or actively working in the field of occupational safety and health.

This research should also identify the hierarchy of control measures required to protect the health and safety of workers caring for patients with the respiratory illnesses.

**Pandemic Planning**

As occurred during SARS, there is now a debate over how influenza is spread and how health workers should be protected during a pandemic. Some experts believe influenza is mostly droplet-spread and surgical masks would be sufficient protection for health workers. Others believe that airborne transmission is a possible means of spreading influenza, and health workers should, as a result, wear fit-tested N95 respirators when caring for people suffering from a pandemic flu virus. The Commission is not in a position to wade into this evolving scientific debate. However, it is worth noting how the CDC has used the precautionary principle in addressing this issue. The CDC is saying, in effect, we don't know enough about how a pandemic influenza might be spread, so it's better to be safe than sorry. It is the kind of precautionary approach all pandemic planners should carefully consider.

The Commission therefore recommends:

- That the precautionary principle guide the development of pandemic-related worker safety policies, practices, procedures and guidelines.

- That in the development and implementation of the Ontario pandemic plan, the Ministry of Labour have responsibility for, and oversight over, all worker safety policies, practices, procedures and guidelines.

- That the Ministry of Labour ensure that the Internal Responsibility System and Joint Health and Safety Committees play a meaningful role in a pandemic response.
Pre-Planned Emergency Response Regarding Funerals

The families of SARS victims often were unable to have a traditional funeral. In some cases, funeral visitations were forbidden, or restricted. Mourners had to stand off at a distance at one burial. For some, there was no closure. Learning from this will be important in the event of another public health crisis like SARS, or if there is a flu pandemic.

The Commission therefore recommends:

- A pre-planned response involving the funeral industry, the Ministry of Health, public health, the hospital community, Emergency Measures Ontario and the office of the Chief Coroner, supported by agreed policies, procedures, protocols, memoranda of understanding and tabletop drill exercises to prevent the problems that arose during SARS.

Emergency Legislation

Ontario has passed into law the Emergency Management and Civil Protection Act, to fill the emergency power vacuum that existed at the time of SARS. It is understandable that the government, in its determination to have some kind of law in place before the next emergency struck, did not stop to address all the specific emergency legislation problems noted in detail in the hundred pages of Chapter 11 of the Commission’s second interim report of April 5, 2005. These problems are serious but easily remedied now. They include:

- The overreaching power to suspend the Habeas Corpus Act, the Elections Act, the Legislative Assembly Act, and other constitutional foundations of ordered liberty under law.

- The power to lock up journalists without trial for violating gag orders.

- The failure to blueprint compensation for those who really need it, such as those quarantined, medical workers deprived of their livelihood and those whose jobs are disrupted.

- The failure to protect medical decisions of the Chief Medical Officer of Health from Emergency Commissioner encroachment.
• The failure to carry out clause-by-clause legal and constitutional scrutiny and obtain a detailed bill of health from the Attorney General.

• The confusion between the emergency powers and the regular *Health Protection and Promotion Act* powers.

It is understandable that the government in its desire to get the emergency legislation into place before the next disaster did not pause to address and to answer in detail the flaws referred to in the Commission’s April 2005 report, flaws which are serious but easily remedied. The government has taken no public position in respect of the detailed flaws noted by the Commission. It is not as if the unimplemented recommendations have been considered and rejected for publicly stated reasons. The unimplemented recommendations have simply not been addressed publicly. The problems that have not been addressed and answered are noted in the chart at the end of this section.

The problem is not with the good intentions of those who will administer and exercise the emergency powers. The problem is that these awesome powers represent a profound change in our legal structure and raise issues that need to be addressed further in this statute that so fundamentally alters our system of government by law. Extraordinary powers like those in the *Emergency Management and Civil Protection Act* are inherently dangerous and require now the sober second thought and detailed legal clause-by-clause review and publicly stated justification which they did not explicitly receive before.

Ontario’s emergency legislation brings to mind what President Lyndon Johnson said about the potential danger of all laws:

> You do not examine legislation in the light of the benefits it will convey if properly administered, but in the light of the wrongs it would do and the harms it would cause if improperly administered.

The Commission recommends the review and amendment of the emergency legislation in accordance with the unimplemented recommendations in Chapter 11 of the Commission’s April 2005 second interim report.
# Emergency Recommendations

<table>
<thead>
<tr>
<th>Topic</th>
<th>Recommendation</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encourage Compliance</td>
<td>• Include basic blueprint for compensation for loss caused by emergency powers, for example, quarantine wage loss.</td>
<td>Not yet implemented</td>
</tr>
<tr>
<td>Prevent Prepare Cooperate</td>
<td>• Provide for integration of emergency plans, and include explicit requirement that emergency plans establish clear allocations of powers and lines of authority.</td>
<td>Not yet implemented</td>
</tr>
<tr>
<td>Clarify Overlap with Existing Public Health Powers</td>
<td>• Clarify the relationship between the emergency powers conferred by this Bill and the powers conferred by the HPPA.</td>
<td>Not yet implemented</td>
</tr>
<tr>
<td>Primacy of CMOH</td>
<td>• Recognize explicitly the primary authority of CMOH in respect of the public health aspects of emergencies.</td>
<td>Not yet implemented</td>
</tr>
<tr>
<td>Emergency Commissioner Must Consult CMOH</td>
<td>• Require consultative exercise of powers as between the CMO and the CEM.</td>
<td>Not yet implemented</td>
</tr>
<tr>
<td>Emergency Powers</td>
<td>• Attorney General to conduct detailed clause-by-clause review of each proposed power for viability against legal and constitutional challenges.</td>
<td>Not yet implemented</td>

</table>
**Emergency Orders**  
- Amend the standard applicable to the making of emergency orders so as to rely on the reasonable perception of the decision-maker.  
**Accepted**

**Power to Implement Emergency Plans**  
- Ensure there is no unintended conferment of powers.  
**Not yet implemented**

**Access to Courts**  
- Provide for access to legal process during emergencies.  
**Not yet implemented**

**Basket Power**  
- Incorporate an objective reasonableness standard into the language governing the use of this power.  
**Not yet implemented**

**Occupational Health and Safety**  
- Require emergency plans to provide for advance consideration of potential OHS issues.  
**Not yet implemented**

**Concurrent Powers**  
- Provide that conferral of new emergency powers does not derogate from existing powers.  
**Accepted**

**Liability Shield**  
- Provide protection from liability for acts which are necessitated by an emergency and which are authorized by other statutes but not the EMA – and vice versa.  
**Not yet implemented**
June 10, 2003

The Honourable Mr. Justice Archie G. Campbell
130 Queen Street West
Toronto, ON M5H 2N5

Dear Mr. Justice Campbell:

This letter will confirm your appointment as an independent Investigator, pursuant to section 78 of the Health Protection and Promotion Act, to investigate the recent introduction and spread of Severe Acute Respiratory Syndrome (SARS). I would like to express my thanks for your valuable input into the development of the Terms of Reference for this inquiry, a copy of which is appended hereto.

As you are aware, persons who disclose information to you in the course of your investigation will be protected from any adverse employment action, pursuant to Section 9.1(1) of the Public Inquiries Act.

As indicated in the Terms of Reference, you will deliver your reports to me and I will release them to the public. You will receive resources and support staff through the Ministry of the Attorney General, pursuant to paragraph 7 of the Terms of Reference.

In accordance with the attached Order in Council, all Government ministries, agencies, boards and commissions and their employees have been directed to co-operate with your investigation and to respect its independence.

On behalf of the Government and the people of Ontario, I thank you for agreeing to accept this most important mandate.

Yours very truly,

Tony Clement
Minister
On the recommendation of the undersigned, the Lieutenant Governor, by and with the advice and concurrence of the Executive Council, orders that:

WHEREAS the Minister of Health and Long-Term Care has appointed the Honourable Mr. Justice Archie G. Campbell to investigate the recent introduction and spread of Severe Acute Respiratory Syndrome (“SARS”) pursuant to section 78 of the Health Protection and Promotion Act;

WHEREAS the Minister of Health and Long-Term Care has provided Mr. Justice Campbell terms of reference for the investigation in a letter dated June 10, 2003;

WHEREAS persons who disclose information to Justice Campbell in the course of his investigation will be protected from any adverse employment action;

AND WHEREAS it is desirable to support Mr. Justice Campbell’s investigation and to mandate full co-operation with him by all Government ministries, boards, agencies and commissions:

ALL Government Ministries, Boards, Agencies and Commissions, and their employees, shall assist Mr. Justice Campbell to the fullest extent in order that he may carry out his investigation;

ALL Government Ministries, Boards, Agencies and Commissions shall respect the independence of the investigation;

THE Attorney General shall furnish Mr. Justice Campbell with the resources and support referred to in paragraph 7 of the terms of reference for the investigation.

Recommended: _______________________________ Concurred: _______________________________
Minister of Health and Long-Term Care

Approved and Ordered: June 10, 2003
Date

O.C./Décret 1230/2003
Terms of Reference

Independent SARS Commission
Terms of Reference

1. The subject matter of the investigation shall be:

(a) how the SARS virus was introduced here and what measures, if any, could have been taken at points of entry to prevent its introduction;

(b) how the SARS virus spread;

(c) the extent to which information related to SARS was communicated among health care workers and institutions involved in dealing with the disease;

(d) whether health care workers and patients in health care treatment facilities and long-term care facilities were adequately protected from exposure to SARS, having regard for the knowledge and information available at the time;

(e) the extent of efforts taken to isolate and contain the virus and whether they were satisfactory or whether they could have been improved;

(f) existing legislative and regulatory provisions related to or that have implications for the isolation and containment of infectious diseases, including the quarantine of suspected carriers;

(g) any suggested improvements to provincial legislation or regulations, and any submissions that the Province of Ontario should make concerning desirable amendments to federal legislation or regulations; and,

(h) all other relevant matters that Mr. Justice Campbell considers necessary to ensure that the health of Ontarians is protected and promoted and that the risks posed by SARS and other communicable diseases are effectively managed in the future.
2. The investigation shall be conducted in a manner that does not impede ongoing efforts to isolate and contain SARS.

3. Mr. Justice Campbell may request any person to provide relevant information or records to him where he believes that the person has such information or records in his, hers or its possession or control.

4. Mr. Justice Campbell shall hold such public or private meetings as he deems advisable in the course of his investigation.

5. Mr. Justice Campbell shall conduct the investigation and make his report without expressing any conclusion or recommendation regarding the civil or criminal responsibility of any person or organization, without interfering in any ongoing criminal, civil or other legal proceedings, and without making any findings of fact with respect to civil or criminal responsibility of any person or organization.

6. Mr. Justice Campbell shall produce an interim report at his discretion and deliver it to the Minister of Health and Long-Term Care who shall make the report available to the public. Upon completion of his investigation, Mr. Justice Campbell shall deliver his final report containing his findings, conclusions and recommendations to Minister of Health and Long-Term Care who shall make such report available to the public.

7. To conduct his investigation Mr. Justice Campbell shall be provided with such resources as are required, and be authorized by the Attorney General and shall have the authority to engage lawyers, experts, research and other staff as he deems appropriate, at reasonable remuneration approved by the Ministry of the Attorney General.

8. The reports shall be prepared in a form appropriate for release to the public, pursuant to the Freedom of Information and Protection of Privacy Act.

9. These terms of reference shall be interpreted in a manner consistent with the limits of the constitutional jurisdiction of the Province of Ontario.

In the event that Mr. Justice Campbell is unable to carry out any individual term of his mandate, the remainder of these terms of reference shall continue to operate, it being the intention of the Minister of Health and Long-Term Care that the provisions of these terms of reference operate independently.
Commission Team

Commissioner

Mr. Justice Archie Campbell has served as a Superior Court trial judge since his appointment in 1986 as judge of the High Court of Justice of the Supreme Court of Ontario, after posts as deputy attorney general and senior Crown counsel.

For approval to serve as Commissioner I am grateful to the Honourable Heather Smith, Chief Justice of the Superior Court, and to the Honourable Warren Winkler, Regional Senior Judge for Toronto.

To my judicial colleagues who shouldered my share of work during the SARS investigation, and to Chief Justice Roy McMurtry for his continuing support and encouragement, I owe a debt of gratitude.

Commission Team

To hand-pick your own team is a rare opportunity. It was my great fortune to work with a small team, the brightest and the best, on whom depended the work of the Commission. Any merit that accrues to the work of the Commission is entirely to their credit.

Counsel

Doug Hunt, Commission Counsel, a leader of the Ontario bar and a former assistant deputy attorney general for criminal law, has earned the highest professional respect through his work in the courts as leading counsel and through his continuing service in many capacities to the administration of justice.

His wise counsel and advice, legal learning and superb judgment complimented his skill in the thoughtful and effective management, with great distinction, of a complex and challenging project. No Commissioner has been better served by counsel.
Associate Counsel

Jennifer Crawford, associate Commission counsel, is a 10-year assistant Crown attorney with an excellent reputation in the courts, seconded through the generosity of Mr. Paul Culver, Crown Attorney for Toronto.

An indefatigable, thoughtful, and enormously dedicated worker, tough-minded yet scrupulously fair, meticulous in her insistence on factual accuracy, gifted with the highest level of professional skill and judgment, she exacted the highest standard of professional performance from herself and inspired her colleagues to do the same.

Senior Adviser

Mario Possamai, a former journalist and seasoned investigative researcher, performed outstandingly and produced magnificent work as a senior advisor. No colleague could be more helpful and supportive. No researcher could be more determined or produce work of greater thoroughness, thoughtfulness and depth.

Investigators

It was the Commission’s privilege to enjoy the services of three highly experienced and widely respected police officers, who served successively as senior investigator to the Commission: Deputy Chief Ron Bain of the Peel Regional Police Service (now retired), Superintendent Eugene Kerrigan of the York Region Force and Acting Inspector Rick Huffman of the Toronto Police Service.

These officers displayed the highest level of investigative skill and judgment in the same manner that has distinguished their outstanding careers in law enforcement.

They were ably assisted in a part-time capacity by Barry Hill, a retired Toronto Police officer.

The Commission is grateful to Chief Armand La Barge of York Region for the secondment of Superintendent Kerrigan and to Chief William Blair of the Toronto Police Service for the secondment of Acting Inspector Huffman.

Editor

To the task of editing and producing the Commission’s reports to the highest standard Jim Poling, Sr., a master of the English language and a most skilful, thoughtful, and effective editor, applied his great depth of experience as a journalist, editor and author.
Administrators

The Commission was extremely well served by David Henderson as Chief Administrative Officer and by Kathy Genore as Manager, Finance and Operations, a key member of the Commission team who made an enormous contribution to its work. Their deep experience in the management of independent Commissions ensured the smooth running of the Commission’s work. The taxpayer is well served by the tight fiscal accountability they ensured as watchdogs over the expenditure of public funds.

The Commission is grateful to Sarina Kashak, Manager Court Operations Durham for Ms. Genore’s secondment to the Commission.

Communications Officer

The Commission benefited greatly from the skill and wise advice of Peter Rehak, admirably suited to the job through his distinguished record in journalism, television, and Commission administration.

Support Staff

The challenging tasks of office support in a demanding working environment were achieved cheerfully, with great skill and competence, by Clita Saldhana, Andrea Luedecke, Sandra Leal, Arlette Al-Shaikh, and Abbie Adelman with welcome assistance from Anita Tse of Hunt Partners LLP. They displayed the finest qualities of grace under pressure.

Consultants

Peter Lawson, a member of the Ontario bar and a legal researcher of formidable ability, assisted the Commission in a number of legal research projects. Michael O’Driscoll, a member of the Ontario bar and a legal consultant, also made a valuable contribution.

For medical research, the Commission is grateful to Dr. David Naylor, President of the University of Toronto, for recommending the services of Dr. Adrienne Chan, Dr. Christopher M. Booth and Dr. Sheldon Singh, who so ably assisted the Commission in a number of medical research projects.
Note on Public Hearings

SARS Commission Public Hearings
List of Presenters
and
Commissioner’s Remarks

September 29th, 2003

Opening Remarks — Mr. Justice Archie Campbell
Upon commencing at 10:00 a.m.

Mr. Justice Campbell: Good morning. Since March of this year forty-four (44) members of our community have lost their lives to SARS. Will you please stand for a minute of silence to remember those who died.

(Moment Of Silence)

Mr. Justice Campbell: Thank you. These three (3) days of public hearings were announced in early August and were widely advertised. We invited those who wished to make public submissions to do so. The response has been strong. We added five (5) hours to this week’s hearings. We will hold the further public hearings on November the 17th to accommodate those who applied but could not be heard this week because so many had applied.

This is an investigation under the Health Protection Act. We conduct the investigation mainly by confidential personal interview. We have spoken so far to around ninety (90) people, perhaps closer to one hundred (100) as of today. We’ve spoken to victims of SARS. We’ve spoken to some of those who have lost family members. We’ve spoken to health care workers who became ill, some of them gravely ill, with SARS.

It is very difficult for people who have been through this to talk about the grief and to discuss their loss, even in a confidential interview. I thank those who have shared their
experiences with us and those who will be speaking to us in the months ahead. Although the interviews themselves are confidential, their stories will be told in the public report with due concern for their personal privacy.

These public hearings represent a very small portion of our work and they give to those who have asked an opportunity to reach a wider public audience. The transcripts of these proceedings will be available on the Commission’s public web page.

The public has a right to know what happened during the SARS outbreak in Ontario. My job is, first, to investigate and to report publicly on what went right, what went wrong, what lessons should be learned. The full Terms of Reference are on our web page. I think a few copies are available here today. And I, in the report, will make public recommendations to improve our ability to protect the public and health care workers against deadly infections like SARS.

The Public Inquiries Act protects from any form of workplace reprisal every person who speaks to the Commission at these public meetings or in private interviews or who approaches us with information. The Commission cannot make findings of civil or criminal liability against any person or organization.

Please keep in mind these public hearings are not a forum to point fingers or to allege blame in relation to individuals. We are still in the information-gathering phase of the investigation and during these public hearings I will not question the presenters. I will not question any presenter at this time, except perhaps for clarification.

At a later stage in the investigation, we will continue to interview in depth people about detailed problems, particular problems, specific concerns and at that phase of the investigation, we will probe more deeply.

We have a lot of people here today. All the time slots have been scheduled in advance, and as you can see, it’s a pretty tight schedule. If you have not registered to speak but you would like to speak to us; if there’s something you want to tell us and you want to have a confidential interview, please speak to members of Commission staff who are here today.

For the presenters, I really would ask you please respect your time limit so that each presenter has a fair chance to be heard.

Upon commencing at 9:00 a.m.

Mr. Justice Campbell: As we begin this second session of public hearings, it's important to us to remember again the deaths from SARS of forty-four (44) members of our community. Their deaths and the sacrifices made by the front-line workers, all of those who suffered from SARS and all of those who fought it continue to motivate the work of all of us who are concerned about the outbreak and everyone who investigates it in the search for the facts of what happened and of the lessons we must learn.

Beginning in August of this year, a series of newspaper ads and radio announcements invited public submissions from anyone who wished to speak out in public about SARS. From September 29th to October 1st, we heard thirty-seven (37) presentations and in the next three (3) days, we will hear from the rest of those who asked to be heard in public.

It’s important to note that those who present at these hearings are not questioned or cross-examined publicly. This investigation under the Health Protection and Promotion Act is driven by confidential personal interviews. There’s no provision for adversary-type hearings and there’s no provision for cross-examination. During the course of this investigation questioning, as in any other investigation, takes place during the course of the confidential interviews. We have followed up in the confidential interviews with a number of those who presented at the last sessions and we will continue to do so with those who presented then and those who present in these sessions.

We’ve interviewed about two hundred (200) people and hundreds of interviews and followup interviews remain to be conducted. There is a great mass of documents to analyze.

In order to present the public with a full account of what happened in the SARS outbreak, in order to make sensible recommendations for future change, a great deal of work remains to be done. It will be approximately a year before I can be confident that the facts have been thoroughly enough investigated to support a final report that tells the public what happened and answers the questions that the public need to have answered.

In the meantime, other reports have been released to the public. Dean Naylor’s excellent report for the federal government, Learning from SARS: Renewal of Public Health in Canada, is extremely helpful, provides great insight and sheds a lot of light on many
of the areas under investigation by this Commission. Senator Michael Kirby’s Commission – Senate hearings have produced a similarly outstanding and very useful report on public health infrastructure, after hearing from the wide range of public health people including some of those involved in the recent SARS outbreak.

Dean David Walker’s forthcoming report to the provincial Ministry of Health is expected to explore in detail a number of research areas with a focus on future recommendations in the nature of policy lessons learned from SARS and health systems approach to consider for the future. One of our tasks is to integrate the results of all that work into our detailed investigations, the findings and analysis of the introduction and spread of SARS in Ontario.

The next two (2) days of public hearings, tomorrow and Wednesday, and today, will accommodate the balance of those who asked to make public statements. During the daytime session today, we’re also having an evening session, but during the daytime session we’ll hear from those invited by the Commission to explore a fundamental yet somewhat ignored issue of critical importance.

And that critical issue is workplace health and safety. It is fundamental that we understand that hospitals are workplaces. It’s fundamental we understand that hospitals, like all workplaces, are subject to a system of legal obligations under the *Occupational Health and Safety Act* and regulations; that legal system is designed to protect the health and safety of hospital workers and other health workers; that legal regime depends on the principle of internal responsibility supported by a system of workplace health and safety committees and enforced and supported by a system of inspection and investigation through the Ontario Ministry of Labour.

The application of workplace health and safety principles in hospitals during the SARS outbreak will provide a focus for most of the daytime presentations today. This evening, we will continue with presentations by family members and concerned citizens affected by SARS.

Ontario Nurses’ Association and Ontario Public Service Employees Union
Registered Nurses Association of Ontario
Service Employees International Union
Canadian Union of Public Employees
Ontario Ministry of Labour
Ontario Hospital Association
Occupational Health Management Services
Occupational Health Clinics for Ontario Workers Inc.
Mr. Justice Campbell: Thank you for your presentation. That concludes this second session of public hearings – in the course of the six (6) days of public hearings for a total of about seventy-five (75) presentations on behalf of many organizations and many individuals affected by SARS.

On Monday night, two (2) evenings ago, we heard how SARS affected families. The presentations by family members and their personal stories were compelling. It was
difficult for people to talk about their grief and we thank them, and all participants who came here, for sharing their experiences, their thoughts, their recommendations with us in public.

These public hearings represent but a very small portion of our work and they give, to those who have asked, an opportunity to reach a wider public audience. The bulk of our work consists of confidential personal interviews and we have so far conducted about two hundred (200) of those.

Those who present at the public hearings, you obviously noted, are not questioned or cross-examined publicly. Questioning takes place during the course of our confidential interviews and not in public. We have conducted follow-up interviews with a number of those who presented at the last public session. We continue to do so with them and we will continue to do with a number of those who presented at the earlier sessions and at these sessions.

Again, I wish to thank everyone who participated in these hearings. The purpose of these Public hearings is now fulfilled. Everyone who asked to make a public presentation has now been heard and no further public hearings are scheduled at this time. The investigation continues. Thank you.

Note

Transcripts of the public hearings are available on the Commission’s website, which will remain active for another year at www.sarscommission.ca and after that on the website of Ministry of Health and Long-Term Care.
THE SARS COMMISSION
First Interim Report

SARS and Public Health in Ontario

Dedication

This report is dedicated to those who died from SARS, those who suffered from it, those who fought the disease, and all those affected by it.
April 15, 2004

The Honourable George Smitherman MPP
Minister of Health and Long-Term Care
10th Floor Hepburn Block
80 Grosvenor St.
Toronto, Ontario
M7A 2C4

Dear Mr. Minister:

Pursuant to the terms of reference, letter of appointment, and Order-in-Council establishing the independent SARS Commission I submit the attached interim report.

Yours truly,

Archie Campbell
Commissioner
Executive Summary

A Broken System

SARS showed that Ontario’s public health system is broken and needs to be fixed. Despite the extraordinary efforts of many dedicated individuals and the strength of many local public health units, the overall system proved woefully inadequate. SARS showed Ontario’s central public health system to be unprepared, fragmented, poorly led, uncoordinated, inadequately resourced, professionally impoverished, and generally incapable of discharging its mandate.

The SARS crisis exposed deep fault lines in the structure and capacity of Ontario’s public health system. Having regard to these problems, Ontario was fortunate that SARS was ultimately contained without widespread community transmission or further hospital spread, sickness and death. SARS was contained only by the heroic efforts of dedicated front line health care and public health workers and the assistance of extraordinary managers and medical advisors. They did so with little assistance from the central provincial public health system that should have been there to help them.

These problems need urgently to be fixed.

Reasons for Interim Report

The work of this Commission will continue until I am satisfied that the necessary evidence has been reviewed. Because government decisions about fundamental changes in the public health system are clearly imminent, this interim report on the public health lessons of SARS is being issued at this time instead of awaiting the final report. This interim report is based on the evidence examined to date and is not intended as the last word on this aspect of the Commission’s investigation.

The fact that the Commission must address public health renewal on an interim basis is not to say it is more important than any other urgent issue such as the safety and protection of health care workers. It is simply a case of timing. The Commission
continues to interview health care workers, SARS victims, the families of those who
died, and those who fought the outbreak. Their story and the story of SARS will be
told in the Commission’s final report.

For an update on the Commission’s ongoing work see Appendix A.

**Twenty-one Principles for Reform**

The lessons of SARS yield 21 principles for public health reform:

1. Public health in Ontario requires a new mandate, new leadership, and new
   resources.

2. Ontario public health requires renewal according to the principles recommended
   in the Naylor, Kirby, and interim Walker reports.

3. Protection against infectious disease requires central province-wide accountability,
   direction, and control.

4. Safe water, safe food, and protection against infectious disease should be the first
   priorities of Ontario’s public health system.

5. Emergency planning and preparedness are required, along with public health
   infrastructure improvements, to protect against the next outbreak of infectious
disease.

6. Local Medical Officers of Health and public health units, the backbone of
   Ontario public health, require in any reform process a strong focus of attention,
support, consultation and resources.

7. Reviews are necessary to determine if municipalities should have a significant role
   in public health protection, or whether accountability, authority, and funding
   should be fully uploaded to the province.

8. If local Boards of Health are retained, the province should streamline the processes
   of provincial leadership and direction to ensure that local boards comply with the
   full programme requirements established by the province for infectious disease
   protection.
9. So long as the local Boards of Health remain in place: The local Medical Officer of Health should have full chief executive officer authority for local public health services and be accountable to the local board. Section 67 of the Health Protection and Promotion Act should be enforced, if necessary amended, to ensure that personnel and machinery required to deliver public health protection are not buried in the municipal bureaucracy.

10. Public health protection funding against infectious disease should be uploaded so that the province pays at least 75 per cent and local municipalities pay 25 per cent or less.

11. A transparent system authorized by law should be used to clarify and regularize the roles of Chief Medical Officer of Health and the local Medical Officer of Health in deciding whether a particular case should be designated a reportable disease.

12. The Chief Medical Officer of Health, while accountable to the Minister of Health, requires the independent duty and authority to communicate directly with the public and the Legislative Assembly whenever he or she deems necessary.

13. The operational powers of the Minister of Health under the Health Protection and Promotion Act should be removed and assigned to the Chief Medical Officer of Health.

14. The Chief Medical Officer of Health should have operational independence from government in respect of public health decisions during an infectious disease outbreak. Such independence should be supported by a transparent system requiring that any Ministerial recommendations be in writing and publicly available.

15. The local Medical Officer of Health requires independence, matching that of the Chief Medical Officer of Health, to speak out and to manage infectious outbreaks.

16. The operational powers of the local Medical Officer of Health should be reassigned to the Chief Medical Officer of Health, to be exercised locally by the Medical Officer of Health subject to the direction of the Chief Medical Officer of Health.

17. An Ontario Centre for Disease Control should be created as support for the Chief Medical Officer of Health and independent of the Ministry of Health. It should
have a critical mass of public health expertise, strong academic links, and central laboratory capacity.

18. Public health requires strong links with hospitals and other health care facilities and the establishment, where necessary, of an authoritative hospital presence in relation to nosocomial infections. The respective accountability, roles and responsibilities of public health care and health care institutions in respect of infectious outbreaks should be clarified.

19. Ontario and Canada must avoid bickering and must create strong public health links based on cooperation rather than competition to avoid the pitfalls of federal overreaching and provincial distrust.

20. The Ontario government must commit itself to provide the necessary resources and leadership for effective public health protection against infectious disease.

21. Public health requires strong links with nurses, doctors and other health care workers and their unions and professional organizations.

It is expected that the final report of the Walker expert panel will recommend a detailed prescriptive blueprint for many of the operational details of a renewed system. Such operational details are beyond the scope of this interim report. Some of the issues that will drive these details are discussed in the report.

Hindsight

Everything said in this report is said with the benefit of 20-20 hindsight, a gift not available to those who fought SARS or those who designed the systems that proved inadequate in face of a new and unknown disease.

It is important to distinguish between the flaws of public health systems and the skill and dedication of those who worked within them. To demonstrate the weakness of Ontario’s public health infrastructure is not to criticize the performance of those who worked within systems that proved inadequate in hindsight. The Commission recognizes the skill and dedication of so many individuals in the Ontario public health system and those volunteers from Ontario and elsewhere who worked beyond the call of duty. Twenty-hour days were common. They faced enormous workloads and pressures in their tireless fight, in a rapidly changing environment, against a deadly and mysterious disease.
It is my hope that those who worked on the front lines and in public health in Ontario during SARS will accept that I have approached the flaws of the system with the utmost respect for those who gave their all to protect the public. We should be humbled by their efforts.

In this interim report I have attempted to avoid, and I invite the reader to avoid, the unfair use of hindsight to judge the actions of those who struggled so valiantly in the fog of battle against the unknown and deadly virus that is SARS.

What Went Right

The litany of problems listed below reflect weaknesses in central public health systems. These weaknesses hampered the work of the remarkable individuals who eventually contained SARS. The problems of SARS were systemic problems, not people problems. Despite the deep flaws in the system, it was supported by people of extraordinary commitment.

The strength of Ontario’s response lay in the work of the people who stepped up and fought SARS. What went right, in a system where so much went wrong, is their dedication. It cannot, however, be said that things went right because SARS was eventually contained. It does nothing for those who suffered from SARS or lost loved ones to SARS to say that the disease which caused their suffering was ultimately contained. For the families of those who died from SARS and for all those who suffered from it, little if anything went right. This enormous toll of suffering requires that the Ontario government commit itself to rectify the deep problems in the public health system disclosed by SARS.

The Decline of Public Health

The decline of public health protection in Ontario began decades before SARS. No government and no political party is immune from responsibility for its neglect.

It is troubling that Ontario ignored so many public health wake-up calls from Mr. Justice Krever in the blood inquiry, Mr. Justice O’Connor in the Walkerton inquiry, from the Provincial Auditor, from the West Nile experience, from pandemic flu planners and others. Despite many alarm calls about the urgent need to improve public health capacity, despite all the reports emphasizing the problem, the decline of Ontario’s public health capacity received little attention until SARS. SARS was the
final, tragic wake-up call. To ignore it is to endanger the lives and the health of everyone in Ontario.

Lack of Preparedness: The Pandemic Flu Example

When SARS hit, Ontario had no pandemic influenza plan. Although SARS and flu are different, the lack of a pandemic flu plan showed that Ontario was unprepared to deal with any major outbreak of infectious disease.

Had a pandemic flu plan been in place before SARS, Ontario would have been much better prepared to deal with the outbreak. The failure to heed warnings about the need for a provincial pandemic flu plan, and the failure to put such a plan in place before SARS, reflects a lack of provincial public health leadership and preparedness.

Lack of Transparency

Because there was no existing plan in place for a public health emergency like SARS, systems had to be designed from scratch. Ad hoc organizations like the epidemiological unit (Epi Unit) and the Science Committee were cobbled together. Procedures and protocols were rushed into place including systems like the case review, or adjudication process, that grew up to determine whether a particular case should be reported as SARS. Because SARS was such a difficult disease to diagnose, there were no reliable lab tests and knowledge about the disease was rapidly evolving, there were disagreements from time to time as to whether a particular case was SARS.

Although well meaning, this system lacked clear lines of accountability and in particular it lacked transparency.

To avoid this problem in the future the Commission recommends that the respective roles of the Chief Medical Officer of Health and the local Medical Officers of Health, in deciding whether a particular case should be designated as a reportable disease, should be clarified and regularized in a transparent system authorized by law.

Lack of Provincial Public Health Leadership

Few worked harder during SARS than Dr. Colin D'Cunha, the Chief Medical Officer of Health for Ontario and Director of the Public Health Branch in the
Ontario Ministry of Health and Long-Term Care. He demonstrated throughout the crisis a strong commitment to his belief of what was in the public interest. Dr. D'Cunha is a dedicated professional who has devoted his career to the advancement of public health. For the brief reasons set out in the report Dr. D'Cunha turned out in hindsight to be the wrong man in the wrong place at the wrong time.

While it may be due to misunderstandings or a simple difficulty on the part of Dr. D'Cunha to communicate effectively, there is a strong consensus on the part of those colleagues who worked with him during the crisis that his highest and best public calling at this time is in an area of public health other than direct programme leadership. This general concern has undoubtedly been reflected in the government’s decision to provide him with other opportunities within his area of expertise.

Because Dr. D'Cunha no longer holds the office of Chief Medical Officer of Health it might be asked why it is necessary in this interim report to deal with his leadership during SARS. The answer is that the public has a right to know what happened during SARS and that obliges me to make whatever findings I am taken to by the evidence. The story of what happened during SARS cannot be told without some reference to the difficulties that arose in respect of Dr. D'Cunha’s leadership.

I cannot fairly on the evidence before me make any finding of misconduct or wrongdoing by Dr. D'Cunha. The underlying problems that arose during SARS were systemic problems, not people problems. Because the underlying problems were about inadequate systems and not about Dr. D'Cunha, it would be unfair to blame him or make him a scapegoat for the things that went wrong.

It is impossible to say, in the end result, that Dr. D'Cunha's difficulties made any ultimate difference in the handling of the crisis. Although his colleagues were frustrated by his approach to things, the crisis was to a large extent managed around him. It is hard to say that the overall result of the SARS crisis would have been different with someone else at the helm.

Lack of Perceived Independence

The Commission on the evidence examined thus far has found no evidence of political interference with public health decisions during the SARS crisis. There is, however, a perception among many who worked in the crisis that politics were at work in some of the public health decisions. Whatever the ultimate finding may be once the investigation is completed, the perception of political independence is
equally important. A public health system must ensure public confidence that public health decisions during an outbreak are free from political motivation. The public must be assured that if there is a public health hazard the Chief Medical Officer of Health will be able to tell the public about it without going through a political filter. Visible safeguards to ensure the independence of the Chief Medical Officer of Health were absent during SARS. Machinery must be put in place to ensure the actual and apparent independence of the Chief Medical Officer of Health in decisions around outbreak management and his or her ability, when necessary, to communicate directly with the public.

Lack of Public Health Communication Strategy

The problems of public communication during SARS are addressed thoughtfully in the Naylor Report and the Walker Interim Report. The Commission endorses their findings and their recommendations for the development of coherent public communication strategies for public health emergencies.

There is no easy answer to the public health communications problems that arose during SARS. On the one hand, if there are too many uncoordinated official spokespeople the public ends up with a series of confusing mixed messages. On the other hand, as Mr. Tony Clement the Minister of Health during SARS pointed out to the Commission, any attempt to manage the news by stifling important sources of information will not only fail but will also lead to a loss of public confidence and a feeling among the public that they are not getting the straight goods or the whole story. What is needed is a pre-planned public health communications strategy that avoids either of these extremes.

Poor Coordination with Federal Government

Problems with the collection, analysis and sharing of data beset the effort to combat SARS. While many factors contributed to this, strained relations between the three levels of government did not help matters.

The lack of federal-provincial cooperation was a serious problem during SARS. This lack of cooperation prevented the timely transmission from the Ontario Public Health Branch of vital SARS information needed by Ottawa to fulfill its national and international obligations. Although recollections differ as to the responsibility for this lack of cooperation, the underlying problems were the lack of pre-existing protocols,
agreements, and other machinery to ensure the seamless flow of necessary information and analysis, combined with a possible lack of collaborative spirit in some aspects of the Ontario response.

The inherent tensions between the federal and provincial governments must be overcome by a spirit of cooperation around infectious disease surveillance and coupled with the necessary machinery to ensure in advance that the vital information will flow without delay. It is clearly incumbent on both levels of government to ensure that the breakdown that occurred during SARS does not happen again.

A Dysfunctional Public Health Branch

The Commission has heard consistent reports that the Public Health Branch of the Ministry of Health had become dysfunctional both internally and in terms of its relationships with the local public health units.

A lack of respect for the Public Health Branch was evident in the responses from outside Ontario and from elements of the Ontario public health system at the local level. When SARS hit, leadership was not forthcoming from a Public Health Branch that turned out to be dysfunctional.

Lack of Central Public Health Coordination

Under the Health Protection and Promotion Act, local Medical Officers of Health were responsible for the local response to SARS. It was to the province however, to the Public Health Branch in the Ministry of Health, that the local public health units looked for guidance. Unfortunately many Medical Officers of Health felt there was no coordinated effort at the Public Health Branch to facilitate the SARS response at the local level. For many in the field it seemed as though the Branch was a silo, disconnected from the field, rather than a partner or a resource.

Many local Medical Officers of Health felt abandoned during SARS, devoid of support and guidance. The Branch’s failure to co-ordinate and guide the local health units was already a big problem before SARS. It turned out to be a harbinger of the problems that arose during SARS.
Lack of Central Expertise

The outbreak was managed, of necessity, around the Public Health Branch of the Ministry of Health and Long-Term Care rather than through it. The critical mass of professional expertise one would expect in a crucial branch of government in a province the size of Ontario simply did not exist, either in the number of experts or their depth of experience. Key operational groups had to be put together on the run and individual experts had to be recruited from the field to fill this void. Machinery such as the Science Committee and the Epi Unit were run on almost a volunteer drop-in basis because there was no depth of expertise in the Branch itself.

SARS demonstrated that our most valuable public health resources are human resources and that Ontario lacked a critical mass of expertise at the provincial level. It is crucial to the success of any public health reform initiatives in Ontario that there be a high level of expertise at both the local and central levels of public health. Ontario cannot continue to rely on the goodwill and volunteerism of others to protect us during an outbreak. Many of those who came forward to work at the provincial level during SARS were disheartened by the problems they saw and a few expressed doubts whether they would be willing to come forward again, particularly if the problems are not addressed. Examples abound of centres of excellence for disease control: British Columbia, Quebec, and Atlanta, among others. Ontario needs to learn from their example. Without a critical mass of the right professionals public health reform, no matter how well-reasoned and well-resourced, has no chance of success.

No Established Scientific Backup

In March 2003, the Public Health Branch in Ontario had neither the capacity nor the expertise to handle an outbreak of the magnitude of SARS. Neither was there any provincial plan to rapidly bring together the necessary experts to provide scientific advice to those managing the outbreak. One outside expert, brought in to help manage the crisis, noted that Ontario simply didn’t have the machinery, people or the leadership at the central level:

It was abundantly clear to everyone who sat in on teleconferences that Ontario was scrambling, didn’t have the infection control expertise, at least the amount of expertise. There were superb infection control people there . . . it’s clear they were unable to pull together the data that was required for them and us to try to understand what’s going on. It was
abundantly clear that there was no obvious concerted leadership of the outbreak at least as we could see . . . It was obvious to all of us that Ontario was in substantial trouble.

Consequently, the Ministry of Health had to turn to experts outside of government for advice and direction. While it is not unusual that outside experts would be consulted during an outbreak, the lack of planning meant that the core expert groups had to be thrown together in haste without adequate planning or organization.

Lack of Laboratory Capacity

Before SARS, concerns had been raised about the capacity of the Ontario Central Public Health Laboratory (provincial laboratory). Despite these warnings, it was not prepared to deal with an outbreak of this magnitude. There were only two medical microbiologists in the laboratory, who were responsible for the entire province.

To make it worse, the Ministry of Health and Long-Term Care, in the fall of 2001, had laid off its PhD level scientists at the provincial laboratory. These scientists were engaged in the diagnosis and surveillance of new and emerging infections as well as research and development.

Within government, there seemed to be a complete lack of understanding of the importance of the work done by scientists at the provincial laboratory. At the time of the layoffs, a Ministry of Health spokesman was quoted as saying:

Do we want five people sitting around waiting for work to arrive? It would be highly unlikely that we would find a new organism in Ontario.

It is unnecessary, in light of SARS, to bring the irony of this statement to the attention of the reader. Less than two years later, SARS struck Ontario. The provincial laboratory did not have the capacity to deal with SARS.

Despite earlier warnings, the Ontario Central Public Health Laboratory proved inadequate during SARS. It is essential that the provincial laboratory be revitalized with the necessary physical and human resources.
No Provincial Epidemiological Unit

When SARS hit Ontario, the Ministry of Health's Public Health Branch was totally unprepared to deal with an outbreak of this nature. To start with, it had no functioning epidemiological unit (Epi Unit).

The Science Committee needed epidemiological data about the transmission of the disease and whether control measures were effective. It needed answers to a number of vital questions: How was the outbreak progressing? What was the incubation period? How long were people infectious? What were the risks in hospital?

Although an Epi Unit was cobbled together as the outbreak unfolded, its work was hampered by the lack of planning and support systems.

It was a major failure of Ontario’s public health system that no such unit was in place when SARS struck. The development of fully resourced epidemiological capacity is vital to protect Ontario against outbreaks of infectious disease. In the absence of major reform, Ontario may not be able in a future outbreak to draw on the extraordinary volunteer resources that helped so much in the spring of 2003.

Inadequate Infectious Disease Information Systems

The fight against SARS was hampered by the lack of an effective reportable disease information system. When SARS hit Ontario neither the provincial Public Health Branch nor the local public health units had any information system capable of handling a disease like SARS. The existing system, known as Reportable Disease Information System, or RDIS, was disease-specific and not flexible enough to handle new diseases.

Until the Epi Unit was up and running, there was no way to coordinate the work of local public health units into a common reporting structure. This delay turned out to be a critical problem. By the time the Epi Unit was established, individual health units were married to their own individual methods of collecting and reporting data. As a result, they were unable and disinclined to change their systems mid-stream, despite problems created by the diverse manner in which the data was being collected and reported.
Because of systemic weaknesses, the Toronto Public Health unit, which had the majority of the SARS cases, relied on a paper-based system of case tracking. This nightmarish system generated cardboard boxes spilling over with paper, all of which had to be collated and analyzed by hand.

The Commission endorses the specific recommendations in the Naylor Report and the Walker Interim Report to address the deficiencies in the federal and Ontario infectious disease information systems.

Should SARS or some other infectious disease hit Ontario tomorrow, the province still has no information system, accessible by all health units, capable of handling an outbreak. The first unheeded wake-up call was the Provincial Auditor’s report in 1997. The second unheeded wake-up call was West Nile. If it takes Ontario as long to respond to SARS as it did to those earlier wake-up calls, the province will be in serious trouble when the next disease strikes.

**Overwhelming and Disorganized Information Demands**

The problem of information flow was not restricted to the lack of the necessary information technology systems. Confusion, duplication, and apparent competition prevailed in the work of those in the central apparatus who sought information from local public health units and hospitals. These unfocused demands consumed valuable time of public health and hospital staff, distracted them from urgent tasks at hand, and impaired their ability to get on with the work of fighting the disease.

SARS caught Ontario with no organized system for the transmission of case information to those who needed it to fight the outbreak. There was no order or logic in the frenzied, disorganized, overlapping, repetitious and multiple demands for information from hospitals and local public health units. Requests would go out simultaneously to many people for the same piece of information. The work of front line responders in hospitals and health units was seriously impaired by this constant and unnecessary harassment.

**Inadequate Data**

The data produced by the jerry-built system through the frenzy of information demands often proved to be inadequate. Accurate data of high quality was vital to the experts on the Science Committee who had to provide evidence- and science-based
direction for the management of SARS. Because so much about the disease was unknown, case-specific information was vital and sound decisions could not be made without adequate data of the necessary quality.

The Science Committee never reached the point where it received adequate data in a timely manner, including information about contacts of those with SARS. Consequently, it was difficult to judge the effectiveness of control measures such as quarantine.

The Epi Unit and the local health units were often unable to provide adequate and timely data. While there is disagreement among those involved as to the amount of data being provided, what is clear is that the experts and officials who needed the data did not get what they needed when they needed it. The information systems and support structures were simply not in place. In the absence of this necessary machinery, not even the hardest work and greatest expertise of those who came forward to staff the Epi Unit and the Science Committee could overcome the obstacles.

**Duplication of Central Data Systems**

Because there was no standard information system for the Public Health Branch and all the local public health units, each individual health unit developed their own data collection system during SARS. The lack of a single, effective, accessible information system, combined with a constant, intense demand for information from a number of different people and groups, resulted in chaos.

Duplicate data systems sprung up at the Ministry of Health. For example, one group in the Ministry ran a system intended to track the situation in hospitals. This group collected data separate from the Epi Unit, but the numbers reported by this Ministry group often differed widely from the numbers reported by the Epi Unit.

The proliferation of data systems, and the confusion and burdens it created, was an inevitable consequence of Ontario’s lack of preparedness for a major outbreak of infectious diseases.

Failure to prioritize public health emergency preparedness, and to devise one central system for the collection and sharing of infectious disease data was a major problem during SARS. Although work has been done since SARS to improve the situation, there is no such system now in place to protect us from a future outbreak. Unless this problem is addressed, duplicate systems will spring up again as people scramble to
devise their own information systems in the absence of systems put in place before the next outbreak hits.

Blockages of Vital Information

There was a perception among many who fought SARS that the flow of vital information to those who urgently needed it was being blocked or delayed for no good reason.

What is striking is that the various groups appear honestly to believe that they communicated the information to each other. Yet clearly there were significant gaps in the transfer of information between Toronto Public Health and the province, between the provincial Epi Unit and the Science Committee, and between Ontario and the Federal government. It is impossible to determine the precise source of the data blockages.

It does not matter whose perception, in the fog of battle against the disease, was correct. The bottom line is that the lack of clarity around the flow of communication and the reporting structure, the absence of a pre-existing epidemiological unit coordinated with the local health units and the absence of clear public health leadership above the Epi Unit provided an environment in which the crucial elements of the fight against SARS were disconnected from each other. Despite the best efforts of individuals attached to all of the groups involved, they simply could not connect effectively.

Legal Confusion

The fight against SARS was marked by the lack of clarity of existing laws that impacted on the public health system. Although the Commission cannot at this interim stage make specific recommendations for legislative reform in Ontario, a few things should be said about the general need for work in this area. Areas of concern include the following:

- Who legally was in charge of the outbreak?
- Who had the ultimate responsibility for the classification of a case: the local jurisdiction or the province?
• What was the legal authority for issuing directives to hospitals?

• What were the consequences of not following those directives?

• What specific information had to be transmitted, by whom, when and to whom?

• To what extent could public officials and private experts share data and for what purpose?

• Who was obliged to notify relatives that a family member was classified as a suspect or probable case?

• Did privacy rights prevent the sharing of information necessary to fight the outbreak?

While protection of patient confidentiality is a key consideration in any data sharing agreement or legislation, it should not in the future hinder the vital communication of data to the extent it did during SARS. Notwithstanding the strong privacy concern demonstrated by many of those who fought the outbreak, a number of families affected by SARS reported that they felt their privacy had nonetheless been violated because personally identifying information somehow made it into the media. It is ironic that although privacy concerns restricted the flow of vital information between agencies fighting the outbreak, they were not always effective to keep personal information from the media.

Whatever the precise path of legislative reform, privacy, while vital, should not impede the necessary sharing between agencies and governments of information required to protect the public against an outbreak of infectious disease.

The Commission during the course of its investigation will continue to address issues around the need for legislative changes identified in the lessons learned from SARS.

Public Health Links with Hospitals

SARS was largely a hospital spread infection. Although there was some spread in households and doctors offices, and a limited element of community spread, most of the transmission took place in hospitals.
There are significant weaknesses in the links between public health and hospitals and there is lack of clarity as to the respective accountability and authority of public health and hospitals in a hospital-based outbreak.

Public health should have strong links with hospitals and establish where necessary an authoritative hospital presence in relation to nosocomial infection. The respective accountability, roles and responsibilities of public health and health care institutions in respect of infectious outbreaks should be clarified.

Public Health Links with Nurses, Doctors and Others

Public health links with nurses, doctors, other health care workers and their unions and professional organizations were often ineffective during SARS.

This section of the report illustrates specific problems that arose from this general failure and points to the need for a better system to ensure that public health develops better links and communication systems with the key participants in the health care system.

Lack of Public Health Surge Capacity: The Toronto Example

The sudden demands imposed by SARS on local public health units were overwhelming. The hardest hit jurisdiction was Toronto, where the cases snowballed with each passing day of the outbreak. While the same was true of other public health units, Toronto is selected as an example because it had the greatest number of cases.

Despite the reassignment of public health staff from other jobs, and despite the influx of workers from other health units to help out, Toronto public health was at times overwhelmed by the staggering workload which included:

- Approximately 2,000 case investigations. Each took an average of nine hours to complete.
- More than 23,000 people identified as contacts.
Of these, 13,374 placed in quarantine.

More than 200 staff working on the SARS hotline.

Over 300,000 calls received on the hotline.

On the highest single day, 47,567 calls.

Despite the best efforts of so many, the systems for redeployment proved inadequate. SARS demonstrated the need to create surge capacity by planning in advance so that every available worker can be redeployed where necessary.

The Case of the Federal Field Epidemiologists

The federal government sent a number of Health Canada employees to work in the field to help with containment efforts. In the early days of the outbreak they sent three federal field epidemiologists to Toronto, often referred to as the field epi’s, who brought a badly needed level of expertise to the provincial response. Unfortunately, the lack of clarity concerning their deployment and, from time to time, the tasks that they were asked to perform led to problems and ultimately contributed to the decision by Health Canada to pull them back from Ontario.

The case of the federal field epidemiologists demonstrates many of the underlying problems of Ontario’s SARS response noted above: poor coordination among levels of government, poor coordination of Ontario’s public health response, and above all a lack of any advance plan for outbreak management.

Improvements Since SARS

This section of the report describes the steps taken to fix the problems disclosed by SARS.

These pending and proposed improvements exemplify an obvious present desire to fix the public health problems revealed by SARS. It is beyond the Commission’s mandate to evaluate or monitor these initiatives. The government’s efforts to ensure the province will not again be confronted by the same problems that arose during SARS will be effective only if it dedicates adequate funds and makes a long-term commitment to reform of our public health protection systems. As in most areas of human
endeavour, actions speak louder than words. Only time will tell whether the present commitment will be sustained to the extent necessary to protect Ontario adequately against infectious disease.

**Naylor, Kirby, Walker**

These three reports share a common vision for the renewal of our public health systems through increased resources, better federal-provincial and inter-agency cooperation, and system improvements. They bear close study and great consideration. Their methodology and approach are sound and their recommendations are solidly based in their respective expertise. Based on the evidence it has seen, the Commission endorses the major findings and recommendations of all three studies.

**Federal–Provincial Cooperation**

Too many good ideas in this country have been destroyed by mindless federal-provincial infighting. The most noble and appealing proposals for reform falter so often in Canada simply because of the inherent bureaucratic and political mistrust between the two levels of government. If a greater spirit of federal-provincial cooperation is not forthcoming in respect of public health protection, Ontario and the rest of Canada will be at greater risk from infectious disease and will look like fools in the international community. While there are hopeful signs that more cooperation will be forthcoming, it will take hard work from both levels of government to overcome the lack of coordination demonstrated during SARS.

Ontario and Canada must avoid bickering and must create strong public health links based on cooperation rather than competition, avoiding the pitfalls of federal over-reaching and provincial distrust.

**Independence and Accountability**

There is a growing consensus that a modern public health system needs an element of independence from politics in relation to infectious disease surveillance, safe food and safe water, and in the management of infectious outbreaks.

Whatever independence may be required by the Chief Medical Officer of Health for public health decisions during an outbreak and for the right to speak out
publicly whenever necessary, he or she should remain accountable to the government for overall public health policy and direction and for the expenditure of public funds.

The proposed power to report directly to the public, combined with independence in relation to the management of infectious outbreaks, provides a significant measure of independence to the Chief Medical Officer of Health. It ensures that on important public health issues the Chief Medical Officer of Health cannot be muzzled and that the public can get a direct sense of emerging public health problems without passing through any political filters. It ensures both the reality and the public perception that the management of infectious disease outbreaks will be based on public health principles and not on politics.

The Commission therefore recommends:

- Subject to the guarantees of independence set out below, The Chief Medical Officer of Health should retain a position as an Assistant Deputy Minister in the Ministry of Health and Long-Term Care.

- The Chief Medical Officer of Health should be accountable to the Minister of Health with the independent duty and authority to communicate directly with the public by reports to the Legislative Assembly and the public whenever deemed necessary by the Chief Medical Officer of Health.

- The Chief Medical Officer of Health should have operational independence from government in respect of public health decisions during an infectious disease outbreak, such independence supported by a transparent system requiring that any Ministerial recommendations be in writing and publicly available.

The local Medical Officer of Health should have the independence, matching that of the Chief Medical Officer of Health, to speak out and to manage infectious outbreaks.

**The Public Health Ping-Pong Game**

Public health in Ontario including protection against infectious disease is delivered primarily through 37 local Boards of Health, which are largely controlled by munici-
pal governments. Public health funding has gone back and forth like a ping-pong ball between the province and the municipalities.

So long as the municipalities fund public health to a significant degree, public health will have to compete with other municipal funding priorities. Communicable disease control is a basic public necessity that can affect the entire province if a disease gets ahead of the controls. Infectious disease control should not have to compete against potholes for scarce tax dollars.

There is no scientific way to determine the appropriate degree of provincial funding upload for infectious disease surveillance and control. Although a case can be made for 100-per-cent funding upload, the persuasive views of a number of local Medical Officers of Health suggest that it would be sensible to upload infectious disease control to a provincial contribution of at least 75 per cent.

Opinions will differ as to how the funding formula should be changed, and whether and how much coordinating or direct power over public health should be uploaded to the province. The one thing on which everyone will agree is that the shifting of funding and accountability back and forth between the province and the municipalities has impaired the stability of Ontario’s public health system. It is time to stop the ping-pong game and to begin an era of stable public health funding relationships between the province and the municipalities.

One Local Funding Problem

This section of the report demonstrates in exquisite detail the problems that can arise through the present system of local funding of public health and the disinterest shown by some municipal politicians in the public interest in effective public health protection.

This story painfully reveals the importance of ensuring that funding for local health activities is not left to the mercies of any intransigent local council that fails to live up to its legal responsibilities in respect of public health protection. Basic protection against disease should not have to compete for money with potholes and hockey arenas. Even if most municipalities respect their public health obligations under the Health Protection and Promotion Act, it only takes one weak link to break the chain of protection against infectious disease. Should an infectious disease outbreak spread throughout Ontario, the municipality that cannot or will not properly resource public health protection may be the weak link that affects the entire province and beyond.
The Municipalities’ Funding Dilemma

All municipalities are affected by the underlying difficulty of funding any provincial programme from the local municipal property base. SARS and West Nile showed that infectious disease protection has to be approached at a provincial level. It is anomalous to fund a provincial programme like infectious disease control from the limited municipal tax base. In a submission to the Commission, the Association of Municipalities of Ontario makes a persuasive case for the province and the municipalities to sit down together and agree on the best structure to fund infectious disease protection and the best process for getting there.

One Local Story: Parry Sound

SARS was not restricted to Toronto. This section outlines the response to SARS by the local hospital, the West Parry Sound Health Centre and the local public health unit. It demonstrates the lack of provincial public health support to a local community faced with SARS and the difficulties caused by the inability of many local public health units to attract and retain permanent a Medical Officer of Health.

If the present system of local control over public health and infectious disease is to be maintained, it is essential that machinery be put in place to ensure continuous unbroken oversight and authority in every public health unit in Ontario supported by the necessary cadre of public health professionals.

An Ontario Centre for Disease Control

A consensus has developed that some kind of separate “CDC Ontario” is needed, with strong academic links, in order to provide a critical mass of medical, public health, epidemiological, and laboratory capacity and expertise. Structural models abound for such an organization, from the British Columbia Centre for Disease Control (B.C. CDC), to the Institut national de santé publique du Québec, to the federal model proposed in the Naylor Report, and even to the United States Centres for Disease Control (CDC) itself. It is expected that the final Walker Report will make detailed and prescriptive recommendations for the structure and mandate of such an organization.

While it is beyond the scope of this interim report to address this issue in the detailed fashion expected from the final Walker report, a few observations are in order.
First, the structure of the new agency or centre, which will combine advisory and operational functions, must reflect the appropriate balance between independence and accountability whether it is established as a Crown corporation or some other form of agency insulated from direct Ministerial control.

Second, it should be an adjunct to the work of the Chief Medical Officer of Health and the local Medical Officers of Health, not a competing body. SARS showed that there are already enough autonomous players on the block who can get in each other’s way if not properly coordinated. There is always a danger in introducing a semi-autonomous body into a system like public health that is accountable to the public through the government. The risk is that such a body can take on a life of its own and an ivory tower agenda of its own that does not necessarily serve the public interest it was designed to support.

Third, it must be made clear from the beginning that the agency is not an end in itself but exists only to support public health.

The success of centres such as the CDC in Atlanta and the CDC in British Columbia flows largely from a widespread recognition that these institutions house the very best of the best. The authority they have comes from their recognition as centres of excellence that can be counted on to work collaboratively with local agencies. To achieve this authority and success an Ontario Centre for Disease Control will require considerable resources and a strong commitment from government to maintain those resources. It will only work if it has the resources to attract recognized experts and to provide them with the best technology and equipment and optimal support to perform their work. It will take years to build a reputation for excellence and anything less than a 100-per-cent commitment to this long-term goal will surely result in failure.

**Public Health Restructuring**

Whenever a system proves wanting it is tempting to blame its problems on structure and to embark on a course of reorganization, or centralization, or regionalization, or decentralization. It must be remembered that organizational charts do not solve problems. The underlying problems of public health in Ontario have to do with a lack of resources, years of neglect, and lack of governmental priority. These problems developed during the regimes of successive governments and no government or political party is immune from responsibility for the decline of public health protection. These problems will not be fixed by drawing boxes on paper around public health units and
moving them into other boxes. The underlying problems will only be solved by a reversal of the neglect that has prevailed for so many years throughout the regime of so many different governments headed by all three political parties.

That being said some attention must be given to the best way to structure and organize the delivery of public health in Ontario. This section discusses the respective merits of different approaches to the restructuring of Ontario’s system of public health protection.

**Greater Priority for Infectious Disease Control**

SARS made it clear that our public health system must give greater priority to protection against infectious disease. It is equally clear, however, that our entire public health system cannot be reorganized around one disease like SARS. Many diseases produce more sickness and mortality than SARS, and the task of plugging the holes demonstrated by SARS cannot be permitted to detract public health from the task of preventing those afflictions that comprise a higher burden of disease than SARS and other infectious diseases.

While it would be wrong to downgrade the long-term importance of health promotion and population health, the immediate threat posed by any infectious outbreak requires that a dominant priority must be given to protecting the public against infectious disease. It does not disrespect the advocates of health promotion to say that the immediate demands of public safety require that public health, as its first priority, looks after its core business of protecting us from infectious disease.

The tension in public health, between priority for infectious disease control and priority for long-term population health promotion, including the prevention of chronic lifestyle diseases, is not going to go away. There is no point in arguing which is more important, because they are both important. There are however five basic reasons why protection against infectious disease should be the first basic priority of our public health system.

The first is that the threat from infectious disease is direct and immediate. The second is that an outbreak of infectious disease, if not controlled, can bring the province to its knees within days or weeks, a threat not posed by lifestyle diseases. The third is that infectious disease catches the direct attention and immediate concern of the public in a way that long-term health promotion does not. It is essential in an infectious disease outbreak that the public be satisfied that they are getting solid information from the
government and that everything possible is being done to contain the disease. The fourth is that infectious disease prevention requires an immediate overall response because it moves rapidly on the ground and spreads quickly from one municipality to another and from province to province and country to country, thus engaging an international interest. The fifth is that health promotion depends largely on partnerships outside the health system between public health and local community agencies like schools and advocacy groups, allies and resources not available to infectious disease control which must stand largely on its own.

For these five reasons safe water, safe food, and protection against infectious disease should be the first priorities of Ontario’s public health system.

Central Control Over Health Protection

An uncontrolled outbreak of infectious disease could bring the province to its knees. The province-wide consequences of a failure in infectious disease control are simply too great for the province to delegate infectious disease protection to the municipal level without effective measures of central provincial control. There is little machinery for direct central control over infectious disease programmes. The existing machinery to enforce local compliance with provincial standards is cumbersome and under-used. Better machinery is needed to ensure provincial control over infectious disease surveillance and control.

During a disease outbreak the international community and organizations like the World Health Organization look for reassurance and credibility to the national and provincial level, not to the particular strength of any local public health board or the particular credibility of any local Medical Officer of Health. Viruses do not respect boundaries between municipal health units. The chain of provincial protection against the spread of infectious disease is only as strong as the weakest link in the 37 local public health units. A failure in one public health unit can spill into other public health units and impact the entire province and ultimately the entire country and the international community. When dealing with a travelling virus, concerns about local autonomy must yield to the need for effective central control.

If the Health Protection and Promotion Act were amended to provide that:

- The powers now assigned by law to the Medical Officer of Health are reassigned to the Chief Medical Officer of Health, and
• The powers reassigned to the Chief Medical Officer of Health shall be exercised by the Medical Officer of Health in the local region, subject to the direction of the Chief Medical Officer of Health, it would leave to the local Medical Officers of Health a clear field to exercise the same powers they have always exercised, subject to ultimate central direction.

Under the old system, such a re-arrangement of powers might raise serious concerns of loss of autonomy on the part of the local Medical Officer of Health including the spectre of political influence from Queen’s Park on local public health decisions. While concerns about local autonomy will never go away in any centralized system, the new independence of the Chief Medical Officer of Health and the Medical Officer of Health should go a long way to allay such concerns.

A further sensible measure to allay these concerns, and to further protect against the perception of political interference with public health decisions, would be to remove from the Minister of Health under the Act the direct operational power in cases of health risk, such powers to be assigned to the Chief Medical Officer of Health.

These measures are proposed to strengthen provincial control over public health protection with adequate safeguards to ensure the political independence of the Chief Medical Officer of Health and the local Medical Officer of Health in relation to infectious disease control.

Without stronger measures to ensure central provincial control of infectious disease control whenever necessary, Ontario will be left with inadequate protection against potential public health disasters.

**Political Will**

A reformed public health system requires a major injection of resources. The Naylor, Kirby, and interim Walker reports analyzed the need for a critical mass of scientific and medical expertise, more capacity to educate, recruit, and retain public health professionals, increased laboratory capacity, and improved technology. Further recommendations are expected in the final Walker report. Significant financial resources will be needed to give Ontario’s public health system any reasonable capacity for protection against infectious disease.

The decline of public health protection in Ontario reflects a consistent lack of political will, over the regime of many successive governments and all three political parties,
to bring up to a reasonable standard the systems that protect us against infectious disease.

Competition for tax dollars is fierce. It is not easy in a time of fiscal constraint for any government to make additional funds available for any public programme. It will require significant political will on the part of the Minister of Health and the Ontario government to commit the funds and the long-term resolve that are required to bring our public health protection against infectious disease up to a reasonable standard.

It would be very easy, now that SARS is over for the time being, to put public health reform on the back burner. It is a general habit of governments to respond to a crisis by making a few improvements without fixing the underlying problems responsible for the crisis. It would be a tragedy if that turned out to be the case with SARS. As the Naylor Report pointed out:

SARS is simply the latest in a series of recent bellwethers for the fragile state of Canada’s . . . public health systems. The pattern is now familiar. Public health is taken for granted until disease outbreaks occur, whereupon a brief flurry of lip service leads to minimal investments and little real change in public health infrastructure or priorities. This cycle must end.¹

Ontario, as demonstrated in this interim report, slept through many wake-up calls. Again and again the systemic flaws were pointed out, again and again the very problems that emerged during SARS were predicted, again and again the warnings were ignored.

The Ontario government has a clear choice. If it has the necessary political will, it can make the financial investment and the long-term commitment to reform that is required to bring our public health protection against infectious disease up to a reasonable standard. If it lacks the necessary political will, it can tinker with the system, make a token investment, and then wait for the death, sickness, suffering, and economic disaster that will come with the next outbreak of disease.

The strength of the government’s political will can be measured in the months ahead by its actions and its long-term commitments.

¹ National Advisory Committee on SARS and Public Health, Learning from SARS: Renewal in Public Health in Canada (Health Canada: October 2003) p. 64. (Subsequent footnotes will refer to this report as the Naylor Report.)
1. A Broken System

SARS showed that Ontario’s public health system is broken and needs to be fixed. Despite the extraordinary efforts of many dedicated individuals and the strength of many local public health units, the overall system proved woefully inadequate. SARS showed Ontario’s central public health system to be unprepared, fragmented, poorly led, uncoordinated, inadequately resourced, professionally impoverished, and generally incapable of discharging its mandate.

The SARS crisis exposed deep fault lines in the structure and capacity of Ontario’s public health system. Having regard to these problems, Ontario was fortunate that SARS was ultimately contained without widespread community transmission or further hospital spread, sickness and death. SARS was contained only by the heroic efforts of dedicated front line health care and public health workers and the assistance of extraordinary managers and medical advisors. They did so with little assistance from the central provincial public health system that should have been there to help them.

These problems need urgently to be fixed.

---

2. Ontario has 37 local Public Health Units. Twenty-seven of them are county-district health units. Nine are regional health departments and one covers a single municipality, the City of Toronto.
2. Reason for Interim Report

The Commission’s terms of reference provide for an interim report in the discretion of the Commissioner:

Mr. Justice Campbell shall produce an interim report at his discretion and deliver it to the Minister of Health and Long-Term Care who shall make the report available to the public.

Ten months have passed since the end of the SARS crisis. Excellent reports on public health renewal have been produced by Dean Naylor, Senator Kirby, and Dean Walker. A consensus has emerged that fundamental reform is necessary and the time has come to make decisions about the future of public health in Ontario.

The work of this Commission will continue until I am satisfied that the necessary evidence has been reviewed. But government decisions about fundamental changes in the public health system are obviously imminent at this time. If the Commission’s report on public health renewal awaits the completion of the entire investigation, of which public health is only one part, it will come too late to be of practical value. The Commission’s public health findings and recommendations must therefore be released now on an interim basis. This interim report is based on the evidence examined to date and is not intended as the last word on this aspect of the Commission’s investigation.

The fact that the Commission must address public health renewal on an interim basis is not to say it is more important than any other urgent issue such as the safety and protection of health care workers. It is simply a case of timing. The Commission continues to interview health care workers, SARS victims, the families of those who died, and those who fought the outbreak. Their story and the story of SARS will be told in the Commission’s final report.

For an update on the Commission’s ongoing work see Appendix A.

This interim report will:

- Summarize the problems in the provincial public health system revealed by SARS.
- Analyze some major issues around fundamental public health renewal.
• Present a few principles that reflect the lessons learned during SARS.

3. Hindsight

Everything said in this report is said with the benefit of 20–20 hindsight, a gift not available to those who fought SARS or those who designed the systems that proved inadequate in face of a new and unknown disease.

As Dr. James Young, Commissioner of Public Safety and Security, pointed out at the public hearings:

... when we called the provincial emergency, we were dealing with an outbreak where we did not know for sure that it was a virus, we did not know for certainty what virus it was, we did not know what symptoms and what order of symptoms SARS presented with. We had a vague idea that some of the symptoms might include fever and cough. We did not, for example, for some period of time, realize that about 30 per cent of patients also could present with diarrhea. We did not know how long it incubated for. We did not know with certainty whether it was droplet spread or whether it was airborne. We did not know when it was infectious. We did not have a diagnostic test for it and still do not have an accurate diagnostic test. We had no way of preventing it, we had no vaccine and we had no treatment. What we had was an illness with many unknowns and virtually no knowns. ³

It is easy, with the benefit of what we now know, to judge what happened during SARS. It is easy now to say which systems were inadequate and which decisions were mistaken. That is the great benefit of hindsight. As one military historian noted:

Once a dramatic event takes place, it always appears to have been predictable because hindsight tells the historian which clues were vital, which insignificant, and which false. The unfortunate general who must act without the benefit of hindsight is much more likely to err. ⁴

---

³. SARS Public Hearings, September 30, 2003, p. 34.
It is easy now in hindsight to see that systems were inadequate. It was harder to see their weaknesses before they were proved by SARS to be inadequate. A system that looks fine in normal times may prove wanting in the face of a new disease of unknown origin.

It is important to distinguish between the flaws of public health systems and the skill and dedication of those who worked within them. To demonstrate the weakness of Ontario’s public health infrastructure is not to criticize the performance of those who worked within systems that proved inadequate in hindsight. The Commission recognizes the skill and dedication of so many individuals in the Ontario public health system and those volunteers from Ontario and elsewhere who worked beyond the call of duty. Twenty-hour days were common. They faced enormous workloads and pressures in their tireless fight, in a rapidly changing environment, against a deadly and mysterious disease.

It is my hope that those who worked on the front lines and in public health in Ontario during SARS will accept that I have approached the flaws of the system with the utmost respect for those who gave their all to protect the public. We should be humbled by their efforts.

Although it is unfair to use hindsight to judge individual behaviour, hindsight is a useful tool in the search for lessons to be learned. Hindsight helps us understand what went wrong and what went right. Hindsight includes knowledge and wisdom learned after SARS and it can help us avoid in the future the mistakes of the past. Indeed the Commission has been urged to use hindsight to this end. Dr. Richard Schabas said at the public hearings:

I want to make it clear and I will make it clear that I think hindsight is a very commendable and useful tool for this Commission.5

It is a defining feature of every investigation into a public crisis that the public interest is best served by a full account of what happened together with an account of the lessons to be drawn from the crisis and the events that led up to it. This necessarily involves the application of hindsight. Hindsight becomes suspect only when inferences are drawn that systems or people “should have” acted differently even though they lacked vital knowledge that became available only later.

---

In this interim report I have attempted to avoid, and I invite the reader to avoid, the unfair use of hindsight to judge the actions of those who struggled so valiantly in the fog of battle against the unknown and deadly virus that is SARS.

4. What Went Right?

Despite everything that went wrong SARS was eventually contained by the extraordinary personal efforts of not only front line hospital workers, and the public health workers in the field, but also by an exceptional group of scientists, doctors, epidemiologists, local Medical Officers of Health and other public health professionals who came forward when needed. SARS was eventually contained not by any central public health system but by the heroic work of those who stepped forward during the crisis.

The litany of problems listed in this report reflect weaknesses in central public health systems. These weaknesses hampered the work of the remarkable individuals who eventually contained SARS. The problems of SARS were systemic problems, not people problems. Despite the deep flaws in the system, it was supported by people of extraordinary commitment.

One observer, talking of the work of the Epi Unit, built from scratch as the outbreak unfolded, referred to the remarkable work done by those who pitched in quickly in order to plug the gaps in the existing systems:

I wanted to make what I hope will be a really strong point and that is that amazing work was done by a lot of amazing people. People who cared passionately about public health, who cared passionately about doing good work under very trying circumstances . . . We had great epidemiologists, we had incredible technical support people . . . And we had great communications with some people outside of the Ministry, with other levels of government, with other jurisdictions and I think that sheer force of will in some cases is why SARS was beaten in this province and I don't want that to be forgotten. So just to, give kudos and say thank you to people who actually never got any formal thank you's.

Another expert from outside Ontario, while quite candid about the problems in the Ontario public health system, remarked how despite all those problems, a large number of people worked very hard to contain SARS. He stated:
I remain in awe of how hard a whole bunch of people were working at trying to deal with the issue of SARS. I have the utmost respect for the efforts that people put into some situations literally putting their lives on the line. For someone who has done infectious diseases in Canada for a long time, that is very unusual but I mean people and particularly in the front line were working unbelievably hard. So were the people in . . . and I do not want to be implied that some of the others in the more senior decision making were not working hard; they were working to the best of their ability so that was good. In any major outbreak investigation that I have been involved, it has been gratifying to see how people step up to the plate and put in the major efforts that they are required and some will do it for months on end.

One official from the Centres for Disease Control in Atlanta, made the following remarks:

Let me begin by saying I think this is my personal view, not necessarily that of my agency. But I will speak plainly because what you are doing is so vitally important and it’s precedent setting. So I will speak plainly. I hope you will take my comments perhaps with a grain of salt but I think personally that what is going on here is one of those examples of heroes without honour in their native land. I think that the . . . more I watch the story as it unfolds and is told and retold, I have a profound sense of awe and respect for some true heroes that stepped up and, and I don’t think there is a health officer in the United States . . . that goes to bed at night that sometime doesn’t hope, if it happens here, we will do as good a job as Toronto did. You are to be commended for this.

The strength of Ontario’s response lay in the extraordinary work of the people who stepped up and fought SARS. What went right, in a system where so much went wrong, is their dedication. It cannot, however, be said that things went right because SARS was eventually contained. It does nothing for those who suffered from SARS or lost loved ones to SARS to say that the disease which caused their suffering was ultimately contained. For the families of those who died from SARS and for all those who suffered from it, little if anything went right. This enormous toll of suffering requires that the Ontario government commit itself to rectify the deep problems in the public health system uncovered by SARS.
5. A Constellation of Problems

Despite the eventual success in containing SARS, so many things went wrong in the provincial public health response that it is difficult to know where to start. These problems include:

- Problem 1: The Decline of Public Health
- Problem 2: Lack of Preparedness: The Pandemic Flu Example
- Problem 3: Lack of Transparency
- Problem 4: Lack of Provincial Public Health Leadership
- Problem 5: Lack of Perceived Independence
- Problem 6: Lack of Public Health Communication Strategy
- Problem 7: Poor Coordination with the Federal Government
- Problem 8: A Dysfunctional Public Health Branch
- Problem 9: Lack of Central Public Health Coordination
- Problem 10: Lack of Central Expertise
- Problem 11: No Established Scientific Backup
- Problem 12: Lack of Laboratory Capacity
- Problem 13: No Provincial Epidemiology Unit
- Problem 14: Inadequate Infectious Disease Information Systems
- Problem 15: Overwhelming and Disorganized Information Demands
- Problem 16: Inadequate Data
- Problem 17: Duplication of Central Data Systems
- Problem 18: Blockages of Vital Information

- Problem 19: Legal Confusion

- Problem 20: Public Health Links with Hospitals

- Problem 21: Public Health Links with Nurses, Doctors and Others

- Problem 22: Lack of Public Health Surge Capacity: The Toronto Example

- Problem 23: The Case of the Federal Field Epidemiologists
The decline of public health protection in Ontario began decades before SARS. No government and no political party is immune from responsibility for its neglect. As one witness observed at the public hearings:

The second concern stems from the fact that we are in an election week. I worry that members of the media who are present here today, or those on the campaign trail will use what is said today as cannon-fodder, against one political party or another. I am not wedded to any party right now, in fact, I’m troubled by all of them, but let it be clearly noted; no party, federal or provincial, no bureaucracy, federal or provincial, is any less culpable for the problems we are seeing in the healthcare system today.6

One local Medical Officer of Health remarked that in his opinion, the general public has shown little interest in public health as well:

I think that the general public has no general interest in public health until there is a specific problem [despite] the kind of wide spectrum of things that public health is supposed to be doing and trying to do with very limited resources and difficulty getting additional resources.

Ontario is not alone in its neglect of the public health system. There has been a clear recognition in the past few decades of a general decline in public health capacity across Canada. Warnings of the decline in Canada’s public health capacity to protect against infectious disease have been raised since the 1970’s.7 In 1997, this problem was clearly identified by Mr. Justice Horace Krever in his report on Canada’s blood system.8 Mr. Justice Krever recommended “that the provincial and territorial minis-

8. The Honourable Mr. Justice Horace Krever, Commission of Inquiry on the Blood System in Canada, (Ottawa; November 26, 1997). (Subsequent footnotes will refer to this work as the Krever Report.)
Public health departments in many parts of Canada do not have sufficient resources to carry out their duties. They must have sufficient personnel and resources to conduct adequate surveillance of infectious diseases, to develop and implement measures to control the spread of infectious diseases, including those that are blood borne, and to communicate with other public health authorities at both the federal and the provincial-territorial levels. Continued chronic underfunding of public health is a disservice to the Canadian public.  

In Ontario, Justice Dennis O’Connor in May of 2002 recommended an amendment to the *Health Protection and Promotion Act* requiring that vacant positions for Medical Officer of Health be filled expeditiously. Mr. Justice O’Connor also recommended that the Ministry of Health conduct on a regular basis assessments to ensure compliance with the Mandatory Health Programs and Services Guidelines and to track on an annual basis trends in non-compliance by public health boards to assess whether altered programme services and guidelines are required and whether resource allocations require adjustment to ensure full compliance.

Mr. Justice O’Connor made the following observation:

Both the Association of Local Public Health Agencies (aLPHA) and the Ontario Medical Association (OMA) made submissions regarding local boards of health. Their submissions focused on two issues: the need to ensure adequate resources to allow boards of health to fulfill their functions, and the need to clearly set out the roles and responsibilities of public health boards. Although the information before me is not extensive, both submissions are supported by the information and evidence brought to my attention. On the question of funding, the Ministry of Health has, since the early 1990s, increased the responsibility of boards of health without increasing the funding required to fulfill those responsibilities. The result has been that boards’ compliance with ministerial requirements has decreased. A 1999 compliance survey carried out by the

---

12. Mr. Justice Dennis O’Connor, *Part One: Report of the Walkerton Inquiry*, (Toronto: January 14, 2002), pp. 263-4. (Subsequent footnotes will refer to this work as the Walkerton Report, Part One.)
ministry found that compliance with the Mandatory Health Programs and Services Guidelines was only 75 per cent\(^\text{13}\).

Despite the force and clarity of these recommendations, they were not followed. As Dr. Larry Erlick, President of the Ontario Medical Association, told the Commission:

> If SARS indicated one thing to the Medical Officers of Health of the Province and to the public health branch itself it was that there is insufficient capacity in the system to deal with public health emergencies.

This was highlighted in the Ontario Medical Association submission to the Walkerton Inquiry where Justice O’Connor’s first recommendation, which was suggested and promoted by the Ontario Medical Association, was that each region be required to employ a full-time Medical Officer of Health. To this date, there are vacancies in eight (8) full-time Medical Officer of Health positions and five (5) associate positions in the Province.

It is not only a human health resource issue that has led to this lack of Medical Officers of Health but also a grossly underfunded public health-care system. The current public healthcare system as it exists today has no elasticity\(^\text{14}\).

The failure of the Public Health Branch\(^\text{15}\) to monitor local compliance with the Mandatory Health Programs and Services Guidelines, notwithstanding the Walkerton recommendations, was noted in the 2003 report of the Provincial Auditor:

> The Ministry had conducted virtually no regular assessments of local health units in the last five years to determine whether the health units were complying with the guidelines for mandatory programs and services. Such assessments were recommended in the Report of the Walkerton Inquiry: The Events of May 2000 and Related Issues (Part One of the Walkerton Report).\(^\text{16}\)

---

15. Under the present structure the Public Health Branch is part of the overall Public Health Division of the Ministry of Health and Long-Term Care. However, in this report, in order to reflect common usage, the Public Health Branch is used to refer to the entire Division.

This failure by the Public Health Branch to fulfill its mandate is unacceptable.

As noted in the Krever Report passage quoted above, however, Ontario is not alone in its lack of public health capacity and not alone in its declining attention to public health. And as the Naylor Report concluded,

"Ontario is assuredly not the weakest link in the P/T public health chain." 17

It is hardly a source of pride to learn that Ontario is not the weakest link in Canada’s chain of protection against infectious disease.

A federal-provincial Deputy Minister’s report in 2002 noted:

"... an overall erosion of the public health system, with ... reduced capacity to address ongoing and emergent challenges to public health such as water quality safety and management of infectious diseases." 18

Senator Michael Kirby in the 2002 report of the Standing Senate Committee on Social Affairs, Science and Technology stated:

"The Committee was told and is aware, however, that promotion, prevention, protection and population health activities do not claim anything like the close focus and high status that health care has in the eyes of the Canadian public and, obviously, public policy decision makers. Although it is clear that, collectively, the non-medical determinations of health have far greater impact on the health of the population than health care, the fact is that the very positive outcomes from promotion, prevention, protection and population health activities are generally visible only over the longer term, and thus they are less newsworthy. Because they are less likely to capture the attention of the general public, they are less attractive politically." 19

---

17. Naylor Report, p. 64.
The decline in public health priority and capacity is not restricted to Canada. A general decline of public health interest and capacity around the world has been attributed to the complacent feeling that improvements in vaccination, antibiotics and clinical medicine had conquered infectious disease. This complacency stemmed from the optimism reflected in a famous statement to Congress in 1970 by William H. Stewart, the U.S. Surgeon General, that the U.S. was

... ready to close the book on infectious disease as a major health threat.

It has been pointed out again and again that this optimism was misplaced and that the health of the world continues to be threatened by infectious diseases including influenza, the West Nile virus, and other new diseases like SARS. One author noted that the re-emergence of diseases which were once on the decline has occurred primarily as a consequence of public health neglect:

Re-emerging diseases are those, like cholera, that were once decreasing but are now rapidly increasing again. These are often conventionally understood and well recognized public health threats for which (in most cases) previously active public health measure had been allowed to lapse, a situation that unfortunately now applies all too often in both developing countries and the inner cities of the industrialized world. The appearance of re-emerging diseases may, therefore, often be a sign of the breakdown of public health measures and should be warned against complacency in the war against infectious diseases.20

The trend towards complacency, followed by public health crisis, is not restricted to Canada. Speaking of New York City’s battle against tuberculosis, Laurie Garrett writes:

Today’s reality is best reflected in New York City’s battle with tuberculosis. Control of the W-strain of the disease – which first appeared in the city in 1991-92, is resistant to every available drug, and kills half its victims – has already cost more than $1 billion. Despite such spending, there were 3000 TB cases in the City in 1994, some of which were the W-strain. According to the surgeon general’s annual reports from the 1970’s and 1980’s, tuberculosis was supposed to be eradicated from the

United States by 2000. During the Bush administration, the CDC told state authorities they could safely lower their fiscal commitments to TB control because victory was imminent. Now public health officials are fighting to get levels down to where they were in 1985 – a far cry from elimination. New York's crisis is a result of both immigration pressure (some cases originated overseas) and the collapse of the local public health infrastructure.21

It is troubling that Ontario ignored so many public health wake-up calls from Mr. Justice Krever in the blood inquiry, Mr. Justice O'Connor in the Walkerton inquiry, from the Provincial Auditor, from the West Nile experience, from pandemic flu planners and others. Despite many alarm calls about the urgent need to improve public health capacity, despite all the reports emphasizing the problem, the decline of Ontario's public health capacity received little attention until SARS. SARS was the final, tragic wake-up call. To ignore it is to endanger the lives and the health of everyone in Ontario.

Problem 2: Lack of Preparedness:  
The Pandemic Flu Example

When SARS hit, Ontario had no pandemic influenza plan. Although SARS and flu are different, the lack of a pandemic flu plan showed that Ontario was unprepared to deal with any major outbreak of infectious disease.

Influenza\textsuperscript{22} is not only one of the oldest known diseases, it is also one of the most common, affecting an estimated 10-25 per cent of Canadians each year.\textsuperscript{23} While most recover completely, hospitalization and deaths occur in high-risk groups. An estimated 500-1,500 Canadians, mostly seniors, die every year from pneumonia related to flu. Between 250,000 and 500,000 deaths occur annually around the world.\textsuperscript{24}

Three times in the last century radical new influenza strains have emerged to cause global pandemics.\textsuperscript{25} The worst was in 1918-19 when 20 to 40 million people died worldwide, including an estimated 30,000 to 50,000 people in Canada.\textsuperscript{26} Unpredictable and devastating, influenza pandemics necessitate extensive levels of preparedness if there is to be any hope of mitigating their consequences.

As Health Canada has stated:

\begin{quote}
22. “Influenza is caused by a virus that attacks mainly the upper respiratory tract – the nose, throat and bronchi and rarely also the lungs. The infection usually lasts for about a week. It is characterized by sudden onset of high fever, myalgia, headache and severe malaise, non-productive cough, sore throat, and rhinitis. Most people recover within one to two weeks without requiring any medical treatment. In the very young, the elderly and people suffering from medical conditions such as lung diseases, diabetes, cancer, kidney or heart problems, influenza poses a serious risk. In these people, the infection may lead to severe complications of underlying diseases, pneumonia and death.” (Source: World Health Organization, \textit{Influenza – Fact Sheet No. 211}, (Geneva: March 2003).
\end{quote}
A pandemic can occur at any time, with the potential to cause serious illness, death and colossal social and economic disruption throughout the world. Experts agree that future influenza pandemics are inevitable but the timing of the next pandemic cannot be predicted. Since there may be little warning, contingency planning is required to minimize the devastating effects of a pandemic.27

There are major differences between SARS and flu. There is no vaccine or timely test for SARS, flu transmission unlike SARS can be asymptomatic, they have different modes of transmission and different patterns of contagion. Despite these differences, a pandemic flu plan would have overcome many of the systemic weaknesses identified above. A pandemic flu plan would have been extremely useful as a template adaptable to SARS. As a member of the Science Committee noted:

A pandemic plan, if we had a good one in place, it would have been extremely useful to pull out and use during this.

A pandemic plan, for example, sets out a process for the orderly ramping up of a staged response – ensuring that the response is commensurate with the scope and the extent of a developing outbreak.

A plan for a staged response would have been particularly helpful in the early days of SARS. The possibility that SARS would spin out of control, move into the community, and get ahead of the containment efforts, was a pressing concern in those early days of the outbreak when no one knew how widely it would spread. As Dr. James Young, Commissioner of Public Security, told the Commission’s public hearings:

We had no idea at that point in time if or how to control with certainty the SARS outbreak. The scope of what was happening, in fact, was increasing. We were having more cases by the day, not fewer and there was no end in sight and that was the experience, in fact, at that point in time, in Hong Kong, in Taiwan and in Beijing, as it started, that it got bigger and bigger and no one was bringing it under control at that point in time.28

Until then, the outbreak had generally been hospital based. The question was: Would it spread from a primarily health care setting and settle in the community? How far would it go? Would it be restricted to Toronto? Or would it spread further? Did it have the virulence necessary to spark a pandemic? Finally, if it did get bigger and bigger, how would the health care system respond?

Faced with these concerns, Dr. Young met with the Science Committee, a quickly assembled ad hoc committee of experts, on the morning of April 2, 2003 and asked Committee members to prepare scenarios for the possible expansion of SARS into the community. The minutes reflected Dr. Young’s concern about the possibility of community spread and his request for the committee to plan quickly for such an occurrence:

Planning for future scenarios (blue sky) – the planning should be done relative to where we are now and relative to the capacity of the health care system. The most immediate planning should be for expansion into the community.

One British Columbia member of the Science Committee suggested to fellow Committee members that Ontario’s pandemic flu plan be used for this and other purposes, and was more than surprised to learn that Ontario did not have a pandemic flu plan:

I was shocked. In fact, I said well let’s just use the pandemic flu plan and everybody looked at me and there was no pandemic flu plan. And so . . . I just got somebody to e-mail the B.C. pandemic flu plan over.

When the Science Committee on April 2, 2003 prepared the document requested by Dr. Young, called “Blue Sky Continued: Scenarios for Community,” the B.C. pandemic flu plan appeared to be integral to laying out three basic scenarios and responses.

The first scenario involved a situation in which,

---

29. One Science Committee member said the B.C. pandemic flu plan was used, in early April 2003, to assist in preparing “the template to develop the precautionary to prevent the transmission of SARS document.”

A few community cases with no apparent risk factors are identified. Recognition that once these cases are identified, this probably represents the “tip of the iceberg.”

Were this scenario to occur, the recommendation appears to be that the B.C. pandemic flu plan – possibly just its preparatory stage – be put in place. If,

A few community cases with no apparent risk factors identified . . . Would argue that the Pandemic Flu Plan – at least the “pre” phase of the plan should be implemented now. Pandemic flu plan for B.C. To be distributed and reviewed.

The second scenario involves an increase in the spread of cases in the community – possibly outside the Greater Toronto Area, also known as the GTA. The B.C. pandemic plan again appears to figure prominently in the possible response.

As above [i.e. the first scenario] but more cases with or without spread outside the GTA. Again would implement the full-scale Pandemic flu plan with ramping up or widening the circle of hospitals/regions involved.

The third scenario involved the possibility that SARS would expand into an epidemic\(^\text{31}\) – or even a pandemic. Once again, the B.C. plan was at the heart of the proposed response:

Widespread community spread with significant morbidity and mortality. In a scenario such as this the GTA and/or Ontario would act as a world epicentre potentially. This scenario is relatively clear as the Pandemic flu plan is the automatic default and it becomes an international event. Must consider the possibility that this is not controllable – that there will be an epidemic event and herd immunity would eventually develop.

Although it was not reflected in the minutes of the Science Committee, one partici-
pant in the deliberations said another B.C. document – its bio-terrorism response plan\textsuperscript{32} – was also helpful in preparing these scenarios.

When the Science Committee subsequently prepared other worst-case scenario documents, they also used the draft federal pandemic plan. One member of the Science Committee told the Commission:

We were looking at the possibility of broader community spread. We were hoping that didn't happen, but we were moving into that era of broader community spread. And so we thought two things, two things really lacking. We saw the need for that type of planning and we saw the need particularly for some Public Health planning around that. But a couple of the planning pieces that we worked on, particularly for the Science Group, actually used, we used the pandemic framework for doing it.

This Science Committee member suggested that the draft federal plan provided a detailed means of preparing for different outcomes:

But why we liked the pandemic framework was, it had all the components in it, and without doing that, we were missing components. So it had, for example, there’s an emergency response component, there’s a clinical services component, there’s a public health measures component, there’s a surveillance component, there’s a communication component. And in the one for continuing to spread, we actually developed it with two columns. And one is immediate measures, like that’s tomorrow, next week. And the other was the slightly longer-term, and that became more the recovery type of thing. And that’s the column that really then turned into our longer-range plan.

Fortunately, SARS was ultimately contained and community spread was limited. But fallback to the B.C. and federal influenza pandemic plans, untested in Ontario and, in the case of B.C., designed for a completely different health care system, would have been required if SARS had gone further in Ontario. Had SARS been more virulent and spread into the community, it appears that the B.C. and federal pandemic plans – in the absence of an Ontario one – would have been crucial to the response.

Ontario had none of the pre-SARS preparedness that would have come from the development, even if not completed, of a pandemic flu plan. One expert thought Ontario was hampered by the need to get people together for the first time in an emergency, instead of falling efficiently into a pre-planned cooperative response:

Q: Do you think the absence of such a plan affected Ontario’s ability to respond to SARS?

A: Yes, I did because you were creating the infrastructure at the same time you were trying to deal with quite the dire situation. I think that the people who did this are wonderful people and very knowledgeable people. But they were working under conditions where they were trying to establish a reporting structure and getting to know people from occupational health and epidemiology and public health – learning how to work with them at the same time they were trying to respond to this crisis.

This expert told the Commission that a pandemic plan, together with the intensive process of preparing it, would have helped put the necessary infrastructure in place:

There was no basic structure, you know, on which anybody could hang their hat. I think that one of the huge differences, and I hate to compare two sites. But it was very clear at the table that a lot of people were meeting for the first time and that’s always difficult because they’re trying to figure out who everybody is and exactly what the roles and responsibilities are. And it’s unclear, and then you’re working under all this pressure. And one of the big differences here [in B.C.] is that we’ve been working together for a number of years, first with our biological response advisory team and then that evolved, of course, into the pandemic flu plan. So we had a structure whereby we were quite familiar with each other in the public health sector and the hospital sector and we also had a number of structures even within the medical microbiology community. Our B.C. Association of Clinical Microbiologists meets regularly. We all know each other. Public health sits on our infection control committee so I think all of that made it just so much easier for us to respond. We knew who the players were, we know what everybody was supposed to do and we worked very cohesively. And I had quite a sense [in the Ontario SARS response] that the medical microbiologists knew each other but that they had never really worked together as a community. Mainly people did their things within their own centres, knew each other colle-
gially from meetings etcetera etcetera, but had never worked on a big
broad stroke project of any type like a pandemic flu plan or a bio-terrorism plan.

Although Toronto Public Health did not have a pandemic flu plan it was in the
process of developing one. The preparation process had already produced some of the
working relationships between agencies that are so essential when the need comes to
work together during an emergency. One Toronto Public Health staffer noted that
these working relationships, created during the course of work on the Toronto flu
pandemic plan, were used to great effect during the fight against SARS:

What we used to the greatest effect were the working relationships that
were established or strengthened through the [pandemic flu] planning
process.

A member of the Science Committee said the same thing about the ongoing work to
develop a federal flu pandemic plan:

Thank goodness that we had strong people that worked on the pandemic
plan federally and we had strong work groups across the country because
they were very much the saviour for the Science Committee in terms of
trying to figure out what were the public health measures that we should
be doing, what were reasonable surveillance things to do, how should we
manage . . . Thank goodness we had a strong work group established for
the pandemic planning federally.

A continuing theme of this report is the lack of clarity of federal, provincial and local
duties, roles and responsibilities and the lack of pre-planned machinery to ensure
effective linkages and cooperation in a time of crisis. Pandemic flu plans establish a
clear command and control structure and outline the duties and responsibilities at
each governmental level in response to an infectious outbreak. Had this kind of
planning and structure been in place before SARS hit, many of the problems noted in
this report could have been avoided.

33. See the following sections in B.C. Pandemic Influenza Preparedness Plan: Annex F – Municipal/Local
Government Planning Considerations; Annex G – Provincial health Agencies Roles and
Responsibilities; and Annex H – Overview of Federal Roles and Responsibilities. See Section 4.0 –
Response, in the Canadian Pandemic Influenza Plan.
Although the lack of an Ontario flu pandemic plan is troubling, Ontario was not the only jurisdiction without such a plan. What is more troubling is that Ontario was so far behind in the pandemic flu planning process. Nothing had been done that provided any significant assistance to the fight against SARS.

It was not as if the need for such a plan was unknown. As early as May 1998, the Advisory Committee on Communicable Diseases in Ontario noted the lack of an Ontario pandemic flu plan and clearly identified the need for it. At that time, Dr. Monica Naus was the Physician Manager and Epidemiologist at the Disease Control Service of the Public Health Branch in the Ministry of Health and Long-Term Care. This Branch oversees the Ministry’s public health programs and is the province’s primary contact point with local public health units. Dr. Naus was by all accounts a strong supporter of the development of an Ontario pandemic flu plan. In the fall of 1998, she arranged a local, provincial and territorial planning conference, noting that;

"... the initiative has implications for other large scale communicable disease emergencies."

The conference took place in February 1999 in Toronto, and was attended by representatives from agencies and institutions in the provinces whose mandates have implications for pandemic planning. The conference’s summary document noted that despite three influenza pandemics in the past century, no plans to deal with such a disaster had been developed either locally or provincially.\textsuperscript{34}

As the conference summary document indicated, attendees were aware of contemporary incidents that underlined the need for a plan. In 1997 an avian strain of influenza was isolated from a child in Hong Kong. After 18 cases, six of them fatal, some feared the outbreak had the potential to become the next influenza pandemic. This outbreak was contained, but the need for pandemic planning and preparedness was further underlined.\textsuperscript{35}

The attendees emphasized the need to establish linkages among experts before an outbreak happens. They also recommended that advance plans be established for communications, surveillance and emergency preparedness – and that a provincial

\textsuperscript{35} Pandemic Conference Report, p. 1.
pandemic influenza committee be established with clear terms of reference and membership, including health care sector institutions.

Regrettably, despite the 1999 recommendation, nothing of note happened. One of the greatest hindrances to the fight against SARS was the lack of linkages between public health and hospitals, linkages that would have been created in the development of a pandemic flu plan. Had the pandemic plan been completed, or even if the planning process had brought the key players together in advance of SARS, Ontario’s defences would have been stronger when SARS hit.

In a statement that foreshadowed what came to pass in SARS, the conference report noted that infectious outbreaks come without warning:

... because a pandemic comes without warning and causes such devastating global and social disruption, it is incumbent on public health to undertake pandemic planning.\(^{36}\)

In October 1999, Dr. Naus sent a letter to all Medical Officers of Health in Ontario that, once again, expressed the importance of pandemic planning. Using words that describe the problems faced when SARS hit Toronto, she stated:

Once we receive a pandemic warning, there may not be time to initiate planning. To a great extent, an effective response will depend on the advance establishment of an effective infrastructure for surveillance, emergency response, vaccine and antiviral delivery, and communication and coordination.

Despite commitments within the Ministry of Health and Long-Term Care in both the early and latter parts of 2000, to form a pandemic planning committee at the provincial level, little seemed to get accomplished. Despite the efforts of Dr. Naus to encourage the development of an Ontario flu pandemic plan, her initiative was not taken up by the Public Health Branch and the task of preparing the plan was eventually re-assigned within the Branch.

In the years that followed, local Medical Officers of Health were encouraged by the province to work on local pandemic flu plans. However, there was little progress on the provincial plan. As one Medical Officer of Health noted:

---

It is pretty difficult to work on your local plan when you don’t know what
the province is going to do.

It is ironic that the Public Health Branch urged local health units to develop
pandemic flu plans when the province had not developed an Ontario plan. One local
Medical Officer of Health, asked whether the province had an overall pandemic flu
plan at the time of SARS, told the Commission:

Well the irony is that I recall Dr. D'Cunha saying on repeated occasions
‘I am telling you that all local health units better have a pandemic flu
plan, I am telling you to do it,’ and I assumed that the province had one if
they were telling us to do one

Regrettably, the province had no such plan.

In May 2001, a national pandemic planning meeting in Montreal was attended by
Ontario representatives. At that time, the provincial Advisory Committee on
Communicable Diseases\textsuperscript{37} noted in a letter to the Ministry of Health that “many
provinces appear to be far ahead in the planning process.” The letter added: “many
other Canadian jurisdictions have better clarified the role of the various agencies and
government partners, which needs to happen in Ontario.”

In May 2001, two years after the above-noted planning conference, the Advisory
Committee on Communicable Diseases wrote a letter to the then Minister of Health,
Mr. Tony Clement, with a copy to the Chief Medical Officer of Health. The letter
outlined the lack of preparation in Ontario and emphasized the need for planning to
move forward. The Committee said:

The next influenza pandemic could overwhelm the health care system
and disrupt all functioning of society for a considerable period. Along
with the federal government and other provinces, Ontario began serious
planning for pandemic influenza in 1999, but we seem to have lost our
way. At a federal-provincial meeting held several weeks ago in Montreal,
it became obvious that Ontario’s planning has fallen seriously behind.
Medical officers of health are trying to develop local pandemic influenza

\textsuperscript{37} This Committee advises the Ministry of Health and Long-Term Care on strategies, guidelines and
policies for communicable disease control in Ontario.
response plans but there work is hindered without a provincial plan and leadership.

The Committee went on to “strongly” recommend that the Ontario pandemic planning process be reactivated as soon as possible. The Committee noted: “While health has the lead for pandemic influenza planning, coordination with other ministries and with Emergency Measures Ontario is vital” and that “pandemic planning has additional benefits and will help ensure preparedness for other disease emergencies.”

Mr. Clement said he had no knowledge of any concern about the lack of a pandemic flu plan and that the letter would not normally come to his attention:

A lot of these letters get replied to by the Branch . . . [It] doesn’t ring a bell, but you know I would have gotten 20,000 letters a year . . . But now, if you would have asked me . . . as Minister, do you assume that your Branch has a pandemic plan? My answer would have been yes, I would have assumed that would have been in the normal course of what you’d want to have in your back pocket . . . The other side of it though, is that every pandemic is different. So you’re going to have to create systems based on the particulars of what you’re facing. Systems are great, but whatever you’re facing is going to be different from whatever you faced the time before.

In the months that followed the May 2001 letter to the Minister, the Public Health Branch continued to emphasize the need for local health units to prepare their pandemic plans, yet the province still seemed to be doing nothing on its own plan.

In July 2001, Dr. Naus left the province to relocate to the British Columbia Centre for Disease Control. In doing so, Ontario lost a strong advocate for pandemic planning. Her departure was regarded by many as a loss to Ontario.

In November 2001, the Advisory Committee on Communicable Diseases noted that the provincial pandemic influenza committee had not met in over a year.

Notwithstanding these wake-up calls, no plan materialized in 2002. It is unclear exactly who or what was the source of the delay.

When SARS hit in March 2003, an early draft of an Ontario pandemic influenza plan is reported to have been in circulation within the Public Health Branch. However, few report having seen the draft or even been aware of its existence and no
one at the Branch seems to have offered to make the draft plan available to the Science Committee.

One Science Committee member said:

The Emergency Response people at the Province should have known that there was a plan, if there was a plan.

No one outside the Branch had seen the draft plan. None of the necessary interdisciplinary connections had been formed and none of the preliminary preparation had been done to make it operational.

As one member of the Science Committee told the Commission:

. . . if there was one in early SARS, we would have seen it; the people who sent it out would have sent it out to the field or would have supplied it to the Science Group [i.e., the Science Committee] who were in fact using the B.C. plan to create some things to work from and busy working from the federal and the B.C. plan so no one produced an Ontario plan.

Whatever stage the draft was at in 2003, the fact remains that it was not yet operational and it provided no assistance during SARS.

To put together a provincial pandemic plan a number of parts needed to come together, including public health, labs, hospitals branch, emergency response and emergency management. Whoever one may consider accountable for this failure of public health leadership, it is clear is that this did not happen and, even after five years and many warnings, there was no provincial pandemic plan. Consequently, when SARS hit there was no plan for a widespread outbreak and the necessary machinery and linkages to deal with a widespread outbreak like SARS had not been established. Although significant work has been done since SARS to develop an Ontario pandemic flu plan, the work is not yet complete.

Had a pandemic flu plan been in place before SARS, Ontario would have been much better prepared to deal with the outbreak. The failure to heed warnings about the need for a provincial pandemic flu plan, and the failure to put such a plan in place before SARS, reflects a lack of provincial public health leadership and preparedness.
Problem 3: Lack of Transparency

Because there was no existing plan in place for a public health emergency like SARS, systems had to be designed from scratch. Ad hoc organizations like the Epi Unit and the Science Committee were cobbled together. Procedures and protocols were rushed into place. There was little opportunity for feedback between the local health units, hospitals and the Provincial Operations Centre that oversaw the effort to contain SARS. A lack of earlier planning and ongoing consultation meant that those working in local health units were often directed by the Provincial Operations Centre to do things for which they thought there was no clear rationale.

Many people regarded the Provincial Operations Centre as a full-fledged organization. In fact, it was simply a room that functioned as an operations centre. To local public health units, it was unclear who comprised the Provincial Operations Centre, what they did, how they made their decisions and what was their legal authority for issuing directives.

One physician at the Public Health Branch of the Ministry of Health described the confusion as follows:

I wanted to know who was in this POC, because when I would call them, they were just saying, you know, POC and I wanted to say like, Who Are You? And, I mean, not that it was a big issue where, you know, you’d imagine major litigation or but it was, it was a huge issue on a day-to-day basis on the clinical side is how do they make these decisions, who’s making them?

Another public health professional who worked with the Provincial Operations Centre described how a local Medical Officer of Health was shocked to learn that he was legally responsible for the outcome of the implementation of directives – not the Provincial Operations Centre that issued them:

38. This interim report deals only with public health issues. Other problems of lack of transparency, for example the creation of the directives to hospitals, will be addressed in the final report.
I said well, the directives, if you understand them correctly they are given out to you and in the end you have to wear them. The person was stunned. They said are you telling me when I carry out directives as a liability, I am the one on the line. Yes, you are.

The lack of transparency surrounding the role of the Provincial Operations Centre was exemplified in the adjudication system it implemented in early May. It sprang up out of necessity. Because SARS was such a difficult disease to diagnose – there were no reliable lab tests and knowledge about the disease was rapidly evolving on a daily basis – there were disagreements from time to time as to whether a particular case was a case of SARS.

Since SARS was a reportable disease under the *Health Protection and Promotion Act*, physicians and hospitals were legally required to report new cases to the local Medical Officer of Health. The local Medical Officer of Health, in turn, had a corresponding duty under the *Act* to report new cases to the province – as either a probable or suspect case of SARS. This was a heavy burden because of the impact of a mistake. Missing a case could lead to further spread of the disease. A faulty diagnosis, on the other hand, could unnecessarily close hospitals, schools, public buildings and other workplaces – and quarantine large numbers of people. It could also have consequences on the world stage – where the WHO was closely monitoring the situation in Ontario.

It was critical that each SARS case be recognized and reported. It was equally vital that every non-SARS respiratory infection not be classified as SARS simply as a precaution.

As one witness commented:

**Q:** When you get clinical and scientific disagreement, how do you tell whether or not it is SARS?

**A:** . . . it was easier to label people as SARS because you had covered yourself. But from a public health follow up it has major implications.

There clearly was a need to ensure accuracy and consistency of classification and

40. Pursuant to s. 31(1) of the *Health Protection and Promotion Act*. 

56
reporting of cases. Having regard for the challenges of making a correct diagnosis, it made sense to set up a case review system to assist local Medical Officers of Health by giving them access to SARS experts. Although well meaning, the adjudication system lacked clear lines of accountability and in particular it lacked transparency.

First, the adjudication system appeared to supplant the decision-making of the local Medical Officers of Health. There was no explanation why, well over a month into the outbreak, the adjudication process was suddenly imposed.

Second, the adjudication system was not clearly defined or explained. A May 2\textsuperscript{nd} memorandum from Dr. D'Cunha, the Chief Medical Officer of Health, to all Medical Officers of Health and Associate Medical Officers of Health simply stated:

\begin{quote}
Effective immediately, all new, potential “probable cases” of SARS require adjudication by the POC.

If a potential probable case is identified in your jurisdiction or circumstances would indicate reclassification of an existing suspect case to a probable case, you are to contact [name and number of contact person] to make arrangements for a chart review.

Please be prepared to forward by courier the copies of all relevant information, including clinical information and copy/s of x-ray/s to the infectious disease consultant on call that day.

Thank you for your cooperation.
\end{quote}

It was unclear in the memo how the adjudicators were chosen, or why they were best qualified to make decisions. While the name and telephone number of a contact person were provided in the memo, many Medical Officers of Health did not know the person and were unfamiliar with her qualifications, position, role, and authority. Moreover, they did not know who would receive any confidential personal health information about a possible SARS case, where this information would go, how many people would have access to it and whether they had a right to it. The local Medical Officer of Health did not know what would happen if they did not accept the advice of the adjudicator or who had the final call. The local Medical Officer of Health did not know who would be accountable and bear the ultimate legal responsibility if they changed their initial classification of a case based on advice given through the adjudication process.
How the adjudication system was to be implemented was unclear. Was it to be voluntary in that the Medical Officer of Health could resort to it for advice but was not required to do so? Or was it mandatory in the sense that all new SARS diagnoses had to be screened through this process? The use of the word “adjudicate”\textsuperscript{41} and the wording of the May 2\textsuperscript{nd} memo suggests that it was to be mandatory. If this was the case, wondered many local Medical Officers of Health, what was the legal authority for the adjudication process?

One Medical Officer of Health described it as follows:

> An adjudication process was introduced that was designed that any listing of a new probable case had to go through a case review by the provincially selected infectious disease specialist. They were to gather all the chart information from the hospital. They would not have the epi information that was in the public health charts on whether this was a case or not—a probable or suspect case, and submit a report in writing to the POC or SOC, it was never described who they would report it to, and then we were supposed to accept this benignly.

The concerns of Medical Officers of Health sometimes rose to serious levels of mistrust. Many were troubled by the fact that the adjudication process was imposed two days after the WHO travel advisory had been lifted. More will be said about the adjudication process and the classification of cases in the final report. Suffice it to say that the lack of transparency in the adjudication system led to confusion over roles and responsibilities and created the perception among some that local Medical Officers of Health were being muzzled by the province.

In a widespread public health system with 37 different local Medical Officers of Health, it makes sense during an infectious disease outbreak to have some central system in place to ensure as much as possible the accuracy and consistency of local decisions to designate a case as a reportable disease. The difficulty with the adjudication system during SARS comes down again to lack of planning and preparedness. There was no time to plan or consult before imposing a system that inevitably, because it sprung up overnight, attracted all the problems associated with lack of prior consultation and lack of transparency.

\textsuperscript{41} The Canadian Oxford Dictionary defines adjudicate as: “Act as judge in competition, court, tribunal, etc.”
To avoid this problem in the future the Commission recommends that the respective roles of the Chief Medical Officer of Health and the Medical Officer of Health, in deciding whether a particular case should be designated as a reportable disease, should be clarified and regularized in a transparent system authorized by law.
Few worked harder during SARS than Dr. Colin D'Cunha, the Chief Medical Officer of Health for Ontario and Director of the Public Health Branch in the Ontario Ministry of Health and Long-Term Care. He demonstrated throughout the crisis a strong commitment to his belief of what was in the public interest. Dr. D'Cunha is a dedicated professional who has devoted his career to the advancement of public health. However for the brief reasons that follow Dr. D'Cunha turned out in hindsight to be the wrong man in the wrong place at the wrong time.

While it may be due to misunderstandings or a simple difficulty on the part of Dr. D'Cunha to communicate effectively, there is a strong consensus on the part of those colleagues who worked with him during the crisis that his highest and best public calling at this time is in an area of public health other than direct programme leadership. This general concern has undoubtedly been reflected in the government’s decision to provide him with other opportunities within his area of expertise.

Because Dr. D'Cunha no longer holds the office of Chief Medical Officer of Health it might be asked why it is necessary in this interim report to deal with his leadership during SARS. The answer is that the public has a right to know what happened during SARS and that obliges me to make whatever findings I am taken to by the evidence. The story of what happened during SARS cannot be told without some reference to the difficulties that arose in respect of Dr. D'Cunha's leadership.

I cannot fairly on the evidence before me make any finding of misconduct or wrongdoing by Dr. D'Cunha. The underlying problems that arose during SARS were systemic problems, not people problems. Because the underlying problems were about inadequate systems and not about Dr. D'Cunha, it would be unfair to blame him or make him a scapegoat for the things that went wrong.

A man who engenders controversial responses, he has strong supporters and strong detractors. This is not the occasion to mediate the controversies about his leadership and management style. It is enough to say that the crisis of SARS
brought out the most controversial and least helpful of his characteristics as a leader and manager.

His friends and supporters see him as a strong advocate for public health, badly treated by the system that he served with such dedication. Those who see him less charitably think he cultivated those above him and did not appropriately value those below him. Against the many anecdotes recounted by those who felt they were inappropriately and wrongly criticized by him, and by those who observed behaviour they considered inappropriate or self-absorbed in a time of public crisis, there are many reports of his total commitment to the proper handling of the crisis according to his own lights. For instance, Dr. Yoal Abells, on behalf of the Ontario College of Family Physicians, in a presentation at their Commission’s public hearings described the leadership of Dr. D’Cunha, among others, as “excellent.”

As noted in this report, there was a sense in recent years that bright independent minded people were not particularly welcomed and that experts from other provinces were reluctant to come to the Ministry of Health’s Public Health Branch because of concern over what they perceived to be a difficult working environment.

A number of Medical Officers of Health even before SARS thought there were problems with Dr. D’Cunha’s leadership. They thought that the Ontario public health community was being shut out of useful federal-provincial committee work because of the perceived difficulty of working with Dr. D’Cunha.

Some senior people in the Branch developed the impression that Dr. D’Cunha discouraged the sharing of information with local public health units in the field and that he communicated the impression to Public Health Branch employees that “the field is not your friend.”

As outlined below, there was a lack of positive leadership in Dr. D’Cunha’s position in relation to West Nile planning, surveillance, and management.

---

42. Dr. Abells is a Toronto-based family physician, a member of the Board of the Ontario College of Family Physicians, and the Chair of Family Physicians Toronto. See SARS Commission Public Hearings, September 29, 2003, p. 126.
To some who worked with him during SARS his behaviour appeared puzzling. It seemed to them that he was more preoccupied with his personal authority as Chief Medical Officer of Health than he was with working with others to get the job done. These concerns include the observation that he would make himself unavailable if he felt personally slighted by the presence of someone he considered an intruder on his own turf. His supporters on the other hand suggest that he responded appropriately by staking out the authority of his office in response to the inappropriate presence of outsiders in the management of a public health crisis that by law and by bureaucratic convention was his alone to direct entirely by himself as he saw fit.

It is unnecessary to review in detail the different points of view between Dr. D'Cunha and some of his colleagues as to whether he blocked the flow of information in order to assert his status and territory in a complex turf dispute among local health units, the provincial Public Health Branch, the Hospital Division of the Ministry of Health, the federal government, and all the other governmental players necessarily involved.

What is abundantly clear, despite Dr. D'Cunha's recollection that he always shared and never withheld information, is that a contrary body of opinion is held by some who worked with him closely. Perception, in a time of crisis, is as important as fact. Many colleagues ended up with the impression that Dr. D'Cunha felt that knowledge was power and the best way to demonstrate to others that he was in charge of his own turf was to show them that he controlled the flow of information. Having regard to Dr. D'Cunha's recollection to the contrary this impression may well be inaccurate and may simply reflect misunderstandings.

The problem is that, in a crisis, teamwork is essential and any impression that impairs teamwork, whether or not the impression is accurate, can defeat the common effort.

It is not the job of this Commission to sort out the conflicting views of Dr. D'Cunha's performance or leadership style. It is enough to say that his management style, and the perceptions of those who felt him difficult to work with — perceptions also found outside the province — impaired his ability to do the job that was necessary in the circumstances.

On the other hand some of those who saw his difficulties recognized also his genuine concern and felt that the basic problem was simply a tendency to micromanage:

I think he was genuinely concerned about the outbreak . . . I'm sure the pressure on him was tremendous and I think his natural reaction was to
grab it and try to micromanage it, which was the wrong, it was the wrong approach . . . You know, in his position, in my view what you have to do is step back, let people go, trust that people are going to do the job and let them do things.

Another knowledgeable observer, referring to Ontario’s public health response said:

I think that Colin [Dr. D’Cunha] was out of his depth. I think that probably most of or all of the senior Ontario response folks were out of their depth so it is not a flaw. I think that they were well meaning and trying hard but did not have the experience to recognize the hole that they were in and to respond in this timely and aggressive and coordinated manner as would have been hoped for. Those are not character flaws but wrong people in the wrong place or not given the support they needed, one or the other.

These problems together with the lack of readiness for a public health emergency forced those fighting the disease to work around Dr. D’Cunha and led to an unwieldy emergency leadership structure with no one clearly in charge. A de facto arrangement had sprung up whereby Dr. D’Cunha shared authority with Dr. Young, Commissioner of Public Safety and Security. More will be said in the final report about this arrangement. The lack of clarity as to their respective roles, together with Dr. D’Cunha’s rigid concept of his personal authority as Chief Medical Officer of Health made it difficult for him to share responsibility and work in a cooperative team fashion with others, including Dr. Young and local Medical Officers of Health in the field.

These problems led in turn to Dr. D’Cunha’s increasing interest in securing the approval of the Minister’s office and his reliance on connections above because of his difficulties in working with people at his own level or below him in the hierarchy. This

43. Micromanagement is a natural human response to crisis and a common problem in emergency leadership by people who may be extremely good at their day-to-day jobs. As noted in Jane’s Facility Security Handbook: “In brief, the Incident Commander is in charge . . . An effective IC must be proactive, decisive, objective, calm and quick-thinking. To handle all responsibilities of this role, the IC also needs to be adaptable, flexible and realistic about his or her limitations. The IC must be a leader, not a micro-manager. Typically, individuals prefer to perform an act themselves rather than delegate tasks . . . The need for an effective IC cannot be overly stressed, particularly during a response to an unpredictable incident that can easily escalate out of control.” [emphasis in original] Source: Jane’s Information Group, Jane’s Facility Security Handbook (London: 2000), p. 310.
unhappy constellation of events in turn produced much of the perception that events were being directed by Dr. D'Cunha's view of what would make his political masters happy.

Dr. D'Cunha did not appear to those who worked in the crisis to have any degree of independence or autonomy from the Minister's office, either functionally or by personal inclination. Many thought that he preferred to deal with the Minister and his office rather than dealing with those colleagues brought in to co-manage the crisis. This in turn led to a perception by some that his approach to the handling of the crisis was politically oriented and not grounded independently in public health principles.

As noted below, the Commission has not at this stage of its investigation found any evidence of political interference with public health decisions during the SARS crisis. There is however a perception among many who worked in the crisis that politics somehow played a part in some of the public health decisions. Whatever the ultimate finding may be on this issue, Dr. D'Cunha's approach left too many colleagues with the perception that he was too much a political animal and too little an independent public health professional.

It is impossible to say, in the end result, that Dr. D'Cunha's difficulties made any ultimate difference in the handling of the crisis. Although his colleagues were frustrated by his approach to things, the crisis was to a large extent managed around him. It is hard to say that the overall result of the SARS crisis would have been different with someone else at the helm.
Problem 5: Lack of Perceived Independence

The Commission on the evidence examined thus far has found no evidence of political interference with public health decisions during the SARS crisis. There is however a perception among many who worked in the crisis that politics were at work in some of the public health decisions. This perception is shared by many who worked throughout the system during the crisis. Whatever the ultimate finding may be once the investigation is completed, the perception of political independence is equally important. A public health system must ensure public confidence that public health decisions during an outbreak are free from political motivation. The public must be assured that if there is a public health hazard the Chief Medical Officer of Health will be able to tell the public about it without going through a political filter. Visible safeguards to ensure the independence of the Chief Medical Officer of Health were absent during SARS. Machinery must be put in place to ensure the actual and apparent independence of the Chief Medical Officer of Health in decisions around outbreak management and his or her ability, when necessary, to communicate directly with the public.
Problem 6: Lack of Public Health Communication Strategy

A full examination of the effectiveness of public health communication during SARS awaits the completion of the Commission’s investigation. The final report will also examine and comment on equally important communication issues, including those involving health care workers, victims of SARS and their families. But, in view of the impending changes to the public health system, it is important that the Commission discuss the evidence to date regarding public health communication because of its crucial role in a crisis like SARS.

When successful, public communication provides everyone with vital information, helps them make an informed assessment of the situation and the attendant risks, bolsters trust between the public and those solving the crisis, and strengthens community bonds. As Dr. Garry Humphreys, Medical Officer of Health for Peterborough County and City, said at the Commission’s public hearings:

"It is important to have a willing cooperation of the community with regards to disease control through voluntary quarantine. This can only be achieved when the community is continuously kept informed. In addition, those placed under quarantine must be fully informed of the circumstances including what is expected of them and the followup through routine monitoring by staff of the health unit."\(^{44}\)

A failed effort can breed confusion and antagonism, disrupt an orderly response, poison relations with public authorities and sow mistrust. It can also significantly hamper the SARS response. As Dr. David McKeown, the Medical Officer of Health for Peel Region, said at the Commission’s hearings:

"I think it’s instructive to know that local Medical Officers of Health, particularly those in the health units adjoining Toronto, who were most involved, often heard, for the first time, about significant developments in the outbreak by watching the daily media briefings."

\(^{44}\) *SARS Public Hearings*, October 1, 2003, p. 17.
I remember hearing a federal health official speak in the midst of the outbreak, with some pride, about the fact that they were monitoring events in Hong Kong by having a Chinese-speaking employee listen to local Hong Kong media. I think that really was evidence of a failure of communication in an international public health system.

And, similarly, the fact that Medical Officers of Health in the Greater Toronto Area felt that it was critical to sit and listen to media broadcasts in order to get critical information to do their work is an indication that the systems of communication within the public health field were not operating as they should have.\textsuperscript{45}

Poor public health communication can also have a negative economic impact, if messages intended for a local audience resonate negatively on the international scene. Some experts believe this may have been the case with SARS. A study of SARS media coverage by the Robarts Centre for Canadian Studies at York University in Toronto\textsuperscript{46} found:

The message used to contain the outbreak locally was the same message heard by investors, consumers and foreign citizens... media consumers around the world... were then more prone to associate the outbreak, rather than its containment, with Toronto.\textsuperscript{47}

Jody Lanard and Peter Sandman,\textsuperscript{48} two prominent American experts in risk communication, contrasted Ontario’s efforts with those of Singapore, which they described as exemplary:

Early on, several Asian countries warned against travel to Singapore. Prime Minister Goh responded, “We can understand that because we also give travel advisories to Singaporeans not to go to the affected places. So we must expect other countries to advise their travellers not to come...

\textsuperscript{45} SARS Public Hearings, October 1, 2003, pp. 30-1.
\textsuperscript{46} Robarts Centre for Canadian Studies, \textit{Media Coverage of the 2003 Toronto SARS Outbreak}, (York University, Toronto; October 29, 2003). The authors of the study examined more than 2,600 Canadian and American newspaper articles and performed detailed content analysis of just over 1,600 SARS related articles in the Toronto Star, the Globe and Mail, the National Post, USA Today and the New York Times. (Subsequent references will refer this study as Robarts Centre Report.)
\textsuperscript{47} Robarts Centre Report, p. 16.
\textsuperscript{48} Sandman helped the CDC upgrade its crisis communication capabilities following the anthrax attack in 2001.
to Singapore . . . If we are open about it and all Singaporeans cooperate by being as careful as they can, we may be able to break this cycle early and if we do then of course people outside will have confidence in Singapore and the way we manage the problem . . .

The same day WHO lifted Canada’s travel warning, the international health agency said that the worst of Singapore’s SARS outbreak seemed to be over. Singapore health ministry spokeswoman Eunice Teo responded, masterfully, by moving to the fulcrum of the risk communication seesaw. “The WHO said the peak is over in Singapore,” she noted, “but our minister has said it is too early to tell.

In this and many other examples, Singapore has occupied the middle ground between people’s fears on one side and tentative medical reassurance on the other. This generates more credibility and confidence than Canada’s angry protests and premature celebrations. Canada’s foreign stakeholders (and in private, even its own citizens) are likely to sit on the worried, distrustful seat of the risk communication seesaw, since Canada is occupying the over-reassuring, over-confident seat.49

Rudolph Giuliani set what many believe is the standard for effective crisis communication in the aftermath of the Twin Towers attack. His key messages were a thoughtful balance of empathy and strong leadership. Asked about the precise number of victims – a difficult question to answer in the middle of a crisis – Giuliani simply replied: “More than we can bear.” Much contributed to Giuliani’s success. There was no confusion about who was the spokesperson in the crisis. Giuliani was the central focus – the single voice. His carefully crafted messages were as resonant and empathetic to the citizens of New York as they were to the myriad audiences watching around the world. Giuliani also benefited from a communication strategy that had been tested during New York’s West Nile Virus outbreak in 2000 – a response that some experts called:

. . . far-reaching, resource intensive, competently handled and effective.50

To be sure, a public health crisis is quite different from a single-episode disaster like the Twin Towers tragedy or an airplane crash. A public health crisis can unfold over a much longer time frame. It is usually characterized by unknowns and intangibles. It evokes sustained and quite reasonable responses of fear. It generates heightened stress levels. And it severely strains community bonds and relationships.

Above all, a public health crisis creates a strong demand for credible public information. That is why a public health communication strategy is so important. Not surprisingly, public communication is an integral part of the federal government’s Canadian Pandemic Influenza Plan released in February 2004.\(^{51}\) It set out a number of considered strategic considerations:

- Canadians are unlikely to distinguish between levels of government in the event of a health emergency. Public communications among all involved organisations must be coordinated and consistent.

- Public Communications around an influenza pandemic will occur in the international context. Key audiences, especially the media, will access various information sources from around the globe including the World Health Organisation. Communications channels must be opened with the WHO, HHS [the U.S. Department of Health and Human Services] and the CDC to ensure an ongoing exchange of information, key messages and information products.

- Canadians will turn to various sources to obtain the information they need and want during a pandemic scenario \(\ldots\)\(^{52}\)

The federal pandemic plan appears to take the view that in an open society a perceived lack of candor during an outbreak can have negative consequences.

The principle of openness was referred to by former Health Minister Tony Clement who told the Commission that he decided during SARS to provide as much information as possible to the public:

> Very early on, I decided, you have to make a decision, a decision how you are going to treat this with the public and there is always advice to play it

---

down, there is no problem, we have a little problem at Scarborough hospital, let us not create a sense of panic in the public. I rejected that advice to this extent, I believed that what would create a greater sense of panic in the public is a lack of information given the fact that death was occurring and so very early on, even before the state of emergency was issued, I made a deliberate conclusion that we were going to give the public as much as information that we had on a real time basis, even on a daily basis in order that they knew exactly what we knew. And Dr. Schabas has been critical of that but I think that it was the right thing to do and I would do it again because the alternative is to hide information from the public and I think that would create more of a problem. It would create a problem of credibility with the government and the public health officials and it would create a problem of assuming far worse than potentially was the case which would actually fan panic rather than contain panic. So yes, guilty as charged, we communicated with the public at every opportunity and I think that was the right thing to do . . .

Unfortunately, Ontario had neither a public health communication strategy, nor, as a default, a pandemic response plan with an integrated communication component. As with much else during SARS public communication tended to be improvised. Despite the best intentions and efforts of those involved in managing the outbreak, public information was hampered by systemic weaknesses.

Unlike the focused strategy of New York City following 9/11, many voices were heard during the more than 40 news conferences held in Toronto. Spokespersons included Drs. D'Cunha, Young and Basrur. Dr. Donald Low of Mount Sinai sometimes participated in the news conferences. And there were spokespersons from the political arena like then Health Minister Tony Clement and former Toronto Mayor Mel Lastman.

Those who criticize the handling of communications during SARS say it was wrong to have this multitude of public voices. Mr. Clement on the other hand said that this multiplicity of voices had merit since it ensured that the public had full access to relevant information:

You do not have credibility by hiding or hoarding information and that sometimes meant that you had a panel of people that might have had a different view. For example, Dr. Low sometimes was off this way, Dr. D'Cunha was off this way and Dr. Young was here. That is the price of being upfront with people and I think that people are not used to that but
I think that was the right thing to do and it actually set the tone of how we dealt with the power blackout and other things . . .

It was an international story. You could not manage the news down even if you had wanted to. Even if you had tried to, they would have found a story every day.

Asked whether it would be better to have a communications model where there was one single spokesperson, Mr. Clement said:

It is not going to work that way. If the spokesperson is too much of a spokesperson, that is to say, here is the line of the day and here are the facts of the day, immediately from the press conference they will rush out to Mount Sinai and find Don Low. They will find Allison McGeer. If Don Low was not there, they would have invented Don Low. I am being a bit dramatic here but you get my point. I understand what you are saying but trust me on this, the media does not work that way and they cannot be managed that way. You would be foolish to even try.

However, some critics complained that there was a perceived lack of a central official voice. As Tom Closson, President and CEO of the University Health Network, told the Commission’s public hearings:

. . . during SARS, was the fact that, there wasn’t enough attention given to unified communication.

We would see infectious diseases specialists being interviewed as being part of the POC. We’d see them being interviewed as representing their hospitals. We’d see them as being interviewed as, maybe, representing themselves and there’s a lot of conflicting information going around.

Again, if we were a single region, we would have had a unified approach and had a single communicator and tried to get all the infectious diseases specialists in a room and get them to be giving a common – a common view. Fighting it out in public is not really the best way to instill confidence. I’ll tell you, our staff were quite frightened during SARS because they heard different things from different people and unified communication was necessary and it would have benefited from a more unified regional structure.53

53. SARS Public Hearings, October 1, 2003, p. 200.
This point of view was echoed by a submission to the Naylor committee signed by the presidents or chief executives of nine major health care groups who argued:

During a crisis or emergency, the public will quickly begin to look for a trusted and consistent source of information. However, during the early days of the SARS crisis, in Toronto, there were occasions when several different public health officials were being quoted and had titles attributed to them that appeared to indicate they were responding in an acting capacity only and not as an ‘official.’ This had the potential to leave an impression with the public that no one with any authority was in control.\(^{54}\)

While the submission to the Naylor committee described this as a problem early in the outbreak, there are indications it persisted long after, including at a critical news conference on May 23, 2003 to announce a new – and very troubling – outbreak at North York General.

Before discussing this event, it is important to note that the Commission does not criticize the participants at this news conference or their intentions. One of the central spokesmen on May 23 was Dr. Low, exhausted after spending a troubling day at North York General reviewing cases files and concluding there was a fresh outbreak that had missed everyone’s attention. Other key panelists, including Drs. D’Cunha and Yaffe, had labored tirelessly for more than two months. The May 23 news conference is mentioned here not from the perspective of perfect hindsight, but rather as a means of identifying systemic weaknesses. More will be said in the final report about the communication of this information to front line nursing and other health care staff.

The event began with a briefing by Drs. D’Cunha and Yaffe. It was not until the floor was opened to media questions that a reporter asked about North York General. Dr. D’Cunha answered:

There are a couple of people under investigation.

Then, he turned the floor over to Dr. Low, who dropped what one reporter called “a bit of a bombshell” and announced the new outbreak:

It’s been a rough day at North York. I don’t have all the answers for you.

---

tonight but what we’ve essentially identified is a cluster of cases that occurred on one ward at North York General . . . That there has been a likely transmission to health care workers. That there has been transmission to family members. And that there’s probably been transmission to other patients.

After Dr. Low suggested that this cluster numbered “in the 20s,” an angry reporter asked:

In the twenties. Okay. Why did you just go through this whole presentation for 20 minutes and we had to get it in a question? Why didn’t you tell us at the start?

Dr. Low, who had worked diligently all day to get to the bottom of new troubling outbreak, was placed in the uncomfortable and unfair position of answering for systemic deficiencies in the uncoordinated flow of information.

The confusion that marked the May 23 press conference exemplified the lack of any coherent communications strategy and the lack of any clear lines of accountability for the communication to the public of vital news about the status of the outbreak.

The Robarts Centre study also suggested that public communication was hampered by competing agendas among stakeholders affected by SARS:

In the SARS crisis, the media was a key tool used by stakeholder groups to advance their agendas. Public health officials used the media to communicate the severity of SARS, and the need for citizens to respect the quarantine measures. The business community used the media to communicate the severity of their economic plight. The Ontario Government used the media in their efforts to extract compensation from the Federal Government. In turn, the Federal Government used the media, most notably during its dispute with the World Health Organization, to show that they were actively working on the SARS issue. In addition to reporting the events of the crisis as they unfolded, the media was also a key part of each group’s communication strategy.

Competing stakeholder groups worked to capture the sympathy and attention of the media in order to advance their own agendas. During the SARS crisis, the objectives of the affected stakeholder groups were increasingly at cross-purposes to one another. In order to contain the outbreak, public
health officials had to communicate the message that SARS was a serious threat. The message that SARS was a serious threat scared visitors away from tourist sites and Asian businesses in Toronto. The public health message and the economic recovery message worked at cross purposes, competing with and undermining each other at key moments.\(^{55}\)

This lack of coordination was also cited in a paper by Christopher Finlay, a doctoral candidate and lecturer at the Annenberg School for Communication at the University of Pennsylvania:

SARS was not a Canadian disease. SARS was a global disease that caught the attention of the world. WHO and the American CDC both communicated their SARS messages to the world. Four [Public Health Agency] voices [i.e., Ontario, Ottawa, WHO and CDC], that did not always agree, could be heard during the peak of the Toronto SARS outbreak. Those on the receiving end, whether they were average citizens or the media, had to basically fend for themselves and decide who they were going to listen to. It is essential that PHA's of all levels work together when faced with a disease such as SARS. Coordinated messages can save lives. Confused and conflicting messages can cause panic and spread misinformation.\(^{56}\)

If there is one important lesson, it is embodied in a recommendation made by the Registered Nurses Association of Ontario at the Commission’s public hearings:

Establish and maintain an effective communication network as a key component of an emergency preparedness plan. This network should link government, health providers, professional organizations, unions, higher education institutions and the public.\(^{57}\)

The problems of public communication during SARS are addressed thoughtfully in the Naylor Report and the Walker Interim Report. The Commission endorses their findings and their recommendations for the development of coherent public communication strategies for public health emergencies.

\(^{56}\) Finlay, Christopher, The Toronto Syndrome: SARS, Risk Communication and the Flow of Information, p. 15. The paper was presented at the Transformations in Politics, Culture and Society Conference, which was held in December 2003 in Vienna, Austria.

\(^{57}\) SARS Public Hearings, September 29, 2003, p. 28.
There is no easy answer to the public health communications problems that arose during SARS. On the one hand, if there are too many uncoordinated official spokespeople the public ends up with a series of confusing mixed messages. On the other hand, as Mr. Clement points out above, any attempt to manage the news by stifling important sources of information will not only fail but will also lead to a loss of public confidence and a feeling among the public that they are not getting the straight goods or the whole story. What is needed is a pre-planned public health communications strategy that avoids either of these extremes.
Problem 7: Poor Coordination with Federal Government

Problems with the collection, analysis and sharing of data beset the effort to combat SARS. While many factors contributed to this, strained relations between the three levels of government did not help matters.

As noted in the Naylor Report:

Dr. D’Cunha stated that protection of patient confidentiality constrained his ability to release data to Health Canada. Senior GTA public health physicians took the same view of their obligations to share data with the Ontario Public Health Branch. Health Canada informants in turn argued that they never wanted personal identifiers, simply more detail to meet WHO reporting requirements. Multiple informants noted that relationships among the public health officials at the three levels of government were dysfunctional.

A memorandum of understanding on data sharing was never finalized between the province and the federal government. High-level public health officials in Ontario and Health Canada have since given the Committee sharply divergent views on how well information flowed with respect to both its timeliness and adequacy. It is clear that at points during the outbreak, Dr. Arlene King of Health Canada dealt directly with Dr. Johnson and local public health officials to acquire the more detailed data necessary for discussions with WHO. Local public health units in turn faced pressure from the Ontario Public Health Branch to send on data for press conferences, for reports to Health Canada, or both.58

These findings are confirmed by the evidence examined by the Commission to date.

One would have expected the federal and provincial governments to iron out seamlessly and immediately the problems around data sharing protocols, processes and procedures. Sadly, this was not the case. The failure to iron out these problems is evidenced by an exchange of letters in late May 2003 – just as the second phase of the outbreak, known as SARS II, was making headlines.

On May 26, 2003, J. Scott Broughton, the Assistant Deputy Health Minister, wrote to Dr. D’Cunha:

Further to the discussion this morning among yourself, Paul Gully and Arlene King, I believe there is a need to confirm the process by which Ontario officially advises Health Canada of status of the Severe Acute Respiratory Syndrome (SARS) circumstances (e.g. outbreaks) in Ontario. As you know, it is critical that Health Canada have timely information in order to meet our national and international obligations.

Two days later, Dr. D’Cunha replied, in part:

Thank you for your letter of May 24, 2003 and our subsequent discussion on May 25th. This will confirm our understanding that the process of daily updating Health Canada at 12 noon which has been in place since the beginning of the SARS outbreak will continue.

One does not have to read very far between the lines to see that these “for the record” letters reflect a serious problem. The mere fact that the federal government found it necessary to formalize its position in writing reflects an obvious breakdown in the informal and cooperative procedures that should have prevailed. One federal official described the background of these letters in terms that yield a picture of many problems coming together at the same time:

The challenge for us, nationally, was to have as much information as possible and as much information as possible that had been analyzed by Ontario, at least initially, in order to ensure that we had as complete a picture as possible of the situation in Canada, primarily in Ontario, in order that we could then share that information with other countries and with WHO, in order to be able to demonstrate that we were responding appropriately. The challenge for us always was we weren’t convinced that we had all the information that existed in Ontario in order to be able to put that picture together. The challenge was, and it continued, was not really knowing what information existed. And a more general comment
really is that, I don’t think we really ever felt that we were working in true partnership with the Province. If it had been clear from Dr. D’Cunha what information he did have, what information he didn’t have, what he couldn’t collect, what he was not able to analyze, what was not coming to him from the Cities, from Toronto primarily, from the other Health Units, what they weren’t able to collect, what they weren’t able to analyze, then we would have been much more comfortable, maybe much more uncomfortable, but at least we would have know what did not exist and did not exist as a result of what. Either a lack of an information system at the Province, lack of an information system at the City level, the Municipality level, a lack of expertise, a capacity to analyze information, and so on. And therefore, the letter from Scott Broughton was really, one thing to be reassured that we had it all and we had it all there in a timely way. Unfortunately . . . we continued to learn information, often as a result of the press conferences that Ontario had every day, which we were really not aware of through that sort of sharing of basic information at noon every day. It was more the analysis of what was going on, what the deficiencies were, what we didn’t know, what Ontario didn’t know, that was important to us. Which is more than just sending information. And it was this lack of, lack of feeling of partnership, that we were all in it together, that we were trying to work together as efficiently and effectively as possible, that was often not there. So, I mean, that’s a very subjective way of putting it, but really that was what was behind the letter. And the response from Colin D’Cunha saying, well we will carry on doing what we’ve been doing, you will have the information that I have, really was not the level of detail and discussion that we would have liked to have had . . .

And we continued to get the impression that the counter-response we got from Colin D’Cunha formally in that letter, you will have that information each day at 12:00 as you always have done, was not the sense of a collaborative working relationship, which really, I think we all needed to have. Now, as I said, it would have been gratifying if we’d known precisely what the situation was in Ontario and why. That would be fine, if it was a deficiency, and I think Sheela Basrur demonstrated quite clearly, as to what deficiencies were, what she could and could not do. Unfortunately, we never got that kind of overall assessment from Colin D’Cunha.

As noted above, Dr. D’Cunha’s recollection was that he always shared and never withheld information. Mr. Clement remains convinced that the province did everything it could to share information with the federal government. He told the Commission:
We felt that we were giving all of the information that we had available to us in an immediate way. But we were unaware of exactly how that was being transmitted to the WHO, or the requirements of the WHO for the type of information required, so that the breakdown in communication was in fact Health Canada not telling us exactly what the information was needed for and how it should have been presented, so that’s the first thing. The second thing is that I make no bones about being frustrated with the federal government, with Health Canada in particular. Not with the Minister but with the bureaucracy, and the Minister has to take responsibility for her bureaucracy because they didn’t take the situation seriously. They didn’t take it seriously at our borders, they didn’t take it seriously in terms of the requirements that we needed in terms of resources. That’s a matter of public record . . .

All I can tell you is that we were providing information on a daily basis, if not multiples of that, and that was continuing from the very beginning, that was my understanding . . .

I do want to say without hesitation we gave all information to Health Canada in a timely way . . .

There are sincerely held views on each side; the province thinking it was providing all it could and the federal government thinking otherwise. Apart from any underlying problems of attitude, there was an obvious breakdown in communication, which is hardly surprising given the inherent difficulties of federal-provincial cooperation and the complete lack of any preparedness or any existing system to ensure an effective flow of information in a time of crisis.

This analysis is supported by the anecdotal recollection of others involved in the outbreak. There was a damaging combination of problems: lack of information systems, lack of preparedness, lack of any federal-provincial machinery of agreements and protocols to ensure cooperation, all possibly overlaid by a lack of cooperative, collaborative spirit in some aspects of the Ontario response.

The federal official quoted above described the impact of this lack of collaborative information flow, suggesting it may have affected the international community’s perspective of how well the outbreak in Ontario was being handled:

What we were lacking, as a result of whatever, in Ontario, was a real sense that they, that Ontario was able to present a daily picture in a
dynamic sense of what was occurring, over and above just the figures. And if we attempted to do that, which is what we did do, unfortunately, it’s another aspect of our relationship which I mentioned before, the lack of a clear message every day from Ontario, because there were numerous spokespersons, never sort of confirmed, was never able to basically support what our suppositions were, however late they ended up being because of lack of information. And that inevitably led to a sense of confusion in the outside world, WHO and other countries, as to how far we had this under control.

The lack of coordination with the federal government did not start with SARS. For years the message that some public health physicians in the Branch perceived from Dr. D’Cunha was that they should not share information with their federal counterparts. One physician who provided research findings to Health Canada as part of a national investigation was criticized for doing so and the impression developed among the Branch physicians that Dr. D’Cunha wanted “no contact with the feds” and that interaction between the provincial Branch and Health Canada was discouraged. Again the issue is not what Dr. D’Cunha actually said, but the impression picked up by public health physicians in the Branch, that cooperation with the federal government was discouraged rather than encouraged.

It is worth noting, for the sake of balance, that as early as 1999 the Auditor General of Canada had raised concerns with Health Canada about a lack of formal procedures with the provinces for collecting and exchanging data on communicable diseases. The 1999 report of the Auditor General noted that Health Canada:

> ... drafted a memorandum of understanding covering the exchange of data on these diseases some 10 years ago, but this was never finalized with the provinces and territories. Currently, provinces and territories report cases of nationally reportable communicable diseases to [the Laboratory Centre for Disease Control (“LCDC”)] on a solely voluntary basis, and they submit the data according to different criteria. For example, information on tuberculosis that LCDC receives (and then presents) is based on the date of onset of illness in Ontario but the date of diagnosis in all other provinces. This makes it difficult to compile a national picture of how many people have tuberculosis and for how long they have been infected. 59

---

Without formal procedures, noted the Auditor General, Canada was vulnerable:

Clearly, comparable surveillance data are essential to estimate the size of a health problem and to determine its economic burden on society, to characterize trends, and to evaluate intervention and prevention programs. Deficiencies in our national health surveillance information also affect Health Canada’s ability to provide valid information for use internationally to address global issues of disease control.\(^{60}\)

Consequently, the Auditor General made the following recommendation in 1999:

Health Canada should work with provinces and territories to establish common standards and protocols for classifying, collecting and reporting data on communicable diseases.\(^ {61}\)

However, when the Auditor General revisited the issue in 2002, it found that Health Canada was slow to address the concerns raised in 1999:

2.29 Lack of agreement on data sharing between Health Canada and the provinces and territories. Disease information is the property of the provinces and territories. To ensure that this information is shared appropriately and that the Privacy Act is not violated, the details of data sharing need to be outlined clearly in written agreements. Agreements on data collection need to cover such details as how the data will be used, who owns the data, what standards will be followed, and how privacy and confidentiality will be protected. Agreements on data dissemination need to cover such details as what information can be published and who can receive it. Finally, each agreement should outline the consequences of not respecting it.

2.30 At present, only a few agreements on data sharing exist (for example, on HIV/AIDS), and no generic agreement has been developed to ensure that all important details are covered. Since much of Health Canada’s disease information comes from other partners, any agreements would need to clearly outline the responsibilities of all partners in the sharing of that information.

2.31 Health Canada slow to develop common standards for data to be shared. We recommended in 1999 that Health Canada establish common standards and protocols for classifying, collecting, and reporting data on communicable diseases.

2.32 Common or uniform standards and protocols are critical to ensuring that disease information is consistent. Consistency is important because national health surveillance involves integrating information so it can be analyzed on a national basis. Our follow-up found only limited progress on the development of common standards. The Communicable Disease Surveillance Sub-Group has begun developing standards for nationally reportable diseases, immunization information, and vaccine-associated adverse events (bad reactions to a vaccine). Progress has been made on the development of standards for data elements and the core data set (the set of data elements that are common to all diseases—for example, gender, and date of onset of illness). However, only very limited progress has been made on elaborating disease-specific data sets (for example, defining the symptoms of a specific disease) and laboratory standards (such as which lab test to use).

2.33 Once standards have been developed, agreement on them must be reached. We found that there is no national agreement on a mechanism for maintaining or approving standards on behalf of all the partners. Without this mechanism, Health Canada has no way of ensuring that common standards are respected.\footnote{62. Auditor General of Canada, 2002 Annual Report, (Ottawa: October 8, 2002) Chapter 2, p. 8}

As a result, the Auditor General made a recommendation in 2002 strikingly similar to the one of three years earlier:

Health Canada should work with provinces and territories to obtain agreement on the sharing of disease information, including agreement on data collection, data dissemination, data standards, and the list of diseases that should be reported nationally. Further, it should work with the provinces and territories to create a mechanism for maintaining and accepting data standards.\footnote{63. Auditor General of Canada, 2002 Annual Report, (Ottawa: October 8, 2002) Chapter 2, p. 9}
While these pre-SARS recommendations were obviously not SARS-specific, they do address the framework of machinery under which information would have been exchanged during SARS, if only the machinery had been in place. It is unfortunate that the recommendations of the federal Auditor General, beginning in 1999 and continuing until the year before SARS, were not followed.

The Auditor General’s comments speak for themselves in respect of the lack of progress at the federal level. But Ontario had an equal obligation to work towards an effective federal provincial framework for the exchange of infectious disease information.

It is most regrettable that effective machinery was not in place during SARS to ensure the necessary flow of information needed so badly by the federal government to discharge its national and international obligations. It is clearly incumbent on both levels of government to ensure that the breakdown that occurred during SARS does not happen again.

The key to effective federal-provincial cooperation is to recognize the provincial responsibility for delivering public health services and the federal role in assisting the provinces and developing partnerships around information sharing and other aspects of disease surveillance and outbreak management. One senior federal official put it very well:

To me the responsibility for public health is at the local level, which then, quite appropriately, are people acting under Provincial jurisdiction. My view is that Health Canada is there to look at the wider interest in Canada, and one, to ensure that the expertise comes to play to assist the Province or Provinces involved in an outbreak, to add to that, to add to what’s necessary in terms of lab support, epidemiologic investigation and so on, and so forth. And unless the Federal government wishes to take some jurisdiction away from the Provincial government, which I’m not saying it does, and I personally don’t feel that’s necessary, I think we can carry on with our separate roles, but in partnership. To me, the Federal government has a part to play in communicable disease control and response, emergency response. Obviously the Provinces and Territories do too. And I believe we can, maybe we have to set up more, firmer agreements to share information, especially during times of emergencies and so on and so forth. That’s in order for us to do our job. And I think to help the Provinces and Territories do their job. But that’s just one part of the way you work in a federation. It’s more about developing a Public
Health strategy and programs for the country with all the different partners involved, rather than necessarily changing jurisdiction or jurisdictional responsibility.

These comments resonate strongly with the Naylor recommendations for new federal-provincial partnerships in public health. Few things more sensible have been said about what needs to be done.

Effective federal provincial cooperation requires more than this positive attitude recently demonstrated by Ontario. It requires determination, patience, hard work, and a sense of urgency. The strength of the government’s commitment will be measured by the progress that is achieved in the months ahead.

A senior federal official, asked if the federal-provincial communications problems were finally being addressed, and whether outbreak control would in the future work in a more collaborative way, said this:

I believe it would work in a more collaborative way. I can't speak for how improved the systems are in Ontario. Obviously we're trying to work with Ontario as much as we can to assist them to improve their systems, but in terms of collaboration, I believe that there is a greater sense of collaboration with Ontario now, and a great willingness to really discuss what the issues are.

To conclude, the lack of federal-provincial cooperation was a serious problem during SARS. This lack of cooperation prevented the timely transmission from the Ontario Public Health branch of vital SARS information needed by Ottawa to fulfill its national and international obligations. Underlying the problem was a lack of pre-existing protocols, agreements, and other machinery to ensure the seamless flow of necessary information and analysis, combined with a possible lack of collaborative spirit in some aspects of the Ontario response. The inherent tensions between the federal and provincial governments must be overcome by a spirit of cooperation around infectious disease surveillance and coupled with the necessary machinery to ensure in advance that the vital information will flow without delay. It is clearly incumbent on both levels of government to ensure that the breakdown that occurred during SARS does not happen again.
In addition to the problems set out above, the Commission has heard consistent reports that the Public Health Branch of the Ministry of Health had become dysfunctional both internally and in terms of its relationships with the local public health units.

One Medical Officer of Health thought the problems of the Branch during SARS resulted from a long and gradual process of decline over many years:

Over the last 15 to 20 years, I have observed a gradual disintegration of the Public Health Branch. A number of years ago, we benefited from the presence of area medical officers and a number of consultants at the Public Health Branch we could reach almost anytime for advice. Advice was given freely and these people seemed to be well disconnected from any political process. Over time, the number of staff or their availability has greatly decreased and their opinions are always guarded; that is if they do hazard a clear opinion. The Public Health Branch needs to be beefed up and the staff needs to feel free to express their professional opinion without fear of retribution . . .

To some outsiders who worked at the Branch during the crisis, it seemed that for the Branch as an organization it was business as usual, with many of the regular Branch employees working 8:30–4:30 days while the outside volunteers were working 20-hour days:

Most of the staff, when I talked to them on the 8th floor, they felt SARS was separate from them, which was fascinating cause when you go to the health units everybody was pulled into SARS . . . We were seen as a separate SARS group that was brought in, we didn’t get the sense of people in the branch coming in and joining in with us. It fit with the lack of a structure.

One observer described the Branch as “the most disheartening place I have ever worked.”
Some expressed concerns that the Branch seemed to spend much of its time preparing briefing notes:

... there were things that were happening that made no sense at all, like having to do the same briefing note 10 times and no direction provided about what should be changed so there was a lot of busy work going on at the expense of things like guideline development and more meaningful public health activities.

The relationship between the Public Health Branch and the local public health units was sometimes problematic. Many local health units felt the Branch had high expectations of the local units, but provided little or no corresponding support. As one local Medical Officer of Health stated:

You cannot do anything wrong or have any kind of hint error. That was particularly in SARS where, I think as the relationships with the Branch and Colin, in particular deteriorated further. I felt that there was a possibility of health units being scapegoated.

The dysfunctional relationship between the Public Health Branch and the local units was observed by many prior to SARS and was known to many in Ontario and elsewhere. One local Medical Officer of Health stated:

They’ve [the other Medical Officers of Health] been very unhappy with our relationship with the Public Health Branch for a long time. We’ve tried to make it as constructive as we can. We’ve tried to separate personality from other things. We’ve tried to give the Branch credit, give Colin credit. But we’ve been very concerned about this.

The lack of collaboration and information sharing felt by the local health units before SARS can be seen in the context of pandemic flu planning. In August 2001, Health Canada provided the Chief Medical Officer of Health in all provinces and territories with access to the federal pandemic plan website. Although the document was in draft form and was to be treated as confidential, the federal government had given explicit permission for the Chief Medical Officers of Health to share the password at their discretion.64 Yet local

---

64. The memorandum from Health Canada announcing that the federal pandemic influenza private website was operational stated “In each P/T the office of the Chief Medical Officer of Health is responsible for releasing the site on a “need to know” basis and will retain a list of people who have received the password.
public health units in Ontario did not immediately receive the password and it was only through the efforts and hard work of others that the passwords were ultimately released to the field almost two months later.

One local Medical Officer of Health expressed their frustration:

The federal [pandemic] plan in its draft version, with many, many annexes, many excellent annexes about how to enlarge your hospital capacity, how to get extra staff, all those pieces, became available on a private website. And that website address was sent out to provinces, and they were advised that they could share it with people who needed it for planning purposes. It [took] several months and a lot of letters back and forth from Health Canada to our province, until they were able to send that password out to local Medical Officers of Health. It was not the sort of information sharing that was seen as relevant and it was really a very difficult exercise to get that to happen . . . it took a lot of work behind the scenes. The people at Health Canada wrote one or two extra letters, and their lawyer phoned, and all sorts of things were done to try and get this to happen. And Colin would just say, well, the letter here says I’m not supposed to do it. But Colin, all the other provinces have, and they tell me you can, and it was just sort of crazy. The sad news is that the password was changed about eight months ago. That information was sent out to [Chief Medical Officers of Health] and we still don’t have the new password. So, now, at this point, there are hugely relevant documents. They’ve gone through a lot more development in the past two years, and local Public Health units, in Ontario at least, have not ever seen that information, which we desperately need for our planning. Because a lot of it would help us with SARS planning. I just find that sad.

It was incumbent on the province to ensure that this vital information was shared with local public health units, instead of blocking their access to it.

One expert from outside the province noted the widespread perception of problems in the branch:

Many of us, maybe most of us in the public health community across Canada have recognized that Ontario in particular had a pretty fragmented and not very functional public health system in terms of coordination. And what we were hearing at least what I was taking from the
teleconferences that were going on almost daily reinforced those kinds of observations.

Another outside expert who worked with both Toronto Public Health and the provincial Public Health Branch described the impact of the dysfunctional relationship as follows:

I would like to say that if the SARS outbreak had happened in a different province with a different city or within the same province in a different city, that the flow of information would probably have been better. I think that there were some and this is my own personal opinion, there were some pre-existing relationships that made that flow of information more difficult . . . I do not know what was going on but you certainly get a feel for people and when you walk into the room you can feel tension or no tension and when I was there, I got the personal kind of gut feeling that there was some tension between the relationship between the City of Toronto Public Health and the Ontario Ministry of Health and I could not, I do not know who it was or if it was a group or you just got a feeling that there was some tension between those relationship. The relationship between the people at the City of Toronto public health and people at the Ministry of Health were tense and there was not that, there was not a lot of talking to each other going on unless it was absolutely necessary. It was sort of the feeling that I got but of course I was not involved in, I never witnessed anything like that, it was just a sense or feeling of that tension which I am sure that you have experience when two people who do not like each other in the room, you kind of sense that even if you did not know that the two people did not like each other. It is just sort of a sense that there was some tension between those two bodies of the whole.

The problems within the Public Health Branch and the dysfunctional relationship between the local public health units and the Branch impacted negatively not only on the flow of information and the working atmosphere, but also on the ability of public health in Ontario to attract and retain experts. During a teleconference call, one witness reported hearing concerns about coming to work at the branch in Ontario:

I remember being on a call where the Ontario folk, someone was pleading for assistance into Ontario Public Health system from other provinces and territories, people to come to help. And got a very cool response. And I added my pleas to this and then one of them said, look guys, you know why we’re not sending people to Ontario. We cannot
send them to work in the Public Health Branch, because we know what it’s like.

The same feeling was expressed within Ontario and confirmed by a federal official. As one Medical Officer of Health said:

There is absolutely no respect for the Public Health Branch; we don’t turn to them for expertise or advice, we turn to our colleagues in the field; the Branch sends us internet links to Health Canada and CDC and WHO that we can find ourselves, it’s absolutely pathetic . . . a lot needs to happen before trust is restored.

A lack of respect for the Public Health Branch was evident in the responses from outside Ontario and from elements of the Ontario public health system at the local level. When SARS hit, leadership was not forthcoming from a Public Health Branch that turned out to be dysfunctional.
Problem 9: Lack of Central Public Health Coordination

Under the *Health Protection and Promotion Act*, local Medical Officers of Health were responsible for the local response to SARS. It was to the province however, to the Public Health Branch in the Ministry of Health, that the local public health units looked for guidance. Unfortunately many Medical Officers of Health felt there was no coordinated effort at the Public Health Branch to facilitate the SARS response at the local level. For many in the field it seemed as though the Branch was a silo, disconnected from the field, rather than a partner or a resource.

Many local public health units felt left to their own devices when it came to getting the vital information they needed to do their job during SARS. Although the provincial Public Health Branch did have daily teleconference calls with the local health units in the Greater Toronto Area, many did not regard it as an effective means of communication, as an effective forum for sharing vital information, or as a source of help for the local units. One local Medical Officer of Health described it as follows:

> The teleconferences that we were having on a daily basis I found to be partly useful. And I say partly because, in fact, the one problem with them was that the people that had the greatest experience with what was going on were never on the teleconferences because they were off doing something else or they were at the public news conference or they were trying to visibly do whatever to try and control the outbreak in their area. They were never available to us to provide us the first hand information about what was really going on so we in the field would know from the source. And as we had questions in the field from those teleconference, there was never anyone there that could answer them because they were off doing something else.

Another local health unit reported that the teleconferences, rather than providing help and guidance to local units, quickly turned into a forum for the province to press the local health units for details about their cases. The teleconferences did not fulfill the needs of the local health units for guidance and information. It was particularly
frustrating for local public health units to report their information to the province during the teleconference, receiving little or nothing in return, only to be asked for the same information all over again shortly after the end of the teleconference. Said one Medical Officer of Health:

[The teleconferences] seemed not to be beneficial to the branch either, because we’d get the same questions later.

One health unit reported that they eventually chose not to participate in the conference calls because they were of such little assistance:

. . . we made the decision to stop participating in Medical Officer of Health teleconferences, in part because you’d wonder if this was going to be another source of information and we’d wonder whether it’s going to be confrontational.

Many local health units felt the information and support provided by the Public Health Branch was inadequate.

One local Medical Officer of Health indicated that the information provided by the Public Health Branch lacked clarity and precision. It provided information that was often a confusing and sometimes contradictory amalgam drawn from a variety of sources:

You probably heard there were disagreements between the Province and Health Canada. Well, imagine our predicament when you’re trying to let your staff know what our key messages are, what our communications are to people, [what] our key messages are [to] physicians, communications, team managers.

Imagine the troubles we faced trying to get the true – true bill. We got guidance with respect to the Public Health management of discharged cases . . . from the World Health Organization, nothing from the Province, nothing from Health Canada, and to this day we do not have any Provincial Public Health person contact name for the guidelines.

Some Medical Officers of Health got their crucial information from television or from the web site of the CDC. One Medical Officer of Health described the frustration:
The other thing that I found that is very interesting was that one of the crucial pieces of information from my perspective about what was going on relating to the outbreak, I found out from my big [satellite] dish. So when CDC in Atlanta was having their educational sessions on SARS, I could go home and I could dial up and I could listen directly. One of the most crucial pieces of information about the cause of this spread of the disease within the Toronto hospitals, was something that I learned from the CDC from one of those sessions. I did not learn it directly through the [Ontario Ministry of Health] teleconferences . . . I did not learn that internally through our system of information; I found that out from Atlanta through their educational session and I thought that kind of conveyed to me this problem with internal communication. In the field, we were not getting direct information from the people who most knew what was going on.

Another local health unit had to hire someone to review world media reports in order to get up-to-date information on the status of the outbreak:

We knew we needed information officers, people to just sit in front of a computer and pull down the latest directives and the latest WHO stuff. I took out a paid subscription to the Hong Kong newspaper, because that’s where all the information came from real fast.

There was a sense that individual local health units were on their own and that there was an absence of coordinated central support and information sharing.

Even when information that could be helpful to local units was generated, it was not always disseminated to the local public health units. Volunteers from the field developed a series of public health guidelines. One Medical Officer of Health noted that these guidelines were never posted nor widely distributed, leading some to wonder where they went:

It was just that it became unconnected. None of the Public Health guidelines ever made it to a web site, just as an example. They never got posted . . . There were a whole series of these Public Health things that never quite officially got published . . . In many cases, they were drafts done up by the field rather than the Branch, but they did not get out on the official website.

SARS was not the first sign of the absence of central coordination at the public health branch. In 2003, the Provincial Auditor’s Report revealed inconsistencies in approach
among individual local health units in tuberculosis surveillance, putting the community at increased risk:

Federal guidelines state that immigrants with inactive tuberculosis who are placed on medical surveillance should receive a complete medical examination, including an x-ray, after arriving in Canada. These individuals are required to obtain a letter from a local health unit verifying their compliance with federal requirements. However, according to the Ministry, the federal government only requires that the individuals contact a local health unit. Nine of the 21 local health units that provided letters indicated that they would do so as soon as the individual contacted them, regardless of whether they had had a physical examination or x-ray. . . . [I]ssuing letters based on contact alone reduces a local health unit's ability to ensure compliance with federal guidelines and places the community at increased risk.65

This lack of central coordination was also reported in respect of the West Nile Virus cases. The failure of the system to learn from West Nile is noted below. The systemic problems of the Branch demonstrated during West Nile were the subject of comment in the Provincial Auditor’s 2003 report. It pointed to the lack of direction from the Public Health Branch on the use of insecticide for which some funding was available from the province. The field guide produced by the Branch, which was supposed to be a clear action plan to guide local health units in their approach to West Nile gave no clear direction on the use of insecticides.

While this Plan covered a wide range of areas, it did not state when local health units should consider the use of insecticides.

Instead, the Plan stated that, prior to using insecticides, local health units are required to conduct their own risk assessments, which should include factors such as community attitudes towards the risks posed by WNv [West Nile virus] versus the likely benefits and risks of using insecticides.

Notwithstanding this ministry guidance, most of the 37 local health units had to conduct their own research to determine best practices for when to use insecticides.

In fact, many of the local health units we surveyed in April 2003 indicated that additional and more timely guidance on when to use insecticides was needed, and in 2002 none of the local health units carried out any insecticiding at all.\footnote{Provincial Auditor of Ontario, \textit{2003 Annual Report}, (Toronto; December 2, 2003), p. 241.}

Other aspects of the response to the West Nile virus point to the lack of a central coordinated effort on behalf of the entire province. For example, during West Nile, a number of local Medical Officers of Health, frustrated at the lack of provincial leadership, set up their own network to plan and manage the surveillance response. One Medical Officer of Health recounted how they unsuccessfully begged the Branch to help:

We begged through letters back and forth to have provincial leadership there – to get provincial guidelines to do things in a coordinated way and we kept being told no, that is not our role, you are in charge, and that we should organize ourselves.

Another Medical Officer of Health said that the local health units “screamed” to no avail for direction and support from the Public Health Branch in dealing with West Nile. Eventually, they took matters into their own hands and the local health units themselves called meetings to deal with West Nile.

In 2003, when SARS hit, the Public Health Branch was working on their 2003 West Nile response – but for many the help was coming too late, as the field had already banded together to coordinate their effort among themselves.

Many local Medical Officers of Health felt abandoned during SARS, devoid of support and guidance. This reflected the long-standing failures noted above. The Branch’s failure to coordinate and guide the local health units was already a big problem before SARS. It turned out to be a harbinger of the problems that arose during SARS.
Problem 10: Lack of Central Expertise

The outbreak was managed, of necessity, around the Public Health Branch of the Ministry of Health and Long-Term Care rather than through it. The critical mass of professional expertise one would expect in a crucial branch of government in a province the size of Ontario simply did not exist, either in the number of experts or their depth of experience. Key operational groups had to be put together on the run and individual experts had to be recruited from the field to fill this void. Vital pieces of machinery such as the Science Committee, and the Epi Unit, were run on almost a revolving door volunteer basis because there was no depth of expertise in the Branch itself.

Some regarded the lack of strategic capacity and expert leadership as a primary weakness during SARS. Dr. Richard Schabas, formerly the Chief Medical Officer of Health for Ontario, said this at the public hearings:

I think the key weakness that the SARS outbreak pointed out in our public health system is a lack of strategic capacity, a lack of really expert leadership in a crisis situation at that time. We have – that capacity has been largely eroded at a provincial level over the past few years and there really was no acceptable alternative within public health.⁶⁷

The Commission heard that over the years a number of bright knowledgeable people drifted away from the Ontario public health system for a number of reasons, including the work environment and a lack of support from above. There was a sense in recent years that bright, independent minded people were not particularly welcomed. As one expert from British Columbia who witnessed this migration of experts commented:

We [British Columbia] benefited from it immensely because Ontario collectively has succeeded in driving away some of their particularly capable people and we have inherited them.

⁶⁷. SARS Commission Public Hearings, September 30, 2003, p. 27.
One such expert who had left the Public Health Branch told the Commission that but for the way they had been treated while at the Branch, they would have remained in Ontario.

The result of this lack of central expertise was felt in the public health field long before SARS hit. One Medical Officer of Health interviewed by the Commission described how local public health units banded together to support each other, since they felt the Public Health Branch was unable to provide the support they needed:

We have been helping out for long, long time. For a few years. We have been almost providing shadow Public Health Branch services for a while . . . There have been a lot of things that the Public Health Branch has not been doing for us.

Over the years, as many senior experienced professionals left the Ontario public health system, the government failed to recruit comparable replacements. As one senior public health expert observed, the vacancies left by senior physicians and experts who left the branch were often filled by junior, inexperienced people:

Many of the others had very little experience. The old-timers, who sort of knew the system and knew all the answers and worked on the federal committees and had all the networks, had retired or been moved. A lot of the . . . nurse epidemiologists that we had and trained up had moved on. Many of them actually have moved to the federal government, and they ended up chairing the various federal working groups during SARS. So, and some of them still live in the Toronto area, but went to work for them instead. So, we’ve lost a lot of talent.

These observations do not detract from the fact that there are some superbly qualified experts in the Public Health Branch. Dr. Erika Bontovic, to take one example, has been singled out by many as someone who provided valuable help during SARS and there are others who made valuable contributions.

The problem was that there were simply too few senior experts and physicians experienced in communicable disease and outbreak management, including epidemiology. When SARS hit, there was no critical mass of seasoned physicians and public health experts in the Public Health Branch to whom the government could turn and trust to step in and do what needed to be done. As one expert observed:
They certainly didn’t have much depth back at the Branch to be able to do it with. Had no epidemiologic capacity for example, and very few public health physicians back there with any experience to be able to run a big outbreak. The Public Health Branch has been very little involved in the outbreaks. Any outbreaks before are handled by health units themselves. Or if they need coordination, typically coordinated by the health units themselves, with the Public Health Branch seldom involved in playing an overall coordinating role. So that was a real problem.

The Naylor Report noted that in the Ontario public health system “neither the analytical capacity nor the communications strategies were anywhere near optimal.” The Walker Panel Interim Report has also recognized the deficiencies in the public health human resources, emphasizing the need to retain experienced individuals and recruit new blood.

There is a clear need to upgrade the professional environment within the Public Health Branch to attract and retain a critical mass of public health expertise and to retain what expertise currently exists. Professional development, collegiality, cooperation and mentorship must be fostered. The opportunities for public health professionals to build collaborative relationships with federal colleagues and colleagues in other provinces must be promoted, opportunities reported by many to be lacking for some time. Many in public health throughout the province and those who have left the province remarked how little support they saw for professional development and collegial collaboration. Many felt shut out of federal/provincial/territorial committees where Ontario chose not to be represented. One public health official described the problem as follows:

So not only do we not have our good person who would like to be there, but we end up with no representation. They knew [Dr. D'Cunha] wouldn’t let people come to things, people who had been signed on as speakers, who weren’t allowed to go out. But they knew those things. But we were suffering on the federal/provincial thing. We certainly lost our credibility as a province that way. We were losing people. We were losing some of our key people because they didn’t want to work in the system. We weren’t getting the expertise we needed when we called in, we were handling a lot of things ourselves on our list serve, or by calls to each other. You know, one person here is the expert in chronic disease prevention . . . someone else is the expert in something else. And so we were using our own network more and more and trying to avoid the Branch.
One public health official who left the Ontario system described how the Public Health Branch did not encourage Ontario’s participation in national conferences and meetings, and how professional development was not promoted. This official contrasted the Ontario approach with the other provinces who actively promote and facilitate participation in federal committees and career-building opportunities:

My [current employer] provided a lot of support to me in accepting that position [as chair of a federal committee] because they felt it was a high profile important thing both for me and [my current employer] to be providing that kind of support to a national committee.

An institutional culture that encourages scientific excellence and extra-provincial collaboration appeared absent from the Ontario Public Health Branch. For public health in Ontario to thrive it must be able provincially and locally to attract and retain the best and the brightest that our country and other countries have to offer. This can only be achieved by improving remuneration levels and the kind of professional culture that attracts the best people.

SARS demonstrated that our most valuable public health resources are human resources and that Ontario lacked a critical mass of expertise at the provincial level. It is crucial to the success of any public health reform initiatives in Ontario that there be a high level of expertise at both the local and central levels of public health. Ontario cannot continue to rely on the goodwill and volunteerism of others to protect us during an outbreak. Many of those who came forward to work at the provincial level during SARS were disheartened by the problems they saw and a few expressed doubts whether they would be willing to come forward again, particularly if the problems are not addressed. Examples abound of centres of excellence for disease control: British Columbia, Quebec, and Atlanta, among others. Ontario needs to learn from their example. Without a critical mass of the right professionals public health reform, no matter how well-reasoned and well-resourced, has no chance of success.
Problem 11: No Established Scientific Backup

In March 2003, the Public Health Branch in Ontario had neither the capacity nor the expertise to handle an outbreak of the magnitude of SARS. Neither was there any provincial plan to bring together rapidly the necessary experts to provide scientific advice to those managing the outbreak. One outside expert, brought in to help manage the crisis, noted that Ontario simply didn't have the machinery, people or the leadership at the central level:

It was abundantly clear to everyone who sat in on teleconferences that Ontario was scrambling, didn't have the infection control expertise, at least the amount of expertise. There were superb infection control people there . . . it’s clear they were unable to pull together the data that was required for them and us to try to understand what’s going on. It was abundantly clear that there was no obvious concerted leadership of the outbreak at least as we could see . . . It was obvious to all of us that Ontario was in substantial trouble.

Consequently, the Ministry of Health had to turn to experts outside of government for advice and direction. While this is not unusual during an outbreak, the lack of planning meant that the core expert groups had to be thrown together in haste without adequate planning or organization.

On March 26th, the day the provincial emergency was declared, a Science Committee was formed at the request of the Commissioners of Public Health and Public Safety and Security (Dr. D'Cunha and Dr. Young). This ad hoc group of experts was known as the Scientific Advisory Committee, although it was also referred to variously as the Scientific Advisory Group, the Science Committee or the Science Group.

Over the weekend of March 27th to March 30th, a number of people were brought in to help. They were recruited by the existing members of the Science Committee, simply through a call asking them to come and help out. Many responded to appeals from Dr. Donald Low, Microbiologist-in-Chief at Mount Sinai Hospital, who used his cross-country network to good advantage. The Naylor Report famously called
them “a human cell phone conglomerate.”68 Luckily, a group of volunteers – some from as far away as Saskatoon and Vancouver – dropped everything to come to Ontario’s assistance.

Initially, the Science Committee consisted of a small group of volunteer experts, including those who had treated patients during the early days of the outbreak. As the Science Committee grew in number, it moved to the Minister’s boardroom at the Ministry of Public Safety and Security, where it remained.69 Their responsibilities were crucial. As one member of the Science Committee described their task:

> There was an expectation on us to analyze the current epidemiology day-to-day and make a recommendation to the SARS operational executive or the provincial operations centre.

Despite the ad hoc way in which the Science Committee was started, it is an inspiring example of partnership and collegiality that so many experts agreed to come forward and that they worked so well together. Many were from outside Toronto and left their families for weeks on end. They worked long days, typically 10 to 14 hours or more. Their dedication and selflessness was remarkable. In an age when many professionals worry as much about personal risks and liabilities, such concerns fell by the wayside. As one member of the Committee told the Commission,

> . . . were we covered, was there risk for me personally? Was my board insurance covering me? None of that was a part of this.

Petty budgetary concerns were also dismissed in the face of this new and ominous threat. One member of the Committee recalled that, at one point, her superiors asked:

> . . . was the province going to pay for this? My response was that it was a public health emergency and we need to do what is right in the short term. In the longer run, sort out who pays for what. If we do not get this sorted out provincially, it is not going to matter whether they pay or not.

What the Science Committee members found at first, however, was a lack of the necessary infrastructure that supports modern medical science. There was no estab-

---

lished process to ensure the effective translation of their scientific conclusions into workable directives that could be sent directly to hospitals and understood by hospital administrators and health care workers. In spite of all these problems the Science Committee did remarkable work under stressful and difficult conditions.

It is important to stress that the problems faced by the Science Committee are no reflection on the performance of the remarkable individuals who comprised it. Nor is it any reflection on the degree of support it received from the government once it got going.

Dr. Brian Schwartz, co-chair of the Science Committee, told the Commission during the Public Hearings that it received tremendous support from all levels of the Ministry of Health. The problems that it faced were not people problems or resource problems. The problems were caused by the fact that the Committee was cobbled together from nothing – with no infrastructure, no pre-existing body or structure, no clarity of roles or reporting relationships. This speaks to two underlying problems that arose again and again during SARS: the lack of a critical mass of expertise in the public health branch and the lack of planning.

The fact that the Committee had to be established ad hoc created a variety of problems, outlined by the members of the Science Committee themselves, in a retrospective review of their role:

The POC/OSSAC structure was created on the fly as the crisis was unfolding. The membership selection was inadequate for deciding in this situation who needed to be on the executive committee or the scientific advisory committee; in the same way that outbreak policies in hospitals are needed to lay out how decisions are made about who needs to be at the table and this needs to be at the table, the province needs a decision-making process about who (both internally and externally) needs to be at the table and this needs to be predetermined and somewhat generic so it is adaptable to the emergency situation at hand – in this circumstance, the “science committee” appeared to be created ad hoc, and some important groups were missed initially.

The membership selection process left little room for consultation or reflection. Membership had to evolve as the outbreak progressed and needs were identified. As

70. The problems with the directives and communication of the directives will be dealt with in greater detail in the final report.
noted in the quote above, some important groups were missed. Those that were missed found it extremely difficult to gain access. For example, the Commission heard that Family Physicians Toronto had to “convince the powers that be” to include a family physician in the Science Committee. Dr. Schwartz, co-chair of the Science Committee, acknowledged this at the public hearings when he stated:

> We had limited, but not enough, communication with other stakeholders in hospitals, in physician's offices, in the Community Care Access Centres in long-term care . . . I think that we could have done better in that regard, but we had to balance that with the imperative to get these directives out as quickly as possible.\(^{71}\)

Another problem with the Science Committee was that early on it became apparent that there was no one at the table from public health.\(^{72}\) To public health officers in the field this was remarkable: that the scientific direction of an infectious disease outbreak was being handled with no direct involvement or input from public health officials, some of whom had extensive experience in outbreak situations. One observer noted:

> . . . they didn't have a public health person there to – to be able to provide the information . . . there was no connection to the Public Health Branch on this . . . I mean Colin [Dr. D'Cunha] was there, but he was not accessible to any of the Science Committee, the people who are to put the directives together. So we are not represented at all in the early days.

The lack of a public health presence in the initial stages of the Science Committee was of great concern to those working in the public health field. As one local Medical Officer of Health described it:

> But I remember, [another Medical Officer of Health], telling us and sharing with us how he thought this response was being structured. And we heard this and we said, there's no one from Public Health in this whole response. How is that? How can it be, when we're dealing with a communicable disease? And they said, well they've got no manpower, and we knew that, in the Public Health Branch. There had been no

---

\(^{71}\) *SARS Commission Public Hearings*, October 1, 2003, p. 89.

\(^{72}\) Although Dr. D'Cunha was a member of the Science Committee, he was not, given his day-to-day responsibilities in a position to be there continuously.
manpower and little expertise in communicable disease at this point. And so we said to ourselves, how can we help? We’re going to have to help.

This problem was rectified when representatives of local health units dropped their day-to-day duties to join the Science Committee.

Because there was no plan in place, there were no pre-existing agreements or arrangements between the Ministry of Health and local health units and hospitals to loan staff to work at the provincial response level. Many members were fortunate to have colleagues who provided backup and support so they could leave their current commitments and work at the Science Committee. Others were unable to leave their positions for any length of time, because no back-fill arrangements were in place.

The lack of preparedness and planning also meant that technical groups had to be formed on the fly. One member of the Science Committee described the problems resulting from the lack of planning as follows:

But to be frank, it [the Science Committee] never got structured the way that I think the whole technical response maybe needed to have been pulled together. And my point here is that if we had had some of that thinking in advance, we might have been able to structure it better. And I think now it’s a very good opportunity, this is one of the recommendations, to do that plan. Think about what would be the appropriate sorts of technical groups, and how they have to interact, so that another time we don’t the gaps. So, we did end up with these gaps. We ended up with gaps, particularly in surveillance and epidemiology. We ended up with a real disconnect . . . So in the middle of SARS, they had to create this structure to try and do that too. I mean, that’s not the time to be doing all of those things. And those areas of interface are really tricky. I know that from having worked on them in the federal plans. They’re very difficult. You’re talking with people who are from completely different cultures and backgrounds and used to responding to things differently.

The wide variety of issues that could be expected to arise during an outbreak had not been previously identified and subcommittees comprised of the key experts to resolve or provide guidance on the specific issues had not been formed. This meant that the Science Committee not only had to answer the questions but had to identify the issues at the outset, prioritize them, and determine who best could help answer the question. It also meant that the Science Committee quickly became inundated with requests for guidance and information. Dr. Schwartz, the co-chair of the Committee,
noted during his public hearing presentation to the Commission, that “the demand for direction was extreme during the SARS outbreaks because people just didn’t know what to do.”

Because the Science Committee was formed abruptly, there was no protocol for the routing of information requests. The Science Committee did not have clear terms of reference and it was not always clear what their priorities were. Dr. Schwartz told the Commission that it was unclear at times where their tasks were coming from. He said:

> We often felt that we were dealing with multiple issues at the same time, getting the directives out, providing education or trying to get educational programs out to the users of these directives, dealing with support of operations, answering the questions and sometimes dealing with questions that flowed down from the media and that led to occasional competing agendas.

Another member of the Science Committee described the pressures as follows:

> The kinds of questions that were thrown at us, when the volume I likened to taking a shower in Niagara Falls. It was colossal and we had to set rules as to how many people were allowed to interrupt us.

The Commission also heard from members of the Science Committee that the dual membership and supervision by Dr. Young and Dr. D’Cunha made it unclear who was in charge and to whom they reported.

Despite all the problems noted above, it is clear that the Science Committee played a vital role in the outbreak and could continue to play a role in future disasters. As Dr. Schwartz stated during his presentation to the SARS Commission “I think the greatest strength was the fact that the Ontario SARS Scientific Advisory Committee even existed.” As another member stated:

> Despite those challenges, I think the concept of an advisory committee like that, that was robust and was hard working was essential to the success of the, and it’s something that should be built into how you

---

73. *SARS Public Hearings*, October 1, 2003, p. 86.
approach I think, certainly a biological event; whether that is, god-forbid, smallpox or SARS or whatever we contemplate, there’s no question that it worked.

The fact that the Science Committee worked so well, despite the confusion and lack of preparedness that preceded its creation, is a testament to the dedication of its members and those who supported it.
Problem 12: Lack of Laboratory Capacity

Before SARS, concerns had been raised about the capacity of the Ontario Central Public Health Laboratory (the provincial laboratory). Despite these warnings, the laboratory was unprepared to deal with an outbreak of this magnitude.

The issue of laboratory capacity has been addressed thoroughly in the Naylor Report. The Ontario Expert Panel on SARS and Infectious Disease Control, known as the Walker panel, has commissioned an independent review of Ontario’s public health laboratory capacity and anticipates being able to provide more detailed direction in its final report.\textsuperscript{76} It is therefore unnecessary for this Commission to say very much about the issue at this stage, subject to further observations in the final report including the effect if any of laboratory capacity in Ontario’s ability to deal with SARS II.

Part of the Ministry of Health, the Ontario Public Health Laboratory is a network consisting of one provincial laboratory in Toronto, known as the Central Public Health Laboratory, and eleven regional labs. Approximately half of the 500 technical and support staff are employed in the Toronto facility.\textsuperscript{77} Their role is described as follows:

\begin{quote}
The public health labs provide diagnostic microbiology testing in support of public health programmes, outbreak management and control, and microbiology reference services for the province in areas where front line microbiology diagnostic testing is not available.\textsuperscript{78}
\end{quote}

One observer described their importance to the smooth function of the Ontario public health system as follows:

\textsuperscript{76} Ontario Expert Panel on SARS and Infectious Disease Control, \textit{For the Public’s Health}, (Ministry of Health and Long-Term Care: December 2003), p. 66. (Subsequent footnotes will refer to this report as the Walker Interim Report.)

\textsuperscript{77} Dr. Margaret Fearon, Medical Microbiologist, Central Public Health Laboratory, Ontario Ministry of Health and Long-Term Care, \textit{SARS: The Ontario Public Health lab’s Experience}, presented at the National Forum on Laboratory Reform, (Toronto: March 23-4, 2004), p. 3. (Subsequent references to this paper will refer to the Fearon Presentation.)

\textsuperscript{78} The Fearon Presentation, p. 3.
But with a public health laboratory, while they do deal with individual patients, doesn’t have that patient as their number one priority despite the fact that, you know, the patient is very important. Their number one priority is understanding how this one patient with that particular disease, whatever it may be, may impact on the greater public. And so a public health laboratory has as its main focus not the one patient but how that one patient may impact on the greater public.

During SARS, the provincial laboratory in Toronto quickly became swamped with specimens. Like other parts of the health care system, it lacked surge capacity – resources to deal with the expanded demands of an outbreak like SARS. One expert described the lab as “under-funded and under-resourced” prior to SARS. Consequently, many of the Ontario specimens had to be sent for testing to the National Microbiology Laboratory in Winnipeg and to private and hospital labs in Toronto.

As noted in the Naylor Report:

> With the provincial lab overwhelmed, some hospitals sent specimens directly to the National Microbiology Laboratory [in Winnipeg] bypassing the usual hierarchy of referral. The Hospital for Sick Children, Mount Sinai and Sunnybrook and Women’s had strong polymerase chain reaction [PCR] technology – an elegant laboratory testing modality that identifies micro-organisms. They became the *de facto* and unfunded referral centres for Toronto SARS testing. 79

Concerns about Ontario’s public health laboratory resources had been raised prior to SARS. In March 2000, two years before SARS would hit Ontario, the Advisory Council on Communicable Diseases sent a letter to the provincial government, expressing their concern about the inability of the provincial laboratory to handle any high volume of testing. The letter stated:

> I am writing on behalf of the Advisory Committee on Communicable Diseases (ACCD) to express concerns about our provincial laboratory’s capacity to adequately deal with the annual influenza outbreaks. The dedication of the public health staff and their willingness to help is beyond question; however, our review of influenza management at recent

---

Problem 12: Lack of Laboratory Capacity

ACCD meetings suggests that they are badly under-resourced. Inadequate resources, both human and material, have meant rationing of tests, delays in processing specimens, and inability to make new rapid tests available. Such tests, for example for influenza B, will considerably improve our management of respiratory disease outbreaks in hospitals and long-term care facilities.

The earlier inability of the provincial laboratory to keep up with the testing volumes required in the West Nile and Norwalk outbreaks was noted in the Naylor Report:

. . . in Ontario, the Central Laboratory was unable to keep up with the testing volumes involved in previous outbreaks of West Nile and Norwalk virus.80

In May 2001, concerns were again expressed by the Advisory Committee on Communicable Diseases about the level of preparedness of the provincial laboratory for an outbreak. The Committee wrote to laboratory officials emphasizing the importance of pandemic planning and the need for public health labs to be part of any such plan. Unfortunately, as noted earlier in the report, there was no pandemic plan in place in Ontario in March 2003.

In May 2002, Mr. Justice O’Connor made the following observations in the Walkerton Report:

I was told by a number of parties in Part 2 of the Inquiry that the expertise within the Laboratory Services Branch as well as the equipment available has been allowed to deteriorate over the last 10 to 15 years and that if this trend continues the branch’s valuable role in the evaluation and development of testing protocols will become impaired.81

When SARS hit, there were only two medical microbiologists in the Ontario provincial laboratory system. They were responsible for diagnostic microbiology testing and for providing clinical consultation in their respective areas of expertise.82 They and their staff were stretched to the limit during SARS. Many staff worked long hours and had to be pulled from other areas to assist with the high volume of SARS speci-

82. The Fearon Presentation, p. 3.
men processing and testing. Their efforts were hampered by lack of capacity. As noted again in the Naylor Report:

The Central Provincial Public Health Laboratory in Toronto was unable to provide optimal support during the SARS outbreak.

To make it worse, the Ministry of Health and Long-Term Care in the fall of 2001 had laid off its PhD level scientists at the provincial laboratory. These scientists were engaged in the diagnosis and surveillance of new and emerging infections as well as research and development. This latter work has been a sorely neglected aspect of public health. As noted in the Naylor Report:

Significant involvement in fundamental curiosity-driven research is a public health laboratory function that has withered. Most public health laboratories view basic science research as someone else’s job.

Within government, there seemed to be a complete lack of understanding of the importance of the work done by scientists at the provincial laboratory. At the time of the layoffs, a Ministry of Health spokesman was quoted as saying:

Do we want five people sitting around waiting for work to arrive? It would be highly unlikely that we would find a new organism in Ontario.

It is unnecessary, in light of SARS, to bring the irony of this statement to the attention of the reader. Less than two years later, SARS struck Ontario. The provincial laboratory did not have the capacity to deal with SARS, let alone to engage in research and development on its own, and had to turn to hospital labs to work on SARS.

In a province the size of Ontario, this void is startling. One witness compared the Ontario situation to New York State.

---

83. The Fearon Presentation, p.6.
88. New York State had an estimated population in 2001 of about 19.01 million, according to the U.S. Census Bureau. By comparison, Ontario had an estimated population of approximately 12 million.
The New York State public health lab, not the federal CDC in the United States, but the New York State public health lab in Albany, New York . . . at last count, they have 150 PhD level scientists working in that institution. They work on every possible area.

One expert in public health speculated that the government had no interest in research because it cost money. He stated “Research costs money, therefore it’s a dirty word right now,” suggesting that the government had abdicated its responsibilities to private and hospital labs.

Post-SARS, the need for investment in the Ontario public health lab has been acknowledged. The Walker Panel has identified:

> . . . [an] ongoing and significant concern that the existing core scientific medical and research capacity at the Ontario Public Health laboratory is far short of what is needed for a province with a population of over 12 million.\(^89\)

The panel observed that Ontario’s public health lab capacity and resources fell short of British Columbia, a province with a much smaller population.\(^90\)

SARS revealed what experts in the field had been telling the government for years, that there is a critical shortage of trained technicians, medical microbiologists and scientists in Ontario’s public health laboratory system. The evidence examined thus far by the Commission supports the recommendations of the Naylor and interim Walker reports that an immediate review of the Ontario public health laboratory system must be undertaken with a view to ensuring that the Ontario Public Health Laboratory has the capacity to deal with both small and large outbreaks in the future.\(^91\)

In December 2003, the Walker interim report recommended, as a short-term measure, the immediate hiring of two microbiologists. That has not occurred to date.

Ontario requires more public health laboratory resources to increase current staffing levels, technology and facilities so they can provide an adequate level of service in our

---

89. Walker Interim Report, p. 65.
system of protection against infectious disease. This will require strategies to recruit and retain highly skilled, scientists in a variety of fields of expertise, the fostering of a culture of excellence and of support for scientific achievement together with the support of collaboration with colleagues locally, nationally and internationally.

There is a further need to link the public health laboratory system with the Public Health Branch and other elements in the health care system. Those who spoke to the Commission about these issues have remarked, without exception, upon the difficulties associated with the physical and functional isolation of the provincial laboratory. It is located in suburban Etobicoke, isolated from the rest of the Ministry of Health and the Public Health Branch and the major teaching hospitals which are located in the city’s downtown. Many expressed a sense that the inability of the provincial laboratory to link in to the health care system, including its scientific and academic communities, has hurt their ability to recruit and retain good people.

Lab staff have reported themselves feeling isolated and neglected. For some time the provincial health lab has lacked the presence of regular, on-site, expert management. One expert from the lab remarked:

In terms of the lab level, we had a corresponding lack of leadership for the lab in that we do not have, and have not had for the past five or six years, a qualified medical doctor or medical, either medical microbiologist or in the past we’ve had a pathologist, who is medical director of the lab and that, to me, has been a serious problem in terms of having strong leadership by an individual, who’s main concern is health care, patient care and serving public health, rather than having a political or personal agenda, and I think the lack of an individual like that has been very detrimental to this organization . . . for over five years, we have not had a lab director who is on site.

The labs at both the British Columbia Centre for Disease Control in Vancouver and the CDC in Atlanta, are physically attached to the buildings where the physicians and scientists work, and they have on-site leaders and managers. This connectivity is vital to the collaboration necessary in such an enterprise. One scientist from British

93. See Chapter 7 of the Naylor Report, wherein he suggests strategies for recruitment.
Columbia described the benefits of having the lab located in the same facility as the rest of the communicable diseases branch:

Housed within the B.C. Centre for Disease Control we have the provincial laboratory and epidemiology services. We’re the only center of its kind in Canada where provincial laboratory and epidemiology are together and I really cannot exaggerate the importance of having epidemiologists and virologists or bacteriologists working side-by-side. Hallway conversations are really critical and a lot of information exchange occurs coincidently and certainly that happened the night that we were first alerted of the first (SARS) case in B.C.

Not only is the provincial laboratory geographically isolated, but many have remarked that it was functionally isolated during SARS, functioning as a separate silo rather than an integrated part of the Public Health Branch. Prior to SARS, neither the provincial lab, nor the national lab in Winnipeg were linked to a larger information system of data collection and analysis. During SARS, since Ontario did not have an information system capable of handling this kind of outbreak, one had to be developed on the fly and it was not linked to either the national lab or the provincial lab. Without a common data base, tracking of patients, specimens and results was problematic.

One expert noted that the Public Health Branch had trouble getting information from the public health laboratory, even though they were part of the same Ministry. This disconnect caused great concern for many of the experts who came forward to help with the Ontario response. As one of them noted:

The lab was a huge issue... What we were really worried about, too, was the number of cases that were positive on the lab test that were negative clinically. Were they missing cases and were these going to be the ones that were transmitting the cases even further, cause they were our real worry, cause that’s how we would lose containment, by the asymptomatic cases... We had trouble getting access to any of the lab information at the Ministry, even though it was the same Ministry.

There is a clear need to link the public health laboratories with the rest of the communicable disease machinery, including epidemiology. These groups should in turn be linked to academic institutions, to provide for a high level of consultation, collaboration and professional development. One expert described the need as follows:
There should be a new unit. It should be based somewhere if not on University Avenue [in downtown Toronto near the major teaching hospitals and the University of Toronto’s medical school] but close to University Ave such that [it] has top lab people and epi disease infection control people linked in with [Public Health] units [and it] has to be linked to teaching hospitals. It has to have labs, public health and universities linked together.

The need for adequate infectious disease information systems, discussed above, includes the need for automated and rapid transmission of data to and from public health laboratories.

An investment in technology is required, to attract and retain good people and to enable high-level research and development and to ensure the rapid testing of a high volume of specimens. One former scientist with the Ministry of Health reported doing their research on borrowed equipment:

I begged and borrowed from, from anybody in the lab, from other organizations, from other public health labs. Wherever I could, from companies. Get a demo in, do your test and, and return it.

The capacity of a laboratory system to respond to an outbreak of infectious disease must pre-exist any future outbreak because it is impossible to create it during an outbreak. The functions performed by public health laboratories require the work of highly skilled professionals. This work cannot be done by recruiting inexperienced volunteers during an emergency. Nor is it adequate to rely on the hope that private and hospital laboratories will have the extra capacity when needed. Laboratory capacity is much like the rest of public health; its importance is not appreciated, nor the impact of its inadequacies felt, until there is an outbreak and then it is too late.

Despite earlier warnings, the Ontario public health laboratory system proved inadequate during SARS, as demonstrated above and in the Naylor Report. It is essential that Ontario’s public health laboratory system be revitalized with the necessary physical and human resources.
Problem 13: No Provincial Epidemiological Unit

When SARS hit Ontario, the Ministry of Health’s Public Health Branch was totally unprepared to deal with an outbreak of this nature. To start with, it had no functioning Epi Unit. Epidemiology is the study of the distribution and determinants of health-related states or events in specified populations, and the application of this study to the control of health problems.\(^94\) An Epi Unit was required to gather, track, confirm, investigate, analyze and report the information about cases and contacts, collected by the local health units. It had a crucial function to perform.

Without epidemiological data, the Science Committee, charged with establishing protocols for managing the outbreak, could not base its decisions on science. The Science Committee needed epidemiological data about the transmission of the disease and whether control measures were effective. It needed answers to a number of vital questions: How was the outbreak progressing? What was the incubation period? How long were people infectious? What were the risks in hospital?

As one observer noted:

The biggest need they [the Science Committee] had was epidemiology and good information that was current . . . we needed a proper epi centre.

It was also the crucial function of the Epi Unit to provide necessary data about the cases in Ontario to the Chief Medical Officer of Health and other Ministry of Health officials who were to then report to Health Canada, who in turn advised to the WHO. This data also formed the basis for information given to the public and media about the status of the outbreak in Ontario.

Because the Public Health Branch had no functioning epidemiology unit, it was necessary to cobble one together as the outbreak unfolded. This fact, in and of itself, is stunning. As one witness told the Commission:

I would argue that you could not do effective public health at least from a communicable disease perspective if you do not have a strong epidemiology. You need it to track what is going on and to describe what is happening and to analyze it and use it for policy or intervention and ultimately make a provincial plan; otherwise, you are doing things without . . . making decisions without data which in this day in age is nonsensical.

Not only was there no functioning epidemiology unit equipped to handle an outbreak, there seemed to be no one at the Public Health Branch with the expertise or willingness to undertake the enormous task of establishing and running the epidemiology unit. In addition, there were not enough qualified staff at the Branch available to assume the epidemiological work that needed to be done.

Consequently, staff were recruited from local public health units and beyond to create the Epi Unit. Once a few experts were brought into the Epi Unit, they were then expected to assume the responsibility for recruiting more. This was not easy. There was no surplus of unemployed epidemiologists waiting in the wings to be hired. That meant that the new Epi Unit staff had to recruit help from the field. But local public health units were also grappling with SARS and, given the uncertainty about how far it would spread, they were understandably reluctant to reduce their staff levels. Despite this, the call for help was answered and field staff did come to work at the Epi Unit. Epidemiologists from Health Canada also went to work in the unit. Finally, in the middle part of April, over a month into the outbreak, the Epi Unit was beginning to be properly staffed, largely by volunteers from the field and staff from Health Canada.

One of the first questions that arose when establishing the Epi Unit was where to locate it. Those recruited to the unit felt that it should be located at the offices of the Public Health Branch, rather than at Toronto Public Health’s offices located in the downtown core, as the outbreak had spread beyond the borders of Toronto at this point and was no longer a local outbreak. Thus the Epi Unit began working out of the second floor of the Ministry of Health building at 5700 Yonge Street in what had formerly been suburban North York. The Public Health Branch was on the eighth floor.

Basic things such as an office, pens, paper, computers, secure faxes, access cards and support staff had to be put in place before the Epi Unit could begin its important work. As of mid April those working in the unit still weren’t being paid and other administrative necessities, such as confidentiality agreements and employment contracts, had not been put in place.
Staffing problems were never permanently resolved. The Epi Unit seemed to be a revolving door with people moving in and out on short-term basis. There was no permanent core of epidemiologists to generate the data needed every day to track the outbreak. When volunteers came, no one seemed to know how long they would stay and the constant changing of staff necessitated ongoing training and raised concerns about inconsistency in work product.

There seemed to be constant confusion over who was in charge, to whom they reported, and what was to be done with the data they were collecting. As one witness described it:

Right off the bat two items came up that were sort of very confusing: one was the overall organizational structure of the unit, trying to determine exactly where we fit in the organizational structure, to whom did we report, how was this basically going to be facilitated, like who, basically who was in charge, where did the reports go.

The Epi Unit was created in the midst of the outbreak and was clearly the result of the hard work and tireless efforts of those seconded to work in the unit. They worked long hours under terrible conditions and incredible stress. Those working in the unit knew the importance of their work and understood the importance of putting aside their frustrations to get the job done.

Many witnesses expressed the concern that the Public Health Branch did not share the same understanding and did not properly support the work of the Epi Unit. When requests were made for staff at the Public Health Branch to assist the Epi Unit, they were told that they were “too busy.” Many questioned what could be more important than SARS and did not perceive the Public Health Branch staff on the eighth floor as being “too busy.” As one witness noted when describing the attitude of the eighth floor Public Health Branch:

There was never a sense of urgency. It was very depressing to work around a few people going crazy while others are acting normal. It amazed everyone.

Epidemiology was a crucial part of the outbreak response and in March 2003, there was simply nothing in place to do the work that needed to be done. As noted by the Interim Walker Report:
Analyzing the surveillance data requires contributions from trained professionals such as epidemiologists, statisticians, and biostatisticians.

These professionals and the systems they needed to do the surveillance and protocols necessary to enable them to do their work could not be put in place overnight. As one observer observed:

... it amazes me to this day that the government put so much credence on these numbers each day and if they knew or had any idea of how this system was put together ... it was like all this high level stuff and people with meetings and we are spending money and we had nothing at the bottom.

None of the problems noted in this report reflect adversely on those who were brought in to work at the Epi Unit. On the contrary the efforts of these remarkable individuals were crucial to the fight against SARS. Those who spoke to the Commission, while candid about the problems faced by the Epi Unit, were equally candid about the strengths of those who worked there. In particular, Dr. Ian Johnson, a professor at the University of Toronto, and Mr. Bill Mindell, of the York Region Public Health Branch, have been cited for their dedication and perseverance in the face of overwhelmingly difficult working conditions.

Unfortunately, despite the tremendous efforts of many who worked in the Epi Unit, its ability to fulfill its function was hampered by a lack of infrastructure, the absence of an information system and a disorganized and constant demand for information from the public health branch. As one outside observer noted:

I mean it’s impossible to implement. You know you cannot, in the event of an outbreak suddenly hire your whole workforce, implement your computer system and then implement the processes and the legislative frameworks in which to produce a coherent surveillance system.

Despite their valiant contribution to the fight against SARS, those who volunteered at the Epi Unit reported leaving it feeling demoralized and despondent. A disturbing outcome is that some question whether they would ever be willing to go back and volunteer again given the systemic problems that impeded their work.

SARS demonstrated the crucial role of an epidemiological unit in the battle against an outbreak of infectious disease. It was a major failure of Ontario’s public health system that no such unit was in place when SARS struck. The development of fully
resourced epidemiological capacity is vital to protect Ontario against outbreaks of infectious disease. In the absence of major reform Ontario may not be able in a future outbreak to draw on the extraordinary volunteer resources that helped so much in the spring of 2003.
Problem 14: Inadequate Infectious Disease Information Systems

The fight against SARS was hampered by the lack of an effective reportable disease information system. Neither the provincial Public Health Branch nor the local public health units had any information system capable of handling a disease like SARS. The existing system, known as Reportable Disease Information System, or RDIS, was disease-specific and not flexible enough to handle new diseases. One observer described the progression of the information systems over the past decade and the limitations of RDIS:

The system prior to 1990 was essentially paper and pen for reportable diseases. So if someone had measles or if someone had tuberculosis, basically they used to keep big books and just keep tabs on it as to how many people were there. Moved over to a new electronic system which is called the Reportable Disease Information System and the abbreviation is RDIS. It’s a DOS-based system built around the late-1980’s . . . it’s programmed for very specific diseases. So for example, salmonella is probably the simplest that you just want to know the bug, the symptoms, the dates and those things. Something like tuberculosis is much more complex cause you need to know the type of tuberculosis, where it’s located, like is it in the lungs, is it in their kidneys, like where is it, you’ve got the sites, you’ve got syphilis, you’ve got various stages so they designed it for every single one of the diseases. And the system creates individual databases in each of the health units, so if each health unit was issued this RDIS software, they then entered all the data locally, and then what happens is that the Ministry of Health’s computer centrally calls up all of the 37 health units, initiates a program, but then the computer goes through and basically downloads a report to the Ministry, giving all the information on the cases that have been confirmed over the last week. No names ever come across, it’s simply an identification number and a confirmation of the diseases, but that system is very specific to each one of the diseases and cannot be easily modified . . . it meant that it was inflexible to take on new diseases so that things like West Nile virus and
SARS . . . And there was a recognition that it has to be updated but presently the system being used by health units is still this one that was designed in the late 1980’s and still uses exactly the same software and approaches. And that’s why, basically the RDIS system could not be used for SARS.

Dr. Sheela Basrur, Medical Officer of Health for Toronto at the time, explained the problem facing her department when SARS hit:

The volume of information generated in the SARS outbreak far exceeded previous experience. Since people have not been put into quarantine for the last 50 years in the City of Toronto, there were no information systems in place at the start of the first SARS outbreak to support the management of people in quarantine and contact follow-up of these individuals. The 14-year-old provincially mandated information system used to support the surveillance of reportable diseases [RDIS] was not equipped to handle quarantine management and, more importantly, could not be modified by the province to support SARS case management.\(^{95}\)

When SARS hit, the RDIS system could provide no assistance in tracking and monitoring cases. Moreover no one at the Public Health Branch stepped up to take charge of coordinating and organizing data collection. As SARS unfolded, local health units and the Public Health Branch were left to their own individual devices to establish information systems that could handle the case and contact information. Although the Public Health Branch and the local health units faced the same problem, there seemed to be little collaboration and cooperation between them.

One observer described the situation as follows:

The [surveillance] system was not well designed, it’s something that had been thrown together for the sake of expediency and efficiency . . . they did not have a good handle on the outbreak, they did not have a good handle on the information system and it was not a good feeling because they were complaining tremendously about other health units, you didn’t get a feeling of collegiality, of people working together.

The local health units were responsible for gathering data about cases and contacts and reporting this information to the Public Health Branch so it could track and analyze the outbreak at a provincial level. Given the inadequacies of the existing information system, one might expect that the local units could turn to the Branch for help in establishing a system that could help them keep track cases and changes in their status. However, there appeared to be no one at the Branch with the expertise and the ability to address the data collection problems and to offer viable solutions to the local units.

Because, as noted above, the Ministry of Health had no established epidemiological capacity at the time of SARS and no one in the Branch took charge of this problem, it was necessary to recruit experts from the public health field to cobble together an Epi Unit. Until the Epi Unit was up and running, there was no way to coordinate the work of local public health units into a common reporting structure. This delay turned out to be a critical problem. By the time the Epi Unit was established, individual health units were married to their own individual methods of collecting and reporting data. As a result, they were unable and disinclined to change their systems mid-stream, despite problems created by the diverse manner in which the data was being collected and reported.

The Toronto Public Health unit, which had the majority of the SARS cases, relied on a paper-based system of case tracking. This nightmarish system generated cardboard boxes spilling over with paper, all of which had to be collated and analyzed by hand. Early into the outbreak, the Toronto Public Health unit began putting its local case information on Excel, a popular software that electronically organizes and analyzes data in the form of tabular spreadsheets. Other public health units did the same. A number of problems arose with this ad hoc approach. Firstly, as the outbreak grew in size, the Excel spreadsheets were simply unable to reflect all the cases and the changes in case status. One participant described it as:

\[\ldots\text{ a small scale system that someone had developed for a small outbreak like when it was at the Scarborough Grace Hospital, and it had now suddenly become the provincial standard that was being used.}\]

One participant described the limitations of the Excel spreadsheet system:

\[\ldots\text{the Excel spreadsheets were used initially during the outbreak because there was a small set of cases, it was trying to create a simple line listing. What you do in an outbreak is you normally create a simple line listing and they used the Excel spreadsheets to create that line listing and it was}\]
okay when you're dealing with a small number of cases that you can visually look at and keep tabs on basically by simply just looking at the spreadsheet and examining it.

The Excel spreadsheet was not, however, capable of doing what was required in an outbreak of this magnitude. One expert described the problem:

You want to be able to look at this as something you could basically visually look on the screen, like I don't think you could have more than 20 or 30 cases . . . You couldn't have more than 20 or 30 cases cause otherwise you're relying on counting. People would sit there and count these . . .

For a small outbreak you can do that . . . the excel spreadsheets would have worked, if you'd had about 20 cases maximum. Once you got over 20, it lost its efficiency, it lost its ability because then what you need to do is start running statistical analyses, you need to run tabular analysis of data, you need to run statistics on it, you can no longer just try to keep track of what do the numbers look like and graphing things by hand and updating things by hand, you need to have an automated system to keep track of things, both from a point of accuracy and to monitor trends and to actually reflect what’s occurring.

The variables in the Excel spreadsheet were not well defined, making it impossible to run the line lists manually – information crucial to the Science Committee. For example, it would have been preferable if the data inputted into the Excel spreadsheets indicated whether a patient had died with a simple “yes” or “no.” Instead, the date of death was often mixed into an area of the spreadsheet where a “yes” or “no” answer would have allowed easy aggregation. This, in turn, prevented the simple tabulation of different types of data. Instead, each day, trained epidemiologists who should have been analyzing data had to manually count lists of such crucial numbers as the total of probable SARS cases. One expert described the problem:

Say you wanted to know case fatality rate you had to manually pull out the data, to manually do this and subtract that. You should just be able to say date 1 minus date 2, give me the distribution of them . . . that should be automatically done, not by hand. All the staff got lost on that. They were spending hours and hours, it'd take two epidemiologists full time just to generate these spreadsheets, it was silly.
The need for staff to count the lists manually created further stress, in an already impossible situation. Staff faced the difficult task of counting hundreds of numbers, at times more than once a day, trying to remember the meaning of the various codes used to classify different types of data, all the time fearful of making a mistake. As one observer described it:

Trying to run a system based on these Excel spreadsheets with people who were there for a week, they would get burned out and then would change and somebody else would come in and of course they’d like to modify the system slightly to suit their tastes. It was trying to build in consistency within that system, there were tremendous time pressures, like Dr. D’Cunha wanted everything by 11 o’clock and would sort of holler and yell if he didn’t get it, and the staff were under tremendous pressure. Imagine just being parachuted into the system like this, and it’s all manual. You’re sitting there manually counting cause you couldn’t run the tables [electronically].

Because the information was being sent from each local health unit separately and there was no system for the province to upload the relevant information electronically from the local units, members of the Epi Unit had to go manually through the spreadsheets daily to generate a larger spreadsheet that reflected case activity across all reporting health units. This was a resource-intensive exercise, made difficult by the lack of co-ordination and consistency in the classification and reporting of cases. For example, the Excel spreadsheets sent to the provincial Epi Unit did not clearly show the changes that had occurred in the cases. It would not be apparent if someone had moved from suspect status to probable, without locating the case on the previous day’s list and the current day’s list and manually comparing the information reported. Similarly, if a person was removed from the case list because another cause for their illness had been discovered, this was not always apparent by simply looking at the spreadsheet. At times, Epi Unit staff would simply notice a case missing and would have to call the local unit to find out what had happened to that person.

Another problem was that the Excel spreadsheet did not contain enough detail to answer all the questions being asked by the various agencies who needed to use the data. One participant described the problem as follows:

What the federal government was asking for and what the Science Committee was asking for was far more detailed than what was available on this particular form or the Excel spreadsheets. Neither the form nor the spreadsheets went into nearly enough detail. For example they would
have . . . fever ‘yes/no,’ cough ‘yes/no’ but they wanted to know when was the onset of fever, when was the onset of exposure, what was the incubation period, which fevers came on first. They were looking for the clinical spectrum, they wanted to know incubation periods, they wanted to know all these details, which are very meaningful, but you couldn’t pull them out of this data, couldn’t really assess it because the data wasn’t there in sufficient detail.

The ad hoc approach to data collection also led to concerns about inconsistency in classification of cases. For example, there was no standard reporting form for all local health units. There was also no data dictionary – the crucial guide to how a database sorts, groups and catalogues information – to help staff collecting data define and classify cases uniformly. It was never clearly defined who fell into each category. This resulted in inconsistency in classification and measurement:

The classic was the exposure variable. The exposure variable would show for example there was a health care worker, and there was another health care worker, a health care worker at Scarborough Grace, a health care worker at York Central Hospital, a patient visitor at York Central, a patient visitor Scarborough Grace. These should have shown where was the location, is it Scarborough Grace, is it North York General, or is it Scarborough Grace or was it York Central, and was it a health care worker, or was it not, was it a visitor, we could have broken those out. And they were all jumbled in together . . . you wound up with these huge long lists of the frequency counts.

It became quickly apparent to those parachuted in to work on the Epi Unit that the information collection system was in dire straits. The Excel spreadsheets simply did not allow for sufficiently rigorous analysis of data related to the outbreak:

We just couldn’t do detailed analysis. That was really the biggest issue, was that you couldn’t do detailed analysis of the Excel spreadsheets. You couldn’t generate graphs of incubation periods, distribution of symptomology, symptoms and profiles, characterizing the disease. You wanted to look at the time between the incubation time to when people were hospitalized, look at all these comparisons of dates to show how efficiently we were doing. They weren’t there. We tried our best to grab it out of the spreadsheets but it was just not efficient . . . one couldn’t do it with any precision.
Other computer systems were available at this time and significant efforts were made to implement a better system. The Federal Government sent two information techni-
cians who were prepared to install a more sophisticated, federally funded outbreak management system called the Integrated Public Health Information System or iPHIS. Extensive efforts went into to developing a standard reporting form, with a data dictionary. The form was developed in cooperation with Health Canada officials, and included important information such whether a patient had given blood – acknowledging that there were other aspects of health, such as the blood supply, at risk. The intention was that these forms would be completed by the local public health units and sent to the Epi Unit at the provincial level for analysis. The goal was that the information be standardized so everyone was measuring the same thing in the same way.

But by this time, over a month into the outbreak and faced with their own huge workload, local public health units were unwilling or unable to change systems. Moreover, iPHIS was not capable of managing the contact information and this caused local units to question its value. On the other hand, while iPHIS was not capable of handling the contacts, those at the Epi Unit felt that it was better than the current system, which in their view could not handle the data adequately. Moreover, the contact information was not, in any event being regularly reported to the province. Toronto had initially attempted to gather and track the contact information electronically but as the numbers swelled this quickly became impossible to do with the Excel system. Toronto Public Health,96 despite its best efforts, was forced to resort to a paper based system, which remained in place throughout the outbreak.

Despite all the efforts of the Epi Unit, the iPHIS system was never implemented at the local health unit level and the standard reporting form did not replace the previous reporting forms that each individual local health unit had developed. No system capable of managing the contacts was ever implemented at any level. The information reporting and information systems problems remained a problem throughout the outbreak. One participant described the frustration within the Epi Unit and the difficulties in motivating the staff, who were burned out and upset with the whole system, to keep going:

You come away feeling absolutely useless that there was a system being used, you couldn't change it, you knew what had to be done, wanted to do it and it

96. Toronto Public Health even had the Ontario Provincial Police come in and try to set up their Powercase System, a computer system used by Ontario police services in the management of major investigations.
just wouldn't go and that people were asking you for reasonable information 
and it was frustrating because there was, again, a lack of organization.

This outline of the problems with data collection and analysis attributes no fault or 
blame to anyone who had to work with inadequate information systems. But it does 
highlight the difficulties that arose by having to use ad hoc systems for information 
collection and analysis. Both the local units and the provincial Epi Unit were faced 
with enormous obstacles and each responded in the best way they could, given the 
tools at their disposal. Many talented and dedicated professionals, both at the local 
units and at the provincial Epi Unit, did their best to deal with these myriad problems 
which were not of their doing. What is remarkable is that they persevered in the face of 
these obstacles. It was a disservice to them and to the public interest in protection 
against infectious disease that such a mess was allowed to develop in the first place 
through lack of planning and preparedness and a failure of the Public Health Branch 
to provide the capacity to collect data and track information on new infectious diseases.

The most disappointing aspect of this problem is that the province had known for 
many years that its current information systems were inadequate and incapable of 
handling an outbreak of a new infectious disease. The 2003 report of the Provincial 
Auditor noted that the need for a new information system to track reportable diseases 
was clearly apparent as early as 1997:

In our 1997 audit, we recommended that the Public Health Branch 
obtain additional information on the results of TB contact tracing by 
boards of health. The Ministry responded that a new information system 
for tracking reportable diseases was in early development and that addi-
tional information on individuals who have come in contact with a person 
with active TB would be included in the system. At the time of our 
current audit, such a system had not been put in place, and the Ministry’s 
information on the extent and results of contact tracing was still limited. 
In addition, ministry and local health unit staff informed us that, except 
under rare circumstances, they generally cannot force individuals who 
have come in contact with a person with active TB to be screened. We 
were informed that the Ministry is considering a federal/provincial/terri-
torial initiative to implement an automated public health information 
system that would support public health case management. Such a system 
would also prove useful in cases of other communicable diseases.97

---

This deficiency was again revealed in public health efforts to combat and track the West Nile virus. Despite these early warnings, when SARS hit, Ontario did not have an information system capable of tracking the outbreak.

The lack of adequate information systems was particularly distressing to those who worked on SARS and had been encountered similar problems in West Nile fever surveillance. One scientist experienced the shock of recognition on learning that the effort to contain SARS faced problems that had plagued the response to West Nile:

... it was fascinating to me how so many of these issues were actually identified back in West Nile virus. They were using Excel spreadsheets for transferring the data back and forth in West Nile virus. The fact that West Nile could not be fit into the standard reportable disease information system was not addressed. Now in SARS, we ran into the problem of not having a proper system. So you had to develop one on the fly; I find it a bit surprising.

This problem was underlined in the 2003 Provincial Auditor’s Report:

... as of May 2003, there was still no electronic system in place to enable more timely reporting of all cases of WNv to the Public Health Branch, though as an interim step, the Ministry has requested local health units to manually report information on all probable and confirmed human cases of WNv.

The 2003 Provincial Auditor’s Report not only noted the lack of preparedness exemplified by West Nile but went further to point out its relevance to diseases like SARS:

The Ministry did not have adequate procedures to ensure that its expectations for public health were being met in a cost-effective manner. The importance of knowing that local health units are meeting the Ministry’s expectations for public health is significantly heightened in light of the

98. The West Nile Fever issues was described on pages 240-1 of the 2003 report of the Provincial Auditor: “West Nile virus (WNv) was first confirmed in North America in 1999 and in Ontario in 2001. The first human cases in Ontario occurred in the summer of 2002. WNv is carried by mosquitoes and affects birds and mammals, including people. Studies indicate that most persons bitten by an infected mosquito will have no symptoms; however, approximately 20 per cent of those infected will develop a mild illness (for example, West Nile fever), and 1 per cent develop a serious illness.”

emergence of new diseases such as West Nile virus and Severe Acute Respiratory Syndrome (SARS). The Ministry must be able to ensure that local health units respond quickly and properly to such diseases while continuing to minimize the health impact of existing diseases and continuing to provide other mandatory public health programs and services.

Many of the issues and concerns raised in this audit were also identified in our 1997 audit of public health. A failure to learn from West Nile was not only surprising, it was also symptomatic of a system that seemed at times paralyzed and incapable of taking appropriate measures to protect Ontarians from communicable disease. A system that does not learn from its earlier failings and correct them is a dysfunctional system.

The 2003 Provincial Auditor’s report gives a good run-down on history of lack of action on information technology:

In October 2000, the Ministry, in conjunction with a consulting firm, prepared a Public Health Information and Information Technology Strategic Plan. The Plan presented an overall information technology strategy for public health. However, at the time of our audit it had generally not been implemented. The Plan also identified a large number of systems that have been developed independently among the 37 local health units, primarily in areas where ministry-supported systems were inadequate or non-existent. The Plan noted that the sharing of information between the local health units and the Ministry was limited and that “current legislation and technology infrastructure limits sharing between the health units themselves.” The development of independent systems is a concern, as it could hinder the integration of public health information across the province, possibly resulting in the loss of timely, important information needed for public health interventions and for prevention activities. It is also a concern because of the duplication of effort, costs, and time associated with independently developed information systems.

Health surveillance is the ongoing collection, analysis, and interpretation of information that can be used to plan and manage efforts to control

---

diseases. This includes information that assists in controlling outbreaks, making informed resource allocation decisions, and developing or changing public health policies and programs to make them more effective.

Currently, the Public Health Branch supports two surveillance systems: the Reportable Diseases Information System (RDIS)—for communicable diseases and vaccine-associated adverse events (such as illnesses occurring as a result of vaccination)—and the Immunization Records Information System (IRIS) for immunization.

In our 1997 Annual Report we noted that the Ministry indicated that it planned to replace RDIS with an improved system. However, this has not happened, even though the Ministry’s October 2000 Strategic Plan noted that RDIS “was developed in the late 1980s with technology that today is extremely outdated, proprietary, and very costly to maintain and support.” It further stated that, “one public health role is to analyze health surveillance data to create public health policy and to prioritize and amend public health programs. Much of the information required to provide this analysis is either unavailable or of questionable quality.”

In this regard, it is worth noting that the 2003 audit was substantially completed by March 2003 before the SARS outbreak and this audit “did not include work in this area.”

Although iPHIS was available prior to SARS, it had not been implemented in Ontario. One federal official explained the delay:

Over as far back as two years now and after some initial legitimate questioning of iPHIS and looking at it against their requirements, I think that Ontario decided that they would go ahead with the pilot and there was a lot of discontent among the local health units and they had set up a pilot with three local health units all of whom dropped out because they could not cope with the delays and the fact that they felt that they were not receiving the financial assistance that they needed to undertake the pilot and this I am very clear it is because Dr. D’Cunha was not able to get the funding; so he wanted to go ahead with this during at least two

fiscal years and the funding was not forthcoming from the province to start the process of putting iPHIS in place.

As noted above, although iPHIS was not equipped to handle the large volume of contact information and tracing that occurred during SARS, experts at the provincial Epi Unit argue had it been implemented across the province it not only would have been better than what they had during SARS but it would have provided uniformity in data collection and allowed for better analysis of the data.

Despite the widespread knowledge that Ontario’s information systems were incapable of handling new diseases or outbreaks, and despite some desultory efforts to consider a new system, nothing had been done before SARS hit.

To be fair, Ontario was not alone in its inability to move forward towards a better information system for infectious diseases. As the Naylor Report noted:

> . . . the Auditor General’s reports in September 1999 and September 2002 were highly critical of the failure of the F/P/T process to establish the needed infrastructure and concluded that these failings were impairing Canada’s ability to detect and respond to such outbreaks.103

Although work had been underway for a number of years, progress has been slow. While iPHIS was available, as noted above, it was limited by the lack of an outbreak management module, which would have given health units and the public health branch the ability to manage information around the quarantine process. As one federal expert described the existing system and the work that has been done to enhance iPHIS post-SARS:

> It had a rudimentary outbreak module but you have to understand that there are different requirements and we simply, at the time of the development the original outbreak module had no concept of this kind of health issue, so we have redone it and we are very confident that the new outbreak module would have been very very affective during the SARS outbreak. The one that was there would have been different. We would have captured the case information and there would have been some ability to use the contact information. What was clearly not there was an ability to manage the information around quarantine persons.

Another gap in public health information technology both provincially and federally, noted above, was the lack of links to public health labs to enable rapid sharing of information and analysis of data. The implementation of iPHIS in the midst of SARS would not have addressed this problem. This gap remains today.

The Standing Senate Committee on Social Affairs, Science and Technology, in November, 2003 made the following observations:

There is clearly a pressing need to seriously upgrade information technology at all levels of the health protection and promotion infrastructure. The lack of a modern database accessible to local, provincial and federal health authorities had adverse impacts on the flow of information to the public and to international agencies. The absence of appropriate and shared databases and capacity for interim analyses of data, also interfered with outbreak investigation and management, and constrained epidemiological and clinical research into SARS. Agreements for data sharing between different levels of government, and the necessary information technology, were apparently not in place before the outbreak.104

Although the implementation of iPHIS is now being funded in Toronto and York Region the system is just at the pilot stage and has not been rolled-out across the province. The federal efforts to improve information systems, as noted in the Naylor Report, progresses slowly and with some difficulty.105 The Commission endorses the specific recommendations in the Naylor Report and the interim Walker report to address the deficiencies in the federal and Ontario infectious disease information systems.

Should SARS or some other infectious disease hit Ontario tomorrow, the province still has no information system, accessible by all health units, capable of handling an outbreak. The first unheeded wake-up call was the Provincial Auditor’s report in 1997. The second unheeded wake-up call was West Nile. If it takes Ontario as long to respond to SARS as it did to those earlier wake-up calls, the province will be in serious trouble when the next disease strikes.

The problem of information flow was not restricted to the lack of the necessary information technology systems. Confusion, duplication, and apparent competition prevailed in the work of those in the central apparatus who sought information from local public health units and hospitals. These unfocused demands consumed valuable time of public health and hospital staff, distracted them from urgent tasks at hand, and impaired their ability to get on with the work of fighting the disease.

During the SARS outbreak, information was urgently required by all those fighting the outbreak: the provincial and federal governments, the Provincial Operations Centre, the Public Health Branch, the expert panel known as the Science Committee, health care professional organizations and the media. All clearly needed to be as fully informed as possible to perform their vital role in the outbreak response. Unfortunately, there was no system in place to ensure that their disparate needs could be met without disrupting the efforts to combat SARS.

Local public health units often questioned the need for the degree of detail demanded of them. They resented spending what precious resources they had to track down detailed information intended, in their view, not to combat the outbreak but for political or media briefings. In reality, this information might well have made a difference in the Science Committee’s work, and everyone recognizes that informing the public is vital in any public health crisis. But the manner in which information was requested, together with the seemingly endless and unfocused volume of requests, discouraged co-operation. One local health unit described their frustration:

The Ministry of Health through the Public Health Division or some group put together a SARS epi-centre and started to ask us for line listings of patients. It started out reasonably narrow in terms of cases and then started to get more and more expansive in terms of what they want from it. During this time, their information requests to us became exponential. It started with trying to get information to them for the daily updates. But I think in the competition for real time information and
trying to bring together hospital reports, our reports and whoever else’s reports, they wanted to find out the definitive. So, unknown to us, they apparently hired nine case managers to track all of our cases and get more detailed information than we needed at a health unit level. They would phone us and the problem is that they would not just phone us once. We started to get harassed with calls, and I mean harassed in the full depth of that word, we would be called after hours, we would be called by not just one person but five people to gather this information. And it would always be marked urgent. If we did not get back to them within five minutes, they would call again. And we didn’t know these people because they’d just been hired. So we want to confirm that they actually are not the media, that they are actually the Ministry of Health and why do you need all this information? And eventually, we learned that they were called case managers and that they were supposed to collect all the information on each of the individual cases, all the information that we had locally and it just made absolutely no sense. It was not modelled after any other report of the disease. There were concerns that the information that we were providing was getting to the media. When the urgent requests would come, it was framed as: Dr. D’Cunha wants this, Dr. D’Cunha needs this and he needs it urgently. Often the information would have already been given . . .

Some of the requirements for information came from the Epi Unit, who needed the information to track the outbreak. Pressure for information came from the Public Health Branch, for reasons that were not always clear to those from whom the information was requested. Staff in the Epi Unit routinely received calls from Dr. D’Cunha or his staff, demanding an immediate response. If these demands for information were not answered quickly enough, tensions rose. Sometimes requests went out from the Public Health Branch to a number of different people simultaneously. One witness described a day when an email was sent to five people asking that they all provide the same information, within 20 minutes, or provide reasons for why it wasn’t being provided. Another witness described a meeting when one pager went off and then as minutes passed each person’s pager around the boardroom sounded. Each person was being paged with the same urgent request for data. These urgent requests filtered out to the local health units and the hospitals, who were also in turn pressured to stop everything they were doing at that moment and provide information immediately.

As one observer noted:
Imagine six people chasing the same people looking for information, calling the same people all the time, it drove the health units nuts. It drove us back and then they would say that we faxed it to you earlier in the day, but we did not know what fax it went to . . . because they are coming in by the thousands. They would say we sent you an email, but [there were so many] we couldn’t open a third of the emails. It was a circus. It was unbelievable.

When people were unable to obtain data fast enough to suit their needs, they resorted to their own means of gathering information. Not only was the Epi Unit gathering information, but at various points during the outbreak, Ministry staff on the eighth floor where the Public Health Branch was located, the Provincial Operations Centre, and the Science Committee were also using different routes to obtain information themselves. This meant that hospitals, local health units and, at times victims, often received multiple calls from different people asking for the same information.

People were stretched to the limit and this constant interference and repetition was frustrating and time-consuming. One public health official tried, to no avail, to negotiate an arrangement whereby the various officials competing for information would not phone more than once every five minutes. Compounding the problem was the fact that the people making the calls were often unknown to the recipient of the request for information. Health officials, health care workers and victims were being asked to provide, over the phone, confidential health information without knowing who they were speaking to or what their authority was to have that information.

Because different groups were seeking information, the lines of reporting became completely confused. The lines of reporting should have gone from hospitals and ambulance, to the local health units, from the local health units to the Ministry and from the Ministry to the Science Committee and Health Canada and other involved parties. This often did not happen, resulting in confusion and frustration.

There was no order in the process and the Public Health Branch would at times call for information directly to hospitals. At other times hospitals would report cases directly to the Public Health Branch in the Ministry of Health, thus bypassing the local health unit’s Medical Officer of Health, to whom they should have reported. The result was that information could be reported to the Ministry of Health but not to the local health unit tasked with fighting the outbreak. The local health unit would then receive a call for details from the Ministry of Health about a case they knew nothing about. Even if the local health unit received the information later, this sometimes resulted in conflicting numbers of probable and suspect patients. Adding to the
confusion was the fact that there was no single person or agency determining how a case was defined.

The constant and overwhelming request for information led to chaos, confusion, frustration and defeat for those who had to respond to these requests. Local health units report dreading having to contact the Branch for fear it would turn into an inquisition for details about cases and become confrontational. One local Medical Officer of Health said for these reasons, they regretted calling the public health branch and avoided it as much as possible.

There is no doubt that those in charge of the SARS response, particularly Dr. D’Cunha, were under their own terrible pressures for timely information in an environment where there were little certainties and a rapidly shifting landscape. As one witness stated:

I believe the demands were overwhelming, I believe that he was under undue pressure. Then that put other people under pressure . . . I think it’s really easy to judge, but if I knew I was going to that table and that I would be expected to have that information, maybe I would have been calling 20 people at once, too. I just think it’s really hard to judge when there were such pressures.

SARS caught Ontario with no organized system for the transmission of case information to those who needed it to fight the outbreak. There was no order or logic in the frenzied, disorganized, overlapping, repetitious, multiple demands for information from hospitals and local public health units. Requests would go out simultaneously to many people for the same piece of information. The work of front line responders in hospitals and health units was seriously impaired by this constant and unnecessary harassment.
Problem 16: Inadequate Data

The data produced by the jerry-built system through the frenzy of information demands, described above, often proved inadequate. Accurate data of high quality was vital to the experts on the Science Committee who had to provide evidence- and science-based direction for the management of SARS. Because so much about the disease was unknown, case-specific information was vital and sound decisions could not be made without adequate data of the necessary quality. The minutes of the April 6, 2003, meeting of the Science Committee note:

... difficult to make a prediction because of data quality.

In the early days of SARS, the Science Committee lacked even the most basic data about the outbreak. One member described what they didn’t get in the initial stages:

Very simple things that we take for granted now, numbers of new cases, where they’re occurring, what was happening. We and the media were hearing stories about cases popping up here, there and everywhere.

Another member stated that they were “operating in a complete vacuum.” Others told the Commission that they would get their data each morning by reading the Toronto Star. Another discussed the challenge faced by the Epi Unit:

The Epi Unit itself has no data, everything it worked with, it needed to get from the health units and what the holdups were there I think were just sheer capacity issues and not having a good infrastructure. But again, it shouldn’t have been that insurmountable because they’re only talking about the cases, not all the contacts.

On April 16, 2003, the Science Committee sent a letter to Dr. Young, outlining their frustration over the lack of data. The letter, which will be discussed below in greater detail, begins:

I am writing concerning my grave concerns about the ability of the Science Committee to function and provide much needed advice to your-
self and Dr. D'Cunha as well as the medical community. This is related to the lack of timely information available to us.

Following this letter, the intervention of Dr. Young and the Deputy Minister of Health, Mr. Phil Hassen, resulted in some improvements in the data flow. At this point, additional outside administrative and epidemiological help was brought to the Epi Unit to improve the flow of information to the Science Committee.

Notwithstanding this support, the Science Committee never reached the stage where it received timely data about contacts of those with SARS. Consequently, it was difficult to judge the effectiveness of control measures such as quarantine. One expert suggested that more limited quarantine measures might have been recommended had data been available during the first stage of the outbreak to demonstrate that a number of people had been exposed to SARS without getting sick:

The difficulty is I knew we had some people, but I didn't know whether it was 100 we had or whether it was 1500. If it was 100 I probably would have done the same thing again, given the pressures. If it was 1500 then I would have been willing to stand my ground and say it's okay we don't need to take this hit on service, we don't need to quarantine all these people. But I couldn't do that because we didn't have the data.

Another expert spoke to the Commission about the lack of data on contacts:

That was a major problem because what you're wanting there is to assess how effective was the quarantine and did we really have to quarantine all the number of people we did and were we missing the key cases? You likely had some contacts that were likely to be infected and therefore they could be transmitting that infection and they are the ones you really want to go after, because you want to stop the spread of the outbreak. You're balancing setting your net really fine to catch everybody so you don't let any of those people slip through, versus catching a whole lot of other people that are not infected and you get all your staff distracted in that they are busy following so many people and if say they're following up 100 people and only ten of them are actual true contacts that are infected, they're wasting their effort on 90 per cent. But if you set your net really coarse you might only get nine of those ten people that are actually the true cases and is that one person that gets by you? Is that going to start a whole other cluster? And that was sort of the balancing point that people were trying to work with and the extreme was people were so afraid of
missing one case they kept going more stringent and putting so many
people in quarantine. We didn’t have the evidence because we didn’t have
the studies to show who was getting infected, who was not, and that’s
where the whole database on the contacts fell down . . . We had no data
on this.

The lack of adequate data did not go unnoticed by outside observers. One expert from
another province who was monitoring the Ontario situation said:

Because one of the big problems was not even, you know, there wasn’t
even an epidemic curve available until some time in, around Easter or
after Easter. So, it was difficult to see what was happening with the
outbreak, and everybody, you know, the WHO and every jurisdiction in
the country, was getting their information about Ontario from the media.
There was no other reliable source of that information.

Health Canada was forever asking for better information sets. Federal officials report
that they did not feel that they were getting adequate data out of Ontario. As one
federal official stated:

We had a lot of challenges, getting the information. We disseminated
what we had . . . and it was very, very limited information. And we even
would rely on media, the Ontario media briefings at 3:00, to actually find
out what the current case count was on any given day . . .

I mean we knew that we needed to be able to produce a lot more timely
information to disseminate. And it was a national embarrassment on
teleconferences when we couldn’t share the information. And because the
officials in Ontario were so busy trying to respond to the problem, they
were never, or rarely, on a national teleconference. And when somebody
was on a national teleconference, they were not the people that knew
what was going on, if anybody was.

The inadequate data also affected the federal effort to persuade the international
community that Ontario had the disease under control. One witness involved in the
provincial effort described how the lack of data sharing impeded efforts to convince
the WHO to lift its travel advisory:

If I had to say whether we did bring it on ourselves to a degree I would
say yes in the sense that we were not as clear and as open with our own
information, the lack of information going up to Health Canada. I’ve no idea how [the federal liaison person with WHO] was able to give these reports to the WHO on the progress of what was happening. She’d simply have to basically parrot whatever is being said at the Science Committee or is being said by the province. I’m sure that if they started to question, to ask a whole lot of detailed questions, I’m sure she’d be in a very tough situation because it’s not as if she had her own people analyzing the data or doing anything. And certainly when she came down she was really frustrated with a lot of the aspects of this.

Another member of the Science Committee also described how the impact of Ontario’s inability to provide adequate data on a timely basis to Ottawa affected the ability of federal authorities to communicate with the WHO:

And so that gave the appearance of incompetence on our part but also gave the appearance of maybe hiding data, with the WHO wondering what was really going on. And Health Canada certainly was distressed by not knowing what was coming out of Ontario. We must never be in that position again.

As noted elsewhere in this report, provincial officials maintain that they gave the federal government what they had and that they did everything they could to share information.

The Epi Unit and the local health units were often unable to provide adequate and timely data. While there is disagreement among those involved as to the amount of data being provided, what is clear is that the experts and officials who needed the data did not get what they needed when they needed it. The information systems and support structures were simply not in place. In the absence of this necessary machinery, not even hard work and the great expertise of those came forward to staff the Epi Unit and the Science Committee could overcome these obstacles.
Problem 17: Duplication of Central Data Systems

Because there was no standard information system for the Public Health Branch and all the local public health units, each individual health unit developed their own data collection system during SARS. The lack of a single, effective, accessible information system, combined with a constant, intense demand for information from a number of different people and groups, resulted in chaos. As one witness observed,

... because the [information] needs were not being met, everybody else wanted to jump in and find a system.

The absence of a central database accessible by everyone involved in directing the response to SARS meant that no one really knew who was gathering what information about whom. And there was no simple way for this data to be shared. As one witness described the problem:

Toronto would have no idea what would happen in York Region because York Region is a separate Public Health Unit... there were no connections so that to a witness it was almost like a giant curtain going right along Steeles Avenue: that they [Toronto Public Health] saw everything to Steeles Avenue and then nothing, and the same thing happened in York Region. York Region saw what was going on in York Region, but again there was a big curtain going right along Steeles Avenue, and they didn't know what was happening in the City of Toronto.

When it came to data gathering, there was no clear agreement on who would do what. While it was expected that local health units would collect data on cases in their areas, many cases crossed boundaries because many people lived and worked in different public health jurisdictions. For example, a health care worker who worked at

106. This problem was also identified in the interim report of the Ontario Expert Panel on SARS and Infectious Disease Control: “Without an electronic surveillance and data entry tool, Ontario a province with considerable resources, has to rely on paper-based systems and/or a number of locally crafted ‘systems.’ In certain cases, these systems lacked consistency and made the final compilation of data extremely challenging.” The Walker Interim Report, p. 161.
North York General, within the jurisdiction of Toronto Public Health, might live in Richmond Hill, which fell under the York Region Health Unit. Because many ill health care workers were treated in their own workplace institution, they were hospitalized in a different jurisdiction than from where they lived. When this occurred, the patient’s data was frequently collected by both local public health units and forwarded to the Epi Unit, the province's ad hoc group of epidemiologists. But each unit’s data was not always the same. For example, the Epi Unit staff report on one occasion receiving a report from one public health unit that a particular case was fine, while a neighbouring public health unit said the same person had been intubated.107

It took time and effort to check these discrepancies, investigate the status of the patient and find out which report was correct. This, in turn, increased the burden of information demands on the hospital and created further work for the Epi Unit.

This lack of coordination also added further stress to those dealing with sick family members and with the isolation and fear of quarantine. One family with many members sick with SARS, hospitalized in both Toronto and York Region, reported receiving calls from Toronto Public Health, York Region Public Health and “from various people from Toronto.” The witness described having to repeat the entire family history and contact history each time someone different called.

Prior to SARS, in 2003 the Provincial Auditor’s Report noted the inability of local health units to share information:

The only information a local health unit can access on a timely basis is information pertaining to its own jurisdiction. This may limit a health unit’s ability to manage fast-spread ing outbreaks that may have occurred in other jurisdictions in Ontario. In addition, because local health units generally send communicable diseases data to the Ministry only on a weekly basis, cross-jurisdiction information may not be readily available at the Ministry on a timely basis. Also, if local health units are behind in entering data into the systems, the information at the Ministry may be incomplete or inaccurate.108

Duplicate data systems also sprung up at the Ministry of Health. For example, one group in the Ministry ran a system intended to track the situation in hospitals. This

107. Intubation, a medical procedure sometimes used to assist the breathing of SARS patients, involves the insertion of a tube into the trachea to assist ventilation.
group collected data separate from the Epi Unit, but the numbers reported by this
Ministry group often differed widely from the numbers reported by the Epi Unit.

One observer described the confusion as follows:

There was another system going on . . . that was set up to be a measure on the hospital system so they knew what they had to shut down but the people used it as verification for public health. They would be reporting 60 cases and we would be reporting 30 cases and that was an enormous amount of misunderstanding for people.

Like many problems identified in this report, this one was systemic. It is natural to expect that individual local public health units, who didn’t start out with the option of a single data-gathering system to use, would turn to their own makeshift ones. Similarly it was not surprising that the Ministry of Health, when it could not obtain timely access to urgently needed and accurate data from the Epi Unit, would devise its own data collection system.

This proliferation of data systems, and the confusion and burdens it created, was an inevitable consequence of Ontario’s preparedness for a major outbreak of infectious diseases.

Failure to prioritize public health emergency preparedness, and to devise one central system for the collection and sharing of infectious disease data was a major problem during SARS. Although work has been done since SARS to improve the situation, there is no such system now in place to protect us from a future outbreak. Unless this problem is addressed, duplicate systems will spring up again as people scramble to devise their own information systems in the absence of systems put in place before the next outbreak hits.
Problem 18: Blockages of Vital Information

For the reasons discussed above, the Epi Unit was not able to get the necessary information to the Science Committee. What is striking is that even though the Epi Unit knew they were not able to provide optimal data to the Science Committee, the two groups still had different views of the extent of information actually provided. Members of the Science Committee reported that they did not receive even the most basic data at times. However, an Epi Unit worker said that the numbers were produced every day and given to the Science Committee:

We gave them the epidemiology that they needed. I have seen things in the press that they did not get it and I do not know what they are saying because as much as we had, the Science Committee got. They got everything that we had and I think the reality is that they did not understand that we did not have that much.

What this shows is the lack of necessary communication between two key parts of the outbreak response. Had the lines of communication been open and direct, their respective positions would have been recognized during the outbreak, explained, and resolved. Without any planning for a widespread outbreak of infectious disease, the necessary machinery simply was not there to ensure a timely and direct flow of information and feedback between those who gathered and analyzed the data and those who applied it to fight the outbreak.

From the beginning, the lines of communication and reporting for the Epi Unit were unclear. Those working at the Science Committee felt that the Epi Unit should report directly to them. Yet a direct reporting relationship between the two groups was never established, despite the desire on the part of experts in both groups to work together. Dr. D'Cunha reportedly took the position early on that data from the Epi Unit had to come to him for his review before it went to the Science Committee. In the April 16, 2003 letter to Dr. Young noted above, Dr. Schwartz, co-chair of the Science Committee, identified the problem and emphasized the need for a immediate solution:

Although our face to face meetings (with the Epi Unit) have been seemingly productive, and our relationships with Drs. Mindell and Johnson
have been excellent, there has been little to make the Science Committee confident that we are receiving timely data. Dr. D'Cunha had repeatedly stated that the data may be delayed because he is responsible for it and must clear it, and wants us to understand that the data are rudimentary and not necessarily entirely accurate. The committee accepts this but some data is better than no data. In particular at this critical point, the committee is left with nothing to deliberate and give its advice on SARS Community Spread. This leaves the operational people, including institutions, and public health, frontline physicians and other health care providers in a void. I must stress that Dick and I fully respect Dr. D'Cunha's authority and his wishes to see the data before it goes out. However, the lack of consistent flow of data and, on at least two occasions on the last four days, clear gaps in our communication with the epidemiology group, Dr. Zoutman and I feel that the Science Committee is not in a position to offer sound advice. I do not know at this time how this will affect the Committee’s function, but I do know at the present time there appears to be no rationale for its continued existence.

Dr. D'Cunha in his judgment felt a responsibility to review the Epi Unit data personally before it was released to the Science Committee and, as noted above, he recalled no significant delays in passing the information forward. However, it is difficult in hindsight to find any objective basis for his insistence that the Epi Unit could not communicate directly with the Science Committee and that the communications had to go through Dr. D'Cunha. Had a rational system been planned in advance, these two groups in the outbreak response would have had a direct reporting relationship and direct communication with each other. It is difficult in hindsight to see any added value by insisting that the information be passed through Dr. D'Cunha as a middleman.

Any delay, no matter how short, impacted the work of the Science Committee. As one member of the Science Committee described it:

It's my perception that Colin [Dr. D'Cunha] would probably say, well the data probably wasn't ready and I needed to see it and make sure it was okay. Our concept, our view of it was, and I think you have to put yourself in the place we were in, in April, where every day there were new things coming out that we were concerned about and new cases in different places that we couldn't piece together, is that we needed the best data that we could get and even a four hour delay, let alone a twenty-four hour delay we felt was putting us behind the eight ball. It sounds trite to say it now
because four hours, what’s the big deal? But in the position we were in at the time, we literally felt it was kind of a life and death thing because people, we didn’t know to what extent it was going to get into the community, we, our colleagues were getting sick and we were pretty anxious.

Witnesses report occasions where Dr. D'Cunha refused to permit the Epi Unit to present data to the Science Committee, notwithstanding their view that there had been sufficient time for him to review the data first. This was also documented in the April 16th letter from the Science Committee to Dr. Young:

On Sunday April 13th, in response to a request from the science group, Dr. Mindell arrived for our 10:00 am meeting with preliminary but essential data including epidemiological curves and spread diagrams for Scarborough Grace and York Central Hospitals, as well as figures on the GTA and the province. He, however, informed me that although he had intended to present the data, he had been directed by Dr. D'Cunha not to do so. He said he would straighten that out in a couple of hours. This never occurred.

Indeed since Friday April 11th, to my knowledge, the Science Committee has not received any data directly from the epidemiology group . . .

On Tuesday April 15th, Dr. David Williams attended our 0730 meeting. Dr. Zoutman and I saw this as an improvement and eagerly awaited the epidemiological data. I had finally distributed Saturday’s data given to me on Sunday, on Monday April 14th in the afternoon. The April 15th data was given to Dick and myself by Dr. D'Cunha at the 500 pm meeting, however, this was not officially sent to us by the epidemiology group.

Yesterday evening, I received a call from Dr. Mindell advising me that Dr. Johnson would be attending our 0730 meeting today to present important data with respect to the BLD outbreak. As this is a crucial juncture in our management of the SARS outbreak, I told him I would advise Dr. Zoutman of this. However, at 1130 pm, I received another call from Dr. Mindell, advising me that Dr. Johnson would not be attending the meeting. I asked when we would receive the data and Dr. Mindell stated that he was not certain.

Another impact of this process that required Dr. D'Cunha to see the data before the Science Committee saw it, and at times of refusing to allow direct reporting between
the epidemiologists and the Science Committee, is that it left many with the belief that data was being deliberately kept from them. Some thought that control of the data enhanced Dr. D’Cunha’s ability to demonstrate to those above him that he had the information first and to show those below him that he was in charge. One member of the Science Committee described the situation as follows:

I think it was, in part the data was not always there, but what was there was hidden, at least to the Science Committee, it wasn't forthcoming even though we knew the data was there. And there was this idea that he who holds the data is powerful with the Ministry senior people, and so it was used to, you know, it was presented to them at the last minute but never to the Science Committee to deliberate on and to contemplate. So there was, you know, “I know something you don’t know” kind of mentality.

Again, we are dealing here with impressions and perceptions, not with contemporarily recorded data. Having regard to Dr. D’Cunha’s recollection that he always shared and never withheld data, it is not possible to make a finding as to whether these impressions and perceptions were accurate. But in a time of crisis, perception is as important as fact. The lack of any public health plan for a major infectious outbreak, and the consequent lack of the necessary machinery, created an environment in which information problems and perceptions were inevitable. It is clear that the Epi Unit had good relationships with both the Science Committee and Health Canada and the groups wanted to communicate directly with each other but were prevented from doing so.

This was not the only example in SARS of cases where data seemed to be blocked. At least in the early days of SARS it would appear that there were significant problems with data flow between Toronto Public Health and the province. Dr. D’Cunha reported to the Naylor Committee that the province did not receive data from Toronto Public Health for the first three weeks of the outbreak.109 Those working at Toronto Public Health, however, report that the data was being collected but was not getting through to the province or to the federal government. One expert who worked with the data was asked if they were aware that the data was not getting through to the province and the Science Committee and the federal government:

Yes, I was definitely was aware that it was not there because my colleagues from Health Canada were saying well no one from Ontario

---

was able to come onto the call or the people from Ontario did not have any information to add. I know that you guys are working 18 hours a day, what is going on?

One expert described the problem as follows:

Their [Toronto Public Health] frustration was that they had quite a lot of data; I would say the Ministry had virtually no data; I was quite taken aback when I arrived by the lack of information and the lack of a system at the Ministry. Whereas Toronto Public Health had a lot of information, granted, it was only on the Toronto cases but they had done their epidemiologic curves they had their analysis, they had it mapped out; their problem was that they felt no one on the SARS Science Committee were listening to them and my impression is there was no transfer of information from Toronto Public Health to the SARS Science Committee. Now, we then get into issues of the transfer of information between Toronto Public Health and Dr. D'Cunha and the SARS Science Committee and Dr. D'Cunha, which there should have been from the Science Committee to Dr. D'Cunha cause he was on the committee . . . My impression was you had two silos that weren't talking to each other . . . there was some miscommunication within Toronto in the sense that there was not the information coming from the federal field epis up through the system to get to the SARS Science Committee via Toronto Public Health. But certainly my understanding was all the spreadsheets and stuff that had been developed at Toronto were being sent up to the Ministry . . . I think it's a combination of the Ministry wasn't asking for it and I think they may not have appreciated what Toronto, what the federal field epis had in terms of the information to give them.

As discussed above and below, the province and the federal government have also disagreed over whether there were problems with the flow of information. This disagreement was noted in the Naylor Report:

High-level public health officials in Ontario and Health Canada have since given the Committee sharply divergent views on how well information flowed with respect to both its timeliness and adequacy.

What is striking from all this is that the various groups appear honestly to believe that they communicated the information to each other. Yet clearly there were significant gaps in the transfer of information between Toronto Public Health and the province,
between the provincial Epi Unit and the Science Committee, and between Ontario and the Federal government. It is impossible to determine the precise source of the data blockages.

It does not matter whose perception, in the fog of battle against the disease, was correct. The bottom line is that the lack of clarity around the flow of communication and the reporting structure, the absence of a pre-existing epidemiological unit coordinated with the local health units and the absence of clear public health leadership above the Epi Unit provided an environment in which the crucial elements of the fight against SARS were disconnected from each other. Despite the best efforts of individuals attached to all of the groups involved, they simply could not connect effectively.
Problem 19: Legal Confusion

The Naylor Report reviews federal legislation in detail and outlines the areas of weakness requiring reform. The report also measures public health legislation of British Columbia, Ontario and Quebec against the United States Centre for Disease Control’s *Model State Emergency Health Powers Act*\(^{110}\) and makes recommendations for improvement of provincial legislation, specifically in the area of disease reporting and information sharing. The Commission endorses the recommendations made in the Naylor Report.

Although the Commission cannot at this interim stage make specific recommendations for legislative reform in Ontario, a few things should be said about the general need for work in this area. Areas of concern include the following:

- Who legally was in charge of the outbreak?
- Who had the ultimate responsibility for the classification of a case: the local jurisdiction or the province?
- What was the legal authority for issuing directives to hospitals?
- What were the consequences of not following those directives?
- What specific information had to be transmitted, by whom, when and to whom?
- To what extent could public officials and private experts share data and for what purpose?
- Who was obliged to notify relatives that a family member was classified as a suspect or probable case?

\(^{110}\) Naylor Report, p. 174. Based on a study by Prof. Sujit Choudhry of the University of Toronto Faculty of Law.
• Did privacy rights prevent the sharing of information necessary to fight the outbreak?

The need for legislative reform to ensure clarity of rules of conduct in public health was emphasized in the Naylor Report:

In Chapter 4 we outlined the basic components of the public health infrastructure, indicating that an appropriate legislative and regulatory framework was essential to giving Canada a stronger capacity for coordinating and managing a response to outbreaks such as SARS. What exist now are separate systems within each of the provinces and territories, as well as a federal system that operates primarily at Canada’s international borders. These systems are connected by a limited number of intergovernmental agreements, rather than through a systemic set of intergovernmental agreements oriented around an agreed strategic plan or through formal legal instruments that enable the systems to operate collectively and detect and address common challenges.

In legal terms, we are speaking of the need for rules of conduct (public health rules) that could guide the behaviour of all actors in the public health system – health care providers (e.g. physicians, nurses), health care institutions (e.g. hospitals, laboratories), public health officials from all levels of government (federal, provincial and local), and private individuals potentially subject to quarantine and isolation orders. With respect to surveillance, examples include rules governing the following: case identification (e.g., uniform criteria for diagnosis and laboratory testing), data sharing (e.g., timelines and procedures for reporting new cases and norms governing the protection of privacy), and information dissemination (e.g., responsibility for communicating to national and international audiences and the content of such communication.)

One of the greatest issues in SARS was the obstacle to data sharing, as noted in the Naylor Report:

Several interviewees reported that data handling protocols were variously unclear or non-existent. Developing them during the SARS outbreak

proved to be time-consuming and frustrating. One interviewee described the situation as “a turf war” on multiple levels.\textsuperscript{112}

Some observers have attributed the reluctance to share data to concerns for patient confidentiality. This rationale was similarly noted in the Naylor Report:

Dr. D’Cunha stated that protection of patient confidentiality constrained his ability to release data to Health Canada. Senior public health physicians in the Greater Toronto Area took the same view of their obligations to share data with the Ontario Public Health Branch. Health Canada informants in turn argued that they never wanted personal identifiers, simply more detail to meet WHO reporting requirements.

The problem was not limited to data sharing between government officials. Some local health units reported problems getting information from some hospitals, pointing to the need for clear rules around the reporting duties of health care providers. As one public health official suggested:

The big problem I think we had in SARS and subsequently is having the hospitals sharing information with the [public health unit] with respect to communicable diseases. Either the hospital reacts by saying we will do the investigation and follow-up ourselves and do not need public health or secondly they will advise us of the issue of patient confidentiality and therefore, because they are not required to provide us with the information, they would not be able to do so. So I think that would really help.

While protection of patient confidentiality is a key consideration in any data sharing agreement or legislation, it should not in the future impede the vital communication of data to the extent it did during SARS. Notwithstanding the strong privacy concern demonstrated by many of those who fought the outbreak, a number of families affected by SARS reported that they felt their privacy had nonetheless been violated because personally identifying information somehow made it into the media. It is ironic that although privacy concerns restricted the flow of vital information between agencies fighting the outbreak, they were not always effective to keep personal information from the media.

\textsuperscript{112} Naylor Report, p. 29.
Whatever the precise path of legislative reform, privacy, while vital, should not impede the necessary sharing between agencies and governments of information required to protect the public against an outbreak of infectious disease. The University of Toronto Joint Centre for Bioethics, in a report to the Naylor Committee, noted that at times an individual’s rights must give way to the need to protect the public’s health:

Public Health versus civil liberties: There are times when the interests of protecting public health override some individual rights, such as freedom of movement. In public health, this takes its most extreme form with involuntary commitment to quarantine.

Privacy of information and the public’s need to know: While the individual has a right to privacy, the state may temporarily suspend this privacy right in case of serious public health risks, when revealing private medical information would help protect public health.\(^{113}\)

There should be a clear distinction between the sharing of data between health care professionals (between public health officials and between public health and private health care workers, institutions and organizations and between private health care institutions/organizations), between public health and researchers seeking to engage in scientific studies, and the release of private medical information into the public domain.

To take one example only of the specific issues that must be addressed, one public health official expresses concern that the current proposals for legal reform are not strong enough:

The *New Information Protection Act 2003* allows the health information custodian to disclose, it says “may” and not “shall” about information of an individual to the Chief Medical Officer of Health or Medical Officer of Health and is very broad. It says for the purpose of that Act. I understand that . . . there has been a lot of opposition to that particular section. I think that section is great because it will help public health move

---

quickly and collect information that it needs when faced with a situation such as SARS or another influenza pandemic. I am concerned that section is going to be wiped out in the future reiteration of the Bill.

In addition to the rules for sharing information, clarity is required around the ownership of personal medical data. Those who needed to use the data and to share it in order to find out how the disease was spreading and do research to keep ahead of the outbreak, were hampered by legal questions such as who owned the data: Does the City of Toronto own the data? Does the province own the data? Can they share the data for research?

One of the leaders in the fight against the outbreak described to the Commission a remarkable inability to share information necessary to fight the outbreak:

And then we got into, well, health units owned their data, how much cooperation should be brought to the public health branch and of course bringing it up, bringing it to the federal level brought in a whole new set of barriers. But even branch to public health unit and between public health units there seemed to be this incredible mindset of not able to share, that there was some reason they couldn’t share data and bring data together.

One public health official, looking beyond SARS, put the problem on a more general basis:

Yes, public health needs more power in health emergencies, infectious or not. There is a really strong need to have better protected but greater access to information on the part of the local Medical Officer of Health and the provincial Medical Officer of Health. Take the potential problems with avian flu; say there is a complaint of an occupational health or environmental hazard in relation to avian flu. Under section 11 of the HPPA [Health Protection and Promotion Act] there is a duty on the part of the local Medical Officer of Health to investigate and to get information from the Ministry of Labour and Ministry of the Environment about the local health concern, and to get whatever information is available from the Canadian Food Inspection Agency. It’s a public health responsibility to investigate and get the information that might have a bearing on the health of farm workers, but other agencies may say that they aren’t legally able to give us the information we need . . . And this is just one example of privacy restrictions, what additional powers should be invoked in an
emergency to ensure that information is shared with those who need it? The whole question of privacy restrictions, where the data is stored, and by whom it can be accessed, needs to be dealt with.

It is regrettable that the lack of legal clarity around the sharing of medical information led to the interjection of legal wrangling into what should have been a seamless emergency response. As one public health official warned:

There should be clear legislation about what powers kick in for health emergencies. There needs to be a clear and scaleable set of legal powers available to the province. Now that the outbreak is over everyone sits back in their armchair and says we have to thinking about human rights; we don’t want to give powers to civil servants, we don’t need laws to require the sharing of health information in an outbreak, if an emergency arises we can enact them then. But of course that’s like locking the barn door after the horse has gone.

The Commission during the course of its investigation will continue to address issues around the need for legislative changes identified in the lessons learned from SARS.
Problem 20: Public Health Links with Hospitals

SARS was largely a hospital spread infection. Although there was some spread in households and doctors offices, and a limited element of community spread, most of the transmission took place in hospitals.

Of the 247 probable cases\textsuperscript{114} in Ontario 190, or 77 per cent, were either health care workers, people who sought care at health care facilities or visitors. Health care workers were the predominant group: 108 were probable cases, a full 43 per cent of all probable cases.\textsuperscript{115}

Before the SARS outbreak, in theory at least, public health had an important role to play in preventing hospital infections. Hospital infection control was one of the Mandatory Health Programs and Services Guidelines issued by the Public Health Branch of the Ministry of Health in December 1997. Established under the authority of Section 7 of the \textit{Health Protection and Promotion Act}, the Guidelines oblige local boards of health, and by extension local public health units and Medical Officers of Health, to meet minimum standards for fundamental public health programs, including infection control.

\textsuperscript{114} The 247 probable cases include the 190 listed in the Ontario Epidemiological Link by Contact Type table, as well as 57 others whose transmission was not linked to a health care setting.

\textsuperscript{115} \textit{SARS Commission Public Hearing}, September 29, 2003, pp. 82-87.

\textsuperscript{116} \textit{SARS Commission Public Hearing}, September 29, 2003, pp. 82-87.
As for hospital infection control, the Guidelines state:

The Board of Health shall ensure appropriate input to hospital infection control programs in the health unit. This shall include as a minimum:

a. representation of the Medical Officer of Health or designate on each hospital infection control committee;

b. reporting of designated communicable diseases from hospitals, including emergency rooms and outpatient clinics, to the Medical Officer of Health as required under the provisions of the *Health Protection and Promotion Act*;

c. consultation with the hospital infection control committee on the development and revision of infection control policies and procedures and an outbreak contingency plan;

d. providing advice when requested or when needed for the appropriate management of communicable diseases and infection control;

e. providing epidemiological information as needed regarding communicable diseases existing within the community and other institutions; and

f. collaboration or assistance in annual in-service education for hospital staff about communicable diseases.

In many cases during SARS the relationship between the public health unit and the acute care hospitals was exemplary. This was particularly so when a good relationship predated the SARS emergency. For example, more than one jurisdiction outside of Toronto reported that a member of their staff sat on the infection control committees of the hospitals and long-term care facilities in their jurisdiction and reported that those links were invaluable during SARS. In those jurisdictions the public health physicians and the hospital infection control physician(s) knew each other, knew how to reach each other, and had previously worked together. As one witness described it, at the time of SARS they already had “a lot of connectivity with our agencies, personally and professionally.” They went on to described the benefit of this relationship as providing them with “all the building blocks” for their outbreak response.

In other cases, however, the links were not as strong. For example, before SARS Toronto Public Health did not have a large role in hospital infection control. Instead,
they focused on long-term care facilities, leaving hospital infection control largely to the individual hospitals. They described their focus as follows:

Long-term care facilities and nursing homes are regulated. We do have a role and that is where we concentrated our infection control with the limited expertise that we had . . . we have a fairly good relationship with them. There are 78 long-term care facilities that we look after in the City of Toronto and we have spent a lot of time throughout the facilities developing policy because they do not have infection control support to the same degree as hospitals and when we talk about we were being shaved, they were being shaved as well and we assumed that hospitals were maintaining a certain level of infection control. We put our eggs in the long-term care facilities because we felt that they needed the most support.

Toronto Public Health lacked the necessary resources to ensure a strong public health presence in each hospital in the Greater Toronto Area. According to its 2004 Operating Budget Submission:

Experience from SARS demonstrated the importance of Toronto Public Health having the capacity to establish enhanced disease surveillance and public health response to hospital-based infectious diseases. Prior to SARS, Toronto Public Health was not meeting provincial minimum mandatory requirements for control of infectious diseases and infection control in institutions.¹¹⁷

Because strong links had not been forged, working together was not always easy. People who had never met or worked together and whom had little or no understanding of the operational issues faced by each other, were being asked to collaborate during a very stressful period of time. Toronto Public Health officials described the problem of trying to get information from a local hospital in the absence of strong links to the hospital:

TPH staff need information from the hospital about a patient in isolation. The hospital refuses to provide CXR or lab results over the phone as they are concerned about patient confidentiality. Because there is only one patient in isolation in this hospital, it is not practical to have a TPH staff person onsite 7 days/week.

In June 2003, to remedy this situation, Toronto City Council approved the creation of a dedicated communicable diseases hospital liaison unit for one year. It requested and received 100-per-cent provincial funding until March 2004 and 50-per-cent funding as an ongoing commitment.\(^\text{118}\)

The issue of future funding and the extent of provincial contribution is now under discussion at the City of Toronto, where the Chair of the Toronto Board of Health said:

> Senior (city) staff have said unless the province pays for the whole thing, it should be scrapped. (Public health) staff feel it’s pretty well essential to deal with a crisis situation."\(^\text{119}\)

Toronto Public Health noted:

> The [Communicable Diseases Liaison Unit] is essential for Toronto Public Health’s capacity to prevent and control serious infectious disease outbreaks in the future.\(^\text{120}\)

Because the transmission took place largely in hospitals, and because the investigation and control of transmission is a public health responsibility, the linkages between the hospitals and the public health system became crucial.

But the boundary lines between public health responsibility and hospital responsibility were not always clear. There was, and remains, little clarity of the respective accountability, roles and responsibilities of hospitals and public health units in relation to a hospital outbreak. One Medical Officer of Health put it very succinctly:

> Q: Were the roles clear then about the lines of public health authority and accountability when there is an outbreak in a hospital? Is there enough clarity now about the role of the Medical Officer of Health in relation to a hospital during an outbreak?

> A: No.

\(^{119}\) Toronto Star, “Filion claims cuts will hurt city’s health,” March 10, 2004.

As another local Medical Officer of Health expanded on this lack of clarity:

When it comes to infection control, communicable disease control had not been the main focus of public health until SARS, which was largely an institutionally based outbreak. The relationship [between public health and hospitals] has been a distant one. In my experience, I have either dealt with quite sophisticated large hospitals which are well resourced for infection control and have people working there who know more than I do, so that is one end of the spectrum, the big teaching hospitals in Toronto, or smaller community based hospitals who occasionally look to public health for some advice but not on the kinds within the four walls of infection control, precautions that are needed for basic day to day infection control, or the control of an outbreak within the walls of hospitals. Many medical officers of health and their staff do not have that training and they have developed some experience with it over the years but we are better trained and accustomed to deal with outbreaks out in the community than within a health care institution.

I think the discussion ought to be about roles. Infection control has been largely within the four walls of the health care institution. Each would look after their own and it became an issue between institutions when patients were transferred. But there were not a lot of situations in which there was an outbreak that spread through hospitals the way that SARS did, so the involvement of the public health local agency as an overseer of the health of the whole population was not as it was in SARS. I think that public health was pulled in to take on that role in a way that we had not had much experience with in the past. I would get consulted about an outbreak such as Norwalk virus in a hospital so that we would support the hospital and work with them on that, but I cannot think of any other situation with a multi-institution outbreak that was not a reflection of what was happening in the community, like a flu in the community and then in the homes and hospitals. But SARS was something different and that was one of the difficulties that arose with public health trying to play a different role than it had historically.

This lack of clarity around the role of public health in hospitals has left some local Medical Officers of Health with the sense that they had no real authority in hospitals, yet they were still held responsible whenever there was a problem:
It always seems that when there is a problem within an institution, then suddenly it is public health’s fault. There was an outbreak of [an infectious disease] in [a hospital] and the hospital essentially told the Medical Officer of Health they would look after it . . . Then all of a sudden when there was a problem it was the health unit that was said to be the source of the problem when in fact it was the hospital . . . Now with SARS, which really was a problem within the hospitals, it was not a community outbreak, it is all of a sudden public health’s failure here to do something that resulted in these outbreaks. Even in today’s Star, I read the comments that if there is another outbreak of SARS, that the hospitals would be more prepared but the general system is still somehow lacking which I say, again, is a slap at public health that somehow these things going on is the fault of public health.

Even where the roles have seemed clear, the relationships between hospitals and public health have not always been strong. One local Medical Officer of Health described the problem as follows:

Up until SARS, the role of health units and of public health in terms of infection control has been rather iffy. The guidelines of what we are supposed to do are clear enough. We are supposed to provide advice and the Medical Officer of Health is supposed to sit on the hospital infection control committee. Some have committees and some do not and others may not have a specific one. They are supposed to report communicable diseases to us. Reporting has not traditionally been 100 per cent and there has always been a tension between public health and hospitals in the sense that hospitals do not want public health to be involved in whatever it is that they are doing until there is a big problem where they are looking for some kind of outside assistance to help. That may be too harsh. I guess that would vary across the province to a degree in which public health is intimately involved in infection control with hospitals.

SARS showed that public health does have an important role to play in infection control in hospitals. The role of local health units in hospital infection control needs to be clarified and fully funded. Yet, this remains a problematic area. One infection control specialist believes that more needs to be done to better focus the role of public health in hospital infection control practices:

So in my view, unless . . . we get a handle on and have good control over infectious diseases, very little else will go forward, or will not go forward
very successfully. I believe that hospital infections account for the fourth leading cause of death, still. And I think we need to bring that up to a level where it has the resources to be effective, I mean we have, you know, we have a Cancer Care Ontario, we have a Cardiac Network, we have a lot of these resources we’ve put into these key diseases as we should, but there is nothing you can put your hands on for infectious diseases. It’s gotten buried under the health units where it’s not clear what their role is. I believe hospital infections occur day in, day out and, you know kill 8,000 to 12,000 Canadians every year. [emphasis added]

Wherever the line of accountability is drawn and however it is adjusted for local conditions and the respective infection control expertise of the Medical Officer of Health and the hospital, it is essential that the lines of accountability be clear and that any increase in responsibility to public health come with the resources to meet them.

Whatever strengthening is necessary of the link between public health and hospitals in relation to infection control, it should not create the impression that public health is taking over infection control in hospitals. As one hospital infection control specialist noted:

I don't particularly want the health unit coming into [our] hospital to tell me how to run an outbreak because a hospital is a community unto itself and I know this community. I know this hospital, you know, this clunky old structure like the back of my hand and I think I'm the best person to run an outbreak in my hospital whereas if it's in the community I call [the local Medical Officer of Health] instantly and he and I understand each other completely and he would never even dream, he's on our infection control committee and he would never dream of coming into [our] hospital and telling us how to run an outbreak. The Health Protection and Promotion Act as I understand it, isn't really clear as to what the role of a medical officer is inside a hospital. The Public Hospitals Act, as I read it, says that it's my responsibility, my Chief Executive Officer's responsibility who then hands it over to me. So my interpretation is if it's an infection issue in my hospital either it's a community infection that intruded in my hospital or it's a hospital infection that's going on, it's my problem. I suppose the medical officer, if he really thought what I was doing was bad or I was derelict, has some capacity to kick at the walls of this place and is supposed to be on the infection control committee but I would be really worried to see the public health unit running hospital
infection control because just as I'm not well suited to running a commu-
nity outbreak, I don't think they're well suited to running a hospital.

This specialist added that there may be situations in a smaller community if the
Medical Officer of Health is the only person in the community, including the hospi-
tal, trained in communicable disease control, it might make sense for the Medical
Officer of Health to be directly involved in controlling the hospital outbreak.

A local Medical Officer of Health agreed that, while the roles and lines of authority
need to be clarified, that does not mean that public health should assume the role of
infection control for all hospitals:

I think that hospitals want to do this, they want to do a good job, if they
are given the resources, if they are given the information and if they are
given some mechanism by which they can coordinate with other parts of
the health care system, I think that they can do a good job.

There is a difference however between taking over infection control in hospitals and
having a role to play in ensuring standards are met and in having an authoritative
presence in relation to infectious disease outbreaks. Infectious disease outbreaks that
occur in hospitals may spread to the community and the potential for community
spread will almost always be present. Public health must have a role to play. As one
local Medical Officer of Health stated:

I would be worried about infection control. There has been this tension
between hospitals and public health and it has not been clear as to who
has the ultimate jurisdiction and responsibilities. I would not like to see
a system where now that hospitals are keenly interested in infection
control within the hospital sectors and want to develop networks, that
the hospitals say we will do that and we do not need public health.
Public health has a very important role in terms of making sure that
things get done, that things do happen. I think a lot of that goes back to
a public health role brought about by credibility and not by legislative
authority. I would feel very badly if the outcome of all this is that the
hospitals get more money to do infection control and public health is
somehow told we do not really need you for this. I think that public
health is important and although infection control is not the major thing
that will improve the health of people in Ontario, it is still an important
ting and it is one of the historical roles for public health and it should
have ongoing a role in this.
Interim Report ♦ SARS and Public Health in Ontario

Problem 20: Public Health Links with Hospitals

The important role of public health in hospital based disease was stressed in the external review of the B.C. Centre for Disease Control:121

Establish a presence in nosocomial infections. Currently each hospital has an Infection Control program. However, no organization coordinates and oversees nosocomial infections for the province. The need for coordinated action between public health in the community and in the institutional sector was highlighted by SARS. A Centre of Disease Control can assume this function.

Despite the above, in many cases the Medical Officer of Health has been able to exercise a good deal of positive influence, notwithstanding these weaknesses and the lack of clear statutory authority regarding their role and responsibilities in hospitals. As one local Medical Officer of Health noted:

It may not be as bleak as you think. Sure, we get called in on things that we do not have all the answers for and all the experience for. But my experience has been that we carry quite a bit of weight even without that [statutory authority]. If I put my views in writing about what I think a hospital should do . . . and give it to them and they do not do it, even though I do not have direct authority, I think that they . . . usually respond . . . If they do not want six months later to have an inquiry and have the Medical Officer of Health letters saying that you should be doing this and have not done it. I have been involved in lots of situations where that has been sufficient to make something happen that needed to happen even though the authority is not clear. So you do carry a fair amount of weight provided that you have credibility. It is liability that is the driver for decision making; we have an expert opinion telling you to do something and I think most institutions are responsive and particularly public ones and private institutions that feel some responsiveness to the community with shareholders or public image, I think generally are responsive unless they have a good reason why they should not or disagree with something.

This observation suggests that the effectiveness of the Medical Officer of Health in relation to hospital outbreaks under the present system may depend largely on their credibility and the degree of moral authority they exercise in the local hospital

community. This is a good reason for putting more resources into local public health to ensure the recruitment and retention of local Medical Officers of Health who will command the necessary credibility. It is also a good reason to clarify the role and authority of the local Medical Officer of Health, subject to the direction of the Chief Medical Officer of Health, in relation to hospital infection control and outbreak management, in order to ensure that the protection of the public is not so entirely dependent on the degree of influence the local Medical Officer of Health has been able to secure based on his or her own personal experience.

More will be said about the relationship between hospitals and public health in the final report. What is clear from SARS is that hospitals can become the epicenters of infectious outbreaks that can move into the community. Much needs to be done to clarify and strengthen the role of public health units in hospital infection control and to strengthen links between hospitals and public health.
Public health links with nurses, doctors, other health care workers and their unions and professional organizations were often ineffective during SARS.

This was evident at the outset, when the province realized it had no way to communicate rapidly with physicians throughout the province. On March 14, 2003, when public health officials realized that there was an infectious disease at Scarborough Hospital at risk to spread to other health care facilities and possibly the community, the Public Health Branch prepared a letter for distribution to all physicians in the province to advise them to be on the alert. But they had no way to distribute the letter quickly and in the end they had to turn to the Ontario Medical Association to help. Through this channel, the letter was distributed via email and fax. The Ontario Medical Association was able to reach about 90 per cent of the province’s doctors in a matter of hours.

It was fortunate that the Association was able to help and that the emergency unfolded on a Friday afternoon, when staff were available to assist the Ministry with the distribution. It is important to note, however, that this did not reach all physicians. Additionally, the notification was dependent on a physician receiving the fax or email and immediately reviewing it. It did not guarantee that emergency rooms and other points of first contact for patients throughout Toronto received immediate notification.

The use of the Ontario Medical Association highlighted a disturbing systemic weakness, however. Other equally important front-line responders, such as nurses, ambulance services, paramedics and nurses – and their unions and professional organizations – were not included in this early notification.

122. The issue of communication of infectious disease alerts will be dealt with in greater detail in the final report.
123. SARS Commission Public Hearings, September 29, 2003, p. 36.
As the Ontario Nurses’ Association and the Ontario Public Services Employees’ Union stated in a joint submission to the Commission, with respect to a subsequent letter:

Not only does the March 18 letter give detailed information about what was known about SARS at the time, it also gives detailed information on Infection Control measures. The letter advises that Health Care Workers who have direct contact with suspect SARS cases use gloves, gowns, eye protection and N95 masks. Neither union has any knowledge that any of this information was communication to HCWs in any health care facility. Why would information pertaining to the protection of HCWs and infection control practices be sent only to physicians?\(^ {124}\)

There is only one appropriate answer to this disquieting question: All health care workers should have been immediately notified.

Although this interim report is limited to questions of public health renewal, much more will be said in the final report about the critical need to listen to nurses and other health care workers and to more effectively communicate with them in hospital and other settings. At the public hearings Mr. Bruce Farr, Chief General Manager for Toronto Emergency Medical Services, described the need for closer links with public health:

> We need better control in terms of notification of outbreaks, the earlier the better so that we can communicate to the staff the importance of protecting themselves. We need to work more closely with public health and hospitals in terms of communication of these issues. Paramedics have a significant role in reporting outbreak from the front line.\(^ {125}\)

Outbreaks can strike at any time and they do not respect standard work days or work week schedules. Nor do infectious outbreaks stand still until people have had an opportunity to check their faxes or read their emails.

When the early warnings of an infectious disease became known, there was a need to notify health care workers, particularly nurses, emergency responders and front line

---

physicians (both hospital and family physicians) and immediately. Time was of the essence, as one missed case could spread and infect many others. Yet there was no system in place to do this. There was no way to get vital information quickly, directly to the front lines, seven days a week, 24 hours a day. Such a system is clearly needed as an element of any renewal of public health infrastructure.126

Beyond the early notification issues, links with various health care sectors remained a problem throughout SARS.

Family physicians comprised a critical group of front line workers who were largely overlooked in the early days of SARS. Jan Kasperski, Executive Director and CEO of the Ontario College of Family Physicians, described the experience of family physicians as follows:

One of our family physicians said that family physicians were treated like mushrooms during the SARS crisis. They felt as if they were kept in the dark and fed manure, in terms of information, and they operated under an umbrella of darkness . . . They needed information and direction to protect themselves and others, yet they suffered from mushroom syndrome throughout those early days. This is in direct contrast with the experience of hospital administrators who state that information was coming at them so fast and furious that they had major problems keeping up with the flow.127

The absence of public health link was evident following the Lapsley Clinic outbreak. In April 2003, a patient who had been exposed to SARS in hospital came in to the clinic for a routine visit. This visit touched off an outbreak amongst clinic staff and patients. Ms. Kasperski, of the Ontario College of Family Physicians, described the lack of support that the clinic had from public health, following the outbreak:

“Meanwhile, [Dr.] Rex Verschuren struggled to keep the practice open at the Lapsley Clinic knowing the needs and, indeed, the fears of the patients he and his partners (who were ill) were serving. At no time did he receive any calls or visits from those in authority and to this day, he

126. A number of witnesses who presented at the SARS Commission’s public hearings emphasized the need to directly communicate with front line workers during a crisis or outbreak. See pages 122 and 134 of September 30th public hearing transcripts.
does not know if those who were exposed in his office were contacted. No one from Toronto Public Health or the Provincial Operation Centre offered the Lapsley Clinic advice on how to decontaminate their office. They simply trucked on.\(^\text{128}\)

Public health and provincial efforts seemed solely focused on hospitals for much of the time. As Dr. Yoal Abells, a Toronto-based family physician and a member of the Board of the Ontario College of Family Physicians and the Chair of Family Physicians Toronto said at the public hearings:

> But the reality is that there was no one who issued orders to community-based physicians. No one said, this is what you must do and you will do it and you will do it now. Doctors Young and D’Cunha did this for the hospital sector, but the community was left out.\(^\text{129}\)

The Lapsley clinic showed that family physicians were clearly at risk, as a SARS case could walk through their door at any time. Many SARS patients did not only go to SARS clinics and hospitals. Many avoided them from fear of SARS and went instead to see their family physician. Ms. Kasperski on behalf of the Ontario College of Family Physicians told the Commission how, in the fog of battle, the risk faced by family physicians and their need for communication and assistance were overlooked:

> In times of war, you hit the hot spots first, and then you engage the second wave. We understand the need to concentrate on hospitals first, especially in the eastern part of the city, but issues and concerns of family-based family doctors should have been dealt with immediately in the second wave. However, we had problems getting on anyone’s radar screen. Flags were going up all over the city that family doctors in particular were confused and needed directions in order to care for their patients and to protect themselves, their families and their staff. While the media started to direct SARS people to SARS clinics, Telehealth and emergency nurses were directing patients with SARS-like symptoms to see their family doctors\(^\text{130}\).

Another critical front line group of health care professionals who were not included in the public health and government communications or response were the radiologists.

Radiologists were responsible for creating and interpreting diagnostic imaging in order to detect and diagnose disease. They practice medicine in hospitals or in Independent Health Facilities, of which there are 600 in Ontario. Radiologists and their technologist colleagues were directly involved in the care of SARS patients, yet they received no communication or support from public health. To fill the gap, Medical Imaging Clinics of Ontario provided assistance to Independent Health Facilities. As Dr. Priditis, Executive Vice President of the Ontario Association of Radiologists, stated:

As imaging specialists we did the best we could to assemble, adapt and disseminate important information but we’re imaging specialists; we’re not infectious disease specialists or public health specialists and there’s no doubt that had the Medical Officer of Health responded to our concerns and worked with imaging specialists to develop a detailed plan we might have done much better.\(^\text{131}\)

Other health care professionals whose links to public health, particularly in Toronto, were lacking during SARS were the Community Care Access Centres. They entered the homes of and provided care to people who may have previously been in hospitals, and therefore needed information on the status of the various hospitals as well as the precautions that their staff should be taking. Julie Foley, Executive Director of the Scarborough Community Care Access Centre, described the problem as follows:

One of the areas of communication particularly relates to that with public health. In Toronto, because of how the public health department was so stretched, we did not have the direct link to public health that many of our sister CCAC’s had in other areas and that needs to be strengthened in the future. There were times when the CCAC’s in the outlying GTA would get some specific instructions from their public health departments that we did not receive and that was difficult to then try and sort out which directive from where or which piece of advice from where was the most appropriate for the client population we were serving. And we do think it’s important that health providers outside the strict publicly funded system are included in communications. There were many healthcare providers who provide ancillary service to our clients, Meals-on-Wheels, a whole community of services that didn’t have enough information about how to manage. So that we would be serving a client

using a certain level of precaution and then some other community provider would be in there not knowing what kind of precautions it should be exercising at the same time.\textsuperscript{132}

Ms. Janis Leiterman, National Director of Clinical Services for the Victorian Order of Nurses, gave concrete examples at the public hearings of the difficulties caused by inadequate links between public health and other health care sectors, in this case the home care sector:

In the beginning, my best source of information was The Globe and Mail and CBC News. VON Canada Branches in Ontario were receiving individuals under investigation for SARS before we knew what this meant. Staff thought they were SARS patients without knowing in advance which meant that we not only had no protective gear but didn’t know it was required, without knowledge about how to manage and without knowing whether the POC, in fact, wanted this. One example is a nurse who had just completed his own course of chemotherapy, visiting a person under investigation for SARS without any info from the CCAC re: the patient’s status so there was no indication of the need to wear protective gear. The next day when VON was informed by the CCAC of the patient’s status, the nurse had already seen a full day’s caseload of other patients. The lack of information for the home care community sector led to exhaustive efforts to get information from the Ontario government for the community. This scenario played itself out at the national, provincial and regional levels. For example, feedback from nurse managers revealed that calling their regional Public Health Departments sometimes resulted in speaking to a casual, part-time worker, giving advice about which they knew very little, likely reflecting under-funding of the public health sector and recruitment of emergency staff. The advice at times varied from worker to worker between levels of staff and from region to region. I want to point out that there was excellent support from public health departments and CCACs in many cases. It simply varied. I have four (4) quotes from my internal debriefing that I’d like to share. The first branch: “This branch doesn’t have any CCAC contracts so we contacted the public health department for advice. They were always excellent in terms of their response time. You might not hear for six (6) hours, but you always heard back the same day.” A second

\textsuperscript{132} SARS Commission Public Hearings September 29, 2003, p. 66.
branch: “The public health department was of little use because I couldn’t get through on their lines.” A third branch: “The public health department was difficult to access. My voice mail messages were never returned.” And a fourth branch: “Our CCAC advised us to call the public health department for direction but then they didn’t always like the answer and didn’t want to comply.”

SARS showed that links between public health and other parts of the health care sector need to be strengthened. Public health bears responsibility for outbreak prevention and management of communicable diseases. To do this effectively, they must ensure an ongoing, active role with all parts of the health care sector, since an outbreak can originate and can spread at any point in the network of individuals, facilities and agencies that provide health care in Ontario. It is not only critical that public health be able to communicate quickly and effectively with the various health care workers and organizations impacted during a public health emergency, but those same health care workers and organizations need to be able to have clear and direct access to public health for information and assistance.

Strengthening links with all aspects of health care can only help bolster public health’s ability to detect emerging infectious diseases in the community. For example, Dr. Abells described the beneficial role that family physicians could play in this regard:

The acute shortage of family doctors and public health staff have left the community vulnerable. Better planning and coordination at the provincial level between these sectors and integration at the local level would provide both levels with enhanced ability to respond to outbreaks. Family physicians need to be better supported in fulfilling their roles in the daily care of their patients in their capacity as sentinels in the system and in responding to patient needs in the event of an outbreak. Family doctors are in a key position to recognize emerging illness trends as they appear. If they see a recurring or unusual pattern of patient infectious disease symptoms, they should be able to easily share these findings with the local public health department and the central coordinating agency. Public health nurses should be assigned to family physician’s offices to

134. Under the Health Protection and Promotion Act, Part IV, local Medical Officers of Health and the province have clear responsibilities for monitoring infectious diseases, reporting them, and giving direction and orders to prevent their spread.
ensure better integration of primary and public healthcare, not only for surveillance purposes but also to address the health promotion and prevention needs of the patient population.\textsuperscript{135}

This lack of two-way communication was evident for the emergency response sector as well. When public health became overwhelmed during SARS, the emergency medical services units assumed responsibility for performing public health duties for their own staff. They did their own notification, contact tracing and referrals for paramedics, fire and police. However, they had no link to public health to provide what little assistance they were seeking from time to time. Mr. Farr explained the problem as follows:

\begin{quote}
One thing we didn’t have was a direct line to Public Health. So if we wanted to phone to inquire about something, we had to enter the queue with every other citizen who’s trying to get through to public health. We were fortunate that our community medicine nurse had come from Public Health and had background channels that we could get information to Public Health.\textsuperscript{136}
\end{quote}

Health care workers, in hospitals and in the community, are the eyes and ears of public health, before and during an outbreak.

SARS demonstrated that public health links with health care workers, health care organizations and community care agencies are deficient. The communication links and relationships necessary to effectively manage an outbreak were not present before SARS and it proved difficult, and for some impossible, to forge them in the midst of a crisis. It is critical that these relationships and links be made before they are required.

Because Ontario had not planned for an outbreak, the necessary relationships had never been identified, much less established before SARS hit. There should be defined links with each key organization, combined with the ability to communicate emergency messages to front line staff regardless of the time of day or the day of the week. As the Victorian Order of Nurses recommended in their submissions to the Commission, there needs to be,

\begin{footnotesize}
\begin{itemize}
\item[\textsuperscript{135}] SARS Commission Public Hearings, September 29, 2003, p. 130.
\item[\textsuperscript{136}] SARS Commission Public Hearings, September 29, 2003, p. 161.
\end{itemize}
\end{footnotesize}
... a point person, identified at every organization, to ensure the ability
to quickly dialogue with key individuals about any given emergency in
any sector. It is too late to start building a communication system once an
emergency strikes.137

It is not good enough to leave it to each individual public health unit to create these
necessary links within the boundaries of the unit. A provincial plan is required, devel-
oped with the advice of local Medical Officers of Health, to ensure effective commu-
nication between public health and the rest of the health care system. The individuals
and groups need to be identified, communication links and relationships need to be
established in advance, and a clear assignment of roles and responsibility established
for the maintenance and operation of direct linkages.
Problem 22: Lack of Public Health Surge Capacity:
The Toronto Example

The sudden workload imposed by SARS on local public health units was overwhelming. The hardest hit jurisdiction was Toronto, where the workload snowballed with each passing day of the outbreak. While the same was true of other public health units, Toronto is selected as an example because it had the greatest number of cases. This staggering workload included:

- Approximately 2,000 case investigations. Each took an average of nine hours to complete.

- More than 23,000 people identified as contacts.

- Of these, 13,374 placed in quarantine.

- More than 200 staff working on the SARS hotline.

- Over 300,000 calls received on the hotline.

- On the highest single day, 47,567 calls.

In one of the world’s most multicultural cities, Toronto Public Health had to ensure that all communities were reached. Print and web materials were translated into 14 languages. Staff at the hotline had access to translators for non-English speaking clients.

Staff worked long hours and demonstrated remarkable dedication to the response effort. Twenty-hour workdays were not uncommon.

The observations in this section do not detract from the remarkable efforts of everyone at Toronto Public Health. This section simply points out that the system was unprepared to deal with an outbreak of this magnitude. The problem was not any lack of dedication and effort, but the fact that it was impossible in the middle of a rapidly
expanding crisis to create the necessary infrastructure. For instance, there were not enough people to work the phones. As a result, people who waited on hold for hours would vent their anger at some unfortunate Toronto Public Health employee when they finally got through. If the employee didn’t have all the answers (which no one did in the early days of the outbreak) it simply increased the callers’ frustration and level of anger. Staff described the following typical scenarios:

The patients are often fearful, upset and/or angry and often direct these emotions at TPH staff. Hospital staff see TPH worker as expert with all the answers. Anger is directed at TPH staff when answers are not known.

A contact follow-up staff calls a woman in quarantine twice a day. She is upset because someone else has also contacted her. She states she has not received her mask and is isolating herself from her children. Her kids are young and do not understand why they can’t hug and kiss her now. She has no food, little money, and has no way of getting friends to deliver any supplies as her whole community is in quarantine. TPH staff provides info about free food delivery as needed and asks if it if okay to have someone call her to provide psychological support. On the way home from work TPH staff person drops off a bag of food for this family.

There was a shortage of staff at Toronto Public Health to do the day-to-day work of identifying contacts, calling them to provide accurate and timely information and to maintain consistent contact throughout the period of quarantine. Some surge capacity was achieved by redeploying staff from other public health work. Additional capacity was achieved at times from other health units and the federal government. Dr. Sheela Basrur, Dr. Barbara Yaffe and Dr. Bonnie Henry noted in a recent article:

Public health staff and physicians from the City of Hamilton, County of Lambton, Middlesex-London, City of Ottawa and Leeds, Grenville and Lanark Health Units as well as the federal government also provided on-site assistance, which proved invaluable in sustaining the TPH response.138

However, even with this out-of-town assistance and the redeployment of workers from other public health jobs, there simply were not enough people to do the work and there were insufficient internal coordinating mechanisms to ensure that the infor-

Information was both obtained and provided in a smooth and efficient manner. Consequently, a number of significant problems arose during SARS around the ability of Toronto Public Health to handle the massive workload.

Not every SARS contact was identified and followed up. Some family members of SARS patients, including some individuals who lost family members to SARS, report that they never received any contact from Toronto Public Health. It was only through watching the news or through information received from another source\(^\text{139}\) that they were aware of the need to go into quarantine. Other witnesses reported being contacted late into their quarantine. For example, one family, who lost a loved one to SARS, did not receive any contact from public health until eight days into their quarantine. Fortunately, they knew to quarantine themselves from watching the news, so had remained at home and had not put anyone else at risk.

While some contacts were initially notified of the need to put themselves in quarantine, many reported that they did not receive regular follow-up calls, or that they did not receive supplies, such as masks, that they needed and had been promised by public health.

The absence of consistent and timely contact could have profound consequences. For example, one relative of a SARS victim described how she almost missed going to the hospital to say good-bye to her dying mother because she had not been discharged from quarantine. Otherwise the hospital would not permit her to see her mother before she died. After many calls to many different numbers, she was finally able to contact a physician at a reporting hotline who released her from quarantine.

The volume of contacts meant it was not possible to ensure consistency and continuity by assigning a particular case to one or even two public health workers. Many observers described the frustration of having to repeat their case history and that of their family members over and over because they were called by different Toronto Public Health staff. Either the information they had previously provided had not been recorded or that record had not been passed on or reviewed by the later staff contact person. Because a paper based system was used to record contact information — another systemic weakness noted above in this report — the knowledge of the Toronto Public Health staff member depended on having a complete file in front of

\(^{139}\) For example one family became aware of the need to quarantine themselves during SARS I as a result of watching the news and because one of their employers had distributed a letter outlining the information regarding who should be in quarantine.
them. This did not always happen. Thus the person who may have been in contact with a suspect or probable SARS case would receive a call from Toronto Public Health staff who had little or no knowledge about the person they were calling. And when a patient or a contact called public health with questions or information, they often ended up having to deal with someone with no knowledge of their case. Many who dealt with Toronto Public Health had to repeat the same information many times throughout their quarantine and sometimes many times in a single day. One SARS victim described her frustration:

When you called [Toronto] public health, no matter what your inquiry is, no matter whether they already had a file started for you, you had to go through the entire process. There was a standard sheet that they had to fill out with every intake. Do you have any idea how frustrating that is? . . . I ask public health the following things: we cannot keep calling and having to start all over again every time we call, they have to fill out this intake sheet; it confuses the people that we are speaking to, it makes them panic about our situation when as public health department, you are already aware of our situation. Our file is sitting somewhere in another desk. You have to allocate someone to look after our family and this particular outbreak. We cannot keep having different people pick up and take over every time we call with a question. Every single family member has not been contacted yet to give them proper directions. We need masks, we need some direction, no one was prepared for this quarantine.

This inability to streamline information or to assign specific workers to specific contacts raised questions for many about confidentiality. Many witnesses expressed concern that they were being asked to provide private personal and health information, over the telephone, to different people with whom they had no prior contact or knowledge. Moreover, they had no idea what happened to that information once it was provided.

At other times contact, when it came, was not always helpful. For example, one family was in quarantine in the early part of the outbreak because a family member was ill with SARS in hospital. The family received regular calls from Toronto Public Health, which was good. But it was not good when someone from Toronto Public Health called and asked how the family member was doing, two days after she had died in hospital from SARS. This was not a single event. Another family reported that they were called by their public health unit and asked for an update on the condition of their mother, three days after she had died. Although many of these examples speak more to
lack of coordination rather than lack of staff, the result for families was the same.

Another problem to be addressed in the final report, the notification of families that a relative died of SARS, is more of a cross-system problem than a purely public health problem. The family of one SARS victim who visited their parent in hospital during the second outbreak was surprised to learn, when contacted by the Commission for an interview, that their parent had contracted SARS let alone that he had died of it. Others, while not surprised, had received no official confirmation of the diagnosis. As late as December 2003 there were still families who had not received word of the cause of death although they had made repeated inquiries. This problem will be addressed in the final report.

Despite the excellent leadership of the Toronto public health system and the hard work of its staff, these examples show a lack of systemic capacity to follow up effectively and to put together and use effectively pieces of information within the knowledge of the health unit.

A distinction must be made between adequacy of staffing levels and adequacy of surge capacity. Toronto Public Health has about 1,800 employees and questions have been raised about the proportion of staff dedicated to outbreak management and infectious disease.\(^{140}\) The issue was acknowledged by a Toronto Public Health observer:

> Eighteen hundred does sound like a lot of people. The observation is correct that relative to the volume of work required in the control of infectious disease programme there were not enough staff to fulfill those responsibilities to the standard expected in a city of this size and complexity. However the communicable disease service was the largest service in public health. There were between 250 and 300 staff people under Dr. Yaffe. Other programmes were not close to that size in terms of having staff under a single director. . . . Communicable disease control was under-funded but at the same time it was one of the larger services and it had gotten more increases since amalgamation than any other services.

However one addresses this question of staffing levels as between infectious disease and other health programmes, the fact remains that extra surge capacity is required in a significant outbreak.

\(^{140}\) Naylor Report, p. 29.
The solution is not to hire large numbers of people to sit around and wait for the next outbreak to arrive. The solution is devise a system through cross-training and re-assignment to deploy more workers on the ground for the painstaking work of contact tracing and following up on those in quarantine. It speaks equally to the need for better internal information systems and a planning process which ensures that the work of core personnel and added personnel can be properly coordinated.

The Naylor Report, in the context of the federal Health Emergency Response Teams,141 known by the acronym HERT, emphasized the need for response capacity beyond simple clinical surge capacity:

While the HERT model has been developed as a multidisciplinary group of clinical support personnel for “all hazards,” the SARS experience demonstrates the need to be able to mobilize select groups of skilled personnel such as quarantine officers and public health nurses.

As noted below, the Public Health Branch at the Ministry of Health has done some work in the area of redeployment and more work remains to be done. One observer described the progress:

. . . probably the sore thumb area that needs review first is the rapid response team epi centre and call centre functions that were the recipient of a lot of SARS money because it was a bag of cash that was grabbed while the going was good. A whole bunch of people were hired and I think we need to have the functions better identified so that the numbers and roles and competencies and deployment arrangements and all of that can be articulated clearly because no one quite understands it . . . there are one-half dozen rapid response teams at the public health branch comprised primarily of IMG, International Medical Graduates. The paper looks real good but I am not sure that in practice the rules and responsibilities and communication protocol are clear. So if a team is deployed to Muskoka-Parry Sound, who do they report to? Do they work under the local Medical Officer of Health? Do they report to the Chief Medical Officer of Health? How does information get collected and shared and you know, a team of what with whom?

141. The National Office of Health Emergency Response Teams was established in December 2001, by the Centre for Emergency Preparedness and Response. Following its creation, the federal/provincial/territorial deputy ministers and ministers of health unanimously endorsed the principles for the development of Health Emergency Response Teams (from Naylor Report, p. 102).
Provincial plans and local plans are required for response to outbreaks, both large and small, which mobilizes surge capacity through redeployment of public health workers cross-trained in outbreak investigation and management.

Such plans should include prearranged agreements and memorandums of understanding between health units to redeploy workers from areas of relatively light activity to areas of peak activity. Under this system, an outbreak in Windsor might attract the temporary redeployment of workers from Toronto and vice versa. This is easier said than done; it requires a real commitment in expenditure to achieve the necessary cross-training, willingness and dedication on the part of the individuals who will be reassigned away from their homes and families and a strong cooperative motivation from all levels of the public health system to make redeployments work. The other obvious limitation to redeployment is that it will not work if the entire province is hit by an outbreak which takes up all the spare capacity of every health unit, in which case the local plans will be critical.

Finally, the province must collaborate with other provinces and with the federal government to ensure clear agreements for support during times of crisis. During SARS the province received help from outside Ontario as a consequence of the goodwill created between colleagues, not as a result of any formal agreement.

SARS was a wake up call. It demonstrated the need to create surge capacity by planning in advance so that every available worker can be redeployed where necessary.
Problem 23: The Case of the Federal Field Epidemiologists

The ability to mobilize and deploy human resources became crucial as local resources were overwhelmed. However, the lack of pre-existing human resource deployment protocols caused some confusion and ambiguity.

The federal government sent a number of Health Canada employees to work in the field to help with containment efforts. In the early days of the outbreak three federal field epidemiologists were assigned to Toronto, who brought a badly needed level of expertise to the provincial response. Unfortunately, the lack of clarity concerning their deployment and, from time to time, the tasks that they were asked to perform led to problems and ultimately contributed to the decision by Health Canada to pull them back from Ontario.

When the federal field epidemiologists arrived in Toronto, they were initially sent to work at Toronto Public Health. They collected and analyzed data and in the opinion of one expert had a good understanding of what was happening in the outbreak. However, they had insufficient input to the Science Committee, which needed their epidemiological expertise. Some observers thought that their expertise was not being used effectively in the tasks assigned to them.

Once the provincial Epi Unit was operational, a decision was made to move the federal field epidemiologists out of Toronto Public Health and bring them to the provincial unit. It is a measure of the confused state of communications and the lack of coordination that to this day there are different understandings as to why and by whom this decision was made. This, in turn, created turf resentments. One observer described it as follows:

The local health units saw them as local support and foot soldiers to help run and control the outbreak. York Region was very upset that all three were based at City of Toronto. They felt that they should have one. Then the City of Toronto got upset when they were moved up to the Ministry.
One of the epidemiologists explained the problem as follows:

It was no longer a City of Toronto, limited to the City of Toronto, there are other jurisdictions involved, because it’s a multi-jurisdiction, really the epi response should be happening at the provincial level. But the City of Toronto had made a request for the field epidemiologists and under the circumstances, of course, was very reluctant to let us go. They were still seeing huge increases every single day on an hourly basis, they still had their staff completely exhausted and running at their ends and there was some negotiation between the province and the city about where these field epidemiologists should reside. And at the same time, you know, York Region and Peel Region and Durham Region are saying, you know we have a problem here, we don’t have the same capacity as Toronto and now we have this many cases, we need a field epidemiologist to help us in this area. My personal, professional opinion is that it was the right move to move the field epidemiologists to the provincial level, but I understand why the City was so reluctant to let us go.

Toronto Public Health was relying heavily on the epidemiologists to conduct investigations and provide support for them in terms of managing and controlling the outbreak. The province, on the other hand, saw the federal field epidemiologists as a resource to be deployed at an overview level in the task of figuring out where the outbreak was going in order to get ahead of it, rather than to be deployed as foot soldiers to help manage the outbreak at a local level. One observer who worked for the province described this distinction in roles:

They [the federal field epidemiologists] should not be looking at control aspects but focus on where spreading and where will go next rather than focusing on day-to-day management.

Some in the federal government also felt that the federal field epidemiologists should be utilized at a higher level. As one federal health official noted:

They were sent there at the request of Ontario, to assist with the investigation. I believe that there was some misinterpretation, whether deliberate or not, on why they were there. And it comes back to my first point about wanting to get a picture of what was going on, is that it would not have been our intention to send epidemiologists of any kind to Ontario just to assist in collecting data. That can be done by lesser-trained health professionals, or indeed, health professionals that were trained in differ-
ent ways. The whole point of analysis of data, to look at trends, to look at risk factors, to look at, for example, who’s in quarantine, what’s the effectiveness of quarantine, what’s the effectiveness of what’s happening in the hospitals, and so on and so forth, is not research. It’s a fundamental part of an outbreak investigation, which gives information to change the response . . . Because our staff were there in order to be able to assist in the investigation, in order to be able to assist Ontario to make operational decisions. It may have been, and I believe it was, that they got drafted into other work, because that’s where there were deficiencies, in terms of just collecting data and so on and so forth, whereas we, I mean that’s a reflection of the whole lack of capacity across the board in Ontario, that seemed to have been evident. That it would have been our wish to assist at the level of the training of the individuals that we sent, so that we could have, we, both Ontario and ourselves, could have ended up with this picture which would then have been dynamic and then we would have been able to present together to the world in terms saying this is what’s happening. We know what’s happening, we’re changing our protocols accordingly, and so on and so forth.

Toronto Public Health felt the province was taking away badly needed resources from the direct management of the outbreak, and this created tension. In hindsight, it is easy to appreciate the perspective of each side. Toronto Public Health was desperate for any help they could get and the province and federal government were desperate for a high level of analysis of what was happening in the outbreak and where it was going. The problems and confusion that grew up around the role of the federal field epidemiologists reflect underlying problems that arose again and again during SARS: lack of coordination between levels of government, bad communication, and above all lack of a pre-planned response system that would have supplied the necessary machinery of cooperation, including insufficient appropriately trained human resources.

The federal field epidemiologists were caught in the middle of this, being pulled in two directions by two different groups. To add to all these problems, concerns were expressed that even after they were moved to the provincial level, they were occasionally asked to undertake tasks which did not make the best use of their expertise. One of the federal field epidemiologists noted:

I think our role was clearly defined, how other people interpreted that role was not necessarily being done properly. We would run into situations where we were told there’s a problem with this, go down there and
deal with that data problem. And that was clearly not our responsibility to go down if the City of Toronto was having a problem with their database which made it difficult for the Ministry to figure out what was going on, it was not our role to go down there and fix the problem. But we would be asked to do that and I think that the field epidemiologists were fairly clear in saying that wasn’t our role at this point and was there somebody more appropriate than us to go down and help with the situation. So I think that although the roles were defined, people’s interpretation of what the field epidemiologists were there to do varied.

Even after they arrived at the province, there was confusion around their reporting structure and the proper route for work requests. As one epidemiologist noted:

I reported to Dr. Ian Johnson as a field epidemiologist, he was our in the field supervisor when we moved to the province. However, I was receiving directions from other individuals at the Ministry as well and that’s where I think Ian (Dr. Johnson) was very clear on what our roles and responsibilities were and other people were not so clear on what they were and might ask us to do things that weren’t appropriate or that we had not been tasked to do.

At the time they were pulled back from Ontario in late April and early May 2003, they had been working in the field since March and had done extensive work on the Scarborough Grace outbreak, the Sunnybrook outbreak, and the York Central outbreak. They had been through a lot and the impression of one expert who worked with them was that they were frustrated and exhausted. As one federal official stated:

It was a tough situation for everybody, and people had been down there a long time, but there was undoubtedly a sense of frustration amongst the cadre of people we did send down. And we obviously wanted to keep up their morale, and we obviously wanted to use them in the most efficient and effective way possible.

One of the frustrations faced by the epidemiologists was that it seemed as though there had been little movement by the province to recruit staff to fill their role so that they could eventually hand over their work and return to their regular employment. As one of them noted:

I was desperately looking for someone to transfer some of my knowledge to for the provincial SARS epi team but those people hadn’t been hired
and so I couldn't do that transfer of responsibilities to people because they weren't there yet. And so the frustration was I felt that my job here was done, I was waiting to transfer responsibilities and there wasn’t anyone for me to hand over to.

Despite the misunderstandings of their role, their help was greatly appreciated and in the words of one expert, they were “terrific.” But the lesson to be learned from the experience with the federal epidemiologists is that surge capacity pre-existing human resource protocols need to be addressed in advance. Clarity in roles and responsibilities is required not only for those who come to help, but also for those who receive the help.

This problem was identified in the Naylor Report:

> . . . federal involvement in Ontario was limited by the lack of a delineated role in an organizational structure, lack of data for outbreak investigation, and absence of business process agreements for inter-jurisdictional collaboration.”142

In the case of the federal field epidemiologists, there were unrealistic expectations about their role. As one expert who worked with them noted “they were expected to come in and solve all the problems.” In times of crisis, when people are being asked to pitch in and help out, expectations must be clearly established in advance for their initial deployment and also for their orderly pull-back as others come on board. Without these understandings clarified in advance, people will simply not come forward to help.

The case of the federal field epidemiologists demonstrates many of the underlying problems of Ontario’s SARS response noted above: poor coordination among levels of government, poor coordination of Ontario’s public health response, and above all lack of any advance plan for outbreak management.

---

6. Improvements since SARS

After many years of decline in Ontario’s public health infrastructure, SARS has finally focused the attention of the government and the public on the public health systems that protect us from infectious disease. SARS exposed the weaknesses in these systems. If we are to learn lessons from SARS these weaknesses cannot be ignored. The problems in our public health system must be fixed. If the next outbreak of infectious disease strikes Ontario as unprepared as it was for SARS, with a public health infrastructure as weak as it was during SARS, the province will be in serious trouble.

It is beyond the Commission’s mandate to monitor the implementation of government initiatives designed to address the public health problems that emerged during SARS. The Ministry has reported to the Commission on various reforms that it is presently undertaking and it is therefore appropriate to note them at this time. The Commission of course is in no position to evaluate these pending and proposed initiatives or to predict whether they will all be successfully implemented. Decisions in respect of their implementation are entirely a matter for the government and beyond the scope of the Commission’s mandate.

Some system improvements have been made since SARS, including the recruitment of a new Chief Medical Officer of Health. The appointment to that office of Dr. Sheila Basrur, who ably led the Toronto response, is hopefully a signal that the government is serious about public health renewal. The Ministry of Health has announced changes that involve both internal organizational enhancements and external system collaboration. Some of those changes are noted below.

Some of these changes by the former and the present governments respond to problems that are not addressed in this interim report but will be addressed in the final report.

An example of internal organizational change is the creation of an Emergency Management Unit (EMU) to coordinate the development of a Ministry emergency preparedness program, integrate it into Ministry business planning, identify the infrastructure requirements for its maintenance and develop a quality improvement program for emergency readiness. The Ministry’s plan calls for the EMU to work
with the Public Health Branch, other Ministry divisions, other ministries and local public health units on policies, procedures and protocols. It has been identified as the Ministry’s principal link for broad government collaboration on emergency management and pandemic preparedness.

Another Ministry organizational change involves the creation by the Public Health Branch of a Surveillance and Outbreak Management section housing an Epidemiology Centre, an Epidemiological Investigation and Policy Unit, Rapid Response Teams and a Public Health Call Centre. With the creation of this section, the Ministry seeks to improve its surveillance, surge capacity, information flow and its capacity to analyze data. Other changes to the federally funded Integrated Public Health Information System (iPHIS) are expected to improve data collection and transmission substantially and to support outbreak management with improved contact, case and quarantine management.

An example of the Ministry’s new approach to system collaboration is the creation of task forces made up of representatives from Health Canada, organized labour, other ministries and colleges that regulate medical professionals to develop and refine infection control and surveillance standards for acute care facilities and community health care settings. In addition, the Ministry is leading a standing, integrated coordinating committee of senior provincial government officials from all relevant ministries created to address emergency preparedness issues.

On the national and international fronts, there are signs that progress is underway. This was signaled in the November 20, 2003 Speech from the Throne:

Your new government . . . is keeping its commitment to work cooperatively with the federal government on health care, in the interests of Ontarians . . .

[Y]our new government will continue to work with Ottawa to fix health care, instead of merely affixing blame.

To this end, the Ministry has begun to work closely with Health Canada in connection with the incorporation of World Health Organization requirements relating to SARS surveillance and management. The Ministry has adopted certain public health measures from Health Canada and put them in place in the event of SARS re-emergence and has revised quarantine protocols to reflect Health Canada guidelines.
As was noted above, although some work has been done post-SARS to develop a provincial pandemic flu plan, it is not yet completed. However, the Ministry has held workshops with a wide range of internal and external stakeholders from both health and non-health sectors to assist in the development of the plan. Representation was included from emergency management, labour, municipal affairs, community safety and correctional services, agriculture and food and community and social services. The current draft plan is aligned with the Canadian Pandemic Influenza Plan, released in February 2004, to be consistent in language, format and definitions. Drafting efforts continue in order to ensure clarity of roles and responsibilities between provincial and local levels and within each level as well as to identify roles and responsibilities by position. The current draft is aligned with the structure of the national plan and incorporates full acceptance of the WHO phasing of a pandemic. The Ministry has indicated to the Commission that its target is to have a consolidated plan for use in the field ready to be released by the end of May 2004. Once the Ontario Pandemic Influenza Plan is developed, planning across all provincial ministries can move forward.

In order to address the serious problem of the lack of a sufficient supply of personal protective equipment for health care workers, patients and others that arose at the outbreak of SARS I, the Ministry has begun to stockpile and secure its supplies. The Ministry reported that a two-month stockpile of personal protective equipment, including masks, gloves, gowns, eye protection and other clinical supplies, for a community the size of Toronto is available and could be distributed quickly through a central distribution system.

Insufficient human resources at the public health unit level not only impeded efforts to gather and analyze important data relating to the spread of SARS but also made effective contact tracing and the application of quarantine management procedures almost impossible. The Ministry has taken some steps to assist local public health units to acquire more staff with the necessary expertise in managing infectious diseases by allocating funding for 180 positions at the local health unit level. It remains to be seen how long this will be maintained.

The Ministry has informed the Commission that it distributed SARS Outbreak Directives to all provincial acute-care facilities in October 2003 and to all other health care facilities in December 2003. The Directives relate to infection control and surveillance procedures for all health-care sectors in the event of another SARS outbreak. The Ministry has indicated that the Directives can quickly be adapted for use during an influenza pandemic or other infectious disease/public health emergency. The Ministry required that all acute-care hospitals confirm that all staff members have been trained in the Directives as of March 31, 2004. Non-acute care
facilities and Community Care Access Centres have been asked to provide confirmation of training by May 1, 2004.

A febrile respiratory illness (FRI) screener has been distributed to health-care providers across the province in order to assist in assessing patients/clients who present with a febrile illness. In addition, the Ministry has reported to the Commission that it has developed infection control and surveillance standards for febrile respiratory illness for non-outbreak conditions. The Ministry has requested the professional colleges to identify strategies to incorporate the guidelines into their respective professional practice standards by July 1, 2004.

The Ministry has advised the Commission that a number of initiatives have been undertaken to facilitate a more effective local response to public health emergencies. The strategies include the following: a 20-bed mobile critical care unit, known as the Emergency Medical Assistance Team (EMAT), that can be deployed on 24 hours notice anywhere in the province in situations where a health emergency is overwhelming local resources; a Designated Hospital model is being finalized to respond to situations in which local health resources are overwhelmed by an infectious disease outbreak such as SARS; the Patient Transfer Authorization Centre (PTAC) has been set up with appropriate authorization protocols to provide a provincial patient tracking system that will facilitate surveillance of patients with FRI who are being transferred between facilities or discharged home; negative pressure rooms, that are used in the treatment of air-borne infectious diseases, across the province have been identified by region, site and type on the CritiCall database which can be accessed by all acute-care facilities; rapid discharge protocols have been developed to facilitate patient discharge from acute-care hospitals to long-term care facilities or home in the event of a health emergency.

The Ministry advised the Commission that it has taken steps to address compliance with the Directives through hospital infection control audits. Every Ontario hospital has confirmed to the Ministry that it has done a thorough review of its infection control procedures and has put proper infection control measures in place. In the future, rigorous infection control audits will become part of each hospital’s ongoing monitoring and reporting to the Ministry and the public.

As has already been noted, Ministry communication with health-care providers and the public was neither timely nor clear during the SARS crisis. The Ministry has reported to the Commission that it has enhanced its capacity to rapidly communicate with health-care providers and with the public in a health emergency. It has indicated that “Important Health Notices” and other critical information docu-
ments can be distributed to all health-care providers in the province through an integrated email/fax/postal system that will facilitate the distribution of timely and accurate information. These Notices can also be used to communicate appropriate infection control and surveillance measures, including directives and standards, during a health emergency. The Ministry has reported to the Commission that it has its own multi-media web server that will support the communication of webcasts with 24-hour notice. It also has the capacity to broadcast live from Queen’s Park with international news conferencing capability (including satellite). Within the Ministry, the Emergency Management Unit, the Public Health Branch and the Communications and Information Branch have established notification protocols in the event of a potential health emergency. The Ministry also advises that it has modified and enhanced its crisis and risk communications strategy by adopting the CDC model.

To begin to address a weakness identified by the Provincial Auditor, the Commission has been informed that the Ministry has started to undertake spot audits to determine whether local health units are meeting mandatory infection control guidelines.

Other strategies being employed to deal with public health human resource needs include: a protocol for emergency out-of-province recruitment and licensure has been put in place; a registry has been established through the Registered Nurses Association of Ontario to facilitate access during an emergency to healthcare workers, including nurses and respiratory therapists; a system of on-call infectious disease specialists to support clinical diagnosis of patients with suspected illnesses has been put in place; and a plan is in development to provide psychological assistance to health care workers and to the public during and after a health emergency.

The measures implemented and contemplated evidence a laudable determination to address the many public health weaknesses identified in this report. These problems, however, are deeply ingrained and systemic. They can only be addressed through a sustained commitment that may take years to bear fruit. History has shown that governments, no matter how well intentioned, do not always have the stamina to oversee changes that require a long-term dedication. This was recently expressed in an audit of the management and planning functions at the CDC. The audit, by the highly regarded U.S. General Accounting Office, underlines the challenge of making fundamental, long-term change. It stated:

Experience shows that successful major change management initiatives in large private and public sector organizations can often take at least 5 to 7 years. This length of time and the frequent turnover of political leader-
ship in the federal government have often made it difficult to obtain the sustained and inspired attention to make needed changes.\textsuperscript{143}

These pending and proposed improvements exemplify an obvious present desire to fix the public health problems revealed by SARS. It is beyond the Commission’s mandate to evaluate or monitor these initiatives. The government’s efforts to ensure the province will not again be confronted by the same problems that arose during SARS, will be effective only if it dedicates adequate funds and makes a long-term commitment to reform of our public health protection systems. As in most areas of human endeavour, actions speak louder than words. Only time will tell whether the present commitment will be sustained to the extent necessary to protect Ontario adequately against infectious disease.

Three excellent reports have recommended public health improvements in the aftermath of SARS.

Dean David Naylor’s federal report recommends a Canadian “CDC north” supported by federal initiatives and transfer payments to help the federal government and the provinces cooperate in the fight against infectious disease. A key contribution of this report is a blueprint for a stronger federal presence in a supportive and co-operative posture towards the provinces rather than an operational or confrontational role.

Senator Michael Kirby’s report recommends a similar federal approach including a communicable disease control fund to help the provinces build up their disease surveillance and control capacity.

Dean David Walker’s Interim Ontario report recommends a series of measures to meet the problems in Ontario’s health care and public health systems demonstrated by SARS. More recommendations are expected in the final report.

These three reports share a common vision for the renewal of our public health systems through increased resources, better federal-provincial and inter-agency cooperation, and system improvements. They bear close study and great consideration. Their methodology and approach are sound and their recommendations are solidly based in their respective expertise. Based on the evidence it has seen, the Commission endorses the major findings and recommendations of all three studies.

The Commission comes to its task from a different perspective. An outsider to the medical, scientific and governmental communities, it is not an expert body. It would be inappropriate to duplicate the work of the earlier reports in their fields of expertise. The best contribution the Commission can make, particularly at this interim stage, is to focus on the evidence gathered thus far and the lessons and principles learned from SARS that emerge from that body of evidence in respect of Ontario’s public health system.
One of the biggest problems during the Ontario SARS crisis was the inability of the federal and provincial governments to get their acts together. A few people of exceptional talent from both levels of government did their best to bridge the gap and make things work. Unfortunately they were unsupported by any machinery of cooperation or any tradition of working together to solve problems.

In light of all the recommendations for change in public health systems, federally by Dean Naylor and Senator Kirby, and provincially by Dean Walker and this Commission, the evidence from SARS makes one thing crystal clear: the greatest benefit from new public health arrangements can be a new federal presence in support of provincial delivery of public health. The greatest danger from new public health arrangements can be further turf wars between the federal and provincial governments, turf wars of the kind that so badly hampered our national, provincial and municipal fight against SARS.

Too many good ideas in this country have been destroyed by mindless federal-provincial infighting. The most noble and appealing proposals for reform falter so often in Canada simply because of the inherent bureaucratic and political mistrust between the two levels of government. If a greater spirit of federal-provincial cooperation is not forthcoming in respect of public health protection, Ontario and the rest of Canada will be at greater risk from infectious disease and will look like fools in the international community. While there are hopeful signs that more cooperation will be forthcoming, noted above, it will take hard work from both levels of government to overcome the lack of coordination demonstrated during SARS.

Ontario and Canada must avoid bickering and must create strong public health links based on cooperation rather than competition, avoiding the pitfalls of federal over-reaching and provincial distrust.
9. Independence and Accountability

There is a growing consensus that a modern public health system needs an element of independence from politics in relation to infectious disease surveillance, safe food and safe water, and in the management of infectious outbreaks.

A number of local Medical Officers of Health noted the need for a greater degree of independence for the Chief Medical Officer of Health. To quote two of them:

The Chief Medical Officer of Health should not report to any specific Minister but perhaps to a neutral non-political third party to take information to Cabinet. It would be preferable if there was continuity rather than intermittent political people in the reporting structure . . .

Public health must be independent of political interference both at the provincial and local level. Not only is the Chief Medical Officer of Health a position that must be out of the political spectrum, but local Medical Officers of Health must also continue to enjoy that position.

It is one thing to say that the Chief Medical Officer of Health needs to be more independent. It is another thing to understand what independence means; independent from whom? Independent to do what? It is yet another thing to prove that any public servant should be independent from the ordinary systems of government accountability. In a democratically accountable system any claim for independence from government, in the exercise of direct power over citizens and in the expenditure of public funds, must be subjected to intense scrutiny.

Whatever independence may be required by the Chief Medical Officer of Health for public health decisions during an outbreak and for the right to speak out publicly whenever necessary, he or she should remain accountable to the government for overall public health policy and direction and for the expenditure of public funds. Public health is a function of government. It is the legitimate business of government to set overall policy and spending priorities. If the government wants to increase or decrease the proportion of public funds being used to promote bicycle safety or infection control, that is perfectly legitimate. At the heart of democratic decision making is the
principle that the elected government, accountable to the public through the Legislative Assembly, sets the priorities for government activities and decides how public funds are spent, and takes responsibility for its performance. One public health official noted that members of the public, if things go wrong in the public health system, will say:

I want to know, who do I vote out?

There must be a clear line of political accountability for public health performance. It is one thing to give the Chief Medical Officer of Health a direct pipeline to the Legislative Assembly and the public, to point out areas where more funds should be spent and to warn of dangers if programmes are not instituted. Also to give the Chief Medical Officer of Health a clearly defined independence in respect of operational decision-making, in deciding whether to say a disease outbreak is over or in deciding whether to quarantine large numbers of people. It is quite another thing to set the Chief Medical Officer of Health above the democratic process in relation to overall policy direction and priorities.

Necessary independent powers to warn the government and the public about dangers to public health, and autonomy in respect of operational decisions in the management of outbreaks, should not be confused with the independent power to make public health policy and decide how public funds are spent.

On the evidence examined thus far, the Commission, as noted above, has found no evidence of political interference with public health decisions during SARS. The investigation continues and more will be said about this issue in the final report on the basis of all the evidence examined.

The problem is that many people suspected political interference and many were convinced that politics was somehow at work behind public health decisions. However, no one interviewed thus far is able to recall any statement or any action by anyone that provides evidence to support that impression. Whatever the Commission’s eventual finding on this issue may be, the problem must be addressed of public perception of the necessary degree of independence of the Chief Medical Officer of Health and the public health system generally.

As noted above, a consensus has developed that machinery is necessary to give the Chief Medical Officer of Health a measure of political independence. Dr. Richard Schabas, a former Chief Medical Officer of Health for Ontario, told the Commission at its public hearings:
I think it [the public health system] has to be arms-length from the political process. I’ve avoided discussing the impact of politics on this outbreak but I think that to ensure that there’s public credibility, that the public understand that the public health officials are acting only in the interests of public health and are not influenced by political considerations, that this has – or that we have to put greater political distance between our senior public health officials and the politicians.¹⁴⁴

There is a consensus that the office of Chief Medical Officer of Health needs a greater degree of actual and perceived independence from government. The key question is what precise kind of independence is needed and how that independence is best balanced with the necessary degree of accountability.

Senator Kirby pointed out that too much of an arm’s length distance between the Chief Medical Officer of Health and the government would affect not only accountability but also the ability of the Chief Medical Officer of Health to have the close links with other parts of the provincial health care system that this Commission found to be inadequate during SARS.

The Naylor Report in advocating a new Chief Public Health Officer for Canada noted the need for a measure of independence in that office. The report pointed out that British Columbia and Manitoba both have independence safeguards of the kinds recommended for the new Canadian Chief Public Health Officer.

In British Columbia, the *Health Act* provides that the Provincial Public Health Officer shall report to the public, in the way he or she considers most appropriate, if in his or her view the public interest requires a public report on health issues in B.C. or the need for legislation or changes in policy or practice. In addition to the power to report to the public whenever the Provincial Public Health Officer thinks fit, he or she must give an annual report to the minister who is obliged to lay the report before the Legislative Assembly as soon as practicable.

In Manitoba the Chief Medical Officer of Health, while accountable to the department and the Minister, has an arrangement that permits him or her to function independently when necessary with a specific power to issue public health advisories and bulletins:

---

While accountable to the Department, the Chief Medical Officer of Health may function autonomously when necessary in the interests of the health of the public. Under these circumstances, the Chief Medical Officer of Health has the authority to issue public health advisories and bulletins, or take other actions. The Chief Medical Officer of Health will inform the Deputy Minister and/or the Minister prior to such actions or as soon as practically possible, in accordance with established protocols.

In Québec, the statute that establishes the Québec National Public Health Institute provides that the public health mission of the Institute is not only to inform the Minister but also to inform the public. The Institute’s mission includes:

- informing the Minister of the impact of public policies on the health and well-being of the population of Québec;
- informing the population of the state of public health and well-being, and of emerging problems, their causes, and the most effective means of preventing or resolving them.

The Walker interim report recommended that the Ontario Chief Medical Officer of Health should be able to report directly to the Legislative Assembly and to make public comment on significant public health issues independently.

One Medical Officer of Health, who saw no need for the structural independence of the Chief Medical Officer of Health, thought however, that the freedom to speak out on public health matters should be guaranteed:

\[\ldots\text{[The]}\text{Chief Medical Officer of Health must be free to speak out on issues and produce reports that contain recommendations that are not yet government policy and may be controversial.}\]

One knowledgeable observer concluded that a position within the Ministry, coupled with the right to report independently to the public, would provide the right balance between accountability and independence:

\[\text{It would be my preference for the Chief Medical Officer of Health to retain administrative control and internal influence that comes with being an Assistant Deputy in the Ministry of Health and to have the agency as support to the Chief Medical Officer of Health with the obligation to make annual reports to the legislature with advance notice to}\]
the Minister, perhaps using the *B.C. Health Act* as a template, with the additional safeguard that the Chief Medical Officer of Health in his or her judgment can make additional reports public through any appropriate means. That way the Minister gets a heads up in the ordinary course of an annual report but the Minister is not the gatekeeper if the Chief Medical Officer of Health thinks something should be made public.

The proposed power to report directly to the public, combined with independence in relation to the management of infectious outbreaks, provides a significant measure of independence to the Chief Medical Officer of Health. It ensures that on important public health issues the Chief Medical Officer of Health cannot be muzzled and that the public can get a direct sense of emerging public health problems without passing through any political filters. It ensures both the reality and the public perception that the management of infectious disease outbreaks will be based on public health principles and not on politics.

Should the Chief Medical Officer of Health remain within the Ministry of Health and Long-Term care? Or should the position be hived off from the Ministry into an independent agency with a line of accountability to the Legislative Assembly similar to independent watchdog officers like the Ombudsman, the Integrity Commissioner, the Environmental Commissioner, the Provincial Auditor and the Privacy Commissioner?

Unlike these officers, the Chief Medical Officer of Health provides leadership to a large and widely dispersed operational system responsible on the ground for infectious disease surveillance and health protection programmes. As one thoughtful observer noted, it makes more sense for the Chief Medical Officer of Health, if some machinery of independence is added to the office, to be at the table within government rather than being a watchdog off in a corner:

> It’s not just a question of balancing independence and accountability. It’s also a question of ensuring that the Chief Medical Officer of Health can get the job done, can fulfill the delivery of the mandatory public health programmes by the local units and carry out the responsibilities of the Chief Medical Officer of Health under the *Health Protection and Promotion Act*. If the Chief Medical Officer is in the ministry they are at the table and has a degree of influence from being at the table but also has to be part of a team to some extent. In my opinion a lot can be accomplished by working within the system provided you have a pathway and protection to speak out when needed, both procedural and legal protection.
The Ministry needs to maintain and control policy, funding, and accountability including the transfer payment function to the local boards of health; the Chief Medical Officer of Health should oversee that. The Chief Medical Officer should retain programmatic responsibilities. Being an assistant deputy minister gives you rights of access you don’t have if you’re a watchdog off in the corner someplace.

The logic of this position is persuasive.

The Commission therefore recommends:

- Subject to the guarantees of independence set out below, the Chief Medical Officer of Health should retain a position as an Assistant Deputy Minister in the Ministry of Health and Long-Term Care.

- The Chief Medical Officer of Health should be accountable to the Minister of Health with the independent duty and authority to communicate directly with the public by reports to the Legislative Assembly and the public whenever deemed necessary by the Chief Medical Officer of Health.

- The Chief Medical Officer of Health should have operational independence from government in respect of public health decisions during an infectious disease outbreak, such independence supported by a transparent system requiring that any Ministerial recommendations be in writing and publicly available.

- The local Medical Officer of Health should have the independence, matching that of the Chief Medical Officer of Health, to speak out and to manage infectious outbreaks.
10. The Public Health Ping-Pong Game

Public health in Ontario including protection against infectious disease is delivered primarily through 37 local Boards of Health, which are largely controlled by municipal governments. Public health funding has gone back and forth like a ping-pong ball between the province and the municipalities.

Before 1997, the province funded 75 per cent of public health expenditure and the municipalities funded 25 per cent everywhere except in the Greater Toronto Area where the province funded 40 per cent and the six separate boroughs funded 60 per cent.

Some public health programmes, however, were funded 100 per cent by the province. One local Medical Officer of Health put it this way:

> They [the province] always make exceptions when they feel like it so there were some stated provincial priorities that they paid 100 per cent for and they started with sexual health clinics back in the 1980’s and then added tobacco prevention and control and then added teaching health units . . . healthy babies, healthy children is one of the most recent . . . They pick and choose what they want to pay for . . .

In 1997, Ontario introduced legislation to download all public health and many social services to the municipalities with the tradeoff that the province would assume full responsibility for education. Although public health financing was to be downloaded, the province was to maintain authority to set provincial standards. Although the province provided no funds for public health, it sought to retain control in the form of mandatory programme and service guidelines promulgated in 1997. This was dubbed the “all say, no pay” regime. It came into force in January 1998.

The rationale for downloading had nothing to do with the best way to run public health. As Mr. Tom Closson, President and Chief Executive Officer of the University Health Network in Toronto, noted at the Commission’s public hearings:

> I think it’s a big weakness in the Ontario healthcare system that Public Health is under the municipalities. As you might know, Public Health
was put under municipalities as a tax issue, because taxation for education was moved out of the municipalities and into the province was a tax balancing effort. It had nothing to do with what would be the best way to run a healthcare system.

Again, if you look at other provinces, you’ll see that Public Health is part of the Regional Health Organizations and hospitals, community health, public health, are all under a single governance structure.¹⁴⁵

Public health, a much smaller budget item than social assistance or public housing, did not bulk large in the controversies and the provincial-municipal negotiations that preceded the downloading. Despite the efforts of the public health community which included the Public Health Branch in the Ministry of Health, the Ontario Public Health Association, the local Medical Officers of Health and local health boards to whom they reported, public health remained relatively invisible and efforts to maintain a stronger provincial role were unsuccessful.¹⁴⁶

The total downloading of public health funding to the municipalities lasted about a year. Since March of 1999 the provincial share has increased and the province and the municipalities now share public health funding 50-50: As one Medical Officer of Health noted:

... typically the chronology is that the municipality approves our budget on the Board’s advice or not and then that goes to the Ministry and they will cover 50 per cent of the eligible costs. Up until now they have not done it on a line-by-line basis; it has been a block grant.

Although the general funding rule is 50-50, some programmes like the Healthy Babies, Healthy Children Program are funded 100 per cent by the province. This means that the global provincial contribution in any particular health unit will likely be more than 50 per cent. To take one example, the 2001 Annual Report of the Muskoka-Parry Sound Health Unit recorded the following revenue breakdown:

---

¹⁴⁵ *SARS Commission Public Hearings,* October 1, 2003, p. 188.

¹⁴⁶ For a helpful review see the following unpublished paper by a group of scholars at the University of Toronto: Kristina A. Millan, Howard Shapiro, Raisa B. Deber, *Who Did What to Public Health in Ontario: A Clash of Policy Communities.* (Subsequent footnotes will refer to this report as the Deber Report.)
Municipal Levy 33.9 per cent

Provincial Public Health Programmes 41.8 per cent

Provincial 100 per cent funded programmes 24.3 per cent

One difficulty with 100-per-cent provincial funding of specially picked programmes is the municipal fear that the province will start a programme at 100 per cent then withdraw the full funding, leaving the municipality holding the bag. A similar observation was made in the context of recent Toronto Public Health budget discussions:

Past health board Chair Joe Mihevc (Ward 21, St. Paul’s) said the province has a pattern of funding programs at 100 per cent initially and then requiring the city to pay 50 per cent once they’re up and running.

The liaison unit and West Nile virus are two prime examples.

“They (province) can’t seduce us into a program and then leave us holding the bag after they’ve paid the initial 100 per cent,” Mihevc said.147

Another difficulty with the current structure of municipal funding, even though it attracts a matching provincial grant, is that there is not enough money to pay for basic programmes like infectious disease and infection control. As one local Medical Officer of Health pointed out:

. . . if you look at control of infectious disease and infection control, which are the two programmes that apply here most specifically, the mandate is not strong enough and the resources are not sufficient . . .

In hindsight, post SARS, the mandate in infection control is quite weak and even in its weakened form, we have not had the resources to implement it to a sufficient degree given the number of hospitals and doctors and number of germs and everything else.

Although the province now shares more than half the cost, it still lacks overall control over public health in Ontario. It is a basic fact of publicly funded programmes that he who pays the piper calls the tune. When the province funds public health directly, it

controls the content and direction of public health. When public health is funded by the municipality, the province loses direct control and can only do its best to influence public health by indirect measures such as the mandatory guidelines published in December 1997.

So long as the municipalities fund public health to a significant degree, public health will have to compete with other municipal funding priorities. Communicable disease control is a basic public necessity that can affect the entire province if a disease gets ahead of the controls. Infectious disease control should not have to compete against potholes for scarce tax dollars. As one group of scholars noted:

At the local level, public health is now in the position of having to constantly battle for funding, within a framework which makes it illegal for local governments to run a deficit . . . Such health protection services as food safety inspection are also vulnerable to political pressure: certainly, in the past, the provincial Medical Officer of Health has had to “back up” local health departments. Full municipal funding has also highlighted the fact that many public health units do not currently have enough resources to deliver even the existing mandatory programs, and some impetus for revising them downwards has lately begun. There is some concern that when difficult economic times recur, even communicable disease control may be seen as a lower priority – until the epidemics begin.148

The next section, “One Local Funding Problem” demonstrates in exquisite detail the problems that can arise through the present system of local funding of public health and the disinterest shown by some municipal politicians in the public interest in effective public health protection.

It is easy for the province to set minimum standards on paper, but difficult to enforce them on the ground when public health services are paid for and controlled by the municipality either completely or on the present 50-50 basis.

There are some institutional elements of provincial influence. The province must approve the initial appointment of the local Medical Officer of Health and the province appoints members to the local Board of Health, but never as many as the municipality. Although the Chief Medical Officer of Health for Ontario has some direct powers that can be exercised in an outbreak, if delegated to her by the Minister,

---

the limited degree of provincial funding and the indirect nature of provincial authority leads to less real day-to-day control and more reliance on time consuming and difficult processes of persuasion and informal mediation. These elements of provincial influence are indirect and give the province no daily operational or administrative control over the local Medical Officer of Health or the local health unit. As one local Medical Officer of Health put it:

... the local Medical Officers of Health report to their local Board of Health which is the legal entity that makes sure that the mandate is delivered, the connection with the province being of pretty loose accountability for boards and Medical Officers of Health to make sure that the programs were delivered. That is about it; there is no administrative reporting requirement as employees or anything like that.

Although machinery does exist to impose provincial will on a local health unit, it is the machinery of last resort, akin to managing a local conflict through the threat of thermonuclear force. As the aforementioned group of scholars noted:

New mandatory guidelines were released in December 1997; they provide the minimum standards and requirements for the provision of public health services. However, municipalities expect “pay for say” and are strongly opposed to rigid and prescriptive standards. Ultimately the Province has “absolute power when it chooses to utilize it,” but will have to decide how much it is willing to antagonize municipal governments to enforce standards.¹⁴⁹

As a practical matter, guidelines and standards have proved ineffective to ensure consistency of public health services throughout the province. Although the system may look good on paper, the Public Health Branch has conducted no regular assessments to ensure compliance. As noted above, the 2003 Provincial Auditor’s report found that no checks had been done in five years to confirm compliance:

... the Ministry had conducted virtually no regular assessments of local health units in the last five years to determine whether the health units were complying with the guidelines for mandatory programs and services. Such assessments were recommended in the Report of the Walkerton

While the Ministry of Health has begun some auditing of local health units, the historical lack of provincial enforcement of uniform standards leads some to suggest that the only answer is for the province to fund 100 per cent of public health programmes or at least 100 per cent of infectious disease programmes and to have a parallel uploading of provincial authority. This would thus ensure the imposition of uniform standards across the province under direct provincial control.

Others say that the need to upload funding and control to the province cannot be demonstrated at this time because the province does not at this time use its full powers to enforce the mandatory guidelines. Under this reasoning, the province should use all of its current powers before asking for more.

As noted below in the section “Central Control Over Health Protection,” it is essential that the province assume greater accountability and authority over public health protection. The Interim Walker Report recommended that the province fund 75 per cent to 100 per cent of public health resources within two to five years. Views will differ as to the precise ratio and as to whether the funding for public health programmes other than infectious disease control should be uploaded to some extent.

There is a consensus that some provincial funding upload is required. One Medical Officer of Health said:

\[\ldots\text{the 50-50 funding formula is killing us, and the Province needs to redress this issue ASAP. The province should pay at least 80 per cent. Furthermore, the Federal Government should contribute so we can maintain a surge capacity, especially if they expect us to do so much of the work in their pandemic plan. This could be part of the new deal for cities, because cities are where we are going to need the surge capacity.}\]

Another Medical Officer of Health said:

\[\text{Overall, more funding is required within the Public Health system. I would suggest a decrease in municipal funding levels to 20 to 25 per cent.}\]

---

This maintenance of some municipal input into funding would maintain interest and accountability.

... 100 per cent provincial funding for some specific programs, for example, control of infectious diseases programs, seems appropriate.

Some regard a 75-per-cent provincial upload as a sensible compromise. To quote one Medical Officer of Health:

The current public health funding has created a lot of dissatisfaction in spite of the fact that taking into consideration the Community Reinvestment Funds, the municipalities probably are accountable for 25 per cent and not 50 per cent of the funding. This however is not transparent and not well recognized. I think most people would be happy or could live with the pre-1998 formula of 75 per cent provincial and 25 per cent municipal. This is also a compromise between the current 50 per cent or the 100 per cent provincial funding advocated by certain people.

One Medical Officer of Health, asked whether the province should fund communicable disease protection 100 per cent, said:

We are torn. The concern would be if infection control gets funded 100 per cent because it is somehow more important than a variety of other things that public health gets involved with. Others would argue and perhaps myself that there are going to be more people that are going to be adversely affected by our rising epidemic obesity and lack of physical activity and all of those things, and yet infection control and SARS have taken the spotlight, West Nile has taken the spotlight. Two men die of West Nile and all of a sudden you have a coroner’s inquest. One hundred women die annually of cervical cancer in this province which is suppose to be a completely preventable cause of death and yet no one seems to want to do anything about them. So infection control, if it is funded 100 per cent because it is seen as being the most important thing that public health does, I think that the broader public health sector would have a problem with that because they do not necessarily see infection control as the most important thing that needs to be done for improvement of the public’s health . . .

It is ironic . . . as someone who has tried to get budgets approved at the local level, it is much easier to get local and municipal funding for a communicable disease program because it is concrete and people under-
stand it. Voters may actually die within the current term of council as opposed to trying to get funding for something that is going to prevent mortality 20 years from now whether that is obesity or nutrition. In fact most Medical Officers of Health have found it easier to get local municipal funding for disease programs than other public health issues. So the ironic thing would be if communicable disease programmes were taken over and funded 100 per cent by the province . . .

Reform has more to do with having a coherent system and the ability to dictate what the program and standards are across the province than adequacy of the funding . . . Especially when there is a demonstrated need, it is possible for local counsels to fund communicable disease control as much as anything else.

A similar view was expressed by another Medical Officer of Health:

My council never said no to infectious disease programmes; tuberculosis, HIV would get attention, but the other stuff, health promotion, we would have more difficulty to get funding for that. It comes down to what scares people the most . . .

Local Medical Officers of Health are leery of 100 per cent provincial funding. Although they complain about their local boards, the existence of the local board means the Medical Officer of Health is not entirely dependant on the province; they think it’s better to stick with the devil they know.

There is no scientific way to determine the appropriate degree of provincial funding upload for infectious disease surveillance and control. Although a case can be made for 100-per-cent funding upload, the persuasive views of a number of local Medical Officers of Health suggest that it would be sensible to upload infectious disease control to a provincial contribution of at least 75 per cent.

Opinions will differ as to how the funding formula should be changed, and whether and how much co-coordinating or direct power over public health should be uploaded to the province. The one thing on which everyone will agree is that the shifting of funding and accountability back and forth between the province and the municipalities has impaired the stability of Ontario’s public health system. It is time to stop the ping-pong game and to begin an era of stable public health funding relationships between the province and the municipalities.
11. One Local Funding Problem

An example of a recent dispute between a local Board of Health and the local Medical Officer of Health on the one hand and the municipalities they served on the other hand, reveals the fight many jurisdictions have to go through for public funding. Although this occurred before SARS, and is not directly related to the response to the outbreak, it nevertheless reveals systemic weaknesses and tensions in Ontario’s public health system.

In 2002, a local Medical Officer of Health in Ontario went to the Board of Health and requested a 27-per-cent increase in their budget. The Medical Officer of Health argued that the increase was necessary due to a 25-per-cent reduction in the budget between 1991 and 2001 and a 30-per-cent reduction in staffing during that same period of time. Based on the material presented by the local Medical Officer of Health, the Board of Health supported the increase in funding and approved the request. This meant an increase in the levy to those affected municipalities.

Under the *Health Protection and Promotion Act*, a local Board of Health has responsibility for ensuring the delivery of health services and programs in accordance with the Act and Regulations. The Board of Health was legally required to prepare an annual estimate of expenses for the next year and then transmit it to the obligated municipalities by written notice. The Act provides that upon receipt of the written notice the obligated municipality “shall pay to the Board of Health the amounts required by notice at the times required by the notice.” The provision is mandatory; there is no discretion not to pay. Moreover, the Act requires that obligated municipalities in a health unit shall ensure that the amount paid is sufficient to enable the Board of Health to provide or ensure the provision of health programs and services in accordance with the mandatory health programs and services and to comply in all other respects with the Act and the regulations.

---

151. *Health Protection and Promotion Act*, S. 59(2)(c). (This document is to be subsequently referred to by the initials *HPPA*.)
152. S. 72(8) *HPPA*
153. S. 72(8) *HPPA*
154. S. 72(2) *HPPA*
ensured by the presence on the Board of Health of a majority of members appointed by the elected municipal councils.

One of the obligated municipalities, in a budget report, noted:

The City Solicitor has confirmed that the Health Protection and Promotion Act requires an obligated municipality to pay expenses incurred by the Board of Health of the Health Unit, and that there is no discretion under the Act in favour of the municipality.

Despite this appreciation that the municipality was legally obligated to pay, the councils of the obligated municipalities went on to move that the health unit budget not be approved and that staff meet with the Board of Health and report back to the councils. Thus, although the Board of Health had approved the increase and the statute required that the municipalities pay it, the municipality refused.

The obligated municipalities asked the province to intervene. The deadlock continued, with the municipalities refusing to pay. On June 14, 2002, the Association of Local Public Health Agencies (aLPHA) expressed its concerns to the then Minister of Health:

As you know, all Boards of Health and Medical Officers of Health are required to comply with the minimum general and program standards embodied in the Guidelines. Local funding pressures not only prevent many boards of health from meeting minimum requirements, but puts additional pressures on them when emerging issues such as bioterrorism, drinking water quality, pandemic influenza, West Nile virus, etc. increase demands on resources.

This situation received significant attention during the inquiry into the Walkerton tragedy. One of the outcomes of this inquiry was the key and explicit recommendation to the Minister of Health and Long-Term Care to ensure that Boards of Health comply with the Guidelines.

We are very concerned that any movement toward excusing obligated municipalities from their statutory requirements runs counter to the HPPA itself, Commissioner O’Connor’s recommendations, and advice received from time to time from the Chief Medical Officer of Health. It would set a precedent that would be extremely detrimental to the ability of all Ontario boards of health and medical officers of health to obtain
the necessary resources required to execute their duties. This would be a significant step backwards in time when the importance of strengthening public health programs has been made abundantly clear.

Your government has already committed to implementing the recommendations of the O'Connor Commission, including ensuring that all boards of health are able to comply with your Ministry’s Guidelines. We hope that you as Ontario’s Minister of Health and Long-Term Care will realize that refusal by obligated municipalities to pay for local public health program constitutes a serious impediment to this ability.

The response from the province, signed by the then Chief Medical Officer of Health, was to advise aLPHA that he had met with the Board of Health and representatives from the obligated municipalities to discuss the budget and that the “ministry would facilitate further meetings of representatives of the Board of Health and obligated municipalities.” It is difficult to understand the need for further meetings. One cannot help but wonder why the Ministry of Health did not simply state the obvious to the councils: the law requires the local Board of Health, an independent entity, to set the budget, they have done so and you are obligated to pay.

On August 19, 2002, the Chair of the Board of Health wrote to the then Minister of Health. The letter summarized what had transpired following the setting of the budget by the Board of Health. The Chair noted that:

. . . members of the municipal councils of our obligated municipalities have met with you and your assistants over the past while, to express their concerns with the budget that has been passed by the Board of Health. We have met with members of the Ministry, as well as the Chief Medical Officer of Health, and the Mayors of our obligated municipalities in order to attempt to clarify for the Mayors our budget and budget process. I would also point out that while information has been provided to the obligated municipalities concerning the budget well before its passage, in fact, the Board of Health is comprised of twelve members, eight of whom are appointed by their respective municipalities, and these municipal representatives participated in our budget deliberations.

In the same letter, the Chair made the following comments about the proposed increase in the budget:
The Board of Health, in passing the budget that it did, approved expenditures that move the Health Unit in a minimally acceptable manner, forward, towards meeting the mandatory programs and standards set by the Ministry. The Board of Health, and not the obligated municipalities, is the body responsible for ensuring that the Health Unit takes reasonable and responsible measures to move towards compliance, mindful of the significant pressures placed on all of our Health Units in light of the Walkerton tragedy and other significant emerging issues such as West Nile virus, food premises inspection, bioterrorism, etc.

The Chair went on to note that, although the Board of Health was confident that it had available the legal means necessary to enforce the levies, it wanted to know, before moving in that direction, whether the Ministry was prepared to fund the short-fall between the levy and what the municipalities had paid, and whether the province intended to amend the Act to delete the mandatory programmes. The Chair noted that they raised this issue “in light of the apparent continuing receptive ear that the Ministry has given to these defaulting obligated municipalities.”

The Ministry of Health responded that there were no plans to change the current funding practice and there were no plans to amend the Act. The letter from the Ministry of Health went on to state:

I would take this time to remind you how critically important it is for boards of health to foster a good working relationship with its stakeholders at the local level. The preamble to the Mandatory Health Programs and Services Guidelines encourages all parties involved in the delivery of public health programs and services to engage in mutually constructive dialogue. I encourage you to seek out a resolution to the current impasse with the municipalities of your area. The only solution that is sustainable is one that is worked out locally. I am of the opinion that to maintain an adversarial relationship with the municipalities can only be detrimental to the public health system.

The impasse continued. Rather than enforce the municipalities’ legal requirements to pay, the Ministry of Health appointed a mediator to try to explore the potential for compromise and a billing adjustment. In effect, they were seeking to negotiate around a clear breach of the law. On September 10, 2002, the mediator proposed that the Board of Health reduce its 2002 budget request by 50 per cent for levy purposes only. This would require a partial refund to those municipalities who had already paid the levy in full. The letter states:
The mayors who have been resisting the budget increase have agreed that this gesture on the Board’s part will result in a reestablishment of meaningful dialogue between the parties respecting the current and future year needs of the health unit.

I realize that it is difficult for the Board of Health to relax its principles, but we believe that by taking this step, the board will send a clear message that it is willing to voluntarily suspend its legislated right, in an effort to build a harmonious relationship with its partners.

The alternative it appears, is for the board to pursue legal means of recovering the unpaid funds resulting in a potentially lengthy and expensive process, which further damages the already fractured relationships, and shifts the board’s focus and energy from addressing the health unit’s pressing public health issues and working towards mandatory program compliance.

We would strongly urge the Board of Health to consider this last ditch effort to restore the partnership, since we are convinced that they only sustainable solution is one reached locally.

The obvious question here is why a process was set up by the Ministry to help a local municipality shirk its legal responsibility to pay for core public health programmes.

Following the letter from the mediator, the Board of Health wrote to the mayors of the obligated municipalities and invited them to attend an information session with the Medical Officer of Health and the Board of Health to discuss a possible resolution. The Board of Health went on to state that they had received a legal opinion that they were in a position to request that the court compel the municipalities to make payment in accordance with their budget but that they did not want to take that drastic step without meeting to discuss any other alternatives. In a subsequent letter, the Board of Health stated that they would be prepared to agree to put any surplus available from the 2002 year to the 2003 levy.

In a response, one local obligated municipality refused to attend the meeting, because they felt that the Board of Health had made it “crystal clear that your client is adamantly opposed to any budgetary adjustment whatsoever” and that the involvement of the Minister and his staff “in seeking an amicable and sensible solution resolution of the issues has obviously been foreclosed.”
As of October 2002, the Ministry continued to communicate with the municipalities and to retain the services of a facilitator.

On October 18, 2002, the Board of Health issued an ultimatum to the municipalities: pay within 15 days or they will commence litigation. In the letter to the obligated municipalities, the Board of Health noted that the position taken by the municipalities had already resulted in significant delays in hiring staff thereby delaying addressing non-compliance with mandatory public health programmes. Moreover, the Board of Health understood that the reduction proposed by the facilitator would mean a reduction in funds from the province, since the province only matched funds actually received by a Board of Health. This meant that the Board of Health would be even further impaired in its ability to comply with mandatory programs and services. It also put the province in a conflict of interest because it benefited fiscally, by a reduction in the matching provincial grant, from any diminution in the municipal contribution. In the October 18, 2002 letter, the Board went on to point out that the proposal of the facilitator fundamentally affected the independent statutory mandate of the Board of Health and the Medical Officer of Health:

Further, of more significant concern to the Board of Health, and what seems to be ignored by [the facilitator] in his proposals, is that the position of the Municipalities at present fundamentally affects the independence of the Board of Health and the Medical Officer of Health. If this process of passing the budget, and requiring that the levy be paid by the Municipalities is altered in this case, it will be impossible to return to a system where the budgets are set by the Board of Health and paid by the Municipalities and the Ministry in accordance with the Act. It will allow municipal politicians and their councils to continue to interfere with the statutory obligations of the Board of Health. This is a particularly perverse result when 8 of the 11 current members of the Board of Health are from the member Municipalities who, on behalf of those Municipalities, pass the budget and approve the procedural by-laws in the first place. Further, at least one of the Municipalities has a legal opinion confirming that it is required to pay. There has been no legal opinion provided, by anyone in this case, indicating an alternative to the opinion. The Board of Health is extremely concerned that to allow the Municipalities to do anything but pay the amounts they are required to by statute, will undermine the independence of this Board and effectively all the Boards of Health throughout the Province. This is a significant and critical public health issue which seems to be entirely ignored in the negations in this matter.
It is critical that public health officials must be free to speak and act in the interests of public health. Unfortunately, the process that is being suggested by you will severely limit the independence of the Medical Officer of Health in protecting the public health in this area. The Board of Health has decided not to allow that to happen.

In the end, the Board of Health rejected your suggestion to write the Minister as we do not believe the Minister, or anyone on his staff, has any authority to change this process short of changing the Act. You will recall that in an interest to resolve this matter, the Chair of the Board of Health wrote to the Minister some months ago, asking for relief from mandatory programs to allow for cost saving. This was rejected out of hand by the Minister and, as such, we find ourselves in the present position.

On October 31, 2002, in a final attempt to persuade the obligated municipalities to pay the levy without having to resort to litigation, the local Medical Officer of Health made a presentation to the mayors of the obligated municipalities, appealing to them to pay the increased levy. During the presentation, the Medical Officer of Health eloquently posed the question:

What would the consequences be of reducing the budget? We would be gambling with people’s health – even their lives. That is not a gamble I am willing to take as your Medical Officer of Health. Especially for less than the price of a postage stamp per month per person . . .

We have heard about how our Health Unit should act as a business and make cuts rather than increase its budget. But the mission of a business is to deliver customer satisfaction at a profit. We do not have the option of eliminating programs to improve our bottom line. Our bottom line is the health of our population. If public health programs are eliminated or reduced, the health of our population will be adversely affected. We can’t say, for example, that we will stop accepting any of the thousands of water samples that are brought to us. Our programs must be accessible to all. Charging for public health programs and services would limit participation by those groups of people within our population who most need them.

155. The estimated increase in the municipal share amounted to $5 per person per year, less than the cost of one first class postage stamp per month.
The Medical Officer of Health concluded:

Our mission as I said at the outset is to protect and promote the health of our community. We are not your adversaries. We are your partners.

Finally, in November 2002, following this meeting and after making it clear to the obligated municipalities that the next step on the part of the Board of Health would be litigation, the obligated municipalities agreed to pay the levy, with the understanding that the municipal share of the Board of Health budget surplus from 2002 would be credited to the first billing for the 2003 levy.

In the meantime, as this battle was taking place, the local health unit had to continue to deliver programmes and services, in the midst of the uncertainty surrounding its resources. Because the province refused to insist that the law be followed, the Medical Officer of Health and the local Board of Health spent the better part of a year arguing about whether or not the municipalities had to follow the law. Unfortunately, the battle did not end there. In January 2003, two months before SARS hit, one of the mayors involved in this dispute was quoted in the media to the effect that although the battle to reduce the 2002 budget was lost, the fight would continue into 2003. Another mayor, in October 2003, listed one of his accomplishments on a campaign flyer as reducing the health unit levy. That same flyer noted that the mayor had improved roads in 2003. While improving roads is a laudable goal, roads should not be improved at the expense of public health protection measures that are required by law.

This story painfully reveals the importance of ensuring that funding for local health activities is not left to the mercies of any intransigent local council that fails to live up to its legal responsibilities in respect of public health protection. Basic protection against disease should not have to compete for money with potholes and hockey arenas. Even if most municipalities respect their public health obligations under the HPPA, it only takes one weak link to break the chain of protection against infectious disease. Should an infectious disease outbreak spread throughout Ontario, the municipality that cannot or will not properly resource public health protection may be the weak link that affects the entire province and beyond.
12. The Municipalities’ Funding Dilemma

In fairness to Ontario’s municipalities it must be pointed out that the problems of public health funding are not restricted to those few municipalities who disrespect their legal obligations. All municipalities are affected by the underlying difficulty of funding any provincial programme from the local municipal property tax base. SARS and West Nile showed that infectious disease protection has to be approached at a provincial level. It is anomalous to fund a provincial programme like infectious disease control from the limited municipal tax base. As the Association of Municipalities of Ontario pointed out to the Commission:

Clearly SARS, as with any epidemic, has demonstrated the need for a provincial public health leadership and financing mandate to tackle global threats. Municipalities simply do not have the capacity, resources or the mandate to tackle them and should not be left vulnerable to public criticism because of this . . .

The impact and speed at which SARS and West Nile virus spread across jurisdictions points to the vulnerability of the current structures, responsibility, authority and responsiveness of the system – both from a policy perspective and certainly the inappropriateness of subsidizing provincial health programmes by the property tax base. We may have another epidemic or pandemic to deal with in the near future, so the question is, are we better prepared than we were at the onset of SARS or West Nile virus? From the municipal perspective, there is still a significant vulnerability if there is no timely provincial policy responsibility and if financing of the public health base still rests on the property tax base. Managing such crises as SARS not only impacts public health services, it impacts other service areas as well from police, to fire, to ambulance, our communication systems and other services.

The capacity of the current structure and how it is financed in order to respond to a serious situation is disconcerting. AMO firmly believes that the time is now for the province and municipal government to develop a plan that begins to better reflect the capacity and ability to pay when it
comes to community health matters. We believe that this plan should start with infectious diseases and that if the province fully assumes this function, then we need to sit together to examine the structure and process for getting there while managing the rest of the public health portfolio.

Underlying the regrettable story just told are the basic systemic flaws pointed out above by the Association of Municipalities of Ontario. The Association makes a persuasive case for the province and the municipalities to sit down together and agree on the best structure to fund infectious disease protection and the best process for getting there.
SARS was not restricted to Toronto. The northern community of Parry Sound had two probable cases and quarantined 697 people. To quarantine 697 people in a town of 6,500, more than 10 per cent, is the equivalent of quarantining hundreds of thousands of people in the Toronto area\textsuperscript{156}.

The Parry Sound experience demonstrates that an infectious disease like SARS can emerge anywhere in Ontario and that each local hospital and each local health unit is a vital link in the chain that protects the entire province. The Parry Sound experience also demonstrates the structural weaknesses inherent in the local Medical Officer of Health system. Parry Sound's local Medical Officer of Health had resigned just before SARS II, a later phase of the outbreak that occurred after May 22, 2003, hit. The interim Medical Officer of Health had been on the job for under a week. There was no apparent mentoring or backup system to assist him. This created a dangerous gap in the province-wide system of surveillance directed by experienced local Medical Officers of Health.

The SARS cases in Parry Sound presented at the local hospital, the West Parry Sound Health Centre, between May 23 and June 1. One patient had been an inpatient in the Orthopaedic Ward at North York General Hospital in Toronto and the other patient had visited their spouse at the same ward. They were diagnosed, treated, and transferred to the Toronto area for further treatment. Another suspect case had been at North York General for a diagnostic MRI test. Because her children were also suspect cases, and had attended day care and school, it was necessary to impose the quarantine mentioned above.

More will be said in the final report about the impact of SARS and quarantine on Parry Sound. More will be said about the extra precautions taken by the hospital after SARS appeared to be over, precautions which ensured that the unexpected SARS cases were screened immediately and put under precautions before they entered the emergency department, thus avoiding spread within the hospital. This interim report

\textsuperscript{156} West Parry Sound Health Centre and the Muskoka-Parry Sound Health Unit, \textit{SARS – Impact in a Rural Community: Parry Sound’s Experience}, November 2003.
will deal with the systemic problems in the public health system demonstrated by the Parry Sound experience.

The hospital and the local public health unit faced major difficulties in their attempts to secure information on the actual SARS status of the patients who had been diagnosed with probable SARS or suspected SARS and transferred to Toronto for treatment. A hospital official noted:

We had extreme difficulty in tracking patients and their status after they left. We still don’t know officially whether they had probable SARS.

The hospital and the public health unit faced major difficulties in their attempts to get direction about the quarantine that appeared to be necessary because of the above-noted attendance at day care and school of the children of a suspect SARS case. On Saturday May 31, the senior hospital physicians and officials met all day. They had trouble getting in touch with the very newly designated interim Medical Office of Health who was busy with emergency patients in a hospital in another community about 80 kilometres away. They were unable to reach anyone in Toronto who could speak on behalf of the Chief Medical Officer of Health. The just-appointed interim Medical Officer of Health, when reached, was naturally reluctant to make any decision. It was initially suggested that officials in the local Parry Sound public health unit could make the decision, although in fact the decision to quarantine can only be made under the Health Protection and Promotion Act by the local Medical Officer of Health or the Chief Medical Officer of Health in Toronto. No one seemed to be in charge. The interim local Medical Officer of Health referred the local doctors to provincial officials in Toronto, and provincial officials in Toronto referred them back to the interim local Medical Officer of Health. The buck kept passing. The interim Medical Officer of Health tried to get in touch with the appropriate officials in Toronto. This indecision and confusion went on for a good part of the day. Eventually, the decision was made to quarantine but only after a decisive local physician made it clear that if no decision was forthcoming he felt himself bound to alert the media to the danger. To this day the local people do not know how the decision came to be made.

157. This quarantine decision has not been free from controversy. The Ontario Medical Association at the SARS Commission’s Public Hearings suggested that “. . . the quarantine recommendation was made without adequate understanding of quarantine protocols. This led to the unnecessary quarantine of nearly 10 per cent of the town’s population” (See SARS Commission Public Hearings, September 29, 2003, p. 51.) To the people at the ground on the time, struggling to contain what looked like a possible community outbreak, things looked much different than they do now to those who look at the decision with the benefit of hindsight. But everyone agrees that the Parry Sound situation was seriously hampered by the lack of a permanent local Medical Officer of Health.
It ascribes no criticism to anyone to say that the Parry Sound experience demonstrated serious systemic problems in Ontario’s public health system. The first problem, the inability to get information about the status of the patients diagnosed with probable SARS is part of the general lack of adequate information and communication systems, noted above.

The second problem, the confusion, indecision, and lack of transparency around the quarantine decision, demonstrates the weakness of a system of local public health control in a province where there are still, notwithstanding the Walkerton recommendations, eight Medical Officer of Health positions that have not been filled on a permanent basis. The Commission has also heard that there is a shortage of potential candidates with sufficient experience in infectious disease control and other public health disciplines.

There was, in the Parry Sound situation, no apparent machinery to support the newly appointed interim Medical Officer of Health; no sign of any mentoring system, no sign that there was anyone to turn to in a crisis for authoritative and experienced advice and assistance. This is no system for an emergency when decisions must be made quickly. It is fortunate, thanks to the judgment of a decisive local physician, that this dangerous gap in the system of public health protection did not lead to serious consequences.

The third problem is that the Muskoka-Parry Sound Public Health Unit, like many others in Ontario, did not have an adequate infectious disease team. Starting at the top, there was an interim temporary Medical Officer of Health who had been on the job less than a week. The position of epidemiologist, a vital function in outbreak management and infectious disease control, had been vacant since 1997. In 2000 the Board of Health agreed to fill the position but the Medical Officer of Health of the day did not think it was a priority. Attempts are now being made to secure approval to recruit an epidemiologist. A full communicable disease team would comprise, optimally, a Medical Officer of Health fully qualified in communicable disease, an epidemiologist, two or three communicable disease nurses, and two or three public health inspectors with communicable disease expertise. Far from a full team, the Muskoka-Parry Sound unit at the time of SARS had only 0.8 of the time of one communicable disease nurse.158

158. Some progress is being made. The 0.8 nurse will go to full time on communicable disease. There are now two part time communicable disease nurses in Parry Sound, the equivalent of one full time person. There is now an acting communicable disease manager, which the Board will be asked to turn into a full time position, and there are three public health inspectors trained in communicable disease.
Part of the general problem in recruiting and retaining the necessary professionals is that salaries set by local boards are not always competitive. A public health inspector making $47,000 in a small Ontario unit can move to Alberta tomorrow and do the same work for $60,000. While it is commendable that Ontario hospitals are increasing their infection control capacity by hiring infection control nurses, it is regrettable that they are hiring some of them away from local public health units who cannot compete with the salaries set by hospitals. Balanced against the strengths of local control over public health administration, is this inherent weakness, that local salary differentials can make it very difficult to attract and retain the level of professional expertise required.

If the present system of local control over public health and infectious disease is to be maintained, it is essential that machinery be put in place to ensure continuous unbroken oversight and authority in every public health unit in Ontario supported by the necessary cadre of public health professionals.
A consensus has developed that some kind of separate “CDC Ontario” is needed, with strong academic links, in order to provide a critical mass of medical, public health, epidemiological, and laboratory capacity and expertise. Structural models abound for such an organization, from the B.C. CDC, to the Institut national de santé publique du Québec, to the federal model proposed in the Naylor Report, and even to the U.S. CDC itself. It is expected that the final Walker Report will make detailed and prescriptive recommendations for the structure and mandate of such an organization.

One thoughtful observer described the need for clear lines between the work of the agency and the work of the Public Health Branch:

I would like to see an agency created as an intelligence service to public health, provincially and locally. There should be a clear lead for the Ministry on governance functions, and a clear lead for the agency on things like training, technology, knowledge transfer, advice on mandatory programme standards, and health human resource planning, the whole gamut of things that frankly those in the Ministry can’t attend to. The agency would have a degree of administrative flexibility that you don’t have in the civil service.

While it is beyond the scope of this interim report to address this issue in the detailed fashion expected from the final Walker Report, a few observations are in order.

First, the structure of the new agency or centre, which will combine advisory and operational functions, must reflect the appropriate balance between independence and accountability whether it is established as a Crown corporation or some other form of agency insulated from direct Ministerial control.

Second, it should be an adjunct to the work of the Chief Medical Officer of Health and the local Medical Officers of Health, not a competing body. SARS showed that there are already enough autonomous players on the block who can get in each other’s way if not properly coordinated. There is always a danger in introducing a semi-
autonomous body into a system like public health that is accountable to the public through the government. The risk is that such a body can take on a life of its own and an ivory tower agenda of its own that does not necessarily serve the public interest it was designed to support.

Third, it must be made clear from the beginning that the agency is not an end in itself but exists only to support public health. A useful summary of the appropriate role for such an agency is set out in the external review report of the B.C. Centre for Disease Control:

The B.C. CDC exists to carry out provincial surveillance, both epidemiologic and laboratory based, to provide expert assistance to local public health professionals and to provide some specific disease control services i.e., for tuberculosis and sexually transmitted diseases. The UBC CDC was created to ensure that research and the development of knowledge was promoted to complement the service mandate of B.C. CDC. The only other similar organization in Canada is the Institut national de santé publique of the Province of Québec. That organization is also responsible for provincial public health laboratory services, research, and expert support for public health practice in the province.159

To ensure that the new Ontario agency complements the service mandate of the public health system, the relationship must be clear between the new Ontario agency and the Chief Medical Officer of Health. Unless he or she has a clear say in the ongoing work and overall direction of the agency, and the ability to mobilize the resources of the agency to meet a public health problem when required, the agency will not fulfill its role as a source of support to public health operations. The Chief Medical Officer of Health must have more than a token role in the direction of any such agency. If the new agency is to have a Board of Directors, the Chief Medical Officer of Health, if not its Chair, should be at least its Associate Chair. To the extent the agency is operational as opposed to purely advisory, the Chief Medical Officer of Health must, in the face of a public health problem, be able to direct the operational resources of the agency so as best to meet the problem at hand, whether the resources are epidemiological, laboratory, or other.

If the Chief Medical Officer of Health lacks the ability to mobilize the resources of the new centre, resources created to support the work of the Chief Medical Officer of

---

159. Report by Dr. Paul Gully and Dr. Thomas Marrie, October 30, 2003.
Health and the local Medical Officers of Health, the danger exists that arose during SARS when the Science Committee and the Epi Unit were disconnected from the field operations. Whatever independence may be needed from government, whatever buffer required to ensure the academic and scientific integrity of the new agency, that independence and those buffers should not prevent the mobilization of its resources under the direction of the Chief Medical Officer of Health when required to meet a public health emergency.

For any public health agency to work, it must have authority with other sectors of the health care system and with the community as a whole. While some legislative authority will be necessary, the most important authority is what one local Medical Officer of Health described as “moral authority.” Speaking of the role he considered the local Medical Officer of Health to play in a community he stated:

Now you talk about the authority of public health . . . I have never felt that I have great authority. On paper, legislatively I have great authority. I can order people to do all kinds of stuff and they can choose not to do it and I can go in front of a judge, as I have on a number of occasions, to have something done. But most of our public health authority comes from our credibility and willingness and ability to work with other people to get things done. It does not come from the Medical Officer of Health issuing orders . . . Our authority comes in terms of dealing with individuals so most of public health success does not come through authority, not legal authority but through moral authority if there is such a thing.

This will no doubt hold true for a Centre for Disease Control in Ontario. The success of centres such as the CDC in Atlanta and the CDC in British Columbia flows largely from a widespread recognition that these institutions house the very best of the best. The authority comes from their recognition as centres of excellence that can be counted on to work collaboratively with local agencies. To achieve this authority and success an Ontario Centre for Disease Control will require considerable resources and a strong commitment from government to maintain those resources. It will only work if it has the resources to attract recognized experts and to provide them with the best technology and equipment and optimal support to perform their work. It will take years to build a reputation for excellence and anything less than a 100-per-cent commitment to this long-term goal will surely result in failure.
15. Public Health Restructuring

Whenever a system proves wanting it is tempting to blame its problems on structure and to embark on a course of reorganization, or centralization, or regionalization, or decentralization. It must be remembered that organizational charts do not solve problems. The underlying problems of public health in Ontario have to do with a lack of resources, years of neglect, and lack of governmental priority. As noted above, these problems developed during the regimes of successive governments and no government or political party is immune from responsibility for the decline of public health protection. These problems will not be fixed by drawing boxes on paper around public health units and moving them into other boxes. The underlying problems will only be solved by a reversal of the neglect that has prevailed for so many years throughout the regime of so many different governments headed by all three political parties.

One Medical Officer of Health stressed the importance of fixing the problems of the system instead of simply reorganizing it:

I think that if anyone is going to come in and think that they will suddenly make this a new system in Ontario and it is going to be functional, I would argue that it will not be. It will not be functional for a decade or more. It would take a great deal of time and effort to start doing those things at a local level and that time and effort would be far better spent in terms of not a reorganization or restructuring or complete revamping of public health in Ontario but focusing on whatever is a big problem, whether it be infectious disease in institutions or something else. Let us focus the effort on trying to fix whatever people think is wrong with that portion of that system rather than trying to restructure everything across the province.

That being said, some attention must be given to the best way to structure and organize the delivery of public health in Ontario. Arguments are made to reduce the number of public health units from 37, on the basis that the smaller units cannot afford the critical mass of expertise required to deliver effective local protection against infectious disease. Those who advocate the reduction in the number of health
units point to many difficulties including the inability or unwillingness of the present system to comply with the recommendations of the Walkerton Inquiry that each public health region be required to employ a full-time Medical Officer of Health. To date there are eight Medical Officer of Health positions that have not been filled on a permanent basis. This demonstrates the remarkable inability of the present regional system, in the aftermath of a public health tragedy, to meet minimum standards. This inability to attract and retain the professional leadership it needs to protect the public shows that something is seriously wrong with the present regional system of local public health units.

The interim Walker report recommended that the existing number of public health units should be reviewed and, within two years, reduced from 37 units to 20 to 25 units.

Some question whether it is necessary to reduce the number of local units instead of providing the necessary critical mass of expertise to serve a number of individual units, on the argument that the problem is not the number of local units, but the lack of support and resources made available to the local units.

Is the problem simply the sheer number of local boards, or is it the functional inability of a local board to attract the critical mass of expertise necessary to manage public health programmes? Although it may be intuitively appealing to say that 37 is just too many, is there a way to preserve the value of a widespread local presence reflected in the present number of boards? Could a regional or centrally supportive structure be devised to give them access to the necessary critical mass of expertise and to consolidate control spans during a time of public health emergency?

No one who spoke to the Commission showed any appetite for a new regional structure, perhaps from fear of another layer of bureaucracy between the field and the Chief Medical Officer of Health. One Medical Officer of Health noted:

> History does not suggest that you need to have that regional level; I mean the concern of adding additional layers, the system is already decentralized enough.

While the last thing the public health system needs is another layer of bureaucracy, Ontario has had success over the years with non-bureaucratic structures of regional support including the Crown Attorney system, the Coroners’ system, and the court system. One Medical Officer of Health noted the usefulness of an earlier system of
regional Medical Officers of Health serving as a local resource. Before closing the book on the options for public health reorganization, consideration should be given to the development of a non-bureaucratic, supportive, regional structure to provide assistance to the field and to consolidate the control span of the Chief Medical Officer of Health.

Another general observation about the restructuring process is that no matter how public health is restructured, it will continue to be delivered at the local level. The local Medical Officers of Health and the people on the ground under their direction are the backbone of the public health system. The point of service is the local public health unit. It would be shortsighted to focus unduly on reform of the central organizations like the Chief Medical Officer of Health and the Public Health Branch of the Ministry of Health and the new CDC Ontario (whatever it is called) at the expense of reforms and increased resources at the local level.

One Medical Officer of Health expressed this view very succinctly:

I'm worried that the public health system at municipal level may not be reformed to extent it should be; I think it's being lost in the shuffle. The primary focus for change and reform seems to be at the provincial level. The backbone of the public health system is the local boards of health and they aren't getting not getting the proper focus or attention.

A similar concern was expressed by another Medical Officer of Health:

Everything happens at the local level. The local level is the point of service. Funds must flow to this level. Public Health saves the province money. Health is a provincial responsibility so the province should fund strong local units. There is also opportunity for the Feds, and it would be far more cost-effective to have funding and results at the local level than many of Health Canada’s current activities.

160. This Medical Officer of Health stated: “There used to be regional MOH’s that worked for the province, at one point three or four of them and at some point up to about six of them. They were resourced to a local MOH. They were individuals who spent the bulk of their time going around the area that they were serving, finding out what was going on and they were a resource that you could go to, but over the years, those positions went. They had no authority but they were consultants, people who had additional information that you could go to and they were of value and of help, perhaps more in the outlying areas than in Toronto.”
Whatever is done by way of structural revision, two adjustments are clearly needed to the role of the local Medical Officer of Health.

The first is to ensure, as noted above, that the local Medical Officer of Health enjoys the same degree of political independence from the local power structure that the Chief Medical Officer of Health enjoys from the province. Both the local Medical Officer of Health and the Chief Medical Officer of Health require the ability to speak out on public health issues without going through a political filter, and need to manage outbreaks free from politically motivated interference.

The second is to ensure that the local Medical Officer of Health is not buried in the municipal bureaucracy. It has been suggested that some local Medical Officers of Health, as municipalities moved to consolidate, have been sucked into the corporate municipal entity instead of retaining the executive authority over their own operations that is necessary to ensure their accountability for the administrative machinery that makes public health work on the ground. As the Association of Local Public Health Agencies noted in October 1997 during the hearings on Bill 152, which significantly amended the Health Protection and Promotion Act:

\[\ldots\text{it is essential for the local Medical Officers of Health to retain statutory responsibility to serve as executive officer of the board of health. Of necessity, this must include responsibility for the management and administration of health programs and services and the related business affairs of the board, as well as responsibility for direction of employees and others whose services are engaged by the board.}\]^{161}

As a result of these concerns, the present Section 67 was added to the Act to provide that those engaged by a Board of Health to deliver public health programmes are subject to the direction of the local Medical Officer of Health who, in turn, is responsible to the local board for the management of those programmes. The problem is that some municipalities have accepted neither the spirit nor the letter of Section 67 and the province has demonstrated little appetite to take on a fight against those municipalities.

Some Medical Officers of Health suggest that Section 67 has not prevented the apprehended danger that public health administration would become lost within the

---

municipal bureaucracies. One Medical Officer of Health described the current diminution in the authority of the local Medical Officer of Health over the administrative machinery that drives the delivery of public health protection:

There is a sense that Medical Officers of Health lost out after the down-loading to the municipalities reflected in Bill 152 in 1997, effective January 1998, when the Medical Officer of Health lost their position as the executive officers of boards of health and the administrative and business function was taken from the Medical Officer of Health and given to municipal government. In some cases staff necessary to deliver public health programmes have, since then, been taken away from the Medical Officer of Health and assigned to other areas of municipal work.

Boards of health and municipalities have taken great liberties as result of the powers and duties of the Medical Officer of Health being watered down. If we change the funding of public health so it is far more driven by the province; it makes sense to revisit those earlier decisions to give more power to municipalities over the Medical Officer of Health.

A Medical Officer of Health in one of Ontario’s largest cities said:

Most of us are lost deep down in municipal bureaucracies. This needs to be corrected. The Medical Officer of Health should be the Chief Executive Officer of a distinct service unit with accountability to a Board.

Because of the overall provincial interest in public health protection and because of the statutory obligations of the local Medical Officer of Health to ensure public health protection, the provisions of Section 67 should be enforced or if necessary amended to ensure that the Medical Officer of Health has direct administrative control over the personnel and administrative machinery required to deliver public health protection.

The big question, of course, is whether the present decentralized system should remain. Should public health in Ontario continue to be delivered and administered through local public health boards accountable in large part to local and regional municipal councils?

On the one hand, no other province in Canada has devolved so much public health responsibility to the municipal level. The Interim Walker Report noted that Ontario has the most widely dispersed and fragmented public health system in the country. In
an age of emerging and reemerging infectious diseases that can sweep across the world and across countries and provinces with no respect for boundaries, it is counterintuitive to place a super-ordinate value on municipal autonomy in infectious disease prevention, surveillance, and outbreak management. Because infectious diseases can spread so rapidly and so widely, Ontario’s protection against infectious disease is only as strong as the weakest local link.

On the other hand, many public health programmes such as chronic disease prevention and health promotion depend on local community partnerships with agencies, schools, nongovernmental organizations, and voluntary associations. There is a strong view that something of great value would be lost if local initiatives and local involvement in health promotion were destroyed through centralization of all public health functions under the province.

Ideally a structural balance can be struck which gives the province central control over infectious disease surveillance, prevention, and outbreak management, leaving with the municipalities some room to participate in those programmes, together with a significant financial and operational role in community-based health promotion.
There is an inherent tension between two kinds of public health work. While different terminology is used from time to time the two kinds of work are sometimes broadly characterized as infectious disease protection on the one hand and health promotion or population health on the other hand.

Infectious disease protection includes safe food, safe water, infection control in hospitals, day care centers and long-term care facilities, rabies control, safe water, sexually transmitted diseases, tuberculosis control, and vaccine preventable diseases. This work includes risk assessment, surveillance, case-finding, contact tracing, immunization, and infection control. It also deals with emergency response, investigation and control during outbreaks including investigation and control.

Health promotion includes programmes to prevent chronic disease and to encourage healthy eating, tobacco reduction, physical fitness, early cancer detection, prevention of injury and substance abuse, family health, sexual health, breastfeeding and other aspects of child and family life.

Infectious disease protection aims at immediate threats to public health like SARS and influenza while health promotion and population health aims at less immediate threats which make up the largest burden of disease in the community, including chronic lifestyle diseases. The work in infectious disease protection is conducted largely within the public health and health care system while the work in health promotion and population health is conducted largely through community partnerships with schools, non-governmental organizations, and the volunteer sector. One thoughtful observer suggested this was a crucial difference between infection control and health promotion, and that infection control requires more public health leadership and resources because, unlike health promotion, infection control lacks the community based allies and partners available to health promotion programmes.

The original mission of public health, historically, had mainly to do with protection against infectious disease. In the 19th century, protection from infectious disease – then a major cause of death – was the main focus of public health in Ontario. The
earliest public health legislation was an Act passed in 1833 by the Legislature of Upper Canada,

\[\ldots\] to establish Boards of Health to guard against the introduction of malignant, contagious and infectious diseases in this province.\[162\]

Vaccines, sanitation, medical improvements and antibiotics reduced the burden of infectious disease, shifting patterns of morbidity and mortality from diseases like diphtheria to diseases like coronary heart disease. As infectious diseases receded in importance as a cause of death in the 20\textsuperscript{th} century, public health expanded into many other program areas, especially in the fields of chronic disease and injury.

The shift in public health priorities to long-term population health promotion, coupled with the general decline in public and governmental attention to infectious disease control,\[163\] has led to the point where our public health system is not well equipped to deal with significant outbreaks of a new communicable disease. As noted in the Naylor Report:

\begin{quote}
As we have seen with SARS, questions now exist as to whether the Canadian public health system is minimally equipped and organized to deal with even a modest-sized outbreak of a new communicable disease.\[164\]
\end{quote}

The inadequate priority for infectious disease protection has been reflected in a number of ways.

Toronto Public Health, for example, may have been the largest public health unit in the country, but it lacked sufficient infectious diseases control resources and capabilities. For example, prior to SARS, it was not meeting provincial minimum mandatory requirements for control of infectious diseases and infection control for institutions. This meant that it did not have strong representation on every hospital infection control committee in Toronto.

Toronto Public Health was not alone.

\[163\] See the section on “The Decline of Public Health.”
\[164\] Naylor Report, p. 45.
As noted above, the infection control capacity of Muskoka-Parry Sound Health Unit before SARS consisted of the equivalent of less than one full-time infection control nurse. The unit also lacked public health inspectors trained in infectious disease control and there was a long-standing vacancy for an epidemiologist. And when SARS II struck, it had a freshly appointed acting Medical Officer of Health.

On the eve of the SARS outbreak, many health units were in the same position of not having a qualified Medical Officer of Health. As the Provincial Auditor stated in his 2003 report:

According to the Ministry, there is a national shortage of physicians with community medicine training to fill vacancies, and as of January 2003, there were eight boards of health without the mandated full-time medical officer of health. While there were individuals acting in the medical-officer-of-health position, according to the Ministry they may not have had all of the required qualifications for the position. At five boards, acting medical officers of health had occupied the position for over three years.\textsuperscript{165}

None of the mandatory guidelines was accompanied by effective compliance monitoring. As a result, there was inadequate provincial oversight to ensure that the public health system was capable of combating an outbreak. In effect, local health units were told what infectious diseases programmes they were required to have, but no one checked to ensure they were actually implementing them – or had sufficient funding to do so.

When Part One of the Walkerton Report was released in January 2002 – incidentally, more than a year before the SARS outbreak – it recommended that the Ministry of Health and Long-Term Care verify compliance with the mandatory guidelines through regular assessments and that it,

\ldots annually track trends in non-compliance in order to assess whether changes are required to the mandatory programs and whether resources require adjustments to ensure full compliance.\textsuperscript{166}

However, as the Provincial Auditor noted in his 2003 report,

Ministry staff informed us that, since 1998, only one assessment of a local health unit had been undertaken and that in March 2003, the Ministry began limited assessments of mandatory program areas at five local health units.\(^\text{167}\)

The Commission has been informed that the Public Health Branch has begun to conduct audits of public health units.

A further example of the lack of priority given to infectious disease control by the provincial Public Health Branch is in the area of TB surveillance, where the Provincial Auditor raised some concerns in his 1997 report. However, these issues had not been fully addressed by the time of his 2003 report. The Provincial Auditor’s 2003 report provides a useful snapshot of the situation in public health infection control in the days leading up to SARS – since it was based on an audit that was mostly completed before SARS.\(^\text{168}\)

On the continuing inadequacy of TB surveillance, the Provincial Auditor stated:

> In our 1997 Annual Report, we recommended that the Ministry should improve its ability to track individuals under surveillance for inactive TB. At that time we noted that the Public Health Branch had indicated that approximately 35 per cent of the individuals who were required to undergo medical surveillance for inactive TB by boards of health, including notifying the appropriate authorities of address changes, could not be followed up on due to missing or incorrect information such as a wrong address provided. Ministry staff also indicated at that time that Public Health Branch staff may be able to use OHIP’s Registered Persons Data Base to obtain the necessary information.

Information reported by local health units to the Ministry for the 2001 year indicated that only 65 per cent of referred individuals were success-

---

\(^{168}\) See page 218 of the 2003 report by the Provincial Auditor which stated: “Our audit, which was substantially completed in March 2003, was conducted in accordance with the standards for assurance engagements, encompassing value for money and compliance, established by the Canadian Institute of Chartered Accountants and accordingly included such tests and other procedures as we considered necessary in the circumstances. The criteria used to conclude on our audit objectives were discussed with and agreed to by ministry management and related to systems, policies, and procedures that the Ministry should have in place. Towards the end of our audit, the Ministry and health service providers were coping with an outbreak of Severe Acute Respiratory Syndrome (SARS). Since our audit fieldwork was substantially completed before this outbreak occurred, our audit did not include work in this area.”
fully contacted and managed by local health units in accordance with the Ministry’s Tuberculosis Control Protocol. We were advised that local health units were required to inform the Ministry of those individuals who could not be contacted. However, the Ministry had not determined whether local health units were fully complying with this requirement. Procedures had also not been implemented to utilize the Ontario Health Insurance Program’s (OHIP’s) Registered Persons Data Base to attempt to locate individuals who had not reported to a local health unit or had not undergone a physical examination and x-ray.

To help reduce the incidence of active tuberculosis, the Ministry should enhance the effectiveness of medical surveillance by:

• ensuring that local health units consistently and appropriately complete the medical surveillance of individuals with inactive tuberculosis, including ensuring that they have undergone a physical examination and x-ray; and

• using all available sources of information, including the Ontario Health Insurance Program’s Registered Persons Data Base, to track those individuals under medical surveillance who were not successfully contacted and managed by local health units.¹⁶⁹

This tuberculosis example presents as a symptom of the inadequate priority given to protection against infectious disease.

SARS made it clear that our public health system must give greater priority to protection against infectious disease. It is equally clear, however, that our entire public health system cannot be reorganized around one disease like SARS. Many diseases produce more sickness and mortality than SARS, and the task of plugging the holes demonstrated by SARS cannot be permitted to detract public health from the task of preventing those afflictions that comprise a higher burden of disease than SARS and other infectious diseases.

As one local Medical Officer of Health noted:

The concern would be [if] infection control gets funded 100 per cent because it is somehow more important than a variety of other things that public health gets involved with and so I think there would be others that would argue, and perhaps myself, that there are going to be more people that are going to be adversely affected by our rising epidemic [of] obesity and lack of activities and all of those things and yet it is infection control and the cases of SARS that has taken the spotlight, it is West Nile has taken the spotlight; . . . two men die from West Nile and all of a sudden you have a coroner’s inquest. One hundred women die annually of cervical cancer in this province which is suppose to be a completely preventable cause of death, and yet no one seems to want to do anything about them.

Another Medical Officer of Health pointed out the greatest burden of disease in the community is no longer communicable disease and that chronic lifestyle diseases pose a greater long-term threat to the health of the community:

I just want to come back to a few things about diseases that public health does. I do not think that anyone has suggested that the response to SARS should be the enhancement of programs for obesity control for example, but aLPHA is making a point that in the same way that community disease control in public health has been neglected in the last few years and it is not the only area. There are other areas which are in need and may in the long run lead to problems. Public health has always been about trying to prevent what is mostly causing people to become ill and die in society. In the late 19th century that was mostly communicable disease so public health had its roots there. If you look at the top 10 causes of death in Ontario in 1880, half of them were communicable diseases. If you look at top 10 causes of death in Ontario today, there is only one communicable disease on the list and that is pneumonia and it is down on the list and usually taking elderly people who are sick with heart disease. So the picture of health has changed dramatically and so our programs have changed. If you are trying to prevent a death and whether it is a death from a heart attack or from SARS, the technology to do that is different. In the case of a heart attack we do not have a vaccine for that but we do have preventative intervention and some of which is educational. It is all about trying to change what a 10-year-old kid eats for lunch and then changes what he eats when he is 40 years old and then 50–60 and what his pattern of activity is and we know if we change those things, then we will have one less heart attack or one hundred less in a
thousand. So those are the interventions that we have early in life now that are comparable to vaccines or hand washing for communicable diseases.

The importance of health promotion and the fight against chronic diseases is directly relevant to the ability of a population to withstand the onslaught of infectious disease. One Medical Officer of Health thoughtfully brought this home in the context of SARS:

If we put all our resources into communicable diseases then other kinds of disease prevention can suffer from lack of investment. Look who was at highest risk from SARS, they tended to be people with chronic disease, diabetes and other chronic diseases. It is shortsighted to put all our eggs into preventing this afternoon’s problems when tomorrow’s problems will become today’s.

While it would be wrong to downgrade the long-term importance of health promotion and population health, the immediate threat posed by any infectious outbreak requires that a dominant priority must be given to protecting the public against infectious disease. It does not disrespect the advocates of health promotion to say that the immediate demands of public safety require that public health, as its first priority, looks after its core business of protecting us from infectious disease.

As noted in the Naylor Report there is little disagreement that:

... public health has essential roles in areas such as health protection (food and water safety), disease surveillance, and outbreak management, and these functions must be given priority.\textsuperscript{170}

As one member of the Science Committee put it, quoted below in a different context:

... I maintain that of all the public health things we can do, if we don’t control infectious diseases there’s no point to going after cancer, cardiovascular disease, well babies and all of those things.

The tension in public health, between priority for infectious disease control and priority for long-term population health promotion, including the prevention of chronic diseases.

\textsuperscript{170} Naylor Report, p. 19.
lifestyle diseases, is not going to go away. There is no point in arguing which is more important, because they are both important. There are however five basic reasons why protection against infectious disease should be the first basic priority of our public health system.

The first is that the threat from infectious disease is direct and immediate. The second is that an outbreak of infectious disease, if not controlled, can bring the province to its knees within days or weeks, a threat not posed by lifestyle diseases. The third is that infectious disease catches the direct attention and immediate concern of the public in a way that long-term health promotion does not. It is essential in an infectious disease outbreak that the public be satisfied that they are getting solid information from the government and that everything possible is being done to contain the disease. The fourth is that infectious disease prevention requires an immediate overall response because it moves rapidly on the ground and spreads quickly from one municipality to another and from province to province and country to country, thus engaging an international interest. The fifth is that health promotion depends largely on partnerships outside the health system between public health and local community agencies like schools and advocacy groups, allies and resources not available to infectious disease control which must stand largely on its own.

For these five reasons safe water, safe food, and protection against infectious disease should be the first priorities of Ontario's public health system.
17. Central Control over Health Protection

An uncontrolled outbreak of infectious disease could bring the province to its knees. The province-wide consequences of a failure in infectious disease control are simply too great for the province to delegate infectious disease protection to the municipal level without effective measures of central provincial control. There is little machinery for direct central control over infectious disease programmes. The existing machinery to enforce local compliance with provincial standards is cumbersome and underused. Better machinery is needed to ensure provincial control over infectious disease surveillance and control.

The present distribution of legal powers under the Health Protection and Promotion Act gives the local Medical Officer of Health an enormous ambit of uncontrolled personal discretion, which is not ordinarily subject to the review or influence of the Chief Medical Officer of Health. The Chief Medical Officer of Health does have some override powers, and cumbersome machinery does exist under which the province might ultimately bring to heel a rogue board of health. But public health authority in Ontario over infectious disease control, including outbreak management, is primarily that of local officials with no direct accountability to any central authority.

There is no clear accountability to any central provincial authority for local public health decisions to quarantine thousands of people locally. There is no clear accountability to any central authority for local decisions not to quarantine, decisions that could lead to epidemic community outbreak of a deadly disease. This lack of clear central authority could require the Chief Medical Officer of Health, during a virulent outbreak like SARS, to negotiate with separate local Medical Officers of Health whether particular cases should be reported as SARS to the international community and whether or not the quarantine power should be invoked. This lack of central authority could lead to gross and irrational inequality in the application of the quarantine powers throughout the province if different local Medical Officers of Health exercised their individual authority without regard to any consistent central guidance.

During a disease outbreak the international community and organizations like the World Health Organization look for reassurance and credibility to the national and provincial level, not to the particular strength of any local public health board or the
particular credibility of any local Medical Officer of Health. Viruses do not respect boundaries between municipal health units. The chain of provincial protection against the spread of infectious disease is only as strong as the weakest link in the 37 local public health units. A failure in one public health unit can spill into other public health units and impact the entire province and ultimately the entire country and the international community. When dealing with a traveling virus, concerns about local autonomy must yield to the need for effective central control.

Although some local Medical Officers of Health treasure their local autonomy from the province and from the Chief Medical Officer of Health, even in relation to outbreak control, there is a degree of recognition that clear and consistent central provincial authority is required for effective protection against infectious disease.

Dr. Richard Schabas, a former Chief Medical Officer of Health, noted at the public hearings:

I think we need clearer lines of authority within our public health system. At the moment, local public health authorities are not directly answerable or reportable to the provincial authority and I think, particularly in a crisis like SARS, that’s something that’s important.\(^{171}\)

The lack of clarity around the respective accountability of the Chief Medical Officer of Health and the local Medical Officer of Health is striking. To quote a former Medical Officer of Health:

Q: I am unclear as to what effective powers the Chief Medical Officer of Health has in general terms over the system of protection against infectious disease.

A: Well it is hugely unclear, is it not? . . . Certainly clarifying the accountability would be a benefit whether the people like the outcome or not because right now it is very vague.

Another Medical Officer of Health commented on the inconsistent relationship between the Chief Medical Officer of Health and the local Medical Officer of Health:

\(^{171}\) SARS Commission Public Hearings, September 30, 2003, p. 28.
the relationship between the local Medical Officer of Health and Chief Medical Officer of Health is not formalized. At times, the Chief Medical Officer of Health can be a mentor and adviser, at other times he or she serves an appellate court function (e.g., HPPA s. 22.1). In dealing with perspectives related to one person in one position, it is also important to acknowledge that personality traits will also influence these informal relationships. At times, incumbent Chief Medical Officers of Health have acted as if a master-servant relationship existed, where none is defined by law or policy. At most other times, the perspective of the province is that public health is delivered through independent boards, with all accountability for decisions a local matter, and an unwillingness to advocate for or support the local Medical Officers of Health. Recommendations in this area would be largely determined by the directions the province chooses to follow with respect to governance, funding and structure.

Another experienced Medical Officer of Health, while favouring a continuing element of local control, agreed that clearer lines of authority were necessary:

I think the first issue is whether Ontario wants to continue to have a decentralized system for public health and decentralized governance under local Boards of Health. If yes, when exceptions would apply in a health emergency, whether infectious or non-infectious. I do think that is a mutual benefit in maintaining some devolution of control to the local level for day-to-day responsibilities including day-to-day management of infection control and local outbreaks. It would be totally overwhelming for the province to be responsible for and give direction on the huge weight of disease issues that come up every day. But the roles and responsibilities and terms of engagement that need to take effect in a multi-jurisdictional situation, an outbreak in a number of local units, needs to be much clearer. One of the outcomes from our collective experiences during SARS is that those roles and relationships need to be more clearly defined . . .

The province will have to revisit both the current framework and the existing mandatory programmes to make the surveillance process stronger and less ambiguous. It is no good at the end of the day to point fingers at each other and say “I thought you were supposed to be doing it” The public has no tolerance for it, and neither do those who work in the system.
Another experienced Medical Officer of Health, no friend of central authority for its own sake, recognized its need in respect of communicable disease control:

I think it has been more recognized because of the widespread nature of the impact of SARS that there is a provincial interest in having an effective public health system . . . [We] do not have in real terms a health care system because of the variety of components that work or do not work together effectively. But the public health system is loosely connected because it is decentralized and is probably appropriate for many different kinds of public health programs that you need to customize to the local needs. But communicable disease control is increasingly being recognized as something necessary across the province and the system needs to work together where communicable disease crosses [local boundaries].

Another Medical Officer of Health, while advocating local public health autonomy in a general sense, recognized in thoughtful terms that infectious disease control requires a stronger element of central provincial control:

I think that communicable disease is one of the areas where local control is a bit less important in my estimation, where consistency is more important. But I would hate to have the entire template for public health set based on that example because local control is more important with many of the other things that we deal with, where you are trying to change community values such as around tobacco, changing the way that the community thinks about health issues, thinks about behaviours which have an impact on health. It is much more important to work locally and they do that very differently in Kenora than in Toronto. But communicable disease control in a hospital in Kenora and Toronto is not as different as it is with these other programmes. I make a plea that local control is very important particularly for other programmes . . .

Clearly infectious disease really requires some kind of consistent application. I would rather have the central organization send out whatever [directives] are necessary even if the are wrong, in one sense, because they could then correct it as they learn more. Whereas if each of the Medical Officer of Health were developing our own procedures and protocols, some of us may be right and others may be wrong and the confusion that would come from that would be far worse than having the central group be wrong and then correct it all around the province the next day or the day after. So I think related to communicable disease control, consistency
is important. So clearly the provincial organization that can collect data on a larger number of cases should be in a much better position to come up with important ways of dealing with that particular kind of infection and should be able to distribute that out to the field in some linked and logical and coordinated kind of way to ensure at the local level that those things are being carried out.

In theory, mechanisms do exist for the province to assert control over a local health unit that is not delivering adequate public health protection. One Medical Officer of Health was asked about this issue:

Q: What if the local board does not allocate enough money to maintain the necessary level of public health protection?

A: Then you move to the assessment and compliance machinery in the HPPA.

The difficulty is that the assessment and compliance machinery is infinitely complicated, replete with notices, directions, orders, procedures before the Health Services Appeal and Review Board and the Superior Court of Justice and appeals therefrom. It more resembles an international peacekeeping operation than it resembles effective machinery to enforce basic health protection standards across the province. And there is a further question of political will. One Medical Officer of Health asked the question:

As long as public health is entangled in two different levels of government it becomes more difficult to find the political will to improve public health. If the provincial government wants to make a deal with a municipality on transport funding, and needs the goodwill of the municipality, will the government encourage the Minister of Health to crack down on the municipality if it isn’t up to standard on public health protection?

Under the present Act, the legal and practical backbone of local disease control is the local Medical Officer of Health. It makes sense that the initial responsibility should be local. But that initial arrangement makes no sense unless it can be influenced by provincial leadership and can shift, instantly, to the provincial level when a threatened or actual outbreak imperils the provincial public interest.

There are two basic ways to ensure the appropriate measure of central accountability and authority for infectious disease protection.
The first way is to leave essential public health legal powers in the initial hands of the local Medical Officer of Health, subject to some machinery to displace those powers to the Chief Medical Officer of Health during a designated provincial public health outbreak. Although this system maximizes the ordinary local autonomy of local Medical Officers of Health, municipal autonomy is hardly a value of superordinate importance when dealing with viruses that cross municipal, provincial, federal, national, and international boundaries. And the complicated legal machinery necessary to trigger the imposition of central powers, unless made infinitely more simple than the almost medieval system for provincial override of local public health boards, would deprive the provincial override of any practical value in a public health threat.

The second way is to place essential public health legal powers in the hands of the Chief Medical Officer of Health, those powers to be exercised on a day-to-day basis by the local Medical Officer of Health, subject to the ultimate direction of the Chief Medical Officer of Health. This retains all the public health powers under the Act within the presumptive local authority of the local Medical Officer of Health. But it leaves a clear role for provincial leadership and it provides a safeguard and an immediate change of the default position, whenever required, to central provincial authority. This kind of arrangement works well in the justice system where the local Crown Attorney is the agent of the Attorney General, and where the regional senior judge exercises in their region the powers of the Chief Justice, subject to the direction of the Chief Justice.

If the Health Protection and Promotion Act were amended to provide that:

- The powers now assigned by law to the Medical Officer of Health are reassigned to the Chief Medical Officer of Health, and
- The powers reassigned to the Chief Medical Officer of Health shall be exercised by the Medical Officer of Health in the local region, subject to the direction of the Chief Medical Officer of Health,

it would leave the local Medical Officers of Health a clear field to exercise the same powers they have always exercised, subject to ultimate central direction.

Under the old system, such a re-arrangement of powers might raise serious concerns of loss of autonomy on the part of the local Medical Officer of Health including the spectre of political influence from Queen’s Park on local public health decisions. While concerns about local autonomy will never go away in any centralized system,
the new independence of the Chief Medical Officer of Health and the Medical Officer of Health should go a long way to allay such concerns.

A further sensible measure to allay these concerns, and to further protect against the perception of political interference with public health decisions, would be to remove from the Minister of Health under the Act the direct operational power in cases of health risk, such powers to be assigned to the Chief Medical Officer of Health.

These measures are proposed to strengthen provincial control over public health protection with adequate safeguards to ensure the political independence of the Chief Medical Officer of Health and the local Medical Officer of Health in relation to infectious disease control.

Without stronger measures to ensure central provincial control of infectious disease control whenever necessary, Ontario will be left with inadequate protection against potential public health disasters.
18. Twenty-one Principles for Reform

The lessons of SARS yield 21 principles for public health reform:

1. Public health in Ontario requires a new mandate, new leadership, and new resources.

2. Ontario public health requires renewal according to the principles recommended in the Naylor, Kirby, and interim Walker reports.

3. Protection against infectious disease requires central province-wide accountability, direction, and control.

4. Safe water, safe food, and protection against infectious disease should be the first priorities of Ontario’s public health system.

5. Emergency planning and preparedness are required, along with public health infrastructure improvements, to protect against the next outbreak of infectious disease.

6. Local Medical Officers of Health and Public Health Units, the backbone of Ontario public health, require in any reform process a strong focus of attention, support, consultation and resources.

7. Reviews are necessary to determine if municipalities should have a significant role in public health protection, or whether accountability, authority, and funding should be fully uploaded to the province.

8. If local Boards of Health are retained, the province should streamline the processes of provincial leadership and direction to ensure that local boards comply with the

172. Basic infectious disease programmes include protection against infectious disease, surveillance for early recognition of infectious outbreaks, food safety, water safety, infection control in hospitals, daycare centres and long-term care facilities, rabies control, sexually transmitted diseases including HIV/AIDS, tuberculosis control, and vaccine preventable diseases.
full programme requirements established by the province for infectious disease protection.

9. So long as the local boards of health remain in place: The local Medical Officer of Health should have full chief executive officer authority for local public health services and be accountable to the local Board. Section 67 of the *Health Protection and Promotion Act* should be enforced, if necessary amended, to ensure that personnel and machinery required to deliver public health protection are not buried in the municipal bureaucracy.

10. Public health protection funding against infectious disease should be uploaded so that the province pays at least 75 per cent and local municipalities pay 25 per cent or less.

11. A transparent system authorized by law should be used to clarify and regularize the roles of Chief Medical Officer of Health and the local Medical Officer of Health in deciding whether a particular case should be designated a reportable disease.

12. The Chief Medical Officer of Health, while accountable to the Minister of Health, requires the independent duty and authority to communicate directly with the public and the Legislative Assembly whenever he or she deems necessary.

13. The Minister of Health should assign his or her operational powers under the *Health Protection and Promotion Act* to the Chief Medical Officer of Health.

14. The Chief Medical Officer of Health should have operational independence from government in respect of public health decisions during an infectious disease outbreak. Such independence should be supported by a transparent system requiring that any Ministerial recommendations be in writing and publicly available.

15. The local Medical Officer of Health requires independence, matching that of the Chief Medical Officer of Health, to speak out and to manage infectious outbreaks.

16. Operational powers of the local Medical Officer of Health should be reassigned to the Chief Medical Officer of Health, to be exercised locally by the Medical Officer of Health subject to the direction of the Chief Medical Officer of Health.

17. An Ontario Centre for Disease Control should be created as support for the Chief Medical Officer of Health and independent of the Medical Officer of Health.
should have a critical mass of public health expertise, strong academic links, and central laboratory capacity.

18. Public health requires strong links with hospitals and other health care facilities and establishes, where necessary, an authoritative hospital presence in relation to nosocomial infection. Respective accountability and roles and responsibilities of public health care and health care institutions in respect of infectious outbreaks should be clarified.

19. Ontario and Canada must avoid bickering and must create strong public health links based on cooperation rather than competition to avoid the pitfalls of federal overreaching and provincial distrust.

20. The Ontario government must commit itself to provide the necessary resources and leadership for effective public health protection against infectious disease.

21. Public health requires strong links with nurses, doctors and other health care workers and their unions and professional organizations.

It is expected that the final report of the Walker expert panel will recommend a detailed prescriptive blueprint for many of the operational details of a renewed system. Such operational details are beyond the scope of this interim report. Some of the issues that will drive these details are discussed above.
19. Political Will

A reformed public health system requires a major injection of resources. The Naylor, Kirby, and interim Walker reports analyzed the need for a critical mass of scientific and medical expertise, more capacity to educate, recruit, and retain public health professionals, increased laboratory capacity, and improved technology. Further recommendations are expected in the final Walker report. Significant financial resources will be needed to give Ontario’s public health system any reasonable capacity for protection against infectious disease.

The decline of public health protection in Ontario reflects a consistent lack of political will, over the regime of many successive governments and all three political parties, to bring up to a reasonable standard the systems that protect us against infectious disease.

Competition for tax dollars is fierce. It is not easy in a time of fiscal constraint for any government to make additional funds available for any public programme. It will require significant political will on the part of the Minister of Health and the Ontario government to commit the funds and the long-term resolve that are required to bring our public health protection against infectious disease up to a reasonable standard.

It would be very easy, now that the SARS outbreak is over, to put public health reform on the back burner. It is a general habit of governments to respond to a crisis by making a few improvements without fixing the underlying problems responsible for the crisis. It would be a tragedy if that turned out to be the case with SARS. As the Naylor Report pointed out:

SARS is simply the latest in a series of recent bellwethers for the fragile state of Canada’s . . . public health systems. The pattern is now familiar. Public health is taken for granted until disease outbreaks occur, where-upon a brief flurry of lip service leads to minimal investments and little real change in public health infrastructure or priorities. This cycle must end.173

173. Naylor Report, p. 64.
Ontario, as demonstrated in this interim report, slept through many wake-up calls. Again and again the systemic flaws were pointed out, again and again the very problems that emerged during SARS were predicted, again and again the warnings were ignored.

The Ontario government has a clear choice. If it has the necessary political will, it can make the financial investment and the long-term commitment to reform that is required to bring our public health protection against infectious disease up to a reasonable standard. If it lacks the necessary political will, it can tinker with the system, make a token investment, and then wait for the death, sickness, suffering and economic disaster that will come with the next outbreak of disease.

The strength of the government’s political will can be measured in the months ahead by its actions and its long-term commitments.
Appendix A: The Commission’s Ongoing Work

The Commission was appointed by order in council dated June 10, 2003. Although some preliminary interviews were conducted in June and July, the work did not get fully underway until August after premises were secured and a small core of staff had been retained.

This preliminary report is based upon the public health aspects of the SARS crisis that have emerged from the evidence obtained during the course of investigation until now.

The Commission continues to investigate in order to tell the public the story of SARS, what happened, what went right, what went wrong, and what lessons emerge from the entire experience. The specific terms of reference, to be addressed in the final report, are set out in Appendix B. These issues include, among others, health worker protection, occupational health and safety in hospitals and emergency response. Many who contracted SARS and who lost family members to SARS have spoken to the Commission with particular concerns which will be addressed in the final report.

Most of the Commission’s investigation takes place through confidential interviews. Over 300 people have provided information on the condition that their names will not be used in the report and that their disclosure to the Commission is confidential and not subject to private or public access. A few people have been interviewed without such guarantees and they may be quoted in the report.

The Commission is grateful to those who have come forward to provide information and in particular to the many who suffered from SARS and lost family members to SARS, who shared their stories despite the pain of reliving their suffering and loss. The Commission will speak to more SARS victims in the months ahead including those who lost loved ones to SARS.

174. During June and into July the health care system was still dealing with SARS patients and public health authorities were still dealing with SARS issues. It was required by the terms of reference, and by common sense, that the investigation be conducted in a manner that does not impede ongoing efforts to isolate and contain SARS.
The Commission will continue to conduct interviews in the months to come. Anyone who wishes to speak to the Commission or provide information to the Commission should contact Commission Counsel, Mr. Douglas Hunt, Q.C., (416-212-6868) or Assistant Commission Counsel, Ms. Jennifer Crawford (416-212-6867).

In addition to the private interviews, the Commission held six days of public hearings. The first round of public hearings were held on September 29, 30 and October 1 at the St. Lawrence Market (North Market) in Toronto. The second round of hearings were held on November 17, 18 and 19, at the St. Lawrence Hall, in Toronto. Everyone who asked to present to the Commission was given an opportunity to be heard. Over one hundred people spoke to the Commission during these six days of public hearings.

Transcripts of the presentations, along with some of the power point presentations and written submissions provided to the Commission by presenters during the public hearings, are available for public viewing at the Commission web site: www.sarscommission.ca.

There is no deadline for the completion and submission of the final report. The Commission's present intention is to have the final report in the hands of the Minister late this year or early next year. The work will continue until the Commissioner is satisfied that all necessary evidence has been reviewed and that the terms of reference have been fulfilled.

For further information or future updates on the work of the Commission, please visit our web site at www.sarscommission.ca.
Ontario
Executive Council
Conseil exécutif

On the recommendation of the undersigned, the Lieutenant Governor, by and with the advice and concurrence of the Executive Council, orders that:

WHEREAS the Minister of Health and Long-Term Care has appointed the Honourable Mr. Justice Archie G. Campbell to investigate the recent introduction and spread of Severe Acute Respiratory Syndrome ("SARS") pursuant to section 78 of the Health Protection and Promotion Act;

WHEREAS the Minister of Health and Long-Term Care has provided Mr. Justice Campbell terms of reference for the investigation in a letter dated June 10, 2003;

WHEREAS persons who disclose information to Justice Campbell in the course of his investigation will be protected from any adverse employment action;

AND WHEREAS it is desirable to support Mr. Justice Campbell’s investigation and to mandate full co-operation with him by all Government ministries, boards, agencies and commissions:

ALL Government Ministries, Boards, Agencies and Commissions, and their employees, shall assist Mr. Justice Campbell to the fullest extent in order that he may carry out his investigation;

ALL Government Ministries, Boards, Agencies and Commissions shall respect the independence of the investigation;

THE Attorney General shall furnish Mr. Justice Campbell with the resources and support referred to in paragraph 7 of the terms of reference for the investigation.

Recommended: _______________________________  Concurred: _______________________________

June 10, 2003

The Honourable Mr. Justice Archie G. Campbell
130 Queen Street West
Toronto, ON M5H 2N5

Dear Mr. Justice Campbell:

This letter will confirm your appointment as an independent Investigator, pursuant to section 78 of the Health Protection and Promotion Act, to investigate the recent introduction and spread of Severe Acute Respiratory Syndrome (SARS). I would like to express my thanks for your valuable input into the development of the Terms of Reference for this inquiry, a copy of which is appended hereto.

As you are aware, persons who disclose information to you in the course of your investigation will be protected from any adverse employment action, pursuant to Section 9.1(1) of the Public Inquiries Act.

As indicated in the Terms of Reference, you will deliver your reports to me and I will release them to the public. You will receive resources and support staff through the Ministry of the Attorney General, pursuant to paragraph 7 of the Terms of Reference.

In accordance with the attached Order in Council, all Government ministries, agencies, boards and commissions and their employees have been directed to co-operate with your investigation and to respect its independence.

On behalf of the Government and the people of Ontario, I thank you for agreeing to accept this most important mandate.

Yours very truly,

Tony Clement
Minister
Appendix D: Terms of Reference

Independent SARS Commission
Terms of Reference

1. The subject matter of the investigation shall be:

(a) how the SARS virus was introduced here and what measures, if any, could have been taken at points of entry to prevent its introduction;

(b) how the SARS virus spread;

(c) the extent to which information related to SARS was communicated among health care workers and institutions involved in dealing with the disease;

(d) whether health care workers and patients in health care treatment facilities and long-term care facilities were adequately protected from exposure to SARS, having regard for the knowledge and information available at the time;

(e) the extent of efforts taken to isolate and contain the virus and whether they were satisfactory or whether they could have been improved;

(f) existing legislative and regulatory provisions related to or that have implications for the isolation and containment of infectious diseases, including the quarantine of suspected carriers;

(g) any suggested improvements to provincial legislation or regulations, and any submissions that the Province of Ontario should make concerning desirable amendments to federal legislation or regulations; and,

(h) all other relevant matters that Mr. Justice Campbell considers necessary to ensure that the health of Ontarians is protected and promoted and that the risks posed by SARS and other communicable diseases are effectively managed in the future.
2. The investigation shall be conducted in a manner that does not impede ongoing efforts to isolate and contain SARS.

3. Mr. Justice Campbell may request any person to provide relevant information or records to him where he believes that the person has such information or records in his, hers or its possession or control.

4. Mr. Justice Campbell shall hold such public or private meetings as he deems advisable in the course of his investigation.

5. Mr. Justice Campbell shall conduct the investigation and make his report without expressing any conclusion or recommendation regarding the civil or criminal responsibility of any person or organization, without interfering in any ongoing criminal, civil or other legal proceedings, and without making any findings of fact with respect to civil or criminal responsibility of any person or organization.

6. Mr. Justice Campbell shall produce an interim report at his discretion and deliver it to the Minister of Health and Long-Term Care who shall make the report available to the public. Upon completion of his investigation, Mr. Justice Campbell shall deliver his final report containing his findings, conclusions and recommendations to Minister of Health and Long-Term Care who shall make such report available to the public.

7. To conduct his investigation Mr. Justice Campbell shall be provided with such resources as are required, and be authorized by the Attorney General and shall have the authority to engage lawyers, experts, research and other staff as he deems appropriate, at reasonable remuneration approved by the Ministry of the Attorney General.

8. The reports shall be prepared in a form appropriate for release to the public, pursuant to the Freedom of Information and Protection of Privacy Act.

9. These terms of reference shall be interpreted in a manner consistent with the limits of the constitutional jurisdiction of the Province of Ontario.

In the event that Mr. Justice Campbell is unable to carry out any individual term of his mandate, the remainder of these terms of reference shall continue to operate, it being the intention of the Minister of Health and Long-Term Care that the provisions of these terms of reference operate independently.
Appendix E: The Economic Impact of SARS

SARS inflicted untold pain and suffering on its victims, their families and friends. In all, 247 people in Ontario had probable cases of SARS and a further 128 had suspect cases. Forty-four people died of SARS. Up to 20,000 people may have been quarantined.\textsuperscript{175}

But SARS also had economic consequences that affected everyone in Ontario. It is impossible to calculate the overall economic effect of SARS, including the personal financial toll on those whose families were struck or the toll on health workers and health care institution. The purpose of this appendix is simply to point to the scale of magnitude of involved in any estimates of the overall costs of SARS.

Some experts have suggested it was fortunate that SARS hit the Greater Toronto Area, with its major teaching hospitals, world-renowned medical school and the largest local public health unit in the country. As the Naylor Report stated:

Having the SARS outbreaks occur in Canada’s largest city presented many challenges. However, it may have been fortuitous that SARS struck Toronto and not a less-advantaged region of the country. Few rural and small urban hospitals have resident specialists in infectious disease; infection control officers/nurses are often part-time, and include infection control among a number of somewhat unrelated functions such as nursing super-vision or occupational health.\textsuperscript{176}

The corollary is that SARS also affected Ontario’s, and indeed Canada’s, most important single economic engine. The GTA, which some economists call the country’s “primary economic locomotive,” produces nearly 20 per cent of Canada’s gross domestic product\textsuperscript{177} and is home to about 40 per cent of Canada’s corporate head

\textsuperscript{175} SARS Commission Public Hearings, September 29, 2003, p.82
\textsuperscript{176} Naylor Report, p. 20.
\textsuperscript{177} The standard measure of the overall size of the Canadian economy, gross domestic product is the market value of all goods and services produced in a year in Canada.
If the GTA falters, the effects are felt not just in Ontario, but also in Canada as a whole.

Because the Ontario and national economies were also affected by the stronger Canadian dollar and the mad cow scare during the second quarter (from April to June) of 2003, federal and provincial experts caution that it is hard to pinpoint the precise impact of SARS.  

The Ontario tourism industry which generates $18 billion in annual sales, about four per cent of Ontario’s GDP, was badly affected by SARS. It employs over four hundred and eleven thousand employees, more than seven per cent of total provincial employment, and more than the construction or public administration sectors.

In a presentation to the Commission, Terry Mundell, President and CEO of the Ontario Restaurant and Motel Association, stated:

The immediate economic impact of the SARS outbreak was previously unimaginable. In areas of Toronto, the epicentre of the outbreak, restaurant sales and many establishments dropped 80 to 90 per cent overnight. With business and leisure travellers cancelling trips into Ontario, some hotels posted single digit occupancy rates . . . In April 2003, Ontario lost over twelve thousand (12,000) hospitality and tourism jobs . . . [In the] first half of 2003, visitors to Ontario dropped 17.9 per cent over the year previous which had also shown decline from 2001. By June of this year [i.e. 2003] international border crossings were down over 20 per cent. U.S. visitors [were] down over 20 per cent. International tourism revenues for the period of February to June of this year [i.e. 2003] were down a staggering $639 million, nearly 30 per cent below Ministry of Tourism forecast for that period.

Other sectors were also affected. According to the Ministry of Finance:

---

The SARS outbreak, which lasted from the end of March to mid-June, had a widespread impact on Ontario’s economy.

In addition to the decline in visitors, local residents curtailed their shopping and entertainment activities. The arts and entertainment sector in Ontario recorded growth of 1.6 per cent compared with 4.2 per cent in the rest of Canada. Retail activity fell 0.5 per cent even though grocery store sales rose as many people chose to substitute meals at home for restaurant outings.

Production in the health and social services sector slipped 0.2 per cent in the second quarter. While the fight against SARS mobilized additional resources, this was more than offset by a drop in activity as many health care workers were placed on quarantine, and most non-emergency procedures were postponed.\textsuperscript{182}

The Naylor Report also looked at the economic impact, stating:

Estimates based on volumes of business compared to usual seasonal activities suggest that tourism sustained a $350 million loss, airport activity reduction cost $220 million, and non-tourism retail sales were down by $380 million. It seems entirely possible that the direct and indirect costs of SARS could reach $2 billion.\textsuperscript{183}

As Table 1 illustrates, SARS also increased provincial spending. At the end of June 2003, the Ministry of Finance estimated that SARS had generated an estimated $1.073 billion in unforeseen expenditures in the 2003-4 fiscal year.\textsuperscript{184}

\textsuperscript{183} Naylor Report, p. 211.

When Erik Peters, the former Provincial Auditor looked at the issue in October 2003, he estimated that SARS-related expenditures would total $720 million, of which $250 million would be recovered from Ottawa.\textsuperscript{186}

The economic consequences of SARS contain an important lesson. They underline the vital importance of sufficiently funding public health, which according to the Association of Local Public Health Agencies, accounts for less than one per cent of provincial health spending.\textsuperscript{187}

As one local Medical Officer of Health told the Commission:

\begin{quote}
The public health system has always demonstrated a tremendous value for the expenditure of public funds. It is important to note that the Ontario public health system was funded at $40 per capita in 2003 . . .
\end{quote}

\begin{quote}
The public health system has delivered tremendous value, and has focused on the overall health priorities. The fact remains that it is a
\end{quote}

\textsuperscript{185} Ministry of Finance, \textit{Ontario Finances — Quarterly Update—June 30, 2003.}
system that is substantially under-funded at a time when the illness care system monopolizes the provincial budget. As the Naylor panel pointed out, “... and, given the very small percentage of publicly funded health spending directed to public health functions, the levels of investment that would have a transformative effective on public health capacity are comparatively small – ranging by province from the tens of millions to the low hundreds of millions annually.” Put another way, what does our society expect for $40 a person?

SARS proved that infectious disease, in addition to its human toll, can have a devastating effect on the economy. When the government considers the cost of public health reform in the overall competition for tax dollars, it should consider the potential cost of failure to invest in public protection against infectious disease. The expenditures required to provide effective protection against infectious disease are relatively small when compared to the overall cost of health care. A failure to invest in public health infrastructure and infectious disease control could be economically disastrous.

</table>
This report is dedicated to those who died from SARS, those who suffered from it, those who fought the disease, and all those affected by it.
April 5, 2005

The Honourable George Smitherman MPP
Minister of Health and Long-Term Care
10th Floor Hepburn Block
80 Grosvenor St.
Toronto, Ontario
M7A 2C4

Dear Mr. Minister:

Pursuant to the terms of reference, letter of appointment, and Order in Council establishing the independent SARS Commission I submit the attached second interim report.

Yours truly,

Archie Campbell
Commissioner
Introduction and Executive Summary

Introduction — Fixing the System

The Commission’s first interim report in April 2004 recommended major changes in the public health system. The government accepted those recommendations and committed itself to implement them in an ambitious three-year programme. Improvements so far have been significant. But much more work remains to fix the broken public health system revealed by SARS in 2003.

More financial and professional resources are needed, otherwise all the legislative changes and programme reforms will prove to be nothing but empty promises. The test of the government’s commitment will come when the time arrives for the heavy expenditures required to bring our public health protection up to a reasonable standard.

This second interim report deals with legislation to strengthen the Health Protection and Promotion Act and to enact emergency powers for public health disasters like SARS or flu pandemics. It is produced now to respond to current government plans for further amendments to the Health Protection and Promotion Act and radical changes to the Emergency Management Act.

The recommendations in this second report are interim, not final or exhaustive. The report touches only on those issues subjected already to sufficient discussion between the government and the health community to make them ripe for action. More extensive consultation is required on issues such as the role of public health in infection control and surveillance in health care facilities, the proposals for emergency powers such as compulsory immunization, the enhancement of infection control standards through amendments to legislation such as the Public Hospitals Act and the Long-

---

1. The Honourable Mr. Justice Archie Campbell, The SARS Commission Interim Report, SARS and Public Health in Ontario, April 15, 2004. (Subsequently referred to as the Commission’s first interim report.)
Term Care Act, 1994, and communication between public health and health care facilities.

Suggestions have been received for legislation to strengthen occupational health and safety protection for health workers. That issue will be dealt with in the final report. Occupational health and safety is a vital aspect of the Commission's work. It cannot however be addressed adequately in the limited confines of this report and must be addressed together with the stories of the many health care workers who sacrificed so much to battle SARS.

The Commission continues to investigate the story of SARS. As noted in Appendix C, Commission's Process and Ongoing Work, more than 400 interviews have been held, including victims of SARS and those who lost family members. Their stories and those of health care workers and others who fought bravely to contain SARS have informed these preliminary reports and will be told in the final report. The final report also will give a general account of what happened during SARS and what further steps are necessary, beyond those already recommended in the Commission's two interim reports, to correct the problems disclosed by SARS.

Independent Medical Leadership

Medical leadership that is free of bureaucratic and political pressure is what builds public confidence in the fight against deadly infectious diseases such as SARS.

As Dr. Richard Schabas, a former Chief Medical Officer of Health for Ontario, so aptly described the issue to the Commission at its public hearings:

I've avoided discussing the impact of politics on this outbreak but I think that to ensure that there's public credibility, that the public understands that the public health officials are acting only in the interests of public health and are not influenced by political considerations, that this has – or that we have to put greater political distance between our senior public health officials and the politicians.

The Commission, noting the government’s steps to give the Chief Medical Officer of Health more independence, recommends completion of the work of ensuring that office is independent of political considerations. Leadership and management of Ontario public health should be consolidated in the hands of the Chief Medical Officer of Health. This requires placing public health emergency planning, preparedness, mitigation, recovery, coordination and public risk communication under the direct authority of the Chief Medical Officer of Health. It also requires transfer of operational authority for public health labs, assessors, inspectors and enforcement from the Minister of Health to the Chief Medical Officer of Health.

The Commission also recommends that a parallel measure of independence be given to local medical officers of health, who are the backbone of our protection against disease in Ontario’s communities. The Commission noted that in some municipalities the local medical officer of health is buried in the municipal bureaucracy. (More on those problems is found in Chapter 3 Local Governance.) Local medical officers of health must be able to speak out about local public health concerns without fear of reprisal, dismissal or other adverse employment consequences.

Since SARS, there has been a proliferation of emergency committees throughout the provincial government. Strangely the Chief Medical Officer of Health is not in charge of those committees that bear directly on issues such as pandemic influenza which are central to our defence in public health emergencies. SARS showed us that while cooperation and teamwork are important, it is essential that one person be in overall charge of our public health defence against infectious outbreaks. The Chief Medical Officer of Health should be in charge of public health emergency planning and public health emergency management.

Public Health Governance

Any one of the 36 local health units can be the weak link in Ontario’s chain of protection against infectious outbreaks. It takes only one dysfunctional health unit to incubate an epidemic that brings the province to its knees.

Public health problems often result from the system of two governments, provincial and municipal, being involved in the operation of local health units. The public health community is divided into those who think this split governance is satisfactory, or at least salvageable, and those who say 100 per cent of funding and control of local health units should be uploaded to the province.
The Commission has heard continuing reports of municipalities diverting public health staff and funds to other departments, boards of health with members whose sole objective was to reduce health budgets, and medical officers of health fighting municipal bureaucracies and budget constraints to attain a proper standard of public health protection.

Not all local health units are dysfunctional. Some are well governed, but certainly the current weak state of affairs is unacceptable and cannot continue.

It is too early to say the system of divided governance is hopeless.

The government needs to make a clear decision on local health governance by the end of the year 2007, which is after the pending public health capacity review and implementation of recommendations. That gives the government time to decide whether the current system can be fixed with a reasonable outlay of resources or whether control of local public health should be uploaded 100 per cent to the province.

Ontario cannot go back and forth like a squirrel on a road, vacillating between the desire for some measure of local control and the need for uniformly high standards of infectious disease protection throughout the entire province. A clear decision point is required before some deadly infectious disease rolls over the province.

Whatever the ultimate solution to these problems, the Commission recommends five immediate measures required to strengthen public health governance and ensure a uniformly high standard of protection across the province: 1) Protect the local medical officer of health from bureaucratic encroachment; 2) Require by law the regular monitoring and auditing of local health units; 3) Change the public health programme guidelines to legally enforceable standards; 4) Increase provincial representation on local boards of health and set qualifications for board membership; and 5) Introduce a package of governance standards for local boards of health.

Local boards of health must be strengthened to ensure that those who sit on them are committed to and interested in public health, that they clearly understand their primary focus is on the protection of the public’s health, and that they broadly represent the communities they serve.
Tuning Up the Legal Engine of Public Health

The work of protecting Ontarians from infectious disease is driven by the legal engine called the Health Protection and Promotion Act. The Act is a complex statute that has served the people of Ontario well since its inception. However, in the aftermath of SARS it is time for the Ministry of Health and Long-Term Care to review the Act to ensure there is no lack of clarity about the precise powers and authority of public health officials to intervene early and manage an outbreak effectively. The review should be conducted in consultation with those who work daily with the Act on the front lines of public health defence.

The Act needs a major overhaul to remove ambiguities that are difficult even for those who work with it daily. The Commission offers four examples of what needs to be done: 1) simplify disease categories; 2) clarify the three streams of power to intervene; 3) simplify the process by which the Chief Medical Officer of Health can exercise powers in Parts III and IV; and 4) strengthen and clarify the powers in s. 22.

The Act must be clear and workable for those who use it to obtain their day to day authority to protect the public’s health. Otherwise, uncertainty and confusion will be the refuge for a noncompliant person or institution, and public protection will suffer as public health officials and lawyers try to determine what they can do and when.

Strengthening Day to Day Public Health Powers

Public health officials require better access to health risk information and greater daily authority, together with more resources and expertise to investigate, intervene, and enforce.

The Commission has identified seven fields of public health activity that require additional daily authority under the Health Protection and Promotion Act:

- in relation to infectious diseases in hospitals;
- to acquire information necessary for them to protect the public from a health risk;
- to investigate health risks to the public;
• for the Chief Medical Officer of Health to establish an adjudication system whereby decisions of local medical officers of health regarding classification of disease may be reviewed;

• for the Chief Medical Officer of Health to issue directives to hospitals and other health care institutions;

• to detain, as a last resort, noncompliant individuals infected with a virulent disease who pose a risk to public health;\textsuperscript{6}

• to enter, as a last resort, a private dwelling to apprehend a noncompliant person infected with a virulent disease who poses a risk to public health.\textsuperscript{7}

The Commission sees a greater role for public health in infection control, whether it be in a hospital, long-term care facility or private clinic. A medical officer of health must have authority under the \textit{Health Protection and Promotion Act} to monitor, investigate and intervene in cases where infectious diseases or inadequate infection control poses a risk to public health.

It recommends entrenching in the Act that each local public health unit have a presence on hospital infection control committees.

**Reporting Infectious Disease**

The conditions of reporting infectious diseases in Ontario are unnecessarily complex, sometimes even illogical. A fundamental weakness is that the \textit{Health Protection and Promotion Act} does not enable public health authorities to get from hospitals and other health care institutions the information needed to protect the public against infectious disease. Without fast access to detailed information about cases of infectious disease, public health cannot investigate, or even be aware of impending danger and therefore cannot protect the public.

The legal obligation to report infectious disease is a foundation of every system of public health legislation. It is necessary not only to encourage reporting but to ensure

\textsuperscript{6} See the full text of this recommendation which contains safeguards and limits including early court hearings.

\textsuperscript{7} \textit{Ibid.}
that the confidentiality laws, designed to protect patient privacy, do not unintentionally undermine the ability of public health authorities to fight the spread of infectious disease.

The Commission recommends a series of changes to the Act to strengthen infection disease reporting. These range from developing standard forms and means of reporting, to clarifying chains of reporting, to educating health care workers about reporting requirements.

The Commission recommends a broad power for the Chief Medical Officer of Health to obtain information, including personal health information, and lab specimens, for the purpose of investigating and preventing the spread of infectious disease.

**Privacy and Disclosure**

The Commission recommends statutory amendments to make clear that the duty to disclose personal health information about cases of infectious disease to public health officials prevails over privacy legislation. Privacy, an important value, cannot be allowed to stand in the way of necessary reporting that is required by law to protect the public against infectious disease. Privacy legislation was never intended to impede the flow of vital health information mandated by the *Health Protection and Promotion Act*.

The law should be so clear that lawyers do not have to argue with each other in the middle of a public health crisis about obligations to disclose information to public health. To fight infectious disease, public health authorities require timely access to personal health information.

The Commission recommends amendments to the *Health Protection and Promotion Act* to clarify the ability of medical officers of health to share, with appropriate safeguards, personal health information where necessary to protect the public against the spread of infections.

The power to obtain personal health information brings with it strong obligations to safeguard its privacy. The Chief Medical Officer of Health should review and if necessary strengthen the internal protocols and procedures that safeguard the privacy of personal health information received by public health authorities.
Protecting Whistleblowers

Health care workers who disclose a public health hazard require legal protection from workplace reprisal. Without whistleblower protection, fear of workplace consequences might discourage the timely disclosure of a public health risk.

Whistleblowing protection should apply to a broad category of people, from nurses to doctors, to porters and clerks and cleaning staff. It should apply to anyone who employs or engages the services of a health care worker, whether part-time, casual, contract or full-time staff. Each and every health care worker in the province should be assured an equal level of protection, regardless of location of employment or employment status.

The Commission recommends that whistleblowing to the local medical officer of health or the Chief Medical Officer of Health be protected by law.

Quarantine

Any fight against infectious disease depends above all on public cooperation. SARS could not have been contained in Toronto without the tremendous public cooperation and individual sacrifice of those who were quarantined. In fact, this high level of public cooperation has drawn the attention of foreign researchers.

It is essential to ensure that the spirit of cooperation shown during SARS is not taken for granted. It must be nurtured and promoted.

Therefore, the Commission recommends that all government emergency plans have a basic blueprint for the most predictable types of compensation that can be tailored following the declaration of an emergency.

The Health Protection and Promotion Act should be amended to allow unpaid leaves for those quarantined or isolated and those who cannot work because they are caring for a dependent relative stricken in an infectious outbreak.

The Commission also recommends that s. 22(5.0.1) of the Health Protection and Promotion Act be amended to provide that the power to order and enforce the isolation of a group must, wherever practicable, be preceded by such degree of consultation with the group as is feasible in the circumstances.
The remarkable story of those who suffered quarantine without complaint will be told in the Commission’s final report which will also address a number of concerns expressed about the administration of the quarantine powers.

Untangling Legal Access

SARS demonstrated weakness and confusion in the legal machinery for the enforcement of health protection orders under the *Health Protection and Promotion Act*, the legal engine that drives health protection. One lawyer told the Commission that their ability during SARS to give clear legal advice was at times hampered by weaknesses in the enforcement portions of the Act:

> During SARS, I would often say when asked if we could do something, ‘you can try it, but if we are challenged we may be on shaky legal grounds and the courts will be in a very difficult position.’

Confusion and uncertainty are the only common threads throughout the legal procedures now provided by the *Health Protection and Promotion Act* for public health enforcement and remedies. Confusion and uncertainty can cause delays and delays can cost lives.

The Commission recommends amendment of the *Health Protection and Promotion Act* to address the problems of: a tangle of enforcement powers, procedural gaps in enforcement machinery, overlapping jurisdiction between the Ontario Court of Justice and the Supreme Court of Justice, lack of one-stop shopping for enforcement of orders in respect of infectious diseases, legal uncertainty in initiating and continuing enforcement procedures in court and the lack of systems to ensure legal preparedness in the application of enforcement machinery.

Health professionals and the lawyers who advise them require not only the clear authority to act in the face of public health risks. They require also a simple, rational, effective and fair set of procedures to enforce compliance and to provide legal remedies for those who challenge orders made against them.
Resources For Public Health Reform

SARS showed that Ontario’s public health system is broken and needs to be fixed. Evidence of its inadequacy was presented in the Naylor Report, 8 the Walker Report, 9 and the Commission’s first interim report.

Since then, as set out in Appendix B, much progress has been made. But this commendable start is merely the beginning of the effort to fix the public health system. The end will not be reached until Ontario has a public health system with the necessary resources, expertise and capabilities, and this will take years to achieve.

After long periods of neglect, inadequate resources and poor leadership, it will take years of sustained funding and resources to correct the damage. Like a large ship, a public health system, especially one as big and complex as Ontario’s, cannot turn on a dime.

The point has to be made again and again that resources are essential to give effect to public health reform. Without additional resources, new leadership and new powers will do no good. To give the Chief Medical Officer of Health a new mandate without new resources is to make her powerless to effect the promised changes. As one thoughtful observer told the Commission:

The worst-case scenario is to get the obligation to do this and not get the resources to do it. Then the Chief Medical Officer of Health would have a legal duty that she can’t exercise.

To arm the public health system with more powers and duties without the necessary resources is to mislead the public and to leave Ontario vulnerable to outbreaks like SARS.

SARS focused on the need for public health to do more to protect us against disease, more by way of planning against threats like pandemic influenza, more by way of increased powers for public health authorities to monitor infectious threats in the

8. National Advisory Committee on SARS and Public Health, Learning from SARS: Renewal in Public Health in Canada (Health Canada: October 2003). (Subsequently referred to as the Naylor Report.)

9. Ontario Expert Panel on SARS and Infectious Disease Control, For the Public’s Health (Ministry of Health and Long-Term Care: December 2003). (Subsequently referred to as the Walker Interim Report.)
community and in health care institutions. It demonstrated that more public health resources are required in many areas, including:

- Laboratory capacity, expertise and personnel;
- Scientific advisory capacity and capabilities;
- Epidemiological expertise;
- Surge capacity;
- Infectious disease expertise and personnel;
- Public health human resources excellence and capacity; and
- Infectious disease information systems.

**Emergency Legislation**

The first goal of public health emergency management is to stop emergencies before they start by preventing the spread of disease. If a small outbreak is prevented or contained, draconian legal powers available to fight a full-blown emergency will not be needed.

Legal powers by themselves are false hopes in times of public crisis. Preparedness and prevention backed by enhanced daily public health powers are the best protection against public health emergencies.

Voluntary compliance is the bedrock of any emergency response. It is essential to compensate those who suffer an unfair burden of personal cost for cooperating in public health measures like quarantine.

The Commission recommends that emergency legislation require that every government emergency plan provide a basic blueprint for the most predictable types of compensation packages and that they be ready for use, with appropriate tailoring, immediately following any declaration of emergency.

Emergency powers are inherently dangerous. They carry the twin dangers of overreaction and underreaction.
The first danger is overreaction. Every emergency power, once conferred, “lies about like a loaded weapon ready for the hand of any authority that can bring forward a plausible claim of an urgent need.” To a hammer, everything looks like a nail. To some emergency managers, every problem may look like an opportunity to invoke emergency powers.

The second danger is underreaction. In the face of a deadly new disease with an uncertain incubation period, ambiguous symptoms, no diagnostic tests, uncertainty as to its infectiveness and mechanisms of transmission, and no idea where in the province it may be simmering, decisive action may be necessary that turns out in hindsight to have been excessive.

The central task of emergency legislation is to guard against overreaction by providing safeguards and to guard against underreaction by avoiding legal restrictions that prevent the application of the precautionary principle.11

There are no pure public health emergencies. Although pandemic influenza might start as a public health emergency, it would rapidly snowball into a general emergency. And big general emergencies that arise outside the field of public health usually have a public health component.

---

10. Mr. Justice Jackson, dissenting, in Korematsu vs. United States, 323 U.S. 214 (1944) in respect of the race-based internment of Japanese Americans during WW II.
11. The precautionary principle addresses the problem of underreaction by pointing out that in face of a grave risk it is better to be safe than sorry:

... the absence of full scientific certainty shall not be used as a reason for postponing decisions where there is a risk of serious or irreversible harm.

Mr. Justice Krever emphasized this principle in the Commission of Inquiry on the Blood System in Canada:

Where there is reasonable evidence of an impending threat to public health, it is inappropriate to require proof of causation beyond a reasonable doubt before taking steps to avert the threat.

Public health emergencies are unique from typical disasters like floods, fires, power blackouts, or ice storms. In floods and power losses people can take certain protective actions on their own, but they have few personal defences against an invisible virus that can kill them. They must turn to trusted medical leadership.

The most important thing in a public health emergency is public confidence that medical decisions are made by a trusted independent medical leader such as the Chief Medical Officer of Health free from any bureaucratic or political pressures. This is particularly true of public communication of health risk. People trust their health to doctors, not to politicians or government managers. It is essential that the public get from the Chief Medical Officer of Health the facts about infectious risks to the public health and the need for precautions and advice on how they can avoid infection. It is essential when public precautions are relaxed, like the removal of protective N95 respirators in hospitals, the re-opening of hospitals, or the declaration that it is business as usual in the health system, that these decisions are made and are seen to be made by and on the advice of the independent Chief Medical Officer of Health free from any bureaucratic or political pressures. It is essential in a public health emergency, or the public health aspects of an emergency such as flood-borne disease, that the Chief Medical Officer of Health be the public face of public communication from the government.

The Commission recommends that emergency legislation provide the Chief Medical Officer of Health with clear primary authority in respect of the medical and public health aspects of every provincial emergency.

In times of emergency it is essential to know who is in charge. As Dr. Basrur noted in her appearance before the Justice Policy Committee:

The point is that someone has to be in charge; people have to know where the buck stops, where decisions are made and where they can be unmade, and who the go-to person is.

The details of the consultation and cooperation between the Commissioner of Emergency Management and the Chief Medical Officer of Health need not be reduced to legislative form. The inevitable boundaries issues can be solved by cooperation, advance planning and above all by common sense. All that is required is for the Commissioner of Emergency Management and the Chief Medical Officer of Health, whoever may succeed to those jobs from time to time, to park their egos outside the door of the incident room and get on together with the job of managing the emergency. Both require not only confidence in their authority but also a clear
acceptance of their mutual roles and limitations.

The Commission reviews competing models of emergency legislation including the “inherent powers” model, an essential element of Ontario’s present system which provides no extra legal powers for the management of emergencies and relies instead on unwritten powers. Although this model, under which 218,000 people were evacuated from their homes in the 1979 Mississauga chlorine gas derailment was adequate in pre-Charter times, the advent of the Charter of Rights and Freedoms other developments since 1979 suggest it may no longer be adequate today.

Although Ontario got through SARS without any special emergency powers the prospect of pandemic influenza or indeed any outbreak more serious than SARS requires the enactment of explicit public health emergency powers.

Because there is no clear line between public health emergencies and general emergencies it would be wrong to introduce separate, freestanding, parallel emergency regimes, one for public health emergencies and the other for all other big emergencies. The existence of two parallel regimes would bring nothing but legal confusion and administrative disorder, two things no one wants in any emergency.

The government has expressed its intention to proceed with general emergency legislation along the lines suggested in Bill 138, an Act to Amend the Emergency Management Act and the Employment Standards Act, 2000, which received first reading on November 1, 2004 as a private member’s bill produced by the Standing Committee on Justice Policy after public hearings.

The Commission’s mandate does not cover general emergency legislation for war, famine, flood, ice storms and power blackouts and the government decision to proceed with Bill 138 is not within the Commission’s terms of reference. Because the government has chosen Bill 138 as the vehicle for all emergency legislation including public health emergency legislation the Commission must say something about Bill 138 as a vehicle for public health emergency powers.

The thoughtful work of the Justice Policy Committee in its hearings and its production of Bill 138 must now be completed. A sober second thought is required. That sober second thought must be informed by the regular processes that ordinarily precede the development of any important piece of legislation including in particular

---

a fundamental legal and constitutional review by the Attorney General. The Attorney General has indicated that he is fully engaged in reviewing Bill 138 to ensure that it meets necessary legal and constitutional requirements.

The strengths of the Committee process are obvious to anyone who has had an opportunity to review its proceedings. Certain legal concerns, flowing largely from the unusual process imposed on the Committee, are referred to in correspondence between the Commission and the government, set out in Appendix H, and are reviewed in this chapter. The essence of the Commission’s concern is the unusual process of proceeding to a draft bill of such profound legal importance without prior policy and operational analysis by departments of government, and without prior legal and constitutional scrutiny by the Attorney General of the kind he has indicated he is now undertaking.

The power of compulsory mass immunization is a paradigm for public health emergency powers. It bristles with legal issues that typify any emergency proposal to interfere with individual liberties for the sake of the greater public good. It exemplifies the legal and policy and practical problems that must be addressed in every analysis of every public health emergency power. Yet it has attracted less policy analysis and discussion than other proposed powers such as the power to ration medical supplies. The power of mass compulsory immunization is not yet ripe for enactment and requires the type of legal, practical, and policy analysis needed for every proposed emergency power.

Ontario’s emergency legislation will probably be challenged in court at some time. It will be a major blow to the integrity of the legislation should a court strike down as unconstitutional any part of the statute or any emergency order made under the statute. It is essential to ensure in advance, so much as possible, that the legislation conforms with the Canadian Charter of Rights and Freedoms.

The Commission recommends that the government and the Attorney General in their review of Bill 138 consider whether it adequately addresses the public health emergency powers referred to in this chapter.

The Commission reviews a number of legal issues around the powers in Bill 138, for instance the power to compel anyone to disclose any information demanded by the government. The Commission recommends that it be made clear whether a journalist or lawyer who refuses to disclose confidential information or the identity of its source is liable to the penalty provided by Bill 138, a fine of up to $100,000 and a term of imprisonment for up to a year for every day on which the refusal continues.
The Commission points to a number of areas that exemplify the need for fundamental review of Bill 138 including the proposed power to override laws such as the Habeas Corpus Act, the Legislative Assembly Act, the Human Rights Code, the Elections Act, and the Courts of Justice Act.

Appendices

The appendices review the action recommended in the Commission's First Interim Report, the work done by the government since then to improve the public health system, and the ongoing work of the Commission.

---

1. Medical Independence and Leadership

Public confidence requires that the fight against infectious disease be driven by medical expertise, free from bureaucratic or political pressure. The Commission, in its first interim report, recommended more independence for the Chief Medical Officer of Health. The government has made significant progress in that direction, by amending the *Health Protection and Promotion Act* to give the Chief Medical Officer of Health a greater measure of independence.

The Commission, in this second interim report, recommends\(^\text{18}\) that this work be completed by transferring operational authority over public health labs, assessors, inspectors\(^\text{19}\) and enforcement provisions of the Act\(^\text{20}\) from the Minister to the Chief Medical Officer of Health. This work must be completed so that the Chief Medical Officer of Health is fully independent of political considerations in respect of medical decisions and direct public health management.

---

18. The Commission's recommendations, if accepted, will have to be put into statutory language by Legislative Counsel, an officer of the Legislative Assembly, with the assistance of departmental lawyers. Although the recommendations sometimes use statutory language they are not offered as statutory amendments but only as a basis for the drafting language chosen by Legislative Counsel to achieve their intent and purpose.

19. The Commission notes that the *Health Protection and Promotion Act* is confusing in its use of inspectors, under s. 80 and public health inspectors, under s. 41. While the former inspects health units and the latter exercises powers under Part III of the Act, to someone not intimately familiar with the Act, it is somewhat confusing that there are inspectors who are not public health inspectors and public health inspectors who are not inspectors.

20. Those contained in s. 102(2) of the *Health Protection and Promotion Act* give power to the Minister of Health to apply to a judge of the Superior Court of Justice for an order prohibiting continuation or repetition of the contravention of an order made under the Act.
The Commission also recommends a parallel measure of independence for local medical officers of health, who are the backbone of our protection against disease. Protecting the local medical officer of health from political and bureaucratic influence is as equally important as protecting the Chief Medical Officer of Health. As recommended in the Commission’s first interim report, such independence should be coupled with a measure of central medical leadership and direction from the Chief Medical Officer of Health, to ensure protection consistency throughout Ontario’s 36\textsuperscript{21} semi-autonomous health units.

Similar consolidation is required to ensure that the Chief Medical Officer of Health and local medical officers of health lead public health emergency planning, and are responsible for public health risk communication. A later chapter will deal with the requirement that the Chief Medical Officer of Health assume leadership of the public health aspects of any provincial emergency.

The Commission therefore recommends that the province:

- Complete the work of making the Chief Medical Officer of Health independent of political considerations in respect of medical decisions and direct public health management. This requires the transfer of operational authority from the Minister to the Chief Medical Officer of Health in respect of public health labs, assessors, inspectors and enforcement.

- Amend the *Health Protection and Promotion Act* so that the powers now assigned by law to the local medical officers of health are assigned concurrently to the Chief Medical Officer of Health. These powers shall be exercised by the medical officer of health in the local region, subject to the direction of the Chief Medical Officer of Health.

- Give local medical officers of health independence in medical matters parallel to that of the Chief Medical Officer of Health.

\textsuperscript{21} Now 36, with the absorption on April 1 of the Muskoka-Parry Sound Health Unit into neighbouring health units. Ministry of Health and Long-Term Care News Release, “Chief Medical Officer of Health Releases Plan to Strengthen Public Health in Muskoka-Parry Sound,” March 9, 2005. This measure, described below, provides a good example of how well the public health system can work under its new leadership and how much there is yet to be done.
• Provide a greater measure of central provincial medical leadership and control in respect of infectious disease protection and management, over the 36 semi-autonomous health units throughout the province.

• Put provincial public health emergency planning under the authority of the Chief Medical Officer of Health and local public health emergency planning under the authority of local medical officers of health.

• Amend the *Health Protection and Promotion Act* to extend the protection from personal liability contained in s. 95(1) to everyone employed by or providing services to a public health board or the provincial Public Health Division, everyone from the Chief Medical Officer of Health to its expert advisors, to public health employees in the field.

The Commission’s Earlier Findings and Recommendations

The management of infectious disease must be driven by medical expertise, not by political expediency. This requires the independence of the Chief Medical Officer of Health in vital areas of medical decision making and direct public health management. Decisions to impose and to relax precautions must be free from political motivation, and must be seen to be free from political motivation.

The Commission so far has not found any evidence of political interference during SARS. But any perception of political interference will sap public confidence and diminish public cooperation. As the Commission noted in its first interim report:

The Commission on the evidence examined thus far has found no evidence of political interference with public health decisions during the SARS crisis. There is, however, a perception among many who worked in the crisis that politics were at work in some of the public health decisions. This perception is shared by many who worked throughout the system during the crisis. Whatever the ultimate finding may be once the investigation is completed, the perception of political independence is equally important. A public health system must ensure public confidence that public health decisions during an outbreak are free from political motivation. The public must be assured that if there is a public health hazard the Chief Medical Officer of Health will be able to tell the public about it without going through a political filter. Visible safeguards to ensure the independence of the Chief Medical Officer of Health were absent during
SARS. Machinery must be put in place to ensure the actual and apparent independence of the Chief Medical Officer of Health in decisions around outbreak management and his or her ability, when necessary, to communicate directly with the public.\textsuperscript{22}

The Commission recommended that the Chief Medical Officer of Health be given independence in respect of medical matters, with the right and the duty to report directly to the public on the risk from infectious diseases, and on the measures necessary to protect the community from communicable disease.

The Commission concluded that the office of the Chief Medical Officer of Health needs a greater degree of actual and perceived independence from government. This independence is vital to ensuring public confidence in the Chief Medical Officer of Health’s ability to act in their best interest and for the sole purpose of protecting the public health. As Dr. Richard Schabas, a former Chief Medical Officer of Health for Ontario, so aptly described the issue to the Commission at its public hearings:

I think it [the public health system] has to be arms-length from the political process. I’ve avoided discussing the impact of politics on this outbreak but I think that to ensure that there’s public credibility, that the public understands that the public health officials are acting only in the interests of public health and are not influenced by political considerations, that this has – or that we have to put greater political distance between our senior public health officials and the politicians.

Although the Commission recommended increased independence of the Chief Medical Officer of Health, it also found that there must be an appropriate balance of independence to ensure that there is not so much arms length distance between the Chief Medical Officer of Health and the government so as to impede the accountability of the Chief Medical Officer of Health and her close links with other parts of the provincial health system. As one thoughtful observer noted, it makes more sense for the Chief Medical Officer of Health, if some machinery of independence is added to the office, to be at the table within government rather than a watchdog off in a corner:

It’s not just a question of balancing independence and accountability. It’s also a question of ensuring that the Chief Medical Officer of Health can

\textsuperscript{22}. The Commission’s first interim report, p. 56.
get the job done, can fulfill the delivery of the mandatory public health programme by the local units and carry out the responsibilities of the Chief Medical Officer of Health under the *Health Protection and Promotion Act*. If the Chief Medical Officer is in the Ministry they are at the table and has a degree of influence from being at the table but also has to be part of a team to some extent. In my opinion a lot can be accomplished by working within the system provided you have a pathway and protection to speak out when needed, both procedural and legal protection.

The Ministry needs to maintain and control policy, funding, and accountability including the transfer payment function to the local boards of health; the Chief Medical Officer of Health should oversee that. The Chief Medical Officer should retain programmatic responsibilities. Being an assistant deputy minister gives you rights of access you don’t have if you’re a watchdog off in the corner someplace.\(^\text{23}\)

The Commission recommended that the Chief Medical Officer of Health:

- Subject to the guarantees of independence set out below, should retain a position as an Assistant Deputy Minister in the Ministry of Health and Long-Term Care.

- Should be accountable to the Minister of Health with the independent duty and authority to communicate directly with the public by reports to the Legislative Assembly and the public whenever deemed necessary by the Chief Medical Officer of Health.

- Should have operational independence from government in respect of public health decisions during an infectious disease outbreak, such independence supported by a transparent system requiring that any ministerial recommendations be in writing and publicly available.\(^\text{24}\)

The Commission also recommended that the Chief Medical Officer of Health and the Public Health Division assume greater central control over health protection, in particular in relation to infectious diseases. As the Commission noted:

An uncontrolled outbreak of infectious disease could bring the province to its knees. The province-wide consequences of a failure in infectious disease control are simply too great for the province to delegate infectious disease protection to the municipal level without effective measures of central provincial control. There is little machinery for direct central control over infectious disease programmes. The existing machinery to enforce local compliance with provincial standards is cumbersome and underused. Better machinery is needed to ensure provincial control over infectious disease surveillance and control.

The present distribution of legal powers under the *Health Protection and Promotion Act* gives the local medical officer of health an enormous ambit of uncontrolled personal discretion, which is not ordinarily subject to the review or influence of the Chief Medical Officer of Health. The Chief Medical Officer of Health does have some override powers, and cumbersome machinery does exist under which the province might ultimately bring to heel a rogue board of health. But public health authority in Ontario over infectious disease control, including outbreak management, is primarily that of local officials with no direct accountability to any central authority.

There is no clear accountability to any central provincial authority for local public health decisions to quarantine thousands of people locally. There is no clear accountability to any central authority for local decisions not to quarantine, decisions that could lead to epidemic community outbreak of a deadly disease. This lack of clear central authority could require the Chief Medical Officer of Health, during a virulent outbreak like SARS, to negotiate with separate local medical officers of health whether particular cases should be reported as SARS to the international community, and whether or not the quarantine power should be invoked. This lack of central authority could lead to gross and irrational inequality in the application of the quarantine powers throughout the province if different local medical officers of health exercised their individual authority without regard to any consistent central guidance.

During a disease outbreak, the international community and organizations like the World Health Organization look for reassurance and credibility to the national and provincial level, not to the particular strength of any local public health board or the particular credibility of any local medical officer of health. Viruses do not respect boundaries between
municipal health units. The chain of provincial protection against the spread of infectious disease is only as strong as the weakest link in the 37 local public health units. A failure in one public health unit can spill into other public health units and impact the entire province and ultimately the entire country and the international community. When dealing with a travelling virus, concerns about local autonomy must yield to the need for effective central control.

Although some local medical officers of health treasure their local autonomy from the province and from the Chief Medical Officer of Health, even in relation to outbreak control, there is a degree of recognition that clear and consistent central provincial authority is required for effective protection against infectious disease.  

Dr. Richard Schabas, a former Chief Medical Officer of Health, noted at the public hearings:

I think we need clearer lines of authority within our public health system. At the moment, local public health authorities are not directly answerable or reportable to the provincial authority and I think, particularly in a crisis like SARS, that’s something that’s important.  

The Commission found a striking lack of clarity around the respective accountability of the Chief Medical Officer of Health and the local medical officer of health. As one former medical officer of health said, in response to a question from the Commissioner:

Q: I am unclear as to what effective powers the Chief Medical Officer of Health has in general terms over the system of protection against infectious disease.

A: Well it is hugely unclear, is it not? … Certainly clarifying the accountability would be a benefit whether the people like the outcome or not because right now it is very vague.

In respect of central control, the Commission made the following recommendation:

Under the present Act, the legal and practical backbone of local disease control is the local medical officer of health. It makes sense that the initial responsibility should be local. But that initial arrangement makes no sense unless it can be influenced by provincial leadership and can shift, instantly, to the provincial level when a threatened or actual outbreak imperils the provincial public interest.

There are two basic ways to ensure the appropriate measure of central accountability and authority for infectious disease protection.

The first way is to leave essential public health legal powers in the initial hands of the local medical officer of health, subject to some machinery to displace those powers to the Chief Medical Officer of Health during a designated provincial public health outbreak. Although this system maximizes the ordinary local autonomy of local medical officers of health, municipal autonomy is hardly a value of superordinate importance when dealing with viruses that cross municipal, provincial, federal, national, and international boundaries. And the complicated legal machinery necessary to trigger the imposition of central powers, unless made infinitely more simple than the almost medieval system for provincial override of local public health boards, would deprive the provincial override of any practical value in a public health threat.

The second way is to place essential public health legal powers with the Chief Medical Officer of Health, those powers to be exercised on a day to day basis by the local medical officer of health, subject to the ultimate direction of the Chief Medical Officer of Health. This retains all the public health powers under the Act within the presumptive local authority of the local medical officer of health. But it leaves a clear role for provincial leadership and it provides a safeguard and an immediate change of the default position, whenever required, to central provincial authority. This kind of arrangement works well in the justice system where the local Crown Attorney is the agent of the Attorney General, and where the regional senior judge exercises in their region the powers of the Chief Justice, subject to the direction of the Chief Justice.

If the Health Protection and Promotion Act were amended to provide that:
The powers now assigned by law to the medical officer of health are reassigned to the Chief Medical Officer of Health, and

The powers reassigned to the Chief Medical Officer of Health shall be exercised by the medical officer of health in the local region, subject to the direction of the Chief Medical Officer of Health,

it would leave the local medical officers of health a clear field to exercise the same powers they have always exercised, subject to ultimate central direction.

Under the old system, such a re-arrangement of powers might raise serious concerns of loss of autonomy on the part of the local medical officer of health including the spectre of political influence from Queen’s Park on local public health decisions. While concerns about local autonomy will never go away in any centralized system, the new independence of the Chief Medical Officer of Health and the medical officer of health should go a long way to allay such concerns.28

Some public health officials have interpreted this recommendation as requiring the removal of all boards of health and the demotion of local medical officers of health to the status of mere agents of the Chief Medical Officer of Health in each local unit. This, as explained below, was never the intention nor the recommendation of the Commission. The recommendation, exercised with common sense and mutual respect, would leave day to day decisions in the hands of the local medical officer of health with no diminution in practical terms of his or her local autonomy.

The only adjustment the Commission would make in this recommendation is to provide that the local medical officers of health retain all their current powers, to be assigned concurrently to the Chief Medical Officer of Health and to be exercised by the local medical officer of health subject to the central direction and accountability of the office of Chief Medical Officer of Health.

The revised recommendation is this:

• The powers now assigned by law to the medical officer of health are

28. The Commission’s first interim report, pp. 204-205.
assigned concurrently to the Chief Medical Officer of Health, and

• These concurrent powers shall be exercised by the medical officer of health in the local region, subject to the direction of the Chief Medical Officer of Health.

More will be said about this later in this chapter.

Chief Medical Officer of Health: What the Government Did

On October 14, 2004, Health Minister Smitherman introduced Bill 124, “An Act to Amend the Health Protection and Promotion Act” to give the Chief Medical Officer of Health greater independence, saying:

I’m delighted to rise in this House today to introduce a bill entitled the Health Protection and Promotion Amendment Act. It amends the Health Protection and Promotion Act. The title being a little unwieldy, I prefer to think of it as the independent Chief Medical Officer of Health act …

When there is a health crisis and politicians speak, some people listen. But when there is a health crisis and the Chief Medical Officer of Health speaks, everybody listens. It is at those times, times when diseases like SARS or West Nile are a real threat, that the Chief Medical Officer of Health must be there for his or her patients, all 12 million of them. It is at times like those that the Chief Medical Officer of Health must be able to interact with his or her patients without worrying about what the Minister of Health might think, what the effect might be on the government or what the opposition might say. We learned that lesson as a province during Walkerton, West Nile and SARS. We learned that what Ontarians wanted, what they needed, from their chief doctor was his or her undivided attention.

In the wake of the SARS crisis, both the Campbell and Walker reports recommended that the Chief Medical Officer of Health be independent, with the authority, and in fact with the duty, to communicate with the public whenever he or she sees fit. He wrote that any doubts about the source, timing or motives of public health information have a corrosive effect on confidence, and addressing this perception and reinforcing the
centrality of an independent voice for public health is a key step in promoting public health renewal in Ontario.

With the legislation I have introduced today we are taking that step . . .

Mr. Smitherman, following the tabling of the proposed amendments to the *Health Protection and Promotion Act*, said:

In the event of a health crisis, Ontarians want to know that their Chief Medical Officer is free of political concerns and interference. An independent CMOH will be able to put the health and safety of Ontarians first.

The amendments received Royal Assent on December 16, 2004, and achieved the following:

- Establishes appointment of the Chief Medical Officer of Health by the Lieutenant Governor in Council, on the address of the Legislative Assembly. Appointment is for a five-year term, which may be renewed.

- Requires that the Chief Medical Officer of Health make an annual report in writing on the state of public health in Ontario, and deliver the report to the Speaker of the Legislative Assembly.

- Gives the Chief Medical Officer of Health the power to communicate with the public, stating that the Chief Medical Officer of Health may

---

31. Subsections 81(1)-81(3) deals with the appointment, term of office and renewal of the Chief Medical Officer of Health. It sets out that the Lieutenant Governor in Council shall appoint the Chief Medical Officer of Health on the address of the legislative assembly; that the term of appointment is for five years and may be reappointed for a further term or terms by the Lieutenant Governor in Council on the address of the Legislative Assembly; that he/she may be removed for cause by the Lieutenant Governor in Council on the address of the Legislative Assembly.

32. Subsections 81(4)-81(6) deal with the annual reports of the Chief Medical Officer of Health. Subsection 81(4) requires the Chief Medical Officer of Health every year to make a report in writing on the state of public health in Ontario, and deliver the report to the Speaker of the Legislative Assembly. The Speaker shall lay the report before the Assembly at the earliest reasonable opportunity. Subsection 81(6) provides that the Chief Medical Officer of Health shall deliver a copy of the report to the Minister at least 30 days before delivering it to the Speaker.
Second Interim Report  ♦  SARS and Public Health Legislation

1. Medical Independence and Leadership

make any other reports respecting public health as he or she considers appropriate and may present such a report to the public or any other person he or she considers appropriate.33

• Transfers the powers in s. 86 of the Health Protection and Promotion Act, previously assigned to the Minister, to the Chief Medical Officer of Health. These powers give the Chief Medical Officer of Health the power to investigate and take action where there is health risk.34 It allows the Chief Medical Officer of Health to exercise the powers of boards of health and local medical officers of health or to direct a person whose services are engaged by a board of health.35

33. Subsection 81(7) gives the Chief Medical Officer of Health the power to communicate with the public. It states that the Chief Medical Officer of Health may make any other reports respecting the public health as he or she considers appropriate and may present such a report to the public or any other person he or she considers appropriate.

34. Subsection 86(1) provides:

Chief Medical Officer of Health may act where risk to health

86(1) If the Minister is of the opinion that a situation exists anywhere in Ontario that constitutes or may constitute a risk to the health of any persons, he or she may investigate the situation and take such action as he or she considers appropriate to prevent, eliminate or decrease the risk.

35. The amendments to ss. 86(2) and 86(3) extend the powers of local boards of health and local medical officers of health in Ontario to the Chief Medical Officer of Health. Those sections provide:

(2) For the purpose of subsection (1), the Chief Medical Officer of Health,

(a) may exercise anywhere in Ontario any of the powers of a board of health and any of the powers of a medical officer of health; and

(b) may direct a person whose services are engaged by a board of health to do, anywhere in Ontario (whether within or outside the health unit served by the board of health), any act,

(i) that the person has power to do under this Act, or

(ii) that the medical officer of health for the health unit served by the board of health has authority to direct the person to do within the health unit.

Authority and duty of persons directed to act

(3) If the Chief Medical Officer of Health gives a direction under subsection (2) to a person whose services are engaged by a board of health,
• Transfers to the Chief Medical Officer of Health the power in s. 86.1 to apply to a judge of the Superior Court of Justice for an Order requiring a local board of health to take such action as the judge considers appropriate to prevent, eliminate or decrease the risk caused by the situation.36

• Transfers to the Chief Medical Officer of Health the power in s. 86.2 to request a board of health to provide such information, in relation to the board of health and the health unit served by the board of health, as the Minister specifies.37

(a) the person has authority to act, anywhere in Ontario (whether within or outside the health unit served by the board of health), to the same extent as if the direction had been given by the medical officer of health of the board of health and the Act had been done in the health unit; and

(b) the person shall carry out the direction as soon as practicable.

Section 22 Powers

(4) For the purpose of the exercise by the Chief Medical Officer of Health under subsection (2) of the powers of a medical officer of health, a reference in section 22 to a communicable disease shall be deemed to be a reference to an infectious disease.

36. Section 86.1 provides:

(1) If the Minister is of the opinion that a situation exists anywhere in Ontario that constitutes or may constitute a risk to the health of any persons, he or she may apply to a judge of the Superior Court of Justice for an order under subsection (2).

Order of judge of Superior Court of Justice

(2) If an application is made under subsection (1), the judge,

(a) may order the board of health of a health unit in which the situation causing the risk exists to take such action as the judge considers appropriate to prevent, eliminate or decrease the risk caused by the situation; and

(b) may order the board of health of a health unit in which the health of any persons is at risk as a result of a situation existing outside the health unit to take such action as the judge considers appropriate to prevent, eliminate or decrease the risk to the health of the persons in the health unit.

37. Section 86.2 gives the Chief Medical Officer of Health the power to request a board of health to provide such information, in relation to the board of health and the health unit served by the board of health, as the Chief Medical Officer of Health specifies. Subsection 86.2(2) provides that the Chief Medical Officer of Health may specify the time and the form in which the information must be provided. Subsection 86.2(3) states that the board of health shall comply with such a request. These powers were previously held by the Minister of Health and Long-Term Care.
Along with these amendments, Dr. Sheela Basrur, Chief Medical Officer of Health, also retained the position of Assistant Deputy Minister, within the Ministry of Health and Long-Term Care, in addition to her role as Chief Medical Officer of Health.\textsuperscript{38}

On October 5, 2004, at the Standing Committee on Estimates, Dr. Basrur made the following comments in response to a question as to the nature of her proposed independence, despite the fact that she remained in government as an Assistant Deputy Minister:

… What I can tell you is that under Operation Health Protection, which is our blueprint for the future for public health, there is a commitment to codifying and strengthening the independence of the Chief Medical Officer of Health through amendments to the \textit{Health Protection and Promotion Act}, the legislation the minister was just referring to.

If I go back to the plan that was announced publicly in June 2004, 60 days after we had received the interim report from Justice Campbell and when we received the final report from Dr. David Walker, who chaired the expert panel on infectious diseases, it was clear that one of the components that needed to be strengthened was the independence of the statutory role that I hold. There were a number of elements that were laid out in that plan relating to the ability and the duty to make reports on matters affecting the health of Ontarians and, secondly, to having a removal of even the perception of political advice or, even worse, interference in public health decision-making. Those elements were set out in that plan of June 2004.

Mr. Baird: Do you feel you have that independence today?

Dr. Basrur: De facto, yes. It is nice to have it codified for clarity and, as I say, to remove any perception that anything untoward might be the case.\textsuperscript{39}

Dr. Basrur’s comments were the harbinger of the legislation to come.

\textsuperscript{38} Ministry of Health and Long-Term Care Press Release: “McGuinty government provides greater independence to Chief Medical Officer Of Health,” New Legislation Will Give Ontario’s Top Doctor More Power To Protect, Toronto, Dec. 16.

Independence of the Chief Medical Officer of Health: Finishing the Task

There seems to be unanimous agreement that the legislative amendments contained in Bill 124 are a step in the right direction. However, there remain a number of powers in the Health Protection and Promotion Act, which continue to be exercised by the Minister that should also be transferred to the Chief Medical Officer of Health to ensure the Chief Medical Officer of Health’s complete independence.

The Health Protection and Promotion Act provides six bundles of powers that are now assigned by law to the Minister. These include the power to investigate by way of inquiry, the power to establish and direct laboratories, the power to appoint inspectors, enforcement powers under s. 102(2), the power to possess a premises as a temporary isolation facility, and the power to appoint assessors and make directions arising from assessor's report. Should these powers remain with the Minister or be transferred in whole or part to the Chief Medical Officer of Health?

Some of these powers are operational in nature and have to do with public health management as opposed to political oversight. These operational powers are an essential part of the managerial stewardship of the public health system, which should reside in a public servant rather than a Minister to the Crown. There are four categories of operational or managerial powers that remain within the domain of the Minister of Health and Long-Term Care, which the Commission recommends be transferred to the Chief Medical Officer of Health:

- Power over assessors;
- Public health laboratories;
- Enforcement powers under s. 102(2); and
- Power to appoint inspectors.

Power Over Assessors

Although the Chief Medical Officer of Health will now hold the power under s. 86(2) to exercise the powers of a board of health where there is a health risk to any person, she lacks the complementary power to order an assessment of a local board of
health. This power would enable her to determine whether the board of health is fulfilling its obligations under the Act and, where it is not, to order specific steps be taken to remedy the failure.

The power to order an assessment of a board of health is contained in s. 82 of the Health Protection and Promotion Act. It simply provides “The Minister shall appoint assessors for the purposes of this Act.” Subsection 82(3) provides the purposes for which an assessor may carry out an assessment. It provides:

(3) An assessor may carry out an assessment of a board of health for the purpose of,

(a) ascertaining whether the board of health is providing or ensuring the provision of health programmes and services in accordance with sections 5, 6 and 7, of the regulations and the guidelines;

(b) ascertaining whether the board of health is complying in all other respects with this Act and the regulations; or

(c) assessing the quality of the management or administration of the affairs of the board of health.

Once an assessment has been completed, s. 83 allows the Minister to give a written direction to the board of health to remedy the problem identified in the assessment.40

40. Section 83 provides:

Direction to board of health

83(1) The Minister may give a board of health a written direction described in subsection (2) if he or she is of the opinion, based on an assessment under section 82, that the board of health has,

(a) failed to provide or ensure the provision of a health programme or service in accordance with section 5, 6 or 7, the regulations or the guidelines;

(b) failed to comply in any other respect with this Act or the regulations; or

(b) failed to ensure the adequacy of the quality of the administration or management of its affairs.
Section 84 allows the Minister to take steps to ensure the direction is carried out.41

(2) In a direction under this section, the Minister may require a board of health,

(a) to do anything that the Minister considers necessary or advisable to correct the failure identified in the direction; or

(b) to cease to do anything that the Minister believes may have caused or contributed to the failure identified in the direction.

Compliance with Direction

(3) A board of health that is given a direction under this section shall comply with the direction,

(a) within the period of time specified in the direction; or

if no period of time is specified in the direction, within 30 days from the day the direction is given.

41. Section 84(1) sets out the actions that the Minister may take. It provides:

Power to take steps to ensure direction is carried out

84(1) If, in the opinion of the Minister, a board of health has failed to comply with a direction under section 83 within the period of time required under subsection 83 (3), the Minister may do whatever is necessary to ensure that the direction is carried out, including but not limited to,

(a) providing or ensuring the provision of any health programme or service in accordance with sections 5, 6 and 7, the regulations and the guidelines;

(b) exercising any of the powers of the board of health or the medical officer of health of the board of health;

(c) appointing a person to act as the medical officer of health of the board of health in the place of the medical officer of health appointed by the board;

(d) providing advice and guidance to the board of health, the medical officer of health of the board of health, and any person whose services are engaged by the board of health;

(e) approving, revoking or amending any decision of the board of health, the medical officer of health of the board of health, or any person whose services are engaged by the board of health; and

(f) accessing any record or document that is in the custody or under the control of the board of health, the medical officer of health of the board of health, or any person whose services are engaged by the board of health.
When Dr. Basrur recently appointed an assessor, Mr. Graham Scott, to examine the state of affairs in the Muskoka-Parry Sound Health Unit, she did so pursuant to authority delegated to her by the Minister of Health and Long-Term Care. This salutary example of leadership is discussed below.

It makes little sense to continue to vest in the Minister this corrective power. The Chief Medical Officer of Health must be able to investigate boards of health where there is a concern that duties under the *Health Protection and Promotion Act* are not being met, and to order that they take action to remedy such a failure.

The shift of these assessment and correction powers from the Minister to the Chief Medical Officer of Health is necessary to ensure that such decisions are made, and seen to be made, exclusively on public health considerations. To leave the power with the Minister is to invite the perception and fuel speculation that the decision to bring a local board to account or to leave it alone is influenced by political considerations. This danger is particularly great with the active political role of so many members of local boards of health.

**Recommendation**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to transfer the powers in ss. 82 through 85 to the Chief Medical Officer of Health.

**Public Health Laboratories**

Another important area of responsibility under the Act, provincial public health labs, remains under the direction of the Minister. Subsection 79(1) provides that the Minister may “establish and maintain public health laboratory centres at such places and with such buildings, appliances and equipment as the Minister considers proper.” Subsection 79(2) provides that the Minister “may give direction from time to time to a public health laboratory centre as to its operation and the nature and extent of its work, and the public health laboratory centre shall comply with the direction.”

Currently, the labs fall under the domain of the Laboratories Branch of the Health Services Division of the Ministry of Health and Long-Term Care. The Central Public Health Lab has a non-medical director who reports to an Assistant Deputy Minister, also a non-medical person. If the Chief Medical Officer of Health is to hold
both the responsibility to ensure the protection of the public health of Ontario and
the power to act independently to ensure that she fulfills that responsibility, the public
health labs must be part of the transfer of power.

The provincial lab has a critical role to play in public health. Part of the Ministry of
Health, the Ontario Public Health Laboratory is a network consisting of one provin-
cial laboratory in Toronto, known as the Central Public Health Laboratory, and 11
regional labs. Approximately half of the 500 technical and support staff are employed
in the Toronto facility.\(^4\) Their role is described as follows:

The public health labs provide diagnostic microbiology testing in support
of public health programmes, outbreak management and control, and
microbiology reference services for the province in areas where front line
microbiology diagnostic testing is not available.\(^3\)

One observer described their importance to the smooth functioning of the Ontario
public health system as follows:

But with a public health laboratory, while they do deal with individual
patients, it doesn't have that patient as their number one priority despite
the fact that, you know, the patient is very important. Their number one
priority is understanding how this one patient with that particular
disease, whatever it may be, may impact on the greater public. And so a
public health laboratory has as its main focus not the one patient but how
that one patient may impact on the greater public.

The Walker report,\(^4\) the Naylor Report and the Commission’s first interim report
noted serious inadequacies in Ontario’s public health laboratory capacity during
SARS. As noted in the Commission’s first interim report, SARS highlighted both
the need for a well-resourced, smooth functioning lab, and the abysmal state of
the Ontario’s Central Public Health Laboratory. The provincial laboratory in

of Health and Long-Term Care, *SARS: The Ontario Public Health Lab’s Experience*, presented at the
National Forum on Laboratory Reform, (Toronto: March 23-4, 2004), p. 3. (Subsequently referred
to as the Fearon Presentation.)

\(^3\) The Fearon Presentation, p. 3.

\(^4\) Ontario Expert Panel on SARS and Infectious Disease Control, *For the Public’s Health*, (Ministry of
Health and Long-Term Care: December 2003) (subsequently referred to as the Walker Interim
Report).
Toronto quickly became swamped with specimens but it was ill-equipped and unprepared to deal with the expanded demands of an outbreak like SARS. Consequently, as Dr. Naylor noted in his report, many of the private hospitals either by-passed the provincial lab altogether, sending specimens directly to the National Microbiology Laboratory in Winnipeg, or they handled the testing themselves, becoming as Dr. Naylor described “the de facto and unfunded referral centres for Toronto SARS testing.”

Laboratories are at the heart of our protection against infectious disease. The Chief Medical Officer of Health, with her independence and professional qualifications, should have the responsibility to establish and maintain the provincial public health labs. This includes ensuring that they are properly resourced. Furthermore, there is a need to ensure that the Central Public Health Lab is connected to and works effectively with the Public Health Division of the Ministry of Health and Long-Term Care. Many of those interviewed by the Commission remarked that the Central Public Health Lab tended to operate as a separate silo, rather than an integrated part of the Public Health Division. One expert noted that during SARS the Public Health Branch had trouble getting information from the public health laboratory, even though they were part of the same Ministry. This disconnect caused great concern for many experts who came forward to help with the Ontario response. As one of them noted:

> The lab was a huge issue... What we were really worried about, too, was the number of cases that were positive on the lab test that were negative clinically. Were they missing cases and were these going to be the ones that were transmitting the cases even further, because they were our real worry, because that's how we would lose containment, by the asymptomatic cases ... We had trouble getting access to any of the lab information at the Ministry, even though it was the same Ministry.

It is only logical that the Chief Medical Officer of Health should have within her basket of powers the ability to direct the provincial public health labs as a vital aspect of public health protection. This direction should not come from an elected official without medical training or public health expertise.

SARS showed us also that it is essential that one person be in overall charge of our public health defence against infectious outbreaks. While cooperation and teamwork

are required in any large endeavor, an effective defence requires that all public health aspects be under the leadership of one person. Why hive off from the Chief Medical Officer of Health the responsibility for public health laboratories? Why put that function under a separate division of the Ministry under different leadership? Essential links in our public health defence against infectious disease, like the public health laboratories, should be under the leadership of the Chief Medical Officer of Health, not an independent bureaucratic entity. SARS showed that this kind of bureaucratic barrier leads only to problems.

The Walker panel recommended that, in the short term, the Ministry of Health and Long-Term Care would retain control of the public health labs:

“Short-term: continued management of public health laboratory system, increasing role of Public Health Division.”

In the long-term, however, Walker recommended transferring the public health labs to the proposed Ontario Health Protection and Promotion Agency:

“Long-term: transfer of responsibility for management of the public health laboratories through coordination with Agency.”

In respect of the Ontario Health Protection and Promotion Agency, Walker recommended the following role for the Chief Medical Officer of Health, to ensure clear linkages between the Chief Medical Officer of Health and the Agency:

It is proposed that strategic direction for the Agency be set by the Chief Medical Officer of Health (CMOH) and day to day operational and scientific leadership be provided by a Chief Executive Officer. The final Walker report also recommended: “... that the Chief Medical Officer of Health be an ex-officio member of the board to ensure a link to the broader direction and functioning of the Agency.”

On June 22, 2004, Minister Smitherman released the three-year public health action

---

plan called “Operation Health Protection.” Its purpose is to institute the recommendations in the Commission’s first interim report, and the Walker Report. This plan indicated that the Ontario Centre for Disease Control (called the Ontario Health Protection and Promotion Agency) and its new laboratory would begin operations in the 2006/7 fiscal year. It also called for the Ministry of Health to “undertake a formal review of the public health laboratory system in [fiscal] 2004/5 to determine the functional and procedural enhancements required for the system to provide appropriate tests and perform optimally during outbreaks and non-outbreak situations.”

The recommendation that the Chief Medical Officer of Health assume responsibility for Ontario’s Public Health Laboratories is intended as a short-term transfer of powers pending the development of the Ontario Health Protection and Promotion Agency and the transfer of powers in accordance with the recommendations in the Walker Report, with which this Commission concurs. Once developed the Agency will be responsible for the public health laboratory system. The Agency in turn will come under the direction of the Chief Medical Officer of Health. It only makes sense for the Chief Medical Officer of Health to have authority over public health laboratories at this time, pending the development of the Health Protection and Promotion Agency. Conversely it makes no sense to leave with the Minister the medical power to direct the public health laboratory as to its operation and the nature and extent of its work.

**Recommendation**

The Commission therefore recommends that:

- The Minister’s power under s. 79 of the *Health Protection and Promotion Act*, to establish and direct public health laboratory centres be transferred from the Minister to the Chief Medical Officer of Health, until such time as the establishment of the Ontario Health Protection and Promotion Agency and the transfer of power over the laboratories in accordance with the recommendations of the Walker Report.

---

49. Ministry of Health and Long-Term Care, “Operation Health Protection: An Action Plan to Prevent Threats to our Health and to Promote a Healthy Ontario” (June 22, 2004). (Subsequently referred to as Operation Health Protection).

Enforcement Powers

Three separate provisions of the Health Protection and Promotion Act address the issue of enforcement. These three sections, s. 35, s. 86.1 and s. 102, authorize court action in the face of noncompliance.

If the powers of the local medical officer of health are assigned concurrently to the Chief Medical Officer of Health as recommended, the Chief Medical Officer of Health would have enforcement powers under s. 35 in addition to the enforcement powers acquired under s. 86.1 following the recent amendment to the Act.

Subsection 102(1) allows the person who made an order or the Chief Medical Officer of Health, or the Minister, to apply to the Superior Court of Justice for an order restraining a contravention of the Act. That subsection provides:

102(1) Despite any other remedy or any penalty, the contravention by any person of an order made under this Act may be restrained by order of a judge of the Superior Court of Justice upon application without notice by the person who made the order or by the Chief Medical Officer of Health or the Minister.

Subsection 102(2) authorizes an application to the Superior Court of Justice for an order prohibiting the continuation or repetition of the contravention or the carrying on of any activity specified in the order. That subsection provides:

102(2) Where any provision of this Act or the regulations is contravened, despite any other remedy or any penalty imposed, the Minister may apply to a judge of the Superior Court of Justice for an order prohibiting the continuation or repetition of the contravention or the carrying on of any activity specified in the order that, in the opinion of the judge, will or will likely result in the continuation or repetition of the contravention by the person committing the contravention, and the judge may make the order and it may be enforced in the same manner as any other order or judgment of the Superior Court of Justice.

More will be said below about the confusing nature of these two parts of this provision. It makes little sense that the Chief Medical Officer of Health should have the power to request an order restraining in s. 102(1) but lacks the power to request an order prohibiting continuation or repetition in s. 102(2). These are operational
powers, not political oversight powers, and they should be in the hands of the Chief Medical Officer of Health rather than the Minister.

**Recommendations**\(^5\)

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to transfer the power in s. 102(2) to the Chief Medical Officer of Health.

- The *Health Protection and Promotion Act* be amended to remove from s. 102(1) the Minister as a listed person who may exercise that power.

**Powers over Inspectors**

Another important enforcement power that currently remains with the Minister is the responsibility for inspectors under the *Health Protection and Promotion Act*. Section 80(1) sets out the power of the Minister to appoint inspectors.\(^5\) Subsection 80(2) sets out the duty of an inspector and s. 80(3) allows the Minister to set limits on the duty or authority of inspectors:

(2) An inspector shall make inspections of health units to ascertain the extent of compliance with this Act and the regulations and the carrying out of the purpose of this Act.

(3) The Minister in an appointment may limit the duties or the authority or both of an inspector in such manner as the Minister considers necessary or advisable.

Subsection 80(4) provides that the Minister may require an inspector to act under the

---

51. These recommendations are directed towards this section if it remains as it is. As discussed in Chapter 10, Legal Access, the sections need to be clarified and amended in their entirety, and set out in a clear, comprehensive enforcement section of the Act.

52. Subsection 80(1) provides:

The Minister may appoint in writing one or more employees of the Ministry or other persons as inspectors.
direction of, or report to, the Minister, the Deputy Minister of Health, the Chief Medical Officer of Health or other officer in the Ministry.

It seems logical that if the Chief Medical Officer of Health has the responsibility to ensure compliance with the *Health Protection and Promotion Act* across the province, she must also have the complimentary power to appoint and direct the inspectors who conduct inspections to determine the extent of a health unit’s compliance with the Act. These are powers of management and enforcement, not powers of political oversight, and therefore should reside with the Chief Medical Officer of Health, not the Minister.

**Recommendation**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to transfer the powers in s. 80 to the Chief Medical Officer of Health.

**Powers to Remain with the Minister of Health and Long-Term Care**

Once these four statutory bundles of power (assessors, public health labs, enforcement and inspectors) are transferred to the Chief Medical Officer of Health, two important powers remain with the Minister: the power to investigate by way of inquiry and the power to take possession of premises for the purposes of temporary isolation.

The power to investigate by way of inquiry is contained in s. 78 of the *Health Protection and Promotion Act*. Section 78 provides that the Minister may make investigations respecting the causes of disease and mortality, and may direct anyone to conduct such an investigation, exercising the powers of a commission under Part II of the *Public Inquiries Act*. It is this

---

53. Part II of the *Public Inquiries Act*, R.S.O. 1990, c. P. 41, sets out the power of a Commissioner. In particular, s. 7 allows the Commissioner to compel evidence:

A commission may require any person by summons,

(a) to give evidence on oath or affirmation at an inquiry; or

(b) to produce in evidence at an inquiry such documents and things as the commission may specify, relevant to the subject-matter of the inquiry and not inadmissible in evidence at the inquiry under section 11.
power, reflected in the Commission’s terms of reference and Order in Council, that enables the work of this Commission. There is no good reason to transfer this power to the Chief Medical Officer of Health. It is not a power that requires any medical expertise or knowledge about infectious disease. Medical expertise is not required to determine that the public interest requires an investigation into some matter of public concern involving the health system. This power belongs with the Minister of Health, an elected official, answerable in the Legislative Assembly and to the public. For this reason the Commission recommends no change to the power of the Minister under s. 78 to launch an investigation into the causes of disease and mortality.

Section 87 of the *Health Protection and Promotion Act* allows the Minister to commandeer any building for use as a temporary isolation facility or as part of a temporary isolation facility.⁵⁴ While some have submitted to the Commission that this power be

---

54. Possession of premises for temporary isolation facility

87(1) The Minister, in the circumstances mentioned in subsection (2), by order may require the occupier of any premises to deliver possession of all or any specified part of the premises to the Minister to be used as a temporary isolation facility or as part of a temporary isolation facility.

**Extension**

(1.1) An order under subsection (1) shall set out an expiry date for the order that is not more than 12 months after the day of its making and the Minister may extend the order for a further period of not more than 12 months.

**Grounds for order**

(2) The Minister may make an order in writing under subsection (1) where the Chief Medical Officer of Health certifies to the Minister that,

(a) there exists or there is an immediate risk of an outbreak of a communicable disease anywhere in Ontario; and

(b) the premises are needed for use as a temporary isolation facility or as part of a temporary isolation facility in respect of the communicable disease.

**Delivery of possession**

(3) An order under subsection (1) may require delivery of possession on the date specified in the order.

**Hearing and submissions**

(4) The Minister need not hold or afford to any person an opportunity for a hearing or afford to any person an opportunity to make submissions before making an order under subsection (1).
transferred to the Chief Medical Officer of Health, the Commission recommends that it remain within the authority of the Minister of Health and Long-Term Care.

Order for possession

(5) Where a judge of the Superior Court of Justice is satisfied on evidence upon oath,

(a) that there has been or is an immediate risk of an outbreak of a communicable disease anywhere in Ontario;

(b) that the premises are needed for use as a temporary isolation facility or as part of a temporary isolation facility in respect of the communicable disease; and

(c) that the occupier of the premises,

(i) has refused to deliver possession of the premises to the Minister in accordance with the Minister’s order under subsection (1),

(ii) is not likely to comply with the Minister’s order under subsection (1), or

(iii) cannot be readily identified or located and as a result the Minister’s order under subsection (1) cannot be carried out promptly,

the judge may issue an order directing the sheriff for the area in which the premises are located, or any other person whom the judge considers suitable, to put and maintain the Minister and any persons designated by the Minister in possession of the premises, by force if necessary.

Execution of order

(6) An order made under this section shall be executed at reasonable times as specified in the order.

Application without notice

(7) A judge may receive and consider an application for an order under this section without notice to and in the absence of the owner or the occupier of the premises.

Compensation

(9) The occupier of the premises is entitled to compensation from the Crown in right of Ontario for the use and occupation of the premises and in the absence of agreement as to the compensation the Ontario Municipal Board, upon application in accordance with the rules governing the practice and procedure of that board, shall determine the compensation in accordance with the \textit{Expropriations Act}.

Procedure

(10) Except in respect of proceedings before the Ontario Municipal Board in accordance with subsection (9), the \textit{Expropriations Act} does not apply to proceedings under this section.
The power in s. 87 is considerable. It empowers the Minister to commandeer any building. It differs in nature from purely operational public health powers and reaches beyond the health care system and those directly affected by disease. It thus requires a different level of nonmedical accountability than that required for purely medical or operational powers. Under the current system the Minister is directly accountable for any exercise of this extraordinary power. On the other hand, the Minister may only make such an order on the advice of the Chief Medical Officer of Health. The latter must certify that there exists or there is an immediate risk of an outbreak of a communicable disease anywhere in Ontario and that the premises are needed for use as a temporary isolation facility or as part of a temporary isolation facility in respect of the communicable disease. The current system thus ensures a double level of accountability, political and medical, for the exercise of this power.

Recommendation

The Commission therefore recommends that:

- The powers in s. 78 (appointment of inquiry) and in s. 87 (commandeering buildings for use as temporary isolation facilities) remain as they are, to be exercised by the Minister of Health and Long-Term Care.

Parallel Independence of Local Medical Officers of Health

The local medical officers of health throughout the province are the backbone of our protection against infectious disease. They, like the Chief Medical Officer of Health, require independence from political and bureaucratic pressures in relation to the prevention and management of infectious disease.

The medical officer of health, as noted earlier, requires a degree of independence parallel to that enjoyed by the Chief Medical Officer of Health, which was recently the subject of amendments to the Health Protection and Promotion Act.\textsuperscript{55} Local

\textsuperscript{55} Subsection 81(1.3) was recently added to require the Chief Medical Officer of Health to report annually to the public on the state of public health in Ontario and to authorize them to make any other reports respecting public health as she considers appropriate. The relevant sections are:

Annual Report
medical officers of health must have both the duty and the power to speak out publicly about local public health concerns. These must include the power to bring to the attention of the public a local board’s failure or refusal to comply with its obligations under the Act. The local medical officer of health must be able to do so without fear of reprisal, dismissal, or other adverse employment consequences.

As will be discussed in greater detail in the following chapter, in many municipalities the local medical officer of health is buried within the municipal governance structure. Their desire to freely communicate on behalf of those citizens living in their unit, in relation to health risks, is tempered by their desire to preserve their jobs. Ironically, one medical officer of health, while supporting greater independence, noted their inability to voice that opinion publicly:

Interestingly enough, with the announcement related to the independence of the Chief Medical Officer of Health, a reporter asked wouldn’t it make sense if that was parallel at the community level as well? And of course in the interests of preserving my job, I actually said I could not comment. So I think that that sort of instinctively appeals and is understood because I think the reasons were very well understood why the Chief Medical Officer of Health needed that independence.

There is a strong concern in the medical officer of health community that their ability to communicate with the public is hampered by their lack of independence and their

---

(4) The Chief Medical Officer of Health shall, in every year, make a report in writing on the state of public health in Ontario, and shall deliver the report to the Speaker of the Legislative Assembly.

Laying before Assembly

(5) The Speaker shall lay the report before the Assembly at the earliest reasonable opportunity.

Minister’s Copy

(6) The Chief Medical Officer of Health shall deliver a copy of the report to the Minister at least 30 days before delivering it to the Speaker.

Other Reports

(7) The Chief Medical Officer of Health may make any other reports respecting the public health as he or she considers appropriate, and may present such a report to the public or any other person he or she considers appropriate.
struggles within the municipal governance structure. One local medical officer of health described how hard it is to get the public health message out to the public:

... for many years I insisted on preparing my own annual report and we printed it and we distributed it through libraries and all the usual venues. The regional corporation actually at that time never had an annual report of their own and they heard about this, so they decided to do their own annual report, I mean apart from their financial statement, which of course they’ve always had to do, but they decided they needed a glossy annual report so for awhile I was allowed to have the two middle pages that related specifically to the health of the residents and over the last two, three years that has disappeared as well, I gave up fighting for that.

As another medical officer of health described the problem:

... communication and public health risk communication is different from corporate communication and that is a very difficult concept for regional corporations to understand, they just feel they own all of the communication because what it means to them is ensuring that pathways are in place for re-election.

Yet another medical officer of health described the struggle to communicate with the public:

I recall one incident where the regional municipality wanted to speak out on a communicable disease investigation. They [the region] make unhealthy public health policy decisions all the time and because I’m embedded in the regional municipality, I can’t speak out, and I think what you’re seeing as well is a disturbing trend of integrating public health risk communications into the municipal communications. The problem with that is the latter often serves as a press secretary function to the regional politicians. And I think you need to give a great deal of consideration to this one, more generally, with respect to emergencies. You need to protect the independent voice of the medical officer of health with respect to public health risk communications, particularly in the municipal setting, because there are conflicts all the time. This may be the opportunity to clean it up so that we can speak authoritatively, locally, on public health risk standards. My hope would be that we would get the same sort of protection that the Chief Medical Officer of Health presumably is going to get, maybe even more as a part of the independ-
ence package that we’re expecting in the Fall.

The problem is particularly acute when it may be necessary to speak out against a health risk created by the municipality itself:

If you subsume the public risk communications machinery in the corporate communications machinery, then your strong public health messages may be sanitized or killed because your message may look bad. [What about] a region who is charged with violations under the Ontario Water Resources Act, failure to report abnormal test results. As you know, we’re required to issue boiled water advisories and as such we are also in the loop with respect to reporting, as is the Ministry of the Environment. Clearly there would be a conflict of interest in us speaking out, if in fact there was a problem with reporting to public health, if in fact it undermined the defence of the Region with respect to charges under the Ministry of the Environment. I mean this is just one of many, many examples, but I think public health risk communication is very, very important.

It is unacceptable that medical officers of health are restricted in their ability to tell the public what it has a right to know about health risk. Public health leadership and risk communication must be the clear domain of the local medical officer of health. The *Health Protection and Promotion Act* must authorize them to speak out on behalf of public health, without fear of adverse employment consequences. They have the duty, and require the power, to tell the public directly about any health risk. Local politics and bureaucratic turf wars have no place in the protection of the public’s health. It is vital to ensure the ability of the medical officer of health to speak out. It is equally vital, as noted in the following chapter, to protect the local medical officer of health from the municipal bureaucracy and ensure his or her direct authority for the administration of staff and public health resources. Both changes are necessary to ensure the ability of the local medical officer of health to protect the public.

The independence recently given to the Chief Medical Officer of Health by statutory amendment should now be extended to those responsible locally for our day to day health protection. As one local medical officer of health said:

I think those of us who are in public health as physicians, really believe in the ability to improve people’s health, and that’s why we got in the job in the first place, and that’s why I’m here, because I want to help shape the system.
They must have the legal authority and independence.

**Recommendation**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to provide for every local medical officer of health a degree of independence parallel to that of the Chief Medical Officer of Health. This would include:
  - Giving the local medical officers of health the same reporting duties and authority as the Chief Medical Officer of Health:
  - To report every year publicly on the state of public health in the unit. This report must be provided to the local board of health and the Chief Medical Officer of Health 30 days prior to it being made public; and
  - To make any other reports respecting the public’s health as he or she considers appropriate, and to present such a report to the public or any other person, at any time he or she considers appropriate.
  - Protecting the independence of the local medical officer of health by providing that no adverse employment action may be taken against any medical officer of health in respect of the good faith exercise of those reporting powers and duties.

**A Continued Need for Greater Central Control over Health Protection**

The present system of central accountability and control is impractical and cannot continue. When a board of health fails in its obligations, the cumbersome enforcement provisions of ss. 82 through 86 are the only recourse for the Chief Medical Officer of Health. As the Commission observed in the first interim report:

The difficulty is that the assessment and compliance machinery is infinitely complicated, replete with notices, directions, orders, procedures before the Health Services Appeal and Review Board and the Superior Court of Justice and appeals therefrom. It more resembles an interna-
tional peacekeeping operation than it resembles effective machinery to enforce basic health protection standards across the province.

These powers had to be invoked in the Muskoka-Parry Sound Health Unit debacle, described below. The process in that case was time consuming and resource intensive. The Chief Medical Officer of Health, as Ontario’s health protection leader, requires a simpler process of intervention than the complex process set out in the *Health Protection and Promotion Act*. The assurance of a uniform level of health protection across the province, particularly in relation to infectious diseases, demands that the Chief Medical Officer of Health have the power to intervene quickly and effectively whenever necessary to protect the public. Health protection across the province relies not only on effective boards of health, but also on knowledgeable, effective local medical officers of health. It is the local medical officers of health who have the authority to make orders under the *Health Protection and Promotion Act*, in the interests of protecting the public’s health. Curiously, although the Chief Medical Officer of Health is the leader for health protection in the province, she does not have the same powers as the local medical officers of health. Moreover, she has no ability to direct persons whose services are engaged by a board of health, short of taking over the board of health.

The Chief Medical Officer of Health can only exercise direct powers under s. 86 of the Act, which requires that she determine that “a situation exists anywhere in Ontario that constitutes or may constitute a risk to the health of any persons.” In such a case, the Chief Medical Officer of Health may investigate the situation and take any action, as she considers appropriate, to prevent, eliminate or decrease the risk. Subsection (2) states that where these criteria are met, she can exercise the powers of the local medical officer of health or the board of health, or direct the services of a person whose services are engaged by the board of health. Although this standard of intervention is not high, it is nonetheless a legal hurdle to intervention. As a legal hurdle it attracts all the legal issues associated with the intervention of a superior authority into the affairs of an autonomous local entity.

That is the wrong way to view the collegial relationship between the Chief Medical Officer of Health and the 36 local medical officers of health scattered throughout the province. The relationship, although collegial, cannot be entirely equal in an era in which the rapid communication of deadly disease requires a strong measure of central accountability and control. The ability of the Chief Medical Officer of Health to intervene where necessary in a local health unit should be part of a seamless continuum where daily authority is exercised by the local medical officer of health subject to the direction, whenever necessary, of the authority of the Chief Medical Officer of
Health. The exercise of central leadership and authority cannot be impeded by this formal legal hurdle more appropriate to an era when local autonomy necessarily trumped central control. The public interest in unified accountability and control requires that there be no formal legal impediment to the local involvement and leadership of the Chief Medical Officer of Health whenever it is required in the wider provincial interest.

Ontario is fortunate in its many skilled, experienced and dedicated local medical officers of health who do a remarkable job delivering services and protecting the public. But this does not detract from the need for the Chief Medical Officer of Health to be able to intervene where the local authorities need leadership, assistance, or intervention.

Threats to public health may arise suddenly and without warning, overwhelming the capacity of a local health unit and local medical officer of health. It is essential in such cases that central resources and leadership be deployed immediately not only to assist the local unit but also to guard against the spread of disease to the rest of the province.

If a West Nile problem or a future SARS or some other hazard cannot be easily contained because the situation overwhelms the resources of the local health unit, they should be able to count on the Chief Medical Officer of Health to do what is necessary, whether that be deploying resources from other health units or the province.

For this reason alone, the Chief Medical Officer of Health requires the ability to step in immediately without the hurdle of s. 86, described above.

The problem with the present lines of authority between the Chief Medical Officer of Health and the local health units is that they harken from a pre-SARS era when it seemed fine for municipalities to run the show as independent legal entities. SARS showed that public health is a provincial concern, not just a local concern. Infectious diseases do not respect the geographic boundaries of Ontario’s local health units. As noted so often, an infectious disease outbreak in one health unit could bring the whole province to its knees within days. Local autonomy has many advantages, but not when it comes to infectious disease problems that threaten the larger Ontario public interest.

The recommendation, for concurrent Chief Medical Officer of Health and medical officer of health powers, exercised locally by the medical officer of health subject to the ultimate central direction of the Chief Medical Officer of Health, does not mean
that the local medical officers of health lose their duties and obligations under the Act or their local leadership and authority. They are still in charge at the local level, better protected against local bureaucratic and political interference, and subject only to the central leadership and direction of the politically independent Chief Medical Officer of Health.

Nor does the recommendation mean that local medical officers of health would lose their ability to address their community needs. It does not mean a cookie cutter approach to public health across the province. The public health challenges faced in a major urban center such as Toronto are not identical to those faced in a small northern community such as Dryden, and neither of those are identical to those faced by a border community such as Niagara Falls. In critical aspects such as infection control, surveillance, and management, as well as emergency preparedness, one would expect that the Chief Medical Officer of Health would lead strongly in setting clear standards that must be met in each health unit. This is vital to ensuring a seamless level of protection against infectious disease across the province. In other activities, however, like those unique to a particular community, the expectation is that the local medical officer of health would have wide discretion in programme planning and delivery of services. Requiring that mandatory standards be met and giving the Chief Medical Officer of Health a strong central role, do not mean that all health units’ programmes must be carbon copies of each other. Nor does it mean that the local medical officer of health would lose the ability to tailor the programmes to the particular region. The recommendation is not to remove their current powers or independence, but simply to give the Chief Medical Officer of Health concurrent power to reinforce central leadership and control when needed.

One local medical officer of health expressed this concern:

I think the principle that you want to set up a framework whereby the Chief Medical Officer of Health can exercise authority at the local level when needed is a good principle. I think that you are right that that exercise is more likely to happen on issues of communicable disease control than it is in other areas. I am just wondering what the best way to do that is. I guess the local MOH is almost always going to be closer to the situation and in a better position by virtue of having information and having worked with it probably for a little while before the issue comes up of whether the Chief Medical Officer of Health should step in.

I would almost rather see the presumption being that there is local autonomy with a mechanism for override rather than delegation with the
option of taking the authority back and there may be some legal differences in those two ways of structuring it. I think the default should be that the person on the scene in the first instance has the responsibility for making decisions.

This thoughtful concern is met by the practical reality that no Chief Medical Officer of Health fulfilling his or her overall provincial responsibilities will have the time, the inclination or the resources to tinker inappropriately with local decisions. Under the present system, whatever its future, local autonomy is required on a day to day basis because you simply cannot run the whole province from Toronto. Day to day management of health protection will devolve necessarily on the local medical officer of health subject to central leadership and direction by the Chief Medical Officer of Health, without legal hurdles, when it seems reasonable.

Under this recommendation it would be business as usual. The local medical officer of health under the present practice runs public health locally but consults with the Chief Medical Officer of Health when particularly sensitive issues arise on which the local medical officer of health wants advice and support from the Chief Medical Officer of Health. This recommendation retains the initial presumption of local control. There is no proposed increase in actual power for the Chief Medical Officer of Health who already has the power of intervention in s. 86, described above. This recommendation simply removes the legalistic baggage potentially attracted by s. 86 and makes the central leadership of the Chief Medical Officer of Health more direct.

Others have raised the concern that transferring the powers to the Chief Medical Officer of Health creates the potential for abuse of these powers by the Chief Medical Officer of Health. While they do not raise this concern about the current Chief Medical Officer of Health, they worry about the use of this power in the hands of an unknown successor.

As noted above and discussed in greater detail below, the independence of the Chief Medical Officer of Health, as well as the greater independence of the local medical officer of health, combined with the ability and security to speak out publicly, would act as a deterrent against any inappropriate use of the powers of the Chief Medical Officer of Health.

One local medical officer of health expressed the concern that problems will arise not necessarily when the Chief Medical Officer of Health decides she needs to intervene, but when members of the public or others in the community seek to use her authority
to undermine or challenge the independence and authority of the local medical officer of health:

I guess a good situation would be one in which the Chief Medical Officer of Health found it relatively easy to step in where needed at their discretion, but the people whom the local medical officer of health is dealing on a day to day basis would not find it easy to appeal as it were over the head of the local MOH. You do not want to give the people that we have to work with on a regular basis the idea that if they do not like the MOH’s decision, they can just bump it up a level.

...is it possible if you do not want to have criteria that would set boundaries, is it possible to indicate a level of concern so that it makes it clear that it is not a day to day avenue that is open to people, some language around extraordinary circumstances or posing a risk to the health of the population. I do not know what would work but a little bit of guidance to people trying to interpret the legislation.

The Chief Medical Officer of Health must ensure that it is clear to everyone, through policy and practice, that her authority and intervention is not available to those who seek to use it simply to second guess an unpopular decision of the local medical officer of health. As recommended above, the strengthened independence of the local medical officer of health recommended below by the Commission will provide an effective safeguard against any inappropriate use of the powers of the Chief Medical Officer of Health.

The Commission proposes a system of dispersed central authority whereby the local medical officer of health exercises in ordinary times local authority concurrent with that of the Chief Medical Officer of Health. Local autonomy of the local medical officer of health is the ordinary position. Local autonomy is secured by the newly recommended independence of the local medical officer of health from bureaucratic interference or political pressure. Local autonomy is fortified by the newly recommended duty and power of the local medical officer of health to speak out publicly in respect of health risks. The local autonomy of the medical officer of health is subject only to the central leadership and ultimate direction by the Chief Medical Officer of Health that is required to ensure a uniformly strong level of protection across the 36 separate local health units, particularly in relation to infectious disease.
Recommendations

The Commission therefore recommends that:

- The powers now assigned by law to the medical officer of health are assigned concurrently to the Chief Medical Officer of Health.

- These concurrent powers shall be exercised by the medical officer of health in the local region, subject to the direction of the Chief Medical Officer of Health.

Public Health Emergency Preparedness and Response

SARS showed us also that it is essential that one person be in overall charge of our public health defence against infectious outbreaks. While cooperation and teamwork are required in any large endeavor, effective defence against infectious disease requires that all public health aspects of that defence be under the leadership of one person.

Since SARS, emergency committees have proliferated and multiplied within the government and particularly within the Ministry of Health and Long-Term Care. Within the Ministry of Health and Long-Term Care, the Health Emergency Management Committee plans for emergencies, the Ontario Health Pandemic Influenza Plan Steering Committee plans for pandemic influenza emergencies, the Emergency Management Unit manages emergencies, and the Executive Emergency Management Committee makes executive decisions. There are also additional layers of committees at the centre of government.

Strangely, the Chief Medical Officer of Health is in charge of none of these committees which are central to Ontario’s defence against public health emergencies.

A case in point is the Emergency Management Unit, established in December 2003, to oversee all the Ministry’s emergency management activities. Under the leadership of a dedicated long-time official in the Ministry of Health and Long-Term Care, the Unit plays a central role in many crucial public health emergency planning activities:

- It is the lead for pandemic influenza planning, including overseeing the steering committee it established to oversee the development of the health pandemic flu plan.
• It is developing a smallpox emergency response plan.

• It is developing a radiation health response plan.

• It is working on the health component of the Foreign Animal Disease Plan.

The Unit’s extensive activities have necessitated the development of draft Terms of Reference for a Scientific Advisory Team to:

Provide advice to EMU based on evidence and best practices on medical/scientific aspects of health emergency planning and response, including but not limited to:

• Personal protection for health care workers;

• Medical response to and treatment of chemical, radiological and nuclear agents;

• Patient triage treatment and transport priorities;

• Needs analysis for pharmaceutical and other antidotes;

• Interaction and integration among health care providers; and

• Educational and research initiatives.

Review and provide input into relevant policies, standards and guidelines as directed by EMU.

Upon request, act as a Scientific Response Team to be convened to support the Ministry’s health emergency response (specific membership to reflect the needs of the emergency).

Provide scientific advice specific to health emergency threats upon request of the Director.56

---

For expertise on infectious disease, the Unit is also developing a relationship with the Provincial Infectious Diseases Advisory Committee (PIDAC) that may require a memorandum of understanding. A recent summary of the EMU’s activities related to PIDAC said:

- Expertise on new and emerging infectious diseases is provided by PIDAC.
- [EMU] Scientific Advisor and Director, EMU members of PIDAC.
- Work under way to develop a memorandum of understanding regarding mutual expectations in an emergency.
- Requests for specific advice on infectious diseases provided on an ad hoc basis, e.g., consolidation of SARS directives, confirmation of basic personal protective equipment in response to an infectious disease.  

The Unit’s web site is also the primary vehicle for public risk communication on significant public health issues. The portion of the web site aimed at the general public contains information on avian flu, influenza pandemic and health advisories. The portion of the web site intended for health care professionals contains technical information on pandemic influenza, avian flu, including screening tools, infection control standards, and important health notices.

The March 1, 2005, organizational chart of the Ministry of Health and Long-Term Care shows the Emergency Management Unit as a separate entity, with an apparent reporting relationship to the Associate Deputy Minister. There is no reporting link from the Emergency Management Unit to the Chief Medical Officer of Health.  

This is clearly a unit that should be under the direct authority of the Chief Medical Officer of Health. Nothing could be more central to the mandate of that office in protecting Ontarians from deadly infection. It makes no sense to hive off from the Chief Medical Officer of Health the responsibility for public health planning for smallpox and pandemic influenza. It makes no sense to put the responsibility for smallpox and pandemic influenza planning under a separate division of the Ministry. Public health emergency planning requires the leadership of the Chief Medical

58. See Appendix G to this Report.
Officer of Health, not an independent bureaucratic entity. SARS showed that this kind of bureaucratic barrier leads only to problems.

A recent “Important Health Notice” from the Ministry of Health in respect of avian flu was distributed on the Unit’s web site and was co-signed by the Associate Chief Medical Officer of Health and the head of the Emergency Management Unit, an official with no medical qualifications and no reporting relationship to the Chief Medical Officer of Health. To those familiar with the confusion during SARS arising from the split responsibility between the Commissioner of Emergency Management and the Chief Medical Officer of Health, this arrangement produces a shock of recognition.

Dr. Basrur explained to the Justice Policy Committee the problem during SARS of this very kind of arrangement:

… there were a multitude of directives issued under the authority of the two commissioners – the Commissioner of Emergency Management and the Commissioner of Public Health – and many comments back that people were unsure who was in charge because there were two signatories; there were always two people who had to be consulted.59

In the event of a provincial pandemic influenza emergency, can we expect three signatures, the Commissioner of Public Safety and Security, the head of the Ministry of Health and Long-Term Care’s Emergency Management Unit, and the Chief Medical Officer of Health, two of whom are not medically trained? To ask the question is to demonstrate that the Ministry’s present organization of emergency responsibility needs amendment to put the Chief Medical Officer of Health clearly in charge.

Another big problem during SARS that resulted from too many people managing the same problem was the multiplicity of information requests. The Commission repeatedly heard from SARS front line workers that much of their time was spent responding to multiple requests from various parts of the government, particularly within the Ministry of Health and Long-Term Care. As one Ministry employee who worked at the epi-unit told the Commission:

Compounding that as we went on, the demand for data and data analysis just became enormous. You know, the mailing list got to be this humungous monster. Everybody wanted the data. Everybody wanted certain charts developed.

As the demands for information grew, people started duplicating work. The insatiable requests for information cascaded down to the front line workers and local medical officers of health and their staff, significantly contributing to their frustration and fatigue. It is important to guard against the creation of multiple responding agencies and committees, which can, by their very multiple existence, create barriers to effective emergency response. Should another infectious disease emergency hit the province, we are at risk, under the current emergency system within the Ministry of Health and Long-Term Care, of repeating the very problems that arose during SARS, with multiple separate groups demanding case information and feeling entitled to it by nature of their emergency response mandate.

This is not to say that the Chief Medical Officer of Health or the local medical officers of health would work in isolation or be responsible for each and every detail of public health emergencies. That is an impossible responsibility. Much of the planning for future emergencies involves the creation of partnerships and working groups. While it is essential to have partnerships and working groups in place prior to an outbreak there still needs to be a single leader, identifiable both internally and externally. As one expert from outside Ontario who worked at the provincial level during SARS described the problem;

Outbreak management 101 would never set up the situation for something like this where you do not have a single person defined as being overall responsible. That does not mean that the person works alone in isolation and would report to someone with legislative powers to do certain things but you do not do something as confusing as this with two leaders …

SARS caught Ontario’s public health system unprepared. Unified preparedness and planning is a vital piece of armour in our protection against infectious disease. It must be a priority not only for the Public Health Division but also for every local health unit.

More will be said about this and the important issue of who is in charge, in the chapter on Emergency Legislation. Public health emergency planning is addressed here, in the context of Chief Medical Officer of Health leadership, as an area of the Ministry
of Health and Long-Term Care that must be put under the direction and control of the Chief Medical Officer of Health.

Key members of the SARS Scientific Advisory Committee suggest that it is important for the EMU, the Ministry’s operational response to a public health emergency and its lead in preparedness planning and implementation and management, to report directly to the Chief Medical Officer of Health. They recommend:

If the Chief Medical Officer of Health is the incident commander during a health emergency, it follows therefore that all other health sectors are accountable to the Chief Medical Officer of Health. This was the premise during the SARS outbreak and worked to the extent that proper command and control structures were exercised, and now the Emergency Management Unit of the Ministry of Health and Long-Term Care is the coordinating structure by which provincial health care providers and organizations would report to the Chief Medical Officer of Health during an emergency and this should be recognized in legislation. During the SARS outbreak there was duplication of information and efforts from within the MOHLTC. One central Emergency Management Unit reporting to the Chief Medical Officer of Health will avoid duplication and confusion.

The Commission endorses their recommendation.

Public health emergency preparedness and planning implementation must be the responsibility of the medical officer of health not only at the provincial level but also at the local level. It is not enough to ensure that the central provincial machinery is prepared. The local machinery in each part of the province must be equally prepared. Local preparation is essential not only to ensure a consistent province-wide response in each locality, but also because some public health emergencies will be local in nature without any immediate province-wide implications.

As one local medical officer of health noted, there must also be clarity around the leadership role of the local medical officer of health in respect of local health emergencies, and when responding to a provincial health emergency, in partnership with the Chief Medical Officer of Health:

We have not talked at all about health emergencies and who is in charge and what is a health emergency and in fact what is the role of the MOH at the local level with respect to health emergencies if at all and does
there need to be a corresponding bulking up of the mandatory health programmes and services and guidelines under that with respect to health emergencies … But I guess why I am asking this question is I meet with and chair a health emergency preparedness kind of committee that involves the hospitals, long-term care and so forth … I pulled this together because nothing is happening locally and I was shocked to learn that despite there being a health emergency management unit created in the Ministry of Health, it has given hospitals, long-term care, and so forth no direction whatsoever to have emergency plans. So, to the extent there are other actors that need to be involved in responding to a local health emergency that does not require a provincial response for example, how does that happen, and what powers and duties can be brought to bear to deal with that situation.

In addition to preparedness and planning, the Chief Medical Officer of Health and the local medical officers of health must have the lead role in public health emergency mitigation, management, recovery, coordination and risk communication. Above all, there must be clarity around roles and responsibilities.

As Dr. Bonnie Henry, former associate Medical Officer of Health for Toronto, noted in her testimony before the Justice Policy Committee, there is currently little clarity around roles and responsibilities:

A few other little things that came out: we have conflicting legislation right now about who has to do what in an emergency. I think that needs to be either umbrella legislation through EMA or we need to look at the Emergency Management Act, the Public Hospitals Act and the HPPA separately to rectify some of the conflicting legislative pieces.\(^{60}\)

Dr. Henry stressed the importance of local public health leadership in a public health emergency:

One of the things we need to remember is that all the actual physical, hands-on management of emergencies happens at the local level. So while we absolutely need to have the authority and decision-making

---

and a command-and-control structure at the provincial level—and I absolutely agree with that—the authority then needs to go to the local people to do what they need to do within their own local jurisdictions, because we know the quirks of our own jurisdictions. Some of the problems we’ve run into, for example, are that under the Public Hospitals Act, hospitals are not necessarily required to be involved with their local emergency response organizations. That needs to be changed. There’s nothing that requires them to be involved at the local level; they report to the province. That, I think, is an issue we have been trying to deal with.61

There is currently nothing in the *Health Protection and Promotion Act* that requires the local medical officer of health to be responsible for public health emergency preparedness, management and recovery or for public health risk communication. While there are scattered references to outbreak planning, emergency planning and risk communication in the Mandatory Guidelines, they are general in nature and do not make it clear what must be done and by whom.62 None of these references put the local medical officer of health in charge at the local level during a public health emergency or in charge of public health risk communication.

One local medical officer of health described the need for reform as follows:

> If you had a mandatory programme or standard so that every health unit shall work out a health emergency plan, a public health emergency plan, and that part of your function is, in the event of a public health emergency, public communication or risk assessment. I think that you have to do it in two places. I think that you have to deal with s. 5(1) and s. 7 … because if you do that then it gives you the authority, it helps you get money from the municipalities. I would also go a step further with respect to public health risk communications, I would also strengthen s.

62. For example, s 2.0 of the Mandatory Guidelines says that services provided by the board of health are expected to be planned and delivered by staff with the required technical/professional skills including skills in risk communication (one of many skills identified). Section 5.0 requires the board of health to have an outbreak response plan, and s. 6.0 requires the board to ensure input to hospital infection control programmes in health units and nursing homes and homes for the aged on their outbreak contingency plan. However, nothing in the mandatory guidelines puts the local medical officer of health squarely in charge of health emergency planning, preparedness, mitigation, management, coordination, recovery or risk communication.
so that there are explicit powers for the MOH to speak out with respect to health emergencies. You and I would agree that that may be covered under s. 67(1) but the people that you need to get to are the municipalities. You need to have some tools at hand to force them to pay for programmes and the way you do that is by declaring something mandatory. And when you do that, not only does the board of health and an obligated municipality have to provide and pay for it, but also it legitimizes the province providing the funding. So that is one of the advantages of naming those two areas in s. 5 and perhaps providing standards under s. 7. But I would also beef up in general the communications page under s. 67 and I think that there are enough other tools in the Act to allow us to get the job done, notably s. 13, s. 14 and infectious disease s. 22.

Another medical officer of health added:

I think the standards would have to be very prescriptive as to the elements of the emergency response plan, and they should be tested on an annual basis. I think there should be support in the Public Health Division to ensure that the quality of the plan across the province is acceptable and that we have people to liaise with.

The Health Protection and Promotion Act must be amended to include local public health emergency planning, preparedness, mitigation, management, recovery, coordination and risk communication as a responsibility of the local medical officer of health. A number of submissions to the Commission have recommended:

Amend section 5 of the Health Protection and Promotion Act to include “public health emergency preparedness, management and recovery and public health risk communication.”

Similarly, the Health Protection and Promotion Act must clearly state that at the provincial level, the Chief Medical Officer of Health is in charge of public health emergency planning, preparedness, mitigation, management, recovery, coordination and risk communication.

Subsection 6.2(1) of the Emergency Management Act requires that each municipality, minister of the Crown and designated agency, board, commission and other branch of government submit a copy of their plan to the Chief, Emergency Management
Ontario, and must ensure that they have the most current plan. The *Health Protection and Promotion Act* should be amended in a parallel manner so as to require that local medical officers of health and local boards of health submit a copy of their emergency plan to the Chief Medical Officer of Health and ensure that she has the most recent copy.

Dr. Bonnie Henry, described to the Justice Policy Committee the need for better integration at the local level and between the various health units:

>I think one of the really key things we need to work on is integration of emergency management programmes at the local level. Right now, everybody is required to have an emergency management program. Health is involved to varying extents in different places but it is not a major player at the local level. As well, we need to integrate with our neighbours. Our emergency management organization has a very different structure than does Peel, for example, but we share a lot of common borders and a lot of common issues, and how we do things is quite different.

As Dr. Henry also said:

>I think the whole issue of hospitals and other parts of the health care organization being part of our critical infrastructure is something that’s not well understood by people in the emergency side of the world – the people who look after critical infrastructure even at the city level. Hospitals are a provincial entity. Do they fit into us, or is the province looking after them? Who’s going to make sure they get the power back on soon? Who’s going to make sure they get the trucks to fill their generators so the patients don’t suffer?

The local medical officer of health must ensure that hospitals, long-term care facilities, nursing homes, outreach programmes, shelters, correctional institutions, and

---

63. Subsection 6.2(1) provides:

>Every municipality, minister of the Crown and designated agency, board, commission and other branch of government shall submit a copy of their emergency plans and of any revisions to their emergency plans to the Chief, Emergency Management Ontario, and shall ensure that the Chief, Emergency Management Ontario has, at any time, the most current version of their emergency plans. 2002, c. 14, s. 10.

64. Justice Policy Committee, Public Hearings, August 18, 2004, p. 149.

other organizations and institutions that would be involved in, or affected by a public health emergency, have their own emergency plans fully integrated with the public health emergency plan, all under the overall policy direction of the Chief Medical Officer of Health.

With this additional responsibility must come additional resources to ensure that the local medical officer of health and the Chief Medical Officer of Health can actually fulfill these expanded duties. To do otherwise would be to create an unacceptable risk.

**Recommendations**

The Commission therefore recommends that:

- Public health emergency planning, preparedness, mitigation, management, recovery, coordination and public health risk communication at the provincial level be put under the direct authority of the Chief Medical Officer of Health under the *Health Protection and Promotion Act*.

- Public health emergency planning, preparedness, mitigation, management, recovery, coordination and public health risk communication under the direction of the local medical officer of health be added to the list of mandatory public health programmes and services required by s. 5 of the *Health Protection and Promotion Act*.66

66. Section 5 provides:

Mandatory health programs and services

5. Every board of health shall superintend, provide or ensure the provision of health programs and services in the following areas:

1. Community sanitation, to ensure the maintenance of sanitary conditions and the prevention or elimination of health hazards.

2. Control of infectious diseases and reportable diseases, including provision of immunization services to children and adults.

3. Health promotion, health protection and disease and injury prevention, including the prevention and control of cardiovascular disease, cancer, AIDS and other diseases.

4. Family health, including.
• The Emergency Management Unit of the Ministry of Health and Long-Term Care be moved to the Public Health Division with its Director reporting directly to the Chief Medical Officer of Health.

• The *Health Protection and Promotion Act* be amended to require that each local board of health and each medical officer of health provide to the Chief Medical Officer of Health a copy of their general public health emergency plan and any incident specific plans and ensure that the Chief Medical Officer of Health has, at any time, the most current version of those plans.

**Protection from Personal Liability**

The *Health Protection and Promotion Act* now protects from personal liability for damages a limited class of people who act in good faith in the intended execution of their duties under the statute. These people include board of health members, medical officers of health and associate medical officers of health, and public health inspectors. Section 95 provides:

No action or other proceeding for damages or otherwise shall be insti-

i. counselling services,

ii. family planning services,

iii. health services to infants, pregnant women in high risk health categories and the elderly,

iv. preschool and school health services, including dental services,

v. screening programs to reduce the morbidity and mortality of disease,

vi. tobacco use prevention programs, and

vii. nutrition services.

4.1 Collection and analysis of epidemiological data.

4.2 Such additional health programs and services as are prescribed by the regulations.

5. Home care services that are insured services under the *Health Insurance Act*, including services to the acutely ill and the chronically ill.

67. Section 95(1).
tuted against a member of a board of health, a medical officer of health, an associate medical officer of health of a board of health, an acting medical officer of health of a board of health or a public health inspector for any act done in good faith in the execution or the intended execution of any duty or power under this Act or for any alleged neglect or default in the execution in good faith of any such duty or power.

Although these individuals are personally protected from being sued, anyone damaged by their negligence still has the right to sue the board of health itself. The provision thus protects a limited number of public health workers personally while it preserves the rights of anyone allegedly damaged by their actions.

The provision is cast too narrowly. By protecting public health officials like the medical officers of health and withholding protection from others like public health nurses, it withholds protection from those who may need it most. It also excludes the Chief Medical Officer of Health.

Section 95 of the Health Protection and Promotion Act should be amended to extend its protection to everyone employed by or providing services to a public health board or the provincial Public Health Division, everyone from the Chief Medical Officer of Health, to its expert advisors, to public health employees in the field.

This amendment will ensure that public health workers are adequately protected against personal liability for damages while preserving the right of anyone allegedly damaged to sue the worker’s employer.

**Recommendation**

The Commission therefore recommends that:

- Section 95 of the Health Protection and Promotion Act should be amended to extend its protection to everyone employed by or providing services to a public health board or the provincial Public Health Division, everyone from the Chief Medical Officer of Health, to its expert advisors, to public health employees in the field.

---

68. Section 95(3).
Conclusion

To avoid the problems that arose during SARS and to increase our protection against infectious disease, it is necessary to increase the independence of the Chief Medical Officer of Health and the local medical officers of health and consolidate public health leadership in the hands of the Chief Medical Officer of Health.

Recommendations

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to transfer the powers in ss. 82 through 85 (power over assessors) to the Chief Medical Officer of Health.

- The Minister’s power under s. 79 of the *Health Protection and Promotion Act*, to establish and direct public health laboratory centres be transferred from the Minister to the Chief Medical Officer of Health, until such time as the establishment of the Ontario Health Protection and Promotion Agency and the transfer of power over the laboratories in accordance with the recommendations of the Walker Report.

- The *Health Protection and Promotion Act* be amended to transfer the power in s. 102(2) (enforcement powers) to the Chief Medical Officer of Health.

- The *Health Protection and Promotion Act* be amended to remove from s. 102(1) the Minister as a listed person who may exercise that power.

- The *Health Protection and Promotion Act* be amended to transfer the powers in s. 80 (power over inspectors) to the Chief Medical Officer of Health.

- The powers in s. 78 (appointment of inquiry) and in s. 87 (commandeering buildings for use as temporary isolation facilities) remain as they are, to be exercised by the Minister of Health and Long-Term Care.

- The *Health Protection and Promotion Act* be amended to provide for every local medical officer of health a degree of independence parallel to that of the Chief Medical Officer of Health. This would include:
Giving the local medical officers of health the same reporting duties and authority as the Chief Medical Officer of Health:

- To report every year publicly on the state of public health in the unit. This report must be provided to the local board of health and the Chief Medical Officer of Health 30 days prior to it being made public; and

- To make any other reports respecting the public’s health as he or she considers appropriate, and to present such a report to the public or any other person, at any time he or she considers appropriate.

Protecting the independence of the local medical officer of health by providing that no adverse employment action may be taken against any medical officer of health in respect of the good faith exercise of those reporting powers and duties.

The powers now assigned by law to the medical officer of health are assigned concurrently to the Chief Medical Officer of Health.

These concurrent powers shall be exercised by the medical officer of health in the local region, subject to the direction of the Chief Medical Officer of Health.

Public health emergency planning, preparedness, mitigation, management, recovery, coordination and public health risk communication at the provincial level be put under the direct authority of the Chief Medical Officer of Health under the Health Protection and Promotion Act.

Public health emergency planning, preparedness, mitigation, management, recovery, coordination and public health risk communication under the direction of the local medical officer of health be added to the list of mandatory public health programmes and services required by s. 5 of the Health Protection and Promotion Act.

The Emergency Management Unit of the Ministry of Health and Long-Term Care be moved to the Public Health Division with its Director reporting directly to the Chief Medical Officer of Health.

The Health Protection and Promotion Act be amended to require that each
local board of health and each medical officer of health provide to the Chief Medical Officer of Health a copy of their general public health emergency plan and any incident specific plans and ensure that the Chief Medical Officer of Health has, at any time, the most current version of those plans.

• Section 95 (protection from personal liability) of the *Health Protection and Promotion Act* should be amended to extend its protection to everyone employed by or providing services to a public health board or the provincial Public Health Division, everyone from the Chief Medical Officer of Health, to its expert advisors, to public health employees in the field.
2. Local Governance

Introduction

Ontario’s 36 local health units are the front line of protection against infectious disease. That chain of protection is only as strong as its weakest link. Some health units are well governed, some poorly. Because viruses respect no boundaries, it is little comfort that some are well governed. It takes only one dysfunctional health unit out of 36 to incubate an epidemic that brings the province to its knees within weeks.

These weak links often result from the system of two governments, provincial and municipal, being involved in the operation of local health units.

Problems caused by split provincial-municipal governance run deep in our public health system. So many members of the public health community have expressed frustration, and have presented evidence of dysfunctionality in the present arrangement, that something must be said about it in this interim report.

Dr. Sheela Basrur, Ontario’s Chief Medical Officer of Health, appointed after SARS, has initiated measures to address these problems. Only time will tell whether this fresh leadership, together with the measures recommended in this report, can fix the deep systemic problems caused by split governance.

It is only fair that those Ontarians who live in health units with good governance have the opportunity to see whether the present system can be fixed within a reasonable time frame.

But there is too much at stake to let the present problems continue indefinitely. The cost of waiting will be the risk of disease and deaths, so a clear decision point is required. The government must decide whether to continue the present system of split governance, or to upload public health funding and control 100 per cent from the municipalities to the province. That decision needs to be made by the end of 2007, the deadline having been chosen for reasons noted below.
The public health community is deeply divided into those who think the present system of split governance is satisfactory, or at least salvagable, and those convinced by their experience that 100 per cent uploading of funding and control to the province is now the only solution. It will take time to resolve that debate. There is a strong consensus that immediate steps are necessary to strengthen the present system, whatever future direction it might take.

This chapter will:

- Expand on the problems, described in the Commission's first interim report, of split provincial-municipal governance;
- Canvass the arguments for retaining the present system and the arguments for 100 per cent provincial control and funding;
- Note the need for a clear decision on this issue by the end of the year 2007; and
- Note the initiatives undertaken under the fresh leadership of the new Chief Medical Officer of Health to improve the present system.

Pending that decision, five measures are urgently required to improve the existing governance system:

1. Protect the local medical officer of health from bureaucratic encroachment;
2. Require by law the regular monitoring and auditing of local health units;
3. Change the public health programme guidelines to legally enforceable standards;
4. Increase provincial representation on local boards of health and set qualifications for board membership; and
5. Introduce a package of governance standards for local boards of health.

---

Much of the attention since SARS has been directed towards the provincial level, the Public Health Division of the Ministry of Health and the office of the Chief Medical Officer of Health. While the work and reform that is occurring at the provincial level is vital, it must always be remembered that the first line of defence against disease is in the hands of local health units and medical officers of health. It was they who struggled against SARS in the front lines. It was they who were hampered by the deficiencies in public health resources and infrastructure. As one medical officer of health told the Commission:

I'm worried that the public health system at municipal level may not be reformed to extent it should be; I think it’s being lost in the shuffle. The primary focus for change and reform seems to be at the provincial level. The backbone of the public health system is the local boards of health and they are not getting the proper focus or attention.

One thing though is clear: The underlying problems must be fixed or the current system of governance must be radically reorganized. The current state of affairs is unacceptable and cannot continue. Great strides to improve the present system are being taken under the leadership of Dr. Sheela Basrur, appointed since SARS. The first question is whether the province will provide the necessary resources available to effect the major changes now planned. The second question is whether local bureaucratic and political resistance will prove too strong. If the province cannot dedicate enough resources and leadership to make the present system work and if the current problems cannot be fixed within the existing system, drastic reorganization is required. Although there may be intermediate solutions, the only solution seriously advanced as an alternative to the present system is to upload the funding and control of public health 100 per cent to the province and to get municipalities out of the public health business.

It would be premature to make such a recommendation, however, without providing some time to see if the system can be fixed within the present framework of governance.

That is why the Commission recommends that the province at the conclusion of the year 2007, which is after the pending public health capacity review, decide whether

---

70. The Public Health Capacity Review Committee will present interim recommendations to the Ministry of Health and Long-Term Care in June of 2005 and a final report in December 2005. The time for the implementation of its recommendations under Operation Health Protection, is one year from then, the end of 2006. The end of 2007 gives enough time to see whether the reforms are working and to decide whether or not to upload public health 100 per cent to the province.
the present system can be fixed with a reasonable outlay of resources or whether control of public health should be uploaded 100 per cent to the province. This will require an amendment to the “Operation Health Protection” plan to include a firm decision point to upload completely or to leave the present system in place.

The burden of persuasion is on those who want to preserve the present system of split provincial-municipal governance. A clear timeline for that decision is required.

A decision to upload 100 per cent control to the province would in one sense be regrettable because a number of local health units function, under the present system of dual governance, as well as could be expected given current levels of resources. The problem is that viruses do not respect health unit boundaries. The fact that some units function well is no comfort when it just takes one dysfunctional unit to spark a province-wide outbreak of infection. Public health is a provincial programme and every citizen is entitled to an equal measure of protection from infectious disease no matter where they live.

Ontario cannot go back and forth like a squirrel on a road, vacillating between the desire for some measure of local control and the need for uniformly high standards of infectious disease protection throughout the entire province. A clear decision point is required before some deadly infectious disease rolls over the province.

Unfortunately there is no clear consensus, among municipal politicians or public health officials, on the solution to the problems of split governance. The different views will be canvassed below.

Whatever the ultimate solution to those problems, the following areas clearly require immediate reform and need not await long-range policy decisions on governance:

- First, amend, strengthen and enforce the *Health Protection and Promotion Act* to ensure the protection of the medical officer of health from bureaucratic and political encroachment in the administration of public health resources and to ensure the administrative integrity of public health machinery under the executive direction of the medical officers of health.

- Second, amend s. 7 of the *Health Protection and Promotion Act* to provide that the Minister, on the advice of the Chief Medical Officer of Health shall publish standards for the provision of Mandatory Health Programs and Services and every board of health shall comply with the published standards which shall have the force of regulations.
• Third, amend the Health Protection and Promotion Act to require by law the regular monitoring and auditing, including random spot auditing, of local health units to ensure compliance with provincial standards. The results of any such audits should be made public so citizens can keep abreast of the level of performance of their local health unit.

• Fourth, amend the Health Protection and Promotion Act to ensure that the greater funding and influence of the province in health protection and promotion is reflected in provincial appointments to local boards of health. Also to ensure that the qualifications required of members of boards of health include experience or interest in the goals of public health.

• Fifth, introduce a package of governance standards for local boards of health.

These measures are in addition to those recommended in the previous chapter of this report to protect the independence of the local medical officer of health and to ensure the direct accountability to that office of those who provide public health services.

Fundamental Governance Problems

The local medical officer of health leading each of the 36 local health units is the backbone of public health in Ontario. However, as was noted in the Commission’s first interim report, many medical officers of health report that a considerable amount of their time and energy is spent in turf wars with the municipal bureaucracy and in fighting against budget constraints that prevent the attainment of a proper standard of public health protection.

Since the Commission’s first interim report, the Commission has heard additional reports of:

• Municipal officials unilaterally removing or transferring public health staff to other departments within the municipality;

• Municipal officials unilaterally reducing the public health budget, without input from the medical officer of health or the board of health;

• Boards of health with members whose sole objective is to the reduce the budget;
• Boards of health determined to micromanage the health unit instead of performing their role of overall stewardship;

• The inability of the medical officer of health and public health staff to get confidential information technology support and legal advice within the structure of municipal services; and

• The diversion to other municipal departments of funding intended for public health.

This is not to suggest that the above problems occur in each health unit across the province. The Commission has been told of jurisdictions where the board of health works well and has a good relationship with the local medical officer of health. Similarly, not all municipal officials or members of boards of health are against public health funding. Many are in fact very supportive of public health, advocate on behalf of the public and generally take their duties and responsibilities to protect the public’s health very seriously.

Unfortunately, experienced and dedicated medical officers of health in other units continue to be demoralized and exhausted by these ongoing struggles. Some of them see little light at the end of the tunnel. As one local medical officer of health described the current state of affairs:

> At a recent meeting of our colleagues, I heard a lot more grief, anger, it was very emotional. People who are close to leaving the profession, who’ve had it with municipal interference, with the provincial bullying. You need to know, you’ve got a very shaky public health system, at least with respect to public health physicians.

This local medical officer of health worried about the ability of public health to attract and retain qualified physicians, if they are going to have to face the problems that exist in relation to public health governance:

> I think that on governance and on powers and duties of medical officers of health alone, unless you correct some of these problems, you’re going to have a heck of a time trying to attract new medical officers of health when they’re put in positions of executive authority but they have to second guess the administration, business affairs part of it. And, in fact, they have to deal with boards of health that are not terribly interested in what they’re doing.
And the problem may not lie only in attracting new medical officers of health. It also lies in retaining experienced medical officers of health whose frustration is reaching the point of no return:

I'm absolutely disgusted, I loathe coming to work. I'm hanging on by my fingertips, waiting to see if the system will get fixed soon and if it doesn't, I'm getting out of the public health business.

The deterioration of public health at the local level in some parts of the province is epitomized by the problems recently evidenced in the Scott Report on the dysfunctional Muskoka-Parry Sound Health Unit, discussed below, which led to a decision to abolish the unit and amalgamate it with neighbouring units.

The difficulties of the Muskoka-Parry Sound Health Unit serve as a cautionary illustration of the deep structural problems in our public health system caused by divided provincial and municipal governance. They show how a dysfunctional board of health can impair the effective delivery of public health services. The Commission in the first interim report identified these problems as examples of the weaknesses in Ontario's public health system disclosed by SARS.

On July 12, 2004, Dr. Sheela Basrur, appointed Mr. Graham Scott, Q.C, a former deputy Minister of Health, to conduct an assessment of the Muskoka-Parry Sound Health Unit, pursuant to s. 82(3) of the *Health Protection and Promotion Act*. Although the power to appoint an assessor is assigned by statute to the Minister, he wisely delegated that power to the Chief Medical Officer of Health.  

Mr. Scott released his report on October 20, 2004 and on October 21, 2004, Dr. Basrur assumed the powers of the Muskoka-Parry Sound Board of Health.

The Scott Report demonstrated that the local board of health had not functioned properly for years;

---

71. For the reasons given earlier in this report, the Commission has recommended that this power be reassigned by statute directly to the Chief Medical Officer of Health

72. The Minister of Health and Long-Term Care granted authority to the Chief Medical Officer of Health to assume the powers of the board of health under s. 86 of the *Health Protection and Promotion Act*. Ministry of Health and Long-Term Care News Release, “Chief Medical Officer of Health takes action to protect health of Muskoka-Parry Sound residents,” October 21, 2004. As discussed below, the powers in s. 86 are now given to the Chief Medical Officer of Health.
The problems plaguing MPSHU are deeply rooted. The fault lies not with any one individual but with an entrenched governance culture that is focused, not on the delivery of public health programs and their adequacy, but on the cost of public health. Efficient and effective management of the costs of public health is obviously important, but the primary responsibility for the Board is the delivery of public health programs and services to ensure the protection of the residents of the two Districts.

The failure of the Board in not engaging fully in the public health role is overwhelmingly evidenced by the lack of strategic consideration to public health issues and the low regard for the role of the MOH within the MPSHU. Further, the Board, in its attempts to address costs has become a micro-manager of the MPSHU. The Board has no role in management of the MPSHU. Even if it were appropriate for a Board to engage in management, it is an assignment that they are not capable of discharging given their limited experience in public health administration, as well as the other demanding responsibilities that require their time in meeting their responsibilities, particularly those serving as councillors and Mayors.

Indeed the evidence is clear that they failed to bring either sound organization or stability to the MPSHU. This is true even on the administrative and cost side that has been their declared area of priority. On the health side, notwithstanding a previous assessor report, a SARS case in 2003 and the interim report of Justice Campbell, they have not carried out any serious health program or performance review at the Board level, which as a minimum would seem an essential response to critical external reviews.73

Mr. Scott summarized what he found in Muskoka-Parry Sound that constituted a dysfunctional board performance:

- The Board had no strategic plan;

- The Board had no process for establishing expectations and monitoring them for either the MOH or themselves;

73. Assessors Report on the Muskoka-Parry Sound Health Unit, Graham W.S. Scott, Q.C., Assessor, October 20, 2004. (Subsequently referred to as the Scott Report.)
• The Board did not fully debate or engage on health issues;

• There was no permanent MOH and the Board chose to exercise some of the duties of the MOH;

• The MOH was not invited to and did not report to every Board meeting;

• There was Board micro-management of the Health Unit;

• The Muskoka-Parry Sound Board was focused on expenses and costs not on health policy matters;

• Most Board members paid little attention to the mission of the Health Unit between meetings.74

Regrettably, many of the problems identified in the Scott report are not confined to the Muskoka-Parry Sound Health Unit. As one experienced medical officer of health told the Commission:

... in fact there are shades of Muskoka-Parry Sound in all 37 health units.

Many local medical officers of health who spoke to the Commission reported that post-SARS the battle for independence and resources at the local level has gotten worse.

For example in one public health unit at the end of the first phase of SARS, the local medical officer of health was told by the Chief Administrative Officer that a significant number of staff, currently situated in the health unit and instrumental in the SARS response, were being transferred out of the health unit for consolidation into the municipal bureaucracy. This transfer not only threatened the ability of the medical officer of health to resource the health unit and fulfill the obligations under the *Health Protection and Promotion Act*, but also represented an apparent contravention of s. 67(2) the *Health Protection and Promotion Act*, which gives the local medical officer of health responsibility over employees of boards of health and those whose services are engaged by a board of health if their duties relate to the delivery of public health programmes and services.

---

Nothing in the Health Protection and Promotion Act or the Municipal Act authorizes a board of health to delegate its administrative authority to a municipal administrator. Neither the Chief Municipal Administrative Officer nor any other municipal official has any authority to control and manage the staff of a health unit. These are the responsibilities of the medical officer of health. One medical officer of health described the day to day struggle to fight off municipal encroachment:

Our corporate communications function largely acts as a press secretary for the regional chair. So what if they take over that? What if they take over epidemiology because in fact it is needed in social services and they have not deemed it to be a high priority? I mean how can you fulfill your duties when you do not have the tools at your disposal to make it happen and what can I do as a MOH? I mean I have to go on the QT to outside legal counsel to get this advice because I cannot go to my legal department; they represent two masters . . .

. . . I have come to the conclusion that you need to fix governance. I mean that you can strengthen section 67 as much as you want. If you have a counsel or a CAO that just completely ignores it and I am not given any tools or resources to deal with it, then what is the point in having it in the legislation to begin with?

Other medical officers of health cite examples of regional officials making unilateral budget decisions which directly impact on the ability of the medical officer of health to deliver programmes and services legally required under the Health Protection and Promotion Act. One medical officer of health described to the Commission how the Chief Administrative Officer for the municipality unilaterally reduced the public health budget, without consultation with the medical officer of health or the chair of the board of health. They simply advised the medical officer of health’s staff to reduce the money from the budget.

Other medical officers of health cite examples of board of health members whose priority is budget cutting, rather than health protection and promotion. One expressed the demoralizing effect of that attitude:

And as a medical officer of health, reporting directly to a board, and I’m speaking now on behalf of medical officers of health, I think the job would be far more appealing if you did have a board that was interested in public health, rather than cutting your budget, freezing your budget, making you beg for all the scraps under the table before they’ll give you
an increase. It’s just demeaning and it’s totally dysfunctional. And I can’t think of any other setting where you’d be governed by a governing body that’s really not interested in what your objects are.

One seasoned medical officer of health thought that the difficulties experienced by many medical officers of health with their local boards and municipalities reflected a cynical municipal political view: if the municipalities made things sufficiently hard for the local medical officers of health, they would encourage the province to take over public health completely and thus free the municipalities from the burden of public health stewardship and expense, and from having to deal with a local medical officer of health who was independent of the municipality.

These difficulties suggest to many that public health in some parts of the province would be better served by removing municipalities from public health funding and public health delivery. These difficulties have been recognized by the Association of Municipalities of Ontario which advised the Commission before its first interim report:

The impact and speed at which SARS and West Nile virus spread across jurisdictions points to the vulnerability of the current structures, responsibility, authority and responsiveness of the system – both from a policy perspective and certainly the inappropriateness of subsidizing provincial health programs by the property tax base.

A medical officer of health described a constellation of problems caused by the present governance structure including the difficulty of giving public health its proper priority in a system where those charged with its stewardship may be more interested in diverting money to other municipal purposes than in protecting public health:

The kinds of individuals that are attracted to, have themselves elected on regional boards are not particularly interested in either health issues or in human infrastructure components. And so where there are police boards that are marching in, for example, in our jurisdiction with an enhancement this year, and the regional tax base is looking to absorb that enhancement, if you’re in a cross-boarder situation where public security is high on the corporate agenda, it squeezes out services like ours, public health services and really our affinity and alignment is much more with other sectors in our community than the regional corporation. . . The particular fiscal challenges that we’re facing with this year’s budget speak, in my mind, to a whole variety of other issues around values, why someone puts themselves forward to be elected, what their passions are. My
chair is a good example of a regional corporate thinker who’s interested in transit and good infrastructure and the reason he’s chair of the public health services board is to get money out of the public health budget. It’s not about the protection of the health of the public.

This chapter comes with two warnings.

The first warning is that the Commission attempted no scientific analysis of the opinions of those engaged in public health. The Commission is grateful to the many medical officers of health and others in the public health community who devoted so much time and energy to written submissions and confidential interviews. The information acquired by the Commission in response to its general request to the public health community was however, because of the nature of the open process of soliciting views, necessarily anecdotal. As noted below, however, even those who want to retain the present system agreed on the need for corrective measures within the present system. And as noted above, it takes only one dysfunctional health unit to bring down the entire province.

The second warning is that the Commission’s mandate is SARS and that this report focuses on infectious disease as opposed to other public health concerns such as childhood obesity, heart disease, and other aspects of health promotion.

Whatever might be disclosed by a scientific analysis of public health opinion, the fact remains that there are serious problems in the present system. As noted above, the fact that some health units work as well as is possible is no comfort when it just takes one dysfunctional unit to spark a province-wide outbreak of infection. Public health is a provincial programme and every citizen is entitled to an equal measure of protection from infectious disease no matter where they live.

As noted above and below, pending the resolution of the deep structural problems caused by divided governance, measures must be taken to ensure that the financial priority given to public health, and accountability and authority of the medical officer of health are not diluted by difficulties with municipal bureaucracies.

**Should Municipalities Get Out of Public Health?**

Should split governance between the municipalities and the province be maintained? Should public health be uploaded 100 per cent to the province with no local stewardship? Should some other path of reform be attempted?
The Commission consulted extensively with members of the public health community. There is a clear division of opinion on stewardship. Some feel that public health should be uploaded 100 per cent and controlled by the province. Others feel it is essential to retain the current system or at least some strong aspect of local control and some local funding.

Out of the many possible models for public health governance in Ontario, three basic models have been proposed to the Commission:

- Give the present system another try and see whether a greater measure of central control and guidance, accompanied by the increase in funding from the province can overcome the serious structural problems that flow from divided provincial and municipal stewardship over public health;

- Upload the funding entirely to the province but leave the local municipalities and boards of health some say in local programme delivery;

- Upload the funding entirely to the province, give the province direct control, remove the municipalities from public health stewardship, and abolish the local boards of health.

So long as some measure of local governance remains it is essential to strengthen the present system by the five measures mentioned above:

1. Protect the local medical officer of health from bureaucratic encroachment;

2. Require by law the regular monitoring and auditing of local health units;

3. Change the public health programme guidelines to legally enforceable standards;

75. The interviews were conducted on the understanding they were confidential and the participants would not be named in the report although what they said might be reported without personal attribution.

76. The idea earlier canvassed, of uploading infection control funding and stewardship entirely to the province and leaving the rest of public health under some form of split governance, was not recommended to the Commission during this phase of consultation. The problem with that model is that it maintains all the problems of split governance that flow from the housing of the health unit in a municipal system. In one or two consultations it was suggested that the worst problems arise in the eight or ten regional municipalities under s. 55 of the Health Protection and Promotion Act where municipal politicians have more ways to cut public health budgets than exist with independent boards. This view was not unanimous. No one suggested that a model which replaced regional boards with “independent” boards would solve the underlying problems.
4. Increase provincial representation on local boards of health and set qualifications for board membership; and

5. Introduce a package of governance standards for local health boards.

Give the Present System Another Try – Increased Pay for Increased Say

Some argue that the pending increase in the proportion of provincial funding to 75 per cent will make a notable difference. They argue that this, combined with a greater enforcement presence by the Chief Medical Officer of Health, should result in greater central control and less problems around municipal governance.

Others have suggested that the solution may lie in uploading the cost of infectious disease protection 100 per cent to the province and continue with split municipal governance. This would do nothing to fix the difficulties of split governance. This suggestion is not a solution to the underlying structural problem.

While the notion of say for pay should result in the Chief Medical Officer of Health having more input and control over local public health and increasing the proportion of provincial control will go some of the distance to ensuring uniform standards of public health protection across the province, it will not solve all the problems identified above.

The recent difficulties in the Muskoka-Parry Sound Health Unit, described above, serve as a paradigm for many of the problems caused by split governance. While Dr. Basrur’s intervention in the Muskoka-Parry Sound Health Unit, and the action in response to Mr. Scott’s report, are a good sign that the will is there to address the problems of split governance, the question remains whether there is the will and resources centrally to monitor and control the local systems throughout the entire province and to mediate governance disputes on an ongoing basis.

Since the release of the Walker Report and the release of the Commission’s first interim report, the proportion of provincial funding for public health services and programmes has increased. Yet, as noted above, some local medical officers of health

77. The provincial share of local public health funding rose to 55 per cent on January 1, 2005. It is scheduled to increase to 65 per cent on January 1, 2006, and to 75 per cent on January 1, 2007. (Source: December 9, 2004 memorandum from Chief Medical Officer of Health to medical officers of health and acting medical officers of health)
continue to report that they face the same problems now that they faced when the municipality paid an equal share of the funding.

As for the recent increase in provincial funding, many local medical officers of health understood that this provincial funding was not to result in a decrease in local funding and not to be used as a form of municipal tax relief. This understanding was based on a memorandum from Dr. Basrur to the medical officers of health, dated December 9, 2004, in which she stated:

As you are aware, the provincial government has made several recent announcements of increased funding for public health programmes and services. This letter is intended to clarify these changes and provincial expectations associated with these increased funds.

New provincial funding is intended to enhance the total funding available for public health in order to improve local public health capacity, and the Province expects municipalities to contribute their full share to this important area of public service. While these provincial initiatives may offer limited financial relief to some local municipalities, the government’s primary purpose is providing these funds it to protect and promote the health of the public.

One local medical officer of health described their interpretation of that memorandum, an interpretation that was shared by others:

The intent of that, which was explained by Dr. Sheela Basrur in the memorandum dated December 9th of this year to MOHs and to chairs of boards of health, was to increase public health capacity across the province. And only in some sort of dire financial situations would it provide some property tax relief for an obligated municipality, that’s the sense of her letter.

Some municipalities, however, did not share this view. For example, the City of Toronto considered a plan that would see half of the additional funding go to Parks and Recreation.78 Councillor John Filion, chair of Toronto’s Board of Health, at a budget meeting where the issue was raised, tried to persuade the City to use the money as it was intended: for public health. He was reported as stating:

---

78. Toronto Star, “Toronto Could Divert Aid From Province,” January 21, 2005
I think we're shooting ourselves in the foot if we don't use this money for public health.79

Toronto was not alone in its eagerness to use public health money for other programmes. As another medical officer of health reported to the Commission:

… the base budget has been reduced arbitrarily by the Chief Administrative Officer, without any consultation with me, which will result in a net decrease, or a total decrease in my public health budget for 2005, based on this new funding formula. It will of course mean that we cannot access those cost-sharing funds that would be due to us from the province. So he has arbitrarily reduced, with in fact not even anything in writing to me, it’s simply appeared this way after I’d had my initial budget meeting with him, as a reduction in our base budget and the municipal contribution, which of course goes against the intent of the new funding formula.

Some see the municipal attitude, notwithstanding the provincial attempts to upgrade public health, as a continuing source of opposition to improvement. Said one medical officer of health:

Things have not improved since SARS notwithstanding the provincial rhetoric of improving public health services because municipal politicians, particularly in regional governments, still see public health as a lower priority than other municipal services such as roads.

The problem is not solely one of funding. The problem is also one of governance. Even if the provincial government uploaded the percentage of provincial funding to 90 per cent, in some municipalities the battle over the remaining 10 per cent and the remaining involvement of the municipality in governance would still lend itself to governance problems and local fights over staff direction, public health communication, and the spending of provincial funds. The problem is not who pays, but who says. Some medical officers of health are convinced that this problem will continue so long as the medical officer of health and local boards of health are embedded in municipal bureaucracies. According to this view, no amount of distant correction, no amendments to the *Health Protection and Promotion Act* can correct the underlying problems facing public health in some municipalities around the province.

Some, however, argue that the combination of increased funding and greater enforcement by the Chief Medical Officer of Health may address the systemic problems. They point to Muskoka-Parry Sound as an example of how the system can work. The situation in Muskoka-Parry Sound cuts both ways. On the one hand, it shows how dysfunctional a public health unit can remain before someone fixes it. On this view it shows that the system is broken. On the other hand, it also shows that the province under new public health leadership has finally taken steps to cure the problem. On this view it shows that the system works. Does one say the system is broken because of the problems or does one say the system works because the province eventually decided to fix Muskoka-Parry Sound Health Unit?

Those who argue that Muskoka-Parry Sound is an example of how the system can work, argue that the province has the tools to ensure compliance with the Act and to ensure a uniform standard of programmes and services across the province. But the system only worked after years of dysfunction, and then only because of the leadership of the new Chief Medical Officer of Health and the Minister of Health. The steps taken in Muskoka-Parry Sound, while admirable, took energy, attention and resources. It cannot be easy for the Chief Medical Officer of Health, amidst all the concern about disease, including pandemic influenza, with myriad pressing daily responsibilities, to confront and wrestle to the ground the local problems caused by the divided stewardship of public health. And Muskoka-Parry Sound was not alone in its problems. It was only the worst and the most obvious. To confront governance problems in a local health unit is to invite political controversy and dispute. Do the Chief Medical Officer of Health and the Public Health Division have enough time, energy and resources to monitor and control local systems, and to mediate governance disputes on an ongoing basis? Is this the best way to use this time, energy and resources? Or is the energy of Ontario’s public health leadership best directed to protecting us from disease?

The Argument for Local Control

Those medical officers of health for whom the current system works argue that you should not change the whole system just because some parts are not working. As one medical officer of health stated:

I don't think you blow up the entire structure because of instances where it didn’t work. You put in appropriate checks and balances and carrots and sticks to make the system work.
Second Interim Report ♦ SARS and Public Health Legislation

2. Local Governance

Some local medical officers of health, concerned about uploading public health entirely to the province, fear that the result will be worse. They fear that the loss of local municipal involvement and contribution will impact their independence and autonomy. They also fear that by relying on an entirely provincial system, you put all your eggs in one basket, and if that system fails to devote the resources to make things work, they will have no other partner to whom they may turn for help. One local medical officer of health said:

I think there’s a concern about too much power being invested in the province. I think the strength, for SARS, Walkerton, whichever, was in the local public health unit response, despite the province. And so, if we centralize too much direction, and then lower the independence of the medical officer of health as well, by uploading it to the province, I have great concerns of that model as well. There’s this balance that we have to try and strike between the strength of the local system and ensuring a system overall.

What’s going through my mind is, if you didn’t have a board of health, then how could you preserve local autonomy and independence without your actions being unduly politicized? If what you mean is a provincial agency, you’d be an employee of that provincial agency. You’d run into the same interference.

Those medical officers of health who oppose provincial uploading position their argument for local stewardship largely in the nature of health promotion work, which depends on local community partnerships with non-governmental organizations, school boards and other local institutions. The argument is that local stewardship strengthens these partnerships, which would be lost or diminished if the province took over public health. As one medical officer of health said:

… I think it does need to be embedded in the local community boards of health, because public health issues really are at the local level and we’re only able to move agendas like the smoking by-laws etc. forward through critical mass at local grass roots level so it does need to be part of that milieu but strengthening it is a piece of it and the question is how … I mean police commissions do very well when you look at how they’re resourced over time and if you’re looking at the public health agenda, you don’t do well at the regional corporate table.

But even those who argue for the preservation of local governance, like the medical
officer of health quoted above, find it hard to see how public health can get a proper priority within a system of municipal governance.

The problem with 100 per cent provincial control is that in some municipalities the present split governance relationship is welcomed by the medical officer of health. One local medical officer of health, who did not want to see public health uploaded 100 per cent to the province, and clearly had a positive relationship with their board of health and with their municipal councillors, stated:

I think the local councillors have a voice and people do listen when they speak in the local area. Municipalities and provinces have a link. There is a cross germination that is helpful. When you pay, you pay more attention. Without pay it would be more difficult to get municipal councillors actively involved. When you think about board of health, public health has a history of being local and it is not without good reason. We do need to make sure that we are interacting with local political situations in terms of getting changes made that are supportive and conducive to public health. We need to make sure that we are in step with what is happening locally. Whatever we do, there needs to be a local flavour … I would argue that municipalities are important partners as well.

Another public health official noted the difference between a health issue that impacts all health units in the province, such as infectious disease, and issues unique to the local area such as community based health promotion programmes. The former attracts a greater provincial influence but the latter, it is argued, benefits greatly from local influence:

I think public health as you know is extremely broad and you know what makes sense perhaps for something like communicable disease control and health protection may have a different balancing in terms of local versus provincial input that is required if you are looking at things that are more community based health promotion. The board of health of course is responsible for the programmes in public health.

One local medical officer of health described the importance of maintaining local boards if balanced by the effective exercise by the province of central control and accountability mechanisms:

I would favour local boards … but I think that in terms of the makeup of the board of health, you could provide provincial direction in terms of the
ideal candidates. Maybe the objects of the board of health, whatever. I think that you can design the makeup of the board of health that reflects the community and gives clear direction as to what their role is. I think there needs to be, as I say, a return to the powers and duties of the medical officer of health, certainly at the time that it was downloaded, with a view towards independence at the local level. And in terms of the interfacing with the province, there are lots of instruments there that ensure accountability. You've got programmes, plans and budgets, you've got the mandatory health programmes and services guidelines. You have financial and operating audits. And this happens all the time anyway. And on specific issues, you can deal with the Chief Medical Officer of Health directly. So, I don't worry about sufficient provincial oversight, because I think the instruments are in place now. If you actually look at downloading, though, in terms of compliance with the Mandatory Health Programs and Services Guidelines, I think there has been a trend towards greater compliance, but, for example, the tools that the Province gave themselves with respect to assessment, I think that only kicked in last year. We don't know anything about the results. We don't know if it led to any changes. So, not only are there instruments in place in terms of accountability, quite frankly, the province hasn't exercised the tools that it has at its disposal already to ensure compliance and the carrying out of provincial policy and so forth.

There is no easy solution. For those medical officers of health who enjoy supportive and proactive boards of health, the upload of control to the province may make things worse. For those mired deeply in municipal bureaucracy and day to day struggles with local politicians, the status quo does nothing to address the serious problems they face. One medical officer of health accurately summarized the dilemma:

One of the challenges I think that you face is the diversity that is out there right now and if you come up with a formula, it is going to make many situations better and some situations worse. For example, [Municipality X] is one of those regional municipalities in which the regional council has elected municipal politicians to serve at the board of health and I think that [Municipality X] would be much better served by an independent board of health with a majority of provincial appointees. In the case of the [Municipality Y], there has been a long history of an extremely progressive group of local politicians. Some members of the board are citizens who are appointed by the municipality but nonetheless are not elected officials themselves and that board has been a leader in
terms of public health policy programmes and services. At the time a number of years ago when the board did have provincial appointees, most of them did not distinguish themselves if I can say so there is … so in different jurisdictions, it is going to work better or worse depending on where they are now.

For those whose boards work well it will be difficult to embrace change when that change is accompanied by the fear it will make their local system worse. As one local medical officer of health noted:

Local medical officers of health are leery of 100 per cent provincial funding. Although they complain about their local boards, the existence of the local board means the medical officer of health is not entirely dependent on the province; they think it’s better to stick with the devil they know.

Upload Public Health Funding and Control 100 Per cent to the Province

There has always been a measure of support for the proposition that municipalities should simply get out of the public health business and leave it entirely to the province. Some municipal politicians involved in the “Who Does What” consultations in the mid 1990’s were confident that Mr. Crombie would recommend that public health and social services be uploaded 100 per cent to the province. One prominent mayor went so far as to say, of local public health boards, “Don’t worry, they’ll be gone” only to be jolted by the government decision in 1997 to download public health funding 100 per cent to the municipalities.

It was the unanimous view of all the municipal councillors at a recent regional seminar on public health governance that they should get out of public health altogether. Because the programme direction came so strongly from the province, and the local medical officer of health was independent of the municipality, the municipal politicians felt that municipal influence was just too small having regard to the proportional municipal tax contribution.

While this regional consensus is not a provincial consensus, some observers suggest that it reflects a deep current of municipal opinion in many parts of Ontario.

Even some outside of public health argue the need for uploading public health and ensuring central control under a single governance structure. Mr. Tom Clossen,
President and Chief Executive Officer of the University Health Network in Toronto, said this at the Commission’s public hearings:

I think it’s a big weakness in the Ontario health care system that public health is under the municipalities. As you might know, public health was put under municipalities as a tax issue, because taxation for education was moved out of the municipalities and into the province was a tax balancing effort. It had nothing to do with what would be the best way to run a health care system.

Again, if you look at other provinces, you’ll see that public health is part of the regional health organizations and hospitals, community health, public health, are all under a single governance structure.

Some medical officers of health see a measure of consensus in the public health community for 100 per cent provincial uploading and control. One medical officer of health had no doubt that the greatest consensus was for 100 per cent uploading:

Q. What is the greatest consensus?

A. For those of us who have been around it is no doubt upload to the province.

One medical officer of health responded to a suggestion that the public health community was generally against a 100 per cent upload of provincial control because of the fear that it would result in the loss of local uniqueness and the ability to deal with local problems:

I totally disagree. I have never had a local person interested in local health issues. I think it should be uploaded 100 per cent … Medical officers of health do like to be independent but some want to have their cake and eat it too … I would much rather have a functioning provincial system with accountability. It used to be done that the province would come and say you are not doing this well or not focusing on this – or they would say we think your demographics are changing and you need to adjust your programmes. There are mandatory programmes for a reason.

Some observers fail to see how community partnerships depend on municipal funding and the involvement of municipal politicians in health board stewardship:
The thrust of their [those who oppose full provincial control] argument is that the grass roots of health promotion are at the municipal level. But the partnership isn’t with the municipal councillors, it’s with the community partners, schools, school boards, long-term care facilities, and so forth. I don’t know why they think that 100 per cent provincial funding would mean no local community partnerships … It’s not the councillors with whom we have partnerships but the staff at the municipal level. For many boards, the only role of municipal councillors is to have input into health to control funding.

Those who favoured full provincial uploading agreed that local health promotion programmes require strong community links. But they thought the continuation of community links had nothing to do with the question of municipal governance. They noted that the important community involvement was not with municipal councils or politicians, but with schools, school boards, long-term care facilities, and other community partners. In their view the strength of these community relationships came not from the political link with the municipalities, but from the work of the medical officer of health and health unit staff in the development of community links.

One public health observer struck a chord with the suggestion that the local municipal link was a political wild card without any consistent benefit throughout the province:

There’s a disconnect here, between the importance of the role of the medical officer of health and bringing in a group of political appointments, Order in Council this, Order in Council that, depends on who the government is, to be your governing body in some way or to give you advice, when in fact, if you get the right person in as the medical officer of health, and you do that across the province, you have direct access to the people who make the decisions about where the money goes. And, to my mind, I can’t see taking the chance that with those in power in your jurisdiction, you’re going to have enough people that are favourable with the government in power, to give you clout when it comes to negotiating, as opposed to the next jurisdiction or somebody in another part of the province who has the real ace card when it comes to this. It seems to me, you can be the local medical officer of health, but you can also be part of a provincial system and derive great benefits from that, without having to rely on this questionable system that brings you only advocacy, depending on whether you’ve got the right group of people or not, and maybe some outreach, which I imagine you could get in other ways.
There are many ways to retain local decision-making and community participation without the existing structure of municipal funding and political involvement. The public partnerships so vital to local health promotion, as noted above, are not with municipal councillors or politicians. They are with schools, school boards, health care institutions, and voluntary organizations. Full tax uploading and full provincial control is perfectly consistent with the continuation of such partnerships. Many Ontario ministries maintain strong local links through advisory groups and community outreach. Local community participation in provincial programmes does not require split provincial-municipal governance.

If one accepts the principle of “say for pay”, a principle the Commission notes is endorsed by the Association of Municipalities of Ontario, then the government that pays for the programme says how it will be run. Many who advocate 100 per cent provincial pay see the result as 100 per cent provincial say with no municipal governance and no problems from the municipal level.

Others want it both ways. Some who strongly favour local decision-making argue that it is possible to upload the funding 100 per cent to the province yet retain the present municipal stewardship through local boards of health. On this highly political question the Commission can do no more than point out the difficulties of any such departure from the principle of political accountability for the expenditure of public funds, and agree with the observation of the experienced public health observer, quoted above, that

Say will be hard without pay.

Because public health is a provincial programme and because the divided accountability between the province and the municipalities works very poorly in some parts of the province, a strong argument can be made for 100 per cent provincial uploading and control. It would be premature to recommend this permanent change in governance in this interim report. Full provincial uploading would have significant tax implications, as shown by the tortured history of provincial and municipal cost sharing and big human resource issues caused by the change of employer. Transition to full provincial funding and control would require enormous administrative adjust-

80. AMO Report to Members: Recent MOU Meeting with Province, February 18, 2005, Alert 05/016.
81. Described in the Commission’s first interim report under the heading “The Public Health Ping-Pong Game.”
ments even beyond those within the present scope of the Public Health Capacity Review Committee.\(^{82}\)

Full provincial uploading would also require a long-term commitment to refrain from further downloading. Unfortunately, as noted in the Commission’s first interim report, Chapter 10, The Public Health Ping-Pong Game, the local public health units have long suffered the impact of consistent provincial downloading to the municipalities that occurred in the late 1990’s. A public health scholar noted recently that the funding crisis has not so much been a ping-pong game, but rather a series of pings, followed by a big pong, then further pings.\(^{83}\)

The history of provincial funding of local public health is not a ping pong game, unless the focus is on a very short period (e.g., 1997 - 1999). The secular trend is one of increasing provincial financial support, both to

---

\(^{82}\) Chaired by Dr. Susan Tamblyn, former medical officer of health for the Perth District Health Unit, the Capacity Review Committee is to advise the Chief Medical Officer of Health on the following:

- Core capacities required (such as infrastructure, staff, etc.) at the local level to meet communities’ specific needs (based on geography, health status, health need, cultural mix, health determinants, etc.) and to effectively provide public health services (including specific services such as applied research and knowledge transfer);

- Issues related to recruitment, retention education and professional development of public health professionals in key disciplines (medicine, nursing, nutrition, dentistry, inspection, epidemiology, communications, health promotion, etc.);

- Identifying operational, governance and systemic issues that may impede the delivery of public health programmes and services;

- Mechanisms to improve systems and programmatic and financial accountability;

- Strengthening compliance with the Health Protection and Promotion Act, associated Regulations and the Mandatory Health Programs and Services Guidelines;

- Organizational models for Public Health Units that optimize alignment with the configuration and functions of the Local Health Integration Networks, primary care reform and municipal funding partners; and staffing requirements and potential operating and transitional costs.

\(^{83}\) Ping reflecting an uploading of funds to the province, a pong indicating a download of funds to the local level. See: “Comparative Historical Perspective, Mr. Justice Archie Campbell’s Ping Pong Game,” Mary Powell, PhD, Visiting Scholar, Comparative Program in Health and Society, Munk Centre, University of Toronto.
more local units and to a larger local units at a higher level of support, beginning in 1940 and continuing consistently until the 1997 decision (effective Jan 1 1998) to download 100% of public health costs to the local level … Mr. Justice Archie Campbell identified 23 problems that contributed to or exacerbated the 2003 SARS crisis in Toronto. Many of them have to do with public health, particularly the dismal state of public health at the provincial level. If we take a historical view, dismal has been the norm for public health.⁸⁴

The question raised above as to whether the Public Health Division has the resources and appetite to oversee the local health units and boards of health so as to ensure compliance with the Act, and to enforce the Act in the face of a recalcitrant or ineffective board of health or where a municipality or municipal council interferes with the delivery of public health services, is an important one. Equally important, however, is whether the provincial government has the commitment to upload public health funding for the long term, or will it be a ping followed years from now with another great pong? And will the provincial government dedicate the resources to ensuring that the Public Health Division is capable for assuming the governance of 36 boards of health across the province.

**Association Of Municipalities’ Position**

The Commission’s first interim report noted the Association of Municipalities of Ontario’s position in respect of municipal funding of public health. During the preparation of this second interim report the Commission repeatedly asked the Association of Municipalities of Ontario for its assistance and position on a number of the issues addressed in this report, including the continuation of local public health governance. The Association of Municipalities of Ontario unfortunately found itself unable to take a position.

**Local Health Integrated Networks**

Before leaving the question of public health governance, a word should be said about the proposed Local Health Integration Networks (LHINs). Announced on July 14, 2004, LHINs are intended to re-align the planning and delivery of health services across Ontario through 14 geographically based networks.

---

Whatever promise the Local Health Integrated Networks may hold for the hospital system and the health system in general, the Local Health Integrated Networks proposals to date make little if any reference to the alignment between LHINs and public health units.

It is difficult to find anyone who says that LHINs will be good for public health. One hospital administrator at a recent conference on Local Health Integrated Networks said:

There’s nothing for public health in the LHIN’s.

The Ministry of Health and Long-Term Care describes their purpose in the following terms:

LHINs are organized geographically to bring health services closer to where people live. Accordingly, geography is a central organizing principle underlying the LHINs. The 14 Local Health Integration Network areas were created to reflect local areas where people naturally seek health care. They were determined by using an evidence-based methodology in collaboration with the Institute for Clinical Evaluative Science (ICES). The boundaries are permeable and do not restrict patient choice of physician and medical or acute services.

Local Health Integration Networks will integrate health care at a local level and consolidate the following functions: planning, system integration and service coordination, funding allocation, and evaluation of performance through accountability agreements. The first function that the LHINs will be expected to take on is integrated health services planning, which will help inform and shape the design and execution of the other functions.85

Governance of LHINs will be through an appointed Board of Directors and through performance agreements with the Ministry:

The Boards will be appointed by an Order in Council. Board members will be selected using a merit-based process, with all candidates assessed for fit between skills and abilities of the prospective appointee and the

---

needs of each individual LHIN. The appointment process will be transparent and consistent – with clear and understandable guidelines applied consistently to all Board appointments.

Board members will be expected to possess relevant expertise, experience, leadership skills, and have an understanding of local health issues, needs and priorities. 86

Some close observers of the public health scene speculate that health unit boundaries will eventually be aligned with Local Health Integrated Network boundaries, 87 especially given the terms of reference of the Capacity Review Committee, chaired by Dr. Susan Tamblyn, former medical officer of health of the Perth District Health Unit. Among other issues, the Capacity Review Committee will examine:

Organizational models for Public Health Units that optimize alignment with the configuration and functions of the Local Health Integration Networks, primary care reform and municipal funding partners; and staffing requirements and potential operating and transitional costs. 88

However it is undertaken, any decision to align public health units with LHINs will prove to be complex. The City of Toronto, for example, will have four of the 14 LHINs within its geographic boundaries, although only one will be entirely in the City. A report to City Council stated:

The only one that falls entirely within the City of Toronto municipal boundaries is Toronto Central. This LHIN encompasses seven high volume hospitals, namely Mount Sinai, Hospital for Sick Children, University Health Network, Sunnybrook, St. Joseph’s, St. Michael’s and Toronto East General. The Central East LHIN includes Rouge Valley and Scarborough General. The Central LHIN includes North York

86. Local Health Integration Networks, “Bulletin No. 5 / December 15, 2004.”
87. It is worth noting that, in the midst of implementing LHINS, the issue of reducing the number of local units appears to have fallen off the radar screen. As stated in the Commission’s first interim report (see pages 190-191), the Walker Interim Report had recommended that the existing number of public health units should be reviewed and, within two years, reduced from 36 units to 20 to 25 units. Some observers questioned whether it is necessary to reduce the number of local units instead of providing the necessary critical mass of expertise to serve a number of individual units, on the argument that the problem is not the number of local units, but the lack of support and resources made available to the local units.
General and Humber River. Last, the Central West LHIN will include both William Osler sites, including Etobicoke.  

Thus, three of the four LHINs in the City will be jointly served by Toronto Public Health and by neighbouring public health units, each of which may do some things differently. As Dr. Bonnie Henry told the Justice Policy Committee, boundaries are already creating coordination problems among some Toronto area public health units:

... we have 22 hospital corporations in the City of Toronto. Many of them have sites outside the City of Toronto. The Rouge Valley Health System has two in Toronto and three outside of Toronto. If we are doing things differently in two different health units, that can be very difficult for a hospital. It’s the same if we look at our mental health system, our community care access centres, our district health councils, our long-term-care facilities. They are all, if you want, regionalized or organized on different geographical and jurisdictional boundaries. That can create massive difficulties in dealing with an emergency, and it’s not limited to the health sector. It’s similar in many other parts of our organization as well. For example, one health unit may actually involve several different municipal police services plus the OPP.

Having regard to the absence of information on public health and LHINS, it is beyond the ability of this report to review and assess the plusses and minuses of transferring local public health into regional networks like LHINS. Nevertheless it is clear that such a transformation would by its very nature be complex and unsettling.

Significantly, it also may generate important stresses and pressures on public health. Were this transformation to occur in the near term before measures to strengthen public health have taken hold, a process that may take years, it would likely add to

89. City of Toronto Council, “Consolidated Clause in Community Services Committee Report 8, which was considered by City Council on November 30, December 1 and 2, 2004,” p. 3.
91. The U.S. General Accounting Office, the equivalent of the Auditor General of Canada, in underlining the challenge of making fundamental, long-term change, has stated: “Experience shows that successful major change management initiatives in large private and public sector organizations can often take at least 5 to 7 years. This length of time and the frequent turnover of political leadership in the federal government have often made it difficult to obtain the sustained and inspired attention to make needed changes.” (Source: U.S. General Accounting Office, Centres for Disease Control and Prevention: Agency Leadership Taking Steps to Improve Management and Planning, but Challenges Remain (Washington, D.C.: January 2004), pp. 2-3.)
the considerable strain already felt by a public health system struggling to cope with the deep-seated problems caused by years of government inattention and neglect.

It is too early to tell what LHIN’s mean for public health. The LHIN documentation and literature makes little if any reference to public health. The significant questions have not been answered: will the LHIN boundaries affect public health boundaries? If so, how? How will LHIN’s governance mesh, if at all, with public health governance? Will LHIN financial and resource planning affect the delivery of public health services? If so, how? These questions far from being answered, do not appear even to have been addressed. The proposed LHIN system, announced as a major transfiguration of Ontario’s health system, appears to ignore public health. The LHIN proposals, from the public health point of view, are a complete wild card.

Conclusion on Uploading

As noted above, Ontario’s protection against infectious disease is only as strong as the weakest public health unit in the province. An outbreak of disease that spins out of control in a dysfunctional health unit can spread to other units and bring the province to its knees within days. Although machinery does exist for provincial oversight of individual health units, the process is unnecessarily cumbersome. The complex procedures for statutory oversight of local health boards take time and energy, distracting the Chief Medical Officer of Health from the more vital task of protecting the public health rather than dealing with intransigent local boards. It is hoped that the recommendations set out below will overcome some of these difficulties.

As for the workability of the present municipal stewardship system, there will be as many different points of view as there are health units. In well functioning local health units people will argue for the virtues of local stewardship. In dysfunctional local health units, or those where the only apparent municipal interest is to cut cost at the expense of public health, those who care about public health will argue that the present system is broken and cannot be fixed.

The province has powers under the *Health Protection and Promotion Act* which enable it to monitor and correct deficiencies in local health units. Although these powers may need to be fine-tuned, the bigger question is whether the province has an appetite to take hold of the local public health system and confront those who need to be confronted in order to make the system work. It may be that the powers of provincial oversight have been exercised unevenly over the years and that some local medical officers of health have felt unsupported by the province in the struggle to maintain
the integrity and political independence of the office of medical officer of health in the face of unfriendly local power structures. The key question at this time is, does the province have the appetite and the resources to oversee municipal stewardship?

It is too early to say the system is hopeless. But the burden of persuasion has fallen to those who want to make the present system work. Is the government prepared to pour into the present system the resources necessary to make it work? Is it prepared to devote the energy, leadership and political will necessary to make it work? If the province does not commit the necessary resources, and develop the will to wrestle the present system of split stewardship into a consistently excellent province wide system of governance, then it should withdraw municipalities from the field. It is infinitely more efficient, and saves infinite time, energy, and resources to administer a unitary stewardship system. It takes enormous work to make a mixed stewardship system work and the question must be asked, is it worth it?

The important question that must be resolved is whether the present system can be fixed and at what cost in resources and focus. The cost of failing to fix it is risk of disease and death … should an infectious outbreak strike a health unit that is poorly resourced, poorly prepared, and struggling to breathe within the municipal bureaucracy.

There is no doubt that municipal stewardship works well in some areas and poorly in others. The challenge is to identify the conditions that make the difference between the good and the bad, and to fix the latter.

Although it may be that the conditions that drive the difference have to do with size and demography, the anecdotal evidence examined by the Commission suggests otherwise. It appears, anecdotally, that large urban health units and small rural health units can be equally successful or unsuccessful depending on a host of factors other than size and demography. The conditions that make a difference are many, including local history and tradition, the organizational culture of the local board and health unit, the personality of the local medical officer of health, board members and politicians, and the cyclical determination and ability of the province, waxing and waning over the years, to do what is necessary to make the local systems work.

One condition that makes for good governance is the adoption of governance standards of the kind recommended below.

The fact that many public health units work in an admirable fashion is a credit to the individuals involved, not to any wisdom in the institutional arrangement that leaves a
provincial function like public health in the hands of local municipalities. In some local units the management of the difficult relationship between the medical officer of health and the board and municipal authorities diverts precious time and energy from the real task of protecting the public against disease. In some cases the difficulty of ensuring local municipal compliance diverts more time and energy from the first priority of the Chief Medical Officer of Health and the province, which should be public health protection rather than mediation with local governments and boards.

All the fine public health initiatives taken since SARS, all the fine initiatives planned and considered for the future, are at risk from the deep problems that attend the municipal role in the delivery of provincial public health services. One dysfunctional health unit can break the chain of protection.

The issues surrounding the municipal governance of public health are complex. As set out above, there is no easy answer and there is no common solution. However, as one local medical officer of health aptly noted, there is plenty of fuel for the discussion. The discussion has to occur now, and a timeline for decision-making and change must be set.

To this end, as noted in the introduction to this chapter, the Commission recommends that the province, by the end of the year 2007, after the implementation of the recommendations of the pending public health capacity review, decide whether the present system can be fixed with a reasonable outlay of resources. If not, funding and control of public health should be uploaded 100 per cent to the province. This will require an amendment to the Operation Health Protection plan to include a firm decision point to upload completely or to leave the present system in place. The take-home message here is that the burden of persuasion is on those who want to preserve the present system of split provincial-municipal governance. A clear timeline for that decision is required.

The underlying problems of municipal funding and municipal governance are the Achilles heel of public health in Ontario. Ontario’s only choice, if these problems cannot be fixed within a reasonable time, is to assume full funding and direct control of public health in Ontario.

This recommendation might be resisted on the grounds that the system is going through enough changes right now without the further distraction of a fundamental

---

92. As noted above, the Capacity Review Committee is to present its final report in December 2005.
review. But if a timetable is not set now to resolve this fundamental issue it will continue to fester for years as it has in the past, to the detriment of the morale of those who serve the system with such dedication and to the detriment of the public interest in public health protection. The risk of inaction is simply too high.

**Recommendation**

The Commission therefore recommends that:

- The province, by the end of the year 2007, after the implementation of the recommendations of the pending public health capacity review, decide whether the present system can be fixed with a reasonable outlay of resources. If not, funding and control of public health should be uploaded 100 per cent to the province.

**Municipal Bureaucracies**

In some municipalities, public health faces a constant flow of problems that impact their ability to deliver health services and to protect the public. These problems include:

- Local health units with unfilled full-time medical officer of health positions;
- Local health units without adequate staff;
- Medical officers of health without operational control over what staff they do have;
- Constant warfare and turf disputes between the municipal authorities and the medical officer of health; and
- Municipal reluctance to authorize payments required by law to meet minimum health protection standards laid down in the Mandatory Guidelines.

---

93. As of October 21, 2004, there were two full-time vacancies in the province: Hastings County and Peel. Additionally, six medical officers of health positions were filled on an acting basis (information provided by the Association of Local Public Health Agencies).
These problems have led to uneven levels of functionality in health units around the province, some strong and others weak. In those areas plagued by these problems, the local medical officer of health and public health staff have done an admirable job trying to protect the public, while struggling daily for operational and administrative control, and to secure appropriate levels of funding. It is a testament to their professionalism and dedication that in the face of these problems they remain in the service of the public, committed to protecting the public.

On the other hand, not every board of health is dysfunctional. Some, as noted above, function quite well. Not every municipal official or board of health member is against public health. Some, as noted above, are very proactive and they provide a supportive voice and, indeed, advocacy on behalf of the public’s health.

Although there is no consensus on the ultimate solution to the problem of the dual system of governance, there is some common ground. The common ground is that so long as the governance of public health remains at the local level, the province, through auditing, enforcement and amendments to strengthen the Health Protection and Promotion Act, must ensure that local medical officers of health are free to do the important job of protecting the public.

Too much energy goes into the conflict between municipal funding concerns and the needs of public health. Too much energy goes into the mediation of disputes arising from the municipal role. A medical officer of health in one of Ontario’s largest cities described the problem to the Commission:

Most of us are lost deep down in municipal bureaucracies. This needs to be corrected. The medical officer of health should be the Chief Executive Officer of a distinct service unit with accountability to a Board.

Despite the existence of s. 67(2), which should provide the medical officer of health with clear authority over and responsibility for public health employees as noted above, in some municipalities local medical officers of health are struggling to keep their staff, much less direct them.

Subsection 67(2) provides:

The employees of and the persons whose services are engaged by a board of health are subject to the direction of and are responsible to the medical officer of health of the board if their duties relate to the delivery of public health programmes or services under this or any other Act.
This provision is designed to ensure that the Chief Medical Officer of Health has the necessary authority and accountability in respect of staff and resources of the board of health. Section 67 looks on its face like a common sense provision with which every sensible person would agree. It has, however, become in some health units a battleground between local medical officers of health, who attempt to preserve the administrative integrity of public health resources, and municipal authorities determined to extend their control at the expense of public health. More will be said below about this problem in the context of s. 67.

As noted above, in Muskoka-Parry Sound, Mr. Scott observed that:

… the Board, in its attempts to address costs has become a micro-manager of the MPSHU. The Board has no role in management of the MPSHU.

The problems faced by some local medical officers of health and the situation in Muskoka-Parry Sound Health Unit suggest that s. 67 has not prevented the apprehended danger that public health administration would become lost within the municipal bureaucracies.

The Commission in its first interim report analyzed serious problems at the local level and recommended:

94. The entire section provides as follows:

Medical officer of health

67 (1) The medical officer of health of a board of health reports directly to the board of health on issues relating to public health concerns and to public health programmes and services under this or any other Act.

Direction of staff

(2) The employees of and the persons whose services are engaged by a board of health are subject to the direction of and are responsible to the medical officer of health of the board if their duties relate to the delivery of public health programmes or services under this or any other Act.

Management

(3) The medical officer of health of a board of health is responsible to the board for the management of the public health programmes and services under this or any other Act.
Whatever is done by way of structural revision, two adjustments are clearly needed to the role of the local medical officer of health. The first is to ensure, as noted above, that the local medical officer of health enjoys the same degree of political independence from the local power structure that the Chief Medical Officer of Health enjoys from the province. Both the local medical officer of health and the Chief Medical Officer of Health require the ability to speak out on public health issues without going through a political filter, and need to manage outbreaks free from politically motivated interference. The second is to ensure that the local medical officer of health is not buried in the municipal bureaucracy. It has been suggested that some local medical officers of health, as municipalities moved to consolidate, have been sucked into the corporate municipal entity instead of retaining the executive authority over their own operations that is necessary to ensure their accountability for the administrative machinery that makes public health work on the ground.

The first recommendation, ensuring the independence of the local medical officer of health, is discussed in the previous chapter, Medical Independence and Leadership.

Following the above passage in the first interim report, the Commission recommended that s. 67 be enforced, or if necessary, amended:

Because of the overall provincial interest in public health protection and because of the statutory obligations of the local medical officer of health to ensure public health protection, the provisions of s. 67 should be enforced or if necessary amended to ensure that the medical officer of health has direct administrative control over the personnel and administrative machinery required to deliver public health protection.

Mr. Scott, in a presentation to the Grey-Bruce Board of Health, set out the important distinction between the CEO/Board relationship in most corporations, and the medical officer of health/board relationship in the Health Protection and Promotion Act:

While the Board is ultimately responsible for the quality and success of the mandatory health programs and in the execution of the above duties, the relationship with the Medical Officer of Health (“MOH”) is central to the success of the health unit.

The foregoing makes it plain that there is a marked difference between
CEO/Board relationship in most corporations and the MOH/Board relationship under the HPPA.

The Board, subject to the approval of the Minister, has the responsibility to hire and fire the MOH, assess the MOH, and hold the MOH accountable for the effective operation of the health unit. This on the surface is similar to the Board/CEO relationship in other corporations. However, in other corporations the Board can interfere with the CEO and remove the CEO at will and even take over the operation of the corporation. This is not an option under the HPPA.

In addition to the substantial medical powers carried by the MOH, the MOH must also ensure the development of a budget that is sufficient to meet the public health needs while administering a health unit that is efficient, and cost effective. The board must approve the budget. This leadership by the MOH in both medical and administrative matters and the policy and approval oversight by the Board should provide assurance that the public health is protected and that public health programs are delivered at a reasonable cost to their taxpayers.

The failure to understand these dynamics and the central role of the MOH was at the root of most of the problems in Muskoka-Parry Sound. The board seemed to believe it could act as it saw fit with the office of the MOH. They were wrong in policy and wrong in law!

In some areas there is a clear lack of understanding of the role of the board of health. This is evidenced by the numerous examples of municipal officials, both those who sit on boards of health and those who aren't members of the board of health, virtually ignoring s. 67. Those examples, along with the Muskoka-Parry Sound experience, demonstrate that s. 67 as it now stands is powerless against any municipality or local board that chooses to ignore or defy it. Section 67 in its present form has proved

---

95. Graham W.S. Scott, Q.C., Presentation to the Grey-Bruce Board of Health: Critical Elements for Effective Governance of Boards of Health in Ontario, January 21, 2005. (Subsequently referred to as the Scott Presentation.)

96. This is clear from the Scott Report findings:

… I am satisfied that the Board has shown little interest in meeting the requirements of the legislation where it is inconvenient. For example:
inadequate to prevent the mischief it was designed to prevent.

The overall provincial interest in public health protection, and the statutory obligations of the local medical officer of health to ensure public health protection, require the amendment of s. 67 to ensure that the medical officer of health has direct administrative control over the personnel and administrative machinery required to deliver public health protection.

The Commission therefore again recommends that s. 67 be amended and strengthened to ensure that those whose duties relate to the delivery of public health services are directly accountable to, and under the authority of, the medical officers of health, and that their management cannot be delegated to municipal officials. More importantly, however, as will be discussed below, so long as public health governance remains at the local level, the provincial government must be vigilant in auditing and taking decisive action where violations of s. 67 occur.

A parallel amendment is required to provide that the local medical officer of health is the chief executive officer of the local board of health. It must be made abundantly clear that the local medical officer of health has exclusive authority over the direction of employees whose duties relate to the delivery of public health programmes and services. It must be clear that the local medical officer of health is responsible to the board for the management and administration of public health programmes and services, and the business affairs of the board of health.

1) The Board has been without a full-time MOH for most of the time since 2000 and consequently has not met the requirements of Section 62(1) of the HPPA, which require it to appoint a full-time MOH.

2) The last time an MOH reported regularly to the Board was during the tenure of Dr. Pfaff. The Board has, at best, been passive about the presence of the MOH at Board meetings and is clearly outside the intent of Section 67(1) of the HPPA.

3) The Board’s actions with regard to personnel matters have circumvented and frustrated the intent of Section 67(2) and (3) which provide that employees are subject to the direction of, and responsible to, the MOH.

4) The Board has, by procedural means, made it difficult for the MOH to exercise the right in Section 70 to attend each meeting of the Board and every committee meeting.

5) The Board has appointed Co-Chairs of the Board notwithstanding that they were aware that the HPPA has no provision that permits the appointment of Co-Chairs.
This measure, among others, is necessary to ensure that local medical officers of health have the clear authority to manage the health unit and that appropriate public health standards are met across the province. So long as municipally governed local boards remain in place, the local medical officer of health requires both full authority, as chief executive officer in respect of local public health services, and direct accountability to the local board free from any municipal intervention.

As noted in the previous section, the medical officer of health requires a degree of independence parallel to that now provided to the Chief Medical Officer of Health. Medical officers of health should have the duty and the authority to speak out publicly about local public health concerns. This must include the power to bring to the attention of the public a local board’s failure or refusal to comply with their obligations under the Act. The local medical officer of health must be able to do so without fear of recrimination, reprisal, dismissal, or other adverse employment consequences. The Commission reiterates its recommendation in the previous section that the Health Protection and Promotion Act must be amended to provide every local medical officer of health with a degree of independence parallel to that recommended for the Chief Medical Officer of Health, including the duty and authority to speak out publicly about local public health concerns without fear of adverse employment consequences.

**Recommendations**

The Commission therefore recommends that:

- The Ministry of Health and Long-Term Care enforce the Health Protection and Promotion Act to ensure the protection of the medical officer of health from bureaucratic and political encroachment in the administration of public health resources and to ensure the administrative integrity of public health machinery under the executive direction of the medical officers of health. In particular, the Ministry of Health and Long-Term Care should:
  - Amend and strengthen s. 67 of the Health Protection and Promotion Act to ensure that those whose duties relate to the delivery of public health services are directly accountable to, and under the authority of, the medical officers of health, and that their management cannot be delegated to municipal officials;
  - Take enforcement actions in respect of violations of s. 67;
2. Local Governance

- Amend the Health Protection and Promotion Act to clearly state that the medical officer of health is the chief executive officer of the board of health; and

- Amend the Health Protection and Promotion Act to provide local medical officers of health a degree of independence parallel to that of the Chief Medical Officer of Health, as set out in Chapter 1 of this Report.

Strengthening Accountability

SARS showed that provincial control over public health protection needs more teeth.

The present regime depends on compliance by local public health boards with the Mandatory Health Programs and Services Guidelines (the Guidelines). First published in 1984, and then revised in 1997, the Guidelines set out minimum requirements for public health programmes and services delivered by public health units across Ontario.

Although the statute requires local boards to comply with the Guidelines, a guideline is no more than a suggestion, making the Guidelines a weaker form of direction than standards. A uniform standard of health protection throughout the province requires more than a series of suggestions that are inadequately monitored, audited and enforced.

Under the Health Protection and Promotion Act, every board of health is responsible for ensuring the provision of health programmes and services required under the Act and its regulations. Section 4 of the Health Protection and Promotion Act provides:

4. Every board of health,

(a) shall superintend, provide or ensure the provision of the health programs and services required by this Act and the regulations to the persons who reside in the health unit served by the board; and

(b) shall perform such other functions as are required by or under this or any other Act.

Section 5 of the Act sets out the types of health programmes and services that every board of health must provide:
5. Every board of health shall superintend, provide or ensure the provision of health programs and services in the following areas:

1. Community sanitation, to ensure the maintenance of sanitary conditions and the prevention or elimination of health hazards.

2. Control of infectious diseases and reportable diseases, including provision of immunization services to children and adults.

3. Health promotion, health protection and disease and injury prevention, including the prevention and control of cardiovascular disease, cancer, AIDS and other diseases.

4. Family health, including,
   
   i. counselling services,
   
   ii. family planning services,
   
   iii. health services to infants, pregnant women in high risk health categories and the elderly,
   
   iv. preschool and school health services, including dental services,
   
   v. screening programs to reduce the morbidity and mortality of disease,
   
   vi. tobacco use prevention programs, and
   
   vii. nutrition services.

4.1 Collection and analysis of epidemiological data.

4.2 Such additional health programs and services as are prescribed by the regulations.

5. Home care services that are insured services under the Health Insurance Act, including services to the acutely ill and the chronically ill.

While s. 5 sets out the general areas, it does not establish a baseline standard of serv-
The Minister may publish guidelines for the provision of mandatory health program and services and every board of health shall comply with the published guidelines.

As the opening paragraph (see below) of the Guidelines demonstrates, the words “guideline” and “standard” are used interchangeably, as if they had the same meaning and same mandatory vigor:

The standards contained in this document obtain their legal authority under provisions of the Health Protection and Promotion Act. Part II, Section 5, of the Health Protection and Promotion Act specifies that boards of health (as defined in the Health Protection and Promotion Act) must provide or ensure the provision of a minimum level of public health programs and services in specified areas. Section 7 of the Health Protection and Promotion Act authorizes the Minister of Health to develop and publish guidelines that represent minimum standards for these programs and services.

However, guidelines are weaker than standards.

The Canadian Oxford Dictionary defines “guideline” as:

A principle or criterion guiding or directing action.

But it defines “standard” as prescriptive in nature:

An object or quality or measure serving as a basis or example or principle to which others conform or should conform or by which the accuracy or quality of others is judged.

Merriam-Webster’s Dictionary of Law defines “standard” as:

Something established by authority, custom, or general consent as a model, example, or point of reference.

Stedman’s Online Medical Dictionary defines “standard” as:
Something that serves as a basis for comparison; a technical specification or written report by experts.

Although to some the difference between the words “guideline” and “standard” may be a matter of linguistics, to others the term “standard” more appropriately reflects their significance and mandatory nature. As one experienced medical officer of health told the Commission:

> It would be very helpful even if you just changed the name because in fact they are … if you read the details they are legally enforceable but you would not think so from the description.

Although this observer thought the Guidelines were legally enforceable, it is difficult to identify any quick and effective legal machinery for their enforcement under the present system.

The term “guideline” connotes discretion and suggests that a particular level of performance is desired but not required. A guideline is simply an indication or outline of policy or conduct; a mere suggestion. Mere suggestions are not enough to ensure a reasonable level of public health protection across the province. It is not enough to require boards of health to meet guidelines. Standards are stronger, requiring a particular level of performance. The measures required to protect public health should be laid down as binding standards across the province, having the force of law and with consequences for noncompliance.

The Commission welcomes the decision of Dr. Basrur to review the Mandatory Health Programs and Services Guidelines, a process that,

> … will incorporate emerging health issues, best practices, new science, as well as lessons learned from Ontario’s experiences with Walkerton, West Nile virus and SARS.97

Many public health advocates have recommended to the Commission that the standards be included as part of the regulations to the Health Protection and Promotion Act, to give them the strength of law. This makes good sense in order to ensure that the standards have the force of law. As one medical officer of health told the Commission:

---

I recommend that the guidelines be replaced as a standard. I recommend that they be given the weight and laws of regulations …

**Recommendation**

The Commission therefore recommends that:

- **Section 7 of the Health Protection and Promotion Act** be amended to provide that the Minister, on the advice of the Chief Medical Officer of Health, shall publish standards for the provision of mandatory health programmes and services, and every board of health shall comply with the published standards that shall have the force of regulations.

**Monitoring, Auditing and Enforcement**

Compliance is weak in any system when standards are considered to be mere suggestions whose observance is discretionary. Compliance declines gravely in any system when standards are perceived to lack the weight of mandatory direction and are not effectively monitored, audited or enforced. Under such conditions, even the best-crafted standard can fall short of its intended goal.

Effective monitoring, auditing and enforcement can help to root out organizational problems before they spin out of control and require drastic measures. They can raise the level of performance among weaker health units. And they can ensure the provision of a uniform level of public health services throughout Ontario.

Ineffective monitoring, auditing and enforcement, as demonstrated by SARS, can allow problems of capacity, resources and leadership to fester and worsen. Weak health units are permitted to decline even further. Ineffective central control deprives Ontarians of their right to expect similar levels of public health protection no matter where they live.

Prior to SARS, the Ministry had a poor track record of monitoring local health unit compliance with the Guidelines. The Provincial Auditor (now the Auditor General) stated in his 2003 report:

Ministry staff informed us that, since 1998, only one assessment of a local health unit had been undertaken and that in March 2003, the
Ministry began limited assessments of mandatory programme areas at five local health units.

When the Guidelines were revised in 1997, the Ministry estimated that it would take three years to achieve full compliance. In 1998, the Ministry initiated an annual Mandatory Programs Indicator Questionnaire (MPIQ), whereby local health units answered a series of questions related to the Guidelines. The Ministry uses their answers to assess whether programme requirements are being met. At the time of our audit, the Ministry was in the process of reviewing the MPIQs covering the year 2001.

We questioned the Ministry’s full reliance on the MPIQ as a basis for its assessment, as the MPIQ data consisted solely of local health units’ self-reported answers and the Ministry did not have any procedures in place for verifying the reliability of the information reported. In this regard, in 2000, the Mandatory Programs Measurement Working Group, comprising representatives from the Public Health Branch and Ontario’s Association of Local Public Health Agencies, recommended that the MPIQ be evaluated for its validity as a tool for assessing compliance with the mandatory programs. At the time of our audit, the recommended evaluation had not been conducted.

Based on its review of the completed MPIQs for the year 2000, the Ministry concluded that local health units were 78 per cent compliant with the Guidelines. This was calculated by averaging the overall compliance rate for each of the MPIQ areas across the 37 local health units. However, we noted that this calculation was not a meaningful measure of compliance and was therefore not an indicator of the Actual performance and overall effectiveness of public health programmes across the province. Specifically, we noted the following weaknesses in the compliance calculation and the MPIQ itself.

- The Ministry calculated overall compliance without considering the relative size of individual health units (the population served by the largest local health unit is over 60 times that of the smallest health unit).

- Compliance was assessed in absolute, “either/or” terms, rather than taking into account degrees of compliance. For instance, one health
unit was about 10 per cent compliant in a mandatory programme area while another was 70 per cent compliant, yet both were rated equally non-compliant.

- The MPIQ did not elicit compliance data for all of the mandatory programmes and services. For example, the Guidelines include an objective for a coverage rate of 95 per cent for vaccinating children for hepatitis B by the end of grade 7, but the MPIQ did not address hepatitis B vaccination coverage rates.98

A compliance monitoring system that does not adequately measure compliance is of little help. Improved monitoring through random assessments was recommended by Mr. Justice O’Connor in the Walkerton Inquiry and also in the 2003 report of the Provincial Auditor;

Under the Act, the Minister of Health and Long-Term Care may assess whether local health units are providing or ensuring the provision of health programmes and services in accordance with the Guidelines. In addition, Part One of the Walkerton Report, released in January 2002 (the report was the result of the Walkerton Inquiry, established in June 2000 to investigate the water-borne E. Coli outbreak in Walkerton, Ontario), recommended that the Ministry conduct random assessments on a regular basis to ensure local health units are complying with the Guidelines. The report also stated that the Ministry should annually track trends in noncompliance in order to assess whether changes are required to the mandatory programmes and whether resources require adjustment to ensure full compliance.99

Since SARS the Public Health Division under Dr. Basrur’s leadership has made important strides in addressing this problem, sending a clear signal that the Guidelines are to be treated as mandatory standards – not suggestions. The Public Health Division’s recently released “2005 Financial Planning and Accountability Guide for Provincial Grants for Mandatory and Related Public Health Programs” advises boards of health and health units:

To ensure that services provided by health units respond effectively to the needs of Ontarians, the Ministry will actively enforce compliance with the Mandatory Health Programs and Services Guidelines.\footnote{100. Public Health Division, “2005 Financial Planning and Accountability Guide for Provincial Grants for Mandatory and Related Public Health Programs,” (Toronto: February 2005), p. 3}

Indeed, a heightened level of accountability is a constant theme of the “2005 Financial Planning and Accountability Guide for Provincial Grants for Mandatory and Related Public Health Programs.” It advises boards of health and health units:

In 2005 the Ministry will implement a performance measurement system. This, along with the Program-Based Grant Request and related reporting requirements, will enable the Ministry to strengthen its review of eligible expenditures in order to effectively monitor programme funding and service delivery. These initiatives will build on the public health system’s demonstrated interest in working towards increased accountability. The continuing cooperation of all public health providers will be essential to our success in demonstrating accountability and “value for money” as we move forward to revitalize Ontario’s public health system.

In addition to improving accountability, the information obtained through the above noted mechanisms will assist us in planning future programme changes and enhancements and will inform the Mandatory Program Review and the Local Public Health Capacity Review committees.\footnote{101. Ibid.}

The Guide, for example, provides clear direction on how funds for infection control should be allocated and monitored. It states:

The Ministry has clarified the requirements for the Infection Control program (formerly the SARS Short-Term Action Plan) initiated in 2003 . . .

- For the Infection Control program, health units are required to stay within both the funding levels and the number of full-time equivalent positions identified in the Ministry’s allocation letter of
December 19, 2003 (supercedes and replaces original allocation letter of September 25, 2003).

- Funding for this initiative must be used solely for the purpose of hiring and supporting staff that will increase the health unit’s ability to monitor and control infectious diseases and enhance its ability to deal with surges of activity related to outbreaks of diseases.

- Effective with the 3rd Quarter Report due October 30, 2005, health units will be required to submit the “Staffing and Related Costs” report for the Infection Control Program as part of their quarterly reports.

- Staff funded through this initiative are required to be available to be re-deployed when requested by the Province to assist with large-scale outbreaks in the event that they threaten to overwhelm another local health unit’s capacity to respond. This is part of the provincial commitment to improve the capacity of all Ontario public health units to control and respond to infectious diseases.102

Meeting the minimum requirements set out in the Guidelines is also an explicit feature of transfer payment agreements between the Province and the local health unit. The recently released Guide states:

Transfer payments involve an agreement between the Province and the applicable health unit. The Ministry must ensure that prior to advancing any provincial funds to health units, signed agreements are in place that:

- Bind the health unit to achieve specific, measurable results per the Mandatory Health Programs and Services Guidelines;

- Require health units, as a condition of funding to have in place governance and administrative structures and processes necessary to ensure prudent and effective management of public funds;

- Require health units to provide periodic reports on financial status and relevant financial and program results achieved;

102. Ibid, pp. 6-7.
• Clearly establish the province’s right to require independent verification of reported information by independent professionals;

• Limit the obligations of the province according to the terms of programs approved by Cabinet; and

• Permit the recovery of provincial funds and/or the discontinuance of ongoing funds in the event of health unit non-performance.\textsuperscript{103}

Monitoring and reporting is also an explicit feature of the transfer payment agreements. The Guide states:

Monitoring and Reporting

The Ministry is required to obtain and review information on the status of health unit eligibility and performance and identify noncompliance with agreements and the failure of health units to demonstrate continued eligibility.\textsuperscript{104}

The Guide also outlines the consequences of failing to meet the terms of the funding agreements:

Corrective Action

The Ministry must initiate corrective action where a health unit has failed to comply with any of the terms of the agreement or where ineligibility is identified. Where appropriate corrective action is outside its direct authority, the Ministry must bring the situation to the attention of officials with the necessary authority.

The nature of corrective action will depend on the type and extent of noncompliance, but in all cases the objective of corrective action is to ensure that provincial funds are used as specified in agreements or returned to the provincial treasury.\textsuperscript{105}

\textsuperscript{103} Ibid, pp. 16-17.
\textsuperscript{104} Ibid, p. 17.
\textsuperscript{105} Ibid, p. 17.
Complimenting these initiatives is an innovative change in the role of the Auditor General (formerly called the Provincial Auditor.) The Guide advises boards of health and health unit staff that Bill 18, *An Act Respecting the Provincial Auditor*, which received Royal Assent in November 2004, expands the mandate of the Auditor General to conduct discretionary value-for-money audits of local boards of health.

Section 9.1 of the Act states:

9.1 (1) On or after April 1, 2005, the Auditor General may conduct a special audit of a grant recipient with respect to a reviewable grant received by the grant recipient directly or indirectly on or after the date on which the Audit Statute Law Amendment Act, 2004 receives Royal Assent.

Exception

(2) Subsection (1) does not apply with respect to a grant recipient that is a municipality.

However, while the Auditor General does not have the mandate to audit municipalities, s. 9.2 of the *Auditor General Act* does provide the following authority with regards to municipal grants:

106. According to the web site of the Auditor General: “An extremely important part of the Auditor General’s mandate is the value-for-money component. Value-for-money audits are assessments of whether or not money was spent with due regard for economy and efficiency and whether appropriate procedures were in place to measure and report on the effectiveness of government programs. Under the Auditor General Act, the Office is required to report to the Legislature significant instances where it is observed that the government is not fulfilling its responsibilities in these areas. To fulfill its value-for-money mandate, the Office annually conducts audits of selected ministry or agency programmes and activities. Major programmes and activities are generally audited every five years or so. Every year, senior management of the Office consider a number of risk factors when selecting which programmes to audit in the coming audit period. These factors include: the results of previous audits, the total revenues or expenditures at risk, the impact of the programme or activity on the public, the inherent risk due to the complexity and diversity of operations, the significance of possible issues that may be identified by an audit, and the costs of performing the audit in relation to the perceived benefits. The results of value-for-money audits are reported on in the Auditor General’s Annual Report and constitute a large portion of that document. As well, of all the observations that the Auditor General reports on, value-for-money findings tend to attract the largest proportion of media coverage and interest from the public and from the Standing Committee on Public Accounts.” (See http://www.auditor.on.ca/english/aboutus/whatwedo_frame.htm)
9.2 (1) The Auditor General may examine accounting records relating to a reviewable grant received directly or indirectly by a municipality.

(2) The Auditor General may require a municipality to prepare and submit a financial statement setting the details of its disposition of the reviewable grant.

The Ministry of Health advises that spot audits have been conducted since SARS to determine whether local health units are meeting mandatory infection control guidelines. This sensible initiative needs to become part of the regular accountability and monitoring process authorized and required by law to serve not only as an accountability measure to encourage compliance and identify problems at an early stage, but also as a management tool to identify and correct general trends in noncompliance.

That’s why the Commission recommends that the *Health Protection and Promotion Act* be amended to require, by law, the regular monitoring and auditing, including random spot auditing, of local health units to ensure compliance with provincial standards. The public should be able to see any such audits so that they can judge the level of performance of their local health unit.

Effective monitoring, auditing and enforcement require sufficient allocation of resources – to the Provincial Health Division, to the local health units, and to the Auditor General. Too often in the past, the importance of monitoring compliance with public health standards has been given short-shrift – both as a strategic imperative and a funding priority. And yet, as suggested by Mr. Justice Horace Krever in the Commission of Inquiry on the Blood System, by Mr. Justice O’Connor in the Walkerton Inquiry, and by the Provincial Auditor in his 2003 report, monitoring and audits are essential to ensuring that public health standards are maintained so that emergencies are either prevented from developing or can be more effectively contained.107

The enactment of a new statutory duty to monitor and audit, together with an increased emphasis on active enforcement, are vital to ensure that problems are found and fixed before they get so big that they require heavy and expensive interventions.

---

With this increased responsibility must come increased resources to fund the monitoring, the audits and the enforcement. As noted below in the section on public health resources, it is idle to enact improvements to the public health system without funding those improvements. Publicly announced initiatives, without adequate funding, mislead the public.

**Recommendation**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to require by law the regular monitoring and auditing, including random spot auditing, of local health units to ensure compliance with provincial standards. The results of any such audits should be made public so citizens can keep abreast of the level of performance of their local health unit.

**Composition & Qualification of Boards of Health**

Acting on recommendations set out by the Commission in its first interim report\(^{108}\) and the recommendations in the Walker Report,\(^{109}\) the provincial government has begun to upload a greater proportion of public health funding. The goal is for the province, by January 2007, to be responsible for 75 per cent of public health funding.\(^{110}\)

---

108. The Commission in its first interim report recommended the following:

There is no scientific way to determine the appropriate degree of provincial funding upload for infectious disease surveillance and control. Although a case can be made for 100 per cent funding upload, the persuasive views of a number of local medical officers of health suggest that it would be sensible to upload infectious disease control to a provincial contribution of at least 75 per cent.

It may be that the provincial acceptance of that recommendation, the initiatives taken by Dr. Basrur since her appointment, and the recommendations in this second interim report will fix the underlying governance problems. It is the Commission’s further position in this report that if these measures do not fix the problems, a clear decision must be made by the end of 2007 whether or not to upload funding and control 100%100 per cent to the province (p. 175).

On the principle of say for pay, it follows that the province should assume a greater representation on local boards of health. If the provincial government is paying for three-quarters of the funding, then it should clearly have a greater say than it does now – less than 50 per cent\textsuperscript{111} – in its representation on local boards of health.

As for the proportion of municipal and provincial appointees on boards of health, it is anomalous that the province, which now pays over 50 per cent of the overall cost, is restricted by statute to less than 50 per cent of board appointees. It is not just a question of money. Public health is a provincial programme. As noted above, the nature of infectious disease requires stronger central control of the machinery that detects and prevents its spread throughout the province. Should the recommendations in this report be implemented, the degree of provincial control will increase. The governance of a provincial programme, funded mostly by the province, requiring a strong measure of provincial control, should attract a majority of provincial appointees on the local governing boards.

The Commission therefore recommends that the province appoint a majority of the members of each local board of health.

A significant practical difficulty attends this recommendation. There has been from time to time a significant delay in the cabinet appointment (by Order in Council) of provincial representatives on local boards, including boards of health. Long standing vacancies interrupt continuity and impair the full functioning of local board. As one medical officer of health noted:

\begin{quote}
The other problem with provincial appointees that has been experienced, especially with district health councils, is if the provincial government delays in appointing it can really paralyze governance bodies, so that’s another piece that attention needs to be paid to. If you happen to get a government that wasn’t supportive of public health, a way to make it very difficult to move forward is to not to fill the empty seats.
\end{quote}

The Commission therefore recommends that if cabinet has not by Order in Council

\textsuperscript{111} Subsection 49(3) of the \textit{Health Protection and Promotion Act} provides that the provincial representation should always be less than half:

\begin{quote}
The Lieutenant Governor in Council may appoint one or more persons as members of a board of health, but the number of members so appointed shall be less than the number of municipal members of the board of health.
\end{quote}
filled a board of health vacancy within six weeks, the vacancy shall be filled by an appointment made directly by the Chief Medical Officer of Health.

When asked about increasing the proportion of provincial representation on boards of health, some members of the public health community met this suggestion with caution. They thought that in many cases the quality of provincial appointments did not reflect the degree of commitment to public health required of those in a stewardship role. One medical officer of health observed:

… from my previous experience, when we had provincial appointees they were not that distinguished or helpful, so I guess it has not been a great experience.

Widespread concern was expressed not only about provincial representatives on health boards, but about the general need for board members to have some qualifications based on experience, interest, and commitment in respect of public health.

Some local medical officers of health have to contend with board of health members whose sole focus is on cutting the budget. As one local medical officer of health described their situation:

… one of the board member’s key agendas is to cut our budget. My budget meeting is next week. [They] have been actively voting against, and trying to undermine what we’re doing since the day [they] walked in the door. And it depends on who’s at the table, whether or not the more reasonable people at a particular meeting, [are] able to carry the discussion around the table. And frankly, it’s very disheartening for me as a medical officer of health and my staff, when they’re just trying to do their jobs, to see how the board behaves.

Whether a board of health member is appointed by the province or the municipality, the member has a duty of stewardship not only for the expenditure of public funds but also for the delivery of public health services that adequately protect the public. They should, as members of a board of health, share a public health agenda, interest, and commitment. Unfortunately this is not always the case.

Mr. Scott, the assessor in Muskoka-Parry Sound referred to above, summarized the conflict faced by many municipal officials who also sit on boards of health:

One central question that needs to be addressed is: Does a conflict of

124
interest exist between a municipal councilor’s duty to the taxpayer and his or her duty to the community as a steward of the public health system?

I encountered these issues directly in carrying out the Muskoka-Parry Sound assessment. There was a very serious disconnect between the way the Board interpreted its role and what constituted specific requirements of the HPPA and many of the established principles of good governance.

I believe many of those problems originated from a fundamental misunderstanding of how their duties as Board members differed from their duties as elected municipal representatives. Clearly elected municipal representatives are expected by their electorate to manage the affairs of their jurisdiction in an efficient and effective manner; and of obvious importance, is the need to manage them in accordance with the resources available. This puts pressure on the elected municipal representatives to deliver as much as they can for as little tax demand as possible. It further creates an incentive to pick and choose among priorities to keep taxes down and to focus on priorities that may get the most positive reception from the electorate. An elected municipal representative, when wrestling with difficult municipal budgetary demands, is obviously tempted to consider the health unit as just another essential service that must play its part in the management of the municipal cost structure.

Unfortunately that is not how it works if the law is to be respected!

I believe that there is a potential conflict most notably arising around what was termed the municipal funding dilemma by Justice Campbell. There is a deep structure problem that drives much of the trouble on boards of health. The municipal funding dilemma is that the municipalities fund public health, a provincial program, from a limited local property tax base. Even though the province underwrites more than 50 per cent of the costs of the program, provincial program growth drives municipal costs. This puts the municipalities in a tough spot, a spot that many municipal councilors feel is unjust and unfair. This is covered succinctly in Justice Campbell’s Interim report, *SARS and Public Health in Ontario*.

A municipal councilor who also sits on a board of health has two hats, the municipal politician hat: *keep taxes down* and the public health hat: *fight disease*. When the councilor is sitting on the board of health he or
she cannot perform their statutory duty by simply saying “no increases because I made a political promise to hold taxes.” The councilor on health board cannot say “all I care about is the money; no tax increases; public health will have to be cut like everything else.” Those statements would constitute a derogation of his or her duty to the Board of Health. Only one hat can be worn on the Board of Health.

Clearly those who control public funds have a stewardship to ensure value for money. But the councilor on the board of health is bound by legal duty under HPPA which is where his or her first loyalty must lie.

It is not at the option of the Board to avoid their statutory duty to meet the budget requirements of the health unit. The mandatory health programmes and services to be delivered are a statutory requirement. Further, the standards expected for programme delivery are clearly laid out, so there is little room for Board members to adjust the Health Unit budget.

This can make it very awkward for elected municipal representatives who are on the Board as they are open to suggestions from their colleagues that they are not applying the same standards of restraint to the Board that they are applying to other municipal responsibilities. While an unfair shot in the circumstances, it is in fact true, due to the lack of flexibility to suspend or cut back on most programs.

This reality does not at all diminish the importance of the Board or the job of ensuring that the budget is well managed and appropriate for the services delivered, but it does very much limit budgetary discretion.\textsuperscript{112}

This is a conflict that is not shared by unelected representatives on the board of health. One local medical officer of health described the important role that the public member of the board of health, an unelected official, played in their board of health:

\begin{quote}
We have a citizen who is knowledgeable and interested in public health and they sit on the board. Having them provides for healthy
\end{quote}

\textsuperscript{112} The Scott Presentation.
checks and balances between the public members who are much more concerned about public health and the business of public health. They have less of an issue with the hats they wear at the table.

Mr. Scott also noted the value of municipally appointed, non-elected public representatives on a board of health:

One final thought on municipal representation. Section 49(2) of the HPPA refers to municipal members. The Act defines municipal member as “… a person appointed to the Board of Health by the Council of the Municipality.” Consequently, the municipality may appoint members who are not elected members of municipal councils. This could have the advantage of removing any conflict an elected representative may experience while providing an experienced individual in the community with an interest in public health the opportunity to serve the interests of public health.

The Commission recommends that the Health Protection and Promotion Act be amended to require that those appointed to boards of health possess demonstrated experience or interest in the goals of public health – to prevent the spread of disease and to protect the health of the people of Ontario – and that they be broadly representative of the community to be served.113

The Commission recommends that consideration be given to a Health Protection and Promotion Act amendment to clarify the role and priorities of health board members, the first priority being compliance with the Health Protection and Promotion Act and the mandatory public health standards.

One local medical officer of health described their vision for a board whose goal is health protection and promotion supported by links with the new proposed Ontario Health Protection and Promotion Agency:

I’ve thought about this, and I thought why do we need a Board. And if

113. Section 2 of the Health Promotion and Protection Act provides:

The purpose of this Act is to provide for the organization and delivery of public health programmes and services, the prevention of the spread of disease and the promotion and protection of the health of the people of Ontario.
you were going to change things, who would you put on your Board? I can imagine there being a Board, and it could be governing, could be advisory, with a senior person from the Boards of Education, so that we could in fact work collaterally with and gain entry to the school boards. We don't have that now. We could have somebody from the business community. Worksites are a venue for public health programmes and services. What a great way of getting a sounding as to whether a service delivery strategy will work, as well as an entrée into the business community. If we did have a successor Board, that's how I would go about structuring it. It would be very strategic, and it would be serving at least two roles. One as a kind of a sounding board type of function, as well as kind of a conduit if you will, into specific sectors that perhaps are not well represented now. So that's how I would do it. It would certainly be far different than it is now, which as you know depends on the whim of the municipal council approval who gets on it, and for many boards of health, it changes yearly. So you make a few gains in terms of their understanding, appreciation and guidance with respect to public health, and just like that, they change. The other thing I would say is, I could imagine a model like CCO, Cancer Care Ontario, if Walker recommends and the government sets up a provincial health protection and promotion agency, that is independent of government, presumably it will be governed by a board of directors, and I could imagine that a local board perhaps could nominate one or two members to the directorship of the Provincial agency, and at a government’s level, that could provide the tie-in there, as it does with the Board of Cancer Care Ontario, and regional cancer advisory committees that are set up at the regional level. I could imagine that as well. And that would be another way of ensuring communication between the province and local authorities, in addition to the Chief Medical Officer of Health.

Whatever the ultimate structure and composition of boards it will, as Mr. Scott points out, be in the best interest of members of boards of health to become proactive and ensure they are complying with their obligations under the Health Protection and Promotion Act and that their sole focus is the protection of the public:

It is not only Justice Campbell who is putting the heat on Boards of Health, the Walkerton Report that you are very familiar with, and the new national and provincial emphasis on public health will necessarily
place a bigger and bigger spotlight on Health Board affairs. Board members will be locally front and centre for the next SARS-type event; growing health information reporting will put you on the spot if you are not meeting provincial or national performance expectations and statutory requirements.

The simple message is – expectations are changing and changing fast with regard to governance and accountability practices and it will not be good news for Boards of Health that have not fully met expectations if things go awry. Things will go awry! Pandemics happen, and with some of the flu and other infectious disease strains that are developing and society’s difficulty in keeping pace with vaccinations and potential cures, the local performance may have a big impact on the spread and/or management of the event. The ability of terrorists to impact public health is real and management and operational incompetence can still have a devastating effect.

When disaster strikes will the Health Board be able to say it met the governance standards expected and did its best when the inevitable questions are asked? That will be the minimum test to protect the community and the Board.

In the event of a public health crisis the Board may not only be under intense public scrutiny but may also be subject to legal action. The issue of whether you met your duties under the law may be subjected to prolonged legal proceedings. This is of little comfort unless you enjoy the spectre of unending legal fees and spending long periods under a potential cloud. A more practical way of assessing whether you are living up to your obligations and hopefully avoid legal proceedings is to apply some simple tests. Given your understanding of your obligations as a board member how would you explain your action as a witness at an inquest or to a Royal Commission or how do you think your position would be portrayed in the media?
Recommendation

The Commission therefore recommends that:

- The Health Protection and Promotion Act be amended to ensure that the greater funding and influence of the province in health protection and promotion is reflected in provincial appointments to local boards of health. Also to ensure that the qualifications required of members of boards of health include experience or interest in the goals of public health. In particular, the Ministry of Health and Long-Term Care should:
  - appoint a majority of the members of each local board, to reflect the greater proportion of provincial public health funding and influence;
  - amend the Health Protection and Promotion Act to provide that where cabinet has not by Order in Council, the vacancy shall be filled by an appointment made directly by the Chief Medical Officer of Health;
  - amend the Health Protection and Promotion Act to require that those appointed to boards of health possess a demonstrated experience or interest in the goals of public health – to prevent the spread of disease and protect the health of the people of Ontario – and that they be broadly representative of the community to be served; and
  - consider an amendment to the Health Protection and Promotion Act to clarify the roles and priorities of health board members, the first priority being compliance with the Health Protection and Promotion Act and the mandatory public health standards.

Good Governance Best Practices

No matter how the relationship between the province and local public health units takes shape, local oversight of public health should reflect the best practices of good governance.

For many years, the word “governance” had a simple meaning. The Canadian Oxford Dictionary defines it as:
The act or manner of governing.

In recent years, as demonstrated by its usage in this chapter, “governance” has taken on a wider meaning to include structures, processes and systems to whose goal is, . . . a robust, well-run organization that achieves peak performance and is accountable to the public it serves.\textsuperscript{114}

Many studies in recent years have compiled best practices of good public sector governance including the final report of the Broadbent Panel on Accountability and Governance in the Voluntary Sector,\textsuperscript{115} the work of American health care consultants Dennis D. Pointer and James E. Orlikoff,\textsuperscript{116} and the recently released guidelines issued by the Office of the Premier of the Province of British Columbia.\textsuperscript{117}

In Ontario, the best framework for health organizations may be the one developed by Mr. Scott and Ms. Maureen A. Quigley for the Ontario Hospital Association and funded by the Ministry of Health and Long-Term Care.\textsuperscript{118} The following key principles for good governance have been derived from the work of Mr. Scott and Ms. Quigley and adapted to the public health environment:

- Boards of local public health units are accountable to the communities they serve: to effectively deliver services; make appropriate use of community resources; and consider their communities’ particular needs and requirements.

- Boards of local public health units also are accountable to the province for: utilizing grants in a manner consistent with provincial directions; ensuring compliance with mandatory health guidelines, regulations and legislation; and measuring performance against accepted standards and best practices.

\textsuperscript{115} Panel on Accountability and Governance in the Voluntary Sector, “Building on Strength: Improving Governance and Accountability in Canada’s Voluntary Sector,” (Ottawa: February 1999)

\textsuperscript{118} Quigley, Maureen A. and Scott, Graham W.S., “Hospital Governance and Accountability in Ontario,” (Toronto: April 2004)
There must be a clear distinction between the roles of management and the roles of boards. While boards delegate authority to management, they must also monitor, assess and evaluate the actions of management. Management oversees the day to day operations of the health unit within the parameters of mandatory health guidelines, regulations and legislation and in the context of their boards' accountability to the communities they serve and the province.

In making board appointments, the province and the municipality should select a percentage of members equal to their respective financial contributions. In most cases, this requirement would be satisfied by the above recommendation that the province appoint a majority of board members.

The province should establish two sets of criteria for board members. One set of criteria should require generic qualities, including the ability to consider issues critically, to work towards a consensus and to foster a positive working environment. The second set of criteria should be more directly applicable to a public health setting, including: a demonstrated interest in public health issues, a scientific or medical background, an understanding of risk communication, or some other qualifications such as business expertise or community development experience.

Terms of board members should be staggered so that, at any one time, two-thirds of the board is comprised of experienced members.

A medical officer of health’s performance should be measured against agreed objectives.

A board’s performance should be measured against the objectives set by the board and the province.

The performance of individual board members should be assessed each year in terms of their participation and contribution to the work of the board.

Recommendation

The Commission therefore recommends that:

The Ministry of Health and Long-Term Care introduce a package of governance standards for local boards of health with reference to those sources.
referred to above, such as the Scott and Quigley governance framework.

**Conclusion**

Public health at the local level needs attention. The existing problems faced in some health units cannot be permitted to continue. The government, for the reasons given above, needs to make a clear decision by the end of the year 2007 whether to upload the financing and control of public health 100 per cent to the province and away from the municipalities.

Although there is no consensus on the ultimate solution for the problems of split provincial-municipal governance, there is a consensus that improvements of the kind described above are required even within the existing system.

Whatever the ultimate solution, the *Health Protection and Promotion Act* must be strengthened and enforced in the manner described above to ensure a uniform standard of protection across the province. Boards of health must likewise be strengthened to ensure that those who comprise the boards of health are committed to and interested in public health, that they clearly understand their primary focus is to be protection of the public’s health, and that they broadly represent the communities they serve.

The current state of affairs cannot continue. The cost of failing to fix will be to risk more disease and death.

**Recommendations**

The Commission therefore recommends that:

- The province, by the end of the year 2007, after the implementation of the recommendations of the pending public health capacity review, decide whether the present system can be fixed with a reasonable outlay of resources. If not, funding and control of public health should be uploaded 100 per cent to the province.

- The Ministry of Health and Long-Term Care enforce the *Health Protection and Promotion Act* to ensure the protection of the medical officer of health from bureaucratic and political encroachment in the administration of
public health resources and to ensure the administrative integrity of public health machinery under the executive direction of the medical officers of health. In particular, the Ministry of Health and Long-Term Care should:

° Amend and strengthen s. 67 of the Health Protection and Promotion Act to ensure that those whose duties relate to the delivery of public health services are directly accountable to, and under the authority of, the medical officers of health, and that their management cannot be delegated to municipal officials;

° Take enforcement actions in respect of violations of s. 67;

° Amend the Health Protection and Promotion Act to clearly state that the medical officer of health is the chief executive officer of the board of health; and

° Amend the Health Protection and Promotion Act to provide local medical officers of health a degree of independence parallel to that of the Chief Medical Officer of Health, as set out in Chapter 1 of this Report.

• Section 7 of the Health Protection and Promotion Act be amended to provide that the Minister, on the advice of the Chief Medical Officer of Health shall publish standards for the provision of mandatory health programmes and services, and every board of health shall comply with the published standards that shall have the force of regulations.

• The Health Protection and Promotion Act be amended to require by law the regular monitoring and auditing, including random spot auditing, of local health units to ensure compliance with provincial standards. The results of any such audits should be made public so citizens can keep abreast of the level of performance of their local health unit.

• The Health Protection and Promotion Act be amended to ensure that the greater funding and influence of the province in health protection and promotion is reflected in provincial appointments to local boards of health. Also to ensure that the qualifications required of members of boards of health include experience or interest in the goals of public health. In particular, the Ministry of Health and Long-Term Care should:
- appoint a majority of the members of each local board, to reflect the greater proportion of provincial public health funding and influence;

- amend the *Health Protection and Promotion Act* to provide that where cabinet has not by Order in Council, the vacancy shall be filled by an appointment made directly by the Chief Medical Officer of Health;

- amend the *Health Protection and Promotion Act* to require that those appointed to boards of health possess a demonstrated experience or interest in the goals of public health – to prevent the spread of disease and protect the health of the people of Ontario – and that they be broadly representative of the community to be served; and

- consider an amendment to the *Health Protection and Promotion Act* to clarify the roles and priorities of health board members, the first priority being compliance with the *Health Protection and Promotion Act* and the mandatory public health standards.

- The Ministry of Health and Long-Term Care introduce a package of governance standards for local boards of health with reference to those sources referred to above, such as the Scott and Quigley governance framework.
3. HPPA Tuneup

The *Health Protection and Promotion Act* is the legal engine that makes public health go. The work of protecting us from infectious disease, during SARS and in normal times, is conducted under its authority. Actions to protect us against disease – prevention, investigation, and intervention – are all taken under this statute. It is a fundamental tool public health authorities use to protect us against infectious outbreaks.

The *Health Protection and Promotion Act* was proclaimed in force in 1983, replacing the former *Public Health Act*. There have been minor amendments since then, directed mainly at funding arrangements and the machinery of service delivery by local boards of health. These amendments have not altered the confusing structure of the statute.

SARS prompted a few urgent spot amendments.\(^{119}\) As noted below, the speed with which these amendments were enacted is a tribute to the skill and professionalism of the lawyers in the Attorney General’s department, including those seconded to legal branches in other Ministries. These amendments aside, there has been no major overhaul of the statute since 1983. That in itself is no reason to amend it. But the more the

\(^{119}\) The *SARS Assistance and Recovery Strategy Act*, 2003, S.O. 2003, c. 1. received royal assent (and thereby came into force) on May 5, 2003. Part I contemplates (s.6) various SARS-related leave scenarios, and then provides for various protections including (ss.8ff) reinstatement, protection of wage rates, and protections against reprisals. In essence this portion of the Act establishes a “SARS leave” which is in addition to the entitlement to the emergency leave provided under recent amendments to the *Employment Standards Act, 2000* (ESA). The Act also provides protection to employers where a termination was carried out “solely for reasons unrelated to the leave.” Part II of the Act provides for a suspension of the retail sales tax on hotel charges during a 5-month period following the SARS crisis. Part III of the Act amends s. 7.1 of the *Emergency Management Act*, which gives the Lieutenant Governor in Council power to make temporary orders to facilitate assistance to victims of an emergency. The new s 7.1(1) specifies that the purpose of the section is to authorize the Lieutenant Governor in Council to make appropriate orders when, in his or her opinion, the victims of an emergency need greater services, benefits or compensation than the law of Ontario provides. Part IV amends Ontario’s *Health Protection and Promotion Act* (HPPA) to allow a medical officer of health to issue a s. 22 order to “a class of persons.” Section 35 was amended to permit the court to name not only a hospital but some “other appropriate facility” in the order. The amended s.87 provides that the Minister may make an order requiring the occupier of any premises to give up possession for use as a temporary isolation facility for a period of 12 months.
Commission worked with the Act in the course of interviewing public health workers, and those in the wider health system who are obliged to comply with it on a daily basis, the more it became apparent that this complex piece of legal machinery needs to be made clearer.

The *Health Protection and Promotion Act* is a convoluted statute, understood by a handful of lawyers and public health officials intimately familiar with it on a daily basis. To those who do not work with it every day the meaning of the *Health Protection and Promotion Act* is not always clear. Even those who do work with it regularly are struck by some of its ambiguities.

In the aftermath of SARS, the powers and authority of public health officials must be carefully reviewed and revised to ensure that during the next infectious disease outbreak, there is no lack of clarity about the precise powers of public health officials to intervene early and manage the outbreak effectively. Nor should there be any ambiguity about the precise obligation of members of the community to abide by orders made by public health officials. The legal authority to intervene and act must be unequivocal. Lack of legal clarity produces confusion, wrangling, and delay when time is of the essence.

The Act needs a major overhaul to remove ambiguity and ensure clarity. The Commission, without embarking on such a major review in this interim report, has identified four examples of what needs to be done:

- Simplify disease categories;
- Clarify the three streams of power to intervene, removing the dangerous ambiguity as to the extent of the powers in s. 13 and simplify the process by which the Chief Medical Officer of Health can exercise the powers provided in Part III and Part IV;
- Clarify and simplify the standards of intervention throughout the Act; and
- Strengthen and clarify the powers contained in s. 22 of the Act.

The *Health Protection and Promotion Act* requires amending not only because existing powers are inadequate, as noted above, but because they are unclear, as noted later in this chapter. Some of the Act’s problems, such as reporting obligations, quarantine powers, the independence of the Chief Medical Officer of Health and the local medical officers of health, the municipal role, and recommendations for additional
powers, are dealt with in other sections of this report. Fixing these will go a long way towards strengthening the Act. For example, amending the reporting provisions as recommended will enhance the ability of the local medical officer of health to learn about infectious cases before they turn into outbreaks. But it is not enough to amend and reword the existing structure. SARS showed us that new infectious diseases can emerge suddenly with enormous consequences for the legal machinery of public health. The lessons learned from SARS and the threat of even deadlier risks, such as avian flu and influenza pandemics, suggest that the Health Protection and Promotion Act should be thoroughly reviewed to provide the clearest possible statement of public health authority and its precise limits.

A statute like the Health Protection and Promotion Act, which drives the entire public health system and empowers the state to encroach on individual liberty by personal detention and isolation, must above all be entirely clear. This is not the case with the Health Protection and Promotion Act. It displays the same problems as those identified in the former Food and Drug Regulations by the Honourable Horace Krever:

> It is recommended that the Food and Drug Regulations be rewritten to make them intelligible ... The Food and Drug Regulations, as they are structured at present, are complex, hard to read, and difficult to interpret ... It is essential that any regulation be intelligible to the regulated, and it is desirable that it also be intelligible to the public. The current regulations fail on both counts ... 120

Everything said by Justice Krever about the old Food and Drug Regulations applies to the Health Protection and Promotion Act. Its complexities and difficulties of interpretation must be removed.

The Commission in this chapter identifies some parts of the Health Protection and Promotion Act that require clarification, particularly those parts that deal with infectious disease. This is by no means an exhaustive analysis or proposal for statutory amendment; it merely sets out examples of major revision the Ministry needs to do in consultation with the public health community, and the wider health community. This

---

120. “The Food and Drug Regulations, as they are structured at present, are complex, hard to read, and difficult to interpret, largely because of the many amendments that have been made over the years. It is essential that any regulation be intelligible to the regulated, and it is desirable that it also be intelligible to the public. The current regulations fail on both counts.” (Source: Volume 3, page 1067, of the Final Report of the Commission of Inquiry on the Blood System in Canada, headed by The Honourable Mr. Justice Horace Krever and released in November 1997.)
is a convenient place to observe that a tremendous body of expertise is available in the fairly small group of lawyers who advise local boards of health. They work with the statute on a regular basis and have a firm understanding of what is needed to make the statute clear. Their advice in the process of amendment would be most valuable.

Overview of the Act

The *Health Protection and Promotion Act* presents an assortment of public health powers scattered throughout different parts of the Act. A snapshot of the powers, their triggers and standards of application, show an overall lack of consistency, clarity, and unified organization. To exemplify the need for general reorganization and revision, a handful of specific provisions will be set out below, with brief illustrative comments.

The powers of a local medical officer of health and the Chief Medical Officer of Health are contained primarily in three main parts of the Act: community health protection, communicable disease, and administration. The powers contained in those sections that were relevant during SARS can be summarized in the following chart:

<table>
<thead>
<tr>
<th>Part III Community Health Protection</th>
<th>Part IV Communicable Diseases</th>
<th>Part VII Administration</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLICATION</td>
<td>s. 1 – definition of health hazard; condition of premises, substance, thing, plant or animal other than man, or a solid, liquid, gas or combination of any of them, that has or is likely to have an adverse effect on the health of any person (Part I)</td>
<td>s. 86(1) – situation that constitutes or may constitute a risk to the health of any persons</td>
</tr>
<tr>
<td>DUTY</td>
<td>s. 10(1) – every MOH shall inspect or cause the inspection of the health unit served by him or her for the purpose of preventing, eliminating and decreasing the effects of health hazards in the health unit</td>
<td>s. 86(1) – is discretionary on part of Chief Medical Officer of Health (formerly was power of Minister of Health)</td>
</tr>
<tr>
<td></td>
<td>Set out in mandatory guidelines (representation on hospital IC, consultation with hospital on infection control and outbreak contingency plan, providing advice when needed or requested for communicable disease management)</td>
<td></td>
</tr>
</tbody>
</table>

121. While these appear to be the main sections which contain powers, other, specific powers can be found in other parts of the Act. For example, the right of entry is included in Part V.
<table>
<thead>
<tr>
<th>POWER</th>
<th>Part III Community Health Protection</th>
<th>Part IV Communicable Diseases</th>
<th>Part VII Administration</th>
</tr>
</thead>
<tbody>
<tr>
<td>s. 13(1) – MOH or public health inspector may, by written order, require a person to take or to refrain from taking any action that is specified in the order in respect of a health hazard</td>
<td>s. 22(1) – MOH by written order may require a person to take or to refrain from taking any action that is specified in the order in respect of a communicable disease</td>
<td>s. 86 – CMOH may investigate the situation and take such action as he/she considers appropriate to prevent, eliminate or decrease the risk</td>
<td></td>
</tr>
<tr>
<td>CRITERIA FOR USING POWER</td>
<td>s. 13(2)(a) – a health hazard exists in the health unit and s. 13(2)(b) – requirements specified in the order are necessary in order to decrease the effect of or eliminate the health hazard</td>
<td>s. 22(2)(a) – communicable disease exists or may exist or there is an immediate risk of an outbreak of a communicable disease in the health unit; and s. 22(2)(b) – the communicable disease presents a risk to the health of persons in the health unit; and s. 22(2)(c) – the requirements specified in the order are necessary in order to decrease or eliminate the risk to health presented by the communicable disease</td>
<td>s. 86(1) – situation exists anywhere in Ontario that constitutes or may constitute a risk to the health of any persons</td>
</tr>
<tr>
<td>STANDARD FOR USING POWER</td>
<td>s. 13(2) – opinion, upon reasonable and probable grounds</td>
<td>s. 22(2) – opinion, upon reasonable and probable grounds</td>
<td>s. 86(1) – opinion (no reasonable and probable grounds standard)</td>
</tr>
<tr>
<td>JUDICIAL REVIEW</td>
<td>s. 102(1) – application by CMOH or MOH to Superior Court for an order restraining a contravention of an order. 102(2) – application by Minister to Superior Court of Justice for an order prohibiting the continuation or repetition of the contravention of an order</td>
<td>s. 35 – application to Ontario Court of Justice for order of detention, examination or treatment in respect of virulent disease s. 102(1) – application by CMOH or MOH to Superior Court for an order restraining a contravention of an order s. 102(2) – application by Minister to Superior Court of Justice for an order prohibiting the continuation or repetition of the contravention of an order</td>
<td>s. 86.1 (1) – application by Chief Medical Officer of Health to Superior Court of Justice to order a board of health to take such action as considered appropriate to prevent, eliminate or decrease the risk</td>
</tr>
</tbody>
</table>
During SARS, legal issues were for the most part put aside. Patients, health care workers, and institutions complied generally with government direction in the hopes that compliance would stop SARS from spreading.

Simplify Disease Categories

The Health Protection and Promotion Act requires amendment to clarify its four overlapping and confusing categories of disease.

The four different categories of disease: infectious, communicable, reportable, and virulent, attract different overlapping sets of legal powers and duties, different reporting duties on the part of doctors and hospitals, and different control powers on the part of medical officers of health and the Minister.

Two categories, communicable, and reportable, are defined in s. 1(1) by way of their inclusion in regulations:

- “communicable disease” means a disease specified as a communicable disease by regulation made by the Minister.
- “reportable disease” means a disease specified as a reportable disease by regulation made by the Minister.

Once the Minister puts a disease into the communicable disease regulation it attracts certain legal consequences, and once the Minister puts a disease into the reportable disease regulation it attracts other legal consequences. The communicable disease regulation specifies 58 diseases and 16 subcategories as communicable. The

---

122. Ontario Regulation 558/91, Amended to O. Reg. 97/03, Specification of Communicable Diseases made under s. 1 of the Health Protection and Promotion Act lists. Acquired Immunodeficiency Syndrome (AIDS); Amebiasis; Anthrax; Botulism; Brucellosis; Campylobacter enteritis; Chancroid; Chickenpox (Varicella); Chlamydia trachomatis infections; Cholera; Cytomegalovirus infection, congenital; Diphtheria; Encephalitis, primary viral; Food poisoning, all causes; Gastroenteritis, institutional outbreaks; Giardiasis; Gonorrhoea; Group A Streptococcal disease, invasive; Haemophilus influenzae b disease, invasive; Hemorrhagic fevers, including: i. Ebola virus disease, ii. Marburg virus disease, iii. Other viral causes; Hepatitis, viral: i. Hepatitis A, ii. Hepatitis B, iii. Hepatitis D (Delta hepatitis), iv. Hepatitis C; Influenza; Lassa Fever; Legionellosis; Leptosy; Listeriosis; Lyme Disease; Malaria; Measles; Meningitis, acute: i. Bacterial, ii. Viral, iii. Other; Meningococcal disease, invasive; Mumps; Ophthalmia neonatorum; Paratyphoid Fever; Pertussis (Whooping Cough); Plague; Pneumococcal disease, invasive; Poliomyelitis, acute; Psittacosis/Ornithosis; Q Fever; Rabies; Respiratory infection outbreaks in institutions; Rubella; Rubella,
reportable disease regulation\textsuperscript{123} specifies all the communicable diseases as reportable and adds to the list of reportable diseases six other diseases, which are not communicable.\textsuperscript{124} Thus all 58 communicable diseases are reportable but six of the reportable diseases are not communicable. The third category, virulent diseases, is defined partly by statute and partly by regulation.

Subsection 1(1) of the \textit{Health Protection and Promotion Act} defines 12 diseases as virulent.\textsuperscript{125} SARS is the only disease specified by regulation as virulent.\textsuperscript{126} Most of the virulent diseases are also communicable and reportable except for Ebola and Marburg virus which are neither communicable nor reportable.

A further category of “infectious diseases” is not defined in the statute or regulations. Control of infectious diseases is a mandatory programme that every board of health is required to deliver:

Every board of health shall superintend, provide or ensure the provision of health programs and services in the following areas . . .

2. Control of infectious diseases and reportable diseases, including provision of immunization services to children and adults.

A further level of complexity is added by s. 86 (4) which provides that when the Minister of Health exercises the authority of a local medical officer of health under s. 22 in respect of a communicable disease, the reference in s. 22 to a communicable disease shall be deemed to be a reference to an infectious disease:

\begin{itemize}
  \item \textit{congenital syndrome; Salmonellosis; Severe Acute Respiratory Syndrome (SARS); Shigellosis; Smallpox; Syphilis; Transmissible Spongiform Encephalopathy, including: i. Creutzfeldt-Jakob Disease, all types, ii. Gerstmann-Sträussler-Scheinker Syndrome, iii. Fatal Familial Insomnia, iv. Kuru; Trichinosis; Tuberculosis; Tularemia; Typhoid Fever; Verotoxin-producing E. coli infections; West Nile Virus Illness: i. West Nile Virus Fever, ii. West Nile Virus Neurological Manifestations; Yellow Fever; Yersiniosis.}
\end{itemize}

\textsuperscript{123} Ontario Regulation 559/91 \textit{Amended to O. Reg. 96/03}, Specification of Reportable Diseases.
\textsuperscript{124} Cryptosporidiosis, cyclosporiasis, Group B Streptococcal disease, neonatal, Hantavirus pulmonary syndrome, Herpes, neonatal, tetanus. The reportable disease list also includes 4 subcategories of encephalitis that are not listed in the communicable disease regulation.
\textsuperscript{125} Cholera, Diphtheria, Ebola virus disease, Gonorrhea, Hemorrhagic fever, Lassa fever, Leprosy, Marburg virus disease, Plague, Syphilis, Smallpox, Tuberculosis.
\textsuperscript{126} Regulation 95/03 made by the Minister on March 25 2003 specifies SARS as a virulent disease. In total there are 13 diseases defined as virulent, in either the Act or Regulation.
For the purpose of the exercise by the Minister under subsection (2) of the powers of a medical officer of health, a reference in section 22 to a communicable disease shall be deemed to be a reference to an infectious disease.

It is difficult to understand why the statute adds this extra layer of undefined “infectious disease” on top of the three defined categories of communicable, reportable, and virulent.

Merely to describe these four categories of disease: infectious, communicable, reportable and virulent, is to illustrate an overlapping and confusing statutory and regulatory framework. Those who work with the Health Protection and Promotion Act on a daily basis are so familiar with its nooks and crannies that they do not complain about the dense confusion of disease categories. To members of the public, and even lawyers who are not steeped in its peculiarities, the Health Protection and Promotion Act categories of disease look like an impenetrable maze.

There was undoubtedly some original logic in the different categories. It makes sense to have two categories of disease to distinguish between virulent diseases like SARS, which require strong and immediate action, and less dangerous diseases like Herpes, which require less dramatic and immediate intervention. It also makes sense to have some very serious diseases specified by statute so that the Legislative Assembly can control the gate for exercising the extreme powers needed to deal with these dangerous bugs. It also makes sense to give the Minister the urgent power to specify immediately by regulation an emerging disease like SARS when there is no time to await the passage of legislation.

But the present structure of four categories of disease, utilizing different methods of designation, and different legal powers and duties, is unnecessarily complex and confusing.

Recommendation

The Commission therefore recommends that:

- The four present categories of disease: infectious, communicable, reportable, and virulent, be simplified and reduced to two categories with clear boundaries and clear legal consequences.
Two Streams of Power

As noted above, the power of the local medical officer of health to act to protect the public is dispersed in two distinct parts of the Act. During SARS, public health authorities derived most of their authority to act from Part IV, Communicable Diseases, but at times had to hope that the Community Health Protection provisions, contained in Part III of the Act, would apply. Yet from the perspective of statutory construction, the fact that the powers in s. 13 are not contained in the communicable disease part of the Act, raises the question of whether they were intended to fill this gap or whether s. 22 was intended to be a one-stop section for powers in relation to communicable diseases.

For example, an unclear application of the Act arises where a hospital’s infection control practices are unsafe and, without improvement, may cause a person to be infected with a communicable disease or create a health risk to the public. Under what section of the Act are public health officials authorized to intervene and give orders to the hospital? Some have argued that this power currently exists in the Health Protection and Promotion Act and in support of this they point to ss. 11, 13 and 14, which authorize a medical officer of health to inspect and make orders where there is a “health hazard.” Action under these sections, however, is premised on there being a “health hazard.”

Health hazard is defined in s.1 of the Act as follows:

“health hazard” means,
(a) a condition of a premises,
(b) a substance, thing, plant or animal other than man, or
(c) a solid, liquid, gas or combination of any of them,
that has or that is likely to have an adverse effect on the health of any person.

First of all, it is worth noting that the powers set out in ss. 11 through 14 are contained in the community health section of the Health Protection and Promotion Act. This part of the Act focuses clearly on environmental and occupational health hazards, not on infectious disease risks which are addressed separately in Part IV, Communicable Diseases. That noted, it is doubtful that these powers were intended to address any situations that arose during SARS, let alone the specific problem of infection control and infectious outbreaks in hospitals. Moreover, the standard of proof in s. 13 makes it inappropriate for use in the context of infectious diseases in
hospitals, and even more importantly it stretches the structure, definitions, and context of Part III to apply these powers to hospital infection control and outbreak problems. It reflects a high degree of legal ambiguity in the *Health Protection and Promotion Act* when public health lawyers can hold sharply divided views on this fundamental issue.

If the powers set out in s. 13 are intended to apply to communicable diseases, the *Health Protection and Promotion Act* should be amended to clarify this point.

Recently, the issue has arisen as to whether the power in s. 13 would allow decontamination of a person. In September, 2004, the Ministry of Health and Long-Term Care, expressed the opinion to Mr. Katch Koch, the Clerk of the Standing Committee on Justice Policy, that s. 13 of the *Health Protection and Promotion Act* could authorize decontamination of a person:

If a situation exists where a possible toxic substance may have contaminated persons in the community (for example the “white powder” scare that occurred across North America following the events of September 11, 2001) it may be appropriate to consider the exercise of certain other powers under the Health Protection and Promotion Act.

Under section 13 of the Act, a medical officer of health or a public health inspector by a written order may require a person to take or refrain from taking any action that is specified in the order in respect of a health hazard. An order may be made under section 13 where the medical officer of health or the public health inspector is of the opinion, on reasonable and probable grounds:

that a health hazard exists in the health unit served by him or her; and

that requirements specified in the order are necessary in order to decrease the effect of or eliminate the health hazard.

An order under s. 13 may include, but is not limited to:

requiring the vacating of premises;

requiring the placarding of premises to give notice to an order requiring the closing of the premises;
requiring the removal of anything that the order states is a health hazard from the premises or the environs of the premises specified in the order;

requiring the cleaning or disinfecting, or both, of the premises or the thing specified in the order; and

prohibiting or regulating the use of any premises or thing.

Because the list\textsuperscript{127} is not exhaustive, it is arguable that a term could include ordering decontamination of a person, where the legal test under s. 13(2) is met.

It is far from clear, and arguably doubtful, that this interpretation of the Act is correct. While s. 13(1) states that the medical officer of health may require a person to take or refrain from taking any action that is specified in the order in respect of a health hazard, a review of the types of things authorized reveals that none of the contemplated actions include a power to do something to a person physically, such as deten-

\textsuperscript{127} This is not a complete list of the specified powers in s. 13(4). Subsection 13(4) provides:

An order under this section may include, but is not limited to,

(a) requiring the vacating of premises;

(b) requiring the owner or occupier of premises to close the premises or a specific part of the premises;

(c) requiring the placarding of premises to give notice of an order requiring the closing of the premises;

(d) requiring the doing of work specified in the order in, on or about premises specified in the order;

(e) requiring the removal of anything that the order states is a health hazard from the premises or the environs of the premises specified in the order;

(f) requiring the cleaning or disinfecting, or both, of the premises or the thing specified in the order;

(g) requiring the destruction of the matter or thing specified in the order;

(h) prohibiting or regulating the manufacturing, processing, preparation, storage, handling, display, transportation, sale, offering for sale or distribution of any food or thing;

(i) prohibiting or regulating the use of any premises or thing.
tion, examination and treatment, as is authorized in s. 22 of Part IV. On the contrary, all powers specified in s. 13 relate to directions to do something or refrain from doing something to a premises. While one might argue that the powers in s. 13(4) are not exhaustive, the fact that the statute does not specifically prohibit something does not mean that it is permitted. Part III, read as a whole, does not suggest that any of the powers are intended to authorize any physical action taken against a person.

As noted later in the chapter titled “A Stronger Health Protection and Promotion Act,” the decontamination of a person gives rise to a number of issues including their right to refuse, and the process by which a person may be decontaminated against their will. Unlike the powers in s. 35, contained in Part IV, there is nothing in Part III that establishes a process by which a person who refuses to abide by an order of the medical officer of health may be legally forced to do so. It would appear that s. 102(1), which allows a Superior Court judge to restrain a contravention of an order made under the Act, would be the avenue of enforcement. Contrasting the powers in s. 35 with those contained in s. 102(1) suggests that it is very unlikely that s. 102(1) was intended to force someone to comply with a process or procedure ordered against them physically. There is no authority in s. 102(1) to force a person to submit to such a procedure or process; rather it speaks to restraining a contravention. Furthermore, there is no authority to detain a person in s. 13. There is a very strong argument that nothing in s. 13 authorizes the medical officer of health to make an order that involves interference with or direction over a person’s bodily integrity.

There is a stream of legal opinion, exemplified by the Ministry of Health and Long-Term Care opinion set out above, that s. 13 can be used to supply any deficiency in

---

128. Subsection 102(1) provides:

> Despite any other remedy or any penalty, the contravention by any person of an order made under this Act may be restrained by order of a judge of the Superior Court of Justice upon application without notice by the person who made the order or by the Chief Medical Officer of Health or the Minister.

> Proceedings to prohibit continuation or repetition of contravention

> (2) Where any provision of this Act or the regulations is contravened, despite any other remedy or any penalty imposed, the Minister may apply to a judge of the Superior Court of Justice for an order prohibiting the continuation or repetition of the contravention or the carrying on of any activity specified in the order that, in the opinion of the judge, will or will likely result in the continuation or repetition of the contravention by the person committing the contravention, and the judge may make the order and it may be enforced in the same manner as any other order or judgment of the Superior Court of Justice.
other parts of the Act, such as Part IV, Communicable Diseases. Unfortunately, where the authority to act is unclear or not explicitly authorized, this is a section to which public health lawyers must resort, in hopes that the interpretation will stand. It is unacceptable to have important powers, such as the power to issue directives to health care facilities in respect of unsafe infection control practices, or the power to decontaminate individuals, subject to uncertainty and legal wrangling and debate. When these powers are needed it will hamper public health’s ability to respond if debate and legal wrangling ensue and lawyers spend days writing legal opinions trying to prove whether the power exists. The Act must be clear. If the current system of three streams of operational powers contained in Part III, Part IV and Part VII is to be maintained, it must be apparent to anyone using the *Health Protection and Promotion Act* what each Part authorizes and how one Part relates to another.

Finally, in respect of s. 13 of the Act, some individuals and organizations have submitted to the Commission that the definition of “health hazard” needs to be reconsidered and expanded. The precise language needed to define a health hazard is beyond the expertise of the Commission. It is recommended, however, that the Ministry of Health, in consultation with local public health officials, review the current definition with a view to determining if there are situations amounting to health hazards that are not currently captured in the Act.

**Recommendations**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to clarify whether the powers contained in the various parts of the Act apply outside of the Part of the Act in which the power is contained. For example, does s. 13 apply in the case of a communicable disease?

- The Ministry of Health and Long-Term Care consider whether the definition of “health hazard” needs to be updated or expanded.

---

129. For example a number of submissions recommended that “health hazard” be amended to include a person.
Clarify Standards for Intervention

Another aspect of the Act requiring clarification is the apparently haphazard overlapping standards for intervention. The standards for intervention are the legal triggers that allow the medical officer of health to act. They are, however, scattered throughout the Act in a seemingly haphazard and illogical manner:

- for the purpose of preventing, eliminating and decreasing the effects of health hazards in the health unit (s. 10(1));
- necessary in order to decrease the effect of or to eliminate the health hazard (s. 13(2));
- immediate risk of an outbreak of communicable disease (s. 22(2)(a));
- communicable disease presents a risk to the health of persons in the health unit served by the medical officer of health (s. 22(2)(b));
- necessary in order to decrease or eliminate the risk to health presented by the communicable disease (s. 22(2)(c));
- significantly increase the risk to the health of any person (s. 22(5.0.3));
- significant risk to the health of the public (s. 35(11)(b));
- a risk to the health of any persons (s. 86(1));
- likely to have an adverse effect on the health of any person (s. 96(4)(c)(d) and (e)).

The Act has both hard triggers, such as reasonable and probable grounds, and soft triggers, such as simply having the opinion that a risk to the public’s health exists. While these differential triggers may be appropriate, there does not seem to be any logic to their current placement in the Act.

For example, in s. 22 of the Act, the standard of intervention is “opinion, upon reasonable and probable grounds.” This is a high hurdle to meet. In the case of communicable diseases, it is a hard trigger that demands that the medical officer of health, before making an order, meet the criminal or quasi-criminal standard of proof.
required before instituting Criminal Code or Provincial Offences Act proceedings.\textsuperscript{130} This high criminal standard of proof may not exist in the early stages of an infectious disease outbreak or infection control problem. What then is the authority to act where a health risk or hazard is present but does not meet the trigger for intervention in s. 22, either because it is in the early stages and unknown or because it is something that is not a classified communicable disease?\textsuperscript{131}

Again, this standard of intervention may be appropriate for some actions but too high for others. For example, when deciding to close a hospital, one would expect the medical officer of health to be governed by a high standard of intervention; one would expect that this would be a “hard” trigger. On the other hand, an order under s. 22(4)(d), requiring that a place be cleaned or disinfected, need not require a high standard of invention and therefore should be a “soft” trigger.

It is time to take a hard look at this disparate collection of standards, and to develop some consistency, some scalable set of triggers so there is a clear progression from a low-end risk with low-end interventions to high-end risk with high-end interventions. What is needed is a hard look at the standards and legal triggers for intervention, and an adjustment to ensure that the soft trigger is available where the danger of inaction outweighs the need for objectively provable grounds, but that the hard trigger is maintained for other cases.

\textit{Recommendations}

The Commission therefore recommends that:

\begin{itemize}
\item The Ministry of Health and Long-Term Care review the numerous standards of intervention contained in the Act, examples of which are noted above, with a view to amending the Act to simplify and rationalize the apparently haphazard and overlapping standards for intervention, and to ensure that whether there is a hard trigger or a soft trigger, it should be rationally connected to the power being wielded.
\item Section 22 of the Health Protection and Promotion Act be amended to adjust the standard of intervention to provide that the medical officer of health can
\end{itemize}

\textsuperscript{130} R.S.C. 1985, C-46, s. 504; R.S.O. 1990, c. P-33.
\textsuperscript{131} The same standard applies in s. 13 and the same issue arising through the use of this standard in Part IV, arise in its use in Part III.
take necessary action without the criminal or quasi-criminal standard of objective proof on reasonable and probable grounds.

Strengthen Section 22

In respect of communicable diseases, public health officials derive most of their power from s. 22. They rely on it to give them authority to intervene and take action to protect the public. Because of its importance, Ministry officials must be vigilant in ensuring that the section works and that any weaknesses or legal ambiguities are addressed clearly and swiftly.

For example, some public health officials have expressed concern about the practical difficulties of administering s. 22 of the Act particularly where the subject of the order is something other than an actual person, for instance a homeless shelter. Subsection 22(1) provides that an order may be made against a “person”. Subsection 22(5) provides that an order may be directed to a person:

a) who resides or is present;
b) who owns or is the occupier of any premises;
c) who owns or is in charge of any thing;
d) who is engaged in or administers an enterprise or activity;
in the health unit served by the medical officer of health.

It may be difficult to determine legal ownership or administration in a timely fashion. If the order is directed at an institution and it requires steps that affect many people, it is critical to direct the order to a wider audience than the person who occupies the premises. Ascertaining who is “in charge” may also be difficult and time-consuming. The problem requires examination by the Ministry of Health and Long-Term Care in consultation with the public health legal community.

Another issue raised by those working in the field is the lack of clarity whether a s. 22 order written and served in one health unit applies outside of that health unit. Those with infectious diseases do not always stay in one unit. When they cross boundaries, the unit in which they are found should be entitled to rely on the existing order from the other unit. It is a waste of scarce resources if every unit must produce their own written order each time an infectious person decides to cross health unit boundaries.
Recommendations

The Commission therefore recommends that:

• The Ministry of Health and Long-Term Care, in consultation with the public health community, examine the issue of any practical difficulties of administering s. 22, with a view to make it more effective for those who rely on its powers.

• The Health Protection and Promotion Act be amended to provide that an order made under s. 22, in respect of a person infected with a communicable disease, is valid in any health unit in Ontario.

Conclusion

The above highlights just a few examples of confusion in the Act. The Act must be clear and workable for those who use it to obtain their day to day authority to protect the public’s health. Otherwise, uncertainty and confusion will be the refuge for a noncompliant person or institution. Action that is necessary to protect the public may be delayed as public health officials and lawyers try to determine what they can do and when. If they are bold enough to act in the face of uncertainty, they risk legal challenges to their authority, which may in turn delay their ability to act effectively.

The Health Protection and Promotion Act is a complex statute that has served the people of Ontario well since its inception. That being said, in the aftermath of SARS, it is time for the Ministry of Health and Long-Term Care to review the Act, in consultation with the Attorney General and those who work daily with the Act on the front lines of public health defence.

Recommendations

The Commission therefore recommends that:

• The four present categories of disease: infectious, communicable, reportable, and virulent, be simplified and reduced to two categories with clear boundaries and clear legal consequences.
• The *Health Protection and Promotion Act* be amended to clarify whether the powers contained in the various parts of the Act apply outside of the Part of the Act in which the power is contained. For example, does s. 13 apply in the case of a communicable disease?

• The Ministry of Health and Long-Term Care consider whether the definition of “health hazard” needs to be updated or expanded.

• The Ministry of Health and Long-Term Care review the numerous standards of intervention contained in the Act, examples of which are noted above, with a view to amending the Act to simplify and rationalize the apparently haphazard and overlapping standards for intervention, and to ensure that whether there is a hard trigger or a soft trigger, it should be rationally connected to the power being wielded.

• Section 22 of the *Health Protection and Promotion Act* be amended to adjust the standard of intervention to provide that the medical officer of health can take necessary action without the criminal or quasi-criminal standard of objective proof on reasonable and probable grounds.

• The Ministry of Health and Long-Term Care, in consultation with the public health community, examine the issue of any practical difficulties of administering s. 22, with a view to make it more effective for those who rely on its powers.

• The *Health Protection and Promotion Act* be amended to provide that an order made under s. 22, in respect of a person infected with a communicable disease, is valid in any health unit in Ontario.
4. Stronger Health Protection Powers

The *Health Protection and Promotion Act*, which provides the legal machinery for our defence against infectious disease, needs to be stronger. Public health officials must be able to act quickly and decisively in the face of a public health risk. Quick action can stop an outbreak before it starts. Although emergency powers may be available after an outbreak gets out of control, it is the daily powers in the *Health Protection and Promotion Act*, powers of investigation, mitigation, and risk management, that prevent public health emergencies from developing. These daily powers require strengthening.

SARS demonstrated the importance of three key aspects of infectious disease prevention and management by public health officials: first, access to information about cases and situations in health care institutions and in the community that may pose risks to public health; second, the authority, resources and expertise to investigate such cases and situations to determine any risk to the public’s health; and third, the authority, resources and expertise to intervene and take appropriate action necessary to protect the public’s health. These three key functions have to be supported by adequate resources and legal powers.

The Commission has identified seven fields of public health activity that require additional authority under the *Health Protection and Promotion Act*:

- Authority of public health in relation to infectious diseases in hospitals;
- Authority of public health officials to acquire information necessary for them to protect the public from a health risk;
- Authority of public health officials to investigate health risks to the public;
- Authority and process by which the Chief Medical Officer of Health can establish an adjudication system to review, where appropriate, decisions of local medical officers of health in respect of case classification;
- Authority of the Chief Medical Officer of Health to issue directives to hospitals and other health care institutions;
• Authority as a last resort to detain noncompliant individuals who pose a health risk to the public, subject to an immediate court hearing; and

• Authority as a last resort to enter a private dwelling to execute an order made under the Act or in exigent circumstances to enter without a warrant, followed by a court hearing.

Health protection legislation requires a scaled response, with powers that increase as the risk increases. It is not good enough to act after a public health problem has erupted into the community. The authority is required to manage risk proactively to prevent a potential public health problem from becoming a public health emergency.

Dr. Basrur, in her submission to the Justice Policy Committee considering the issue of emergency legislation, referred to the need to strengthen the power for medical officers of health to deal with day to day risks to public health. She emphasized the need for public health’s response to be ramped up depending on the level of risk, without having to declare a provincial emergency so as to have the legal authority to utilize those powers. She stated:

You might, in the case of the health legislation, have a series of what I call “scalable” powers that are consistent with the day-to-day structure of the regulation of public health, not totally divorced from it, so that when you start with what seems like one case, two cases, four cases, and, “Gee, it’s not just one institution, it’s two institutions, and yes, there were workers who crossed over and we’re not sure where a third one may have worked because we can’t find that person,” you want to be able to scale up but not have to invoke a new statute entirely in a non-provincial-emergency situation. You want to be able to scale up, scale back, scale up in particular geographic areas or on particular functional areas so that you’ve got a sensible response.

Now, it is possible to have that kind of provision built into individual statutes – the Health Protection and Promotion Act, the Nursing Homes Act, the Homes for Special Care Act, the Charitable Institutions Act, all of the rest of them. You might have it in the Ministry of Health and Long-Term Care Act. Not being a lawyer, I’m not going to try to nuance what the differences would be. All I will say is that from a public health standpoint, I need the latitude, and I know the local medical officers of health need the latitude, to say: “These are our authorities. We know what we can do on a daily basis.”
we can ramp up this quickly, but when we hit certain parameters, we’ve got to escalate it to the province, because this really goes beyond our borders; it goes beyond our competence,” or, “It’s multi-jurisdictional, and therefore a comprehensive response needs provincial coordination and control.”

The idea is to have a range of powers available daily to deal with any public health problem short of a provincial emergency. Once the problem rises to a level where emergency machinery and powers and the full resources of government are required, a bright line would be crossed and a provincial emergency would be declared. Once a provincial emergency is declared, the emergency powers kick in and there would be no more question of scalable powers. But the existence of a strong emergency management legislation does not negate the fact that public health officials must have their powers strengthened to allow them to deal with a public health problem short of it becoming an emergency.

To achieve this goal the *Health Protection and Promotion Act* must be strengthened. Medical officers of health must be involved in and aware of infection control issues as soon they arise in health care facilities. The powers and obligations set out in the *Health Protection and Promotion Act* must enable public health officials to become aware of unusual clusters of illness and reportable events both in health care facilities and in the community, they must empower them to direct epidemiological investigations where necessary, and they must authorize them to intervene and act, by making orders to individuals, groups, institutions and health care facilities for the protection of the public. Not all infectious disease outbreaks will require the declaration of a provincial emergency or resort to the broader emergency legislation. If the daily authority in the *Health Protection and Promotion Act* is strong enough, emergencies will be more preventable and the use of emergency powers will very seldom be necessary.

**The Relationship Between Public Health and Hospitals**

Faced with the risk of infectious disease outbreak, public health and hospitals need to work quickly and need to work together. There is no time for turf wars, procedural wrangling, jurisdictional disputes, or fine legal arguments. Deadly viruses do not stand still while hospitals and public health officials sort out their differences.

---

As noted in the Commission’s first interim report, the sudden onslaught of SARS forced public health and hospitals to work together in a way and scale never previously encountered or even contemplated. This was no problem in some parts of the province because the local health unit and the local hospitals had good working relationships, including an active public health presence on hospital infection control committees. For other parts of the province, however, the opposite was true. It proved difficult in some cases for public health and hospitals to work together in a new and unfamiliar relationship driven by a crisis for which no one had planned. This uneasy and unplanned relationship detracted in some cases from the mutual fight against SARS.

A critical issue during SARS and now is the management of infection control concerns or outbreaks or potential outbreaks of infectious diseases in health care institutions and the role of public health. There are two distinct issues: first the role of public health when there is an infection control problem that poses a risk to the community, and second the role of public health in infection control programmes and standards in general. More will be said about the latter issue in the final report together with the story of what happened during SARS.

This report will focus in a preliminary way on the structures and relationships required between public health and hospitals to prevent, detect, investigate and manage infectious outbreaks in hospitals.

The Commission received many submissions on the relationship between public health and hospitals in respect of the prevention and management of infectious diseases within health care facilities. One common theme throughout the submissions, received from both the public health and health care communities, is the need for greater clarity in their respective roles and relationships in respect of infection control. Both sides want clarity. Both want to work together more effectively. Both sides realize that the working relationship, whatever it may become, must above all be transparent with clear role definitions and clear lines of authority and accountability.

As noted in the Commission’s first interim report, public health authorities, at least in theory, have some role in hospital infection control. The Mandatory Guidelines under the Health Protection and Promotion Act provides as follows:

The Board of Health shall ensure appropriate input to hospital infection control programs in the health unit. This shall include as a minimum:
a. representation of the Medical Officer of Health or designate on each hospital infection control committee;

b. reporting of designated communicable diseases from hospitals, including emergency rooms and out-patient clinics, to the Medical Officer of Health as required under the provisions of the *Health Protection and Promotion Act*;

c. consultation with the hospital infection control committee on the development and revision of infection control policies and procedures and an outbreak contingency plan;

d. providing advice when requested or when needed for the appropriate management of communicable diseases and infection control;

e. providing epidemiological information as needed regarding communicable diseases existing within the community and other institutions; and

f. collaboration or assistance in annual in-service education for hospital staff about communicable diseases.

The Guidelines provide for communication, advice and consultation between public health and hospitals in respect of infection control. But they give public health no authority and they require from hospitals no accountability. These Guidelines have not always been followed. Nor have they typically been enforced. Some hospitals had a minimal, if any, relationship with public health authorities around infection control. In those cases where some relationship existed, the relationship was sometimes poorly defined and poorly understood. As noted in the Commission’s first interim report there is great confusion and uncertainty around the respective roles, responsibilities, authority and accountability of public health and hospitals in infection control and infectious outbreaks in hospitals.

The present uncertainty makes it obvious that legislation is required to clarify these roles and responsibilities. But the most exquisite legislation will not solve the problem without an underlying framework of cooperation and an underlying attitude of respect between hospitals and public health authorities. While there will always be room for disagreement, it is essential to foster an atmosphere of mutual respect around the respective authority and accountability of hospitals and public health in respect of infection control. Some think this will be achieved if hospitals have clear
primary responsibility for managing outbreaks within an institution, subject to a
greater role for public health in surveillance, investigation and, as a last resort, inter-
vention.

As one submission to the Commission suggested:

Authority for managing outbreaks of infection should be vested within the infection control officer of the hospital with the requirement that all outbreaks are reported immediately to the medical officer of health. The medical officer of health and the infection control officer of the hospital must work collaboratively to control infections in their respective juris-
dictions and keep each other informed of infectious disease outbreaks.

While the goal of any professional relationship should be collaboration and coopera-
tion, clear lines of authority are also required. The public interest requires that a health care facility’s management of infection control problems, infectious disease outbreaks, or other public health risks be subject to investigation and, if necessary, intervention, by public health authorities. The medical officer of health and the Chief Medical Officer of Health require the authority and the resources to intervene whenever there is a risk to the public health, no matter where that risk is situated. The fact that a hospital may have an infection control programme does not negate the need for public health officials to intervene when an infection control problem or an outbreak present public risk. The ease with which a hospital based infection can spread to the community makes it essential that public health officials have the power to investi-
gate, and if necessary, to require a hospital to take positive steps to prevent the spread of infection within the hospital and from the hospital to the community. As one submission received by the Commission observed:

The Health Protection and Promotion Act should include more appropriate accountability mechanisms to ensure public health exercises control over all health care facilities, including hospitals, to ensure better oversight of infection control procedures.

Public health officials and experts can monitor a potential problem and act on it in time only if they know about it. Unless they are informed in its early stages, later investigation and intervention may come too late. It is too late to involve public health officials after a case is absolutely confirmed or an outbreak has clearly developed. The specific powers to enable public health officials to intervene and act to protect the public’s health from infectious diseases are discussed below.
As a starting point it must be clear in the *Health Protection and Promotion Act* that public health has a role to play in infection control, whether in a hospital, a long-term care facility or a private clinic. The medical officer of health must have a legal duty, entrenched in the Act, to monitor, investigate and intervene where necessary in cases of infectious diseases, or where inadequate infection control standards or procedures pose a threat to public health. A curious gap in the Act is a positive duty to inspect and monitor community health hazards under s. 10 and environmental and occupational health hazards under s. 12, yet no concurrent duty to do the same in the case of communicable diseases. Part of the resistance to public health intervention may be addressed if it were made clear that this is their job and that they are legally required to be involved. The entrenching of these duties as a statutory requirement would also make it more difficult for municipalities to cut spending in the area of infectious disease prevention and management. Supported by the statutory duty, the local medical officers of health could point out that they are legally required to perform these functions.

The first step to strengthening the relationship between public health and hospitals is to reinforce the requirement that public health have a presence in the infection control committees of all hospitals in the province. To this end, the Commission recommends amending the *Health Protection and Promotion Act* to provide that each hospital infection control committee must have as a member the medical officer of health or his or her designate. While this simply puts into the Act what already exists in the Guidelines, it gives it the force of law, with a view to ensuring that it is a duty that cannot be overlooked or under-resourced.

It is further recommended that the Act be amended to impose a positive duty on public health officials to monitor, investigate, provide advice and intervene where necessary in the case of communicable diseases. The present language of the Mandatory Guidelines, which implies that the role of public health is optional, as if they are guests to be heard in hospitals only when invited, is unacceptable. Public health has a role in institutional infection control whenever there is a potential danger to the public’s health.

**Recommendations**

The Commission therefore recommends that:

- The role and authority of public health officials in relation to hospitals be clearly defined in the *Health Protection and Promotion Act* in accordance with the following principles:
The requirement that each public health unit have a presence in hospital infection control committees should be entrenched in the Act; and

The authority of the local medical officers of health and the Chief Medical Officer of Health in relation to institutional infectious disease surveillance and control should be enacted to include, without being limited to, the power to monitor, advise, investigate, require investigation by the hospital or an independent investigator, and intervene where necessary.

Information

As noted earlier in this report, the ability of public health officials to intervene in the case of a health risk is dependent on them being informed. This can only be done where public health officials have access to current information about the existence or suspected existence of an infectious disease within a hospital or any other health care institution or facility. As one public health lawyer commented:

We're really, quite frankly, waiting for the hospitals and practitioners to do the right thing and contact the local health unit if there’s something that’s getting out of hand. I think experience in the last two years has shown that that’s not always satisfactory. If you give the medical officer of health a power to require compliance when an institution is engaging or stepping up its infection control procedures, then I think that you get over the hurdle of the hospital’s lawyers saying, wait a second, you don't have any obligation to report this, let’s just keep this in-house.

The reporting of infectious diseases information is dealt with in the following chapter of this report. It is critical that public health be informed of cases in hospitals and other health care settings immediately, so it can take steps to protect the public. Amending the specific sections of the Act to clarify and expand existing reporting obligations is only one part of the solution, however. Many public health professionals have suggested that it is not enough to simply be advised when there is a confirmed case of a reportable or communicable disease in a health care institution. By the time that determination is made the disease may have already spread to numerous people.

The *Health Protection and Promotion Act* does not deal with public health risks that fall outside the limited definitions within the statute. The local medical officer of health
has the power to act in the face of a “health hazard” as defined in the Act\textsuperscript{133} or in relation to diseases that are defined as “communicable” under the Act. But public health risks may well arise that do not meet the limited definitions of “health hazard” but are not identified as a “communicable disease” under the Act.

There are two parts to this problem: first the ability of doctors and other health care professionals to inform public health voluntarily of any public health risk; second the ability of public health officials to compel the disclosure of information that does not fall within the categories requiring reporting under the \textit{Health Protection and Promotion Act}. The latter problem, enabling public health officials to compel the disclosure of information outside of that clearly set out in the Act, will be dealt with in the following chapter on reporting.

The solution does not lie in amending the regulations each time a new illness or health hazard presents itself. Consider the example of SARS. Had a hospital in Ontario been confronted with one or more SARS cases before the mysterious new disease was identified, given a name, and classified as communicable, and taken the position that they would deal with the matter internally and not alert public health officials, there would have been no legal requirement for them to report details about the case or cases prior to March 25, 2003.\textsuperscript{134}

It is essential that public health be aware of and be able to monitor, investigate and where necessary direct that action be taken in relation to health risks that do not meet the limited categories currently set out in the \textit{Health Protection and Promotion Act}. Physicians who diagnose and treat patients must be able to report to public health a case of illness or an infection control issue, which may, if not addressed, represent a public risk. The principle is clear. The difficulty is to define the trigger for such an unspecified situation.

\textsuperscript{133} “Health hazard” means, (a) a condition of a premises, (b) a substance, thing, plant or animal other than man, or (c) a solid, liquid, gas or combination of any of them. See s. 1(1) of the \textit{Health Protection and Promotion Act}.

\textsuperscript{134} On March 25, 2003, amendments to Ont. Reg. 559/91 and Ont. Reg. 558/91 were filed as well as Ont. Reg. 95/103. The filing of these regulations designated SARS as a communicable, reportable and virulent disease. The regulations came into effect on March 25, 2003, the date they were filed but for purposes of enforcement did not come into effect until April 12, 2003, the date the regulations were printed in the \textit{Ontario Gazette} unless actual notice of the regulation was given. For example, Toronto Public Health attached a copy of the regulations to orders served before April 12, 2003 to ensure notice was given. See ss. 3 and 5(3) of the \textit{Regulations Act}, R.S.O. 1990, c. R-21.

\textsuperscript{135} R.S.Q. S-2.2.
A possible model for reporting public health risks generally can be found in Quebec’s Public Health Act. Under this Act, physicians and institutions have positive obligations to report certain specified diseases (as designated by the Minister) but also must report to the public health director, situations where the health of the population is threatened. Section 93 of the Act provides:

93. Any physician who suspects the presence of a threat to the health of the population must notify the appropriate public health director.

Possible Threat

Health and social services institutions must report to the appropriate public health director any situation where they believe on reasonable grounds that there exists a threat to the health of the persons who are present in their facilities.

Under the Quebec Act, “health threat” is defined in s. 2, as follows:

A threat to the health of the population means the presence within the population of a biological, chemical or physical agent that may cause an epidemic if it is not controlled.

As attractive as this broad and expansive language is, it imposes a reporting duty which is vague and unspecified. As one public health official noted, it is one thing to allow a physician the discretion to report in such an unspecific event, but it is another to hold them potentially professionally liable or punishable under the Act for failure to report in that same situation:

. . . it makes sense that a physician has the capacity to do it without reprimand but if they don’t are they sued or liable, that would be very discouraging though . . . if the physician, he or she feels that there is some

---

136. Under s. 371 of the Health and Social Services Act, each region must appoint a public health director. The position of “public health director” is similar to the position of medical officer of health under the Ontario regime.

137. It is important to note that these reporting obligations have certain limitations. They do not include a requirement to report sexually transmitted diseases or to disclose personal or confidential health information unless the public health authority requires such information to exercise their powers under part XI of the Act, which sets out the powers public health may exercise in the event of a threat to the health of a population.
concern, they could do so and not then be protected from reprimand on that, but at the same time, well were you not aware of something and how come you did not so therefore you are charged. It is very difficult. Right now we are working on seeking a voluntary mechanism to ask them to report proactively rather than saying well I better check with the CMPA [Canadian Medical Protective Association] and every legal obligation and cover all my P’s and Q’s before I report, it would be too late.

Another suggestion is to amend the Act to require the reporting of an unusual cluster of unexplained illness, or to establish some threshold criteria to capture an unusual and potentially dangerous event that has not yet been determined to be a reportable disease. As one public health lawyer told the Commission:

... to change the wording of the regulation to broaden it, say that more things get reported to public health units and that when public health asks for it, then the hospitals are required to provide it. And that, I think, covers up some of the gaps. But it doesn't get at this initial problem that public health units are all, I think, saying when something, whatever that something is, is going on, we want you to report it. I think going to try and come up with some of those triggers, like sitting down with public health and saying, okay guys, sit down, what are the words that we can use, and we just didn't have time to do that. But they've got the triggers in s. 38 for the reportable events for the immunization. They've got triggers there for that kind of situation. I think we should come up with our own triggers, like the immunization situation, where it is an infection control situation, and here are the triggers that allow us to get the information that we need. And I think it will take some time, but I think we can do it.

Unlike the Quebec example, this reporting obligation would presumably be imposed on both physicians and health care institutions. This expansion of the duty makes sense, since what might seem like a single case of illness to one doctor may be a cluster of cases to the person in charge of infection control or the hospital administration who is aware of a number of similar cases of illness.

However, the language suggested above remains problematic in that, while it is somewhat more precise than “public health risk,” it is still difficult to define. For example, what is a cluster? What is the meaning of “unusual” or “adverse”, what is the meaning of a “dangerous event”? And with a penalty on one side for nondisclosure and the fear of penalty on the other side for violating privacy legislation, the reporting party is left to navigate these imprecise terms without concrete guidance.
The reality is that reporting in these instances will only work if there is cooperation from those on the front lines, those in infection control programmes in health care institutions, and health care administrators and leaders. A physician or hospital who does not want to report will find refuge in the vagueness of the terminology. It is only where there is a desire to report, combined with certainty in the legal authority to disclose the personal health information, that the problem of alerting public health of health risks, actual or potential, will be addressed.

The first requirement, creating a desire to report, will come only if there is a strong relationship between public health and those with reporting obligations. As noted above, public health must have a presence within all aspects of the health care system, from family clinics to hospitals, to nursing homes and long-term care facilities. There must be a mutual relationship of respect and understanding of the important roles each side occupy. This can only be achieved if public health and hospitals each have the time, resources and manpower to establish and maintain these relationships.

If the physician or the health care institution can be convinced of the importance of reporting anything that may pose a public health risk, regardless of whether it is defined as a reportable disease or whether it neatly meets the definition of health hazard, they must be able to do so without any question regarding their legal ability to do so and without fear of violating privacy legislation.\textsuperscript{138} That being the case, it is important to add to the \textit{Health Protection and Promotion Act} a broad and expansive reporting power for health care practitioners and institutions. One public health expert succinctly described the value of such a provision:

\begin{quotation}
\ldots one of the things was that physicians out in the field [during SARS] felt disenfranchised with the [reporting] process. If a doctor felt there was something that needs to be reported, they would like to be able to pick up the phone on an informal basis, to call and report. If for that they were reprimanded, lost hospital privileges or whatever, they could seek protection and say, well by law I could and I had grounds to do so.
\end{quotation}

\textsuperscript{138} More will be said about the potential impact of privacy legislation on report in Chapter 7, Privacy and Disclosure.
**Recommendations**

The Commission therefore recommends that:

- The Ministry of Health and Long-Term Care, in consultation with the Provincial Infectious Diseases Advisory Committee, and the wider health care and public health communities, define a broad reporting trigger that would require reporting to public health where there is an infection control problem or an unexplained illness or cluster of illness.

- Whether or not a workable trigger can be defined for compulsory reporting, a provision be added to the *Health Protection and Promotion Act*, to provide that a physician, infection control practitioner or hospital administrator may voluntarily report to public health officials the presence of any threat to the health of the population.

**Investigation**

Once armed with information, public health officials require sufficient authority to investigate the problem that has arisen in a health care facility or institution, whether it has been reported formally or has come to their attention through some other means. It goes without saying that hospitals and other health care institutions will try to deal with problems in the way they think best. The problem is that what is best for a hospital is not necessarily best for the public interest in protecting the health of the wider community. A mechanism is required to ensure that the public interest is protected in any case where the hospital’s approach to an infection control problem or a potential infection outbreak may not adequately protect the public interest.

Take, for example, a cluster of unexplained illness within a hospital, of which public health becomes aware. What powers does public health have to require the hospital to conduct an epidemiological investigation or to conduct surveillance on staff and other patients? Under Part IV, Communicable Diseases, s. 22 empowers a medical officer of health to make orders related to communicable diseases. However, to make such an

---

139. Section 22 provides:

Order by M.O.H. re: communicable disease
order, the medical officer of health must, on reasonable and probable grounds, believe:

- that a communicable disease exists or may exist or that there is an immediate risk of an outbreak of a communicable disease in the health unit served by the medical officer of health;

(1) A medical officer of health, in the circumstances specified in s. (2), may give directions in accordance with s. (3) to the persons whose services are engaged by or to agents of the board of health of the health unit served by the medical officer of health.

Subsection 24(2) provides:

When M.O.H. may give directions

(2) A medical officer of health may give directions in accordance with subsection (3) where the medical officer of health is of the opinion, upon reasonable and probable grounds, that a communicable disease exists in the health unit and the person to whom an order is or would be directed under section 22,

(a) has refused to or is not complying with the order;

(b) is not likely to comply with the order promptly;

(c) cannot be readily identified or located and as a result the order would not be carried out promptly; or

(d) requests the assistance of the medical officer of health in eliminating or decreasing the risk to health presented by the communicable disease.

Contents of Directions

(3) Under this section, a medical officer of health may direct the persons whose services are engaged by or who are the agents of the board of health of the health unit served by the medical officer of health to take such action as is specified in the directions in respect of eliminating or decreasing the risk to health presented by the communicable disease.

Idem

(4) Directions under this section may include, but are not limited to,

(a) authorizing and requiring the placarding of premises specified in the directions to give notice of the existence of a communicable disease or of an order made under this Act, or both;

(b) requiring the cleaning or disinfecting, or both, of any thing or any premises specified in the directions;

(c) requiring the destruction of any thing specified in the directions.
• that the communicable disease presents a risk to the health of persons in the health unit served by the medical officer of health; and

• that the requirements specified in the order are necessary in order to decrease or eliminate the risk to health presented by the communicable disease.\textsuperscript{140}

The powers in s. 22 can be exercised only on a high standard of proof, the criminal standard of reasonable and probable grounds. In the above fact scenario, the medical officer of health may not yet have sufficient knowledge to form an opinion on reasonable and probable grounds. Moreover, the disease may be too new or too little understood to be listed by regulation as a communicable disease and may therefore be outside the scope of this section of the \textit{Health Protection and Promotion Act}. The new disease might not even have a name, as was the case in the early days of SARS.

The powers in s. 22 do not give public health the necessary power to become involved with a hospital disease outbreak at the earliest stage, the crucial stage where there may still be time to stop its spread.

This is not to suggest that hospitals or other health care institutions would necessarily alert public health in the future should an unidentified disease enter its facility. In many jurisdictions public health has an ongoing relationship with the health care providers in their jurisdiction and there is a vital exchange of information that occurs on a continuous basis. But that is not the case with all institutions and with all public health units. And there is always the risk that fear of bad publicity, concern over panicking patients and visitors, or fear of civil litigation might cause a health care institution to report a risk to the public later rather than sooner. Or, they might attempt to handle the matter internally without involving public health officials. Add to this the fact that individuals and institutions now have to consider their potential legal liability and question the legal authority before they disclose personal health information to public health officials. Absent a clear legal authority to do so, many health care providers will likely have concerns about providing personal health information to public health and may opt to err on the side of nondisclosure rather than risk violating privacy laws. Public health must have the power to enter and investigate where there is a risk to the public, not just in those cases where the disease is communicable or where, in the hospital’s own opinion, it determines it is necessary. The power must be set out in explicit statutory language to ensure that health care

\begin{footnotesize}

\textsuperscript{140} See s. 22(2).

\end{footnotesize}
providers can be confident of their ability to cooperate in an investigation and to ensure that public health officials have the clear authority to compel cooperation from a dubious or reluctant institution.

An example of the type of power that is needed can be found in Part XI of Quebec’s Public Health Act. Under that part, public health authorities have a number of powers to enable them to respond to a threat to the health of the population. Among those powers is the power to conduct an epidemiological investigation. Section 96 provides:

96. A public health director may conduct an epidemiological investigation in any situation where the public health director believes on reasonable grounds that the health of the population is or could be threatened and, in particular,

1) where the director receives a report of an unusual clinical manifestation following a vaccination under section 69;

2) where the director receives a report of an intoxication, infection or disease to which Chapter VIII applies;

3) where the director receives a notice under Chapter IX to the effect that a person is refusing, omitting or neglecting to be examined or treated or to comply with compulsory prophylactic measures;

4) where the director receives a report under Chapter X.

The relationship under this Quebec regime between public health and hospitals is two-way. Where an investigation reveals that a health threat had origins in a health care institution, or in a deficient practice, public health must notify the director of professional services or the executive director. The section also requires that the

141. Section 99 provides:

Health threat in health facility

A public health director who becomes aware during an epidemiological investigation that a threat to the health of the population appears to have its origin in a facility maintained by a health or social services institution or in a deficient practice within such an institution must notify the director of professional services or, if there is no such director, the executive director.
institutions must take all measures required as soon as possible to inspect its facilities and review its practices and, if necessary, correct the situation. The measures taken must be communicated without delay to public health authorities.

Section 100 of Quebec’s Public Health Act sets out the powers of the public health investigator and s. 106 sets out the powers of the public health director where, following the investigation, a “threat to the health of the population” is found to

142. Section 100 provides:

Powers of public health investigator

Subject to s. 98, a public health director may, where required within the scope of an epidemiological investigation,

1) require that every substance, plant, animal or other thing in a person’s possession be presented for examination;

2) require that a thing in a person’s possession be dismantled or that any container under lock and key be opened;

3) carry out or cause to be carried out any excavation necessary in any premises;

4) have access to any premises and inspect them at any reasonable time;

5) take or require a person to take samples of air or of any substance, plant, animal or other thing;

6) require that samples in a person’s possession be transmitted for analysis to the Institut national de santé publique du Québec or to another laboratory;

7) require any director of a laboratory or of a private or public medical biology department to transmit any sample or culture the public health director considers necessary for the purposes of an investigation to the Institut national de santé publique du Québec or to another laboratory;

8) order any person, any government department or any body to immediately communicate to the public health director or give the public health director immediate access to any document or any information in their possession, even if the information is personal information or the document or information is confidential;

9) require a person to submit to a medical examination or to furnish a blood sample or a sample of any other bodily substance, if the public health director believes on reasonable grounds that the person is infected with a communicable biological agent.
exist.\(^{143}\) Section 104 makes it clear that cooperation must be given to the public health director to enable him or her to conduct an epidemiological investigation:

104. Every owner or possessor of a thing or occupant of premises must, at the request of a public health director, provide all reasonable assistance and furnish all information necessary to enable the director to conduct an epidemiological investigation.

---

143. Section 106 provides:

\textbf{Powers of public health director}

Where, during an investigation, a public health director is of the opinion that there exists a real threat to the health of the population, the director may

1) order the closing of premises or give access thereto only to certain persons or subject to certain conditions, and cause a notice to be posted to that effect;

2) order the evacuation of a building;

3) order the disinfection, decontamination or cleaning of premises or of certain things and give clear instructions to that effect;

4) order the destruction of an animal, plant or other thing in the manner the director indicates, or order that certain animals or plants be treated;

5) order the cessation of an activity or the taking of special security measures if the activity presents a threat for the health of the population;

6) order a person to refrain from being present for the time indicated by the public health director in an educational institution, work environment or other place of assembly if the person has not been immunized against a contagious disease an outbreak of which has been detected in that place;

7) order the isolation of a person, for a period not exceeding 72 hours indicated by the public health director, if the person refuses to receive the treatment necessary to prevent contagion or if isolation is the only means to prevent the communication of a biological agent medically recognized as capable of seriously endangering the health of the population;

8) order a person to comply with specific directives to prevent contagion or contamination;

9) order any other measure the public health director considers necessary to prevent a threat to the health of the population from worsening or to decrease the effects of or eliminate such a threat.
The Quebec legislation allows for a scaled response: inform, investigate and then act if required. A similar model of response is required for Ontario.\footnote{144}

Some question whether our public health system has the capacity to enter and provide infection control direction to health care institutions, particularly well-known teaching hospitals with renowned staff experts in infection control. One public health official questioned whether public health has the necessary technical expertise:

I’m concerned, if we’re given the statutory authority to demand actions on the part of hospitals where we consider that there’s an issue, a problem, a substandard approach to an infection control issue, whether we have at this point in time the full skill set related to infection control, especially with the myriad of complexities in some of our larger acute care institutions … To give us the authority to demand action without the skill and resource base to do that may be a recipe for credibility issues, for a less fulsome success as could be the case. And I’m wondering if there isn’t a parallel but separate mechanism like the Provincial Infectious Diseases Advisory Committee to increasingly establish what are the standards of practice, the expectations, the evidence based practice dimensions of an increasingly comprehensive approach to infection control; and then the resources, the human resources, the skills, the protocols the audits, monitoring capabilities and then the sanctions, the requirements to comply with these increasingly comprehensive and specific infection control standards of practice. This puts less of the onus on us. I’m impressed and humbled by the complexity of that terrain [infection control] and in

\footnotetext{144. The Commission is recommending that powers similar to those found in Quebec’s Public Health Act be added to the Health Protection and Promotion Act. There are, however, portions of the Public Health Act that the Commission would not support. For example, s. 107 provides:

107. Notwithstanding the provisions of s. 106, a public health director may not use a power provided for in that section to prevent a threat to the health of the population from worsening or to decrease the effects of or eliminate such a threat if a government department, a local municipality or a body has the same power and is able to exercise it.

It is difficult to understand the rationale behind this section. The Chief Medical Officer of Health, with her political independence and obligation to speak and act on behalf of the health of the public of Ontario, and local medical officers of health who have similar obligations, are best positioned to determine when and where to act. The fact that another politician or official may have similar powers should not detract from the power available to public health officials.}
my training, most if not all of our training, we just don’t get the exposure to a sufficient level of detail nor the opportunity and the resources to maintain a currency with development in the evidence related to infection control that we would need to be truly credible and competent directors, requirers of action if we feel that something is not up to snuff.

This is a legitimate point. Public health must invest in the scientific and professional capacity necessary both locally and provincially to provide meaningful expertise and advice to health care facilities and institutions. For long-term issues, protocols, policies and directives, the province has a tremendous resource in the Provincial Infection Diseases Advisory Committee (PIDAC),145 with its multi-disciplinary approach and

145. PIDAC’s Main Committee consists of the following members:

Co-Chairs

Dr. David Williams  Medical Officer of Health – Thunder Bay District Health Unit
Dr. Dick Zoutman  Director of the Joint Infection Control Service
Chief of the Joint Microbiology Services
Attending Physician, Infectious Diseases Service
Kingston General, Hotel Dieu, and St. Mary’s of the Lake Hospitals
and the South Eastern Ontario Health Sciences Center

Members

Anne Bialachowski  Infection Control Practitioner
Hamilton Health Services Centre, Hamilton General Hospital

Dr. Maureen Cividino  Occupational Health Physician
St. Joseph’s Hospital, Hamilton

Dr. Gary Garber  Head of Infectious Diseases
Ottawa Hospital

Dr. Ian Gemmill  Medical Officer of Health
Kingston, Frontenac and Lennox and Addington Health Unit

Dr. Colin Lee  Associate Medical Officer of Public Health
Simcoe County District Health Unit
Staff Emergency Physician, Royal Victoria Hospital of Barrie

Dr. Anne Matlow  Director, Infection Prevention and Control
The Hospital for Sick Children, Toronto

173
4. Stronger Health Protection Powers

Dr. Chris O’Callaghan Project Coordinator, NCIC Clinical Trials Group
Assistant Professor, Queen’s University

Dr. Mary Vearncombe Medical Director, Infection Prevention and Control
Sunnybrook and Women’s College Health Sciences Centre

Ex Officio

Dianne Alexander Manager, Policy Planning and Coordination
Community Health and Acute Services Divisions
Ministry of Health and Long-Term Care

Dr. Karim Kurji Associate Chief Medical Officer of Health
Ministry of Health and Long-Term Care

Dr. Frances Jamieson Medical Microbiologist
Clinical and Environmental Microbiology Department
Ministry of Health and Long-Term Care

Dr. Sandy Nuttall Manager (A) Hospital Policy and Funding Unit
Hospitals Branch, Ministry of Health and Long-Term Care

Allison J. Stuart Director, Emergency Management Unit
Ministry of Health and Long-Term Care

Terms of Reference – PIDAC

Mandate

The Provincial Infectious Diseases Advisory Committee (PIDAC) advises Ontario’s Chief Medical Officer of Health with respect to the prevention, surveillance and control measures necessary to protect the people of Ontario from infectious diseases. PIDAC provides expert advice relevant to both ongoing and emerging infectious disease issues.

Activities

Activities of PIDAC include the following:

• Reviewing and recommending the revision of provincial standards and guidelines for infection control, including but not limited to comprehensive infection control programs, human resource requirements, infection control training and education, and specific infection control protocols and procedures.

• Preparing advisory statements and bulletins for health care providers, to address new infection control developments or infectious disease issues of provincial significance, as they arise.

• Collaborating with appropriate academic, research and professional bodies in the development of such things as core indicators, audit tools, model infection control protocols or
wide spectrum of expertise, to play the role of advisor and expert. But no advisory committee can supply the operational resources required to respond to immediate problems in the field that require speedy investigation and intervention. As another public health official noted:

- Reviewing and advising upon:
  - specific areas of infectious disease control, including surveillance;
  - infection control and infectious disease research priorities;
  - educational programmes about infectious diseases for both health professionals and the public;
  - proposed changes to existing provincial legislation and regulations related to infectious diseases;
  - infectious disease protocols and guidelines;
  - immunization issues;
  - emergency preparedness issues, including emergency response protocols or contingency plans, as the need arises.

- Advising upon relevant infection control and infectious disease policy, at the request of the Chief Medical Officer of Health.

- Reviewing regularly the regulations under the Health Protection and Promotion Act which designate Communicable, Virulent and Reportable Diseases.

- Reviewing regularly communicable disease surveillance protocols published jointly by the Ontario Hospital Association and the Ontario Medical Association, pursuant to subsection 4(2) of Regulation 965 under the Public Hospitals Act.

Membership

Membership of PIDAC includes individuals chosen for their expertise in the areas of epidemiology, public health, infection control, medical microbiology, adult infectious disease, paediatric infectious disease, occupational health and safety, zoonotic disease and primary care, as well as Ministry of Health and Long-Term Care representatives (ex officio).

Members are appointed to PIDAC in writing for a three-year term by the Chief Medical Officer of Health. Sitting members may be reappointed for additional terms of three years each. After ceasing to be a PIDAC member, an individual may serve as a member of a subcommittee or on a working group as requested.
... certainly within public health there is a level of expertise and we may not know all the ins and outs of infection control within the [different hospital] units, but we know if there’s a problem. We can then ensure the protection of the patients that are also entering [a hospital] who will then subsequently be discharged in 48 hours out back into the community.

Another health expert, asked how to deal with major teaching hospitals whose level of infectious disease expertise may surpass that of public health, said:

My response to that would be work towards the majority. We have five or six major centres in this province where they probably have an infection control person who is world renowned and knows a hell of a lot more than just about any other person. But we also have, if you want to include all the long-term care facilities that these guys have to deal with, hundreds of facilities out there, most of which have someone who has got sixteen hours out of grad school under their belt and they have been thrown into an infection control management position and quite honestly if the academic centres want to complain about having a two or three years out of grad school person come in and point fingers, let them complain. They might not be happy to hear me say that but you have to work towards what is out there and the majority of the situations are really poor or lacking or needing direction in the kind of programmes going on and I think we need to look at the larger population needs as opposed to the academic science centres.

SARS demonstrated that hospitals and other health care facilities are not isolated institutions operating on their own. Events that occur in one hospital may have implications for the broader public health. In those cases, public health must have the knowledge and power to monitor and, where necessary, intervene to ensure that the protection of the public is paramount.

**Recommendation**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to include powers similar to those set out in Quebec’s *Public Health Act*, to allow for early intervention and investigation of situations, not limited to reportable or communicable diseases, that may pose a threat to the health of the public.
Case Classification

During SARS, the classification of cases as suspect or probable was the responsibility of local medical officers of health. Since SARS was a reportable disease under the *Health Protection and Promotion Act*, physicians and hospitals were legally required to report new cases to the local medical officer of health. The local medical officer of health, in turn, had a corresponding duty under the Act to report new cases to the province, as either a probable or suspect case of SARS. This was a heavy burden because of the impact of a mistake. Missing a case could lead to further spread of the disease. A false-positive diagnosis, on the other hand, could unnecessarily close hospitals, schools, public buildings and other workplaces and quarantine large numbers of people. It could also have consequences on the world stage where the World Health Organization was closely monitoring the situation in Ontario.

Because SARS was such a difficult disease to diagnose, because there were no reliable lab tests, and because knowledge about the disease was rapidly evolving on a daily basis, there were disagreements from time to time between the reporting institution and public health officials as to whether a particular case was a case of SARS. It was critical that each SARS case be recognized and reported. It was equally vital that every non-SARS respiratory infection not be classified as SARS simply as a precaution.

In May 2003, a central “adjudication” system under the apparent authority of the Chief Medical Officer of Health sprang up in an attempt to resolve disputes over classification of cases. The Commission described the adjudication system and the concerns surrounding it, in the Commission’s first interim report, under the heading “Lack of Transparency:”

There clearly was a need to ensure accuracy and consistency of classification and reporting of cases. Having regard for the challenges of making a correct diagnosis, it made sense to set up a case review system to assist local medical officers of health by giving them access to SARS experts. Although well meaning, the adjudication system lacked clear lines of accountability and in particular it lacked transparency.

---

146. Pursuant to s. 25(1) and 27(1) of the *Health Protection and Promotion Act*.  
147. Pursuant to s. 31(1) of the *Health Protection and Promotion Act*.  

177
First, the adjudication system appeared to supplant the decision-making of the local medical officers of health. There was no explanation why, well over a month into the outbreak, the adjudication process was suddenly imposed.

Second, the adjudication system was not clearly defined or explained. A May 2\textsuperscript{nd} memorandum from Dr. D'Cunha, the Chief Medical Officer of Health, to all medical officers of health and associate medical officers of health simply stated:

Effective immediately, all new, potential “probable cases” of SARS require adjudication by the POC.

If a potential probable case is identified in your jurisdiction or circumstances would indicate reclassification of an existing suspect case to a probable case, you are to contact [name and number of contact person] to make arrangements for a chart review.

Please be prepared to forward by courier the copies of all relevant information, including clinical information and copy/s of x-ray/s to the infectious disease consultant on call that day.

Thank you for your cooperation.

It was unclear in the memo how the adjudicators were chosen, or why they were best qualified to make decisions. While the name and telephone number of a contact person were provided in the memo, many medical officers of health did not know the person and were unfamiliar with their qualifications, position, role, and authority. Moreover, they did not know who would receive any confidential personal health information about a possible SARS case, where this information would go, how many people would have access to it and whether they had a right to it. The local medical officer of health did not know what would happen if they did not accept the advice of the adjudicator or who had the final call. The local medical officer of health did not know who would be accountable and bear the ultimate legal responsibility if they changed their initial classification of a case based on advice given through the adjudication process.

How the adjudication system was to be implemented was unclear. Was it
to be voluntary in that the medical officer of health could resort to it for advice but was not required to do so? Or was it mandatory in the sense that all new SARS diagnoses had to be screened through this process? The use of the word “adjudicate”\textsuperscript{148} and the wording of the May 2\textsuperscript{nd} memo suggests that it was to be mandatory. If this was the case, wondered many local medical officers of health, what was the legal authority for the adjudication process?

One medical officer of health described it as follows:

An adjudication process was introduced that was designed that any listing of a new probable case had to go through a case review by the provincially selected infectious disease specialist. They were to gather all the chart information from the hospital. They would not have the epi information that was in the public health charts on whether this was a case or not – a probable or suspect case, and submit a report in writing to the POC or SOC, it was never described who they would report it to, and then we were supposed to accept this benignly.

The concerns of medical officers of health sometimes rose to serious levels of mistrust. Many were troubled by the fact that the adjudication process was imposed two days after the WHO travel advisory had been lifted. More will be said about the adjudication process and the classification of cases in the final report. Suffice it to say that the lack of transparency in the adjudication system led to confusion over roles and responsibilities and created the perception among some that local medical officers of health were being muzzled by the province.

In a widespread public health system with 37 different local medical officers of health, it makes sense during an infectious disease outbreak to have some central system to ensure as much as possible the accuracy and consistency of local decisions to designate a case as a reportable disease. The difficulty with the adjudication system during SARS comes down again to lack of planning and preparedness. There was no time to plan or consult before imposing a system that inevitably, because it sprang up overnight, attracted all the problems associated with lack of prior consultation and lack of transparency.

\textsuperscript{148} The Canadian Oxford Dictionary defines adjudicate as: “Act as judge in competition, court, tribunal, etc.”
To avoid this problem in the future the Commission recommends that the respective roles of the Chief Medical Officer of Health and the medical officer of health, in deciding whether a particular case should be designated as a reportable disease, should be clarified and regularized in a transparent system authorized by law.¹⁴⁹

For many local medical officers of health, the system was suspect, coming months into the SARS outbreak, shortly after the imposition and subsequent lifting of the travel advisory, with little explanation or rationale for the system itself and without transparency in the process or the identity of those who would make the decisions. For example, what expertise did the adjudicator have that made their classification more reliable than that of the local medical officer of health? How the adjudication system was to be implemented was unclear. Was it to be voluntary in that the medical officer of health could resort to it for advice but was not required to do so? Or was it mandatory in the sense that that all new SARS diagnoses had to be screened through this process? If it were mandatory, did the overriding party assume and bear all accountability in the event their decision was wrong? It was unclear under what authority in the Health Protection and Promotion Act the Chief Medical Officer of Health could override the discretion of the local medical officer of health? The only answer appears to lie in ss. 86(1) and (2) which provide:

86(1) If the Minister is of the opinion that a situation exists anywhere in Ontario that constitutes or may constitute a risk to the health of any persons, he or she may investigate the situation and take such action as he or she considers appropriate to prevent, eliminate or decrease the risk.

(2) For the purpose of subsection (1), the Minister,

(a) may exercise anywhere in Ontario any of the powers of a board of health and any of the powers of a medical officer of health; and

(b) may direct a person whose services are engaged by a board of health to do, anywhere in Ontario (whether within or outside the health unit served by the board of health), any act,

(i) that the person has power to do under this Act, or

(ii) that the medical officer of health for the health unit served by the board of health has authority to direct the person to do within the health unit.

But this is an awfully blunt tool. In a widespread public health system with 36 different local medical officers of health, it makes sense during an infectious disease outbreak to have some central system that ensures as much as possible the accuracy and consistency of local decisions to designate a case as a reportable disease. Furthermore, not all medical officers of health may feel that they have sufficient expertise about a particular disease to classify a case. Consider the case of SARS. During March, April, May and June of 2003, there were a number of brave and dedicated physicians in the greater Toronto area had been involved in the diagnosis and care of many SARS patients. Had SARS spread to a smaller community outside the greater Toronto area, the physicians in that community, including the local medical officer of health, could undoubtedly have benefited from the depth of their colleagues’ experience and knowledge. In such a case one might expect that the Chief Medical Officer of Health would intervene and assist or ensure that the local medical officer of health had the benefit of the expertise available from outside their jurisdiction.

But the process by which this would occur must be clearly established in advance and it must be clear how it may be initiated. The respective roles of the Chief Medical Officer of Health and the medical officer of health, in deciding whether a particular case should be designated as a reportable disease, should be clarified and regularized in a transparent system authorized by law. As one submission to the Commission stated:

> There needs to be clarity with respect to who has authority to designate cases of infectious disease in an outbreak situation; what lines of authority are in such instances; and who has the responsibility for making the final determination.

It is unlikely that the power and process by which cases are classified will become an issue on a day to day basis. However, should an outbreak of an infectious disease occur, the same issues that arose during SARS regarding the classification of cases will undoubtedly surface again. Now, in the aftermath of the outbreak, is the time to address the issue and implement a clear process should the need arise to adjudicate the classification of cases in the future.
Recommendation

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to clarify and regularize in a transparent system authorized by law, the respective roles of the Chief Medical Officer of Health and the medical officer of health, in deciding how a particular case should be classified.

Directives

During SARS, directives were issued to hospitals and other health care providers under the signature of the Chief Medical Officer of Health, Dr. D'Cunha, and the Commissioner of Public Safety and Security, Dr. Young.\(^ {150} \) They differed from orders under s. 22 of the *Health Protection and Promotion Act* in that they were issued across the province, broadly targeting hospitals and other health care providers. They were not issued based on individual criteria and circumstances, but rather they were general directives to health care providers that required particular procedures and precautions in the management of SARS cases and the prevention of its spread.

While many privately questioned the authority of either group to make blanket orders to hospitals and other health care facilities, regardless of whether they met the criteria for an order under s. 22 of the Act, for the most part health care facilities and hospitals complied, leaving aside legal uncertainty in the spirit of cooperation. Post-SARS, directives have continued to be issued directing health care facilities on issues ranging from infection control to surveillance and case management.

Even now that SARS is over, the question remains: under what legal authority were these directives issued and under what authority are they continued and replaced by new directives?\(^ {151} \) Many directives were issued across the board to all hospitals

---

150. For example: Directive 03-01, Directives to all Ontario Acute Care Hospitals, April 1, 2003; Directive L03-03, Directives to all Ontario Non-Acute Care Facilities for Admissions and Transfers from Hospitals of Non-SARS Patients, April 11, 2003.

151. For example: Directive PHCO03-01, Directives to all Pre-Hospital Care Providers and Ambulance Communications Centres Regarding Management of Patients with Possible Communicable Diseases Including SARS under Outbreak Conditions, December 7, 2003; Directive HR04-13, Directive to all Ontario Health Care Facilities/Settings for High-Risk-Aerosol-Generating Procedures Under Outbreak Conditions, April 15, 2004.
whether they had SARS cases or were even within the greater Toronto area. How
would those hospitals without SARS cases, remote from the greater Toronto area, fit
the requirement under s. 22 that a “communicable disease exists or there is an imme-
diate risk of an outbreak of a communicable disease in the health unit”? Legal argu-
ments can be made for and against the authority of the Chief Medical Officer of
Health to issue such directives under s. 86 of the Health Protection and Promotion Act.
It may be that a generous reading of the Health Protection and Promotion Act could
support the legal authority for the directives issued to hospitals during and after
SARS.

There is too much at stake to leave this vital issue to a debate between lawyers about
strict and generous interpretations of the Health Protection and Promotion Act. The law
must be clear. The Chief Medical Officer of Health must have the clear power to
issue directives to health care facilities and institutions on issues related to the preven-
tion and control of infectious diseases to ensure a uniform and adequate standard of
public health protection within the health care field as a whole. One undetected or
unreported case of an infectious disease may have disastrous consequences for the
public’s health. One health care facility with substandard procedures or poor infection
control could be the site where the index patient of a new disease seeks treatment and
spreads the deadly virus. The province, through the Chief Medical Officer of Health
after appropriate consultation with the appropriate experts and health care communi-
ties, must have the authority to direct and ensure an appropriate level of institutional
protection against infectious disease.

The Chief Medical Officer of Health must be able to issue directives on a broad range
of issues in respect of the prevention and control of infectious diseases, applicable
across the province or directed at specific types of institutions or specific areas of the
province. One public health official noted the importance of this power:

… there have been instances from time to time when a piece of contam-
inated equipment has been identified or a manufacturer’s malfunction has
been identified and it can’t be properly sterilized and that’s only discov-
ered after the fact. And it would be really helpful to have clear authority
from the Chief Medical Officer of Health in those instances to issue
directives, rather than the present way of working through the bureau-
cracy in a way that is not efficient.

It is imperative that hospitals and other health care institutions, both private and
public, have clear direction as to the legal authority of the directives and the potential
consequences of noncompliance. As one hospital wrote the Commission:
Under the *Public Hospitals Act*, a hospital must be governed by a board of directors, who have certain enumerated responsibilities and duties, in addition to the broad common law duty to govern in the best interest of the hospital corporation. Given this model of hospital governance, it may be expected that hospital board members would query directives emanating from a central body, particularly where such directives require the hospital to implement new services, discontinue existing services, or completely reorganize the delivery of such services. Therefore, any special health emergency legislation that provides for a centralized authority, external to hospitals, with the power to issue directives, must also make clear the legal force of such directives and the consequences to members of the health care sector for departing from them.

Accountability requires that all directives be issued under one single authority. As one hospital said:

> During a declared Provincial Emergency, a single authority should be designated for the purpose of issuing guidance to health care organizations. Each action communicated to health care organizations by this authority should be clearly labelled as to whether the action is mandatory, recommended or discretionary.

The Commission recommends that all directives be issued under the signature of the Chief Medical Officer of Health. The independence and medical expertise associated with that office make it the best single source of directives. The directives of the Chief Medical Officer of Health would of course be informed by the best advice of other health care professionals and medical experts. But at the end of the day the directives come under the signature of the Chief Medical Officer of Health alone and the holder of that office bears full accountability.

The power to issue directives is distinct from the power to issue orders under s. 22 of the Act. The power to issue directives should provide explicitly that it does not derogate from the existing power under s. 22.

To support this enormous responsibility it is essential that the Chief Medical Officer of Health have the scientific support and resources to administer a timely system of directives. These directives must reflect the best scientific advice and the best operational advice on how they should be organized and expressed to make them understandable and practical in the field. The directive system used during SARS was hampered by the fact that it was thrown together quickly without the time or
resources necessary to ensure that the directives made immediate sense to those administering them in the emergency rooms, hospital wards and medical floors of the hospitals. It would be unfair and dangerous to assign this task to the Chief Medical Officer of Health without the resources to carry it out. Should this occur, the Commission would expect that the only recourse available to the Chief Medical Officer of Health would be to exercise her independence and speak out publicly to alert the public and health care providers of the situation and the clear risk that such an event would pose to the public’s health.

As noted above it is vital to ensure that the directives are not only medically sound but that they are also capable of being followed in a practical manner. The Commission has heard repeatedly from various members that the directives sent during SARS and post-SARS are lengthy and unwieldy for practitioners. As Dr. Larry Erlick of the Ontario Medical Association said in the Commission’s Public Hearings:

The directives that were produced by the provincial operations center or POC during the height of the emergency, suffered immeasurably from a lack of simple practicality. These directives did not work from a hands-on clinical perspective. The disparity between what will function academically and practically during an emergency became obvious in these directives.152

One physician provided a stark example to the Commission of a directive that spanned over many pages, which the chief of staff at his hospital had to reduce to one page, so that emergency room physicians could review and absorb the main message in a timely fashion. As he described it to the Commission:

Here are current directives for respiratory illness during emergency [holds up thick document]. And here's what our Chief of Emerge did when trying to sort out what to do [holds up one sheet of paper]. When we get a directive from the MOHLTC it is pages and pages of stuff and buried in there is what is important. Practicing physicians cannot cope with this. It is too much. These are final ones, dated March/04, not the kinds we were getting in March and April 03 which where changing all the time. I cannot read that in less than one hour and make sure I’ve got it straight. When there is a central body that wants to give directives that central body, whatever it is, whoever makes directives, there has to be a

receiving person for all the different types of professionals, a receiving nurse or receiving community based physician, who is responsible for rewriting them in the language of receivers. This one page document from the Chief of Emerge works for me. It speaks my language. But to a public health nurse it won’t mean anything. I don’t know who can read the directives well. I can do it if I take an afternoon off and have no distractions. But it is nuts for every single practicing physician in the community to have to do that. What a waste of resources. It is appropriate to have various receiving leaders for whom the directive is designed, area experts to rewrite directives in the receivers’ language because we all use different language, then show it to the decision makers and say is this what that says, and then use it.

Another hospital wrote:

If directives are to be the mechanism for the centralized authority to direct the activities of the health care sector during an emergency, such directives should be written in clear and unambiguous language so that the recipients are equally clear as to the measures that are to be taken, and whether the directives are permissive or mandatory.

It was an incredible waste of time and energy during SARS that each institution had to take the directives and translate them individually into accurate messages that their staff could quickly learn and retain.

The Commission recommends the appointment of a working group comprised of health care professionals from various institutions who are tasked, and paid, to translate the directives into a form that can be understood and applied by staff, without altering the content of the message. The Commission recommends further the development of an educational programme to ensure that everyone affected by the directives knows how they work, what they mean and how they should be applied. There is often room for different interpretations of medical directives and it is essential that they be applied consistently to ensure that the hospitals throughout Ontario take the same message and apply it in the same way. This group would be tasked with the additional responsibility of overseeing the education of health care professionals about the directives, to ensure that regardless where the health care institution was situated, the directives were being applied consistently.

It is not enough to ensure that the directives are medically sound and are vetted to make them understandable and workable in the field. Understanding and workabil-
ity require active feedback machinery. Even the most exquisitely crafted directives require a regular reality check to ensure they are properly understood and practically workable in the field and that they are in fact clear and manageable. The enormous experience and wisdom of the nurses and doctors and other health care workers in the field will be wasted if not incorporated into a simple feedback system driven by those whose job it is to make the directives work in practice.

As Dr. Larry Erlick of the Ontario Medical Association told the Commission:

Another area of deep concern was that POC was established with little or no capacity to hear feedback or suggestions from affected stake-holders. On some occasions, only when we refused to distribute confusing or incorrect directives, were we finally able to get a hearing to our concerns and make suggestions for improvement.\(^{153}\)

On a cautionary note, it must be understood that the directives are addressed to specific public health concerns and expressed in a general way that applies to health care facilities across the province or, in the case of a limited direction, a substantial number of facilities. The directives represent the minimum that needs to be done to protect public health. The directives do not in any way diminish the standard of care ordinarily required by the circumstances that prevail in any particular institution. The directives represent the floor, not the ceiling, of medical precaution. They do not relieve any institution of the obligation to take further precautions where medically indicated. As one hospital wrote to the Commission:

Recommendations from the Minister should represent the minimum standards in an evolving situation when it is not always clear what the minimum should be. For example, it is now known that SARS is airborne as well as droplet and contact mode of transmission. Therefore institutions should be required to meet the recommendations of the Provincial Medical Officer of Health, but free to implement additional precautions as deemed necessary in such situations, for example use of two gowns versus one gown, a hood versus a head covering etc.

Another cautionary note is that for the directives to be effective there must be some machinery of enforcement. Any enforcement mechanism to be workable requires consultation with, and input from, health care facilities and private clinics, as well as a

\[^{153}\text{Ibid.}\]
means by which the Public Health Division can audit those to whom the directives are targeted to ensure compliance. The Commission therefore recommends that the Ministry of Health and Long-Term Care consult the affected health care communities with a view to developing effective machinery to enforce directives.

**Recommendations**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health to issue directives to hospitals, medical clinics, long-term care facilities, and all other health care providers, private or public, in respect of precautions and procedures necessary to protect the public’s health. All directives should be issued under the signature of the Chief Medical Officer of Health alone.

- The Ministry of Health and Long-Term Care appoint a working group of health care professionals from various institutions who are tasked, and paid, to translate the directives into a form that can be understood and applied by staff, without altering the content of the message. The Commission recommends further the development of an educational programme to ensure that everyone affected by the directives knows how they work, what they mean and how they should be applied.

- The Ministry of Health and Long-Term Care, in consultation with the affected health care communities, develop feedback machinery driven by health care workers in the field, to ensure the directives are clear and manageable from a practical point of view in the field.

- The *Health Protection and Promotion Act* and the directives provide explicitly that they in no way diminish the procedures and precautions required by the circumstances that prevail in any particular institution, that they represent the floor, not the ceiling, of medical precaution, and do not relieve any institution of the obligation to take further precautions where medically indicated.
Power to Detain

Freedom from arbitrary detention is a social value of superordinate importance. Detention must be clearly authorized by law and accompanied by safeguards. It has proved necessary to grant, sparingly, powers of detention and arrest in cases clearly required by the public interest, such detention to be followed by an early opportunity to challenge the detention in a court of law. The realities of the risk posed by a virulent disease require a narrow zone of power to detain individuals who present a clear danger to the public’s health. While such power must be protected with legal safeguards, the community cannot shirk its obligation to detain, however briefly it may be necessary, those who threaten the safety of the entire community. The power to detain necessarily carries with it the power to arrest. The power to detain temporarily an infectious person, unless ultimately backed up by the power to arrest in those rare cases where the detainee refuses to cooperate, has no practical force.

The issue of detention arises in a number of possible scenarios:

- Brief detention for the purpose of identification;
- Detention for the purpose of decontamination; and
- Detention for the purpose of examination, treatment, isolation or to prevent the spread of disease.

Currently, the *Health Protection and Promotion Act* only deals with the third scenario, detention for the purposes of treatment or isolation in respect of a virulent disease. Under s. 35(3) of the Act, a judge may order a person who fails to comply with an order of a medical officer of health detained:

35(3) In an order under this section, the judge may order that the person who has failed to comply with the order of the medical officer of health,

(a) be taken into custody and be admitted to and detained in a hospital or other appropriate facility named in the order;

(b) be examined by a physician to ascertain whether or not the person is infected with an agent of a virulent disease; and

(c) if found on examination to be infected with an agent of a virulent
disease, be treated for the disease.

An order under s. 35(3) can be made only for noncompliance with an order made under s. 35(2) in relation to a communicable disease that is virulent. Subsection 35(2) provides:

An order may be made under subsection (3) where a person has failed to comply with an order by a medical officer of health in respect of a communicable disease that is a virulent disease,

(a) that the person isolate himself or herself and remain in isolation from other persons;

(b) that the person submit to an examination by a physician;

(c) that the person place himself or herself under the care and treatment of a physician; or

(c) that the person conduct himself or herself in such a manner as not to expose another person to infection.

One gap in the law is the lack of machinery for the rare situation where public health authorities need urgently to take the name and address of someone who may have come into contact with an infectious disease. Take for instance the closing of a hospital because an infectious disease outbreak within the hospital appears to be running out of control. It is necessary to identify all those leaving the hospital when it is closed. Otherwise there is no way to ensure that they have not become carriers into the community of a deadly disease. Most people leaving a hospital in these circumstances will cooperate and provide to public health authorities their name and address and telephone number. But for those few who refuse to cooperate, those who decline to stop on their way out, and decline to give their name and address for the purpose of contact tracing, clear authority is required to enforce cooperation. There is now no authority to stop and require identification from people leaving places of infection.

Without this authority it may be impossible to ensure the appropriate follow-up of those who may spread a deadly infection to the community, and indeed to their own families.

It would better protect the public if public health authorities have the power to detain briefly and to require identification from anyone leaving a place of infection or
suspected infection. One observer described the importance of this temporary power of detention which would have to be backed up with the possibility of arrest and police assistance in cases of non-cooperation:

The idea is not so much to detain them as to make sure you know who was there at any point in time. If they all walk out and scatter and run home you inadvertently expose all their families when we have nothing sorted out in terms of who was there. It takes sixteen times as long to sort out who was there, if they don’t identify themselves before they leave.

The Commission therefore recommends that the *Health Protection and Promotion Act* be amended to provide authority to public health officials to detain temporarily for the purpose of identification anyone who refuses to provide their name and address and telephone contact information when required to do so for the purpose of identifying those who are leaving or have been in a place of infection, this power to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

The next legal gap to consider is the lack of any authority to detain for the purpose of decontamination.

Dr. Henry, testifying before the Justice Policy Committee, described the need for this power in relation to an anthrax threat. She stated:

I think we need to look at some authorities that we may need to have. One of the issues we ran into when we were dealing with suspicious packages – and you may notice that we haven’t actually evacuated Queen’s Park for quite some time because we put together a very coordinated response to this. But the questions arise. Somebody receives a threat in an office, a credible threat with a powder in it; they’re covered in white powder and they panic and they want to go home. We currently have no authority to detain that person: the police do not and the medical authority does not. We can probably fake it and try and convince them to stay, but they could pose a danger to other people. They don’t fit into the communicable disease sections because they’re not actually sick with the disease, and they don’t fit into the police sections at the moment. So we need to think about these situations.”\(^{154}\)

---

Similarly, public health officials have noted the need for a power akin to the quarantine power, to decontaminate individuals or groups who may have been exposed to a health risk that poses a threat to themselves or to the public. Classic examples include exposure to a white anthrax-like powder or nuclear contamination. Dr. Basrur told the Justice Policy Committee:

… if you have a white powder exposure and a whole lot of people covered with stuff, and you don’t want them all heading home because they’re scared, and some of them go on the subway and some go to the parking lot, you need an ability to detain them, but it’s not necessarily an infectious agent that they’ve got on them. They need to be decontaminated, counselled, their whereabouts identified, and then sent home, with follow-up.\(^{155}\)

The Ministry of Health also pointed out the need for authority in respect of:

Decontamination in emergency situations, where such action is considered appropriate (decontamination orders are not currently found under the Act, but such procedures may be required for individuals or large groups in the event of a nuclear disaster.)\(^{156}\)

Like isolation orders and treatment orders, the power to decontaminate must include the power to detain at least temporarily for the purpose of a court hearing, those who refuse voluntary decontamination. Otherwise, an exposed person could simply refuse, walk away, and expose countless members of the public. However, unlike the power to detain temporarily for the purposes of identification or to detain for the purposes of obtaining a s. 35 order, the power to detain for decontamination purposes implies that the power to decontaminate is part and parcel of the detention. But what does it mean to decontaminate someone? The U.S. Army’s “Guidelines for Mass Casualty Decontamination during a Terrorist Chemical Agent Incident” describes the following decontamination process:

Decontamination by removing clothes and flushing or showering with water is the most expedient and the most practical method for mass casualty decontamination. Disrobing and showering meets all the

\(^{155}\) Ibid, p. 160.

\(^{156}\) Letter to Mr. Doug Hunt, Q.C., Commission Counsel, from Mr. Phil Hassen, Deputy Minister of Health and Long-Term Care, August 4, 2004. See Appendix H to this Report.
purposes and principles of decontamination. Showering is recom-
mended whenever liquid transfer from clothing to skin is suspected. Disrobing should occur prior to showering for chemical agents; however, the decision to disrobe should be made by the Incident Commander based upon the situation. Wetting down casualties as they start to disrobe speeds up the decontamination process and is recom-
mended for decontaminating biological or radiological casualties. However, this process may:

• Force chemical agents through the clothing if water pressure is too high.

• Decrease the potential efficacy of directly showering skin afforded by shear forces and dilution.

• Relocate chemical agent within the actual showering area, thereby increasing the chance of contamination spread through personal contact and shower water runoff.

The MCDRT recommends that victims remove clothing at least down to their undergarments prior to showering. Victims should be encour-
egaged to remove as much clothing as possible, proceeding from head to toe. Victims unwilling to disrobe should shower clothed before leaving the decontamination area. It is also recommended that emergency responders use a high volume of water delivered at a minimum of 60 pounds per square inch (psi) water.157

This is clearly more intrusive than asking someone for identification or detaining someone for a defined period of time pending a court order for treatment. The power to decontaminate must be considered separate and apart from the power to detain for such purposes. It must be clear what decontamination means, who can order it and under what circumstances, and the nature of the consequences for refusal. Like the power to order treatment, forcing someone to undergo decontamination should only be done pursuant to judicial authorization.

Similarly, the following passage, taken from Jane’s Chem-Bio Handbook, a well-informed, practical handbook for first-responders on the scene of a suspected bioterrorist attack, underlines the operational necessity of being able to detain and decontaminate people:

Some victims may become agitated and fearful and may attempt to either leave the exclusion zone (the zone containing special response personnel in PPE and victims, which is cordoned off from public access. Also known as the hot zone.) or approach, or even contact, rescue personnel. Victims must be contained if risk of further contamination is to be prevented.

The power to detain is necessary for those who do not agree voluntarily to the decontamination process. Otherwise an infectious person could simply refuse, walk away, and spread the contaminant. And the power to detain for decontamination, like the power to detain for identification, must have the ultimate backup of an arrest power and police assistance if it is to work on those who refuse to cooperate. Because decontamination is akin to a medical procedure it must, in those cases where consent is refused, operate in conjunction with a legal process to secure judicial authorization before a person may be compelled to submit to decontamination. The power to detain and isolate someone pending such judicial authorization is very different from the power to force someone to undergo decontamination, and the two issues must be dealt with separately under the Health Protection and Promotion Act.

It must again be emphasized that the solution to public health emergencies is voluntary cooperation, not coercive legal powers. Coercive legal powers will never work in the face of significant non-cooperation. The key lies not in the coercive powers required for ultimate backup, but in the initial work of emergency responders in informing people what is medically required and why it is in their own best interest to cooperate. No matter how strongly the statutory authority for such a power is worded, it will be impossible to enforce without the support and cooperation of those directly affected.

The Commission recommends that the power to detain for decontamination and to decontaminate by court order in the absence of consent, should come under the day to

---

159. Ibid, p. 17.
day powers of the Health Protection and Promotion Act and not be limited to a power available only during a declared provincial emergency. A problem that requires decontamination may emerge suddenly before an emergency is even contemplated, as in an unexpected terrorist attack by weaponized smallpox or anthrax.

In addition to amending the Health Protection and Promotion Act to allow for the power to detain temporarily for the purposes of identification and the power to detain for decontamination, the provisions, which now authorize detention for the purposes of examination, treatment, isolation or to prevent the spread of disease, need to be strengthened.

As noted above, s. 35 allows a court to order detention of a person who refuses to submit to an examination, treatment, isolation or to conduct themselves in such a way so as to avoid the spread of disease. The power can only be exercised by court order. What do you do with a virulently infectious person in an area thronged with people on a Saturday evening, who refuses to go for treatment? A medical officer of health, under s. 22 of the Health Protection and Promotion Act, could order the person to submit to an examination, treatment and to isolate themselves. But if the infectious person thumbs his nose at the authorities, they can do nothing under the present law absent a court order under s. 35 of the Act. There is no power to detain the person while an application is being made to court. The person can continue to infect the throng or can wander away and disappear and infect others. Under the present law nothing can be done to stop them. This is unsatisfactory.

The medical officer of health requires the authority to order a person temporarily detained, for the purposes of isolation or to prevent the spread of disease, pending a court hearing under s. 35. The detention would be temporary, requiring that the person be brought before a justice within 24 hours, to ensure their detention is justified and that they are given their due process rights. The order would be available only where a person refuses to comply with the s. 22 order. The power to detain, like the other powers to detain discussed above, must be backed up by the power to arrest in the case of non-cooperation and the power to invoke police assistance. The power should be valid whether made in writing or orally by a medical officer of health.

It is important to note that this temporary power of detention would not include any power in relation to treatment. It is a key component of our law that no person shall be treated without their consent, without a court order. To obtain such a court order there must first be a hearing, which meets all the rules of natural justice. That fundamental protection must apply and should not be diluted in any manner.
While the power to detain a person, however temporarily, amounts to a violation of their liberty, such a power may be found to be reasonable and justified where it is necessary to protect the public from a virulent disease. It must come with strong protection, to make it as temporary as possible, pending a court order. It should only be available to a medical officer of health and the Chief Medical Officer of Health.

All of these recommended powers involve the ultimate assistance of the police in those cases where there is non-cooperation to the point where police assistance is required. There is no greater source of potential enforcement problems than the boundary line between two separate agencies who are required suddenly and without warning to cooperate smoothly in the face of an unexpected crisis. It is therefore of the utmost importance that police and public health authorities develop protocols, education packages, and training exercises to ensure smooth and effective cooperation.

**Recommendations**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health or a medical officer of health to order temporarily detained for identification any person who refuses to provide their name, address and telephone contact information when required to do so for the purpose of identifying those who are leaving, or have been in a place of infection. The detained person, unless immediately released, must be brought before a justice as soon as possible and in any event within 24 hours for a court hearing. This power is to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health or a medical officer of health to order the temporary detention of, for the purpose of a court hearing, any person suspected of having been exposed to a health hazard, and who refuses to consent to decontamination. The detained person must be brought before a justice as soon as possible and in any event within 24 hours. This power is to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

- The *Health Protection and Promotion Act* be amended to authorize the Chief
Medical Officer of Health or a medical officer of health to order the temporary detention of anyone who there is reason to suspect is infected with an agent of a virulent disease, for the purposes of obtaining a judicial order authorizing the isolation, examination or treatment of the person, pursuant to s. 35 of the *Health Protection and Promotion Act*. The detained person must be brought before a justice as soon as possible and in any event within 24 hours. This power is to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

**Power to Enter A Dwelling-House**

Public health officials are of the view that in some cases they require the power to enter a dwelling-house. In their view, this power is important to enforce orders under the Act.

Most public health officials agree that the *Health Protection and Promotion Act* should be amended to include a power of entry when enforcing a judicial order to apprehend made after a court application under s. 35 of the Act. As one medical officer of health described the problem to the Commission:

Public health agencies face the difficulty of trying to enforce an Order under HPPA s. 35, authorizing a police service to “locate, apprehend and deliver” a person with an infectious disease to a hospital named in the Order. The specific difficulty is the lack of any provision in the HPPA authorizing the police to enter into a private dwelling for the purpose of apprehending and delivering the subject of the Order to a hospital. We have become aware that, in the absence of any such authorizing provision, the police take the view that they do not have any powers of entry. In a situation where a person is the subject of a s. 35 Order to locate, apprehend and deliver him or her to a hospital for treatment in accordance with the terms of the Order, the lack of police powers of entry means that in order for the apprehension of the subject individual to occur, inordinate resources must be spent by the public health agency or the police on surveillance, etc. to identify an opportunity when the subject of the Order can be apprehended outside of whatever private dwelling they may be located in. As well, there may be delay and concomitant opportunity for the subject of the Order to evade apprehension. The resulting opportunity to spread the infectious disease sought to be treated pursuant to the s. 35 Order is obvious.
This is not a remote hypothetical situation. Public health officials reported to the Commission the example of a woman in a major urban center in Ontario who was infected with tuberculosis (TB). Public health officials issued a s. 22 order against the woman, requiring that she isolate herself and seek treatment. She refused to comply. They obtained a court order under s. 35 of the *Health Protection and Promotion Act*, authorizing that she be apprehended, isolated and treated. Because the order did not authorize entry to her home, public health officials had to sit outside her home waiting for her to leave. In the meantime, she continued to reside with other family members in the house, while she was infectious. Public health officials were unable to constantly maintain surveillance on the home. She managed to leave her home, travel to the airport and leave the country, exposing countless other people on her journey. She was later apprehended while attempting to re-enter Canada.

Had the court been able to authorize as part of the s. 35 order entry to her home to apprehend her and ensure she was isolated and treated, the risk she posed to countless people in the community and abroad could have been prevented.

The references to rights of entry are contained in Part V of the *Health Protection and Promotion Act*. Section 41 of the Act authorizes public health inspectors, inspectors, a medical officer of health or a person acting under the direction of a medical officer of health, to enter any premises, other than a private dwelling, to enforce the Act, exercise a power or carry out a duty under the Act, or carry out a direction given under the Act. Subsection 43(1) authorizes issuance of a warrant permitting entry to a

160. Subsection 41(1) provides:

Rights of entry and powers of inspection

Interpretation persons

The persons referred to in subsections (3) to (5) and (8), (10) and (11) are the following:

1. An inspector appointed by the Minister.

2. A medical officer of health.

3. A public health inspector.

4. A person acting under a direction given by a medical officer of health.

Interpretation purposes

(2) The purposes mentioned in ss. (3) to (5) and (11) are the following:
premises for the purpose of enforcing the Act or Regulations, and for exercising a power or carrying out a duty or direction under the Act. Subsection 43(1) provides:

Where a justice of the peace is satisfied on evidence upon oath,

(a) that there is reasonable and probable grounds for believing that it is necessary,

(i) to enter and have access to, through and over any premises,

(ii) to make examinations, investigations, tests and inquiries, and

(iii) to make, take and remove samples, copies or extracts related to an examination, investigation, test or inquiry,

or to do any of such things, for the purpose of this Act, the enforcement of any section of this Act or the regulations, the exercise of a power or the carrying out of a duty under this Act or the regulations or the carrying out of a direction given under this Act; and

(b) that an inspector appointed by the Minister, a medical officer of health, a public health inspector or a person acting under a direction given by a medical officer of health,

(i) has been denied entry to the premises,

1. The purpose of this Act.

2. The enforcement of any section of this Act or the regulations.

3. The exercise of a power or the carrying out of a duty under this Act or the regulations.

4. The carrying out of a direction given under this Act.

Entry

(3) A person mentioned in s. (1) may enter and have access to, through and over any premises for a purpose mentioned in s. (2).

Private Residence

(7) Subsection (3) is not authority to enter a private residence without the consent of the occupier.
(ii) has been instructed to leave the premises,

(iii) has been obstructed, or

(iv) has been refused production of any thing or any plant or animal related to an examination, investigation, test or inquiry,

by the occupier of the premises,

the justice of the peace may issue a warrant in the form prescribed by the regulations authorizing an inspector appointed by the Minister, a medical officer of health, a public health inspector and any person who is acting under a direction given by a medical officer of health, or any of them, to act as mentioned in clause (a) in respect of the premises specified in the warrant, by force if necessary, together with such police officer or officers as they call upon to assist them.

While the power contained in s. 43 authorizes entry into “any premises,” it confers no explicit authority to enter a private dwelling to apprehend a person. The fact that s. 43(1) does not expressly prohibit such entry into a private dwelling is hardly relevant because the law requires explicit language to authorize such entry into a dwelling and the courts will not read that power into a statute unless it is expressly conferred. The activities identified in paragraph (a) refer to testing things, removing samples, and accessing premises, not to entry for the purposes of apprehending a person and to doing “any of such things.” If the drafters intended this section to contain the power to enter a private dwelling to apprehend a person, one of the most serious of all enforcement actions, one would expect they would have clearly said so. The absence of any reference to apprehending a person strongly suggests that this section is not intended to authorize such an action.

It is questionable whether the authority to enter a private dwelling and apprehend a person is provided in the Provincial Offences Act. Section 158(1) allows the issuance of a warrant authorizing entry to any place, but the language of that section speaks to

161. R.S.O. 1990, c. P-33. Section 158(1) provides:

Search Warrant

Where a justice is satisfied by information upon oath that there is reasonable ground to believe that there is in any building, receptacle or place,
entry for the purposes of searching for and seizing evidence, not the apprehension of an individual.

These sections, s. 43 of the *Health Protection and Promotion Act*, and s. 158 of the *Provincial Offences Act*, do not clearly authorize entry to a private dwelling and apprehension of an individual who is the subject of an order under s. 35 of the Act. The Court should have the power in appropriate circumstances to authorize entry into a home for the purpose of enforcing a court order to take a person into custody. Given the scarcity of resources available to public health and the other critical demands on the time and resources of police services, neither should be expected to establish around the clock surveillance for an indeterminable amount of time until the person who is the subject of the order decides to leave their home. Under the present system, however, that is the only method available to prevent the person from leaving home and spreading a virulent disease throughout the community. The power to enter a private dwelling to execute an order under s. 35 of the Act is an important one. It must be clearly authorized in the *Health Protection and Promotion Act* so as to avoid legal debate and confusion regarding whether or not the authority exists.

For example, Dr. Henry explained to the Justice Policy Committee how this power would enhance the ability to enforce isolation orders:

> Who has the authority to detain somebody who’s not actually sick but might be a hazard, but we don’t know? Who has the authority if we have a section 35 order on somebody who is sick with tuberculosis but they are in their private home? Nobody has the right, right now, to go in and actually get them. We can’t do that. Should we have that? I don’t know. I

(a) anything upon or in respect of which an offence has been or is suspected to have been committed; or

(b) anything that there is reasonable ground to believe will afford evidence as to the commission of an offence,

the justice may at any time issue a warrant in the prescribed form under his or her hand authorizing a police officer or person named therein to search such building, receptacle or place for any such thing, and to seize and carry it before the justice issuing the warrant or another justice to be dealt with by him or her according to law.

Section 100 of the *Health Protection and Promotion Act* provides that anyone who does not comply with an order under the Act is guilty of an offence:

100. Any person who fails to obey an order made under this Act is guilty of an offence.
think those are authorities that need to be looked at very closely in the legislation.\textsuperscript{162}

A local medical officer of health proposed a solution as follows:

In my respectful submission, one way of dealing with this would be to provide police powers of entry into private dwellings in order to exercise the direction from a Court to locate, apprehend and deliver the subject of a s. 35 Order to a hospital. Such powers of entry would not be unique or unusual. For example, s. 36 (5) of the \textit{Children's Law Reform Act} gives the police the power to enter and search any place for the purpose of locating and apprehending a child who has been wrongfully withheld from a parent, and who is the subject of an Order under s. 36. When a CLRA s. 36 Order is made, there are certain guidelines that must be followed by the police with respect to the times when such a power of entry may be exercised.

Certainly, police powers of entry must be authorized by law and exercised judiciously when circumstances require. Certainly, we highly value the concept of a person's home being their castle. However, equally certainly, there are circumstances when public health concerns with respect to mandating treatment and preventing the spread of infectious diseases mitigate in favour of allowing police to enter into a private dwelling to carry out an Order under s. 35. Carefully crafted amendments to the \textit{Health Protection and Promotion Act} could address these competing interests, and might be critical in dealing with any future outbreaks similar to the one we experienced during the SARS crisis.

The need for this amendment is clear.

However, others have submitted to the Commission that there is a need for a broader power of entry, without a warrant or prior judicial authorization, in cases where the medical officer of health has reasonable and probable grounds to believe there is a risk to health due to a health hazard or an infectious disease.

The Ministry of Health in its submission to the Commission proposed the following amendment:

\textsuperscript{162} Justice Policy Committee, Public Hearings, August 18, 2004, p. 152.
Authorizing medical officers of health to enter any premises, including a private residence, without a warrant, where the medical officer has reasonable and probable grounds to believe there is a risk to health due to a health hazard or an infectious disease.\footnote{163}

Dr. Basrur, the Chief Medical Officer of Health for Ontario, in her testimony before the Justice Policy Committee, explained the rationale for such a power:

Finally, extraordinary powers may be needed for a local medical officer of health to enter any premises, including a private residence, without a warrant – and I take a breath when I say this – where he or she has reasonable grounds to believe that a risk to health exists due to a health hazard or an infectious disease, if there is a declared emergency under the Emergency Management Act. By way of a small example that gives you the kind of dilemma we face, on a day-to-day basis we have authority to regulate food premises. Yet you can have a catering operation that operates out of someone’s private residence, and the duty to inspect, the right of access to enter those premises where it is also a private home, is not crystal clear. That may just be the way it is in a free and democratic society on a day-to-day basis, but if you’re in an emergency situation, you probably want some additional authority to be able to kick in.\footnote{164}

Reasonable though this may seem to those with the difficult task of protecting the public against infectious disease, the power to enter a dwelling house without judicial authorization is an extraordinary power. The distinction between the power to enter a home without a warrant and the power to enter a business or factory without a warrant is vital not only in a legal sense but also as a matter of public policy. Mr. Mike Colle, the acting Chair of the Justice Policy Committee, asked the following questions about the right of entry under the \textit{Environmental Protection Act}:

Could they enter a home without a warrant? This is what came up yesterday. Dr. Young felt that they had no power to enter private property. They would be charged with trespassing. Yet the Ministry of the Environment has already solved the problem.

\footnote{163. Letter to Mr. Doug Hunt, Q.C., Commission Counsel, from Mr. Phil Hassen, deputy Minister of Health and Long-Term Care, August 4, 2004. See Appendix H to this Report.} \footnote{164. Justice Policy Committee, Public Hearings, August 18, 2003, p. 143.}
The question I want clarified is that this is essentially private property, whether it be a plant, a place of business or a residence. I think this is very crucial for our committee, given Dr. Young’s presentation yesterday. He felt one of the encumbrances to dealing with an emergency was that they really had no power to trespass or to enter a person’s home.\(^\text{165}\)

The Supreme Court of Canada in *R. v. Feeney* ruled that warrantless entry of a dwelling house to make an arrest, offended the *Charter of Rights and Freedoms* even in a case where the police were in fresh pursuit of a murder suspect.\(^\text{166}\) The courts have recognized however that in cases of “exigent circumstances” a police officer may enter a home without a warrant. Although courts have been reluctant to define “exigent circumstances” in general terms, obvious cases include emergency response to a 911 call suggesting that someone’s life is in danger, or entry to a burning house to save an occupant.

After *Feeney*, Parliament amended the *Criminal Code* to provide tightly defined powers to enter a dwelling house without a warrant when there are reasonable grounds to suspect it is necessary to prevent imminent bodily harm or death to any person.\(^\text{167}\)

Although rare, cases may arise where a corresponding power is necessary to enter a residence to secure the immediate detention of someone who poses a grave immedi-

---

167. Section 529.3 provides:

(1) Without limiting or restricting any power a peace officer may have to enter a dwelling-house under this or any other Act or law, the peace officer may enter the dwelling-house for the purpose of arresting or apprehending, a person, without a warrant referred to in section 529 or 529.1 authorizing the entry, if the peace officer has reasonable grounds to believe that the person is present in the dwelling-house, and the conditions for obtaining a warrant under section 529.1 exist but by reason of exigent circumstances it would be impracticable to obtain a warrant.

(2) For the purposes of subsection (1), exigent circumstances include circumstances in which the peace officer

(a) has reasonable grounds to suspect that entry into the dwelling-house is necessary to prevent imminent bodily harm or death to any person; or

(b) has reasonable grounds to believe that evidence relating to the commission of an indictable offence is present in the dwelling-house and that entry into the dwelling-house is necessary to prevent the imminent loss or imminent destruction of the evidence.
ate risk to the health of others if not detained. However, in the view of the Commission, the power should be a limited one. It is one thing to have these powers to enforce an isolation order under s. 35, where the goal is preventing the spread of infectious disease, but it is quite another to have these powers in respect of other public health activities, such as food safety.

The Commission therefore recommends that the Health Protection and Promotion Act be amended to provide for a court to authorize, by warrant, entry into a dwelling, by a medical officer of health or specially designated public health official with police assistance, for the purpose of enforcing an order under s. 35 of the Act.

But the power to enter without a warrant must be limited by conditions analogous to those in the Criminal Code Feeney amendments and further limited by a court hearing as soon as possible and in any event within 24 hours.

The Commission therefore recommends that the Health Protection and Promotion Act be amended to provide that a medical officer of health or specially designated public health official with police assistance may under exigent circumstances enter a dwelling house for the purpose of apprehending a person where there are reasonable and probable grounds to believe that a basis for a s. 35 warrant exists and reasonable grounds to believe that the delay required to obtain such a warrant might endanger the public’s health. The detention must be the subject of a court hearing as soon as possible and in any event within 24 hours.

**Recommendations**

The Commission therefore recommends that:

- The Health Protection and Promotion Act be amended to provide for a court to authorize, by warrant, entry into a private dwelling, by a medical officer of health or specially designated public health official with police assistance, for the purpose of enforcing an order under s. 35 of the Act.

- The Health Protection and Promotion Act be amended to provide that a medical officer of health or specially designated public health official with police assistance may under exigent circumstances enter a dwelling-house for the purpose of apprehending a person where there are reasonable and probable grounds to believe that a basis for a s. 35 warrant exists and reasonable grounds to believe that the delay required to obtain such a warrant
might endanger the public’s health. The detention must be the subject of a court hearing as soon as possible and in any event within 24 hours.

Conclusion

As noted at the beginning of this chapter, the *Health Protection and Promotion Act*, which provides the legal machinery for our defence against infectious disease, needs to be stronger. It is the daily powers in the *Health Protection and Promotion Act*, powers of investigation, mitigation, and risk management that prevent public health emergencies from developing. It is these daily powers that require strengthening.

Public health officials, to protect us from disease and to prevent small problems from growing into emergencies, require access to health risk information and the authority, resources, and expertise to investigate, intervene, and enforce.

The powers and safeguards recommended above are necessary to achieve these ends.

**Recommendations**

The Commission therefore recommends that:

- The role and authority of public health officials in relation to hospitals be clearly defined in the *Health Protection and Promotion Act* in accordance with the following principles:
  - The requirement that each public health unit have a presence in hospital infection control committees should be entrenched in the Act; and
  - The authority of the local medical officers of health and the Chief Medical Officer of Health in relation to institutional infectious disease surveillance and control should be enacted to include, without being limited to, the power to monitor, advise, investigate, require investigation by the hospital or an independent investigator, and intervene where necessary.

- The Ministry of Health and Long-Term Care, in consultation with the Provincial Infectious Diseases Advisory Committee, and the wider health care and public health communities, define a broad reporting trigger that
would require reporting to public health where there is an infection control problem or an unexplained illness or cluster of illness.

- Whether or not a workable trigger can be defined for compulsory reporting, a provision be added to the *Health Protection and Promotion Act*, to provide that a physician, infection control practitioner or hospital administrator may voluntarily report to public health officials the presence of any threat to the health of the population.

- The *Health Protection and Promotion Act* be amended to include powers similar to those set out in Quebec's *Public Health Act*, to allow for early intervention and investigation of situations, not limited to reportable or communicable diseases, that may pose a threat to the health of the public.

- The *Health Protection and Promotion Act* be amended to clarify and regularize in a transparent system authorized by law, the respective roles of the Chief Medical Officer of Health and the medical officer of health, in deciding how a particular case should be classified.

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health to issue directives to hospitals, medical clinics, long-term care facilities, and all other health care providers, private or public, in respect of precautions and procedures necessary to protect the public's health. All directives should be issued under the signature of the Chief Medical Officer of Health alone.

- The Ministry of Health and Long-Term Care appoint a working group of health care professionals from various institutions who are tasked, and paid, to translate the directives into a form that can be understood and applied by staff, without altering the content of the message. The Commission recommends further the development of an educational programme to ensure that everyone affected by the directives knows how they work, what they mean and how they should be applied.

- The Ministry of Health and Long-Term Care, in consultation with the affected health care communities, develop feedback machinery driven by health care workers in the field, to ensure the directives are clear and manageable from a practical point of view in the field.

- The *Health Protection and Promotion Act* and the directives provide explicitly
that they in no way diminish the procedures and precautions required by the circumstances that prevail in any particular institution, that they represent the floor, not the ceiling, of medical precaution, and do not relieve any institution of the obligation to take further precautions where medically indicated.

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health or a medical officer of health to order temporarily detained for identification any person who refuses to provide their name, address and telephone contact information when required to do so for the purpose of identifying those who are leaving, or have been in a place of infection. The detained person unless immediately released, must be brought before a justice as soon as possible and in any event within 24 hours for a court hearing. This power is to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health or a medical officer of health to order the temporary detention of, for the purpose of a court hearing, any person suspected of having been exposed to a health hazard, and who refuses to consent to decontamination. The detained person must be brought before a justice as soon as possible and in any event within 24 hours. This power is to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health or a medical officer of health to order the temporary detention of anyone who there is reason to suspect is infected with an agent of a virulent disease, for the purposes of obtaining a judicial order authorizing the isolation, examination or treatment of the person, pursuant to s. 35 of the *Health Protection and Promotion Act*. The detained person must be brought before a justice as soon as possible and in any event within 24 hours. This power is to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

- The *Health Protection and Promotion Act* be amended to provide for a court to authorize, by warrant, entry into a private dwelling, by a medical officer of health or specially designated public health official with police assistance, for the purpose of enforcing an order under s. 35 of the Act.
• The *Health Protection and Promotion Act* be amended to provide that a medical officer of health or specially designated public health official with police assistance may under exigent circumstances enter a dwelling-house for the purpose of apprehending a person where there are reasonable and probable grounds to believe that a basis for a s. 35 warrant exists and reasonable grounds to believe that the delay required to obtain such a warrant might endanger the public’s health. The detention must be the subject of a court hearing as soon as possible and in any event within 24 hours.
It is a cornerstone of our protection against infectious disease that doctors and hospitals and public institutions are legally required to disclose to public health authorities every case of reportable disease. Without knowledge of the prevalence and incidence of TB or SARS, who has it, who may have it, where did they get it, how, from whom, who else may be at risk, public health officials are powerless in the face of infectious outbreaks. Unless cases are reported to public health, it cannot investigate or even be aware of impending danger. Without adequate information the medical officer of health cannot protect the public.

The legal obligation to report infectious disease is a foundation of every system of public health legislation. The legal obligation is necessary not only to encourage reporting but also to ensure that the confidentiality laws, designed to protect patient privacy, do not unintentionally undermine the ability of public health authorities to fight the spread of infectious disease. To express the machinery of obligation in point form:

- The Health Protection and Promotion Act requires under certain conditions the reporting: to the medical officer of health;

- by hospitals, other institutions, doctors and other health care profes-

168. Subsection 21(1) provides:

In this Part, “institution” means,

(a) “charitable institution” within the meaning of the Charitable Institutions Act, (b) premises approved under subsection 9 (1) of Part I (Flexible Services) of the Child and Family Services Act, (c) “children’s residence” within the meaning of Part IX (Licensing) of the Child and Family Services Act, (d) “day nursery” within the meaning of the Day Nurseries Act, (e) “facility” within the meaning of the Developmental Services Act, (f) Repealed: 2001, c. 13, s. 17. (g) “home for special care” within the meaning of the Homes for Special Care Act, (h) “home” within the meaning of the Homes for the Aged and Rest Homes Act, (i) “psychiatric facility” within the meaning of the Mental Health Act, (j) “approved home” and “institution” within the meaning of the Mental Hospitals Act, (k) “correctional institution” within the meaning of the Ministry of Correctional Services Act, (l) “detention facility” within the meaning of section 16.1 of the Police Services Act, (m) “nursing home” within the meaning of the Nursing Homes Act, (n) “private hospital” within
sionals and practitioners\textsuperscript{169} including nurses, chiropractors, dentists, pharmacists, optometrists, and drugless practitioners;

- of the fact that a patient has or may have a disease specified in overlapping definitions as communicable, reportable, or virulent.

The conditions of reporting outlined below are unnecessarily complex and in places apparently illogical. Structural elements that require amendment include:

- the inconsistent obligations on doctors and others to report some cases and not others, depending on whether the patient is in hospital or an out-patient or someone who walked into a doctor’s office;

- the limited categories of who must report;

- the absence of a broad power to allow the Chief Medical Officer of Health to obtain information, including personal health information, from any person, institution or government department, where the information is necessary to prevent the spread of an infectious disease;

- the lack of precision in the necessary timeliness of the reporting; and

- the different levels of information required to be reported, depending on the identity of the disclosing party.

SARS demonstrated the importance of notifying public health of the risk of an infectious disease in a health care setting or any other part of the community. Vital information about infectious disease typically comes to light only when a patient seeks medical treatment from a health care worker, whether it be a doctor, nurse, clinic, hospital or

---

\textsuperscript{169} The meaning of the \textit{Private Hospitals Act}, \((o)\) place or facility designated as a place of secure custody under section 24.1 of the \textit{Young Offenders Act} (Canada), and includes any other place of a similar nature; ("établissement")

169. Subsection 25(2) defines practitioner as a member of the College of Chiropractors of Ontario, a member of the Royal College of Dental Surgeons of Ontario, a member of the College of Nurses of Ontario, a member of the Ontario College of Pharmacists, a member of the College of Optometrists of Ontario or a person registered as a drugless practitioner under the \textit{Drugless Practitioners Act}. 
indeed from any health care practitioner. This confidential patient information can only be shared with public health officials if there is a legal duty or authority to do so. Without such legal duty and authority every doctor and nurse and health care practitioner runs the risk of violating privacy legislation and public health officials will lack the power to compel the disclosure by a reluctant health information custodian. Infectious disease will not pause for a legal debate on whether the disease should be reported to public health. During an infectious outbreak it is critical that the reporting structure set out in the *Health Protection and Promotion Act* be clear and unassailable so that health professionals understand and properly discharge their reporting obligations under the Act, confident in their legal authority to do so. Only then will public health officials be armed with the information needed to protect the public.

**Current Reporting Requirements**

The *Health Protection and Promotion Act* puts reporting obligations on physicians, practitioners, hospital administrators, superintendents of institutions, school principals, and laboratory operators. Pursuant to the Act, these individuals must report a case to public health in the case of a patient who has or may have a reportable or communicable disease.

Reporting obligations under the *HPPA* are triggered by the requirement that a disease be either reportable or communicable. The lists of reportable and communicable diseases are set out in the Regulations to the *Health Protection and Promotion Act*. Regulation 558/91 specifies the communicable diseases, while Regulation 559/91 specifies the reportable diseases. This designation is vital. It is only where a person has or may have a reportable or communicable disease that the obligations are triggered under the Act.

Sections 25 through 30 of the *Health Protection and Promotion Act* impose reporting duties on specific groups of individuals such as doctors, nurses, hospital administrators, superintendents of institutions, school principals, and laboratory operators. They are as follows:

---

170. Subsection 25(2) defines practitioner as a member of the College of Chiropractors of Ontario, a member of the Royal College of Dental Surgeons of Ontario, a member of the College of Nurses of Ontario, a member of the Ontario College of Pharmacists, a member of the College of Optometrists of Ontario or a person registered as a drugless practitioner under the *Drugless Practitioners Act*.
s. 25(1) A physician or a practitioner as defined in subsection (2) who, while providing professional services to a person who is not a patient in or an out-patient of a hospital, forms the opinion that the person has or may have a reportable disease shall, as soon as possible after forming the opinion, report thereon to the medical officer of health of the health unit in which the professional services are provided.

s. 26 A physician who, while providing professional services to a person, forms the opinion that the person is or may be infected with an agent of a communicable disease shall, as soon as possible after forming the opinion, report thereon to the medical officer of health of the health unit in which the professional services are provided.

s. 27 (1) The administrator of a hospital shall report to the medical officer of health of the health unit in which the hospital is located if an entry in the records of the hospital in respect of a patient in or an out-patient of the hospital states that the patient or out-patient has or may have a reportable disease or is or may be infected with an agent of the communicable disease.

s. 27(2) The superintendent of an institution shall report to the medical officer of health of the health unit in which the institution is located if an entry in the records of the institution in respect of a person lodged in the institution states that the person has or may have a reportable disease or is or may be infected with an agent of a communicable disease.

s. 27(3) The administrator or the superintendent shall report to the medical officer of health as soon as possible after the entry is made in the records of the hospital or institution, as the case may be.

s. 28 The principal of a school who is of the opinion that a pupil in the school has or may have a communicable disease shall, as soon as possible after forming the opinion, report thereon to the medical officer of health of the health unit in which the school is located.
s. 29(1) The operator of a laboratory shall report to the medical officer of health of the health unit in which the laboratory is located each case of a positive laboratory finding in respect of a reportable disease, as soon as possible after the making of the finding.

s. 29(2) A report under this section shall state the laboratory findings and shall be made within the time prescribed by the regulations.

In addition to these provisions, s. 30 imposes a reporting condition on a physician who signs a medical certificate of death where the cause of death or a contributing cause of death was a reportable disease.\(^\text{171}\)

It is important to note the distinction between the reporting requirements in s. 25 and s. 26, discussed in detail below.

The overriding goal of the reporting provisions should be a clear statement of the reporting obligations of any party who could potentially have information about the presence or suspected presence of a communicable disease. Unfortunately, the current provisions contain some clear gaps addressed below, which have impeded the ability of public health officials to obtain reports regarding diseases.

### In Hospital or Out of Hospital

Section 25 requires physicians and practitioners caring for patients who are not in-patients or out-patients at a hospital to report reportable diseases. Section 26 requires physicians, regardless of the status of the patient, to report communicable diseases. It is unclear why the legislation distinguishes between the reporting of reportable diseases and the reporting of communicable diseases. Perhaps physicians and other practitioners treating patients in a hospital or who are out-patients of a hospital are precluded from reporting obligations in s. 25 because of a belief that the

\(^\text{171}\) Section 30 provides:

A physician who signs a medical certificate of death in the form prescribed by the regulations under the Vital Statistics Act where the cause of death was a reportable disease or a reportable disease was the contributing cause of death shall, as soon as possible after signing the certificate, report thereon to the medical officer of health of the health unit in which the death occurred.
reporting will occur under s. 27, via the hospital administrator. However, both physicians/practitioners and hospital administrators have reporting duties where the disease is communicable, and it is unclear why reportable diseases would be treated differently, particularly since not all reportable diseases are communicable. If there are two categories of diseases and both are sufficiently serious threats to public health that they require reporting from a hospital administrator and from physicians and practitioners working with persons who are not in-patients or out-patients of a hospital, it is unclear why the reporting requirements are not the same regardless of the patient’s location.

Whatever the logic of the distinction between reportable and communicable diseases in ss. 25 and 26, public health officials interviewed by the Commission expressed a common position that leaving reporting in any case to a hospital administrator is insufficient. Many public health officials reported to the Commission that they frequently did not receive reports from hospital administrators. In fairness, the hospital administrator can only report what they are aware of, so absent a functioning internal system requiring immediate reporting to them, they may not be aware that a case exists. Whether they are aware of a case or not, as one public health official stated, “it is the hospital doctors and the health care workers that we need access to”, not hospital administrators. It is insufficient in the case of hospitals to leave reporting to the hospital administrator. The hospital administrator is unlikely to be working when the infectious patient enters the emergency room in the middle of the night. Public health officials need to connect with the emergency room physician and staff to obtain information necessary to begin their important work of ensuring the infectious disease remains contained and does not threaten the public’s health.

As noted below, the scope of information that a physician must provide under s. 25 is far greater than that which a hospital administrator must provide under s. 27. Consequently, a physician in a family clinic may be required under the Health Protection and Promotion Act to provide far greater information on a reportable disease than a hospital administrator when the patient is an in-patient or out-patient of a hospital. This distinction makes little sense, as the importance of notifying public health of the existence or suspicion of a reportable disease does not turn on the location of the patient. Therefore, s. 27 does not compensate for the exclusion of hospital physicians in s. 25. This gap in the reporting requirements frustrates public health

172. As noted above, all communicable diseases are reportable but not all reportable diseases are communicable.
officials who require information to perform their duties. One public health expert described the problem, using tuberculosis (TB) cases as an example:

It’s been an ongoing frustrating problem. We’re not getting information about the most recent chest X-rays, we’re not getting information about medication that patients may be on, or when they come from the hospital out into the community. We’re just not getting the information that our public health docs are telling me that we need. Some hospitals are better than others. But there just seems to be a brick wall there. And we’re being faced with, well, we don’t have to provide anything other than name and address, date of birth, sex and date of onset of symptoms, because that’s all we’re required to report under s. 1(1), but 1(2) is, for example, currently not directed at the hospital administrator. And that’s one of the reasons why we wanted to take out the words “who is a patient or an in-patient” at the hospital, because it’s the physicians in the hospital that have all the information that aren’t reporting it to us.

It would be far more effective simply to combine ss. 25 and 26 and to require all physicians, regardless of the status of the patient, to report a disease that is either reportable or communicable. This way, a physician would be legally required to report and, as a backup, the hospital administrator would also have a legal duty to report pursuant to s. 27. Duplicate reporting obligations raise potential concerns around multiple reporting and around who is primarily responsible to report. Public health officials advise, however, that over-reporting would be preferable to the current trend of under-reporting. This problem could be easily addressed by ensuring an effective internal compliance system within each hospital or institution. As one public health expert stated:

Multiple reporting doesn’t happen. We get under-reporting. Now a hospital administrator has to report but they don’t do it. I think it should be incumbent on the hospital to have a reporting policy. For example, if a nurse identifies a disease she can say the most responsible physician should report it, or is it the infection control people – but they need to have an internal way of doing that. Right now what mostly happens is everyone thinks everyone else does it and it is not done.

Such an internal compliance system would not only allow physicians and health care workers to ensure compliance with reporting obligations, but would serve to identify those cases where the obligations have not been fulfilled. Hospitals are busy places and physicians have enormous responsibilities in providing patient care. Clear report-
ing obligations, even if they result in multiplication of duties, can only serve to ensure that cases do not slip through the cracks.

A group of highly qualified experts involved in the SARS response advised the Commission:

Presently, section 25 of the HPPA speaks to the reporting requirements for physicians; however, this only refers to those services provided outside of hospitals. This leaves a gap in reporting of patients who are seen as either out-patients of the hospital or who are admitted to a hospital by physicians. Presently, the HPPA requires the administrator of the hospital to report cases of reportable diseases for out-patients and in-patients of a hospital. It is suggested that compelling hospital-based physicians to report consistent with requirements applicable to out of hospital will build redundancy and will assure reporting of such cases.

Recommendations

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to repeal, in the duty of a physician to report to the medical officer of health, the distinction between hospital patients and non-hospital patients. This may be achieved by deleting from s. 25(1) the words “who is not a patient in or an out-patient of a hospital.”

- The Ministry of Health and Long-Term Care require each hospital, long-term care facility, nursing home, home for the aged, community care access centre, private medical or health services clinic, and any health care institution, to establish an internal system to ensure compliance with the reporting obligations set out in the *Health Protection and Promotion Act*.

Expanding the Categories of those who must Report

As noted above, the *Health Protection and Promotion Act* imposes reporting obligations on specified groups of persons such as doctors, nurses, hospital administrators, superintendents of institutions, school principals, and laboratory operators. A gap in the system emerges where a caregiver such as a midwife has information about a
reportable or communicable disease and the caregiver does not fall into one of the categories of people listed in ss. 25 through 30.

Section 25 requires that a physician or a practitioner who, while providing professional services to a person who is not a patient in or an out-patient of a hospital, forms the opinion that the person has or may have a reportable disease, shall make a report to the medical officer of health of the health unit in which the professional services are provided. Subsection 25(2) defines “practitioner”. It provides:

(2) In subsection (1), “practitioner” means,

(a) a member of the College of Chiropractors of Ontario,

(b) a member of the Royal College of Dental Surgeons of Ontario,

(c) a member of the College of Nurses of Ontario,

(d) a member of the Ontario College of Pharmacists,

(e) a member of the College of Optometrists of Ontario, or

(f) a person registered as a drugless practitioner under the Drugless Practitioners Act. 1998, c. 18, Sched. G, s. 55 (3).

Pursuant to s. 27(2), a superintendent of an institution must report to the medical officer of health of the health unit in which the institution is located if an entry in the records of the institution in respect of a person lodged in the institution states that the person has or may have a reportable disease or is or may be infected with an agent of a communicable disease. “Institution” is defined in s. 21(1) as:

“institution” means,

(a) “charitable institution” within the meaning of the Charitable Institutions Act,

(b) premises approved under subsection 9 (1) of Part I (Flexible Services) of the Child and Family Services Act,

(c) “children's residence” within the meaning of Part IX (Licensing) of the Child and Family Services Act,
(d) “day nursery” within the meaning of the *Day Nurseries Act*,

(e) “facility” within the meaning of the *Developmental Services Act*,

(f) Repealed: 2001, c. 13, s. 17.

(g) “home for special care” within the meaning of the *Homes for Special Care Act*,

(h) “home” within the meaning of the *Homes for the Aged and Rest Homes Act*,

(i) “psychiatric facility” within the meaning of the *Mental Health Act*,

(j) “approved home” and “institution” within the meaning of the *Mental Hospitals Act*,

(k) “correctional institution” within the meaning of the *Ministry of Correctional Services Act*,

(l) “detention facility” within the meaning of section 16.1 of the *Police Services Act*,

(m) “nursing home” within the meaning of the *Nursing Homes Act*,

(n) “private hospital” within the meaning of the *Private Hospitals Act*,

(o) place or facility designated as a place of secure custody under section 24.1 of the *Young Offenders Act* (Canada),

and includes any other place of a similar nature; (“établissement”)

“superintendent” means the person who has for the time being the direct and actual superintendence and charge of an institution (“chef d’établissement”).

But a health care provider may have information regarding a communicable disease and may not be a member of one of the professional bodies set out in s. 25(2) nor a superintendent of an institution as defined in the Act. In such a case, there would be no reporting obligation, and the provision of personal health information to public health authorities to prevent the spread of infectious disease may require intensive
/legal review of privacy legislation before a health care provider could be confident of their ability to disclose constitute a violation of privacy legislation. For example, recently, the case of a midwife caring for a pregnant woman with Hepatitis B came to the attention of public health officials through a mandatory report from a laboratory. Public health officials had the name of the midwife and the mother as a result of receiving the lab slip, reporting the positive Hepatitis B test. However, the lab slip did not give public health officials enough information about the patient to allow them to conduct their investigation to ensure that the newborn received the necessary vaccinations. In the normal course, public health would have contacted the treating physician or health care provider to obtain the additional information. Time was of the essence as public health officials had a relatively small window during which they could vaccinate the newborn to prevent it from contracting Hepatitis from its mother. The midwife, although wanting to cooperate with public health officials, felt that she could not disclose the required information as it was confidential health information and she had no duty under the *Health Protection and Promotion Act* to report. A midwife is not a “practitioner” as defined in the Act.

An easy solution lies in simply adding all potential custodians of health information to the list of “practitioners” under the *Health Protection and Promotion Act*. Some have suggested that the solution lies in adding to the definition of practitioners the list of professionals set out in the *Regulated Health Professionals Act*. Others have

suggested that this list would be overly broad, capturing people who would not have such information. As one person remarked:

\[ \ldots \text{it might capture people where it would be of limited utility to have them be included, such as massage therapists or dieticians. One wonders how far you want the net to expand and there are some “non-traditional” professions included in the Regulated Health Professions Act.} \]

On the other hand, it is better to cast the net too widely than too narrowly, and to include health care providers, whether traditional or non-traditional, who have information vital to public health. When the Act was drafted in the early 1980’s, and through all its amendments since then, clearly no one contemplated the scenario where a midwife might hold critical information. The danger in trying to predict every possible category of person or institution is that one that does not seem relevant today suddenly becomes relevant in the future.

Another suggested solution has been to redefine practitioner in the Health Protection and Promotion Act to match the definition in the Personal Health Information Protection Act. In s. 2 of the Personal Health Information Protection Act, “health care practitioner” is defined as follows:

“health care practitioner” means,

(a) a person who is a member within the meaning of the Regulated Health Professionals Act, 1991 and who provides health care,

(b) a person who is registered as a drugless practitioner under the Drugless Practitioners Act and who provides health care,

(c) a person who is a member of the Ontario College of Social Workers and Social Service Workers and who provides health care, or

(d) any other person whose primary function is to provide health care for payment; (“praticien de la santé”)

This definition is quite broad. It includes not only everyone who is a member within the meaning of the Regulated Health Professionals Act, but also has a broad catch-all provision that includes any person whose primary function is to provide health care for payment. It is important that the definition of “practitioner” in the Health Protection and Promotion Act, be amended to conform with that in the Personal Health
Even beyond the definition of “practitioner” and “institution,” the list of custodians who are identified in the *Personal Health Information Protection Act* as being potential custodians of personal health information, is far broader than those with reporting obligations under the *Health Protection and Promotion Act*. In s. 3(1) of the *Personal Health Information Protection Act*, “health information custodian” is defined as follows:

In this Act, “health information custodian,” subject to subsections (3) to (11), means a person or organization described in one of the following paragraphs who has custody or control of personal health information as a result of or in connection with performing the person’s or organization’s powers or duties or the work described in the paragraph, if any:

1. A health care practitioner or a person who operates a group practice of health care practitioners.

2. A service provider within the meaning of the *Long-Term Care Act, 1994* who provides a community service to which that Act applies.

3. A community care access corporation within the meaning of the *Community Care Access Corporations Act, 2001*.

4. A person who operates one of the following facilities, programmes or services:
   
   i. A hospital within the meaning of the *Public Hospitals Act*, a private hospital within the meaning of the *Private Hospitals Act*, a psychiatric facility within the meaning of the *Mental Health Act*, an institution within the meaning of the *Mental Hospitals Act* or an independent health facility within the meaning of the *Independent Health Facilities Act*.
   
   ii. An approved charitable home for the aged within the meaning of the *Charitable Institutions Act*, a placement coordinator described in subsection 9.6 (2) of that Act, a home or joint home within the meaning of the *Homes for the Aged and Rest Homes Act*, a placement coordinator described in subsection 18 (2) of that Act, a nursing home within the meaning of the *Nursing Homes Act*, a placement coordinator described in subsection 20.1 (2) of that Act or a care home within
the meaning of the Tenant Protection Act, 1997.

iii. A pharmacy within the meaning of Part VI of the Drug and Pharmacies Regulation Act.

iv. A laboratory or a specimen collection centre as defined in section 5 of the Laboratory and Specimen Collection Centre Licensing Act.

v. An ambulance service within the meaning of the Ambulance Act.

vi. A home for special care within the meaning of the Homes for Special Care Act.

vii. A centre, program or service for community health or mental health whose primary purpose is the provision of health care.

6. A medical officer of health or a board of health within the meaning of the Health Protection and Promotion Act.

7. The Minister, together with the Ministry of the Minister if the context so requires.

8. Any other person prescribed as a health information custodian if the person has custody or control of personal health information as a result of or in connection with performing prescribed powers, duties or work or any prescribed class of such persons.

The definition of “health information custodian” in the Personal Health Information Protection Act is far broader than that contained in the Health Protection and Promotion Act. It follows that a broad spectrum of health care providers have strong duties to protect the patient privacy with no corresponding duty to override that privacy where necessary to tell public health authorities and so prevent the spread of deadly infection. For example, ambulance services do not have reporting obligations under the Health Protection and Promotion Act. Service providers within the meaning of the Long Term Care Act, are not included in the definition of either “practitioner” or “institution” in the Health Protection and Promotion Act. While s. 29(1) requires that the operator of a laboratory report, it does not include a laboratory specimen collection centre.
Community Care Access Corporations are not included in the reporting sections of the Health Protection and Promotion Act. Nor are pharmacies included in the Health Protection and Promotion Act. The drafters of the Personal Health Information Protection Act obviously contemplated that these groups and individuals might have personal health information and it necessarily follows that they might have health information in relation to a communicable disease. It follows that they should have clear reporting obligations.

The list of “practitioners” and “institutions” as defined in the Health Protection and Promotion Act should be kept up-to-date and should be easily amended to ensure that all those who may receive personal health information about a patient infected with a communicable disease have reporting obligations. There should also be consistency between the Health Protection and Promotion Act and the Personal Health Information Protection Act to avoid the current situation where some have a clear duty not to disclose without the concurrent duty to disclose in the case of a communicable disease.

Recommendations

The Commission therefore recommends that:

- The definition of “practitioner” in the Health Protection and Promotion Act be amended to coincide with that set out in the Personal Health Information Protection Act.

- The list of “institutions” as defined in s. 21(1) of the Health Protection and Promotion Act, be amended to coincide with that set out in the Personal Health Information Protection Act.

- The Health Protection and Promotion Act be amended to ensure consistency between those who are defined as “health information custodians” under the Personal Health Information Protection Act and those who have reporting obligations under the Health Protection and Promotion Act.

- The Health Protection and Promotion Act be amended to authorize the Minister of Health and Long-Term Care to amend the definition of “practitioner” or “institution” by regulation.
Broad Powers to Obtain Information

It is a band-aid solution to amend the *Health Protection and Promotion Act* each time a new health care provider or a gap in the existing legislation is identified. It may be impossible to predict every potential custodian of information relevant to public health officials in communicable disease prevention and control. As the case of the midwife illustrated above, an investigation into a potential infectious disease will very likely require speed. This cannot be achieved if the only solution lies in amending the *Health Protection and Promotion Act* every time a person with important health information turns out to be exempt from the Act. Medical officers of health must have the power to ask for personal health information from any person or institution, where the information is required to prevent the spread of infectious disease or any other risk to the public’s health. Their ability to protect the public from health threats, in particular infectious diseases, should not turn on the ability of legislative drafters to foresee each and every possible source of information.

This problem became apparent early into SARS, when it became necessary to amend the *Hospital Management Regulation*\(^{174}\) under the *Public Hospitals Act* to require hospitals to provide medical information to public health officials in respect of SARS. Section 23.2\(^{175}\) of the *Hospital Management Regulation* was added to provide:

23.2 (1) A hospital shall provide information from records of personal health information to the following persons for the purposes of the diagnosis of persons who may have contracted SARS and the investigation, prevention, treatment and containment of SARS:

1. The Chief Medical Officer of Health within the meaning of the *Health Protection and Promotion Act*.

2. A medical officer of health within the meaning of the *Health Protection and Promotion Act*.

3. A physician designated by the Chief Medical Officer of Health.

(2) In subsection (1), “SARS” means severe acute respiratory syndrome.

---

175. O. Reg. 201/03, s. 1., made under the *Public Hospitals Act*.
It demonstrates a fundamental weakness in the structure of the *Health Protection and Promotion Act* reporting system that this amendment was necessary in the middle of SARS. Public health legislation must be robust enough to require the flow of necessary information from hospitals to public health officials at all times. It should not be necessary to amend the reporting requirements in the middle of an outbreak of some new disease.

The problem of collecting information about risks that are not defined as either a health hazard or as a reportable disease arose after SARS, as individual health units were required to collect information and attempt to be informed and proactive in respect of febrile respiratory illnesses within hospitals. One public health lawyer described the problem for the Commission:

> I think it’s important for us to know these things are happening, as well. For example, if there’s some sort of strange trend going on at a hospital, everyone has this high fever, we never find out about it, because it’s not a reportable disease, it’s not a communicable disease, and then we find out about it when there’s a SARS outbreak. There’s nothing really for us to be sharing information so that we know there might be something that can happen here and can we do something to prevent it. Can we implement some infection control protocols? Can we be prepared for it? There’s nothing really allows us to foreshadow that something like this is going to occur. And I think the Ministry is asking us to collect information about febrile respiratory illness and severe respiratory illness, and all the health units are asking well, what is our authority to require the hospitals to give us that information? And the hospitals are calling us saying, we’re not giving it to you, because there’s nothing in the statute that requires us to report that. And the Ministry I think was trying to get something that would allow us to forecast. Well if there’s some weird thing, a lot of people with a fever, certain other symptoms, maybe there’s something that we need to investigate, we need to have discussions about and see whether it’s happening in other places. And there’s nothing really that allows us to do that.

One hospital in particular took the position that there was not only an absence of legal authority to report cases of febrile respiratory illness to public health officials, but that to do so would be a contravention of privacy legislation. As noted later in this chapter, respiratory infection outbreaks were recently added to Regulation 569, as requiring reporting to public health officials to address this issue.
The fundamental weakness in the *Health Protection and Promotion Act* is that it does not enable public health authorities to acquire the information from hospitals and other health care institutions that is needed to protect the public against infectious disease. This fundamental weakness is not cured by a narrow spot amendment restricted to SARS in an obscure hospital regulation outside the framework of the *Health Protection and Promotion Act*. The amendment applies only to SARS and not to any other infectious or communicable or reportable or virulent disease. Nor does it apply to any new disease that might at first, like SARS, not even have a name.

It is essential to ensure that public health officials, in the event of any infectious disease outbreak, have access to whatever information they require to protect the public. Tinkering is not enough. The fundamental weakness in reporting requirements, demonstrated by the SARS spot amendment to the *Public Hospitals Act*, should be remedied by a *Health Protection and Promotion Act* amendment to provide that hospitals must provide to public health the information it needs to fight infectious outbreaks.

Quebec has addressed this problem in its *Public Health Act*, through a power available to the public health director. Under s. 96 of the Act the public health director may conduct an epidemiological investigation in any situation where he or she believes on reasonable grounds that the health of the population is or could be threatened and, in particular, where the director receives a report of an intoxication, infection or disease as required by the Act and regulations. Section 100 sets out the powers of the public health director in the course of an epidemiological investigation. One of these powers, set out in s. 100(8), provides the public health director the power to obtain information relevant to an epidemiological investigation from any source. It states:

> [The Public Health Director may] order any person, any government department or any body to immediately communicate to the public health director or give the public health director immediate access to any document or any information in their possession, even if the information is personal information or the document or information is confidential.

The Quebec legislation strikes a balance between the need to identify cases and access private health information quickly, and the need to ensure privacy is respected and that the power is not over utilized.

If a similar provision were added to the *Health Protection and Promotion Act*, the local medical officer of health would still have the power recommended below to request further details on reported cases from parties with reporting obligations under the
Act. A general power for the Chief Medical Officer of Health to request and obtain information, similar to that set out in Quebec’s *Public Health Act*, would fill a gap in cases where the person with vital information about a disease, or any other health risk, did not happen to be listed as someone with a legal duty to report. The power must be broad, to allow for access to information where a disease or health risk is previously unknown or unidentified.

Required information may not be limited to details about specific cases. It may also include the provision of specimens. The Ministry of Health and Long-Term Care in its written submission to the Commission,\(^ {176} \) stressed the need for an amendment to the *Health Protection and Promotion Act* to provide the authority for the Chief Medical Officer of Health to:

\[
\text{... order the collection, analysis, and retention of any laboratory specimen from any person, animal, plant or anything the Chief Medical Officer of Health specifies, and to acquire previously collected specimens and test analyses from anyone, and to disclose the results of test analyses as the Chief Medical Officer of Health considers appropriate.}
\]

Dr. Basrur, in her appearance before the Justice Policy Committee, explained this proposed power:

Authorizing the Chief MOH to order the collection, analysis and retention of any lab specimen from any person, plant or anything that he or she specifies: That sounds pretty open-ended. You might want that if you come across an incident that you’ve never anticipated in your life.

Authorizing the Chief MOH to acquire previously collected specimens: My neighbour to my left gave blood when she was expecting a baby. That blood is in storage and, in an emergency, I can take that and use it for some other purpose. You might want to think about what kinds of safeguards would be necessary to protect the individual and, frankly, to protect the official and the government so that they’re doing the right thing and not more than is absolutely necessary.\(^ {177} \)

---

176. Letter to Mr. Douglas Hunt, Q.C., Commission Counsel, from Mr. Phil Hassen, Deputy Minister of Health and Long-Term Care, August 4, 2004. See Appendix H to this Report.
The Commission accepts this proposal with a few qualifications. First, it should not include the power to take a bodily sample or specimen from a person without their consent or, absent consent, without court approval. The power must only apply to specimens already taken. The protection of one’s bodily integrity is a fundamental part of our law\(^\text{178}\) that must be protected from unreasonable state intrusion. Second, the collection must be limited to the purpose of investigating and preventing the spread of infectious disease. The specimen must be used only for this express purpose. For example, a specimen taken for the purposes of investigating whether a person is infected with a virulent disease should not then be available to the state for any other purpose.\(^\text{179}\) Third, this power should not override any other provisions of the Act, which set out a specific process for the obtaining of samples.

The above proposed amendments would give Ontario’s public health authorities the ability to acquire information about cases of infectious disease necessary to protect the public. By making the power available only to the Chief Medical Officer of Health, it would ensure that the Chief Medical Officer of Health is aware and kept informed of new and unidentified risks throughout the province.

**Recommendations**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to include a provision similar to the provisions in Quebec’s *Public Health Act*, by which the Quebec

---

178. In *R. v. Stillman* (1997), 133 C.C.C. (3rd) the Supreme Court of Canada stated that seizures that infringe upon a person’s bodily integrity, may constitute the “ultimate affront to human dignity” (at p. 341). The Court said:

> It has often been clearly and forcefully expressed that state interference with a person’s bodily integrity is a breach of a person’s privacy and an affront to human dignity (at p. 342).

Recently, in *R. v. Tessling*, [2004] S.C.J. No. 63, the Supreme Court of Canada said:

> Privacy of the person perhaps has the strongest claim to constitutional shelter because it protects bodily integrity, and in particular the right not to have our bodies touched or explored to disclose objects or matters we wish to conceal. [para. 21]

179. The Supreme Court of Canada has ruled that seizure of a blood sample that is authorized by law for the purposes of the provincial *Coroner’s Act* cannot be used for the purpose of a *Criminal Code* prosecution for impaired driving. See *Colarusso v. The Queen* (1994), 87 C.C.C. (3d) 193. [1994] 1 S.C.R. 20.
public health director may order any person, any government department or any body to immediately communicate to the public health director or give the public health director immediate access to any document or any information in their possession, even if the information is personal information or the document or information is confidential.

- This power should be broadly defined, to enable the Chief Medical Officer of Health to require any person, organization, institution, government department or other entity, to provide information, including personal health information, to the Chief Medical Officer of Health, for the purposes of investigating and preventing the spread of infectious disease.\textsuperscript{180}

- The \textit{Health Protection and Promotion Act} be amended to authorize the Chief Medical Officer of Health to order the collection, analysis and retention of any laboratory specimen from any person, animal, plant or anything the Chief Medical Officer of Health specifies, and to acquire previously collected specimens and test analysis from anyone, and to disclose the results of test analysis as the Chief Medical Officer of Health considers appropriate for the purpose of investigating and preventing the spread of infectious disease.\textsuperscript{181} This power, however, should be subject to the following restrictions:

  - It should not include the power to take a bodily sample or specimen directly from a person without their consent or, absent consent, without court order. The power should only apply to specimens already taken;

  - The collection should be limited to the purpose of investigating and preventing the spread of infectious disease. The specimen should be used only for this express purpose; and

  - The power should not override any other provisions of the Act, which set out a specific process for the obtaining of samples.

\textsuperscript{180} As noted above, this is not drafting language. The use of the term “infectious disease” is intended to include but not be restricted to diseases already designated as communicable, reportable or virulent under the \textit{Health Protection and Promotion Act}. The provision should be defined broadly enough to cover bioterrorism risks. It should not, however, extend to every health risk, such as obesity or other lifestyle problems.

\textsuperscript{181} \textit{Ibid.}
Timing

Neither the *Health Protection and Promotion Act* nor the Regulations specify how soon a report must be made.\(^{182}\) The reporting sections set out in ss. 25 through 30 of the Act simply state that the report must be made “as soon as possible” after the opinion is formed, which is not defined. Is that within an hour, a day, or a few days? What if the physician or the administrator is busy or overworked? Does it mean as soon as is convenient for them? Many medical officers of health have raised this issue and have noted the need for immediate notification to enable them to respond to a problem before it spreads out of control. As one public health expert stated:

> We need to set a timeframe within which the reports have to be made. This is a chronic problem for public health where the legislation says you have to report but it doesn't say within what timeframe. This doesn't help public health in terms of their ability to do work. It leaves us with little enforcement alternatives as physicians who are not reporting cannot be prosecuted for breaching legislation because there is no time frame.

Given the importance of timely public health intervention in the case of a communicable or infectious disease, it is important to specify that the reporting must be immediate in those cases where time is of the essence. But it may not be necessary for every reportable disease to be reported immediately. It may be necessary to require immediate reporting only for those diseases where immediate notification and intervention is necessary for public health protection.

For example, in Quebec, the Minister’s Regulation under the *Public Health Act*\(^ {183}\) requires that for certain diseases\(^ {184}\) the report must be made to both the national public health director and the public health director in the territory, immediately, by telephone and also in writing within 24 hours. For other diseases, however, the report must be made to public health, in writing, within 24 hours.\(^ {185}\)

---

182. The Ministry of Health and Long-Term Care distributes an information sheet that contains a list of diseases which they request be reported immediately. This list however does not carry with it the force of law, but merely acts as a guideline for reporting institutions.
183. R.S.Q., c. S-2.2, ss. 47, 48, 79, 81 to 83 and s. 136, paras. 6, 8 and 9.
184. Section 1 provides that in the case of Anthrax, Botulism, Cholera, Plague, Smallpox, Viral haemorrhagic fever, Yellow fever, a report must be made “immediately, by telephone, by any physician and any chief executive officer of a laboratory or of a department of medical biology to the national public health director and the public health director in the territory” and that “A written report must also be transmitted to those authorities within 48 hours by the person making the report.”
185. See the *Minister’s Public Health Regulations*, ss. 2 through 5.
Recent amendments to the reporting regulations set out in Regulation 569, amended to O. Reg. 1/05, identify the need for immediate reporting from the local level to the provincial level. Subsection 6(1) previously stated:

Where a medical officer of health receives a report made under section 25, 26, 27 or 28, subsection 29(2) or section 30 of the Act, he or she shall forward a copy to the Public Health Branch of the Ministry.

It has been amended to state:

Where a medical officer of health receives a report made under section 25, 26, 27 or 28, subsection 29(2) or section 30 of the Act, he or she shall immediately forward a copy to the Public Health Branch of the Ministry in a secure manner.

It is easy to understand why the Ministry would want to ensure immediate reporting from the local level to the provincial level. However, unless the local level also benefits from a similar legal requirement that reports from the field be made immediately to them, the effectiveness of the entire reporting regime will be undermined. There is little benefit to the Ministry of receiving an “immediate” report from the local level when the local level has received news of an infectious disease days or weeks after the fact.

**Recommendations**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to require that in the case of specific diseases, designated by regulation, information be reported “immediately” by telephone to the local medical officer of health, and that such report be followed up in writing within 24 hours.

- The *Health Protection and Promotion Act* be amended to require that as in the case of those diseases not designated for immediate reporting, a written report must be provided to the local medical officer of health within 24 hours.
Content of the Report

The *Health Protection and Promotion Act*, and its accompanying regulations, must be clear not only as to who must report and when, but must also be clear as to what information must be reported. It is frustrating for a medical officer of health to request information that he or she knows is relevant and necessary to control the spread of an infectious disease or to investigate a possible outbreak of an infectious disease, only to be told that he or she is not legally entitled to the information. It is similarly frustrating for the physician or practitioner who wants to assist public health but does not want to violate privacy laws. The law should be so clear that the physician and the practitioner need no longer grapple with these legal puzzles in the midst of a busy practice and other important demands on their time. The Regulation, which sets out the type of information that must be provided in a report, was recently amended. While the changes go a long way to improving the inadequacy of the previous version of the Regulation, there are still improvements that need to be made for the sake of clarity for public health officials and for those with reporting obligations.

The amendments are a positive step towards the goal of arming medical officers of health with greater information to allow them to prevent the spread of an infectious disease. With a little clarification and a little more strength the new Regulation will go a long way to address the concerns of local medical officers of health in respect of their difficulties in obtaining necessary details about reported cases from health care providers.

The *Health Protection and Promotion Act* does not specify what information must be reported to the medical officer of health. It simply provides that a report must be made. Regulation 569 specifies the type of information that must be provided to the medical officer of health. A number of problems with the Regulation have recently been addressed in Regulation 1/05. Two specific problems were the limited list of information required to be included in a report under the Act, and the limited class of people who were required to provide additional information as requested by the medical officer of health.

Regulation 569, both previous and current, state that the following information is required when making a report under the Act:

1(1) A report required under s. 25, 26 or 27 of the Act shall, with respect to the person to whom the report relates, contain the following information:
5. Reporting Infectious Disease

1. Name and address in full.
2. Date of birth in full.
3. Sex.
4. Date of onset of symptoms.

1(2) A report required under section 28 of the Act shall, with respect to the pupil to whom the report relates, contain the following information:
1. Name and address in full.
2. Date of birth in full.
3. Sex.
4. Name and address in full of the school that the pupil attends.

1(3) A report made under subsection 29(1) of the Act [by a laboratory operator] shall, with respect to the person to whom the finding was made, be made within twenty-four hours of the making of the finding and shall contain the following information:
1. Name and address in full.
2. Date of birth in full.
3. Sex.
4. Date when the specimen was taken that yielded the positive finding.
5. Name and address in full of the physician or dentist attending the person.

1(4) A report made under subsection 30 of the Act [by a physician who signs a death certificate] shall, with respect to the deceased, contain the following information:
1. Name and address in full.
2. Date of birth in full.
3. Date of death in full.
4. Name and address in full of the physicians who attended the deceased.

Section 5 of the Regulation specifies in what cases additional information must be reported, together with what additional information must be provided with the report of disease. Prior to the recent amendment, there were seven diseases listed in s. 5,¹⁸⁶

requiring that additional, specified information be provided when reporting. The amendments to Regulation 569, effected by O. Reg 1/05, have significantly expanded both the list of diseases for which additional information must be reported, and the type of information that must be reported. Under the new amendments, some 66 diseases now require additional information beyond the basic information set out in s. 1(1) of Regulation 569. The amendments cover all diseases listed in the three categories of disease specified by regulation: communicable, reportable and virulent. Although at first blush Regulation 569 seems to require the provision of very limited information; name, sex, date of birth and date of onset, the result of the amendments to s. 5 of the Regulation is that virtually every disease listed under the regulations, whether it is communicable, reportable or virulent, now requires the provision of additional information as specified in the amendment sections. The information required by the amendment is detailed and broad. In some cases it includes such things as travel history, lab findings, immigration status, contacts identified, contacts traced, history of exposure and the potential for community transmission.

This amendment brings into force an important change in the scope of information required to be reported. Under the new amendments, those with reporting obligations under the Act are no longer simply required to provide the most basic patient information. The amendments require that significant information about the condition, treatment and history of a patient be reported to the medical officer of health. One expert group described the importance of broadening the reporting requirements under the Act as follows:

Involved health units during the SARS outbreak encountered difficulties in acquiring diagnostic imaging, laboratory results and clinical status updates on suspect or probable cases of SARS who were hospitalized. It appeared that some hospitals interpreted the Health Protection and Promotion Act too narrowly, resulting in their restricting access of the health units to this clinical information feeling that this information was not required to be reported unless dealing with a confirmed “reportable disease”. We recommend that appropriate sections be added to the reporting regulations to provide the medical officer of health with the authority to acquire additional information as required to allow control of the disease or an outbreak. This may include information about contacts as well as information about diagnostic and laboratory tests and results of negative laboratory tests, treatment and prognosis of cases from hospitals, clinics and schools. The rationale for this recommendation is to facilitate local Medical Officers of Health and the Chief Medical Officer of
Health in investigating and managing an outbreak that often requires more than just minimal demographic information.

While the amendments are a helpful start to rectifying the difficulties experienced by public health in obtaining additional information in relation to reportable diseases, they appear to have been drafted with little input from local medical officers of health in the field or their counsel, who assist them in interpreting the Act and its regulations. A number of inconsistencies and ambiguities in the language used in the Regulation should be addressed in order to strengthen the Regulation. ¹⁸⁷

The Regulation requires that a number of pieces of information be reported, of which the reporting party may not have knowledge. The Regulation fails to make it clear

¹⁸⁷ A few examples of ambiguity and inconsistency are as follows: In relation to reporting of contacts, s. 5(1)(xii) requires that the number of contacts be reported yet says nothing about reporting the name of the contacts. This problem likewise exists in ss. 5(5), 5(6), 5(9), 5(10), 5(11), 5(12) and 5(17). All require the reporting of numerical information about contacts, such as the number identified, the number traced, the number quarantined, and the number tested, but say nothing about reporting their names. Subsection 5(5)(xxii) refers to the “number of contacts of the person who have been traced,” whereas the other sections that require reporting on contacts refer to the “number of contacts traced.” Subsection 5(7)(iv), however, refers to “the contacts who have been traced.” Although a minor point, there should be consistency in language in the Regulation. Similarly, the sections that require contact information, identified above, require reporting of “the number of contacts tested and number of contacts treated,” yet s. 5(5)(xxiii) refers to “number of contacts tested and treated, if applicable.” Again, although a minor discrepancy, it reflects a lack of overall clarity in some aspects of the drafting of the regulation. Another apparent inconsistency can be found in respect of the requirement to report the use of an ambulance. Subsection 5(4)(ix) requires that the reporting party state if an ambulance was used and date of use. This information may be important to both identify ambulance personnel involved in transporting the patient to determine their exposure and risk and where a disease is either airborne or spread by droplets to ensure that the ambulance and the machinery inside have been properly cleaned and is not itself a vector for contagion. This was critical during SARS as some ambulance personnel did contract SARS while attending to and transporting infectious patients. Yet this reporting requirement is only required in relation to Lassa Fever, Hemorrhagic fevers, including Ebola virus disease, Marburg virus disease and Hemorrhagic fevers from other viral causes and Plague. While these are clearly highly infectious and deadly diseases, identifying those cases transported by ambulance could also be important for cases such as SARS, yet it is not a listed piece of information in relation to that disease. Another potential problem can be found in s. 5(12)(vi), which sets out the information that must be reported in relation to respiratory infection outbreaks in institutions. One of the reporting requirements is to report the date of the outbreak and the outbreak number. This is followed by the requirement the date the outbreak was declared over. The unfortunate use of the past tense and the wording of that subsection leads the reader to wonder if it may be permissible to report an outbreak after the outbreak is over rather than when it first comes to the attention of the health care provider or institution. Perhaps the reporting hospital should be required to report the date the outbreak “is” declared over or the ongoing status of the outbreak in the hospital. To require them to report the date the outbreak was declared over suggests that the reporting is going to occur after that fact.
that the reporting parties need only report what is known to them, and that they are not obliged to conduct their own independent investigation to obtain all of the information set out in the regulations. As noted below, the names and personal information of contacts, where known, should clearly be reported, but it should not be the job of the physician or hospital to track down contacts of which they have no knowledge. To take another example, the reporting party should not be required to investigate the patient’s immigration status, if the patient or a relative are unable to communicate it.

It seems curious that the reporting party is required to identify the health unit responsible for reporting contacts, a fact more appropriately within the knowledge of the public health authorities. It is open to question whether the reporting party should be obliged to identify the “case classification,” or whether this is a matter for public health authorities to determine in their internal reporting from the local health unit to the province and their external reporting to Health Canada or the World Health Organization. If the “case designation” has to do with reports made by public health after the information is received from the physician, it might be better to separate the reporting obligations of physicians to public health from the reporting obligations that arise within the public health system after the physician makes the report.

As helpful as the amendments are, they do not eliminate the need for the power of the medical officers of health and the Chief Medical Officer of Health to request additional information from any person or institution making a report under the Act, if that information is required in order to respond to that report. SARS taught us many lessons about the wide variety of information required to fight an infectious disease. Things such as travel history, employment status (is the patient a health care worker) and contact information became critically important during SARS. A piece of information that seems irrelevant now may suddenly become relevant in the face of a new disease. A new disease may necessitate the provision of a detail not currently identified in the regulations.

To that end, s. 1(2) of Regulation 569 allows the medical officer of health to request additional information from the reporting party. Prior to the amendments in Regulation 01/05, this power to request additional information was limited to those making a report under s. 25 and s. 26, failing to include hospital administrators who have obligations to report under s. 27. The new amendments address this, adding reports made under s. 27 to s. 1(2).

The Commission recommends that the power of the medical officer of health to request additional information from a party with reporting obligations under the Act should apply to all those individuals and institutions required to report. Thus, those
parties with obligations to report under s. 28 (school principals), s. 29 (labs), and s. 30 (a physician who signs a medical certificate of death where the cause of death or a contributing cause of death was a reportable disease) may also be legally required to provide any additional information requested by the medical officer of health in relation to the report.

The Commission further recommends that the power currently contained in s. 1(2), of the Regulation, which enables the medical officer of health to request additional information from any party reporting under the Act, be entrenched in the Act itself, protected from any subsequent amendment without legislative debate and openness as to the reasons for the amendment. Rather than being limited to the current specific categories of people and institutions required to report, the power should be directed at any person or institution who makes or is required to make a report under the Act.

**Recommendation**

The Commission therefore recommends that:

- Subsection 1(2) of Regulation 569 be expanded to apply to any person who makes a report under the *Health Protection and Promotion Act*. Thus any person who gives information in accordance with a duty under the *Health Protection and Promotion Act*, shall, upon the request of the medical officer of health, give to the medical officer of health such additional information respecting the reportable disease or communicable disease as the medical officer of health considers necessary.

- This portion of Regulation 569 (s. 1(2), additional information) be moved to the Act itself, to form an integral part of the reporting obligations set out in the Act and to ensure that the power is protected, absent legislative debate, from subsequent amendment.

- Amendments to the *Health Protection and Promotion Act* and Regulations be preceded by consultation with the public health community who have to apply them in the field.
Reporting Contacts of Cases

Another gap in the legislation that became apparent during SARS is that the Health Protection and Promotion Act only requires that information be given in respect of a patient. Nothing in the Act requires a physician or hospital to provide information about contacts of the patient. This information turned out to be crucial during SARS, as the management of SARS required the identification and isolation of contacts to prevent the spread of the disease. Information about the identification of contacts became particularly critical in the context of health care workers exposed to SARS patients, as they often became a vector for transmission requiring early identification and isolation to stop the spread of SARS.

The reporting of contacts is important for diseases beyond SARS. As one public health expert stated:

I think there are a number of diseases where it’s really important to identify contacts. We need to keep them away from people … for example, people we don't know about have been around people with TB and they then develop it themselves and then pass on to other people.

A submission to the Commission from a group of experts, who were all closely involved in the SARS response, recommended that the reporting sections of the Health Protection and Promotion Act be amended to support the work of health units in tracing the contacts of patients with infectious diseases:

The current HPPA does not give specific reference to contacts of infectious cases. Release of information on the cases as well as contacts is essential for infectious disease control. This was a major obstacle during the management of the SARS outbreak. We believe that the requirement to report contacts referred to specifically in the legislation will allow practitioners to provide this information to their medical officer of health.

The amendments to Regulation 569, effected in Regulation 01/05, address this issue. Contacts initially identified or later traced are included in most of the lists specifying additional information that must be reported to the medical officer of health. In particular, it is included in the case of SARS, TB, influenza and febrile respiratory illness. This means that those who have reporting obligations under the Act are now required to provide contact information.
Standardizing Reporting

The amendments to Regulation 569 impose significant additional responsibilities, in respect of the type and amount of information that must be provided, on those with reporting obligations under the Act. While this is a positive step for public health, it must be matched with the recognition that health care institutions and facilities are busy places and health care professionals have many demands on their time. An emergency room physician does not, for example, have the time or luxury to sit and spend hours completing reports while ill patients wait to be treated.

Some have complained that there was a lack of uniform reporting requirements during SARS. Different public health units at different times wanted different information transmitted in different ways. Often a health care facility would provide information to a local health unit, only to be called a few moments later by someone from the provincial Public Health Division or some other part of the government, requesting the same information. In the first interim report, the Commission noted the impossible burden imposed on front line workers by the repetitive and overwhelming demands for information. Professionals will loathe and avoid reporting if the process is overly time consuming or unclear, or if the obligation it imposes changes depending on the recipient of the report. Public health therefore requires a uniform reporting protocol and standardized reporting formats applicable to all institutions. Hospitals must establish internal reporting policies to ensure reporting. Hospitals, physicians and other health care professionals must work together to develop standardized reporting forms, systems and protocols.

As one health expert noted in respect of the expansion of reporting requirements:

Reporting mechanisms should not be made too onerous. Report either electronically or through a simple fax and ensure there is someone on receiving end. Part of the problem that public health has been plagued with is under funding. As long as [the reporting system] is something relatively quick and easy, I don’t think it will be really bad. It comes down to mechanisms for reporting and lack of standardization, something we suffer from constantly. We are going through it now with pandemic flu. No one wants to say you have to do it this way. It irritates everyone and nothing is fixed. Hospitals report in different ways. Some by Excel, some by fax, most by e-mail. If a fixed method in the way a report gets there, whether by a portal in the net … hit it and say I’m hospital number ABC, without lab confirmation I have two cases of TB – looks like it and
walks like it, then public health can do what they want to do from there … If you don’t mandate what you want and how you want it you are going to get it 350 ways. If hospital A is collecting temperatures in degrees Fahrenheit and hospital B in Celsius, or they are doing blood pressure different ways, you create scenarios where accidents will happen and mistakes will be made. The data ends up being noncomparable. Reproducibility and comparability - if you can’t compare your data you will never be able to use it. It needs to be fixed, whoever does it, whether it is done by the Chief Medical Officer of Health in collaboration with a crew of very important people who know what is going on. Someone needs to say what they want and how they want and when they want it. SARS was perfect example of this.

The expansion of reporting obligations requires clarity around who receives the report, who follows up with the information providers when required, and how the information flows after it reaches the hands of public health. Currently, reporting goes from institutions to local public health to the Public Health Division at the Ministry of Health. During SARS however, some health providers, even though they were already supplying all necessary information to their local public health branch, were called directly by the Public Health Division or by the Minister’s staff:

During SARS we had examples of phone calls from political staff asking for nominal information on those who were ill from the local medical officers of health. The MOH’s were just downright irritated by it.

Recommendations

The Commission therefore recommends that:

- Local public health officials and the Public Health Division, in collaboration and consultation with hospitals, other health care institutions and professional organizations, develop a standardized form and means for reporting under the Health Protection and Promotion Act.

- The standardized reporting include clarity around to whom the report must be made, and to clearly confirm that the chain of transmission goes from the hospital and health care facilities, to the local health units, to the province, so as to avoid multiple requests for information.
Reporting – Education and Awareness

As noted in the following chapter, Privacy and Disclosure, Ontario has entered a new era of restriction in the sharing of personal health information with the passage of the *Personal Health Information Protection Act*. Much effort has gone into educating health care workers, professionals and administrators about the Act and ensuring that they understand the importance of maintaining the privacy of personal health information. This laudable objective becomes dangerous if it emphasizes overwhelmingly the duty not to disclose without a corresponding emphasis on the duty to disclose to public health officials when required. The duty under the *Health Protection and Promotion Act* to disclose information for the sake of public safety is not discretionary and there should be no mistake about the fact that this duty to disclose overrides any discretionary powers in the *Personal Health Information Protection Act* to withhold information.

Health care professionals and institutions must be educated on the importance of reporting cases immediately to public health, and involving them in discharge decisions of infectious patients. Public health continues to learn about infectious cases long after they have been admitted into hospital and, at times, long after their discharge. Often public health finds out when the patient is readmitted, having spent time in the community while infectious. As one public health official described the problem:

> One of the ongoing issues that public health experiences with TB prevention and control is the lack of reporting on the part of physicians.

In general, the Central Public Health Lab does most of the reporting of new cases. When a specimen is sent to the lab and a positive smear for TB is identified, the lab will send the results to the local health unit. Physicians, although obligated to report TB, rarely report to public health. The majority of the time this lack of reporting is compensated for by the lab. However, about 15 to 20% of the cases of TB in Toronto are diagnosed clinically, that is there is no lab evidence to support the diagnosis. This may occur because the physician does not bother to confirm the diagnosis by sending off specimens, or specimens are sent off and they are of poor quality so the lab cannot confirm the diagnosis, or the TB is diagnosed in an organ or structure such as kidney where it may be difficult to obtain a specimen. It is these cases where the lack of physician reporting can be very serious …
… It is essential that physicians understand the obligation to report and it is essential that they do so in a reasonable period of time to allow public health to assist in the management of the case and to conduct the contact follow-up investigation.

An example of the negative consequences of not reporting can be illustrated through the discussion of a case managed by a local public health unit in the early part of 2004. A man visited a very busy community hospital emergency room with gastrointestinal complaints. After investigation, the patient was started on treatment for TB. This was an appropriate clinical decision as the patient had significant risk factors for TB; he had been in a country where the rate of TB is very high and was intermittently homeless, living in the shelter system. Unfortunately, the physician did not order any confirmatory tests such as a sputum smear, did not report the case to public health, and started the patient on an incorrect treatment regimen. As the physician was feeling uncomfortable with treating TB, he consulted the infectious diseases (ID) service in the hospital and made many attempts to transfer this patient’s care to the infectious disease physician. Unfortunately, as this patient was difficult to deal with and presented mental health issues, the ID service was not interested in taking over his care and would only agree to consult. It took more than two weeks for this case to be reported to the local public health unit. By that time, the gastrointestinal physician was overwhelmed with the case as TB was not his area of expertise. He was getting ready to discharge this still infectious patient into the community where he would most likely have ended up back in the shelter system. The public health unit, finally alerted to the situation, interceded, sent in a public health nurse that day to collect a sputum sample to confirm the diagnosis and quickly arranged for this patient’s transfer to another hospital able to treat a TB patient. The delay in reporting led to a delay in the ability of the local health unit to initiate a contact follow-up investigation, which ultimately involved two large homeless shelters. The patient had been living in the shelter system for many months while he was symptomatic and infectious with TB. Public health officials described the consequences of this delay in reporting:

The delay in reporting led to many significant consequences. First, this infectious patient was almost discharged back into the shelter system. More important, the delay in reporting led to a delay in public health being able to initiate a contact follow-up investigation, which ultimately involved two large shelters. This case had been living in the shelter system for many months while he was symptomatic and infectious with TB. A delay in contact follow-up could have meant a delay in finding other infectious cases in the shelter system as a result of exposure to this patient. Fortunately, our contact follow-up investigation did not find
other cases of active disease in the involved shelter. However, it is important to note that this population is highly mobile and so the quicker public health can initiate contact follow-up the more likely we are to successfully find the identified contacts. In this case, although we didn't find active cases, we also had difficulty locating a significant proportion of the contacts as too much time had lapsed since the exposure and our setting up of contact follow-up clinics. This again was the consequence of a significant reporting delay.

Another example emerged from a TB case in late 2004. The patient had initially entered a busy emergency room suffering from TB. He was briefly treated and released into the community, to reside in the shelter system, without any notification to public health. Shelter workers, upon seeing the ill man, sent him to a different local hospital, as he appeared to them very ill and in desperate need of treatment. Although the patient was admitted to a second hospital where he was treated for TB, public health officials did not become aware of the case for a few days, delaying their initiation of contact tracing.

It is essential that physicians, other health professionals, and health care administrators, understand the obligation to report, and it is essential that they do so quickly to enable public health to do what is required by way of management, investigation and follow-up to protect the public. Physicians and health care providers must understand the important role of public health officials in the management of infectious disease cases. As noted above, it is not only vital to notify public health immediately, but public health must also be kept updated on the status of the patient and discharge plans. Yet public health officials report that this continues to be a frequent problem. The consequences for noncompliance can be severe.

Consider the example of another TB patient admitted to hospital in the early part of 2004. The patient had been diagnosed and treated approximately five years earlier for fully sensitive pulmonary TB. This person unfortunately did not complete the appropriate treatment regimen for TB, was not cured, and as a result the disease “reactivated” in 2004. The patient initially did not take the drugs as prescribed and developed resistance to the most important first line drugs in TB control. When his disease reactivated he was hospitalized for six months and treated for Multi-Drug Resistant [MDR] TB. During hospitalization the patient was compliant with the treatment plan. As MDR TB is the most serious form of TB from a public health point of view due to the resistance to the two most important first line drugs, patients can be hospitalized for up to two years to ensure that the disease has been completely cured. In this case, the hospital planned for discharge six months into this patient’s
treatment. Local public health officials were not notified of this discharge plan because the hospital was planning to discharge this patient into a region other than that in which the hospital was located. Public health officials described to the Commission the important work that lay ahead for public health officials following a discharge of a patient in this situation:

It is important to note that when sending an MDR patient home prior to the completion of treatment, the health care provider and public health officials must be completely confident that the individual will comply with isolation at home, take the drugs as directed through complying with directly observed therapy (DOT), and regularly appear for the intensive follow-up at the TB clinic. This follow-up can often be as intensive as every two weeks. The reason for these strict discharge conditions is to allow for strict monitoring of the case's level of infectivity. It is to prevent a case of MDR TB from becoming infectious after discharge and inadvertently infecting close contacts and members of the community with the same strain. Preventing transmission of this type of TB is paramount as it is difficult to treat and cure, and it has a very poor prognosis. Transmission of this strain in the community could lead to catastrophic public health consequences as was experienced in the New York City MDR TB outbreak in the 1990's that led to significant morbidity and mortality, transmission across state borders, and cost billions of dollars to contain.

When this patient was discharged, none of the discharge criteria were met. The patient had no fixed address, was highly mobile, often homeless, and had substance abuse issues. The likelihood of compliance in the community was low prior to discharge. The hospital notified the involved health unit approximately two days before discharge. Although the health unit was not in support of the early discharge, the patient was released to a rooming house in an unfamiliar area in June 2004, with the stipulation of complying with directly observed therapy. Not surprisingly, the patient was noncompliant with treatment and within a short period of time became infectious again. The patient was eventually readmitted to the same hospital that had discharged him. In the summer of 2004 he was back in hospital, however, public health officials were not informed until approximately one month later that the patient had been taking the bus every day into another nearby large community during the period of time that he was out in the community. Upon further investigation and interviewing of the patient it became clear that he was circulating within our shelter system and amongst the homeless population while infectious. As a result of this non-reporting, public health officials were unable to identify all those with whom
the infectious patient came in contact. The potential for a major outbreak and the cost to public health and the community was very real. As one public health official noted:

The potential of having an unknown group of contacts exposed to MDR TB in the shelter system who could develop active disease and infect others is daunting, and very similar to what occurred in New York City in the 1990’s …

… Due to the resistance pattern of the case, there are currently no drugs that can be effectively used to treat the identified contacts. As a result, this group will have to be followed intensely, at least every 3 months, by the TB clinic to ensure they have not become symptomatic. This will not only stretch the capacity of the TB clinics but it will stretch the capacity of public health. Many of the identified contacts will likely be homeless and highly mobile. Public health will have to ensure that people get to their appointments, which will often mean trying to locate contacts that may have moved to a different shelter or even a different jurisdiction. This type of follow-up will continue for two years. Should any of the identified contacts become symptomatic within these two years or beyond, they will require immediate hospitalization for medical assessment.

In summary, the consequences of this inappropriate discharge include needless exposure of a serious strain of TB to a vulnerable and still ill-defined population, increased use of resources now and in an ongoing manner by public health and the hospital TB clinic, readmission of this patient with an expanded resistance pattern (over the month while he was taking his drugs erratically he developed resistance to more medications) worsening his prognosis, and the use of key resources at Health Canada to assist in this investigation. The consequences that are less measurable will be the fear and anxiety that is caused when contacts are notified and the anxiety that this will likely cause within the shelter system once public health initiates this investigation in conjunction with Health Canada. This could have been prevented had the hospital been obligated to consult with public health and have the consent of public health before discharging this patient into the community.

It is essential that the Ministry make every effort to educate all those with reporting duties under the Act of their legal obligation to do so. They must do so on an ongoing basis, with a clear emphasis on the important relationship between health care profes-
sionals and institutions and public health in protecting the public from infectious
diseases. Misunderstanding of Ontario’s complex system of privacy laws cannot be
permitted to interfere with the duty to report that is required by law to protect the
public from infectious disease. Where education fails, enforcement should begin.188

Recommendation

The Commission therefore recommends that:

• The Ministry of Health and Long-Term Care, Public Health Division, in
  collaboration with local medical officers of health, health care facilities and
  professional organizations, engage in broad-based education of reporting
  requirements under the Health Protection and Promotion Act and that such
  education be maintained on a regular basis.

Reciprocal Reporting Obligations

All hospitals have a clear interest in ensuring that infectious disease outbreaks do not
occur in their facilities. Many hospitals who made submissions to the Commission
remarked on the need for a two-way relationship between them and public health.
Hospitals want to know when an investigation reveals that their institution is a source
of an infectious disease so they can take immediate steps to fix the problem. One
hospital put it this way:

Public health authorities should be mandated, under the Health
Protection and Promotion Act to provide public hospitals with the confi-
dential health information of persons about whom a report is made,
where the investigation of that report gives rise to information that a
communicable disease was acquired or may have been acquired at a
public hospital. This information is essential to the hospital’s ability to
determine the extent of a nosocomial outbreak and to take measures to
respond to and control the outbreak. The amendments should provide

188. Subsection 100(2) provides:

Any person who contravenes a requirement of Part IV to make a report in respect of a reportable
disease, a communicable disease or a reportable event following the administration of an immuniz-
ing agent is guilty of an offence.
that the information must be communicated as soon as it comes into the possession of the public health authority. Hospitals and physicians are simply not in a position to respond to a potential infectious disease outbreak within the hospital, where information relevant to the outbreak is held outside the hospital.

This recommendation makes great sense.

Section 39(1) of the *Health Protection and Promotion Act* specifically prohibits the medical officer of health from disclosing information received pursuant to a report under the Act. It states:

> 39(1) No person shall disclose to any other person the name of or any other information that will or is likely to identify a person in respect of whom an application, order, certificate or report is made in respect of a communicable disease, a reportable disease, a virulent disease or a reportable event following the administration of an immunizing agent.

While s. 39(2) provides exceptions to this prohibition, the exceptions do not appear to relate to preventing the spread of an infectious disease. One hospital described the problem to the Commission as follows:

In particular, there is a need for greater clarity around the hospitals’ ability to request health information back from public health with respect to

---

189. Subsection 39(1) does not apply,

(a) in respect of an application by a medical officer of health to the Ontario Court of Justice that is heard in public at the request of the person who is the subject of the application;

(b) where the disclosure is made with the consent of the person in respect of whom the application, order, certificate or report is made;

(c) where the disclosure is made for the purposes of public health administration;

(d) in connection with the administration of or a proceeding under this Act, the *Regulated Health Professions Act, 1991*, a health profession Act as defined in subsection 1 (1) of that Act, the *Public Hospitals Act*, the *Health Insurance Act*, the *Canada Health Act* or the *Criminal Code* (Canada), or regulations made thereunder; or

(e) to prevent the reporting of information under section 72 of the *Child and Family Services Act* in respect of a child who is or may be in need of protection.
tracing ill staff and transferred patients, who are diagnosed and treated at other institutions, but whose illness is linked to the index hospital. This is essential to the hospital’s ability to assess the extent of a nosocomial outbreak internally. Section 39(1) of the Health Protection and Promotion Act provides that all information obtained by public health authorities with respect to a person about whom a report has been made will be held in confidence and shall not be disclosed. Section 39(2) of the statute provides certain exceptions allowing disclosure, but it is unclear whether any of these exceptions would permit the disclosure to hospitals required to manage a nosocomial outbreak. It would greatly assist the hospital sector to amend the Health Protection and Promotion Act to require public health authorities to report back to a hospital, where public health is in possession of information that suggests a reportable disease may have been acquired through exposure at that hospital. This amendment should not be left to special health emergency legislation, as timely reporting of such information may assist in stemming an outbreak prior to it reaching emergency proportions.

These recommendations are sensible. Hospitals and other health care facilities need information about cases originating or having been treated in their facilities, to enable them properly to assess their risk and respond so as best to protect the safety of other patients and staff. As one medical officer of health also noted, a two-way reporting system between public health and health care institutions can only strengthen the vital relationship between these two partners:

… it is important in terms of relationship building in an ongoing way to have that ability to do it so. Where in doubt, it ought to be included to allow us to do that.

The wording of such a section would undoubtedly require that there be some assessment by the medical officer of health that the information was linked to a potential risk to the health of other patients as well as the amount of information that would be necessary to provide to mitigate the risk. As one medical officer of health noted:

I think there has to be a potential risk to the health of other patients, visitors, and staff. So it implies that there’s a risk assessment done by the medical officer of health or staff of the health unit that warrants the provision of this information, both to reduce the clutter of reports coming back that are not actionable by the hospital or the long-term care facility and also to protect information unless it’s required.
The ultimate goal is to arm hospitals and other health care institutions with information so they can protect their staff and patients. If information in the hands of public health officials would help hospitals do a better job, public health should give hospitals that information. It has to be a two-way street. Just as public health requires information from hospitals, so do hospitals and other health care facilities require information from public health. It is completely unhelpful for an institution to learn months after the event that an infectious patient passed through their hospital or that an infectious staff member had been working while ill without the hospital’s knowledge. If public health has such information no legal barrier should prevent public health from sharing it with the hospital or any other health care facility. Currently, both s. 39(1) of the *Health Protection and Promotion Act* and the *Personal Health Information Protection Act* may prohibit the sharing of personal health information in such a manner. This should be remedied for the protection of all patients and staff who work in health care institutions.

**Recommendations**

The Commission therefore recommends that:

1. The *Health Protection and Promotion Act* be amended to require public health authorities to report to a hospital or any other health care facility, including family medical clinics, any information in the hands of public health that suggests a reportable disease may have been acquired through exposure at that site.

2. Section 39(2) of the *Health Protection and Promotion Act* be amended to include an exception permitting public health officials to provide hospitals and other health care facilities, with the personal health information of persons about whom a report is made, where they are of the opinion that the information may reduce the risk of exposure or transmission to staff, patients or visitors.

**Conclusion**

Medical officers of health and the Chief Medical Officer of Health can only protect the public if they are aware of the existence of a threat to the health of the public. In respect of communicable diseases it is critical that health care providers are aware of and vigilant in complying with their reporting obligations under the Act. This
requires both education of health care workers and health care institutions as well as a collaborative effort between public health, health care providers and professional bodies to ensure, so much as possible, ease in complying with the reporting obligations under the Act. If the reporting structure or requirements are too onerous they will invite noncompliance. On the other hand, legal duties that are vague or unenforced will similarly invite noncompliance. It could take only one failure to report the presence or suspected presence of a communicable disease to lead to a serious outbreak in a health care institution or in the community at large.

The Chief Medical Officer of Health requires broad powers to compel information from health information custodians where necessary to protect the public from an infectious disease. The Act and its regulations cannot predict and provide for unknown diseases, such as SARS, which may come upon us suddenly and which require a strong and swift public health response.

There must also be an open exchange of information between health care professionals and public health with a common goal of investigating and preventing the spread of infectious disease.

**Recommendations**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to repeal, in the duty of a physician to report to the medical officer of health, the distinction between hospital patients and non-hospital patients. This may be achieved by deleting from s. 25(1) the words “who is not a patient in or an out-patient of a hospital.”

- The Ministry of Health and Long-Term Care require each hospital, long-term care facility, nursing home, home for the aged, community care access centre, private medical or health services clinic, and any health care institution, to establish an internal system to ensure compliance with the reporting obligations set out in the *Health Protection and Promotion Act*.

- The definition of “practitioner” in the *Health Protection and Promotion Act* be amended to coincide with that set out in the *Personal Health Information Protection Act*. 
• The list of “institutions” as defined in s. 21(1) of the *Health Protection and Promotion Act*, be amended to coincide with that set out in the *Personal Health Information Protection Act*.

• The *Health Protection and Promotion Act* be amended to ensure consistency between those who are defined as “health information custodians” under the *Personal Health Information Protection Act* and those who have reporting obligations under the *Health Protection and Promotion Act*.

• The *Health Protection and Promotion Act* be amended to authorize the Minister of Health and Long-Term Care to amend the definition of “practitioner” or “institution” by regulation.

• The *Health Protection and Promotion Act* be amended to include a provision similar to the provisions in Quebec’s *Public Health Act*, by which the Quebec public health director may order any person, any government department or any body to immediately communicate to the public health director or give the public health director immediate access to any document or any information in their possession, even if the information is personal information or the document or information is confidential.

• This power should be broadly defined, to enable the Chief Medical Officer of Health to require any person, organization, institution, government department or other entity, to provide information, including personal health information, to the Chief Medical Officer of Health, for the purposes of investigating and preventing the spread of infectious disease.\(^{190}\)

• The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health to order the collection, analysis and retention of any laboratory specimen from any person, animal, plant or anything the Chief Medical Officer of Health specifies, and to acquire previously collected specimens and test analysis from anyone, and to disclose the results of test analysis as the Chief Medical Officer of Health considers appropriate for the purpose of investigating and preventing the spread of infectious disease.

---

\(^{190}\) As noted above, this is not drafting language. The use of the term “infectious disease” is intended to include but not be restricted to diseases already designated as communicable, reportable or virulent under the *Health Protection and Promotion Act*. The provision should be defined broadly enough to cover bioterrorism risks. It should not, however, extend to every health risk, such as obesity or other lifestyle problems.
infectious disease.\textsuperscript{191} This power, however, should be subject to the following restrictions:

- It should not include the power to take a bodily sample or specimen directly from a person without their consent or, absent consent, without court order. The power should only apply to specimens already taken;

- The collection should be limited to the purpose of investigating and preventing the spread of infectious disease. The specimen should be used only for this express purpose; and

- The power should not override any other provisions of the Act, which set out a specific process for the obtaining of samples.

- The \textit{Health Protection and Promotion Act} be amended to require that in the case of specific diseases, designated by regulation, information be reported “immediately” by telephone to the local medical officer of health, and that such report be followed up in writing within 24 hours;

- The \textit{Health Protection and Promotion Act} be amended to require that as in the case of those diseases not designated for immediate reporting, a written report must be provided to the local medical officer of health within 24 hours.

- Subsection 1(2) of Regulation 569 be expanded to apply to any person who makes a report under the \textit{Health Protection and Promotion Act}. Thus any person who gives information in accordance with a duty under the \textit{Health Protection and Promotion Act}, shall, upon the request of the medical officer of health, give to the medical officer of health such additional information respecting the reportable disease or communicable disease, as the medical officer of health considers necessary.

- This portion of Regulation 569 (s. 1(2), additional information) be moved to the Act itself, to form an integral part of the reporting obligations set out in the Act and to ensure that the power is protected, absent legislative debate, from subsequent amendment.

\textsuperscript{191} \textit{Ibid.}
• Amendments to the *Health Protection and Promotion Act* and Regulations be preceded by consultation with the public health community who have to apply them in the field.

• Local public health officials and the Public Health Division, in collaboration and consultation with hospitals, other health care institutions and professional organizations, develop a standardized form and means for reporting under the *Health Protection and Promotion Act*.

• The standardized reporting include clarity around to whom the report must be made, and to clearly confirm that the chain of transmission goes from the hospital and health care facilities, to the local health units, to the province, so as to avoid multiple requests for information.

• The Ministry of Health and Long-Term Care, Public Health Division, in collaboration with local medical officers of health, health care facilities and professional organizations, engage in broad-based education of reporting requirements under the *Health Protection and Promotion Act* and that such education be maintained on a regular basis.

• The *Health Protection and Promotion Act* be amended to require public health authorities to report to a hospital or any other health care facility, including family medical clinics, any information in the hands of public health that suggests a reportable disease may have been acquired through exposure at that site.

• Section 39(2) of the *Health Protection and Promotion Act* be amended to include an exception permitting public health officials to provide hospitals and other health care facilities, with the personal health information of persons about whom a report is made, where they are of the opinion that the information may reduce the risk of exposure or transmission to staff, patients or visitors.
To fight infectious disease, public health authorities require timely access to personal health information. The first step to correct the access problems encountered during SARS is to strengthen the reporting and information-sharing provisions of the *Health Protection and Promotion Act* as recommended above.

This, however, is far from enough. The second step is to amend the privacy legislation to make it crystal clear that it was never intended to impede the flow of vital health information mandated by the *Health Protection and Promotion Act*.

Since SARS, a new set of privacy laws have come into force. These complex laws are poorly understood and they create, as a practical matter, serious barriers to the sharing of patient information urgently required by public health authorities.

Even if the *Health Protection and Promotion Act* is amended to expand and clarify reporting obligations and information-sharing powers, those who have the information and the public health officials who need it, will have to navigate a complicated series of privacy laws to see if they are able to disclose information. Consequently, medical officers of health may now expect resistance on two fronts: firstly that the disclosure is not required under the *Health Protection and Promotion Act*, then if they pass that hurdle, that the disclosure is not permissible because it would violate existing privacy legislation.

This is not to criticize the policy behind the new privacy regime. It is not fair to blame privacy policies for failures to report infectious disease as required by law. The problem is that the privacy laws are so complex they are not easily understood even by lawyers. This lack of understanding, coupled with a privacy culture that conditions people to say no to disclosure automatically, must be overcome in relation to the reporting of disease to public health officials.

It is not enough to dismantle the first hurdle of reporting powers and sharing information without addressing also the second hurdle of confusing privacy requirements.
Ontario’s Privacy Legislation

In Ontario, Bill 31, *The Personal Health Information Protection Act, 2004* received royal assent on May 20, 2004.\(^{192}\)

The main provision of *The Personal Health Information Protection Act* authorizing the disclosure of information to public health officials under the *Health Protection and Promotion Act* is s. 39(2)(a) which provides:

\[39(2)\] A health information custodian may disclose personal health information about an individual,

(a) to the Chief Medical Officer of Health or a medical officer of health within the meaning of the Health Protection and Promotion Act if the disclosure is made for a purpose of that Act …

This provision gives health information custodians discretion to disclose information for the purpose of the *Health Protection and Promotion Act*. The broad purposes of the *Health Protection and Promotion Act* include the prevention of the spread of disease.\(^ {193}\)

Although the provision deals with a broad range of disclosure that health information custodians are under no legal obligation to disclose under the *Health Protection and Promotion Act*, it confusingly ignores disclosure that is legally required under specific provisions of the Act.

This provision, by ignoring the legally required disclosure that is at the heart of the *Health Protection and Promotion Act*, does nothing but confuse. It may be understood by lawyers steeped in the intricacies of the *Personal Health Information Protection Act*, to whom the distinction is clear between disclosure “made for a purpose” of the *Health

---

192. The schedules to the Act did not come into full force until November 1, 2004.
193. Section 2 of the *Health Protection and Promotion Act* provides:

The purpose of this Act is to provide for the organization and delivery of public health programs and services, the prevention of the spread of disease and the promotion and protection of the health of the people of Ontario.
Protection and Promotion Act and disclosure required by the Act. But it cannot be clear to anyone else.

The provision misleads because it fails to distinguish between the “discretion” to disclose information “for the purpose of” the Health Protection and Promotion Act and the duty to disclose information required by the Act. To anyone but a privacy lawyer, it misleadingly suggests that disclosure under the Health Protection and Promotion Act is discretionary, not mandatory.

Whatever the internal legal logic that produced this provision, its dangerous lack of clarity cannot be allowed to stand. It must be made clear to health information custodians that they must disclose all information required by the Health Protection and Promotion Act and that they have no discretion to refuse.

The Commission therefore recommends that s. 39 of the Personal Health Information Protection Act be amended by the following addition to make it clear that disclosure required by the Health Protection and Promotion Act is mandatory, not discretionary:

A health information custodian shall disclose personal health information about an individual,

to the Chief Medical Officer of Health or a medical officer of health
if the disclosure is required under the Health Protection and Promotion Act.

---

194. They would doubtless point to s. 6(3) of the Personal Health Information Protection Act which provides:

Permissive disclosure

(3) A provision of this Act that permits a health information custodian to disclose personal health information about an individual without the consent of the individual,

(a) does not require the custodian to disclose it unless required to do so by law;

(b) does not relieve the custodian from a legal requirement to disclose the information; and

(c) does not prevent the custodian from obtaining the individual's consent for the disclosure.

195. See previous footnote. The only way to do this is to give the mandatory reporting duty in respect of reports required under the Health Protection and Promotion Act a more prominent position in relation to s. 39(2) of the Personal Health Information Protection Act.
Disclosures that are not authorized by the *Health Protection and Promotion Act* or “for the purpose of the Act” must be authorized by another section in the *Personal Health Information Protection Act*. Authorization for such a disclosure would appear to lie in ss. 43(1)(g) or (h) of the Act, which provides:

43(1) A health information custodian may disclose personal health information about an individual . . .

(g) subject to the requirements and restrictions, if any, that are prescribed, to a person carrying out an inspection, investigation or similar procedure that is authorized by a warrant or by or under this Act or any other Act of Ontario or an Act of Canada for the purpose of complying with the warrant or for the purpose of facilitating the inspection, investigation or similar procedure;

(h) subject to the requirements and restrictions, if any, that are prescribed, if permitted or required by law or by a treaty, agreement or arrangement made under an Act or an Act of Canada.

Subsection 43(2), the interpretation provision, provides:

(2) For the purposes of clause (1) (h) and subject to the regulations made under this Act, if an Act, an Act of Canada or a regulation made under any of those Acts specifically provides that information is exempt, under stated circumstances, from a confidentiality or secrecy requirement, that provision shall be deemed to permit the disclosure of the information in the stated circumstances.

This latter demonstrates the lack of clarity that creates problems in the *Personal Health Information Protection Act*. Although a legal privacy expert may understand it, anyone else would find it hard to grasp. The question is not whether those lawyers intimately familiar with the statute understand what they think it means, but whether the statute is clear to those who have to work with it, and those lawyers who have to advise those who work with it.

In addition to these disclosure provisions, there is a general disclosure power contained in ss. 40(1) of the *Personal Health Information Protection Act*:

40(1) A health information custodian may disclose personal health information about an individual if the custodian believes on reasonable grounds
that the disclosure is necessary for the purpose of eliminating or reducing
a significant risk of serious bodily harm to a person or group of persons.

A disclosure in this case is discretionary and will depend on the custodian's belief that
reasonable grounds exist to make the disclosure, adding a subjective decision making
layer. It is up to the individual deciding whether to disclose to determine what
evidence is sufficient to meet the standard of “reasonable grounds to believe” and what
constitutes a “risk of serious bodily harm to a person or group of persons.”

The sections permitting disclosure to public health officials are intended to enable
where necessary the free flow of information for the protection of the public. But they
are far from clear and the decision to disclose will, in many cases, require the health
information custodians to use their discretion. The problem is that health information
custodians with any doubt about their ability to disclose will naturally err on the side
of nondisclosure, having regard to the presumption of nondisclosure created by the
privacy culture and the severe penalties against violating the privacy laws.

Subsection 72(1) of the Personal Health Information Protection Act provides that
anyone who “wilfully collects, uses or discloses personal health information in contra-
vention of this Act or its regulations” is guilty of an offence. Section 65 provides that
damages may be sought where there has been a violation of the Act, either as a conse-
quence of an order by the Commissioner to remedy a violation or as a result of convic-
tion under s. 72(1).196 A breach of s. 72 carries the potential for significant monetary

196. Section 65 provides:

Damages for breach of privacy

(1) If the Commissioner has made an order under this Act that has become final as the result of
there being no further right of appeal, a person affected by the order may commence a proceeding
in the Superior Court of Justice for damages for actual harm that the person has suffered as a result
of a contravention of this Act or its regulations. 2004, c. 3, Sched. A, s. 65 (1).

Same

(2) If a person has been convicted of an offence under this Act and the conviction has become final
as a result of there being no further right of appeal, a person affected by the conduct that gave rise to
the offence may commence a proceeding in the Superior Court of Justice for damages for actual
harm that the person has suffered as a result of the conduct. 2004, c. 3, Sched. A, s. 65 (2).

Damages for mental anguish

(3) If, in a proceeding described in subsection (1) or (2), the Superior Court of Justice determines
that the harm suffered by the plaintiff was caused by a contravention or offence, as the case may be,
that the defendants engaged in willfully or recklessly, the court may include in its award of damages
an award, not exceeding $10,000, for mental anguish.

259
penalties, including a fine of up to $50,000 for an individual like a nurse and up to $250,000 for a corporation like a hospital. Officers, members, employees or other agents of a corporation may also be personally subject to prosecution under s. 72(3) if they authorized the offence or had the authority to prevent it, and knowingly refrained from doing so.

It is essential to clarify the privacy legislation by way of a simple amendment lest it be blamed for nondisclosure of vital information about infectious diseases.

Consider the tragic case in British Columbia of the young university student who committed suicide in February, 2004. University staff and health professionals, out of a mistaken belief that privacy legislation prevented disclosure, did not advise her mother of a previous suicide attempt, preventing her from taking action that might stop another attempt. British Columbia's privacy legislation contained provisions that could have arguably authorized the disclosure. As one newspaper editorial described the problem with the legislation:

That these parts of the law [the sections that could have authorized the disclosure] can be interpreted in different ways presents a problem for hospital staff in that they’re unlikely to act on their own interpretations for fear of running afoul of the law.

---

197. Subsection 72(2) provides:

**Penalty**

A person who is guilty of an offence under subsection (1) is liable, on conviction,

(a) if the person is a natural person, to a fine of not more than $50,000; and

(b) if the person is not a natural person, to a fine of not more than $250,000. 2004, c. 3, Sched. A, s. 72 (2).

199. Consider, for example, the following sections of the *Personal Information Protection Act* (British Columbia).

18(1) An organization may only disclose personal information about an individual without the consent of the individual, if

(k) there are reasonable grounds to believe that compelling circumstances exist that affect the health or safety of any individual and if notice of disclosure is mailed to the last known address of the individual to whom the personal information relates.

(l) the disclosure is for the purpose of contacting next of kin or a friend of an injured, ill or deceased individual.

The sentiment heard by the Commission in respect of Ontario’s privacy legislation is that people are confused and intimidated by its complexity. The prevailing attitude seems to be, when in doubt, do not disclose. When the health of the public is at risk, this nondisclosure born of doubt and confusion cannot be permitted to continue.

**Recommendation**

The Commission therefore recommends that:

- Section 39 of the *Personal Health Information Protection Act* be amended to include:

  - A health information custodian shall disclose personal health information about an individual, to the Chief Medical Officer of Health or a medical officer of health if the disclosure is required under the *Health Protection and Promotion Act*.

**Disclosures by a Medical Officer of Health or the Chief Medical Officer of Health**

The recommended amendments, set out above and below, will clarify the power of a health care custodian to disclose information to a medical officer of health or the Chief Medical Officer of Health. The problem remains of the ability of a medical officer of health or the Chief Medical Officer of Health to disclose information in respect of a person against whom an application, order, certificate or report is made in respect of a communicable disease. This is a power that is integral to their ability to protect the public.

Consider an example of a person infected with a virulent disease, such as SARS, against whom the medical officer of health issues an order under s. 22, requiring that they isolate themselves to avoid spreading the disease to others in the community. If that person ignores the order and continues to move about in the community, it is unclear if the medical officer of health can share with any person any information about that person, that will or is likely to identify them.

Consider the example of the woman with TB who managed to evade public health authorities, avoid apprehension under a s. 35 order, and leave Canada to travel to another country. If the medical officer of health in the jurisdiction which obtained the
order was unable to share personal identifying information with federal public health officials, border officials and quarantine officials in the federal government, they could not apprehend her as she attempted to re-enter Canada.

Although both disclosures might be permitted under the *Personal Health Information Protection Act*,\(^{201}\) s. 39(1) of the *Health Protection and Promotion Act* contains a prohibition on disclosure of the name or identifying information of a person against whom an application, order, certificate or report under the communicable disease provisions of the Act have been made. Subsection 39(1) provides:

No person shall disclose to any other person the name of or any other information that will or is likely to identify a person in respect of whom an application, order, certificate or report is made in respect of a communicable disease, a reportable disease, a virulent disease or a reportable event following the administration of an immunizing agent.

Subsection 2 sets out exceptions to the prohibition of disclosure in s. 39(1). It provides:

Subsection (1) does not apply,

(a) in respect of an application by a medical officer of health to the Ontario Court of Justice that is heard in public at the request of the person who is the subject of the application;

(b) where the disclosure is made with the consent of the person in respect of whom the application, order, certificate or report is made;

(c) where the disclosure is made for the purposes of public health administration;

\(^{201}\) For example, s. 40(1) of the *Personal Health Information Protection Act*, discussed in greater detail below, permits disclosure if “the custodian believes on reasonable grounds that the disclosure is necessary for the purpose of eliminating or reducing a significant risk of serious bodily harm to a person or group of persons.” Subsection 39(2)(b) of the *Personal Health Information Protection Act* permits disclosure of personal health information by a health information custodian to a public authority that is similar to the Chief Medical Officer of Health or a medical officer of health, that is established under the laws of Canada, some other province or territory, if the disclosure is made for a purpose that is substantially similar to a purpose of the *Health Protection and Promotion Act*. Section 2 of the *Health Protection and Promotion Act* includes the prevention of the spread of disease and the promotion and protection of the health of the people of Ontario. A medical officer of health is defined as a health information custodian under s. 3 of the *Personal Health Information and Protection Act*. 

262
(d) in connection with the administration of or a proceeding under this Act, the Regulated Health Professions Act, 1991, a health profession Act as defined in subsection 1 (1) of that Act, the Public Hospitals Act, the Health Insurance Act, the Canada Health Act or the Criminal Code (Canada), or regulations made thereunder; or

(e) prevent the reporting of information under section 72 of the Child and Family Services Act in respect of a child who is or may be in need of protection.

For a medical officer of health or the Chief Medical Officer of Health to disclose identifying or potentially identifying information in respect of a person against whom an order, application, certificate or report has been made under Part IV (communicable diseases) of the Act, they must fit within one of these exceptions. Paragraph (c) appears to be the only provision that might authorize disclosure in the circumstances described above.

This means that unless the medical officer of health can be confident that such a disclosure is for the purposes of “public health administration,” they would be disclosing that information on the hope and a prayer that they are correct in their interpretation of the phrase. One public health lawyer described its lack of clarity to the Commission:

There is a need to clarify what is meant by public health administration. Many might say that public health administration is meant to be interpreted to mean that you can tell your staff, for example those who are helping you draft orders, as opposed to meaning the medical officer of health can do what he or she needs to do to protect the public. It is not really very clear.

It is far from clear that this vague terminology allows the medical officer of health or the Chief Medical Officer of Health to do what is necessary to protect the public.

The Canadian Oxford Dictionary defines “administration” as “a management of a business” or “management of public affairs”. It is far from clear that this would permit the disclosure of identifying or potentially identifying information to anyone outside of the local health unit of the Ministry of Health.

As one public health lawyer said:
6. Privacy and Disclosure

There are a lot of circular arguments. The bottom line is that would probably be fine to disclose and people might not get wound up about it but it would be nice to be clear.

The Chief Medical Officer of Health and medical officers of health must be able to share identifying information, where necessary to protect the public. The fact that the person has been the subject of an application, order, certificate or report should not prohibit disclosure, provided it is in compliance with the privacy legislation. This is particularly vital in respect of disclosures to public health officials in other provinces or in the federal government.

As Dr. Basrur told the Justice Policy Committee:

It is not quite clear as yet how the chief medical officer of health in this case can and should report that information more broadly to, say, Health Canada or other authorities, and whether that can be nominal, or named, information with personal information in it or whether it must be anonymized information. So when you’re looking at things that should be clearer in the future – again, I can expect you’ll hear this from Justice Campbell in his interim report – that is one of those areas that would benefit from greater clarity.²⁰²

Recommendations

The Commission therefore recommends that:

- Subsection 39(2) of the Health Protection and Promotion Act be amended to allow an exception to s. 39(1) to permit the disclosure of the name of or any information that will or is likely to identify a person in respect of whom an application, order, certificate or report is made in respect of a communicable disease, by the Chief Medical Officer of Health or a medical officer of health to any person where it is necessary to investigate or prevent the spread of a communicable disease.

- Subsection 39(2) of the Health Protection and Promotion Act be amended to allow an exception to s. 39(1) to permit the disclosure of the name of or any

²⁰² Justice Policy Committee, Public Hearings, August 18, 2004, p. 139.
information that will or is likely to identify a person in respect of whom an application, order, certificate or report is made in respect of a communicable disease, by the Chief Medical Officer of Health or a medical officer of health to a public health authority as described in s. 39(2)(b) of the Personal Health Information Protection Act.

The Need for Clarity

Lawyers who advise health professionals and hospitals whether they should disclose will likely bear in mind the severe penalties in the privacy legislation and lean towards nondisclosure if there is any lack of clarity about the legal duty to disclose. Another risk is that the complexity of the law may enable individuals or institutions who do not want to disclose information, for whatever reason, to use the legislation as a shield and delay or breach their disclosure obligations.

The Ministry of Health and Long-Term Care, in a submission to the Commission, stated:

It is our view that the new Personal Health Information Protection Act, 2004, (PHIPA) resolves any concerns relating to “legal obstacles” and “lack of clarity” as outlined in your attachment entitled “Possible Issues Re: Legislation.” The passage of PHIPA received unanimous support in the Legislature. During the Committee hearings on the bill, there was no criticism that the proposed Act failed to address the concerns raised during the SARS outbreak.

While the legislation may appear clear to those who wrote it, the Commission has heard from many groups and individuals who find it unclear and confusing. As for the Committee hearings, one close observer of the proceedings told the Commission that the impact of the legislation on a new SARS-like outbreak was not discussed.

Consider the case of the hospital that took the position that there was not only an absence of legal authority to report cases of febrile respiratory illness to public health officials, but that to do so constitutes an illegal contravention of privacy legislation. Their interpretation of the legislation prohibited disclosure. Although no infection resulted from this position, it demonstrates that some will resist any disclosure to public health, however reasonable, unless an explicit legal duty can be demonstrated conclusively.
One professional organization described the need for clarity:

… the patient’s right to confidentiality does NOT override the public good. In providing care to any patient with a potentially infectious or contagious disease, all health care professionals (physicians, nurses, paramedics) and institutions MUST share such information in order to safeguard staff and to prevent further spread of the disease in question. The professionals involved are obligated to treat such information as confidential. Processes should be in place to address those individuals and/or institutions that fail to address this or who fail, in a timely manner, to provide appropriate confidentiality for the patient information that has been shared with them.

Expanded reporting duties and expanded information gathering and sharing powers under the *Health Protection and Promotion Act* are only part of the solution. Information necessary to enable public health officials to protect the public must not be blocked by the misunderstandings created by the complexities of privacy legislation. This is not to suggest that the provisions in the Act are not helpful, or thoughtfully drafted. But the duty to disclose information to public health officials, free from penalty under the privacy legislation, must be clear. It must be clear that if there is a duty to report a matter to public health, that duty prevails over any other consideration. As one health care provider told the Commission:

… specific legislation that clearly defines which act supercedes another in given situations will be important.

The Ministry, in a letter to the Commission,\(^{203}\) although reluctant to agree that changes are needed in the *Personal Health Information Protection Act*, acknowledged that the legislation is complex to the point that it would encourage health care providers to seek legal advice instead of acting immediately to comply with a valid demand for information under the *Health Protection and Promotion Act*:

If Ontario had had a PHIPA in place during the SARS outbreak, all of these provisions that have been highlighted would have provided greater clarity around information sharing. PHIPA, therefore, addresses the perceived “lack of clarity” or “legal obstacles” facing various health infor-

---

\(^{203}\) Letter from Mr. Phil Hassen, Deputy Minister of Health and Long-Term Care, to the Mr. Justice Archie Campbell, SARS Commission, August 4, 2004. See Appendix H to this report.
mation custodians during the SARS outbreak. The legislation, however, is complex as the rules cover a broad range of custodians and recipients. We cannot say, therefore, that this new Act is so clear that it would preclude health care providers from “seeking legal advice and direction instead of acting immediately.” Even if legislation were to be written in mandatory language, this may not alleviate concerns of those who need to rely on it for authority to do something or refrain from doing something. PHIPA does clearly set out that custodians, such as hospitals, nursing homes, nurses and doctors, can disclose personal health information to the Chief Medical Officer of Health or a medical officer of health or a person with similar authority in another province and ultimately does provide protection from liability to those providers who exercise their discretion reasonably in the circumstances.

The point is not that there is anything wrong with legal advice. In the early stages of the life of a statute a measure of education is necessary. The problems reviewed here, however, require clarifying amendments as well as education. The point is that the law should be so clear that lawyers do not have to argue with each other in the middle of an infectious disease outbreak about the obligation to disclose information to public health. Notwithstanding the logic of those who are intimately familiar with the exquisite legal intricacies of the privacy legislation, it must be remembered that the life of the law is not logic, but experience. Experience tells us that if the privacy law does not clearly authorize disclosure where legally required for public health purposes, such disclosure will be impeded.

As Dr. Henry told the Justice Policy Committee:

The one other caveat I wanted to bring up is the whole protection of privacy of health information. As you know, Bill 31 is going through the legislative process right now and it will in some ways severely curtail our ability to actually track and monitor certain diseases. I think we need to build our IT systems around protection of personal health information, but also somehow strike the balance between being able to use that information for the broader good and the prevention of transmission of disease. Right now that balance is a little unclear.\textsuperscript{204}

\textsuperscript{204. Justice Policy Committee, Public Hearings, August 18, 2004, p. 151.}
What is required is a simple statutory override to make clear that the duty to disclose to public health officials prevails over the privacy legislation. Even those who resist amendment agree that the duty to disclose to public health officials prevails over the privacy legislation. Why not say it clearly in the legislation?

Override provisions are not unheard of in statutes and indeed the *Health Protection and Promotion Act* itself contains one. The *Health Protection and Promotion Act* has been amended to set out the duties of disclosure and nondisclosure of a medical officer of health in respect of reports received about environmental or occupational health hazards, and the statute now provides an explicit override of the privacy legislation. Subsection 11(3) provides:

The obligation imposed on the medical officer of health under subsection (2) prevails despite anything to the contrary in the *Personal Health Information Protection Act, 2004*. 205

Both the *Personal Health Information Protection Act* and the *Health Protection and Promotion Act* must make it clear that the reporting obligations and information sharing powers set out in the *Health Protection and Promotion Act* prevail.

The Commission therefore recommends that the *Personal Health Information Protection Act* be amended to provide that nothing in the Act prevents a health information custodian from disclosing personal health information to the Chief Medical Officer of Health or a medical officer of health, pursuant to the *Health Protection and Promotion Act*.

205. The complete provision reads as follows:

11(1) Where a complaint is made to a board of health or a medical officer of health that a health hazard related to occupational or environmental health exists in the health unit served by the board of health or the medical officer of health, the medical officer of health shall notify the ministry of the Government of Ontario that has primary responsibility in the matter and, in consultation with the ministry, the medical officer of health shall investigate the complaint to determine whether the health hazard exists or does not exist.

(2) The medical officer of health shall report the results of the investigation to the complainant, but shall not include in the report personal health information within the meaning of the *Personal Health Information Protection Act, 2004* in respect of a person other than the complainant, unless consent to the disclosure is obtained in accordance with that Act.

(3) The obligation imposed on the medical officer of health under subsection (2) prevails despite anything to the contrary in the *Personal Health Information Protection Act, 2004*. 268
The Commission recommends that both the *Health Protection and Promotion Act* and the *Personal Health Information Protection Act* be amended to provide that in the event of any conflict between the two statutes, the disclosure duties in the *Health Protection and Promotion Act* prevail.

The *Personal Health Information Protection Act* provides protection from punishment in those cases where a health information custodian makes a reasonable disclosure, in good faith reliance on the *Personal Health Information Protection Act*, that later turns out should not have been made. Section 71(1) provides:

71(1). No action or other proceeding for damages may be instituted against a health information custodian or any other person for,

(a) anything done, reported or said, both in good faith and reasonably in the circumstances, in the exercise or intended exercise of any of their powers or duties under this Act; or

(a) any alleged neglect or default that was reasonable in the circumstances in the exercise in good faith of any of their powers or duties under this Act.

While this provides a measure of protection, similar protection should be extended to those who disclose in reliance on the *Health Protection and Promotion Act*.206

The Commission recommends that the *Personal Health Information Protection Act* be amended to provide that where a good faith disclosure is made to the Chief Medical Officer of Health or a medical officer of health, in reliance on the *Health Protection and Promotion Act*, the health information custodian will be exempt from liability.

---

206. The *Health Protection and Promotion Act* does exempt from liability a person who makes, in good faith, a report of a communicable disease under the Act. Subsection 95(4) provides:

No action or other proceeding shall be instituted against a person for making a report in good faith in respect of a communicable disease or a reportable disease in accordance with Part IV.

This protection does not clearly protect them from liability under privacy legislation. Moreover, if the reporting powers are broadened as recommended in Chapters 5 and 6 of this report, the protection afforded in s. 95(4) will have to be similarly broadened to protect any report authorized under the *Health Protection and Promotion Act*. 
Recommendations

The Commission therefore recommends that:

- The *Personal Health Information Protection Act* be amended to provide that nothing in the Act prevents a health information custodian from disclosing personal health information to the Chief Medical Officer of Health or a medical officer of health, pursuant to the *Health Protection and Promotion Act*.

- The *Health Protection and Promotion Act* and the *Personal Health Information Protection Act* be amended to provide that in the event of any conflict between the two statutes, the disclosure duties in the *Health Protection and Promotion Act* prevail.

- The *Personal Health Information Protection Act* be amended to provide that where a good faith disclosure is made to the Chief Medical Officer of Health or a medical officer of health, in reliance on the *Health Protection and Promotion Act*, the health information custodian is exempt from liability.

Disclosure for Research

A number of groups and individuals expressed concern to the Commission about the process by which scientists, during a health emergency, would have access to personal health information urgently required for the purpose of research to fight the emergency. During SARS, it was critical for scientists to have access to data to learn more about the cause of SARS and research possible treatment.

Section 44 of the *Personal Health Information Protection Act* sets out the rules in respect of disclosure of personal health information for the purposes of research.  

---

207. Section 44 provides:

Disclosure for Research

44(1) A health information custodian may disclose personal health information about an individual to a researcher if the researcher,

(a) submits to the custodian,
While long-term research is important, SARS revealed the importance of immediate short-term research. Rules and guidelines that permit the fast tracking of approval for disclosure of personal health information where research is urgently required are

(i) an application in writing,

(ii) a research plan that meets the requirements of subsection (2), and

(iii) a copy of the decision of a research ethics board that approves the research plan; and

(b) enters into the agreement required by subsection (5).

Research Plan

(2) A research plan must be in writing and must set out,

(a) the affiliation of each person involved in the research;

(b) the nature and objectives of the research and the public or scientific benefit of the research that the researcher anticipates; and

(c) all other prescribed matters related to the research.

Consideration by Board

(3) When deciding whether to approve a research plan that a researcher submits to it, a research ethics board shall consider the matters that it considers relevant, including,

(a) whether the objectives of the research can reasonably be accomplished without using the personal health information that is to be disclosed;

(b) whether, at the time the research is conducted, adequate safeguards will be in place to protect the privacy of the individuals whose personal health information is being disclosed and to preserve the confidentiality of the information;

(c) the public interest in conducting the research and the public interest in protecting the privacy of the individuals whose personal health information is being disclosed; and

(d) whether obtaining the consent of the individuals whose personal health information is being disclosed would be impractical.

Decision of Board

(4) After reviewing a research plan that a researcher has submitted to it, the research ethics board shall provide to the researcher a decision in writing, with reasons, setting out whether the board approves the plan, and whether the approval is subject to any conditions, which must be specified in the decision.
needed for the protection of the public’s health. As one health organization submitted to the Commission:

… the \textit{Personal Health Information Protection Act} needs to address the collection and use of confidential health information for research purposes during an infectious disease outbreak. During a health emergency, pressure may be brought to bear on hospital Research Ethics Boards for expedited approval of research and investigations designed to gain a better understanding of a new infectious disease. While such expediency is understandable, clear guidelines for the fast track approval of such studies is required, and the emergency sharing of health information on which the study depends. This is extremely critical when dealing with new agents of illness, where research findings will enable control of the outbreak.

\textbf{Recommendation}

\textbf{The Commission therefore recommends that:}

\begin{itemize}
  \item The Ministry of Health and Long-Term Care, in consultation with the appropriate community, establish fast-tracking approval procedures for access to personal health information for the purposes of urgently required research, to enable health care custodians to provide access to data in a timely manner, without fear of violating privacy legislation.
\end{itemize}

\textbf{Privacy Safeguards}

Safeguards are required to ensure that personal health information does not get disclosed beyond public health professionals who have public health duties.\footnote{208. The \textit{Health Protection and Promotion Act} provides some safeguards to protect personal health information in the hands of public health officials. For example, s. 39 of the Act, discussed in the previous chapter.} During SARS, one medical officer of health reported that functionaries in the Minister’s office, who had no public health duties, were at times privy to personal health information. They questioned why this was the case and maintained that under no circumstances would this be necessary:
We sat in the SARS Committee meetings and I recall [an individual] from the Minister’s office while we were discussing nominal information but very detailed clinical information – we were going through our line list of individuals – I thought it was completely outrageous … Non-health professionals, i.e. … Ministers and political staff, except those in the public health division who fall under confidentiality provisions of HPPA, should have no access to personal health information in times of crisis.

One professional organization described this problem to the Commission:

During SARS multiple reports of the improper sharing of confidential health information, being requested by political staff who had no clear need for the information, and open teleconference discussions of nominal information on patients where the teleconference participants were unclear, were had. This is unacceptable, placing the individual and their care provider in a difficult position, should the information be inappropriately disseminated further.

The power to obtain personal health information brings with it strong obligations to safeguard its privacy. Medical officers of health, as health information custodians, are required under the Personal Health Information Protection Act to have in place practices that comply with the requirements of the Act and regulations:

10(1). A health information custodian that has custody or control of personal health information shall have in place information practices that comply with the requirements of this Act and its regulations. 2004, c. 3, Sched. A, s. 10(1).

These practices should be uniform across the province and should ensure that only those public health officials who require access to personal health information to perform their duties under the Health Protection and Promotion Act have access to such information.

**Recommendation**

The Commission therefore recommends that:

- The Chief Medical Officer of Health review and, if necessary, strengthen the internal protocols and procedures now in place to ensure effective
privacy safeguards for personal health information received by public health authorities.

Conclusion

Health professionals and public health professionals should not have to negotiate through lawyers to enable the disclosure of information required by law. There should be no avenue for delay. In an infectious disease outbreak, time is of the essence. Public health physicians and staff require access to personal health information to enable them to identify cases of disease and to investigate and manage an outbreak. Medical officers of health must be able to obtain the information they need to do their job, the disclosure of which is required by law. Confusion around complex privacy laws must not impede the vital flow of this legally required information. Simple amendments, which in no way affect the integrity of privacy legislation, are required to fix this problem.

Recommendations

The Commission therefore recommends that:

• Section 39 of the Personal Health Information Protection Act be amended to include:

  ° A health information custodian shall disclose personal health information about an individual, to the Chief Medical Officer of Health or a medical officer of health if the disclosure is required under the Health Protection and Promotion Act.

• Subsection 39(2) of the Health Protection and Promotion Act be amended to allow an exception to s. 39(1) to permit the disclosure of the name of or any information that will or is likely to identify a person in respect of whom an application, order, certificate or report is made in respect of a communicable disease, by the Chief Medical Officer of Health or a medical officer of health to any person where it is necessary to investigate or prevent the spread of a communicable disease.

• Subsection 39(2) of the Health Protection and Promotion Act be amended to allow an exception to s. 39(1) to permit the disclosure of the name of or any information that will or is likely to identify a person in respect of whom an
application, order, certificate or report is made in respect of a communicable disease, by the Chief Medical Officer of Health or a medical officer of health to a public health authority as described in s. 39(2)(b) of the Personal Health Information Protection Act.

- The Personal Health Information Protection Act be amended to provide that nothing in the Act prevents a health information custodian from providing personal health information to the Chief Medical Officer of Health or a medical officer of health, pursuant to the Health Protection and Promotion Act.

- The Health Protection and Promotion Act and the Personal Health Information Protection Act be amended to state that in the event of any conflict between the two statutes, the duties in the Health Protection and Promotion Act prevail.

- The Personal Health Information Protection Act be amended to provide that where a good faith disclosure is made to the Chief Medical Officer of Health or a medical officer of health, in reliance on the Health Protection and Promotion Act, the health information custodian will be exempt from liability.

- The Ministry of Health and Long-Term Care, in consultation with the appropriate community, establish procedures for the fast-tracking of approval of access to personal health information for the purposes of urgently required research, to enable health care custodians to provide access to data in a timely manner, without fear of violating privacy legislation.

- The Chief Medical Officer of Health review, and if necessary strengthen, the internal protocols and procedures now in place to ensure effective privacy safeguards for personal health information received by public health authorities.
The Case for Whistleblower Protection

Ontario health care workers need whistleblower protection to ensure that public health risks are reported promptly to public health authorities without fear of consequences. Without this protection, fear of workplace consequences might discourage the timely disclosure of public health risk. Front line health care workers made enormous sacrifices during SARS. They are entitled to be protected when they raise an alarm to protect public health.

As one nurse told the Commission:

I want to have the freedom to speak out, so that I’m not worried I might lose my job.

Nurses and other health care workers should be able to alert public health authorities to infection control and disease outbreak problems within hospitals, nursing homes, and the like. If instruments are not being properly sterilized, if a hospital is not actively investigating reports of a possible infectious outbreak, health care workers should be able to report it to public health officials without fear of personal consequences. Workers who disclose information vital to protecting the public’s health should be assured that they are protected legally against any form of employer reprisal or workplace consequence.

This chapter will focus on the need to add public health whistleblower protection to the Health Promotion and Protection Act. As for other whistleblower issues, there are already whistleblower provisions in the Occupational Health and Safety Act,209 and the larger question of general whistleblower protection for public employees is beyond the scope of this Commission.

Subsection 95(4) of the *Health Protection and Promotion Act* does allow that “no action or other proceeding shall be instituted against a person for making a report in good faith in respect of a communicable disease or a reportable disease in accordance with Part IV.” However, it is of limited protection. As noted in a submission to the Commission:

The *Health Protection and Promotion Act* should be amended to provide reprisal protection for employees who, in good faith, raise concerns about how a public health risk is being addressed. The Act does provide that “No action or other proceeding shall be instituted against a person for making a report in good faith in respect of a communicable disease or a reportable disease in accordance with Part IV,” (*Health Protection and Promotion Act*, R.S.O. 1990, c. H.7, s. 95 (4)), but that protection only deals with reporting specific occurrences, and not with raising concerns about how such an occurrence is being addressed by the public health system. This lack of real “whistleblowing protection” for public health workers is a gap in Ontario’s health protection system.

Fear of reprisal is very real. Many nurses and other health care workers expressed fear of workplace consequences if it became known that they were being interviewed confidentially by the Commission. In some cases health care workers agreed to be interviewed on a confidential basis only after they understood that their disclosures to the Commission were protected by the whistleblower protection in Ontario’s *Public Inquiries Act*,210 which governs this Commission: Section 9.1 provides

1. No adverse employment action shall be taken against any employee or any person because the employee, acting in good faith, has made representations as a party or has disclosed information either in evidence or otherwise to a commission under this Act or to the staff of a commission.

2. Any person who contrary to subsection (1) takes adverse employment action against an employee is guilty of an offence and on conviction is liable to a fine of not more than $5,000.

---

3. This section applies despite any other Act and the oath of office of a Crown employee is not breached where information is disclosed as described in subsection (1).211

Even with this protection under the Public Inquiries Act some witnesses were initially reluctant to speak to the Commission. Their fear of workplace retaliation was more immediate to them than the seemingly remote protection provided by the statute.

The measure of the concern was expressed by one reluctant witness, a health care worker, who was “afraid of losing my job.” Even after being briefed on the confidential nature of the Commission process, and the whistleblower protection in the Public Inquiries Act, the witness said:

There are lots of other reasons for firing people.

The initial reluctance of some health care workers to speak confidentially to the Commission, even after the Public Inquiries Act whistleblower protection was explained, underlines their feelings of vulnerability even when given a measure of legal protection. Those feelings of vulnerability are necessarily greater when there is no legal protection at all in respect of a disclosure of a public health danger. Other than the protection when reporting a reportable or communicable disease as required by s. 95(4)212 of the Health Protection and Promotion Act, health care workers who disclose a public health hazard have no protection at all from workplace reprisal.

Health care work can be tough and demanding. The demanding work may strain relationships between workers and supervisors. The atmosphere and pressures on the hospital floor may be less conducive to appropriate disclosure than the higher-ups may think. The fear of retaliation exists and is very real in the minds of those who might have information highly relevant to the protection of the public against an outbreak of infectious disease. These fears have the potential to impede the reporting of information that is vital to the protection of other health care workers and the public, particularly in the case of an infectious disease, where timely reporting and action is critical.

211. These amendments received Royal Assent on June 23, 2003, following submissions from OPSEU calling for whistle-blower protection in the Walkerton Inquiry.
212. Subsection 95(4) provides:

No action or other proceeding shall be instituted against a person for making a report in good faith in respect of a communicable disease or a reportable disease in accordance with Part IV.
Barb Wahl, the then President of the Ontario Nurses’ Association (ONA), in a statement at the SARS Commission public hearings: emphasized the need for whistleblower protection:

Nurses need whistle-blower protection so that they can go elsewhere with the information they have. They need respect and recognition as professionals and essential members of the health care team. Nurses are tired of being shunted aside and disregarded. It’s another reason they’re leaving the profession. They see they’re not included in the decisions and, as a result, they feel they and their patients are not safe.

Adeline Falk-Rafael, President of the Registered Nurses Association of Ontario (RNAO) noted its long standing advocacy of whistleblower protection for health care workers as an important safety valve in the health care system:

Immediately introduce whistleblower legislation to ensure that nurses and other health care workers can express their concerns without fear of reprisal from their employer. RNAO first requested this legislation from the Premier of Ontario in March of 1998. Failure to implement this legislation has meant that an important safety valve is missing from our health care system.

Whistleblower protection is advocated by the unions that represent Ontario health care workers.

The Canadian Union of Public Employees (CUPE), in a written recommendation to the Commission, stated “Whistleblower legislation is necessary for any employees who feel an employer is putting themselves or the public at risk.”

213. The Ontario Nurses’ Association (ONA) is the trade union that represents 50,000 registered nurses and allied health professionals working in hospitals, long-term care facilities, public health, community agencies and industry throughout Ontario (Source: ONA website). On January 1, 2004, Linda Haslam Stroud succeeded Wahl as ONA President.

215. The Registered Nurses Association of Ontario (RNAO) is the professional association representing over 20,000 registered nurses in Ontario.

217. CUPE is Canada’s largest union. With more than half a million members across Canada, CUPE represents workers in health care, education, municipalities, libraries, universities, social services, public utilities, transportation, emergency services and airlines. (Source: CUPE website).
The Ontario Public Service Employees’ Union (OPSEU)\(^{218}\) in recommending whistleblower protection for health care workers, made the following submission to the Commission:

Any person with public health responsibilities should be able to bring their good faith concerns about public health risks to the attention of an independent public authority, and, if necessary, the public, without facing reprisal or retaliation from vested interests. The leading Canadian study makes the following observation concerning federal public servants:

An effective regime for the identification, disclosure and correction of wrongdoing . . . provides public servants with the tools and support they need to reveal and correct instances where conduct and decision-making fall short of the high standards expected in public institutions. In addition, a trusted disclosure regime can make a significant contribution to public service morale and conduct, and to public confidence in government. (Government of Canada, Report of the Working Group on Disclosure of Wrongdoing, 2003, Executive Summary: on Treasury Board website.)

These comments apply equally to persons employed in public sector health functions.

OPSEU made the following recommendation to the Commission:

Amend the *Health Protection and Promotion Act* to add a provision similar to the *Environmental Bill of Rights*, Section 105, but broadened to include protection against reprisals: where the employee is employed by an enforcement agency, for bringing the matter to public attention after the matter was first brought to the attention of the employer of that person.

Those concerned about the need for whistleblower protection will experience a shock of recognition in the findings made by Associate Chief Judge Murray Sinclair, in the

\(^{218}\) OPSEU is the third largest union in Ontario, with approximately 100,000 full- and part-time members, nearly 500 locals, and 20 offices across Ontario. OPSEU represents Ontario public service employees, education workers, health workers, social services workers, justice workers and some municipal employees.
Report of the Manitoba Paediatric Cardiac Surgery Inquest. The inquiry looked at the deaths of 12 infants at a Winnipeg Hospital and concluded that five were preventable, three “were still surrounded by more questions than answers,” and only one had been acceptably explained. Judge Sinclair found:

The evidence suggests that because nursing occupied a subservient position within the HSC structure, issues raised by nurses were not always treated appropriately.  

He wrote:

Historically, the role of nurses has been subordinate to that of doctors in our health-care system. While they are no longer explicitly told to see and be silent, it is clear that legitimate warnings and concerns raised by nurses were not always treated with the same respect or seriousness as those raised by doctors. There are many reasons for this, but the attempted silencing of members of the nursing profession, and the failure to accept the legitimacy of the concerns, meant that serious problems in the paediatric cardiac surgery programme were not recognized or addressed in a timely manner. As a result, patient care was compromised.

Judge Sinclair said:

It is necessary to put in place structures that ensure that all staff can make their concerns known without fear or reprisal. It is also important to ensure that the structure of the HSC be adjusted to ensure that the position of nursing does not continue to be a subservient one.

To this end, he recommended that:

The Province of Manitoba consider passing ‘whistle blowing’ legislation to protect nurses and other professionals from reprisals stemming from their disclosure of information arising from a legitimately and reasonably held concern over the medical treatment of patients.

---

Everything said in that report about the barriers to disclosure, and the need for whistleblower protection, applies to the concerns expressed by Ontaro health care workers. All Ontario workers now enjoy a limited protection in respect of the disclosure of workplace health and safety hazards. The Ontario *Occupational Health and Safety Act*\(^{221}\) whistleblower provision provides:

(50) No employer or person acting on behalf of an employer shall,

(a) dismiss or threaten to dismiss a worker;

(b) discipline or suspend or threaten to discipline or suspend a worker;

(c) impose any penalty upon a worker; or

(d) intimidate or coerce a worker,

because the worker has acted in compliance with this Act or the regulations or an order made thereunder, has sought the enforcement of this Act or the regulations or has given evidence in a proceeding in respect of the enforcement of this Act or the regulations or in an inquest under the *Coroners Act*.

The Ontario workplace safety disclosure provisions require that the worker seek compliance with the statute, as opposed to simply disclosing a concern about a hazard, before the worker attracts whistleblower protection. The focus of this legislation is not on public health but rather on workplace safety, a matter to be dealt with in the final report.

It is important to distinguish between occupational health and safety whistleblower protection and public health whistleblower protection directed to health care workers who make a disclosure to a medical officer of health in respect of a public health risk. Obvious examples include disclosure of a dangerous infection control practice in a hospital, or a cluster of cases that warrants investigation for evidence of an infectious disease outbreak.

A number of statutes, both provincial and federal, provide whistleblower protection. For example, in addition to the *Occupational Health and Safety Act*, Ontario’s

\(^{221}\) R.S.O. 1990, c. O-1.
Environmental Bill of Rights makes it an offence for any employer to take reprisals against an employee where the latter has, in good faith, complained, provided information for an investigation or review or participated in a process under the Act.\(^{222}\) Similarly, the Ontario Labour Relations Act, 1995, makes it an offence for either the employer or the Union to take employment action against a person who has made a complaint under the Act.\(^{223}\)

\(^{222}\) R.S.O. 1993, s. 105(1) provides:

Any person may file a written complaint with the Board alleging that an employer has taken reprisals against an employee on a prohibited ground.

Reprisals mean:

(2) For the purposes of this Part, an employer has taken reprisals against an employee if the employer has dismissed, disciplined, penalized, coerced, intimidated or harassed, or attempted to coerce, intimidate or harass, the employee.

Subsection (3) sets out the prohibited grounds:

(3) For the purposes of this Part, an employer has taken reprisals on a prohibited ground if the employer has taken reprisals because the employee in good faith did or may do any of the following:

1. Participate in decision-making about a ministry statement of environmental values, a policy, an Act, a regulation or an instrument as provided in Part II.

2. Apply for a review under Part IV.

3. Apply for an investigation under Part V.

4. Comply with or seek the enforcement of a prescribed Act, regulation or instrument.

5. Give information to an appropriate authority for the purposes of an investigation, review or hearing related to a prescribed policy, Act, regulation or instrument.

6. Give evidence in a proceeding under this Act or under a prescribed Act.

\(^{223}\) S.O., 1995, c. 1, Sched. A, s. 87(1) provides:

(1) No employer, employers’ organization or person acting on behalf of an employer or employers’ organization shall,

(a) refuse to employ or continue to employ a person;

(b) threaten dismissal or otherwise threaten a person;

(c) discriminate against a person in regard to employment or a term or condition of employment; or
7. Whistleblower Protection

There are somewhat similar whistleblower provisions in federal legislation such as the *Canadian Environmental Protection Act, 1999*.224

(d) intimidate or coerce or impose a pecuniary or other penalty on a person,

because of a belief that the person may testify in a proceeding under this Act or because the person has made or is about to make a disclosure that may be required in a proceeding under this Act or because the person has made an application or filed a complaint under this Act or has participated in or is about to participate in a proceeding under this Act.

Same

(2) No trade union, council of trade unions or person acting on behalf of a trade union or council of trade unions shall,

(a) discriminate against a person in regard to employment or a term or condition of employment; or

(b) intimidate or coerce or impose a pecuniary or other penalty on a person,

because of a belief that the person may testify in a proceeding under this Act or because the person has made or is about to make a disclosure that may be required in a proceeding under this Act or because the person has made an application or filed a complaint under this Act or has participated in or is about to participate in a proceeding under this Act.

224. R.S.C. 1999, c. 33, s. 16. provides:

(1) Where a person has knowledge of the commission or reasonable likelihood of the commission of an offence under this Act, but is not required to report the matter under this Act, the person may report any information relating to the offence or likely offence to an enforcement officer or any person to whom a report may be made under this Act.

(2) The person making the report may request that their identity, and any information that could reasonably be expected to reveal their identity, not be disclosed.

(3) No person shall disclose or cause to be disclosed the identity of a person who makes a request under subsection (2) or any information that could reasonably be expected to reveal their identity unless the person authorizes the disclosure in writing.

(4) Despite any other Act of Parliament, no employer shall dismiss, suspend, demote, discipline, harass or otherwise disadvantage an employee, or deny an employee a benefit of employment, by reason that

(a) the employee has made a report under subsection (1);

(b) the employee, acting in good faith and on the basis of reasonable belief, has refused or stated an intention of refusing to do anything that is an offence under this Act; or

(c) the employee, acting in good faith and on the basis of reasonable belief, has done or stated an intention of doing anything that is required to be done by or under this Act.
Whistleblower protection of a more general nature has been advocated in Ontario from time to time. A complicated series of 1993 amendments to the *Public Service Act*, passed by the Legislative Assembly, would have provided general protection for Ontario government employees against retaliation for disclosing allegations of serious government wrongdoing and would also have provided a means for making those allegations public. The legislation proposed an elaborate structure of advice, disclosure, review, reports, notices, reviews, exemptions, submissions, consents, referrals, complaints, arbitrations, settlements, and appeals involving an independent counsel as an officer of the Legislative Assembly. Since its enactment 11 years ago no government has ever proclaimed it in force. The Act applies primarily to government employees and even if proclaimed would withhold protection from most health care workers who are not employed by a government institution.

A more recent Ontario initiative was the introduction into the Legislative Assembly on May 23, 2002, by Shelley Martel M.P.P., of Bill 27, “*An Act to promote patients’ rights and to increase accountability in Ontario’s health care system.*” This private members’ public bill called for the appointment of a Health Care Standards Commissioner, whose function would include, among other things the administration of a system of whistleblower protection. The Act was never

---

226. The proposed whistleblower section provides:

4(1) The purposes of this section are,

- to protect employees of providers of health care services from adverse employment action for disclosing allegations of noncompliance with the Patients’ Bill of Rights or a health care standard; and

- to provide the means for making those allegations public.

4(2) An employee of health care service provider may disclose to the Commissioner information that is obtained in the course of his or her employment and that the employee is otherwise required to keep confidential, for either or both of the following purposes:

To seek advice about the employee’s rights and obligations;

To allow the information to be made public, if the employee believes that it may be in the public interest to do so.

Subsection 4(5) provides:

No provider of health care services or person acting on behalf of such a provider shall take adverse employment action against an employee because the employee has, acting in good faith, disclosed information under subsection (2).
The focus of that proposal was on patients’ rights and health care standards generally, not on public health risk in particular. It involved a complex system of reporting, including a separate agency to receive and investigate complaints.

More recently, two pieces of federal legislation one enacted and one pending, provided whistleblower protection in the federal domain.

The first, Bill C-12, repealed and replaced the former Quarantine Act, with "An Act to prevent the introduction and spread of communicable diseases." This new Quarantine Act was passed on February 10, 2005. It contains a section which provides:

54. (1) A person who, in good faith, reports to a screening officer, a quarantine officer or an environmental health officer a contravention of this Act by another person, or the reasonable likelihood of such a contravention, may request that their identity, and any information that could reasonably reveal their identity, not be disclosed to their employer or the other person.

(2) Subject to any other Act of Parliament, no person shall disclose or permit the disclosure of that identity or information unless authorized in writing by the person who made the request.

(3) Despite any other Act of Parliament, no person shall dismiss, suspend, demote, discipline, deny a benefit of employment to, harass or otherwise disadvantage a person for having

a) made a report under subsection (1);

b) refused or stated an intention of refusing to do anything that they believed on reasonable grounds was or would be a contravention under this Act; or

---

227. Bill 22 was first introduced as private members in Bill 50, 1998, in the 2nd Session of the 36th Parliament by Marion Boyd. Bill 22 remains essentially the same as drafted under Ms. Boyd’s direction with two additions noted by Ms. Martel in 2002, in the 3rd Session 33rd Parliament, in debate and second reading. It has been referred to the Committee of the Whole House once under Ms. Boyd and once under Ms. Martel but was never debated and died.
c) done or stated an intention to do anything that they believed on reasonable grounds was required under this Act.

The other recent piece of federal legislation is Bill C-11, titled *An Act to establish a procedure for the disclosure of wrongdoings in the public sector, including the protection of persons who disclose the wrongdoings.*\(^{228}\) It mandates the establishment of a process by which public sector employees can report wrongdoings in the public sector. Section 19 prohibits reprisals against public servants who make disclosures in accordance with the Act. The protection, however, is limited to federal public sector employees.

Recently, the Justice Policy Committee, examining emergency management law in Ontario, made the following recommendation in respect of whistleblower protection:

> Preventing the spread of communicable diseases such as SARS, and ensuring a proper response by the public health system requires open communication between those on the front line, hospital administrators, and government representatives. Sec. 95(4) of the *Health Protection and Promotion Act* protects employees who report occurrences of communicable or reportable diseases, but does not protect, for example, individuals who raise concerns about how disease is being addressed by the public health system.

14. The Committee recommends that government protect employees who, in good faith, raise concerns about public health and other emergency risks by codifying whistleblower protection.\(^{229}\)

### Principles of Whistleblower Protection

Enough has been said to demonstrate the wide range of current whistleblower provisions and proposals which exist federally and in Ontario. A similarly wide range of legislation exists in other countries.\(^{230}\) The form of protection depends on its purpose. Some whistleblower statutes have as their purpose the public exposure and prosecu-

\(^{228}\) Bill C-11 received first reading on October 8, 2004.

tion of the employer. These statutes focus on wrongdoing and punishment. However, the object of public health whistleblower protection is not to punish but to protect the public’s health by ensuring timely investigation of a public health risk.

The structure of public health whistleblower protection would be necessarily different from the provincial workplace safety provision and the federal environmental provisions. The latter statutes deal largely with disclosure for the purpose of enforcement or prosecution, while public health disclosure is encouraged for the purpose of investigation and correction.

Another unique feature of health care worker whistleblowing is the private and confidential health information about individual patients that might necessarily be involved in the disclosure to a medical officer of health of a public health danger.

It is beyond the Commission’s mandate to debate the question of whether there should be some form of general whistleblower protection throughout the health care system, or indeed the government in general. The Commission’s mandate is limited to the public health issues raised by SARS.

The Commission proposes a strong and simple form of protection based on the need to protect employees and encourage the speedy investigation and resolution of public health risks without focusing on wrongdoing or prosecution. The Commission’s proposal consists of a clear prohibition against whistleblower retaliation and requires no administrative machinery.

SARS demonstrated that an infection control problem in one hospital can quickly become a problem for the entire province. It must be ensured that any problem in any health care facility that creates a public health hazard is brought to the attention of the medical officer of health or Chief Medical Officer of Health. Otherwise such problems can simmer within a health care institution, uninvestigated and unknown to the authorities, and then break out into the community suddenly and without warning.

The elements of the proposed protection are:

- It applies to every health care worker in Ontario and to everyone in Ontario who employs or engages the services of a health care worker;

- It enables disclosure to a medical officer of health (including the Chief Medical Officer of Health);
• It includes disclosure to the medical officer of health (including the Chief Medical Officer of Health) of confidential personal health information;

• It applies to the risk of spread of an infectious disease and to failures to conform to the Health Protection and Promotion Act;

• It prohibits any form of reprisal, retaliation or adverse employment consequences direct or indirect;\(^\text{231}\)

• It requires only good faith on the part of the employee; and

• There is both a punitive and a remedial penalty attached to the protection.

The protection should apply to a broad category of people, from nurses, to doctors, to porters, clerks and cleaning staff. It should apply to anyone who employs or engages the services of a health care worker, whether they be permanent staff, contract staff, full-time staff, or part-time casual staff. Each and every health care worker in the province must be assured an equal level of protection, regardless of location of employment or their employment status.

The Commission recommends that the whistleblowing be permitted to the local medical officer of health or the Chief Medical Officer of Health. Some have recommended to the Commission that the whistleblower provisions must include the power to allow a health care worker to whistleblow publicly. For example, OPSEU, in their submission to the Commission, stated:

Indeed, we suggest that this protection be augmented. The Environmental Bill of Rights provision does not include protection for providing information to the public. This shortcoming is of particular importance in circumstances where the employee of an enforcement agency is raising a concern that the enforcement agency itself is not performing its duties appropriately. In those circumstances, the only practical alternative for

\(^{231}\) Although specific types of reprisal could be listed, as in Ontario’s workplace legislation, the listing of specific examples can shift the focus from the strong general prohibition to any gaps in the examples that can be found by an ingenious lawyer or administrator. It is therefore recommended that the prohibition remain general.
that employee may be to provide the information to the public or to the political process for review. There should be protection for doing so.

The extension of whistleblower protection into the political and media arena would add an entirely new layer to the proposed system of disclosure to the Chief Medical Officer of Health or the medical officer of health. Such extension would require a separate system of safeguards to guarantee that disclosure could not bring confidential personal health information directly or indirectly to the public domain.

It is not clear at this time that anything is required beyond confidential disclosure to the Chief Medical Officer of Health or a medical officer of health who are protected from political interference and armed with the fullest independent authority to investigate and to intervene and speak out publicly\textsuperscript{232} without fear of employment consequences. The proposed system of protected disclosure to the Chief Medical Officer of Health or a medical officer of health should be given a chance to work before building an extra layer on the speculation that the proposed system will not work. Until the proposed system has been given a chance to work, the proposal for media and public disclosure is not ripe for enactment.

The Commission recommends that this whistleblower protection described above, be included in the \textit{Health Protection and Promotion Act} and that it extend to all disclosures made in relation to the risk of spread of infectious disease and/or violations of the \textit{Health Protection and Promotion Act}. It would thus become an integral part of the public health protection system administered by the medical officer of health and the Chief Medical Officer of Health.

For three reasons, the Commission recommends that the disclosure be tied directly to the risk of the spread of infectious disease and/or violations of the \textit{Health Protection and Promotion Act}.

The first reason is that other health system problems, such as patient treatment generally, patient safety, occupational health and safety and other general health issues, are outside the direct responsibility of the Chief Medical Officer of Health and the medical officer of health. They cannot, with their enormous range of duties and limited resources, be expected to solve all the problems of the health care system. As one expert commented to the Commission:

\textsuperscript{232} As noted above, the government has increased the independence of the Chief Medical Officer of Health. This report recommends further measures of independence for the Chief Medical Officer of Health and local medical officers of health.
... the push will come that it ... needs to be universal. If I see a patient maltreated, I want to be able to report; I do not care if it is a public health issue or not ... The worst-case scenario is it gets broadened, broadened, broadened and the medical officers of health become the arbiters of every problem in the health system.

The second reason is that to encourage health care workers to report to the medical officers of health problems unrelated to their own duties and resources is to create unrealistic expectations on the part of the public as to the limited role of the medical officers of health and their inability to solve all problems. As another health expert cautioned:

Keep in mind too, the medical officers of health are constrained by the Act itself. Their powers are set out in the Act, their ability to respond to whistle blowing is limited by the Act. So if they are getting a whole bunch of reports outside their mandate, it is true that they are not under any obligation to act. But it is going to create a fairly negative impression from members of the public if they are being asked to do things that are clearly outside their authority to do under the Act and they are going to get such pressure if there is no limit put on what sort of complaints can be brought forward to the medical officer of health as part of whistle-blower protection.

To encourage workers to report a problem to an official who has no mandate or ability to deal with the problem is to mislead both the worker and the public.

The third reason is that other forms of disclosure relating to matters such as worker health and safety are already covered by existing legislation and governed by the machinery of other statutes such as the Occupational Health and Safety Act. Workplace health and safety issues arising from SARS are strongly on the Commission's agenda and will be dealt with in the final report. This interim report deals only with the public health aspects of whistleblower disclosure where health care workers have no protection at all. Whatever issues may be identified in the current legislation or in the role that the Ministry of Labour played during the SARS outbreak, the solution does not lie in forcing the medical officer of health to intervene in relation to issues outside their mandate, resources and legal powers.

The good faith requirement proposed by this Commission excludes from protection only those disclosures that are made for some bad faith purpose, such as personal malice. Some whistleblower legislation, by requiring “reasonable and probable
grounds” instead of mere good faith, diminishes the protection afforded to the worker.

To require that the worker have “reasonable and probable grounds” to believe that the apprehended problem actually does exist in fact is a high hurdle for the health care worker, akin to the criminal requirement that a police officer, before laying a criminal charge, must have objective reasonable and probable grounds to believe that a criminal offence has been committed. There are lower thresholds such as “reasonable suspicion” and “reason to believe.” A requirement of “reasonable and probable grounds” or even “reasonable suspicion” attracts the criminal standard and it could lead to endless arguments in court about the degree of proof required before a health care worker can disclose a problem. This criminal law baggage is an unnecessary burden for the health care worker who sees a potential infection control problem or a cluster of uninvestigated suspicious infections and simply wants to make sure that someone looks into it.

It is important to ensure that the whistleblower protection does not put the threshold too high for effective health care worker protection. The Commission recommends that the worker be protected so long as the disclosure is made in good faith. In recommending the good faith requirement the Commission rejects the “reasonable and probable grounds” requirement that would afford too little protection to the worker.

Finally, the protection must come with penalties for violation, both punitive and remedial. For example, paragraph 70(1)(a) of the Personal Health Information Protection Act, makes it an offence for anyone to dismiss, suspend, demote, discipline, harass or otherwise disadvantage a person who has made a report or complaint to the Commissioner under the Act. Such a violation is punishable by a fine of up to

---

233. The Public Interest Disclosure Act, 1998 (U.K.), 43B(2) of the United Kingdom:

to qualify for protection, requires that the worker making the disclosure must be acting in good faith throughout and must have reasonable grounds for believing that the information disclosed indicates the existence of one of the defined problems.

234. Subsection 70(1) provides:

No one shall dismiss, suspend, demote, discipline, harass or otherwise disadvantage a person by reason that,

(a) the person, acting in good faith and on the basis of reasonable belief, has disclosed to the Commissioner that any other person has contravened or is about to contravene a provision of this Act or its regulations;
$50,000.00 where the offender is a natural person and $250,000.00 where the offender is not a natural person.\textsuperscript{235}

While these deterrent penalties are essential, remedial protection is equally important. It is not enough to punish the employer if the employee is left without any remedy. It is of little assistance to the health care worker if the violating employer is fined but the worker is left without a job. Other statutes, such as the \textit{Environmental Bill of Rights}\textsuperscript{236}

\underline{Subsection 72(1) provides:}

A person is guilty of an offence if the person,

(j) contravenes section 70.

\underline{235. Subsection 72(2) provides:}

A person who is guilty of an offence under subsection (1) is liable, on conviction,

(a) if the person is a natural person, to a fine of not more than $50,000; and

(b) if the person is not a natural person, to a fine of not more than $250,000.

\underline{236. Subsection 105(1) provides:}

Any person may file a written complaint with the Board alleging that an employer has taken reprisals against an employee on a prohibited ground.

\textbf{Reprisals}

(2) For the purposes of this Part, an employer has taken reprisals against an employee if the employer has dismissed, disciplined, penalized, coerced, intimidated or harassed, or attempted to coerce, intimidate or harass, the employee.

\textbf{Prohibited grounds}

(3) For the purposes of this Part, an employer has taken reprisals on a prohibited ground if the employer has taken reprisals because the employee in good faith did or may do any of the following:

1. Participate in decision-making about a ministry statement of environmental values, a policy, an Act, a regulation or an instrument as provided in Part II.

2. Apply for a review under Part IV.

3. Apply for an investigation under Part V.

4. Comply with or seek the enforcement of a prescribed Act, regulation or instrument.
7. Whistleblower Protection

and the Occupational Health and Safety Act,\textsuperscript{237} have attempted to address this issue by establishing procedures for review by the Ontario Labour Relations Board, in cases of

5. Give information to an appropriate authority for the purposes of an investigation, review or hearing related to a prescribed policy, Act, regulation or instrument.

6. Give evidence in a proceeding under this Act or under a prescribed Act.

Labour relations officer, authorization

106. The Board may authorize a labour relations officer to inquire into a complaint.

Labour relations officer, inquiry into complaint

107. A labour relations officer authorized to inquire into a complaint shall make the inquiry as soon as reasonably possible, shall endeavour to effect a settlement of the matter complained of and shall report the results of the inquiry and endeavours to the Board.

Inquiry by the Board

108. If a labour relations officer is unable to effect a settlement of the matter complained of, or if the Board in its discretion dispenses with an inquiry by a labour relations officer, the Board may inquire into the complaint.

Burden of proof

109. In an inquiry under section 108, the onus is on the employer to prove that the employer did not take reprisals on a prohibited ground.

Determination by the Board

110. If the Board, after inquiring into the complaint, is satisfied that the employer has taken reprisals on a prohibited ground, the Board shall determine what, if anything, the employer shall do or refrain from doing about the reprisals.

Same

(2) A determination under subsection (1) may include, but is not limited to, one or more of,

(a) an order directing the employer to cease doing the Act or acts complained of;

(b) an order directing the employer to rectify the Act or acts complained of; or

(c) an order directing the employer to reinstate in employment or hire the employee, with or without compensation, or to compensate instead of hiring or reinstatement for loss of earnings or other employment benefits in an amount assessed by the Board against the employer.

237. Subsection 50(1) provides:

No employer or person acting on behalf of an employer shall,
7. Whistleblower Protection

(a) dismiss or threaten to dismiss a worker;

(b) discipline or suspend or threaten to discipline or suspend a worker;

(c) impose any penalty upon a worker; or

(d) intimidate or coerce a worker,

because the worker has acted in compliance with this Act or the regulations or an order made there-under, has sought the enforcement of this Act or the regulations or has given evidence in a proceeding in respect of the enforcement of this Act or the regulations or in an inquest under the Coroners Act.

Arbitration

(2) Where a worker complains that an employer or person acting on behalf of an employer has contravened subsection (1), the worker may either have the matter dealt with by final and binding settlement by arbitration under a collective agreement, if any, or file a complaint with the Board in which case any rules governing the practice and procedure of the Board apply with all necessary modifications to the complaint.

Inquiry by Board

(3) The Board may inquire into any complaint filed under subsection (2) and section 96 of the Labour Relations Act, 1995, except subsection (5), applies with all necessary modifications as if such section, except subsection (5), is enacted in and forms part of this Act.

Same

(4) On an inquiry by the Board into a complaint filed under subsection (2), sections 110, 111, 114 and 116 of the Labour Relations Act, 1995 apply with all necessary modifications.

Onus of proof

(5) On an inquiry by the Board into a complaint filed under subsection (2), the burden of proof that an employer or person acting on behalf of an employer did not act contrary to subsection (1) lies upon the employer or the person acting on behalf of the employer.

Jurisdiction when complaint by Crown employee

(6) The Board shall exercise jurisdiction under this section on a complaint by a Crown employee that the Crown has contravened subsection (1).

Board may substitute penalty

(7) Where on an inquiry by the Board into a complaint filed under subsection (2), the Board determines that a worker has been discharged or otherwise disciplined by an employer for cause and the contract of employment or the collective agreement, as the case may be, does not contain a specific penalty for the infraction, the Board may substitute such other penalty for the discharge or discipline as to the Board seems just and reasonable in all the circumstances.
dismissal or workplace reprisals against a whistleblowing employee. In both statutes the burden of proof is on the employer to establish that it did not take reprisals on the prohibited ground. Health care workers who whistleblow for the protection of the public’s health require protection equal to that afforded by the *Environmental Protection Act* and the *Occupational Health and Safety Act*.

The Commission therefore recommends that an employer who breaches the whistleblower protection is liable to a fine of up to $50,000.00 where the offender is a natural person and $250,000.00 where the offender is not a natural person, and that remedial machinery be enacted to restore a whistleblower to the position he or she held before the unlawful reprisal.\(^{238}\)

**Conclusion**

Any health care worker should be free to alert public health authorities to a situation that involves the risk of spreading an infectious disease, or a failure to comply with the *Health Protection and Promotion Act*. Public health officials do not have the resources to be present in every health care facility at every moment. While one would expect that a facility administrator, infection control specialist, or practitioner would report to public health officials situations or cases that might risk the public’s health, the cost of nonreporting or inaction is too high. In the event of such a failure to report, regardless of its cause, it is not enough to hope that public health officials will stumble across the problem eventually. SARS and other diseases\(^{239}\) clearly demonstrate the importance of timely reporting of a risk to public health. Health care workers can be the eyes and ears of public health and the front line protectors of the public’s health. They must be free to communicate with public health officials without fear of employment consequences or reprisals.

---

238. The liability and penalty should be the same as that in the *Personal Health Information Protection Act*, including liability of officers and other employees as set out in s. 72(3). It provides:

72(3) If a corporation commits an offence under this Act, every officer, member, employee or other agent of the corporation who authorized the offence, or who had the authority to prevent the offence from being committed but knowingly refrained from doing so, is a party to and guilty of the offence and is liable, on conviction, to the penalty for the offence, whether or not the corporation has been prosecuted or convicted.

It should also include liability of directors.

239. For example, Tuberculosis. Consider the case of the delayed reporting of a homeless man with tuberculosis, which is discussed earlier in the “Reporting Requirements” chapter.
Recommendation

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to provide health care workers whistleblower protection in accordance with the following principles:
  
  - It applies to every health care worker in Ontario and to everyone in Ontario who employs or engages the services of a health care worker;
  
  - It enables disclosure to a medical officer of health (including the Chief Medical Officer of Health);
  
  - It includes disclosure to the medical officer of health (including the Chief Medical Officer of Health) of confidential personal health information;
  
  - It applies to the risk of spread of an infectious disease and to failures to conform to the *Health Protection and Promotion Act*;
  
  - It prohibits any form of reprisal, retaliation or adverse employment consequences direct or indirect;\(^{240}\)
  
  - It requires only good faith on the part of the employee; and
  
  - It not only punishes the violating employer but also provides a remedy for the employee.\(^{241}\)

---

\(^{240}\) Although specific types of reprisal could be listed, as in Ontario’s workplace legislation, the listing of specific examples can shift the focus from the strong general prohibition to any gaps in the examples that can be found by an ingenious lawyer or administrator. It is therefore recommended that the prohibition remain general.

\(^{241}\) As noted above, the punishment recommended for an employer who violates the protection is a fine of up to $50,000.00 where the employer is a natural person and $250,000.00 where the employer is not a natural person.
Quarantine

Introduction

Quarantine and isolation are essential defences against infectious disease outbreaks. Public health officials must have the power to isolate those who are infected and to quarantine those who may have been exposed to infection and may be infectious to others.242

It is a great tribute to health care workers and the public that virtually all the quarantine and isolation during SARS took place voluntarily. Many thousands of people were quarantined in the greater Toronto area, enduring 10 days or more of home isolation.

It was necessary in only a handful of cases to resort to formal orders under the Health Protection and Promotion Act. Only 27 orders were issued in Toronto. It is a heartening demonstration of public cooperation, and a remarkable tribute to the public spirit of so many people, that so few formal orders were necessary.

The remarkable story of those who suffered quarantine without complaint will be told in the Commission’s final report which will also address a number of concerns expressed about the administration of the quarantine powers. This interim report on legislative change will examine the legal machinery of quarantine in light of SARS and recommend some amendments to the Health Protection and Promotion Act.

Public Cooperation

Before turning to legal powers it must be emphasized that any fight against infectious disease depends above all on public cooperation. Without public cooperation, laws are little help.

242. The word “quarantine” has a technical legal meaning quite different from the ordinary meaning understood by everyone during SARS. This is discussed below.
SARS revealed an enormous spirit of public cooperation that has drawn the attention of foreign researchers. Of note are the findings of a major U.S. study of quarantine in Toronto that drew on a comprehensive series of interviews, telephone polls and focus groups. It concluded that civic duty, not fear of legal consequences, was the main motivator for those who observed quarantine:

Overall, 94% of the 195 quarantined health care workers in our Health Care Workers Survey said that the most important reason for complying was to reduce the risk of transmission to others. This was the principal motivation among non-health care workers as well; “protection of the health of the community” was cited by 50 of 68 general population poll respondents who were directly affected by quarantine, and the majority of interviewees and focus group participants cast this motivation as “civic duty.”

In general, fear of running afoul of the law played little role in compliance. None of the 68 General Population Survey respondents who were directly affected by quarantine said that their most important reason for complying was to avoid enforcement measures and penalties, and 24 of 30 respondents who had been quarantined and were aware of the penalties said that their knowledge of these penalties did not affect their decision to comply.243

What generated this remarkable level of civic duty? According to this U.S. study, some distinctive elements of Canadian society, including publicly funded health care, likely helped to promote high levels of quarantine compliance:

With the bulk of the Toronto SARS outbreak contained primarily in its health care facilities and among its health care workers, a centralized health care system (including employee pay and benefits) offered some advantages. These unifying aspects will not be in place in societies that rely heavily on private health care. Finally, while the overall quarantine compliance rate among residents of the GTA appears to have been high, the influence of “civic duty” and social responsibility may not be as significant in other countries and cultures.244

244. Ibid, p. 271.
Added one expert from the Centers for Disease Control and Prevention in an interview with the Commission:

I really believe you were the model. It may not feel that way inside your silo, but you really did move boldly and swiftly. We are all forever grateful for that fact that when you did this, you treated your Canadian citizens with dignity and respect and a lot of people are starting to write on this in academia . . . The way you proceeded appeared to be transparent. It appeared to be open and I think it worked. The data is stunning. The data that the Toronto health people, Dr. Barbara Yaffe and Jane Speakman, present . . . We all know about civil liberties and the aggressive advocacy-driven U.S. civil liability system and the civil liberties ship that launched itself in 1954 in this country, we believed that there would be a much more hostile perception to quarantine. And so seeing your data is stunning. Why did it go so well?

Laws are only the last resort. Legal procedures are useless without overwhelming public cooperation of the kind demonstrated in SARS. While it is important to strengthen the legal machinery available to public health officials, it is even more important to strengthen the things that encourage public cooperation. It is essential to ensure that the spirit of cooperation shown during SARS is not taken for granted. It must be nurtured and promoted using the lessons learned from SARS as a guide.

Public cooperation depends on public confidence that public health decisions are made on an independent medical basis with the single-minded goal of protecting the public from infectious disease. Any perception that decisions are made for political or economic reasons will sap public confidence and diminish public cooperation. That is why it is so important to have the Chief Medical Officer of Health, with the assistance where necessary of other public officials, actually and visibly in charge of any public health emergency.

Public cooperation depends on public understanding of what is necessary and on public trust that the authorities are keeping everyone informed of what is happening. Dr. Garry Humphreys, Medical Officer of Health for Peterborough County and City, said at the Commission’s public hearings:

It is important to have a willing cooperation of the community with regards to disease control through voluntary quarantine. This can only be achieved when the community is continuously kept informed.245

245. SARS Public Hearings, October 1, 2003, p. 17.
To that end, as recommended in the Commission’s first interim report and repeated here, it is vital that an independent Chief Medical Officer of Health be front and centre in informing the public about important health issues like SARS. This avoids the perception of political interference and bureaucratic turmoil, fosters the trust between the public and those managing, and strengthens the community confidence so vital to the effective management of a public health emergency.

It is also vital that the public trust the judgment and expertise of the Chief Medical Officer of Health. The public will not follow an expert, no matter how much power he or she has, unless they trust both their motives and their abilities. This reinforces the need to enhance the Public Health Division to provide the Chief Medical Officer of Health with the best expert support and resources to make the right decisions, at the right times.

**Compensation**

In any emergency it is essential to compensate those who suffer an unfair burden of personal cost by reason of their cooperation with public health measures like quarantine.

While Ontario enjoyed high levels of quarantine compliance, it is vital that this not lead to complacency. SARS also revealed obstacles to compliance that may, if not adequately addressed, hamper the response to a future public health emergency, an influenza pandemic. In its interviews, telephone polls and focus groups, the U.S. study identified the following impediments to observance:

- Fear of loss of income;
- Poor logistical support;
- Psychological stress;
- Spotty monitoring of compliance;
- Inconsistencies in the application of quarantine measures between various jurisdictions; and
- Problems with public communications.\(^{246}\)

---

\(^{246}\) Published in Biosecurity and Bioterrorism: Biodefense Strategy, Practice and Science, Volume 2, Number 4, 2004, pp. 267-70.
Fear of loss of income topped the list of concerns:

Fear of loss of income was of paramount importance. It was especially significant, according to our interviews, focus groups, and Health Care Workers Survey, for people who were unconvinced that their quarantine was necessary. This fear was the most common reason given to us for noncompliance or non-self-quarantine among people who were advised that they met quarantine criteria. And the fear was justified. Although some employers assured their employees at the outset that their pay would continue while they were in quarantine, others said it would not. The situation was even more disconcerting for those whose income came from part-time work, casual work, or self-employment.247

The federal and provincial governments provided a number of SARS compensation programmes.

On April 4, 2003, the federal government amended Employment Insurance regulations to make it easier for eligible workers to access EI benefits. A government news release stated:

The amendments remove the usual two-week waiting period for SARS-related cases. The requirement for a medical certificate will also be removed when the period involved is the SARS-related quarantine (currently 10 days).

The amended regulations apply to any SARS-related claims for EI sickness benefits where the period of quarantine has been imposed or recommended on the claimant by a public health official and the claimant was asked by the employer, a medical doctor, a nurse or another person in authority to quarantine himself/herself.248

On May 2, 2003, the federal government announced an income relief programme for health care workers who were not eligible for Employment Insurance but who suffered a loss of employment income because of being quarantined, isolated or contracting SARS. A government news release said:

Weekly payments will be $400 per week for full-time workers, and $200 per week for part-time workers. A full-time worker is defined as a person who works the number of hours, days or shifts normally worked in a calendar week by a full-time worker in the same or similar occupation, and at the same or similar premises. A part-time worker is defined as a person who does not work full-time as described above. Eligible recipients will be able to receive a maximum of $6,000 for a maximum period of 15 weeks. The program is retroactive to March 30, 2003.\(^{249}\)

On May 28, 2003, the Government of Ontario announced financial aid for health care workers for income lost due to SARS. A government news release stated:

Eligible health care employees and physicians will be reimbursed for income lost due to SARS. This financial aid is expected to total up to $190 million.\(^{250}\)

On June 13, 2003, the Ontario government announced a compensation programme for individuals who were sick, isolated or gave care to someone directly affected by SARS, but who did not receive full pay from their workplace or from other sources. The programme provided an isolation payment of $500 for full-time employees and $250 for part-time employees. Those whose losses were greater could apply for more compensation. So could those who received partial payments from other sources. The maximum amount was $6,000. A government news release said:

This program is open to employed and self-employed Ontario residents who lost income because they were isolated, sick with SARS, or gave care to someone directly affected by SARS for at least five days between March 14 and June 30, 2003. Individuals who received full pay from their workplace or from other sources for the time they were off work are not eligible for this program.

Individuals who received no income or benefits from their employer or other sources may be eligible for an isolation payment of $500 (part-timers are eligible for a $250 isolation payment.) Those whose losses

were greater than the isolation payment can apply for more assistance. Applicants will be required to submit appropriate documentation to support their claim and consent to the verification of information.

Those who received partial payment for the time they were in isolation may also be eligible. Any financial assistance provided by other sources will be deducted from the total claim e.g. Employment Insurance payment etc. Full documentation of losses is required with every claim. If any of the information is found to be untrue, appropriate action will be taken to recover any amounts already paid through the program.

The maximum amount of assistance under this programme is $6,000. Full programme details are available with the application forms. For those who were ill or isolated and are in extreme, immediate financial hardship, help is available.251

The Ontario SARS compensation programme was designed, as one government official put it,

… for people who had been quarantined and so have lost wages; they could come forward and claim two thousand dollars I think and five thousand dollars for health care workers … It was a recognition that these people had obeyed a request and had suffered a loss because of it. We wanted to recognize … and thank them for fulfilling their obligations as citizens, because these were people who were not even under a court order. It was just a request … to stay home for 10 days.

Compensation packages, were not implemented until well into the outbreak. The impression also may have been created, whether intended or not, on April 16, 2003, that provincial compensation efforts would be limited.252 Less than a week later, the government announced that workers would be reimbursed for any lost income as a

252. An April 16, 2003, report on the CBC stated: “Ontario Premier Ernie Eves says governments can’t afford to compensate every person or business affected by SARS … [Eves] warned that governments can’t afford widespread compensation for the economic impact of SARS. ‘If we start to write cheques to every single individual that has any economic impact as a result of SARS you can see what the result would be. The bill would be tens of billions, perhaps even more than that,’ said Eves.” (Source: CBC, “Eves considers tax relief for SARS losses,” 16 April 2003).
result of being in quarantine. Premier Ernie Eves said:

“I am giving you my word that any Ontarian who has lost wages because they’ve been asked to go into quarantine by public health officials will be fully compensated,” Eves said as he took the unusual step of attending the daily SARS briefing held by health officials.

“People will not have to choose between doing the right thing and putting food on their table.”

As noted in the U.S. study referred to above:

The provincial government’s initial approach did not assuage these concerns. There were no plans in place that could provide assistance to those in quarantine, and when the issue was raised, the provincial premier dismissed compensation packages as being unfeasible. In addition, the province’s Workplace Safety and Insurance Board, which administers the workers’ compensation system, announced that only those who developed symptoms of SARS and were infected at work would be eligible for compensation. This meant that the vast majority of those in quarantine would not receive workers’ compensation for their time away from work. On April 24, the premier reversed his position on compensation and said, “People will not have to choose between doing the right thing and putting food on the table.” This new position, however, was not accompanied by any immediate, concrete action.

Compensation was not addressed until May 27, when the province announced a C$190 million compensation package for health care workers who had lost wages due to SARS. It was not until June 13 that a similar “compensation allowance” was announced for non-health care workers who had missed work due to quarantine or caring for someone else in quarantine.

Despite criticism that it took too long to bring forward an appropriate compensation package, some observers suggest that the compensation system, once in place, was

largely responsible for the success of the voluntary quarantine programme. Dr. James Young has said that compensation for those quarantined was a vital element of Ontario’s response to SARS:

During SARS, we were using quarantine for the first time in 50 years. One of the important things in using quarantine was getting people to abide by it. One of the important ways of getting people to abide by it was by offering financial compensation so they would in fact abide by it and stay in quarantine if and when they were ordered by the medical officer of health. We got approval from the Ontario government to institute a quarantine program and to pay people for that. That resulted in us being able to manage the quarantine in an effective manner.255

The message is that it is important to plan in advance for the compensation of those whose cooperation in the emergency effort is so vital. It is impossible to predict in advance exactly what form and level of compensation is necessary and affordable for every conceivable emergency. But it is possible to require by legislation that every government emergency plan include a basic blueprint for the most predictable types of compensation packages. And it is possible to legislate that compensation, in a form and amount to be decided by the government.

**Recommendation**

The Commission therefore recommends that:

- Emergency legislation require that every government emergency plan provide a basic blueprint for the most predictable types of compensation packages and that they be ready for use, with appropriate tailoring, immediately following any declaration of emergency.

**Adequate Support Systems**

Public confidence also requires that those who make personal sacrifices by isolating themselves from their friends and family get adequate support from the system that

---

restricts their freedom. Whatever legal authority there is for quarantine, it will only work if emergency response plans provide adequate and timely information and support.

The U.S. study noted:

Communications to the public from the government regarding quarantine’s concept, rationale, and rules received mixed reviews in our polls, focus groups, and interviews and in the government’s own assessment. Challenges arose from the lack of information about the new disease of SARS and the uncertainties of its future course. Another source of confusion was inconsistency in the definitions of “probable cases,” “suspect cases,” and “cases under investigation” employed by public health officials and the World Health Organization. For example, on May 28, 2003, at the beginning of the second SARS outbreak in Toronto, an official reported the total number of probable SARS cases in the Toronto area as 11; but, under questioning, another senior public health official revealed that the real number was somewhere between 23 and 48. In addition, the tendency of the media to report cumulative cases of SARS rather than changes in the number of new cases gave the appearance that the outbreak was spiraling higher when in fact it was ebbing. Another major problem involved the government’s use of the term “voluntary quarantine,” because it suggested that compliance was at the discretion of each person. Officials told us they initially believed that people would be more willing to comply and less likely to “panic” with use of the adjective “voluntary,” but, in retrospect, they realized they should have avoided that word.256

Many of those interviewed by the Commission who were placed in quarantine raised concerns about the lack of information and support. Hawryluck257 made similar findings in their survey of 129 quarantined individuals258:

258. Similar findings were cited by researchers in Toronto and New York, who conducted a web-based survey open to anyone who was quarantined during SARS in Toronto. A total of 129 individuals volunteered to participate.
During the outbreak, nearly 30% of respondents thought that they had received inadequate information about SARS. With respect to information regarding home infection control measures, 20% were not told with whom they could have contact; 29% did not receive specific instructions on the use and disinfection of personal items, including toothbrushes and cutlery, 77% were not given instructions regarding the use and disinfection of the telephone.\(^{259}\)

The Hawryluck study also found:

Those who did not think that they had been well-informed were angry that information on infection control measures and quarantine was inconsistent and incomplete, frustrated that employers (health care institutions) and public health officials were difficult to contact, disappointed that they did not receive the support they expected, and anxious about the lack of information on the modes of transmission and prognosis of SARS.

This is not to criticize the remarkable work done by overworked public health workers struggling to cope without a plan, without preparation, and without adequate resources. The problems were systemic, not personal or professional.

The U.S. study found that the stigma of quarantine persisted for many people long after they had left quarantine:

Being the target of stigma was reported by 17 of the 43 quarantined persons in our General Population Survey, and 68% of the 195 quarantined health care workers reported that stigma affected them or someone close to them. Focus group participants who were quarantined reported that they and their families often felt stigmatized, even after the 10-day period of quarantine ended. They reported unwanted attention, ridicule, avoidance, and withdrawn invitations from such social events as children’s birthday parties and family reunions. Their children were unwelcome in some daycare centers, and some spouses of quarantined health care workers were sent home from work. Because of this treatment,

participants said they became reluctant to tell others that they had been in quarantine.\textsuperscript{260}

Whatever legal authority there is for quarantine, it will only work if emergency response plans provide the resources and machinery to help those who must go into quarantine.

The Commission heard countless stories of family members and neighbours providing the support necessary to enable those under quarantine to be compliant. As one woman under quarantine described the experience:

\begin{quote}
Nobody worked. Nobody went to work, nobody went to the grocery store, nobody did anything. We had neighbours that were delivering groceries.
\end{quote}

For those individuals with children at home, the hardship and stress of quarantine proved to be even more overwhelming. One health care worker with small children at home, described the hardship of quarantine:

\begin{quote}
… you are completely detached from everybody, okay? I'm a single parent. I don't have anybody to get my groceries for me … So to be locked up 10 days in the house for me, with my kids. I have nobody to take care of them. I have nobody to bring me my groceries, I relied on the kindness of my friends time after time after time.
\end{quote}

In one story told to the Commission, the need to ensure the well-being of a child clashed with the need to comply with quarantine. The woman's young child became ill while the mother was under quarantine. An ambulance was called and the child was taken to hospital. The mother, quarantined because of her previous exposure to SARS, was not allowed to go in the ambulance. Desperate with concern for her child she broke quarantine and followed the ambulance to hospital where she tried to gain admission, which was denied. While one can appreciate her concern and fear for her child, it might have had disastrous consequences had she entered the hospital and spread the infection there. This demonstrates the human problems that arise during quarantine and the need for sensitive yet firm enforcement of quarantine.

\textsuperscript{260} Published in Biosecurity and Bioterrorism: Biodefense Strategy, Practice and Science, Volume 2, Number 4, 2004, p. 269.
In another case a public health unit was placed in the difficult position of trying to find caregivers for two young children who exhibited no symptoms but whose father was in hospital with SARS. Although the mother was at home, she had a fever and her condition worsened. There was no one else to look after the children. By the time the mother had to be admitted to hospital the children were showing symptoms and all three were taken to hospital. This shows again the human problems that arise in the administration of quarantine.

Prior to SARS, widespread quarantine measures had not been used in more than 50 years.261 For myriad reasons outlined in the Commission’s first interim report, public health workers, by reason of systemic failure and no fault of their own, were ill-equipped and unprepared to deal with the vast number of individuals who were quarantined.

Despite these handicaps, public health officials rose to the occasion and deserve praise for their commendable efforts to address the problems caused by quarantine. In the case involving the two young children, for example, a public health physician, despite her other overwhelming duties, went to extraordinary lengths to find alternate caregivers. In another noteworthy instance, a public health unit went to great trouble to establish a contingency facility in case homeless individuals had to be quarantined. As noted in the Commission’s first interim report, the problems in the administration of quarantine reflect a lack of planning and preparedness, not a lack of dedication or effort on the part of public health officials. As one expert from the Centers for Disease Control and Prevention remarked:

I had seen those people from Canada and Toronto, Ontario and Health Canada speak at health forums in this country. And they all get a lump in their throat when they describe it. And it puts a lump in mine. They did a heroic job. And they’re to be commended and this process that unfolds afterwards is something to be expected but they know, they know how we

---

261. Severe acute respiratory syndrome (SARS) was contained globally by widespread quarantine measures, measures that had not been invoked to contain an infectious disease in North America for more than 50 years. Although quarantine has periodically been used for centuries to contain and control the spread of infectious diseases such as cholera and the plague with some success, the history of invoking quarantine measures is tarnished by threats, generalized fear, lack of understanding, discrimination, economic hardships, and rebellion. Hawryluck L, Gold WL, Robinson S, Pogorski S, Galea S, and Styra R. SARS control and psychological effects of quarantine, Toronto, Canada. Emerg Infect Dis [serial on the Internet]. 2004 Jul [date cited]. Available from: http://www.cdc.gov/ncidod/EID/vol10no7/03-0703.html.
feel about them. They are our heroes and we all hope that when our number gets called, that we can do as good a job as they did. And we’re trying to learn from those lessons.

The studies and stories of quarantine during SARS show above all that the legal power to quarantine comes with a concurrent responsibility to ensure that those in quarantine are given adequate support to enable and encourage them to comply with quarantine. This duty applies with particular force to the most vulnerable in our community including the homeless.

Necessary support may require a wide range of assistance including:

- delivery of groceries;
- refill and delivery of medication;
- ensuring that children are safely transported to and from daycare or school;
- taking care of children, people with special needs and the elderly whose primary caregivers have been quarantined;
- special quarantine contingencies for vulnerable populations, such as the homeless;
- ensuring that those under quarantine have an adequate supply of personal protective equipment.

As the U.S. study stated:

Logistical support of those in quarantine was mostly handled privately, not through the government. Non-health care workers whom we interviewed or who participated in our focus groups praised public health authorities for delivering kits of medical supplies at the beginning of their quarantine periods. These kits contained thermometers (for twice-daily monitoring of body temperature), surgical masks, wipes, and similar items; health care workers obtained these supplies on their own or through their employers. It was a different story, however, for groceries and other routine supplies needed for daily living. With no prior planning for such large-scale deliveries and difficulties in coordination between local health departments and volunteer and service organiz-
tions, the government was unable to meet these needs. Internet grocery delivery services were widely used and well rated by those with access to computers at home, and some medical facilities established small grocery stores in their cafeterias for the benefit of their employees who were on “work quarantine.” However, 83% of the quarantined health care workers in our survey said they relied on friends, relatives, or neighbors for groceries and supplies, and 4% said they broke quarantine to get them for themselves. Of 47 health care workers who said they needed to arrange for the transportation of someone in their household who normally would rely on them for transportation, such as children or a disabled or elderly relative, 39 relied on family or friends, but 6 had to leave quarantine to provide this service themselves. From our interviews and focus groups, it seemed that single people and students had greater difficulty in relying on or obtaining the assistance of others.262

It is not suggested that government programmes should be designed to replace or supplant the great outpouring of private family and community support that helped so many people get through quarantine during SARS. It is suggested that the crucial nature of this support be publicly recognized and encouraged in every way possible.

There is also a need to secure access to support systems for those under quarantine who experience unusual stress. Many interviewed by the Commission spoke of the psychological stress of quarantine. One person, who lived alone, experienced weeks of agony during quarantine. She described to the Commission how she became increasingly depressed during quarantine, and how there was no support available for her to talk to or to ensure that she was mentally coping during her quarantine:

… not once did they ask me if I had any thoughts of hurting myself; I threw out my Tylenol because I was afraid that I was going to take it … Could you image what [that many] days is like with no human contact with anyone? I understand that this is a contagious disease and you want to control it and they needed to control it but they also needed to understand that there is a mental health issue here with these people and I know that I am not the only one that got upset and depressed.

The Hawryluck quarantine study found that a substantial portion of the 129 respondents displayed symptoms of post-traumatic stress disorder.\textsuperscript{263}

SARS made us aware not only of the need for quarantine to prevent the transmission of infectious diseases, but of the real human hardship caused by quarantine, and of the need for programmes to provide direct support and encourage private family and community support.

This conclusion is endorsed by Hawryluck:

\begin{quote}
Public health officials, infectious disease physicians, and psychiatrists need to be aware of this issue [the psychological distress caused by quarantine]. They must work to define the factors that influence the success of quarantine and infection control practices for both disease containment and community recovery and must be prepared to offer additional support to persons who are at increased risk for the adverse psychological and social consequences of quarantine.\textsuperscript{264}
\end{quote}

Public health staff alone cannot bear the responsibility for meeting these demands. Employers, educators, community groups, businesses, emergency responders, hospitals and public health must plan together to ensure that those quarantined in the future have timely and adequate information and the support necessary to encourage and enable them to comply with quarantine.

\section*{Recommendation}

The Commission therefore recommends that:

\begin{itemize}
\item The \textit{Health Protection and Promotion Act} be amended to provide that it is a mandatory public health standard for each local medical officer of health to develop under the guidance of the Chief Medical Officer of Health a local plan in consultation with employers, educators, community groups, businesses, emergency responders, and health care facilities to ensure that plans are in place to ensure that those quarantined in the future have timely and adequate information, and the support necessary to encourage and enable them to comply with quarantine.
\end{itemize}

\textsuperscript{263} Ibid.

\textsuperscript{264} Ibid.
Job Security

By the same token, those who are ordered into quarantine should not have to worry about job security. This concern was raised by a number of those who spoke to the Commission, and was also discussed during the Standing Committee on Justice Policy hearings:

Ms. Broten: One very quick, last question. We also heard that during SARS one of the barriers of keeping individuals safe and in their homes or under quarantine was the concern they would lose their jobs because there was no job-protected quarantine leave or what have you—I see everyone nodding. If someone just wanted to comment as to whether that was a reality you faced out on the front lines.

Dr. Henry: Early on, it was a very difficult problem. Businesses were reluctant to let their people stay home. We wrote a number of very stern letters suggesting to them that the risk to their business if this person became ill in the workplace might outweigh their reluctance to let this person stay home for the period of time we prescribed. I think being able to enact emergency financial assistance to people in a crisis is extremely important, and I don’t believe there was the legislative ability to do that at the time.265

On April 30, 2003, the SARS Assistance and Recovery Strategy Act was introduced in the Ontario legislature. It received first, second and third reading that day and received Royal Assent on May 5, 2003. The Act addressed a number of issues, including the problem outlined above of people who feared losing their employment as a consequence of quarantine or illness during SARS. Section 6(1) provides that a person was entitled to a leave of absence without pay where he or she was unable to work as a result of investigation or treatment related to SARS or because they were subject to quarantine or isolation.266 The section also protects those who were unable to work

266. Section 6 (1) provides:

During the period beginning March 26, 2003 and ending on a day specified by proclamation of the Lieutenant Governor under subsection 1(2), an employee is entitled to a leave of absence without pay for any day or part of a day during which he or she falls into one or more of the following categories:

1. The employee is unable to work because he or she is under individual medical investigation, supervision or treatment related to SARS.
because they were needed to provide care or assistance to a spouse, child, grandparent, sibling or relative who was dependent on the employee for care and assistance.

The Act, while important, did little to alleviate the stress and uncertainty for those whose employment was threatened due to quarantine or illness prior to its enactment.

This is an important consideration in preparing for future health emergencies. Focus groups conducted for the above-noted U.S. study suggested that an important impediment to compliance is not knowing the precise details of compensation packages:

Participants in our focus groups were asked the level of detail they would require about the compensation package as a condition for complying with “voluntary” quarantine. The general consensus was that a significant level of detail would be required, including the level of compensation, whether benefits would be included in the calculation of compensation, and the length of time that an individual would have to wait to receive compensation. When asked in our Health care Workers Survey, 60% of doctors, 76% of nurses, and 70% of other health care workers said that they would want “fairly detailed information about when, how, and how much compensation” they would receive as encouragement to comply with quarantine.267

2. The employee is unable to work because he or she is acting in accordance with a SARS related order under section 22 or 35 of the Health Protection and Promotion Act.

3. Subject to subsections (2) to (4), the employee is unable to work because he or she is in quarantine or isolation or is subject to a control measure in accordance with SARS related information or directions issued to the public, a part of the public or one or more individuals, by the Commissioner of Public Security, a public health official, a physician or a nurse or by Telehealth Ontario, the Government of Ontario, the Government of Canada, a municipal council or a board of health, whether through print, electronic, broadcast or other means.

4. The employee is unable to work because of a direction given by his or her employer in response to a concern of the employer that the employee may expose other individuals in the workplace to SARS.

5. The employee is unable to work because he or she is needed to provide care or assistance to an individual referred to in subsection (5) because of a SARS related matter that concerns that individual.

One problem during SARS was that people worked while ill, a tendency exhibited by many hardworking Canadians. It is necessary to discourage anyone from attending work who displays symptoms of an infectious disease or who is required to be in quarantine as a result of contact with an infectious person. One only need consider the case of the Hewlett-Packard factory, where nearly 200 employees and visitors went into quarantine because an employee attended work while ill and under quarantine.\(^{268}\)

It is essential that educational, compensation, and enforcement programmes be planned in advance and put in place immediately to prevent this kind of problem.

**Recommendation**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to add a provision similar to s. 6(1) of the *SARS Assistance and Recovery Strategy Act*, to apply to infectious diseases as identified by the Chief Medical Officer of Health. The amendment should provide, in respect of such a disease, that a person is entitled to a leave of absence without pay where he or she is unable to work as a result of investigation or treatment related to the disease, or because he or she is subject to quarantine or isolation. The amendment should also protect those who are unable to work because they are needed to provide care or assistance to a spouse, child, grandparent, sibling or relative who is dependent on the employee for care and assistance.

**Monitoring of Compliance**

It is hard to suffer the pangs of quarantine only to see a neighbour thumb his or her nose at a quarantine order. The perception that others are cheating can easily erode the commitment to voluntary compliance. The U.S. study found:

> Spotty monitoring of compliance produced incomplete rates of compliance and invited cheating. Public health authorities announced

---

\(^{268}\) CBC News, “Man Who Broke Quarantine May Face Charges,” April 11, 2003; CBS, May 29 2003. A Hewlett-Packard employee near Toronto has died. The 62-year-old HP employee broke quarantine to go to work at the company's information processing plant in Markham, north of the Toronto, despite showing symptoms of SARS. Health authorities called for a quarantine of the HP plant last month when they learned the man could have knowingly placed nearly 200 co-workers in danger.
that they would telephone people in quarantine at home twice a day, at varying times, to monitor their compliance. That monitoring played “an important role in terms of establishing the credibility of quarantine in general,” said 75% of the physicians in our Health care Workers Survey, 81% of the nurses, and 85% of the other health care workers. Yet, 58% of the physicians, 37% of the nurses, and 40% of the other workers rated the monitoring of their compliance while in quarantine as bad. When people wanted or needed to break quarantine—for example, to get groceries—they said they did so with little fear of getting caught. The problem was that the large number of people in quarantine swamped the information technology capabilities, staff, and phone lines of the public health systems. Regions in the GTA with fewer people in quarantine were generally better able to increase their capabilities to carry out this monitoring, but the city of Toronto’s public health department was overwhelmed.269

For these reasons it is important that the legal machinery be adequate to ensure the fair and uniform application of the quarantine system, including the ability to enforce quarantine orders against those few people who are disinclined to obey them. The very existence of quarantine laws, and the fairness of their application, reinforces the individual and community sense that voluntary compliance is the reasonable thing to do.

The present system under the Health Protection and Promotion Act has two basic elements.

1. A medical officer of health may make a written order requiring the isolation of someone who may have a communicable disease. This order is called a s. 22 order.270

---

270. Subsection 22(1) provides:

Order by MOH re: recommunicable disease

A medical officer of health, in the circumstances mentioned in subsection (2), by a written order may require a person to take or to refrain from taking any action that is specified in the order in respect of a communicable disease

Subsection 22(4) provides:

What may be included in order,
2. If a person refuses to comply with the order of the medical officer of health in respect of a virulent disease a judge of the Ontario Court of Justice may order the person to be taken into custody and detained in a hospital or other facility. This order is called a s. 35 order.

(4) An order under this section may include, but is not limited to,

(a) requiring the owner or occupier of premises to close the premises or a specific part of the premises;

(b) requiring the placarding of premises to give notice of an order requiring the closing of the premises;

(c) requiring any person that the order states has or may have a communicable disease or is or may be infected with an agent of a communicable disease to isolate himself or herself and remain in isolation from other persons;

(d) requiring the cleaning or disinfecting, or both, of the premises or the thing specified in the order;

(e) requiring the destruction of the matter or thing specified in the order;

(f) requiring the person to whom the order is directed to submit to an examination by a physician and to deliver to the medical officer of health a report by the physician as to whether or not the person has a communicable disease or is or is not infected with an agent of a communicable disease;

(g) requiring the person to whom the order is directed in respect of a communicable disease that is a virulent disease to place himself or herself forthwith under the care and treatment of a physician;

(h) requiring the person to whom the order is directed to conduct himself or herself in such a manner as not to expose another person to infection.

271. A virulent disease is a particularly hazardous communicable disease. Virulent diseases, as set out in regulations to the HPPA, include: (a) Cholera, (b) Diphtheria, (c) Ebola virus disease, (d) Gonorrhoea, (e) Hemorrhagic fever, (f) Lassa fever, (g) Leprosy, (h) Marburg virus disease, (i) Plague, (j) Syphilis, and (l) Tuberculosis. On March 25, 2003, SARS was specified as a virulent disease by an amendment to Ontario Regulation 95/03.

Severe Acute Respiratory Syndrome (SARS) is specified as a virulent disease for the purposes of the Act. O. Reg. 95/03, s. 1.

272. Subsection 35(1) provides:

Order by Ontario Court of Justice
Dr. Bonnie Henry provided the Justice Policy Committee with this explanation of how these two types of orders worked during SARS:

The Acting Chair: …. We heard during SARS that there were certain people who were restricted and were given isolation orders to stay in their homes.

Dr. Henry: There were orders under section 22 of the Health Protection and Promotion Act, which basically required them to do what we said they needed to do to prevent the transmission of a disease.

The Acting Chair: And what if they didn’t?

Dr. Henry: Then we had the potential to issue an order under section 35 in which we could detain them. We had the ability to go before a judge, but section 35 at the time said they must be detained in a hospital. That has since been changed so that we could, under section 35, require someone to stay in their home. Then we could work with our local police forces to enforce that.273

---

Upon application by a medical officer of health, a judge of the Ontario Court of Justice, in the circumstances specified in subsection (2), may make an order in the terms specified in subsection (3).

Paragraph (a) of s. 35(2) provides:

When court may make order

An order may be made under subsection (3) where a person has failed to comply with an order by a medical officer of health in respect of a communicable disease that is a virulent disease,

(a) that the person isolate himself or herself and remain in isolation from other persons;

Paragraph (a) of s. 35(3) provides:

Contents of order

In an order under this section, the judge may order that the person who has failed to comply with the order of the medical officer of health;

(a) be taken into custody and be admitted to and detained in a hospital or other appropriate facility named in the order;

During SARS it was necessary to amend the *Health Protection and Promotion Act* when concerns arose about the possible community spread of SARS within a religious community. The story of this concern, and the notable cooperation of the religious group, BLD, will be told in the final report. The concern led to an amendment to the *Health Protection and Promotion Act* to provide that a s. 22 quarantine order (the original order by the medical officer of health described above) could be directed not only towards an individual but also to a named group of people. The specific reason for the amendment was explained by Dr. Basrur at the Justice Policy Committee Hearings:

> One of the elements that arose during SARS was our inability to issue orders on anything but a person-by-person, one-at-a-time kind of basis. There was an instance wherein we had an entire group of people who needed to be put into quarantine on a weekend. It was physically and logistically impossible to issue orders person to person on a Saturday afternoon for 350 people who happened to live in three or four different health units all at once, each with their own MOH, their own solicitors and so on. So now there is an amendment to the Act. Again, that was processed even between phases one and two of the SARS outbreak. So things can happen fast when the will is there, but also when the need is apparent, such that orders can be issued against a class of persons. In a future pandemic or other wide-scale emergency, that will be a very helpful provision so we can issue mass orders if necessary and if warranted under the circumstances.

The power to quarantine any group, whether it is a tightly knit religious community or a student body must obviously be exercised with great sensitivity. Toronto Public Health officials, as will be noted in the final report, went out of their way to approach the concerned religious group with tact and understanding. Toronto Public Health sought, and received, a commendable level of cooperation from the leadership of the group. In times of crisis, however, it would be all too easy for officials with lesser

274. Section 22 was amended to include s. 5.0.1 which provides:

> Class order

> An Order under this section may be directed to a class of persons who reside or are present in the health unit served by the medical officer of health.

sensitivity to act immediately, without consultation, and to think only later of the ensuing stigmatization, disruption, and confrontation.

It is therefore recommended that the proposed amendment be tempered to provide that the power to order and enforce the isolation of a group must, wherever practicable, be preceded by such degree of consultation with the group as is feasible in the circumstances.

While the *Health Protection and Promotion Act* now allows public health authorities to issue quarantine orders against both individuals and classes of persons, the lingering question remains of how to enforce these orders. This is particularly so in the case of class orders.276

The enforcement of class orders involves practical problems around the service requirements. Section 5.0.2 provides that if a class order is made, notice of the order shall be given to each member of the class, where practicable to do so.277 However, s. 44(3) provides:

(3) although a hearing is required in accordance with this Part, an order under this Act takes effect:

(a) when it is served on the person to whom it is directed; or

---

276. During a CBC interview with Michael Enright, Dr. Basrur stated: “In fact the statute was amended towards the end of phase one to give the medical officers of Ontario the powers to quarantine large numbers or classes of people because previously we only had the power to quarantine people one at a time. So if we had an apartment building for example or a community of interest that all needed to be in quarantine, we would have to go find them and serve them with a process server or a police officer one at a time, however many thousands of hours that would take. That’s not an effective control measure. Now we can do it on a broader basis. The question of enforcement still applies but at least we can initiate it more quickly.”

277. If a class of persons is the subject of an order under subsection (5.0.1), notice of the order shall be delivered to each member of the class where it is practicable to do so in a reasonable amount of time. Subsection 5.0.3 provides:

Same, general notice

(5.0.3) If delivery of the notice to each member of a class of persons is likely to cause a delay that could, in the opinion of the medical officer of health, significantly increase the risk to the health of any person, the medical officer of health may deliver a general notice to the class through any communications media that seem appropriate to him or her, and he or she shall post the order at an address or at addresses that is or are most likely to bring the notice to the attention of the members of the class.
(b) in the case of an oral order or an order directed to a person described but not named in the order, when the person to whom it is directed first knows or ought to know the contents of the order.

Subsection 106(1) provides:

Any notice, order or other document under this Act or the regulation is sufficiently given, served, or delivered if delivered personally or sent by ordinary mail addressed to the person to whom it is to be given, served or delivered at the person’s last known address.

The difficulty with class orders is that they may be directed at individuals whose identity or description is unknown. For example, during SARS II, public health officials questioned whether they would issue a class order requiring all visitors and patients who had been inside a particular facility during a specific period to go into quarantine. They did not know the names of the visitors and patients so they would have been unable to “serve” them with notice within the meaning of the Act. The order contemplated would have had no legal effect because it would not have taken effect without service.

To clarify this problem, the Commission recommends a simple amendment to s. 106 to provide that in the case of a class order made under s. 5.0.2, service is effective when notice of the class order is posted and the order may be enforced as soon as it is brought to the actual attention of the person affected.

A final word is necessary about the unnecessary legal confusion surrounding the words “quarantine” and “isolation”. Although the words are used indiscriminately and interchangeably there are technical legal distinctions between them. “Quarantine” is not a legally defined term in the Health Protection and Promotion Act. While, in popular parlance, thousands of people were quarantined during SARS they were actually, in a technical legal sense, isolated rather than quarantined. The problem is that the technical legal definitions are completely out of step with the actual language that everyone uses and understands.

Dr. Basrur pointed out to the Justice Policy Committee:

Dr. Basrur: … We used the word “quarantine” because it was widely understood as being—

The Acting Chair: But it technically was not.
Dr. Basrur: No. It was an order to isolate yourself or to conduct yourself in such a way as not to expose another person. That would be the legal language under the Act.278

Dr. Henry noted further:

The term “quarantine” just doesn’t appear in any of our legislative wording in Ontario. There’s a Quarantine Act that is a federal act that only applies—the word only applies to people coming into the country … Right now the word “quarantine” and the action of quarantine actually only applies to the powers the federal government has. In legislation in Ontario we have the ability to isolate someone; we don’t actually have the ability to quarantine someone.279

Because of the gap between what people understand by the word “quarantine” and its technical legal meaning, it is recommended that the word “quarantine” be introduced to the Health Protection and Promotion Act as a defined legal term to correspond to the universal popular understanding of that word as used during SARS.280

280. It is true that s.91.11 of the Constitution Act, 1867 assigns legislative authority over “Quarantine and the Establishment and Maintenance of Marine Hospitals” to Parliament. The scope of this power is unclear. It has not been subjected to detailed interpretation of the Supreme Court of Canada. However, the manner in which “quarantine” is conjoined to “marine hospitals”, and the contiguity of the power with other items on the list suggests that its primary focus is control over Canada’s shores and borders. This is arguably the focus of the federal Quarantine Act, R.S.C. 1985, c. Q-1. In addition, in his decision for the majority of the S.C.C. in Schneider v. The Queen (1982), 139 D.L.R. (3d) 417 (S.C.C.), Dickson J., as he was, quoted a passage from the report of the 1938 Royal Commission on Dominion-Provincial Relations (the Rowell-Sirois Commission) suggesting that the use of the term quarantine in s.91 referred to ship quarantine: “presumably ship quarantine.” By contrast, provincial jurisdiction within the sphere of public health should permit a provincial legislature to legislate a quarantine power so long as the purpose of the latter is the protection of the public’s health. Public health legislation in other provinces already provides for a quarantine power. See for instance British Columbia’s Health Act, R.S.B.C. 1996, c. 179, s.11(1); Alberta’s Public Health Act, R.S.A. 2000, c. P-37, s. 29(1); Manitoba’s Public Health Act, C.C.S.M. c. P210, s.12; and Newfoundland’s Communicable Diseases Act, S.N.L. 1990, c. C-26, s.30.
Recommendations

The Commission therefore recommends that:

- Section 22(5.0.1) be amended to provide that the power to order and enforce the isolation of a group must, wherever practicable, be preceded by such degree of consultation with the group as is feasible in the circumstances.

- Section 106 of the *Health Protection and Promotion Act* be amended to provide that in the case of a class order made under s. 5.0.2, service is effective when notice of the class order is posted and the order may be enforced as soon as it is brought to the actual attention of the person affected.

- The word “quarantine” be introduced to the *Health Protection and Promotion Act* as a defined legal term to correspond to the universal popular understanding of that word as used during SARS.

Conclusion

Quarantine and isolation are essential measures in the defence against infectious outbreaks. SARS could not have been so quickly contained in Toronto without the tremendous public cooperation and individual sacrifice of those who were quarantined. While public health officials require the power to isolate those who are infected, and to quarantine those who may have been exposed to infection and may be infectious to others, this power comes with the responsibility to provide information, support, and job protection.

Recommendations

The Commission therefore recommends that:

- Emergency legislation require that every government emergency plan provide a basic blueprint for the most predictable types of compensation packages and that they be ready for use, with appropriate tailoring, immediately following any declaration of emergency.

- The *Health Protection and Promotion Act* be amended to provide that it is a mandatory public health standard for each local medical officer of health to
develop under the guidance of the Chief Medical Officer of Health a local plan in consultation with employers, educators, community groups, businesses, emergency responders, and health care facilities to ensure that plans are in place to ensure that those quarantined in the future have timely and adequate information, and the support necessary to encourage and enable them to comply with quarantine.

• The *Health Protection and Promotion Act* be amended to add a provision similar to s. 6(1) of the *SARS Assistance and Recovery Strategy Act*, to apply to infectious diseases as identified by the Chief Medical Officer of Health. The amendment should provide, in respect of such a disease, that a person is entitled to a leave of absence without pay where he or she is unable to work as a result of investigation or treatment related to the disease, or because he or she is subject to quarantine or isolation. The amendment should also protect those who are unable to work because they are needed to provide care or assistance to a spouse, child, grandparent, sibling or relative who is dependent on the employee for care and assistance.

281. Section 6 (1) provides:

During the period beginning March 26, 2003 and ending on a day specified by proclamation of the Lieutenant Governor under subsection 1(2), an employee is entitled to a leave of absence without pay for any day or part of a day during which he or she falls into one or more of the following categories:

1. The employee is unable to work because he or she is under individual medical investigation, supervision or treatment related to SARS.

2. The employee is unable to work because he or she is acting in accordance with a SARS related order under section 22 or 35 of the *Health Protection and Promotion Act*.

3. Subject to subsections (2) to (4), the employee is unable to work because he or she is in quarantine or isolation or is subject to a control measure in accordance with SARS related information or directions issued to the public, a part of the public or one or more individuals, by the Commissioner of Public Security, a public health official, a physician or a nurse or by Telehealth Ontario, the Government of Ontario, the Government of Canada, a municipal council or a board of health, whether through print, electronic, broadcast or other means.

4. The employee is unable to work because of a direction given by his or her employer in response to a concern of the employer that the employee may expose other individuals in the workplace to SARS.

5. The employee is unable to work because he or she is needed to provide care or assistance to an individual referred to in subsection (5) because of a SARS related matter that concerns that individual. 2003, c. 1, s. 6 (1).
8. Quarantine

- Section 22(5.0.1) be amended to provide that the power to order and enforce the isolation of a group must, wherever practicable, be preceded by such degree of consultation with the group as is feasible in the circumstances.

- Section 106 of the *Health Protection and Promotion Act* be amended to provide that in the case of a class order made under s. 5.0.2, service is effective when notice of the class order is posted and the order may be enforced as soon as it is brought to the actual attention of the person affected.

- The word “quarantine” be introduced to the *Health Protection and Promotion Act* as a defined legal term to correspond to the universal popular understanding of that word as used during SARS.
SARS demonstrated weakness and confusion in the legal machinery for the enforcement of health protection orders under the *Health Protection and Promotion Act*, the legal engine that drives health protection. One lawyer told the Commission that their ability during SARS to give clear legal advice was at times hampered by weaknesses in the enforcement portions of the Act:

> During SARS, I would often say when asked if we could do something, ‘you can try it, but if we are challenged we may be on shaky legal grounds and the courts will be in a very difficult position.’

The powers in the *Health Protection and Promotion Act* that authorize public health officials to make orders to protect the public are only as strong as the enforcement mechanisms that support them. Unless backed up by the power to enforce, an order is simply a request. Clarity in respect of enforcement powers is vital. Those who make orders and those who are obliged to comply with orders must know clearly in advance the consequences of noncompliance. Uncertainty is a prescription for trouble, doubly so in an emergency when there is no time to ponder and argue an uncertain power or an ambiguous enforcement procedure.

The *Health Protection and Promotion Act* requires amendment to ensure that the legal enforcement powers are strong and clear.

The following problems need to be addressed:

- The confusing tangle of enforcement powers.
- The procedural gaps within the enforcement machinery.
- The overlapping jurisdiction between the Ontario Court of Justice and the Superior Court.
- The lack of one-stop shopping for enforcement of orders.
• Uncertainty in the legal requirements for initiating and continuing enforcement procedures in court.

• The lack of systems to ensure legal preparedness in the application of enforcement machinery.

The Tangle of Enforcement Powers

The power to make orders lies primarily in three sections of the *Health Protection and Promotion Act*: s. 13, which deals with environmental or occupational hazards; s. 22, which deals with communicable diseases; and s. 86, which allows the Chief Medical Officer of Health to act in the face of a health risk.

These three sections each have their own court enforcement route whenever a public health official seeks to compel the subject of the order to comply. In a completely different parallel process, the Health Services Appeal and Review Board under the *Ministry of Health Appeal and Review Boards Act, 1998*, becomes involved whenever the subject of an order requests a hearing. From that board there is an appeal to the Divisional

---

282. Subsection 13(1) provides:

A medical officer of health or a public health inspector, in the circumstances mentioned in subsection (2), by a written order may require a person to take or to refrain from taking any action that is specified in the order in respect of a health hazard.

283. Subsection 22(1) provides:

A medical officer of health, in the circumstances mentioned in subsection (2), by a written order may require a person to take or to refrain from taking any action that is specified in the order in respect of a communicable disease.

284. Subsection 86(1) provides:

If the Chief Medical Officer of Health is of the opinion that a situation exists anywhere in Ontario that constitutes or may constitute a risk to the health of any persons, he or she may investigate the situation and take such action as he or she considers appropriate to prevent, eliminate or decrease the risk.

285. S.O. 1998, c. 18, Sched. H.

286. Sections 44 through 46 deal with the review of orders by the Health Services Appeal and Review Board and the appeal process that follows. Those sections provide:

44(1) An order by a medical officer of health or a public health inspector under this Act shall inform the person to whom it is directed that the person is entitled to a hearing by the Board if the
person mails or delivers to the medical officer of health or public health inspector, as the case requires, and to the Board, within fifteen days after a copy of the order is served on the person, notice in writing requiring a hearing and the person may also require such a hearing.

Oral order

(2) An oral order or an order directed to a person described but not named in the order need not contain the information specified in subsection (1) but a person to whom the order is directed may require a hearing by the Board by giving the notices specified in subsection (1) within fifteen days after the day the person first knows or ought to know the contents of the order. R.S.O. 1990, c. H.7, s. 44 (2).

Effect of order

(3) Although a hearing is required in accordance with this Part, an order under this Act takes effect,

(a) when it is served on the person to whom it is directed; or

(b) in the case of an oral order or an order directed to a person described but not named in the order, when the person to whom it is directed first knows or ought to know the contents of the order,

but the Board, upon application with notice, may grant a stay until the proceedings before the Board are disposed of.

Powers of Board

(4) Where the person to whom an order is directed requires a hearing by the Board in accordance with subsection (1) or (2), the Board shall appoint a time and place for and hold the hearing and the Board may by order confirm, alter or rescind the order and for such purposes the Board may substitute its findings for that of the medical officer of health or public health inspector who made the order.

Time for hearing

(5) The Board shall hold a hearing under this section within fifteen days after receipt by the Board of the notice in writing requiring the hearing and the Board may, from time to time, at the request or with the consent of the person requiring the hearing, extend the time for holding the hearing for such period or periods of time as the Board considers just.

Extension of time for hearing

(6) The Board may extend the time for the giving of notice requiring a hearing under this section by the person to whom the order of the medical officer of health or public health inspector is directed either before or after the expiration of such time where it is satisfied that there are apparent grounds for granting relief to the person following upon a hearing and that there are reasonable grounds for applying for the extension, and the Board may give such directions as it considers proper consequent upon the extension.

Parties and evidence

45. (1) The medical officer of health or public health inspector who made the order, the person who has required the hearing and such other persons as the Board may specify are parties to the proceedings before the Board.

Examination of documentary evidence

(2) Any party to the proceedings before the Board shall be afforded an opportunity to examine
before the hearing any written or documentary evidence that will be produced or any report the contents of which will be given in evidence at the hearing.

Members holding hearing not to have taken part in investigation, etc.

(3) Members of the Board holding a hearing shall not have taken part before the hearing in any investigation or consideration of the subject-matter of the hearing and shall not communicate directly or indirectly in relation to the subject-matter of the hearing with any person or with any party or representative of the party except upon notice to and opportunity for all parties to participate, but the Board may seek legal advice from an advisor independent from the parties and in such case the nature of the advice shall be made known to the parties in order that they may make submissions as to the law.

Recording of evidence

(4) The oral evidence taken before the Board at a hearing shall be recorded and, if so required, copies or a transcript thereof shall be furnished upon the same terms as in the Superior Court of Justice.

Release of documentary evidence

(6) Documents and things put in evidence at a hearing shall, upon the request of the person who produced them, be released to the person by the Board within a reasonable time after the matter in issue has been finally determined.

Appeal to court

46. (1) Any party to the proceedings before the Board under this Act may appeal from its decision or order to the Divisional Court in accordance with the rules of court.

Stay of order

(2) Where an appeal is taken under subsection (1) in respect of an order that was stayed by the Board, a judge of the Superior Court of Justice upon application may grant a further stay until the appeal is disposed of

Record to be filed in court

(3) Where any party appeals from a decision or order of the Board, the Board shall forthwith file with the Divisional Court the record of the proceedings before it in which the decision was made, which, together with the transcript of evidence if it is not part of the Board’s record, shall constitute the record in the appeal.

Minister entitled to be heard

(4) The Minister is entitled to be heard, by counsel or otherwise, upon the argument of an appeal under this section.

Powers of court on appeal

(5) An appeal under this section may be made on questions of law or fact or both and the court may confirm, alter or rescind the decision of the Board and may exercise all powers of the Board to confirm, alter or rescind the order as the court considers proper, or the court may refer the matter back to the Board for rehearing, in whole or in part, in accordance with such directions as the court considers proper.
Court, and if leave to appeal is granted, a further appeal to the Ontario Court of Appeal. This cumbersome appeal system stands in contrast to the system by which labour injunctions are appealed directly to the Court of Appeal to eliminate the time-consuming process of an intervening appeal to the Divisional Court and the uncertainty whether leave will be granted to appeal further to the Court of Appeal. The Commission recommends that the *Health Protection and Promotion Act* be amended to eliminate this complex appeal process, rife with delay, and provide an appeal as of right directly to the Court of Appeal with no prior requirement to secure leave to appeal.

The Commission has had no opportunity in the course of preparing this interim report to study the impact on enforcement of the injection into the judicial enforcement process of the Health Services Appeal and Review Board process. It is, however, logical to ask whether it is appropriate to have this confusing and time-consuming parallel mixture of separate judicial and administrative procedures when infection is spreading and time is of the essence. Considering the need during an infectious outbreak for speed and one-stop shopping, it is logical to ask whether it would be better to remove the board from the process and to substitute a hearing before a Superior Court judge as part of the process of consolidating all powers and procedures in one forum.

The discussion below will focus on the enforcement of orders in the face of noncompliance. The following comments and recommendations apply only to procedures in respect of orders made under Part IV (Communicable diseases) and Part VII (Administration). It is in these two parts of the *Health Protection and Promotion Act* that the enforcement powers of the local medical officers of health and the Chief Medical Officer of Health in respect of communicable diseases are found. The Commission makes no recommendations in respect of the enforcement procedures set out in Part III of the Act.

An order made under s. 22, in relation to a virulent disease, may be enforced in the Ontario Court of Justice, through an application under s. 35 of the *Health Protection and Promotion Act*. Section 35 authorizes the Court to order that a person be taken

---

287 Subsection 35(1) provides:

Upon application by a medical officer of health, a judge of the Ontario Court of Justice, in the circumstances specified in subsection (2), may make an order in the terms specified in subsection (3).

(2) An order may be made under subsection (3) where a person has failed to comply with an order by a medical officer of health in respect of a communicable disease that is a virulent disease,

(a) that the person isolate himself or herself and remain in isolation from other persons;
into custody and detained, examined by a physician to determine if infected with the agent of a virulent disease, and, where infected, treated. An Ontario Court of Justice order under s. 35, enforcing a public health order made under s. 22, may be appealed to a judge of the Superior Court and may be further appealed to the Court of Appeal but only if a judge of that court, in a separate hearing, grants special leave to appeal on a question of law alone. Although it is sensible that the appeal goes directly to the Court of Appeal without a time consuming intermediate appeal to the Divisional Court, the requirement of special leave creates delay. The restriction of the appeal to a question of law alone restricts the access to justice of someone affected by an order that significantly infringes his individual rights. The Commission recommends that this complex appeal process, which produces delay and restricts access to justice, be simplified. This process could be simplified by eliminating the intermediate appeal to the Superior Court or the restricted leave to appeal to the Court of Appeal or both.

Orders made under s. 22 that do not relate to virulent diseases or that require action other than detention, examination or treatment, must be enforced through s. 102 of the Act. If the order relates to virulent disease and involves detention, examination or treatment, the order is enforced in the Ontario Court of Justice, through the quasi-criminal machinery of the *Provincial Offences Act*. If the order is of any other kind, it is enforced in the Superior Court pursuant to s. 102, through the civil machinery of the *Rules of Civil Procedure*. In an earlier day and age this arcane mixture of proceedings may have

(b) that the person submit to an examination by a physician;

(c) that the person place himself or herself under the care and treatment of a physician; or

(d) that the person conduct himself or herself in such a manner as not to expose another person to infection.

(3) In an order under this section, the judge may order that the person who has failed to comply with the order of the medical officer of health,

(a) be taken into custody and be admitted to and detained in a hospital or other appropriate facility named in the order;

(b) be examined by a physician to ascertain whether or not the person is infected with an agent of a virulent disease; and

(c) if found on examination to be infected with an agent of a virulent disease, be treated for the disease.

appeared logical. In times like these when disease can strike overnight, clarity, speed, and unified procedures are required. The Commission recommends that this multiplicity of procedures be replaced by a single, simple, codified procedure in the Superior Court.

Section 102 contains two parts: s. 102(1), which allows a court to restrain the contravention of an order, and s. 102(2), which allows a court to prohibit continuation or repetition of a contravention. 289

If this were not complex enough it must be remembered, as noted above, that s. 86 of the *Health Protection and Promotion Act* provides a completely separate and parallel duplicate system of enforcement in respect of orders made by the Chief Medical Officer of Health in respect of a health risk. Where an order is made under s. 86, by the Chief Medical Officer of Health, the enforcement of that order is governed by s. 86.1, 290 which authorizes an application to the Superior Court. Under s. (2), the

289. Subsection 102(1) provides:

Despite any other remedy or any penalty, the contravention by any person of an order made under this Act may be restrained by order of a judge of the Superior Court of Justice upon application without notice by the person who made the order or by the Chief Medical Officer of Health or the Minister. Proceedings to prohibit continuation or repetition of contravention.

290. Section 86.1 provides:

If the Chief Medical Officer of Health is of the opinion that a situation exists anywhere in Ontario that constitutes or may constitute a risk to the health of any persons, he or she may apply to a judge of the Superior Court of Justice for an order under subsection (2).

(2) If an application is made under subsection (1), the judge,

(a) may order the board of health of a health unit in which the situation causing the risk exists to take such action as the judge considers appropriate to prevent, eliminate or decrease the risk caused by the situation; and

(b) may order the board of health of a health unit in which the health of any persons is at risk as a result of a situation existing outside the health unit to take such action as the judge considers appropriate to prevent, eliminate or decrease the risk to the health of the persons in the health unit.
court may order a board of health to take or refrain from taking action where there is a health risk. It does not authorize the court to make an order against anyone other than boards of health.

Therefore, if the Chief Medical Officer of Health makes an order under s. 86 that is directed at an individual, institution or organization other than a board of health, she too must resort to the enforcement powers in s. 102.

The wording of s. 102(1) is unclear and confusing. Subsection (1) authorizes a restraining order, an order to stop someone from doing something. It does not authorize a mandatory order; an order to require someone to do something. Subsection 102(2), which was obviously intended to add some additional power, is unclear in its purpose, intention, and scope. It can only be triggered by the Chief Medical Officer of Health or the Minister. It contains the same problem as s. (1) in the sense that it does not provide for a mandatory order.

This lack of mandatory power in s. 102 has led public health lawyers to have to frame their argument in a reverse fashion. For example, instead of asking the court to order a person to comply with an order of a medical officer of health, the court order must be to refrain from noncompliance with the order of a medical officer of health: a double negative along the lines of “Don’t not do what you have been ordered to do,” instead of “do what you have been ordered to do.”

The Superior Court procedure set out in s. 102 is confusing and weak. This is no way to enforce a statute. The Commission recommends that the Health Protection and Promotion Act be amended to provide the Superior Court, when ordering compliance with a public health obligation, with a full range of remedial power including the power to make mandatory orders.

What the Health Protection and Promotion Act lacks, and what it needs, is a single, clear, one-stop shopping system for the enforcement of all public health orders in respect of communicable diseases. Jurisdiction to enforce public health orders is divided artificially and confusingly between the Superior Court and the Ontario Court of Justice. The Ontario Court of Justice, if the subject of an order does not comply in response to an order in relation to a virulent disease, may order compliance. The Superior Court may make a similar order. As noted in greater detail below, each

291. An application under s. 102(1) may be made without notice, although a judge can always require notice if the circumstances appear to require it.
court has different procedures, none of them tailor-made for the purpose of public health protection. None of the legal procedures are designed for the delicate task of balancing individual rights against the right of the public to be protected against infectious disease. None of the legal procedures is designed for the speed required in an emergency.

The problem of overlapping jurisdiction is compounded by a number of constitutional rules which severely limit the power of the Ontario Court of Justice to issue certain kinds of orders and to grant certain kinds of remedies.

The Provincial Court lacks constitutional authority to make orders of the kind contemplated in s. 102 of the *Health Protection and Promotion Act*, which provides for Superior Court orders to restrain the contravention of public health orders and to prohibit the continuation of the contravention of such orders. In some specified circumstances the order may be made without notice and in other cases a judge may, under the inherent power of the court and the *Rules of Civil Procedure*, proceed without notice on an interim basis subject to a later hearing.

Orders of the kind required for a full range of enforcement procedures, orders in the nature of mandatory orders or orders for injunctions, are constitutionally reserved to the exclusive authority of the Superior Court. Even if Ontario passed a statute to give the Ontario Court of Justice such power, the statute would be constitutionally dubious in the sense of invalid and ineffective on the grounds that the province cannot give such power to a provincially appointed judge. A similar problem arises from the limited jurisdiction of the Ontario Court of Justice to grant remedies under the *Canadian Charter of Rights and Freedoms* because rigid constitutional doctrines reserve that power primarily to the Superior Court. It is only in Superior Court that the

---

292. Section 96 of the *Courts of Justice Act* confers on non-superior courts the power to apply the rules of equity but not the power to grant equitable relief, including injunctive relief: see also *Moore v. Canadian Newspapers Co.* (1989), 60 D.L.R. (4th) 113 (Div. Ct.). Altering this jurisdiction, even indirectly, would be difficult. Historically, Canadian courts have been vigilant in limiting efforts by provincial legislatures to enhance the jurisdictions of non-superior courts and statutory tribunals. The Supreme Court of Canada has repeatedly allowed challenges to purported extensions of the powers of non-superior courts and tribunals: see for example *Re Residential Tenancies Act* [1981] 1 S.C.R. 714.

293. Section 24(1) of the *Canadian Charter of Rights and Freedoms* limits remedial jurisdiction to courts of “competent jurisdiction.” Provincial superior courts are always courts of competent jurisdiction; they constitute the “default court of competent jurisdiction” for the purpose of Charter applications: *Dowet-Boudreau v. Nova Scotia (Minister of Education)* [2003] 3 S.C.R. 3 at para 49. By contrast, a non-superior court is a court of competent jurisdiction to grant a Charter remedy only if it has the power independently of the Charter to grant that remedy: *R. v. 974649 Ontario Ltd.* [2001] 3 S.C.R. 575.
availability of a full range of Charter remedies is constitutionally unassailable.

These constitutional limitations on the jurisdiction of the Ontario Court of Justice complicates matters unnecessarily for those who seek to enforce public health orders, or those who seek remedies for the alleged infringement of their legal rights. It makes no sense to divide public health enforcement and public health remedies so confusingly between two different courts.

Legal clarity and simplicity is vital in the enforcement of public health orders and the availability of legal remedies to those affected by orders. Multiplicity of courts and procedures produces nothing but delay and confusion. One court should have unified jurisdiction over all public health enforcement procedures and remedies. Without one-stop shopping in one court and one single code of procedure, the application of public health law will be hopelessly cumbersome. Unfortunately the rigidity of constitutional doctrines around court jurisdiction give no choice as to which court should have the full jurisdiction to enforce public health orders and grant remedies to individuals. The one court with that plenary jurisdiction is the Superior Court. The Commission recommends that the Health Protection and Promotion Act be amended to provide that all public health enforcement and remedial procedures be taken in the Superior Court pursuant to a unified code of procedure to be enacted with the Act.

**Recommendation**

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to eliminate the complex appeal process, rife with delay, in respect of an appeal by the subject of an order from a decision of the Health Services Appeal and Review Board, and provide an appeal as of right directly to the Court of Appeal with no prior requirement to secure leave to appeal.

- The Ministry of Health and Long-Term Care consider whether the Health Services Appeal and Review Board is a necessary step in the complex hearing and review process in the *Health Protection and Promotion Act* or whether some other system should be enacted.

- The *Health Protection and Promotion Act* be amended to simplify the complex and restrictive appeal process in respect of appeals from provincial court to the Superior Court and then to the Court of Appeal but only if a
judge of the Court of Appeal grants leave to appeal on special grounds on a question of law alone. This process could be simplified by eliminating the intermediate appeal to the Superior court the restricted leave to appeal to the Court of Appeal or both.

- The multiplicity of procedures in respect of the enforcement of Orders made under Part IV (communicable diseases) and Part VII (administration) of the Health Protection and Promotion Act, be replaced by a single, simple, codified procedure in the Superior Court.

- The Health Protection and Promotion Act be amended to provide the Superior Court, when ordering compliance with a public health obligation, with a full range of remedial power, including the power to make mandatory orders.

**Procedural Uncertainty**

To complicate matters further the Health Protection and Promotion Act does not even contain all the rules for the enforcement of health protection orders. Some of these rules are found in the Provincial Offences Act, a quasi-criminal statute that codifies many of the procedures for the enforcement of Ontario laws like the Highway Traffic Act that provide for prosecutions and punishments. For Superior Court procedures, the compendious and complex Rules of Civil Procedure must be followed. It is unacceptable that those enforcing public health protection have to wrestle with a multiplicity not only of courts, but of outside procedural regimes such as the Provincial Offences Act and the Rules of Civil Procedure.

For example, s. 86.1(1) of the Health Protection and Promotion Act, which allows the Chief Medical Officer of Health to resort to the Superior Court for an order directing a board of health to act in a situation where there is a health risk, says nothing about notice requirements or the procedural aspects of the application, for which one would have to consult the compendious and complex Rules of Civil Procedure.

To those who simply want to get on with the urgent business of enforcing public health orders or securing remedies in respect of those orders, the present law presents a confusing maze of overlapping and uncertain judicial powers and procedures best described as a legal nightmare.

---

One public health legal expert described a few of the problems:

[T]here is no procedure provided under the HPPA for obtaining a s. 35 order, there is nothing really prescribed under the HPPA for how you go about getting a s. 35 order. Actually in the case of SARS it was unclear whether s. 35 was really what was needed, given that for the most part, the types of orders that we would have wanted to enforce were home quarantine orders and whether s. 35 was really the right tool for enforcing a home quarantine order, raises questions given that you are going to be taking someone out of their house and detaining them in a hospital under s. 35 and whether that is really what you want to do in those circumstances.

... I guess one of the other revelations in doing research into it was that if there was any procedure provided for obtaining a s. 35 order, it appears to be under the *Provincial Offences Act*, s. 161 of the *Provincial Offences Act*.

I think in a nutshell ... that is not where most of us really expect it to be. Most people think of it really as a civil kind of an injunction or application. They do not think of it as a criminal type of procedure and I think there is some confusion between the proceedings under s. 35 and those that are permitted under s. 102 that allows you to go *ex parte* [in the absence of the person against whom an order is sought] to the Superior Court to obtain an order. We were very focused on s. 35 because it deals specifically with communicable diseases. It seems to have everything you want to do under s. 35 but when you actually look more closely into it, it is actually more of a straightjacket to what you want to do than would be the case under s. 102. It is very specific on what you are allowed to get.

If you look at s. 35(3) it basically prescribes the order that you can get and it says that the person may be taken into custody, admitted and detained in a hospital, now it has been amended to say other appropriate facility named in the order, to be examined by a physician and, if found on examination to be infected, to be treated. So that is what it allows you to get. My question was if you just wanted people to stay home, and that is what you wanted to enforce, and you were not getting police assistance otherwise, and the police may not give you any assistance unless you get a court order, is this what you really want?

I think that at first glance, it seems to be a procedural void. When you
first look at the HPPA, you think there is no procedure here for obtaining this. When you look at s. 161 of the POA, your second impression is, I am going to the Ontario Court of Justice but what does the Ontario Court of Justice do? It normally does provincial offences or it does custody and access kind of disputes. So you are thinking, do I make it look like a custody and access application or do I make it look like some sort of a provincial offences application, otherwise they may not let me file this anywhere.

This highlights many areas of confusion in the current system of court enforcement. It is inappropriate to enforce a public health order in the Ontario Court of Justice through the quasi-criminal provisions of the *Provincial Offences Act*, which were never designed for that purpose. It is inappropriate in the Ontario Court of Justice (Provincial Court) or the Superior Court to use a system of procedure that was never designed for the special problems of public health enforcement.

The lack of certainty as to whether the law requires the presence at the hearing of the person sought to be quarantined is particularly troublesome. Applications under s. 35 of the *Health Protection and Promotion Act*, in which the court is asked to enforce a quarantine order made by the medical officer of health, are brought in the Ontario Court of Justice. These orders are governed by the quasi-criminal procedures of the *Provincial Offences Act*, which requires in s. 161(b) that parties be given an opportunity to respond to any application. This requirement can be impracticable in a public health emergency when a noncompliant infected person cannot be found immediately. The requirement of notice and an immediate opportunity to be heard before even a temporary order can be made, may be impracticable if there is no machinery in place to ensure the infected person can safely be brought to court without endangering the health of everyone in the courthouse. It might be sensible to

---

Subsection 161(b) provides:

Where, by any other Act, a proceeding is authorized to be taken before the Ontario Court of Justice or a justice for an order, including an order for the payment of money, and no other procedure is provided, this Act applies with necessary modifications to the proceeding in the same manner as to a proceeding commenced under Part III, and for the purpose,

(a) in place of an information, the applicant shall complete a statement in the prescribed form under oath attesting, on reasonable and probable grounds, to the existence of facts that would justify the order sought; and

(b) in place of a plea, the defendant shall be asked whether or not the defendant wishes to dispute the making of the order.
make an initial temporary order in the Ontario Court of Justice without notice to the person involved, subject to review at a telephone or video hearing within a day or two in which he or she could participate electronically. However sensible it might be to do so, it is questionable whether there is jurisdiction to do so. One expert in the field noted:

If in fact the Ontario Court judge is saying, ‘well what I am going to do is on an interim basis, I am going to allow you to get police assistance to keep them at home and then it is returnable in a few days.’ The question is: is that really a substantive order under s. 35? Is he really making a determination that is not what that judge is permitted to make under s. 35. Is there a substantive element to that?

There are obvious problems with rules that require a public court attendance by someone who should be quarantined because he poses a risk of transmitting a virulent disease. It makes no sense to invite the virulent infection into the courthouse where others may be endangered and the entire court process may be jeopardized. The risk, which the law seeks to reduce, may in fact be increased by the procedure required to reduce it.

One expert familiar with the process described the problem to the Commission as follows:

… Well, can I do this *ex parte* [in the absence of the person against whom an order is sought?] Can I not do this *ex parte*? … And every time I get a 35 I cringe because of this whole procedural quagmire, because the judges rightly so have never seen such applications. It was very rare before SARS … And they are concerned about the health of their staff, the court officials and legitimately so. They do not want them there at first instance. Do I give the person notice, do I not? Do I go there and try to get an interim order and then have them appear by teleconference or through an agent? And the real risk, we were very cognizant of this, what if we give them notice and they take public transportation to the place. Do we have to stand outside their houses and give them a mask. What is our authority to put a mask on them? This became very real in SARS. But even in a case we had after SARS with a TB patient, we did not know what to do with this person. You give them notice at first instance but they go on public transportation. Do we have to send them a cab and which cab company would take them. How do we force them to wear masks because contempt [of court power] would be too late. And what I notice
about the people who have to get s. 35 orders against them, they do not believe that they have the disease. The common thread through every single s. 35 that I have done, is that they do not believe they have the disease. So they will get on public transportation, they will walk, they will do whatever, because they think this thing has been blown out of proportion. I think we need circumscribed set of circumstances. You can go *ex parte* initially, have a first cut at it, you can go *ex parte*, you can go with a three day order; have them at least assessed quickly, do you have TB, or do you not? That could be done I think pretty quickly.

Another suggested that many of the procedural difficulties could be resolved by sending all the enforcement applications to the Superior Court, which has more familiarity with *ex parte* procedures and interlocutory relief, and wider constitutional power than the Ontario Court of Justice:

My preference with respect to these issues perhaps shows my roots as a civil litigator. It is to do away with the Ontario Court procedures and just have these applications in Superior Court. There is a familiarity of civil court judges for interlocutory procedures ultimately resulting in a restraining order or an order requiring one to remain in a particular place. It is not going to be, I believe, as much of an educational process … I do not see there being any real purpose in having these two separate processes that you can go to the Ontario Court or you can go to the Superior Court. Again I am showing my roots but my preference would be to go to the Superior Court to seek that type of relief. I do not anticipate there would be any kind of delay involved in going to Superior Court … That court would have greater familiarity with dealing with *ex parte* proceedings than would the Ontario Court because it really is not an offence based request by the medical officer of health, it is a request for interlocutory relief to detain someone. Now if you were to go that route to require that such applications are always made to the Superior Court, then you could still flesh out what types of orders could be made, including order more expansive than what is in s. 35(3) right now, and clarify in there that the judges can request and require the assistance of the police and all of that sort of thing. I do not know necessarily if the judges would require that sort of thing but I think that they would be fairly familiar with those types of terms, in restraining orders and the like. You could have a fairly clear process set out by which these applications would be made. But I think that you could make it more clear by going to the Superior Court.
As noted above, the powers of judicial enforcement are scattered throughout the Act between two separate courts without any procedural guidance or explicit machinery for crucial procedures such as dispensing with hearings, determining whether a hearing should be open to the public, or amending orders as conditions change. It is not the time, in the middle of an infectious outbreak or even before it starts, for medical officers of health and their lawyers to navigate the substantive and procedural mysteries of this confusing and inadequate legal system.

Another area that requires amendment for procedural clarity is the power of medical officers of health to obtain police assistance in the enforcement of s. 35 orders. Subsection 35(6) provides:

Section 35(6) provides:

An order under this section may be directed to a police force that has jurisdiction in the area where the person who is the subject of the order may be located, and the police force shall do all things reasonably able to be done to locate, apprehend and deliver the person in accordance with the order.

Uncertainty ensues when the person crosses boundaries into another health unit, with a different police service. One medical officer of health described the problem with this section to the Commission:

There have been cases where a judge has issued a s. 35 order and circumstances required the services of a police department in a jurisdiction outside that of the health unit who applied for the s. 35 order, and the police refused to carry out the order claiming that because it was from outside it did not apply to them.

The Commission recommends that the Health Protection and Promotion Act be amended to provide that an order under s. 35 may be directed to any police service in Ontario where the person may be found, and the police service shall do all things reasonably able to be done to locate, apprehend, and deliver the person in accordance with the order.

It is not enough to provide legal authority to make orders. If the orders cannot be enforced through a clear set of reasonable and efficient procedures, there is no point in making the order in the first place. The procedures to exercise those powers must be in place and must be clear and fair. They must be learned thoroughly by all those
involved in their application. As one expert from the Centers for Disease Control and Prevention observed:

… obviously you have to have the authority, you have to have the legal authority to do so. But you need more than that. You need procedures. You can have the authority but you need procedures. How is this actually going to work and those procedures have to be fair, they have to conform with the constitution of the United States, they have to allow due process in that sense, 14th amendment. They have to be defensible. These may have to be defended in court sometime and so they must be defensible legally. To be legally prepared, you have to have legal expertise in this state. People who understand these laws, how to use them, what their limits are. Coordination along jurisdictions is absolutely crucial … We learned this and we could learn it again with other public health challenges. And you need communications, three times, communications and education amongst all law officials, law enforcement and judiciary.

Recommendations

The Commission therefore recommends that:

- The *Health Protection and Promotion Act* be amended to consolidate and codify all provisions in respect of court enforcement and access to judicial remedies in respect of communicable diseases into one seamless system or powers and procedures.

- The *Health Protection and Promotion Act* be amended to include special procedures such as *ex parte* procedures for interim and temporary orders, video and audio hearings, and other measures to prevent the court process from becoming a vector of infection.

- The *Rules of Civil Procedure* be amended to include a clear, self-contained and complete code of procedure for public health enforcement and remedies in respect of communicable diseases.

- There be a consequential amendment to the *Courts of Justice Act* to provide that proceedings in respect of the *Health Protection and Promotion Act* enforcement and remedies in respect of communicable diseases shall be heard at the earliest opportunity.
• The Health Protection and Promotion Act be amended to provide that an order under s. 35 may be directed to any police service in Ontario where the person may be found, and the police service shall do all things reasonably able to be done to locate, apprehend, and deliver the person in accordance with the order.

• The judiciary be asked to establish court access protocols in consultation with the public health legal community.

• The Health Protection and Promotion Act be amended to provide that an order under s. 35 may be directed to any police service in Ontario where the person may be found, and the police service shall do all things reasonably able to be done to locate, apprehend, and deliver the person in accordance with the order.

• The Ministry of Community Safety and Correctional Services and the Ministry of the Attorney General, together with public health officials, establish protocols and plans for the enforcement of orders under the Health Protection and Promotion Act and the involvement of police officers in that process.

Legal Preparedness

Legal counsel for public health units faced a daunting task during SARS. When seeking judicial authority to enforce an order, they had to navigate a confusing maze of overlapping and uncertain judicial powers and procedures when speedy enforcement was vital to the containment of SARS. As one lawyer involved in the response to SARS told the Commission:

It is quite a challenge to be in a middle of an emergency with the kind of huge range of legal issues coming up and you have to figure out what the legal requirements are and how to get what needs to be done, done in the face of those issues and still keeping everyone within the law.

SARS demonstrated that it is vital in the middle of an infectious outbreak to be able to get a judicial order quickly and to enforce it quickly.

Legal preparedness is seen increasingly as an essential element of public health preparedness, like epidemiological preparedness or diagnostic preparedness. As noted
in a paper published by the Centers for Disease Control and Prevention:

Historically, public health legal counsels have served as “technicians” in public health practice, asked by the public health agencies they serve to interpret arcane statutory language and render opinions. Legal preparedness, however, is increasingly being viewed as a critical component of state and local government public health preparedness activities. As demonstrated repeatedly, in the SARS outbreak (quarantine/isolation); in the introduction of monkey-pox in the Western Hemisphere (restrictions upon the exotic animal pet trade); and during West Nile virus season (mosquito abatement/spraying programs), legal issues are nearly always intertwined with public health responses.296

A group of American public health experts added:

Legal preparedness has gained recognition as a critical component of comprehensive public health preparedness for public health emergencies triggered by infectious disease outbreaks, natural disasters, chemical and radiologic disasters, terrorism and other causes. Public health practitioners and their colleagues in other disciplines can prepare for and respond to such an event effectively only if law is used along with other tools. The same is true for more conventional health threats.297

Public health lawyers in Ontario distinguished themselves during SARS by the initiatives they took to overcome the marked lack of systemic legal preparedness. Their hard-earned expertise inspired U.S. officials to develop new approaches to legal preparedness. An expert at the Centers for Disease Control and Prevention, for example, credited a presentation by Jane Speakman, Toronto Public Health’s legal counsel, and Dr. Barbara Yaffe of Toronto Public Health, as a central element in the Centers for Disease Control and Prevention’s development of a legal preparedness guide:

This is something that we developed and posted, based upon some collaboration after hearing Jane Speakman and [Dr.] Barbara Yaffe pres-

---

ent at the Phoenix Health Officers Conference in September. Then on
the plane ride back, we started putting that together for the lawyers and
the health officers in this country to get ready for SARS. So a lot of this
is part of the presentation they had given together with some of things
we had been thinking about for folks in this country, getting ready for
SARS when it comes again. Know your legislation. Plan due process.
Draft your documents in advance. Contact your other jurisdictions. Alert
your judiciary. Plan for the practical problems in communication as filed.
This is a work in progress … I heard very early in conference calls with
Toronto that when they went to the judges, the judges were a little
surprised. What is this law that you can issue an order without it first
coming before the judiciary. That’s the way many laws are in this country.
That’s the way our federal authority is. You can do it *ex parte*. And, and
my understanding is that the judiciary was concerned with two parts:
one, we’ve got to be sure that the law enforcement officials that are carry-
ing out this are properly protected. What are the personal protective
equipment and those rules of separation. And there needs to be legal
representation for people that are put under order and that’s where we’re
starting to draw this in. You’ve got to plan the due process.

Although the role of law in public health is not new, SARS underlined the impor-
tance of having not only the right laws and regulations in place, but also the ability to
enforce them quickly and fairly. The current emphasis on legal preparedness reflects
the perspective of James A. Tobey, the American public health legal scholar, who
stated more than 50 years ago:

... practical laws, reasonably and equitably enforced, are essential as a
foundation for the public health activities of government. Education and
moral suasion, desirable as they may be in the practice of public health,
will not bring results unless the people realize that behind them is the
long arm of the Law.\textsuperscript{298}

Public health legal preparedness takes many forms and reaches into all aspects of
emergency response. A group of American public health experts noted;

At first glance, public health legal preparedness may appear to be only a
matter of having the right laws on the books. On closer examination,

however, it is as complex as the field of public health practice itself. Public health legal preparedness has at least four core elements: laws (statutes, ordinances, regulations, and implementing measures); the competencies of those who make, implement, and interpret the laws; information critical to those multidisciplinary practitioners; and coordination across sectors and jurisdictions.  

SARS demonstrated the importance of clearly drafted and well understood legal procedures in the containment of infectious outbreaks. The need for clarity and speed was stressed by a public health lawyer who responded to SARS; a procedure for obtaining a section 35 order should be fully outlined in section 35 of the Health Protection and Promotion Act. This procedure should set out the most expeditious manner of providing individuals with rights to due process while at the same time expediting the process to reduce the potential transmission of disease.

As part of legal preparedness, public health officers need to be familiar with the legal procedures required to isolate infectious people and to quarantine exposed people. Courts need judicial education programmes to familiarize judges with the law, procedure, and practical challenges of public health enforcement powers and remedies. Protocols for court access, including electronic hearings and access to legal aid, need to be developed in consultation with private lawyers and public health officials. Echoing the experience of Ontario, the Centers for Disease Control and Prevention advises:

Public health officers need to be prepared for the practical problems that may arise in affording adequate due process protections to persons subject to isolation and/or quarantine orders. Such problems may include how to arrange for the appearance and representation of persons in quarantine (e.g., video conference or other remote means); how to serve an isolation/quarantine order (likely through law enforcement) and other procedures to advise persons of their legal rights; and isolation arrangements for transient or homeless populations.

300. See: The Centers for Disease Control and Prevention has published a useful guide entitled: “Fact Sheet: Practical Steps for SARS Legal Preparedness.”

In addition, echoing another lesson also learned in Ontario during SARS, the Centers for Disease Control and Prevention advises:

… public health officers should consider drafting key documents in advance of an emergency. These template documents can be critical time savers in an emergency. Documents that jurisdictions should consider preparing in advance include: draft quarantine and/or isolation orders; supporting declarations and/or affidavits by public health and/or medical personnel; and an explanation of the jurisdiction’s due process procedures for persons subject to an isolation/quarantine order.302

An important element of legal preparedness is ensuring that court orders can be enforced. This may require police assistance.

The enforcement of public health orders involves police work different from the day to day experience of most officers. The orders arise from the opinions, beliefs and knowledge of medical professionals with expertise that police officers are unlikely to share. Police officers may face unfamiliar risks of infection without adequate information on how to protect themselves. In one case police officers were sent to apprehend an un-cooperative tuberculosis patient who was refusing medication and had a habit of spitting at persons in authority. The Police were not told that he had an infectious disease and they were not provided with the requisite personal protective equipment.

In the worst case scenario, police may face the prospect of trying to control large numbers of citizens who may balk at following certain public health orders. A study by a U.S. law enforcement think tank, the Police Executive Research Forum, highlights the insurmountable problem, and disturbing consequences, of trying to enforce the unenforceable:

One person or a small number of persons can be restricted by force. As the number of affected persons increases, the efficacy of force diminishes because it is impossible to force a large number of persons, spread over a large area, to comply with restrictive orders. People must be convinced that the restrictions are for the public good and that they should comply with them voluntarily. The vast majority of the population will behave responsibly if they have confidence in public authorities and are properly

302. Ibid.
informed. The role of the police then becomes one of facilitation of proper behavior and the management of non-complying individuals.303

SARS demonstrated the potential difficulties of police involvement in public health emergencies. Dr. Bonnie Henry reported that Toronto Public Health received exemplary cooperation from police in Toronto, but some other local units had a different experience:

… the Toronto Police Service was extremely helpful to us. As a matter of fact, when the outbreak happened in Toronto, the deputy police chief said, “What can we do to help?” That is, I think, a monumental change in attitude, and we are probably the only jurisdiction in Ontario where that happened. Certainly in some of our neighbouring jurisdictions, police said, “We have no role in this.”304

A public health lawyer for a neighbouring region had a different experience:

Although the section 35 order authorizes police to [do] all things reasonable to locate, apprehend and deliver the person subject to the section 35 order to the hospital or facility, police are reluctant to become involved in a “health matter.”

For example, we were involved in an incident where police attempted to apprehend a person pursuant to a section 35 order on three occasions but were unsuccessful. Thereafter, the board of health used a public health inspector to undertake surveillance given the police indicated that this was a “health matter” as opposed to a “criminal matter,” that they had insufficient resources and would simply “red flag” the address.

This public health inspector was required to follow the person subject to the section 35 order when the person left the residence and to telephone police to apprehend the person pursuant to the section 35 order. A board of health does not have the expertise or the staff to undertake surveillance.

This shows that legal preparedness requires prior consultation, planning, training, and protocols between public health and police.

Dr. Bonnie Henry pointed out the importance of this prior consultation and planning:

I work for Toronto Public Health, but part of my job is coordinating very closely with our police, fire, EMS, and our office of emergency management … We’ve certainly had the discussions on a number of occasions. One of the things that our relationship has fostered is the ability to understand each other’s roles a bit better … Developing those relationships and understand where each other’s authority and responsibility lie makes a huge difference in allowing you to respond in a coordinated manner.\(^{305}\)

Legal preparedness requires cooperation between jurisdictions. As the Centers for Disease Control and Prevention advises:

It is possible for federal, [provincial], and local health authorities simultaneously to have separate but concurrent legal quarantine power in a particular situation (e.g., an arriving aircraft at a large city airport). Furthermore, public health officials at the federal, [provincial], and local level may occasionally seek the assistance of their respective counterparts, e.g., law enforcement, to assist in the enforcement of a public health order. Public health officers should therefore be familiar with the roles and responsibilities of other jurisdictions: vertically (local, [provincial], federal), horizontally (public health, law enforcement, emergency management, and health care), and in geographical clusters (overlapping neighbors).\(^{306}\)

SARS demonstrated the importance of all these aspects of legal preparedness. The Commission therefore recommends that legal preparedness be an integral component of all public health emergency plans.

Recommendation

The Commission therefore recommends that:

- Legal preparedness be an integral component of all public health emergency plans.

Conclusion

Confusion and uncertainty are the only common threads throughout the legal procedures now provided by the Health Protection and Promotion Act for public health enforcement and remedies. Uncertainty as to which court to use. Uncertainty as to when notice is required and how to dispense with it when necessary. Confusion as to the procedural authority for orders and their degree of permanence. Uncertainty as to the procedure to amend orders to suit the circumstances. Confusion as to the authority and the procedure to obtain an interim ex parte order (a temporary order made in the absence of the person against whom the order is sought, to be followed by a court hearing) and the duration of such an order. Uncertainty as to the process by which the exclusion of the public from a hearing may be challenged.

Public health officials and the lawyers who advise them require not only the clear authority to act in the face of public health risks, they require also a simple, rational, effective and fair set of procedures to enforce compliance and to provide legal remedies for those who challenge orders made against them. Delays in legal enforcement may cost lives. Delays in legal remedies may put individual liberty at risk. The above recommendations are necessary to secure effective access to enforcement and to remedies.

Recommendations

The Commission therefore recommends that:

- The Health Protection and Promotion Act be amended to eliminate the complex appeal process, rife with delay, in respect of an appeal by the subject of an order from a decision of the Health Services Appeal and Review Board, and provide an appeal as of right directly to the Court of Appeal with no prior requirement to secure leave to appeal.
The Ministry of Health and Long-Term Care consider whether the Health Services Appeal and Review Board is a necessary step in the complex hearing and review process in the Health Protection and Promotion Act or whether some other system should be enacted.

The Health Protection and Promotion Act be amended to simplify the complex and restrictive appeal process in respect of appeals from provincial court to the Superior Court and then to the Court of Appeal but only if a judge of the Court of Appeal grants leave to appeal on special grounds on a question of law alone. This process could be simplified by eliminating the intermediate appeal to the Superior court and the restricted leave to appeal to the Court of Appeal or both.

The multiplicity of procedures in respect of the enforcement of Orders made under Part IV (communicable diseases) and Part VII (administration) of the Health Protection and Promotion Act, be replaced by a single, simple, codified procedure in the Superior Court.

The Health Protection and Promotion Act be amended to provide the Superior Court, when ordering compliance with a public health obligation, with a full range of remedial power, including the power to make mandatory orders.

The Health Protection and Promotion Act be amended to consolidate and codify all provisions in respect of court enforcement and access to judicial remedies in respect of communicable diseases into one seamless system or powers and procedures.

The Health Protection and Promotion Act be amended to include special procedures such as ex parte procedures for interim and temporary orders, video and audio hearings, and other measures to prevent the court process from becoming a vector of infection.

The Rules of Civil Procedure be amended to include a clear, self-contained and complete code of procedure for public health enforcement and remedies in respect of communicable diseases.

A consequential amendment to the Courts of Justice Act provide that proceedings in respect of the Health Protection and Promotion Act enforcement and remedies in respect of communicable diseases shall be heard at the earliest opportunity.
• The *Health Protection and Promotion Act* be amended to provide that an order under s. 35 may be directed to any police service in Ontario where the person may be found, and the police service shall do all things reasonably able to be done to locate, apprehend, and deliver the person in accordance with the order.

• The judiciary be asked to establish court access protocols in consultation with the public health legal community.

• The *Health Protection and Promotion Act* be amended to provide that an order under s. 35 may be directed to any police service in Ontario where the person may be found, and the police service shall do all things reasonably able to be done to locate, apprehend, and deliver the person in accordance with the order.

• The Ministry of Community Safety and Correctional Services and the Ministry of the Attorney General, together with public health officials, establish protocols and plans for the enforcement of orders under the *Health Protection and Promotion Act* and the involvement of police officers in that process.

• Legal preparedness be an integral component of all public health emergency plans.
Public Health Resources

SARS showed that Ontario’s public health system is broken and needs to be fixed. Evidence of its inadequacy was presented in the Naylor Report, the Walker Report, and the Commission’s first interim report.

Since then, as set out in Appendix C, much progress has been made. The government has moved forward by appointing Dr. Sheela Basrur as the new Chief Medical Officer of Health, making legislative changes, and beginning to allocate resources. But despite a promising start, much more remains to be done. After long periods of neglect, inadequate resources and poor leadership, it will take years of sustained funding and resources to correct the damage. Like a large ship, a public health system, especially one as big and complex as Ontario’s, cannot turn on a dime.

There is wide agreement on what still needs to be accomplished. But it takes unflagging commitment and determination to rebuild a broken public health system. Without a sustained commitment to fund the necessary changes, much that has been done will wither away and much that is urgently required will never be realized.

SARS focused on the need for public health to do more to protect us against disease, more by way of planning against threats like pandemic influenza, and more by way of increased powers for public health authorities to monitor infectious threats in the community and in health care institutions. It demonstrated that more public health resources are required in many areas, including:

- Laboratory capacity, expertise and personnel;
- Scientific advisory capacity and capabilities;
- Epidemiological expertise;
- Surge capacity;
- Infectious disease expertise and personnel;
• Strengthening public health human resources; and

• Infectious disease information systems.

Naylor, Walker, and this Commission recommended more public health resources to prevent infectious outbreaks before they erupt, and to control them once they start. The government has accepted in principle this need. The problem is that new leadership, legislative changes, reviews and new programmes require continued funding. This underlying need for sustained levels of resources was described by Dr. Donald Low before the Justice Policy Committee:

A clear authority, I think, is number one, as you’ve heard, and critical; and not only having a clear authority but the resources to back that up. If you don’t have those resources, then you really can’t take advantage of that authority. Finally, being able to draw on the expertise to support you, whether that expertise comes locally, nationally or from other countries, is critical, especially in a setting such as SARS or pandemic influenza. The problem with dealing with these outbreaks is the sustainability of them. We can handle it for a week, but we can’t handle it for two, three, six weeks. We need the expertise.\(^{307}\)

Some resources have already been allocated to improve the health care system. The Ministry of Health and Long-Term Care, for example, has pledged to implement a federally-funded outbreak management system called the Integrated Public Health Information System or iPHIS. Full deployment in all public health units is expected to be completed by the end of 2005. In another example, the Ministry is creating a permanent central expert body, the Provincial Infectious Disease Advisory Committee, to continue the development of standards and guidelines for health professionals and organizations faced with infectious disease outbreaks.

This is a commendable start, but these measures mark merely the end of the beginning of the effort to fix the public health system. The end will not be reached until Ontario has a public health system with the necessary resources, expertise and capabilities, and this will take years to achieve. The U.S. General Accounting Office, the equivalent of the Auditor General of Canada, has noted that fundamental changes in large institutions can take at least five to seven years:

\(^{307}\) Justice Policy Committee, Public Hearings, August 18, 2004, p 156.
... change is necessarily a long-term undertaking, requiring leadership and commitment. Experience shows that successful major change management initiatives in large private and public sector organizations can often take at least 5 to 7 years. This length of time and the frequent turnover of political leadership ... have often made it difficult to obtain the sustained and inspired attention to make needed changes.\textsuperscript{308}

The difficulty of effecting change over such a long time-line, and the importance of continuing to provide resources to sustain such profound and long-term change, is best exemplified by the problems faced by the Public Health Division in trying to revitalize the Central Public Health Laboratory.

Located in Toronto, the Central Public Health Laboratory is the Ministry of Health and Long-Term Care’s key provider of diagnostic microbiology testing. As such, it is supposed to be the primary laboratory in the province supporting outbreak management and control efforts. During an infectious disease outbreak, epidemiologists and clinicians rely on laboratory tests to verify diagnoses, identify the nature and characteristics of the infectious agent, map the extent of an outbreak and gauge the effectiveness of counter-measures. These tests must be completed quickly and efficiently, and the results conveyed to those managing the response to the outbreak in a timely manner.

But, as noted in the SARS Commission’s first interim report, the provincial laboratory failed to discharge its responsibilities effectively during SARS. The Commission’s first interim report stated:

The capacity of a laboratory system to respond to an outbreak of infectious disease must pre-exist any future outbreak because it is impossible to create it during an outbreak. The functions performed by public health laboratories require the work of highly skilled professionals. This work cannot be done by recruiting inexperienced volunteers during an emergency. Nor is it adequate to rely on the hope that private and hospital laboratories will have the extra capacity when needed. Laboratory capacity is much like the rest of public health; its importance is not appreci-
ated, nor the impact of its inadequacies felt, until there is an outbreak and then it is too late.\textsuperscript{309}

The Naylor Report noted:

> With the provincial lab overwhelmed, some hospitals sent specimens directly to the National Microbiology Laboratory [in Winnipeg] bypassing the usual hierarchy of referral. The Hospital for Sick Children, Mount Sinai and Sunnybrook and Women’s had strong polymerase chain reaction [PCR] technology – an elegant laboratory testing modality that identifies micro-organisms. They became the de facto and unfunded referral centres for Toronto SARS testing.\textsuperscript{310}

Of particular concern during SARS was the lack of sufficient scientific expertise. When SARS hit, there were only two medical microbiologists employed by the provincial labs. All the PhD level scientists had been laid off two years earlier.

The professional inadequacy of our public health laboratory system during SARS illustrated dramatically the urgent need for sustained resources, without which Ontario will continue to be unprepared for the next outbreak of infectious disease. The sad plight of the public health laboratories provides a cautionary example of what happens when inadequate resources are allocated on a continuing basis to vital elements in our protection against infectious disease.

When the Walker Panel recommended in April 2004 that the Ministry begin establishing a Health Protection and Promotion Agency, it recommended that the Central Public Health Laboratory be one of its core components. The Walker Panel stated:

> The ability to provide timely and accurate lab information to those involved in structuring the province’s epidemiologic analysis and overseeing the surveillance efforts is key to an effective surveillance system and to a responsive public health system.

In its interim report, the Panel highlighted the need to align the public health laboratory system and the epidemiological and surveillance functions. The Panel also called for immediate short-term action to address the significant shortage of microbiology

\textsuperscript{309} Commission’s first interim report, p. 96.
\textsuperscript{310} Naylor Report, p. 33.
expertise and medical leadership at the existing Central Public Health Laboratory:

In looking to the future, the Panel strongly suggests that the province aims to co-locate a revitalized Central Public Health Laboratory with the Agency. This will involve new lab capacity being built over time; Ontario should vigorously pursue this in addition to federal support to assist in it being realized. The Panel also believes that there are tremendous opportunities to develop formalized and much closer linkages between the central laboratory and the laboratory infrastructure at major academic health sciences centres in Ontario. The Ministry should actively seek to retain the focus and vision of the Public Health Laboratory while ensuring that it is part of a formal, broader critical mass of expertise through the appropriate partnerships with lab networks at the federal and provincial levels. A clear hallmark of the effectiveness of the B.C. and Quebec agencies is the co-location of laboratory expertise within the agency structures. Co-location allows for rapid on-site review of emergent issues, and ensures that the perspective of those involved in the testing and laboratory analysis components of surveillance and response are integrally and directly linked to the efforts of an overall team.311

The SARS Commission endorsed this thoughtful recommendation, which the Government accepted in June 2004, when it released *Operation Health Protection: An Action Plan to Prevent Threats to our Health and to Promote a Healthy Ontario*. This document stated:

Central to the establishment of the Agency is the modernization of Ontario’s Central Public Health Laboratory and the public health laboratory system … The Agency Implementation Task Force will also guide an operational review of the public health laboratory system to align the available testing services with what is required. This will also help determine the functional and procedural enhancements needed to ensure that the system performs at optimal levels on a daily basis as well as during an outbreak. This review will be completed over the next few months. Formal linkages are already being strengthened and technological infrastructure has recently been created within the Ministry and the Central Public Health Laboratory to improve communication and information exchange.

Our goal is to ensure a state-of-the-art public health laboratory system in Ontario. In order to strengthen the province’s laboratory capacity and to prepare for co-locating appropriate functions of the Central Public Health Laboratory with the Agency, we will enhance the medical capacity of the public health laboratory system, beginning with the addition of a senior medical director and additional medical microbiologists.  

Achieving this important goal is no easy matter. The Public Health Division is in the unenviable position of rebuilding a critical institution in the midst of trying to implement short-term solutions to endemic systemic problems. It is like trying to build a new dike while, at the same time, shoring up a crumbling barrier of sand bags.

Take the problem of the lack of professional expertise. While the government has approved recruiting six medical microbiologists and a medical director, and recruitment is well under way, it is difficult and time-consuming to attract the best people to an organization without a record of excellence and, until now, a lack of commitment to excellence. Adding to the difficulty is the fact that medical microbiologists are in high demand across North America. As one official told the Commission:

It’s a seller’s market.

For such a critical institution as the Central Public Health Laboratory, a recruitment misstep could have long-term consequences.

While rebuilding the Central Public Health Lab’s professional expertise, the Public Health Division is also facing a more immediate and critical need to keep the Central Public Health Lab functioning. Since SARS, one of the provincial laboratory’s two medical microbiologists has left for another position and has not been replaced, and the second microbiologist is on leave. Luckily for the province, Dr. Donald Low, whose spirit of public service during SARS is to be commended, has once again stepped up and has arranged on a temporary basis for a team of microbiologists from Mount Sinai Hospital in Toronto to fill the gap.

Adding to this difficult balancing act, the Public Health Division is also in the process of commissioning experts to conduct a capacity review of the public health laboratory.

---

system and determining how it can be effectively integrated into the new Ontario Health Protection and Promotion Agency. Again, this needs to be undertaken with care and prudence, and it takes time.

The reality is, for all the Public Health Division’s commendable efforts, and Dr. Low’s exemplary assistance, the Central Public Health Lab remains in a difficult state. This is critical when one considers the possible threat of an influenza pandemic and the important role expected of the Central Public Health Lab. As stated in the Ontario Health Pandemic Influenza Plan:

Ontario must have the ability to identify a new strain of influenza virus quickly (prompt identification increases the lead time to develop a vaccine and implement management measures) and to track virus activity. To effectively prepare for and monitor pandemic influenza activity, Ontario must have a rapid, accurate surveillance system, which includes:

- laboratory or virologic surveillance (i.e., isolating and analyzing influenza viruses for their antigenic and genetic properties, definitively diagnosing influenza). This activity is essential to monitor the antigenic drift and shift of influenza viruses circulating among humans. Because the signs and symptoms of influenza are similar to those caused by other respiratory pathogens, laboratory testing is required to definitively diagnose influenza …313

Having regard to the continuing issues faced by the Central Public Health Lab, the Commission recommends, in an effort to mitigate its continuing problems, that it be transferred temporarily to the control of the Chief Medical Officer of Health until it can be integrated into the new Ontario Health Protection and Promotion Agency. Now housed in an area of the Ministry completely separate from the Chief Medical Officer of Health, the Central Public Health Laboratory needs to be under the direction of the Chief Medical Officer of Health to ensure unified leadership and administration of activities that bear directly on our protection against infectious disease.

To its credit, the government recognizes that fixing public health must be done over a period of years. In June 2004, two months after the release of the Commission’s first interim report and of the Walker panel’s final report, the government unveiled

Operation Health Protection, a three-year plan to fix the weaknesses in the public health system exposed by SARS.

Despite a good beginning, some of the biggest spending lies ahead:

- Establishing the new Ontario Health Protection and Promotion Agency;
- Implementing recommendations of the assessment of the public health laboratory system;
- Integrating the public health laboratory into the new Agency;
- Implementing the recommendations of Capacity Review Committee of local public health;
- Revitalizing the Public Health Division;
- Increasing the provincial share of local public health funding from the current 55 per cent to 75 per cent by January 1, 2007; and
- Funding the increased levels of monitoring, auditing and enforcement outlined in chapter 3 (Municipal Role) of this report.

While many commendable initiatives have been undertaken, a considerable number involve studies, reviews, assessments and planning: a task force to help design and develop the new Ontario Health Protection and Promotion Agency is to make its final recommendations by the fall of 2005; a review on revitalizing the Central Public Health Laboratory and integrating it into the Agency is under way; and a Capacity Review of local public health is to be completed by year’s end.

This is not to say that task forces and review committees are unimportant. They are vitally important. Fixing the public health system cannot and should not be done in haste or without care. The point is that it is easier to commit massive funds to a task force than to massive expenditures recommended by a task force. The proof of commitment comes not when the task force is launched, but when its recommendations are ripe for implementation and expenditure.

As the province moves into the latter stages of Operation Health Protection, stages when significant funding will be required, the challenge will be to provide the neces-
sary resources to sustain the momentum for change despite the government’s other budgetary pressures.

The point has to be made again and again that resources are essential to give effect to public health reform. Without additional resources, new leadership and new powers will do no good. To give the Chief Medical Officer of Health a new mandate without new resources is to make her powerless to effect the promised changes. As one thoughtful observer told the Commission:

The worst-case scenario is basically to get the obligation to do this and not get the resources to do it. Then the Chief Medical Officer of Health would have a legal duty that she can’t exercise.

To arm the public health system with more powers and duties without the necessary resources is to mislead the public and to leave Ontario vulnerable to outbreaks like SARS.
Emergency Legislation

Introduction

The first goal of public health emergency management is to stop emergencies before they start by preventing the spread of disease. If a small outbreak is prevented or contained, the draconian legal powers available to fight a full-blown emergency will not be needed.

This is why the Commission in the previous 10 chapters has gone into such detail about strengthening the *Health Protection and Promotion Act* with workable daily powers that can prevent emergencies.

Preparedness and prevention backed up by enhanced daily public health powers are the best protection against public health emergencies.

Legal powers by themselves are false hopes in times of public crisis. In the face of impending disaster no law will work without public cooperation and individual sacrifice of the kind demonstrated by so many during SARS. Without machinery to support public cooperation, emergency powers will be of little use.

Some emergencies, however, will require extraordinary action beyond ordinary government intervention and ordinary government power. Emergencies will come upon us suddenly and without warning, no matter how prepared and vigilant we may be. Any emergency, once it gets going, may overwhelm the protection provided by existing legal powers.

Ontario got through SARS without any explicit emergency legal powers. Ontario’s *Emergency Management Act*, then as now, conferred no special powers to be used in any kind of emergency. SARS showed that explicit emergency powers are required to protect the public from even more catastrophic public health disasters such as the next influenza pandemic, thought by some scientists to be overdue.

---

314. Paraphrased from Mr. Justice Learned Hand’s 1944 address *The Spirit of Liberty*. 
Such a colossal epidemic would require strong explicit emergency powers of the kind that were not legally available during SARS.

Another reason why explicit emergency powers would be required for pandemic influenza is the uncertainty about the legal extent of existing emergency powers. Many of the actions taken to fight SARS were done without explicit statutory authority. The legal authority for every governmental action taken during SARS may be legally defended on a generous reading of existing inherent and statutory powers, but the extent of our present legal emergency authority is far from clear. Many who complied willingly with emergency directives during SARS have since then, on reflection, expressed concern that they might not do so again unless the power to issue directives and orders is spelled out clearly in some form of explicit emergency legislation.

The Commission has recommended strengthening the Health Protection and Promotion Act with daily powers that can be exercised with or without a declared emergency. These recommended powers include warrantless entry of dwelling houses in urgent situations but subject to a later court hearing, and subject also to court hearing, temporary detention and decontamination of people exposed to infectious agents such as anthrax or weaponized smallpox.

The special powers advocated for public health emergencies such as pandemic influenza include such measures as mass compulsory vaccination, compulsory requisition of supplies such as vaccines and respirators, compulsory closing of hospitals and other institutions, involuntary transfer of patients, and a wide range of general powers such as evacuation and rationing. These emergency powers cannot be met by the Health Protection and Promotion Act. Explicit emergency powers are required in addition to the daily powers now available under the Health Protection and Promotion Act and the further daily powers recommended by the Commission.

Public health emergencies are in many ways unique and unlike typical disasters like floods, fires, power blackouts, or ice storms. In floods and power losses people can take certain protective actions on their own. However, they have few personal defences against an invisible virus that can kill them. They must turn to trusted medical leadership.

The most important thing in a public health emergency is public confidence that medical decisions are made by a trusted independent medical leader such as the Chief Medical Officer of Health, free from any bureaucratic or political pressures. This is particularly true of public communication of health risk. People trust their health to
doctors, not to politicians or government managers. It is essential that the public get
from the Chief Medical Officer of Health the facts about infectious risks to the public
health and the degree that precautions are needed and advice on how they can avoid
infection. It is essential when public precautions are relaxed, like the removal of
protective N95 respirators in hospitals, the re-opening of hospitals or the declaration
that it is business as usual in the health system, that these decisions are made and are
seen to be made by and on the advice of the independent Chief Medical Officer of
Health. In a public health emergency, or the public health aspects of an emergency
such as flood-borne disease, the Chief Medical Officer of Health should be the public
face of public communication from the government.

It is artificial to try to distinguish between public health emergencies and general
emergencies. Indeed there is no such thing as a pure public health emergency. Every
big public health emergency creates problems beyond the realm of public health.
Schools, jails, homeless shelters, tourism, travel restrictions, and the economy are not
typically within the expertise of medical advisors. If medical predictions are correct,
the next influenza pandemic will start as a public health emergency, and rapidly snow-
ball into a general emergency.

Conversely there is no such thing as a pure general emergency. Big general emergen-
cies that arise outside the field of public health will usually have a public health
component. A major flood might bring disease through infected water. The break-
down of sanitation would soon involve public health, as would a power blackout that
spoiled restaurant food.

Because there is no clear line between public health emergencies and general emer-
gencies it would be wrong to introduce separate, freestanding, parallel emergency
regimes, one for public health emergencies and the other for all other big emergen-
cies. The existence of two parallel regimes would bring nothing but legal confusion
and administrative disorder, two things no one wants in any emergency.

The government has expressed its intention to proceed with general emergency legis-
lation along the lines suggested in Bill 138, an Act to amend the Emergency
Management Act and the Employment Standards Act, 2000, which received first reading
on November 1, 2004 as a private member’s bill produced by the Standing
Committee on Justice Policy after public hearings.

The Commission’s mandate does not cover general emergency legislation for war,
famine, flood, ice storms and power blackouts and the government decision to
proceed with Bill 138 is not within the Commission’s terms of reference. Because the
government has chosen Bill 138 as the vehicle for all emergency legislation including public health emergency legislation, the Commission must say something about Bill 138 as a vehicle for public health emergency powers.

Bill 138 gives government officials unrestricted authority to override virtually every other Ontario law that gets in the way of any power they consider necessary to exercise in an emergency. It represents a profound change in our legal structure and raises issues that must be addressed whenever a statute is proposed that so fundamentally alters our system of government by law.

Every emergency power, once conferred, “lies about like a loaded weapon ready for the hand of any authority that can bring forward a plausible claim of an urgent need.” This danger of overreaction is accompanied by the danger of underreaction, not doing enough in the face of an uncertain and ambiguous new disease threat.

This report is interim, not final. It is written now to respond to current government plans to amend the Health Protection and Promotion Act and the Emergency Management Act. Because of its interim nature the report takes no final position on every issue around emergency powers. This chapter identifies issues such as compulsory mass immunization where further examination of the evidence may be required before the right balance can be achieved between public protection and personal rights. It also identifies issues that have not been fully confronted.

On Bill 138’s impacts on public health emergencies, the Commission in this chapter notes the need for:

• A fundamental legal and constitutional overhaul of the proposed legislation by the Attorney General who has indicated he is fully engaged in reviewing Bill 138 to ensure that it meets necessary legal and constitutional requirements;

• Specific provisions to ensure Chief Medical Officer of Health leadership in every public health aspect of every emergency;

• A process to ensure that the general powers of Bill 138 cover all authority needed for public health aspects of emergencies; and

315. Mr. Justice Jackson, dissenting, in Korematsu vs. United States, 323 U.S. 214 (1944) in respect of the race-based internment of Japanese Americans during WW II.
A fundamental review to cover all these legal and operational aspects, a review of the kind exemplified in the Commission’s analysis of compulsory mass immunization.

The various aspects of emergency legislation examined by the Commission in this chapter are found under the following headings:

- Voluntary Compliance
- Prevention, Preparedness and Cooperation
- Who’s in Charge?
- Types of Emergencies
- Emergency Legislation: Two Models
- Emergency Response: Inherent Dangers
- Role of the Chief Medical Officer of Health
- Specific Public Health Emergency Powers
- Compulsory Mass Immunization: a Paradigm
- Bill 138
  - Power to Override Ontario Laws
  - Trigger, Criteria and Limitations
  - Power to Implement Emergency Plans
  - Basket Clause
  - Occupational Health and Safety
  - The Problem of Concurrent Powers
- Summary of Recommendations
Voluntary Compliance

Voluntary compliance is the bedrock of any emergency response. Even the most exquisite emergency powers will never work unless the public cooperates.

Legal powers are false hopes during a public crisis.\textsuperscript{316} No law will work during a disaster without the public cooperation and individual sacrifice shown during SARS. Nor will any law work without the machinery that supports and compensates those who sacrifice for the greater good of public health.

Voluntary compliance also depends on public trust in those managing the emergency and public confidence that medical decisions are made on medical evidence, not on grounds of political expediency or bureaucratic convenience. The latter issue is addressed below in the context of the emergency role of the Chief Medical Officer of Health.

It is essential in any emergency to compensate those who suffer an unfair burden of personal cost for cooperating in public health measures like quarantine.

While Ontario enjoyed high levels of quarantine compliance during SARS, it is vital that this not lead to complacency. SARS revealed obstacles to compliance that may, if not adequately addressed, hamper the response to future public health emergencies. In its interviews, telephone polls and focus groups, the U.S. study on the elements of voluntary compliance referred to above identified these impediments to compliance:

- Fear of loss of income;
- Poor logistical support;
- Psychological stress;
- Spotty monitoring of compliance;
- Inconsistencies in the application of quarantine measures between various jurisdictions; and

\textsuperscript{316} Paraphrased from Mr. Justice Learned Hand's 1944 address \textit{The Spirit of Liberty}. 
• Problems with public communications.\textsuperscript{317}

Fear of loss of income topped the list of concerns:

Fear of loss of income was of paramount importance. It was especially significant, according to our interviews, focus groups, and Healthcare Workers Survey, for people who were unconvinced that their quarantine was necessary. This fear was the most common reason given to us for noncompliance or non-self-quarantine among people who were advised that they met quarantine criteria. And the fear was justified. Although some employers assured their employees at the outset that their pay would continue while they were in quarantine, others said it would not. The situation was even more disconcerting for those whose income came from part-time work, casual work, or self-employment.\textsuperscript{318}

Despite criticism that it took too long to bring forward an appropriate SARS compensation package, some observers suggest that the compensation system once in place was largely responsible for the success of the voluntary quarantine programme. Dr. James Young said:

During SARS, we were using quarantine for the first time in 50 years. One of the important things in using quarantine was getting people to abide by it. One of the important ways of getting people to abide by it was by offering financial compensation so they would in fact abide by it and stay in quarantine if and when they were ordered by the medical officer of health. We got approval from the Ontario government to institute a quarantine program and to pay people for that. That resulted in us being able to manage the quarantine in an effective manner.\textsuperscript{319}

A lesson from SARS is that advance planning for health emergency compensation is vital. It is impossible to predict in advance the precise form and amount of compensation necessary and affordable for every conceivable emergency. It is possible to require

\textsuperscript{318} \textit{Ibid}, pp. 267-68.

\textsuperscript{319} Justice Policy Committee, Public Hearings, August 3, 2004, p. 10.
by legislation that every government emergency plan include a basic blueprint for the most predictable type of compensation packages.

**Recommendation**

The Commission therefore recommends that:

- Emergency legislation require that every government emergency plan provide a basic blueprint for the most predictable types of compensation packages and that they be ready for use, with appropriate tailoring, immediately following any declaration of emergency.

**Prevention, Preparedness and Cooperation**

Without preparedness, emergency powers are of little use. Systems that prevent little problems from becoming big emergencies are much more important than the legal details of the emergency powers. If put in place before an emergency arises, they reduce the need to use draconian emergency powers. These systems ensure adequate planning and training and include coordinated incident management, secure sources of supply for medical and protective equipment and effective public communications.

The importance of public health emergency planning is stressed in the above chapter on medical leadership. It is essential as recommended above that the Chief Medical Officer of Health be in charge of provincial public health emergency planning; the medical officer of health on the local emergency planning level. These responsibilities should be crystallized in mandatory standards under the *Health Promotion and Protection Act*. Legal preparedness should be an essential part of every emergency plan, as should public health risk communication by the Chief Medical Officer of Health and the local medical officer of health.

It is not enough to be prepared generally or to develop “one size fits all” general emergency plans. An emergency plan for an ice storm will be of no use in an influenza pandemic. An influenza pandemic plan will be of no use in an ice storm. Specific emergency plans are required for specific threats. Generic plans are not enough.

Dr. James Young told the Justice Policy Committee that specific plans are needed to address specific risks:
... we have come to learn that preparedness and response alone will not do it. As SARS illustrated ... when an emergency happens, I can only deal with the system that’s already built. I have to make that system work. I have to design other infrastructure around it, and other ways of managing. That means, then, that we're going to have bigger calamities and more problems if we start doing it at that point in time. The real work needs to be done in advance so that we can minimize the effect.

We've come to recognize that a generic set of plans, a single binderful that will manage every emergency in Ontario, is not the way to go. We have to do risk-based plans. We have to figure out what the risks are in communities and to provincial ministries, and then we have to do specific planning for those risks. 320

Measures resulting from advance planning require resources of people and equipment. Examples are surge capacity for human resources and medical equipment such as N95 respirators, gloves, gowns, visors and other protective equipment, and a secure source of supply and an effective logistical system to distribute them.

Every emergency power, such as the power to ration food, vaccines and antiviral medicines, should be supported by such systems.

The provincial response to emergencies in Ontario is structured on the incident management system, an approach pioneered by forest fire managers in California in the 1970s that has become widely accepted in Canada and the United States.

The Incident Management System (IMS) is an international emergency protocol adopted by Emergency Measures Ontario as the operational framework for emergency management for government, and is being introduced at the local level. To ensure consistency, MOHLTC has adopted the IMS system, which will be activated once a health emergency is declared. 321

The Johns Hopkins and Red Cross-Red Crescent Public Health Guide for Emergencies details the history of the incident management system:

320. Ibid, p. 9
In the 1970s, after a severe wildfire season, fire managers in California (on the west coast of the United States) realized they needed a new approach to emergency response. In incident after incident, they ran into the same overall problem – poor inter-agency co-ordination. Most agencies are experienced in responding to routine or small-scale incidents. This usually involves only a few agencies and the demand for resources is limited. As disasters intensify, more agencies arrive on the scene. This brings further communication, logistical, and co-ordination problems, as listed below:

1. Having uncommon radio frequencies, signals, and codes – this leads to poor interagency communication.

2. Lack of common terms – when agencies did talk, they often misunderstood each other.

3. No effective or functional command system – each agency operated on the luck and personality of its leaders. In some situations, the operational effectiveness depended on which leader or chief was working that day.

4. Insufficient methods for giving out resources effectively.

5. Poorly defined ways of responding to disasters – there were no standard guidelines. How each response related to other functions depended upon individual interpretation.

A group of aircraft engineers agreed to help the fire managers develop a disaster management strategy for co-ordinating all agencies responding to large-scale emergencies such as wild-land fires. As a result, the modern Incident Command System (ICS) was developed. It was based on the “systems approach” common to the defence and aerospace industries.

Over the next two decades, ICS teams were only organized for wild-land fire fighting. Later, people in other emergency response sectors began to think that if ICS teams could handle a major wild-land fire, they should also be able to apply ICS to any type of emergency or disaster, ranging from natural disasters, technological disasters, terrorism, or complex humanitarian emergencies.
As a result, ICS terminology and management aspects were revised and the ICS concept was broadened to an “all-hazards” approach. The Incident Command System (ICS) became the Incident Management System (IMS) – an all-risk, all agencies, coordinated system ...

The incident management system is intended to bring an orderly, consistent and flexible chain of command and control within an emergency response. Dr. Young told the Justice Policy Committee:

One of the hallmarks of what we’re trying to do with response is to bring in an incident command system, so whether it’s the police, fire, ambulance, the municipalities or the province, we’re all organized the same way and we all use the same system. When we’re sitting in the middle of an emergency, we’re speaking the same language and we’re managing it in the same way.323

In the event of an infectious disease emergency and the incident management system is activated, Dr. Sheela Basrur, Chief Medical Officer of Health, indicated that she would assume the role of incident commander and oversee the response to the emergency. She said:

… there will be many other impacts right across the city, whether it be, “Is it safe to go on the subway system?” or “Should non-essential people stay home because we need the roads clear for the ambulances?” …

So in the incident management system, if I or my designate is the incident commander, there would be a whole series of operational responses, public health responses and conceivably other responses as well. They would all be planned and carried out under a public health lead to the extent that infectious disease is the thing we’re trying to get control over.324

The question of management and clarity arose again and again in the concerns of those who helped pull the province through SARS and who want to make sure that

the lessons so painfully learned are not forgotten and that something is done to ensure that the problems of emergency management are addressed.

Two common themes ran through many submissions to the Commission in respect of emergency management. The first was the need for clear lines of authority (who’s in charge) and for clarity around roles and responsibilities (who does what). The second was the need to integrate emergency plans, for instance any provincial public health emergency plan, any local public health emergency plan, any hospital plan, and indeed every emergency plan with a public health component.

The best way to present these ideas is through the thoughtful words of those who struggled with SARS and came to realize what must be done to prepare for the next emergency.

On the question of who’s in charge and who does what, the following recommendations were made to the Commission:

Specifically there is a need for clearly defined levels of authority during an emergency health situation, such as SARS. Lack of coordination and contradicting messages between the Public Health Authority, the Ministry of Health and Long-Term Care, Ministry of Labour, and Health Canada made it very difficult to function confidently during the SARS outbreak. Clearly defining the over-riding authority in such situations would decrease confusion and allow health care workers to respond quickly and confidently.

———

We require clear legal powers and lines of authority to respond to an infectious disease or biological threat, including a need for quarantines or restrictions to travel and balanced against the need to respect individual rights …

… The wording of the Act addresses the responsibilities of municipalities and Ministries, but not those of the agencies that are subordinate to Ministries, such as hospitals or health departments.

———

During a declared Provincial Emergency, a single authority should be designated for the purpose of issuing guidance to healthcare organiza-
tions. Each action communicated to healthcare organizations by this authority should be clearly labeled as to whether the action is mandatory, recommended or discretionary.

———

The introduction of health emergency legislation would provide an opportunity for each of the participants to have a clear understanding of their role and to engage in the appropriate planning process. While the lack of such legislation did not prevent hospitals from responding to the SARS outbreak, we believe that the introduction of such legislation would enhance the system’s ability to respond and provide greater clarity to hospitals and health care workers, which will assist them in responding to future outbreaks.

From a system-wide perspective, it is the Hospital’s view that the essential components of special health emergency legislation include:

1. Clear designation of areas of responsibility as between the Provincial Ministry of Health, public health authorities, public hospitals, ambulance services and individual physicians and other health care providers;

2. Provision of authority to those so designated under item 1, so that they are able to carry out their particular responsibilities, giving particular attention to clarify hierarchical and centralized decision making powers;

3. A definition of the criteria under which the legislative enactments conferring such responsibility and the authority are to apply, and a mechanism for determining when the health emergency is over and normal operations may be resumed …

———

Based on our experience during the SARS crisis, the key areas that need to be addressed, in terms of legislation for an emergency situation such as SARS, are:

• The current structure of who is ultimately accountable and authorized
to manage an emergency …

… Our suggestions for improvement in these areas are:

• To legislate the creation of an emergency plan/framework that has a single point of accountability and authority to manage an emergency, i.e. one person with emergency powers to create/manage a system-wide response to the emergency. This would ensure consistency in officials’ directions and messages to health providers and greater cooperation between organizations.

The Act [the Emergency Management Act] does define the powers of the Premier, which may be delegated to another Minister, but little else. The lack of clear roles and a designated authority structure created confusion during the SARS outbreak and should be outlined explicitly in the Act.

Scope – It is recognized that legislation cannot provide for, nor address in any detailed manner, all conceivable emergencies, but nonetheless legislation should, in a comprehensive manner, provide for the key components of emergency management – i.e. lines of communication, containment of risk; provision of expertise and human resources; establishment of a clear chain of command.

Systemic coordination – During the SARS experience, hospitals continued to function as individual entities, yet there are system requirements that need to be coordinated in response to province-wide emergencies. Legislation must therefore clearly identify who or what entity has the authority to direct hospitals and other health care facilities and providers during an emergency; what the facilities responsibility is to this authority and who is accountable for actions taken, or conversely, for failure to act. We would further suggest that in this regard, the relationship and respective powers of the Public Health Branch and the Healthcare Programs Branch of the Ministry of Health and Long-Term Care during a provincial emergency be clearly articulated.
Clarity of role, leadership, funding envelopes, and accountability needs to be struck for all aspects of emergency planning, response, and recovery programs put in place in Ontario. Not only is it unclear who is responsible during an outbreak or emergency, but also how this authority and power is shifted when an emergency is declared (shifting from the non-emergency to emergency state). Clearly defined roles and responsibilities need to be made during the transfer …

… [We] once again re-emphasize the need for clear authority and a collaborative working relationship between all parties during an outbreak: the EMA does not illustrate this or emphasizes its utility. The Act sets out a generic framework. It makes no mention of specific roles for agencies and individuals. It empowers the control group to take actions within the law to control the emergency, but it does not go the further step to establish a functioning relationship between the parties. This is a key principle, especially when the health emergency is health related. The EMA deals with non-health related emergencies, and as witnessed in SARS (2003), it is poor in dealing with health emergencies.

A lack of a clear delineation of authority and responsibility between jurisdictions resulted in disjointed communication, information overload, and mixed messages to clinicians.

On the question of integrating emergency plans, the following recommendations were made to the Commission:

… no outbreak follows political boundaries. This said it has to be noted that there is little if any room in the current legislation to deal with cross boundary issues (inter-provincial, and inter-jurisdictional issues within Canada let alone International issues) that may arise during an outbreak. A prime example of this can be found in the current experience with the Pandemic Influenza planning process underway in Ontario. Jurisdictional and political “turf wars” are guiding this process, more than the betterment and protection of “the public” in general. Coupled with this issue, is the lack of acknowledgement of the differing circumstances in the rural versus urban centres in Ontario. Generic planning for “Ontario” diminishes the complexity of Ontario’s society and culture – including Native issues, the multi-cultural nature of the province, global
communications, and the rural urban divide, which clearly exists in the province.

Repeatedly, it has been stated that what will work for Toronto, will not necessarily be sustainable or practical outside of Toronto, and this needs to be acknowledged in reforming the system. To date, there have been no clear indications that this is being done. There is a continuing lack of clarity between the activation and response functions of different levels of government. This is particularly true in counties, as distinct from regions in Ontario. In these sites, a small lower tier municipality (town or township) has an emergency program (plan, education, exercises). More recently, the upper tier county level of government has been mandated to develop an emergency program. The coordination of lower tier vs. upper tier responses is not well characterized in legislation. Healthcare providers, facilities and municipalities need practical, applied simulation exercises (e.g. table top exercises) without the need to develop these independently in all areas …

… Currently townships, counties, and hospitals design, prepare and run simulations, and fund their emergency planning process through their own budgets. There is collaboration on many fronts with these various levels of governance, but emergency planning is very much an independent process. The *Emergency Management Act* does not clearly delineate what happens to this independence during an emergency and if the control of the process remains at the local/hospital level or if it is subsumed by the Chief Medical Officer of Health or provincial emergency management unit. Some greater clarification of this process needs to be developed including taking into consideration the ‘health’ aspects of the emergency.

———

In future, we believe the province requires a centralized command-and-control structure on a “civil defence model” for emergency situations where there is integration of federal, provincial and municipal legislation and plans. This would require strengthening and altering the *Emergency Management Act*. Lines of authority should be clearly integrated and defined across federal, provincial and municipal jurisdictions. Individual health facility emergency plans also need to be standardized and integrated into municipal plans. Training should be provided to all those in
the lines of authority to ensure that the scope of their authority and responsibilities are clear, feasible and understood. We would recommend one designated lead authority and spokesperson working with subgroups in future vs. multiple leads, as was the case in 2003. Multiple leads sometimes conveyed conflicting messages at press conferences and in private consultations.

The wording of the Act [the Emergency Management Act] should provide a legal mandate and requirement for agencies which are subordinate to the Ministries, such as hospitals, to formally coordinate their planning and related activities with those of the communities in which they are located.

… we agree with the need for all levels of government to review their respective legislative instruments in light of the lessons learned from SARS. Moreover, we have to ensure, collectively, that the provincial/territorial and the federal legislation complement each other so as to improve the public health protection offered to Canadians.

Because these views come from organizations who worked in the front lines during SARS they are entitled to great weight and careful consideration.

The Commission therefore recommends that Bill 138 provide explicitly for a process to ensure the integration of all emergency plans and the requirement that every emergency plan specify clearly who is in charge and who does what.

SARS not only underlined the importance of having an effective emergency management structure, it also emphasized the need to have sufficient quantities of medical supplies, secure supply chains and the means to distribute the supplies. While more will be said in the final report about these issues, it is relevant in this interim report for the Commission to examine certain legal questions related to public health emergency supply chain matters.

Many who worked through SARS told the Commission about their frustration with persistent supply chain problems.
Karen Sullivan, Executive of the Ontario Long-Term Care Association, said at the SARS Commission Public Hearings:

Supply chain issues across the system led to shortages of equipment, N-95 masks, et cetera, that are not part of typical infection control management supplies. Coordination to ensure – to assure system-wide distribution of key emergency supplies is an important lesson.\footnote{SARS Commission, Public Hearings, October 1, 2003, p. 56.}

David McKinnon, past president of the Ontario Hospital Association, noted at the SARS Commission Public Hearings that supply chain management is lacking. He said major studies suggest that there should only be one supply chain management for all systems – “for all hospitals and that the technologies which underline that system should be fully contemporary so that the availability of supplies and equipment is transparent to everyone and so that we are not caught with fundamental information blockages at time of emergencies.”\footnote{Ibid, p. 109.}

Dr. Yoal Abells, Chair of the Family Physicians of Toronto, said at the SARS Commission Public Hearings:

In terms of supplies and equipment, a reliable source of equipment – supplies and equipment is necessary. The just-in-time delivery system did us in. It may have looked good to the financial gurus and our hospital bean counters but it simply took too long to get supplies and equipment to the front line care worker – providers because there was a shortage of supplies and equipment. We need a reliable materials management system with immediate surge capacity.

Supplies and equipment are useless without an effective distribution system.\footnote{Ibid.}

Getting enough supplies of N95 respirators was a widespread problem. An article in the \textit{Lancet Infectious Diseases} by officials from Toronto’s University Health Network describes the particular challenge of getting enough masks:

\ldots submicron filtering masks (e.g., N95 masks) were in variable supply, because before SARS such masks were used only for patients with
airborne infections and hence most facilities would have only kept a limited supply. With 211 hospitals in Ontario alone requiring these supplies, Canadian suppliers rapidly ran out of stock. There was no pre-existing supply stockpile, and our mask supplies were obtained from foreign manufacturers. Because SARS was a worldwide threat, there was great difficulty in acquiring masks from other countries, since foreign governments understandably wanted to keep such supplies for their own citizens.\textsuperscript{328}

The Commission heard from many nurses and other health care workers, whose story will be told in the final report, about the problems they encountered with insufficient supplies such as respirators.

The importance of having emergency supplies and a secure supply chain is an important lesson as we prepare for the possibility of future public health emergencies, like pandemic influenza.

Dr. Young testified at the Commission’s public hearings:

> We clearly learned lessons out of this about inventory control on the future and maintaining supplies of infectious control materials, but that, again, in the world we lived in, in those days, did not exist and we had to create those systems and create those systems for delivering supplies to doctors’ offices. Those systems were simply not in place.\textsuperscript{329}

The Walker interim report said:

> SARS thus revealed clear provincial and national weaknesses around both production and distribution of emergency supplies. The Panel is aware of work at the provincial and federal levels to upgrade stockpiles and formalize distribution networks.\textsuperscript{330}

In January 2005, the province announced an investment of $13.5 million on emergency medical equipment. It said:

\textsuperscript{329} SARS Commission, Public Hearings, September 29, 2003, p. 133.
\textsuperscript{330} Walker Interim Report, p. 123.
The $13.5 million investment aims to build preparedness for chemical, biological, radiological and nuclear (CBRN) emergencies, such as nuclear-related illnesses and train derailments. It is the first investment of its kind in Ontario’s history. The investment will be used to:

- Purchase one portable, self-contained decontamination tent for every hospital emergency department. Tents ensure decontamination of any patients exposed to chemical, biological, radiological or nuclear (CBRN) agents occurs outside of the hospital, reducing risk to other patients and staff. Tents contain an area for stretchers, shower facilities, and can store potentially contaminated grey water from shower runoff.

- Build emergency stockpiles of equipment and supplies to assist hospitals in dealing with a CBRN event. These stockpiles will include:

  - gloves, masks, goggles
  - protective suits
  - hand sanitizer
  - spill control products
  - radiological/nuclear monitoring systems and air samplers

- Train hospital staff for all types of emergencies, including CBRN events.

- Enable hospitals to conduct emergency exercises in conjunction with Ontario’s Emergency Medical Assistance Team and in partnership with community first responders.

- This investment will bring a consistent level of emergency preparedness across the hospital sector.\textsuperscript{331}

\textsuperscript{331} Canada News Wire, Operation Health Protection’ Giving Hospitals Improved Training And Emergency Supplies, January 13, 2005.
Despite these important and commendable efforts and others to prepare for an emergency, one can imagine the heightened demand on emergency stockpiles and supply-chains in the event of an influenza pandemic.

The Justice Policy Committee’s report recommended that hospitals be designated to receive key medical and other supplies during an emergency:

… the government designate hospitals as priority services in municipal emergency plans to ensure priority access to water supplies, fuel, and telecommunications during an emergency.332

The Commission endorses this recommendation and recommends that, in the event of a public health emergency, it be extended to all front-line components of the public health response.

During a public health emergency like an influenza pandemic, the demands on medical and other necessary supplies might require strong measures to secure necessary supplies and ration them appropriately.

Public health emergencies require legislation to address the supply chain problems addressed above. Those jurisdictions with separate public health emergency statutes address the problem specifically in terms of medical supplies. Bill 138, because it is general legislation designed to cover all emergencies, addresses the problem in general terms.

Section 7.0.2 (4) of Bill 138 contains the following emergency supply-chain powers:

7. The use of any necessary goods, services and resources within any part of Ontario.

8. The procurement of necessary goods, services and resources, the distribution, availability and use of necessary goods, services and resources and the establishment of centres for their distribution.

9. The fixing of prices for necessary goods, services and resources and the prohibition against charging higher prices in respect of necessary goods,

services and resources than the fair market value of the necessary goods, services or resources immediately before the emergency.

These powers are unclear. They do not provide that goods and services and resources may be used or procured without consent. Words like use, procure, fix, and requisition do not necessarily imply any element of compulsory taking. They do not authorize expropriation or compulsory seizure. Other emergency statutes do make such provision. 333

The Commission therefore recommends that Bill 138 be examined to determine and clarify whether the supply chain powers in s. 7.0.2 (4) 7, 8, and 9 are intended to authorize compulsory seizure and expropriation of property and, if explicitly compulsory, what provisions should be made for compensation, administrative procedures, or other safeguards.

This particular example of lack of legal clarity in Bill 138 raises a general concern about its proposed powers. Is their purpose clear, and do they achieve their purpose, or do they on close examination reveal ambiguity as to their purpose and effect. The Commission therefore recommends that all the powers proposed in Bill 138 be reviewed by the Attorney General to ensure that there is no doubt as to their intended purpose and their legal effect.

**Recommendations**

The Commission therefore recommends that:

- **Bill 138 provide explicitly for a process to ensure the integration of all emergency plans and the requirement that every emergency plan specify clearly who is in charge and who does what.**

- **Bill 138 be examined to determine and clarify whether the supply chain powers in s. 7.0.2(4) 7, 8, and 9 are intended to authorize compulsory seizure and expropriation of property and, if explicitly compulsory, what provisions should be made for compensation, administrative procedures, or other safeguards.**

• All powers proposed in Bill 138 be examined to remove ambiguity of the sort that appears in s. 7.0.2(4) 7, 8 and 9 to ensure there is no lack of clarity as to the intended purpose and legal effect of any proposed power.

Who’s in Charge?

In times of emergency it is essential to know who is in charge. As Dr. Basrur noted in her appearance before the Justice Policy Committee:

The point is that someone has to be in charge; people have to know where the buck stops, where decisions are made and where they can be unmade, and who the go-to person is.334

This interim report addresses the question of who was in charge at the public service level, not the political level.335

The leadership confusion and lack of clarity during SARS was at the operational and managerial level. There was no system in place to ensure one person was in charge of the overall management of the crisis and one expert medical leader to be in charge of medical issues. Lines of authority and accountability were unclear. These problems presented at the top, middle, and front line of the operational response to SARS. They resonated negatively throughout the response to SARS in the form of blurred chains of command, ambiguous reporting relationships and confusing directives and orders.

335. The Commission, as noted in the first interim report, continues to investigate the question whether public health decisions were influenced by political considerations. The Interim Report stated: “The Commission on the evidence examined thus far has found no evidence of political interference with public health decisions during the SARS crisis. There is, however, a perception among many who worked in the crisis that politics were at work in some of the public health decisions. Whatever the ultimate finding may be once the investigation is completed, the perception of political independence is equally important. A public health system must ensure public confidence that public health decisions during an outbreak are free from political motivation. The public must be assured that if there is a public health hazard the Chief Medical Officer of Health will be able to tell the public about it without going through a political filter. Visible safeguards to ensure the independence of the Chief Medical Officer of Health were absent during SARS. Machinery must be put in place to ensure the actual and apparent independence of the Chief Medical Officer of Health in decisions around outbreak management and his or her ability, when necessary, to communicate directly with the public.”
At the top it was unclear who was in charge: Dr. James Young, the then Commissioner of Public Safety and Security (a position now called the Commissioner of Emergency Management), or Dr. Colin D’Cunha, the then Chief Medical Officer of Health. One medical leader put it this way:

I think that if you asked me who was in charge of the SARS outbreak at a provincial level, I would have a very difficult time telling you who.

This confusion was highlighted by a submission to the Naylor committee signed by the chief executives of nine major health care groups:

During a crisis or emergency, the public will quickly begin to look for a trusted and consistent source of information. However, during the early days of the SARS crisis, in Toronto, there were occasions when several different public health officials were being quoted and had titles attributed to them that appeared to indicate they were responding in an acting capacity only and not as an ‘official.’ This had the potential to leave an impression with the public that no one with any authority was in control.\(^{336}\)

As noted in the Commission’s first interim report, the SARS response was also hamstrung by an unwieldy emergency leadership structure with no one clearly in charge. A \textit{de facto} arrangement whereby the Chief Medical Officer of Health of the day shared authority with the Commissioner of Public Safety and Security resulted in a lack of clarity as to their respective roles which contributed to hindering the SARS response. Compounding the problem, in the view of some observers, was that branches of the Ministry of Health and Long-Term Care appeared to function on their own. As the Naylor report said:

… the dual leadership structure was less than ideal, and one person should have been in charge. Matters were further complicated as other branches of the MOHLTC helped to manage the interactions with hospitals, long-term care facilities, physicians, and various elements of the health service system. A number of physicians involved in caring for SARS patients began actively discussing whether and how the management of the outbreak could be handed over to a single “SARS czar”.\(^{337}\)

\(^{336}\) Naylor Report, p. 32.  
\(^{337}\) \textit{Ibid}, p. 31.
The disastrous news conference on May 23, 2003 to announce a major SARS outbreak at North York General reinforces the point that one person needs to be in charge of public communication of health risk and that the Chief Medical Officer of Health, armed with the independence recommended by the Commission and accepted by the government, should be that person.

During the news conference, a reporter initially asked Dr. D’Cunha about the situation at North York General. Dr. D’Cunha answered:

There are a couple of people under investigation.

Then, he turned the floor over to Dr. Low, who dropped what one reporter called “a bit of a bombshell” and announced the new outbreak:

It’s been a rough day at North York. I don’t have all the answers for you tonight but what we’ve essentially identified is a cluster of cases that occurred on one ward at North York General … That there has been a likely transmission to health care workers. That there has been transmission to family members. And that there’s probably been transmission to other patients.

After Dr. Low suggested that this cluster numbered “in the 20s,” an incredulous reporter asked with justifiable heat:

In the twenties. Okay. Why did you just go through this whole presentation for 20 minutes and we had to get it in a question? Why didn’t you tell us at the start?

As noted in the Commission’s first interim report, the confusion that marked the May 23 press conference exemplified the lack of any coherent communication strategy and the lack of any clear lines of accountability for the communication to the public of vital news about the status of the outbreak.

Dr. Low, who had worked diligently all day to get to the bottom of a new troubling outbreak, was placed in the uncomfortable and unfair position of answering for systemic deficiencies in the uncoordinated flow of information.

The confusion that marked the May 23 press conference exemplified the lack of any coherent communications strategy and the lack of any clear lines of accountability
for the communication to the public of vital news about the status of the outbreak.\textsuperscript{338}

Tom Closson, President and CEO of the University Health Network, made this point at the Commission’s public hearings:

\ldots during SARS, was the fact that, there wasn’t enough attention given to unified communication. We would see infectious diseases specialists being interviewed as being part of the POC. We’d see them being interviewed as representing their hospitals. We’d see them as being interviewed as, maybe, representing themselves and there’s a lot of conflicting information going around.

\ldots Fighting it out in public is not really the best way to instill confidence. I’ll tell you, our staff were quite frightened during SARS because they heard different things from different people and unified communication was necessary…\textsuperscript{339}

It is essential during an emergency that the public and those fighting the emergency know who is in charge. As noted below it is essential that the Chief Medical Officer of Health be in charge of medical decisions, medical advice, and public communication about health risk and health safety, that the Commissioner of Emergency Management be in charge of all other matters, and that their respective roles be clear. Machinery to secure clear lines of authority is discussed below.

**Types of Emergencies**

The introduction to this chapter notes the uniqueness of public health emergencies. An infectious disease emergency like SARS can unfold over a much longer time frame than other emergencies. It is usually characterized by unknowns and intangi-
bles. It evokes sustained responses of fear, both reasonable and unreasonable. It generates heightened stress. And it has the potential to strain severely, over time, personal and community bonds.

With a train derailment, a tornado or the 9/11 tragedy, one knows quite clearly in the early stages of the event’s unfolding that a terrible catastrophe has occurred. Public health emergencies like SARS may involve a new illness, or one radically different from known disease strains. The new illness may not even have a name. It may present symptoms quite similar to other diseases. Its lethal nature and long-term effects may be completely unknown. And, while the outbreak gathers momentum, there may be no fool-proof means of diagnosing it or identifying its victims.

Again, as noted in the introduction to this chapter, it is artificial to speak of public health emergencies as if they are distinct from general emergencies. There are no pure public health emergencies. Although pandemic influenza might start as a public health emergency, it would rapidly snowball into a general emergency. Big general emergencies that arise outside the field of public health will usually have a public health component, such as flood-borne water infection.

Public health emergencies are different because unlike forest fires, floods or tornadoes, the underlying cause of an infectious disease emergency and its progress defies efforts to locate its core, its expanding perimeter and its agents of transmission.

In short, an infectious disease emergency is not easily traceable in real time. A public health emergency can unfold over a long, complex time frame. If there is a readily discernable beginning, it may not be identifiable until well into the outbreak. In all likelihood, as occurred with SARS, there may be no easily identifiable end. To declare an end to a public health emergency is fraught with danger. Declare it over too soon and hidden reservoirs of the disease may still linger, waiting for opportunities to re-emerge.

Dr. James Young told the SARS Commission hearings:

…it’s not like a forest fire which, in and by itself, can be difficult enough to control, but if I want to know the size of a forest fire, I can get above the forest fire, see where it is and build a barrier so that the forest fire does not jump over that barrier and even if it does, I may be able to have a series of smaller fires I can put out.

The theory in controlling something like SARS is the same but the difficulty and the problem is, I have no idea where it is. I only know where it
was 10 days ago and I have to not only catch up that 10 days, I must get further ahead.  

This means that accountability and governance requirements may have to be different in a public health emergency than, say, a power outage. The uncertain time frame of a public health emergency means that the feasibility and dynamics of accountability and governance require modification from those expected in other types of emergencies.

Dr. Young has said:

I firmly believe there must be accountability and that’s the way you have to operate, but I also think you have to be careful that you don’t trip over your accountability. In the middle of an emergency, there is an awful lot going on and there are a lot of ends, so if your accountability time frames are either too rigid or too short, you’re going to stop what you’re doing and lose focus on what you’re doing just so you can go back and account. Then you’re going to be accounting for why you lost your focus and why people died because you were busy producing a report to go to a Legislature or somewhere else. So I think the accountability has to be at a point in time when you have the ability and the luxury to do it and do it well and to stop and consider it. It should be on an ongoing basis but it shouldn’t be so tight that it interferes with the actual management of the emergency. …

I would have been quite happy in the power blackout – you know, two weeks after we’re in pretty good shape and we can start to account for it. In SARS, after two weeks we were still at the height of it, and being accountable two weeks into it would have been a very major burden.

The other thing, from a personal point of view, is that after you’re over it, for the people who are involved in it, there’s a certain level of fatigue that sets in at that point and you’ll get a better accounting a little bit later, when you’ve had a couple of days off once in a while.

The problem with accountability – and I don’t know the solution; I can’t give you the answer – is that it does vary to some extent. If it’s an ongoing

process and an ongoing emergency like SARS, the accountability needs to be further out; if it’s a shorter thing, then the accountability can be sooner.\textsuperscript{341}

Further distinguishing public health emergencies are the tools and resources required to resolve the crisis. Where other kinds of emergency responses may require heavy-equipment operators and electrical experts, resolving public health emergencies is in the hands of a relatively small cadre of skilled professionals and agencies. Containment efforts rely on the resources and capabilities of medical specialties, like infection control and epidemiology, focused on disease prevention and containment in the population. Cutting-edge epidemiological and scientific direction and advice is vital to timely containment.

The key institutions and agencies at the forefront of containing a public health emergency tend to be publicly-funded and regulated. Although there was some spread in households and doctors’ offices, and a limited element of community spread, SARS was largely a hospital-spread infection. Of the 247 probable cases in Ontario 190, or 77 per cent, were either health care workers, people who sought care at health care facilities or visitors. Health care workers were the predominant group: 108 were probable cases, a full 43 per cent of all probable cases.

Public health emergencies thus engage Ontario’s complex, fragmented, unwieldy health care system, with all the challenges that entails. The Toronto Public Health unit, for example, has 22 hospital corporations within its jurisdiction. Some, however, also have sites outside the City of Toronto. The Rouge Valley Health System has two sites in Toronto and three outside the city.\textsuperscript{342}

As Dr. Bonnie Henry, formerly of Toronto Public Health, has said:

\begin{quote}
If we are doing things differently in two different health units, that can be very difficult for a hospital.
\end{quote}

\begin{quote}
It’s the same if we look at our mental health system, our community care access centres, our district health councils, our long-term-care facilities. They are all, if you want, regionalized or organized on different geographical and jurisdictional boundaries. That can create massive difficul-
\end{quote}

\textsuperscript{341} Justice Policy Committee, Public Hearings, August 26, 2004, p. 320.
ties in dealing with an emergency, and it’s not limited to the health sector. It’s similar in many other parts of our organization as well. For example, one health unit may actually involve several different municipal police services plus the OPP.\textsuperscript{343}

This is not to say that public health professionals are only involved in infectious disease emergencies. As noted below by Dr. Basrur they also play important albeit less directing roles in responding to emergencies where public health capabilities, expertise and resources are not the main factors in the response.

Filling the legal gaps identified by SARS requires consideration of both the primary and secondary roles of public health in crises that are not public health emergencies.

An Ontario expert whose public health experience in emergency management began in the 1970s told the Commission that there is a clear distinction between the primary and secondary emergency roles of public health professionals and agencies:

If a nuclear plant goes down, that’s a much different kind of situation. There’s a health component to it immediately for anybody injured – for evacuation of people out of the area. But you’re not dealing with major medical [event] on a broad scale. Just those people that were injured at the initial site or whatever – if it was a train derailment or a bomb, or whatever. That’s different from a communicable disease kind of outbreak, because we’re not looking at putting out a fire, or repairing a facility or cleaning a bio-hazardous material from the area – that is something that is spread through communicable disease. That’s probably where it divides.

Public health emergencies have unique aspects that require expert independent medical leadership from the Chief Medical Officer of Health as described in the next section of this chapter.

As noted by one professional association:

Prefacing this section, it must be stated that a health emergency is fundamentally different than an emergency caused by a natural disaster, or other human-initiated emergency that may have some health implications. Specific health emergency legislation is needed to draw together

\textsuperscript{343} Ibid.
expertise, resources, and establish a hierarchical transfer of authority to those in the healthcare system who will have the responsibility to make informed evidence based decisions to protect the public.

There is a clear and present need for special emergency health legislation in Ontario. Coupled with this, there is a need for clarification of the ownership of the health hazard and risk assessment (s 5.1.2 of the EMA) and the accountability of provincial authorities concerning CBRN, bioterrorism, infectious disease, etc. Embedded in this there are implications for the new *Personal Health Information Protection Act* that need to be explored.

Very clear roles, responsibilities, linkages, and inter-relationships for the health agencies, facilities and professionals involved in the health emergency need to be demarcated in this legislation, as well the role of the CMOH and the local MOH in the declaration of the emergency and the roles once the declaration has been made need to be determined.

The Missouri State Emergency Management Agency describes this difference in the following terms:

Public health emergencies can occur as primary events by themselves, or they may be secondary to another disaster or emergency, such as tornado, flood, or hazardous material incident.\(^{344}\)

In her appearance before the Justice Policy Committee, Dr. Sheela Basrur made a similar observation, suggesting that in infectious disease outbreaks, the Chief Medical Officer of Health needs to lead the provincial response, but may take a more supporting role in other kinds of emergencies:

For other emergencies, whether it’s a toxic release or a radiation accident or a major flood, there may well be health implications attached to those, but it’s not as clear to me that the Ministry of Health and the public health division is the lead agency for the care and control of the incident. They are absolutely going to be main supporters of the response, but not necessarily the lead. That’s the distinction I would make.

---

We can probably have a long debate, till the end of the day, about what’s a public health emergency where you might have a mixture. They talk about the spectre of, let’s say, a dirty bomb. A dirty bomb might be an explosive device that contains either nuclear or radioactive material, or it may have some real or perceived infectious pathogens in it. You’re going to have mixed responsibilities, mixed jurisdictions. You’d have to deal with that on a case-by-case basis, and everyone is going to have to work together extremely closely anyway.\textsuperscript{345}

At the same time, it must be kept in mind that certain emergencies can begin without a public health focus but can, depending on how events unfold, become public health emergencies. Response to an outbreak of avian flu could start with efforts to cull infected birds, protect the health and safety of workers involving in the culling and dispose of the carcasses in a manner that does not contaminate the environment. But if any humans get infected, it could become a public health emergency. If someone infected with avian flu also happened to be carrying another human virus at the same time, it could lead to the creation of a new virus that may have the ability to pass from one person to another.

As Dr. Young has warned:

So the great risk with an avian flu is that it could turn into the new Spanish flu. We think that’s how the Spanish flu started in 1918-19. Between 20 million and 50 million died of the Spanish flu at that time.\textsuperscript{346}

Emergencies in the real world do not separate themselves into pigeonholes like general emergencies, public health emergencies, serious emergencies and catastrophic emergencies. Emergencies, by their unexpected nature and their ability to change direction suddenly, defy precise legal classification.

The argument against distinct and separate statutory regimes for different levels and types of emergencies was put very clearly by Dr. Young to the Justice Policy Committee;

Mr. Arthurs: Could the application, the inclusion in legislation of these extraordinary powers, be in distinct legislation?

\textsuperscript{345} Justice Policy Committee, Public Hearings, August 18, 2004, p. 142.
\textsuperscript{346} Justice Policy Committee Hearings, August 3, 2004, p. 12.
Dr. Young: I would recommend against it. I think when you separate it out, you’re making it – it makes more sense to me that it’s part and parcel of an emergency, and I don’t think it’s an accident that it sits within other acts as well and not as a separate and distinct thing. If you start putting it outside and putting it separately, then you’re saying, “We’ve got about five levels of emergencies,” and I think it’s very confusing.

If we start and we have a provincial emergency and then on the third day I need an extraordinary power, we announce we’ve bumped it up and we’re using an extraordinary power, and two days later I say, “We’ve still got an emergency, but we’ve bumped it down one level of emergency,” what you get is the weariness and the problems the United States is having with the coding system: What does it mean and how do you manage and do I not have to pay attention now because the extraordinary powers are out? I think it just becomes potentially a management issue in running the emergency, because you’ve got so many levels that people are going to be arguing with you, “Well, yesterday I had to follow your direction; today I don’t.” So I think there are issues around it.\footnote{347}

It is simply too confusing to enact separate legislative regimes for separate and distinct levels and categories of emergencies.

Because public health emergencies do not confine themselves to public health problems, and because general emergencies invariably involve some component of public health emergency, and because Ontario has chosen Bill 138 as the primary legal vehicle to carry emergency action, it would not be helpful to enact a separate definition of public health emergency. Although legislation in many American jurisdictions and some other Canadian provinces\footnote{348} refers specifically to public health emergencies as distinct from other emergencies, Ontario’s SARS experience suggests strongly that it is better to have one single seamless emergency response without artificial legal barriers to inter-agency cooperation. To have a separate definition and separate legal regimes for public health emergencies and other emergencies would create two separate systems when SARS showed us that it is difficult enough to coordinate a single emergency system.

\footnote{347. Justice Policy Committee, Public Hearings, August 26, 2004, p. 319.}
The Commission’s view is shared by the Ministry of Health, as indicated in a letter from the Minister to the Commission received on March 14:

We understand that the upcoming report will focus mainly on public health and proposed amendments to the *Health Protection and Promotion Act (HPPA)*. In addition to amendments to the *HPPA*, you have referred to powers of the Chief Medical Officer of Health in the course of a “public health emergency.” While we are committed to ensuring that the Chief Medical Officer of Health has the necessary powers under HPPA to address issues as they arise under that legislation, including powers available in any emergency, and we will continue to look at how best this can be achieved, we do not feel that a separate definition of “public health emergency” per se achieves this goal in a clear manner.

I, the Minister of Health and Long-Term Care, have sought the advice of the Chief Medical Officer of Health and she has expressed to me her reservations on this point, including the risk of potential confusion that could arise with dual definitions of emergency. In our view, it would be difficult to imagine an emergency that does not have some public health component or risk. Therefore, while the concept of clear roles for a CMOH in an emergency is clearly one we agree with, the manner in which this is achieved requires careful examination. We therefore look forward to reviewing your report in full and particularly your detailed comments on this matter.

For the reasons set out above and the reasons advanced by the Minister, the Commission recommends against the enactment of separate public health emergency legislation. For the same reasons the Commission recommends that Bill 138 make it clear that the special powers available in an emergency are in addition to the powers in the *Health Protection and Promotion Act* and the declaration of an emergency does not prevent the continuing use of the *Health Protection and Promotion Act’s* health protection powers.

While SARS showed us that there should be only one emergency response system, it showed us also that medical aspects of emergency response should be directed by the Chief Medical Officer of Health for all the reasons referred to above, including medical expertise, independence, public trust, and the unique nature of the health care and public health systems. This special requirement, discussed below, will not necessitate a separate definition of public health emergency. It will however require some statutory language to ensure clarity in the respective roles of the Chief Medical
Officer of Health and the Commissioner of Emergency Management. The best way to provide clarity is to give words their ordinary day to day meaning. The drafting of amendments to Bill 138 is a job for Legislative Counsel and the Crown law officers. All the Commission can do is to offer some general suggestions for elements they may wish to consider when drafting those provisions of Bill 138 that deal with the role of the Chief Medical Officer of Health in public health emergencies and the public health aspects of larger emergencies:

“Public health” in the expressions “public health emergency” and “public health aspect of any emergency” includes any matter touching on the protection of the health of the people of Ontario from infectious disease or any other health risk including, without restricting the generality of the foregoing, public communication of health risk and safety.

This approach avoids a definition of public health emergency that creates an artificial distinction between public health emergencies and other emergencies. This approach ensures clarity as to the role of the Chief Medical Officer of Health in the public health aspects of any emergency.

**Recommendation**

- For the reasons set out above and the reasons advanced by the Minister, the Commission recommends against the enactment of separate public health emergency legislation. For the same reasons the Commission recommends that Bill 138 make it clear that the special powers available in an emergency are in addition to the powers in the *Health Protection and Promotion Act* and the declaration of an emergency does not prevent the continuing use of the *Health Protection and Promotion Act* health protection powers.

**Emergency Legislation: Two Models**

Of the many models for emergency legislation two systems are relevant for Ontario at this time.

The first is the present model which involves three elements:

1. Specific statutory powers to deal with specific emergencies such as forest fires.
2. Inherent powers, not set out in legislation, such as the power used to evacuate 218,000 Mississauga residents after the 1979 chlorine gas train derailment.

3. An *Emergency Management Act* which provides no additional emergency powers but concentrates existing powers for effective emergency deployment and provides for emergency plans.

The second is the model represented by Bill 138 which enacts broad emergency powers to make orders which override existing laws.

The case for the existing model without any special emergency powers was made in a 1981 discussion paper prepared by Solicitor General Roy McMurtry who had managed the Mississauga derailment within the framework of the existing law without any special emergency powers:

Some persons feel that the draft Bill should grant special powers, for example, authorizing the entry of private property and the commandeering of property in an emergency. The draft Bill does not adopt this recommendation. It is felt that existing powers are adequate to deal with emergencies, both large and small. The responsible officials have the same powers when one building is threatened by fire as when one hundred buildings are threatened by fire.

———

It is infinitely better that the courts should decide as each case arises, whether having regard to the necessities of the case the safeguards required in the public interest, the police are under legal duty in the particular circumstances.”

Deputy Commissioner Maurice Pilon of the Ontario Provincial Police noted before the Justice Policy Committee that the existence of these inherent powers gives the police the authority to evacuate neighbourhoods without additional powers of the kind proposed in Bill 138. But he noted, very significantly, that it would make the work of the police easier in an emergency if their authority was set out in more legally explicit terms:

———

349. It may be more technically correct to refer to these powers as ancillary powers because they are necessarily incidental to statutory powers such as those contained in the *Police Services Act*. 
… on the issue of evacuation during emergencies, it’s my opinion that we need not create additional powers since they exist and can be locally exercised, thereby respecting the notion of the lowest competent level of response. Having said that, in practical terms in the absence of legislation that specifically authorizes evacuation, and forcible evacuation if necessary, it sometimes becomes a very difficult issue in dealing with the residents who choose for their own personal reasons not to leave a facility or a residence. You’ll find that the elderly in particular do not wish to leave. They become confused and so on.

So I would say that while we have the authority, it could be very much tested in law. It would be much easier if the law did specify that that authority existed.\(^\text{350}\)

Before turning to the arguments for and against these two principal models, this is a convenient place to note a suggestion that there may be a third model which involves a significant judicial presence in emergency management. The *Toronto Star* in a thoughtful editorial\(^\text{351}\) said this:

> One way to ensure the government is held to account would be to immediately refer any emergency declaration to a court to assess its legitimacy. The government could then make emergency orders pending the court’s decision, but in the knowledge that its actions were being reviewed.

It is difficult in the absence of a more fully developed model to comment on the merits of this suggestion. Nothing in the experience of judges or the process of the courts suggests they are particularly well qualified to provide a speedy approval process for governmental emergency action. One difficulty is that courts will be obliged to hear individual applications to enforce public health statutes and emergency orders as well as challenges against emergency declarations and emergency orders. The courts’ prior involvement in the process of oversight and review of such orders could make it difficult to provide a detached and independent forum for the adjudication of applications to enforce such orders and challenges against such orders.

Turning back to the two principal models under discussion, two major changes since 1981 suggest, to those who advocate the Bill 138 model, that the inherent powers

---

\(^{350}\) Justice Policy Committee, Public Hearings, August 16, 2004, p. 78. See also the remarks by Mr. Alan Borovoy, general counsel of the Canadian Civil Liberties Association, before the Justice Policy Committee on October 14, 2004, at p. 347.

model is no longer sufficient to protect against emergencies.

The first major change was the advent in 1982 of the Canadian Charter of Rights and Freedoms. It revolutionized our legal system by a new emphasis on individual rights and increased scrutiny of governmental action by way of judicial review. Although the Charter did not sweep away the existing inherent powers discussed above it became infinitely more important for governments, in defending their actions, to rely on explicit sources of power supported by rational arguments marshalled in advance of the exercise of the power.352

352. It was acknowledged during the Justice Policy Committee hearings that there are arguments for and against the sufficiency of inherent powers and the need for explicit emergency powers. The following exchange took place on August 19, 2004 between Mr. Kormos and Mr. Twohig of the Attorney General's Department:

Mr. Twohig: Certainly, if you go back to the white paper of 1981, we had the Mississauga train derailment, we have Mr McMurtry—and it’s right in the paper. They say, “We consider the need for special powers,” and we say no. We say . . .

Mr Kormos: And McMurtry is a pretty smart guy.

Mr Twohig: Well, and he says, “We’ll leave it to the common law.” That was 1983 or 1981. When you look at the other provincial statutes—and we were discussing it this morning—of the other nine provinces and the federal government, seven of those jurisdictions, post-charter, have passed legislation with these wide, sweeping powers. They thought it was necessary. Presumably they read the McMurtry paper and disagreed. But that question, whether there’s a need or not, I can’t carry that. I was asked to assume that there was a need, and if we asked you to construct the powers with appropriate checks, what would it look like?

Mr Kormos: Fair enough. But now, because we talked about that just a little bit here in the committee, because we’ve got that McMurtry white paper, the 1981 paper, and all of us—I think it’s pages 26, 27, 28, and boom, right to that special powers, you’ll see it. It’s not the same politics as mine, but I knew him as a smart guy when he was justice minister and I consider him a pretty smart guy now. Maybe he’s changed his mind, but do you dispute the conclusion he reached as a lawyer?

Having said that, because we also tried to reflect on what changed from 1981, the only thing we could think of was the charter, right? So I suppose I’d ask you to tell us what about the charter would change or impact on the conclusions that Minister McMurtry, as he was then, reached in his report of 1981.

Mr Twohig: I absolutely take no issue with the fact that there is an argument. That’s the threshold question: Is there a need for change? Did the charter in fact make McMurtry’s argument even stronger? I appreciate that that’s an argument, but to address that argument, I never got to that. I was asked to assume that there was a need, and if there was a need, the direction was, “Have something ready. We don’t want to be caught. If it turns out that people aren’t following directives, if it turns out that the evacuation of people needs to take place and someone says, ‘Well, wait a minute; you don’t have the authority to do it,’ what would those powers look like?” That’s what I did. But your question is certainly the critical threshold question.
The second major change is the increasingly serious and complex nature of the threats that might require emergency action, a terrorist attack of an unforeseen nature or an influenza pandemic to take two examples only. The argument that broad and explicit emergency powers are required to combat these new threats was made by Dr. James Young in his letter to the Premier dated June 21, 2004:

Although we have made significant advancements in the Province’s state of emergency preparedness, the risk situation from a number of factors including terrorism, global warming, interconnected and aging infrastructure, and pandemics is greater today than at any point in the province’s history. We continue to address these issues at all levels of government and are making steady progress in our ability to respond.

Clearly, one of the best ways to guide our preparation is to learn from our past experiences. With this goal in mind, I would like to specifically comment on some deficiencies in our emergency legislation. The 1998 ice storm and particularly the 2003 SARS and power blackout emergencies, have demonstrated limits in our current legislation.

In the event of a declared provincial emergency, the *Emergency Management Act* concentrates existing legislative power in your hands, but does not add any additional powers to manage the unique issues that arise during an emergency. For example, it is not clear if you could force an evacuation or control the distribution or price of vital supplies such as gas, electricity or medical protective equipment. In concert with other ministries, we have been looking at a range of potential powers and comparing our proposed approach with existing legislation in other provinces. Currently, Ontario has the weakest legislation in the country. The additional powers we have considered appear in other provincial or federal legislation and most of the legislation describes these powers in similar ways. Any additional powers, of course, must be used carefully in an emergency and an accountability mechanism should be built into their use. The overriding principle, however, is that these powers are necessary to protect public safety in an emergency situation.

I believe that our research and analysis has evolved to a point where we can offer constructive and comprehensive advice to you concerning necessary legislative amendments to the *Emergency Management Act*. 
For your information, I am attaching to this letter a jurisdictional analysis of emergency powers legislation in other provinces.

Dr. Young's letter was supported by a chart showing that the federal government and every province except Ontario had enacted emergency legislation along the general model represented by Bill 138.

Correspondence between the Commission and the Ministry of Health and Long-Term Care in Appendix H makes it clear that the government is committed to the second model represented by Bill 138. The Commission has no mandate in respect of emergency legislation generally or the particular model the government chooses to use for all emergencies including public health emergencies.

The model chosen raises natural concerns by reason of its extremely open-ended and vague powers to make emergency orders, coupled with the awesome power to override existing laws whenever the government considers it necessary. There are however three arguments in favour of an explicit powers model that may make it difficult to oppose at least in some modified form after a major legal overhaul by the Attorney General.

The first argument is that every other jurisdiction in Canada has adopted some form of explicit emergency power regime of the kind generally represented by Bill 138, putting a burden of persuasion on those who argue that Ontario should choose a radically different model such as an inherent power model.

The second argument is that you can never in this day and age foresee exactly what form an emergency may take and therefore you can never legislate in advance the precise limits of all the powers that may be necessary to protect the public.

The third argument is based on evidence of increasing concern about legal liability and legal authority. Many who stepped up to the plate during SARS, and complied unquestioningly with directives rather than challenging their legal authority, suggest that they might not do so again in the absence of explicit legal authority because of concern about their own legal obligations and potential liability.

Emergency Response: Two Inherent Dangers

Emergency powers are inherently dangerous. They carry the twin dangers of overreaction and underreaction.
The first danger is overreaction. As noted above every emergency power, once conferred, “lies about like a loaded weapon ready for the hand of any authority that can bring forward a plausible claim of an urgent need.” To a hammer, everything looks like a nail. To some emergency managers, every problem may look like an opportunity to invoke emergency powers.

The second danger is underreaction. In face of a deadly new disease with an uncertain incubation period, ambiguous symptoms, no diagnostic tests, uncertainty as to its infectiveness and mechanisms of transmission, and no idea where in the province it may be simmering, decisive action may be necessary that turns out in hindsight to have been excessive.

The problems of overreaction are familiar to the legal system. Lawyers and legislators and courts and judges have become adept over the years at preventing the problems of overreaction by means of legislative safeguards. These legislative safeguards will be addressed below in the discussion of Bill 138.

The legal system is not designed to prevent the problems of underreaction. Although a public body might be sued after the fact for failing to prevent a problem such as an attack by a known sexual predator, these lawsuits are complex and they do nothing to prevent the problem in the first place. All the legal system can do is ensure that the emergency managers are not hamstrung by legislative requirements that prevent them from acting unless and until they can prove objectively that emergency action is necessary. Such objective standards may prevent emergency managers from acting until it is too late.

The precautionary principle addresses the problem of underreaction by pointing out that in the face of a grave risk it is better to be safe than sorry:

> The absence of full scientific certainty shall not be used as a reason for postponing decisions where there is a risk of serious or irreversible harm.

Mr. Justice Krever emphasized this principle in the Commission of Inquiry on the Blood System in Canada:

---

353. Mr. Justice Jackson, dissenting, in *Korematsu vs. United States*, 323 U.S. 214 (1944) in respect of the race-based internment of Japanese Americans during WW II.

Where there is reasonable evidence of an impending threat to public health, it is inappropriate to require proof of causation beyond a reasonable doubt before taking steps to avert the threat.\textsuperscript{355}

Suggestions that the authorities overreacted during SARS, and suggestions that the authorities underreacted during SARS, are questions for the Commission’s final report. It is enough to say now that the precautionary principle may require emergency managers to overreact in order to avert a threat of unknown proportions. Dr. James Young addressed this issue in the hearings of both the SARS Commission and the Justice Policy Committee:

And so, in my view, the only way of combatting something like this, is to go after it very hard and very fast and attempt to get far enough ahead that, in fact, if we have any breakout it’s very limited. Areas that did not do this at the beginning, such as Beijing, ended up with a much bigger breakout because, in fact, that was the only way of getting in front of it.\textsuperscript{356}

Unfortunately, the safest and the best way when you’re thinking about emergencies and potential emergencies is to overreact and then cut back rather than under-react. If you play catch-up and you under-react and you make mistakes, you’ll spend much longer trying to repair the damage and the human or economic loss will be much greater.\textsuperscript{357}

The only legal solution to the problem of underreaction is to permit the application of the precautionary principle by ensuring first that the emergency managers have all the necessary legal tools and legal powers they require, and second that they are not unduly hampered by objective standards that require too high a level of proof before sensible precautions can be imposed.

The central task of emergency legislation is to guard against overreaction by providing safeguards and to guard against underreaction by avoiding legal restrictions that prevent the application of the precautionary principle.

\textsuperscript{356} SARS Commission Public Hearings, September 30, 2003, p. 36.

Role of Chief Medical Officer of Health

The most important thing in a public health emergency is public confidence that medical decisions are made by a trusted independent medical leader such as the Chief Medical Officer of Health, free from any bureaucratic or political pressures. This is particularly true of public communication of health risk. People trust their health to doctors, not to politicians or government managers. It is essential that the public get from the Chief Medical Officer of Health the facts about infectious risks to the public health and the degree that precautions are needed and advice on how they can avoid infection. It is essential when public precautions are relaxed, like the removal of protective respirators in hospitals, the re-opening of hospitals or the declaration that it is business as usual in the health system, that these decisions are made and are seen to be made by and on the advice of the independent Chief Medical Officer of Health. It is essential in a public health emergency, or the public health aspects of an emergency such as flood-borne disease, that the Chief Medical Officer of Health be the public face of public communication from the government.

Health Minister George Smitherman highlighted the vital role of the Chief Medical Officer of Health when he introduced amendments in October 2004 to the *Health Protection and Promotion Act*\(^\text{358}\) enhancing the independence of the Chief Medical Officer of Health. He told the Ontario legislature:

The position of chief medical officer of health is probably not one that most Ontarians think about very often. After all, you don't generally think about your doctor until you have a health problem. The chief medical officer of health, or CMOH, is, in a very real sense, the top doctor for 12 million Ontarians. So it's only when there is a public health problem that has the potential to affect anyone and everyone that this position suddenly takes on its extremely important public profile.

When there is a health crisis and politicians speak, some people listen. But when there is a health crisis and the chief medical officer of health speaks, everybody listens. It is at those times, times when diseases like SARS or West Nile are a real threat, that the chief medical officer of health must be there for his or her patients, all 12 million of them. It is at

\(^{358}\) The amendments were introduced in Bill 124, which was passed by the Ontario legislature on December 15, 2004, and received Royal Assent one day later.
times like those that the chief medical officer of health must be able to interact with his or her patients without worrying about what the Minister of Health might think, what the effect might be on the government or what the opposition might say. We learned that lesson as a province during Walkerton, West Nile and SARS. We learned that what Ontarians wanted, what they needed, from their chief doctor was his or her undivided attention.359

The government, as noted above, has started to strengthen the independence of the Chief Medical Officer of Health and the Commission has recommended the completion of this task together with a parallel measure of independence for the local medical officer of health. These additional measures are necessary to ensure that these trusted medical figures have the actual independence and the perceived independence necessary to secure public confidence that whatever they do and whatever they say in a public health emergency is for the public’s health and not for some political or bureaucratic expediency.

The importance of the independence and leadership of the Chief Medical Officer of Heath and medical officers of health during an emergency was emphasized by one professional association:

The provincial Chief and local Medical Officers of Health should be granted authority in managing the health aspects of any emergency and possess full authority delegated by the Provincial Commissioner of Emergency Management or municipal Chief of Emergency Management in managing a health emergency. This should be addressed in the Emergency Management Act itself.

There is also a clear conflict of interest that may develop during an emergency if the “political will” of the government of the day stands in the way of actions that need to be taken by the Chief Medical Officer of Health to protect the health of the public. This is to say, that there may be clear variance from a government’s policy directions in the choices made by the Chief Medical Officer of Health in order to protect the public. The Chief Medical Officer of Health needs to be given the authority to act and protected in the EMA from recourse of such choices.

Further to this, it remains unclear whether the HPPA or the EMA is the more powerful, and hence presiding legislation, during health emergencies. When the emergency is declared it is clear that the EMA is the dominant legislative authority, however as mentioned above, the EMA does not deal with health emergencies, and therefore the linkages between the players in the system. Where the control lies, either with the CMOH or MOH, and the role of each in decision-making and the custodianship of emergency planning, management, and recovery plans needs to be more clearly defined.

The emergency role of the Chief Medical Officer of Health and medical officer of health should, as recommended above, include the fullest direct authority for public health emergency planning. While the medical officers will, of course, consult other agencies in the development of public health emergency plans, there should be no mistake as to who is in charge of the public health emergency planning process. It is for instance unacceptable, for the reasons noted above, that provincial public health emergency planning not be under the authority of the Chief Medical Officer of Health.

To give the Chief Medical Officer of Health special authority in public health emergencies and the public health aspects of more general emergencies is to provoke the excellent question: who’s in charge? How can you have the Commissioner of Emergency Management in charge of the emergency and the Chief Medical Officer of Health in charge of its public health aspects? Does that not invite the SARS problem of unclear authority? The rhetorical answer is to ask “in charge of what?” There should be no difficulty, when lines of authority are clear and a good working relationship is ensured in advance by consultation, protocols, and drills, in an incident management system where the Chief Medical Officer of Health is in charge of the medical aspects and the Commissioner of Emergency Management is in charge of everything else. The inevitable boundaries issues can be solved by cooperation, advance planning, and, above all common sense. All that is required is for the Commissioner of Emergency Management and the Chief Medical Officer of Health, whoever may succeed to those jobs from time to time, to park their egos outside the door of the incident room and get on together with the job of managing the emergency. Both require not only confidence in their authority but also a clear acceptance of their mutual roles and limitations.

Key members of the Ontario SARS Scientific Advisory Committee recommend the following:
At the provincial level, the Commissioner of Emergency Management should have the power and authority to manage all provincial emergencies and be accountable directly to the Premier. Where an emergency principally involves health, this authority should be delegated to the Chief Medical Officer of Health with coordination, support and authority to manage all the non-health aspects of the emergency remaining with the Commissioner of Health Management.

If the Chief Medical Officer of Health is the incident commander during a health emergency, it follows therefore that all other health sectors are accountable to the Chief Medical Officer of Health. This was the premise during the SARS outbreak and worked to the extent that proper command and control structures were exercised, and now the Emergency Management Unit of the Ministry of Health and Long-Term Care is the coordinating structure by which provincial health care providers and organizations would report to the Chief Medical Officer of Health during an emergency and this should be recognized in legislation. During the SARS outbreak there was duplication of information and efforts from within the MOHLTC. One central Emergency Management Unit reporting to the Chief Medical Officer of Health will avoid duplication and confusion.

This means that, during a public health emergency, the Chief Medical Officer of Health must be an integral part of every emergency committee, from the highest level down, that is relevant to containing the emergency, even if it is a committee whose meetings normally would only be open to the Commissioner of Emergency Management. Otherwise, the independent accountability of the Chief Medical Officer of Health for public health risk communication and the Chief Medical Officer of Health’s exclusive authority over medical decisions are nullified.

Dr. Sheela Basrur described her public health emergency role during testimony to the Justice Policy Committee:

The point is that someone has to be in charge; people have to know where the buck stops, where decisions are made and where they can be unmade, and who the go-to person is. For infectious diseases, I think it needs to be the chief MOH. For other emergencies, whether it’s a toxic release or a radiation accident or a major flood, there may well be health
implications attached to those, but it’s not as clear to me that the Ministry of Health and the public health division is the lead agency for the care and control of the incident. They are absolutely going to be main supporters of the response, but not necessarily the lead. That’s the distinction I would make.

We can probably have a long debate, till the end of the day, about what’s a public health emergency where you might have a mixture. They talk about the spectre of, let’s say, a dirty bomb. A dirty bomb might be an explosive device that contains either nuclear or radioactive material, or it may have some real or perceived infectious pathogens in it. You’re going to have mixed responsibilities, mixed jurisdictions. You’d have to deal with that on a case-by-case basis, and everyone is going to have to work together extremely closely anyway.\footnote{360}

To meet the problem of divided leadership during SARS, Dr. Basrur suggested that the Chief Medical Officer of Health be the one issuing directives in a public health emergency:

During SARS, as you are aware, there were a multitude of directives issued under the authority of the two commissioners – the Commissioner of Emergency Management and the Commissioner of Public Health – and many comments back that people were unsure who was in charge because there were two signatories; there were always two people who had to be consulted. I would say that if you have a public health emergency, which means primarily that you have an infectious disease emergency for which public health is clearly the lead agency, it is wise, in my opinion, for those directives to be issued under the authority of the chief MOH. That’s not to say that the chief MOH wouldn’t check in with a whole lot of people: Dr. Stuart – honorary doctor; lucky you – as the director of the emergency management unit; obviously with the deputy minister; with Dr. Young over where he is, and so on. I’m sorry; the acronym escapes me.\footnote{361}

Dr. Donald Low told the Justice Policy Committee:

Let me just, again, put my focus on a couple of these issues that I thought were particularly important. One was critical: the identification of somebody who is really in charge. During this outbreak, that didn't happen, and I really would support that we identify who that person should be. Obviously, in medical emergencies, it should be the chief medical officer of health, and not only that that person has the authority, but also the authority to appoint individuals to assist with the investigation and managing of the outbreak.362

The Commission therefore recommends that emergency legislation provide that the Chief Medical Officer of Health has clear primary authority in respect of the public health aspects of every provincial emergency including:

- Public communication of health risk, necessary precautions, regular situation updates;

- Advice to the government as to whether an emergency should be declared, if the emergency presents at first as a public health problem;

- Strategic advice to the government in the management of the emergency;

- Advice to the government as to whether an emergency should be declared to be over, and emergency orders lifted, in respect of the public health measures taken to fight the emergency;

- Advice to the government in respect of emergency orders of a public health nature and emergency orders that affect public health e.g. ensuring that gasoline rationing does not deprive hospitals of emergency supplies;

- Delegated authority in respect of emergency orders of a public health nature; and

- Such further and other authority, of a nature consistent with the authority referred to above, in respect of the public health aspects of any emergency.

362. Ibid, p. 146.
This primary emergency authority carries with it the duty to consult with the Commissioner of Emergency Management and other necessary agencies. Although this is just basic common sense, it would be well to make the duty of consultation explicit as a public signpost enshrined in legislation. This public signpost would ensure that the problems never happen again that arose during SARS in respect of the office of Chief Medical Officer of Health. The office of the Chief Medical Officer of Health must never, no matter who succeeds to the office from time to time, become a separate silo as it sometimes appeared to others during SARS, jealous of its own authority and reluctant to cooperate and share that authority with other agencies.

The Commission therefore recommends that emergency legislation provide that the Chief Medical Officer of Health shall exercise his or her authority, so far as reasonably possible, in consultation with the Commissioner of Emergency Management and other necessary agencies. Conversely, the Commission recommends that emergency legislation provide that the Commissioner of Emergency Management, on any matter affecting public health, shall exercise his or her authority so far as reasonably possible in consultation with the Chief Medical Officer of Health.

The details of the consultation and cooperation between the Commissioner of Emergency Management and the Chief Medical Officer of Health need not be reduced to legislative form. It is not, for instance, necessary to specify in legislation whether emergency directives to hospitals be cosigned by the Chief Medical Officer of Health and the Commissioner of Emergency Management as they were during SARS. This kind of detail should be worked out in advance between them in a protocol or memorandum of agreement that is flexible enough to allow for the unexpected and clear enough to point the holders of both offices, and those with whom they work, along a simple path of cooperation.

**Recommendations**

The Commission therefore recommends that:

- Emergency legislation provide that the Chief Medical Officer of Health has clear primary authority in respect of the public health aspects of every provincial emergency including:
  - Public health emergency planning;
• Public communication of health risk, necessary precautions, regular situation updates;

• Advice to the government as to whether an emergency should be declared, if the emergency presents at first as a public health problem;

• Strategic advice to the government in the management of the emergency;

• Advice to the government as to whether an emergency should be declared to be over, and emergency orders lifted, in respect of the public health measures taken to fight the emergency;

• Advice to the government in respect of emergency orders of a public health nature and emergency orders that affect public health e.g. ensuring that gasoline rationing does not deprive hospitals of emergency supplies;

• Delegated authority in respect of emergency orders of a public health nature; and

• Such further and other authority, of a nature consistent with the authority referred to above, in respect of the public health aspects of any emergency.

• Emergency legislation provide that the Chief Medical Officer of Health shall exercise his or her authority, so far as reasonably possible, in consultation with the Commissioner of Emergency Management and other necessary agencies. Conversely, the Commission recommends that emergency legislation provide that the Commissioner of Emergency Management, on any matter affecting public health, shall exercise his or her authority so far as reasonably possible in consultation with the Chief Medical Officer of Health.

Specific Public Health Emergency Powers

The first line of public health emergency defence, as noted above, is to stop emergencies before they start by arming the Chief and local medical officers of health through the Health Protection and Promotion Act with stronger daily powers to prevent the
spread of infection. The measures recommended above will provide a strong shield against the onslaught of public health emergencies.

But public health emergencies will arise despite the greatest vigilance of public health authorities and the most vigorous exercise of their daily powers.

The quintessential public health emergency is an outbreak of infectious disease that overwhelms the capacity of the public health system. The most serious predictable public health emergency is pandemic influenza which would overwhelm not only the public health and hospital and medical systems but also the other systems that keep the province going. Pandemic influenza exemplifies the need for strong emergency powers.

Three times in the last century radical new influenza strains have emerged to cause global pandemics. The worst was in 1918-19 when 20 to 50 million people died worldwide, including an estimated 30,000 to 50,000 people in Canada. Leading experts agree a flu pandemic that could kill millions around the world is inevitable and overdue.

The Ontario Health Pandemic Influenza Plan, which suggests that a flu pandemic in

364. “Even in the best case scenarios of the next pandemic, 2 to 7 million people would die and tens of millions would require medical attention. If the next pandemic virus is a very virulent strain, deaths could be dramatically higher.” (Source: WHO, “Estimating the impact of the next influenza pandemic,” December 8, 2004.) Also note that Peter Sandman and Jody Lanard, American experts in risk communication, have said: “Estimates of how many people a flu pandemic will kill are basically informed guesses. Nobody knows how virulent the influenza strain that launches the pandemic will be, or how that strain will attenuate or intensify once it starts to spread; nobody knows what percentage of the world’s population will be infected or what percentage of those infected will die; nobody knows how soon a vaccine will be mass-produced and distributed; nobody knows how well the vaccine will work or how successful “social distance” strategies will be in the meantime.” (Source: Lanard, Jody and Sandman, Peter, “Pandemic Influenza Risk Communication: The Teachable Moment.”)
365. Some experts like Sandman and Lanard have questioned whether there is sufficient evidence to believe pandemics are cyclical: “If there are really reasons for thinking flu pandemics are cyclic (for example, if going decades without a pandemic makes the human population more vulnerable to a novel strain) then this makes sense. But we haven’t seen it argued as a scientific proposition … If pandemics are random events, then each year’s odds are the same, regardless of what happened the year before,” See: Lanard, Jody and Sandman, Peter, “Pandemic Influenza Risk Communication: The Teachable Moment.”
the province could result in as many as 52 thousand hospitalizations, 2.25 million outpatient visits, and 12 thousand deaths,\textsuperscript{366} said:

Although no one can predict when the next influenza pandemic will hit, public health officials have warned that a global influenza pandemic is overdue.\textsuperscript{367}

A study by experts at the Institute of Medicine of the National Academies in the U.S. said:

All influenza virologists agree that a new pandemic is imminent.\textsuperscript{368}

Health Canada said:

A pandemic can occur at any time, with the potential to cause serious illness, death and colossal social and economic disruption throughout the world.\textsuperscript{369}

The WHO has identified three prerequisites for the start of a pandemic:

1. A novel virus subtype must emerge to which the general population will have no or little immunity.

2. The new virus must be able to replicate in humans and cause serious illness.

3. The new virus must be efficiently transmitted from one human to another; efficient human-to-human transmission is expressed as sustained chains of transmission causing community-wide outbreaks.\textsuperscript{370}

The WHO believes that the H5N1 virus, which has caused unprecedented outbreaks of highly pathogenic avian influenza in large parts of Asia, has met the first two prerequisites:

\textsuperscript{366} Ministry of Health and Long-Term Care, \textit{Ontario Health Pandemic Influenza Plan} (Toronto: May 2004) p. 6.
\textsuperscript{367} Ibid, p. 10.
\textsuperscript{368} Institute of Medicine of the National Academies, \textit{Microbial Threats to Health} (Washington: 2003), p. 146.
All prerequisites for the start of a pandemic had been met save one, namely the onset of efficient human-to-human transmission. Should the virus improve its transmissibility, everyone in the world would be vulnerable to infection by a pathogen – passed along by a cough or a sneeze – entirely foreign to the human immune system. 371

Concludes the WHO:

During 2004, the world moved closer to a further pandemic than it has been at any time since 1968. 372

Dr. Julie Gerberding, director of the CDC, believes H5N1 represents the “most important threat we are facing right now.” 373

Raising the level of concern over H5N1 are reports that create doubts about the reliability of laboratory tests in some affected areas of Asia, raising the possibility that the virus’s progress may have been underestimated. 374

Some experts, however, question whether the next pandemic will be triggered by the H5N1 virus. They question whether there is sufficient scientific evidence to point definitely to H5N1 as the cause of the next pandemic. Some skeptics even go so far as to suggest that the fear factor is good business for agencies and industries with a vested interest in directing public attention and public funds to emergency preparedness. 375

It would of course be unwise to accept at face value, without critical analysis, every portent of disaster. History has not been kind to Cassandra or Chicken Little. Those who warn of disasters have been accused throughout history of simply trying to scare people. Whether the next pandemic will be caused by H5N1 or another novel disease, or whether fears about H5N1 may, in hindsight, turn out to be exaggerated, it would be reckless not to prepare for the next pandemic. As the U.K. Ministry of Defence’s Chief Scientist has said:

---

371. Ibid, p.11.
372. Ibid, p.3.
Although it sounds alarmist, the balanced view is that we are overdue a major pandemic.\textsuperscript{376}

Prudence and precaution require that effective planning and preparedness for an influenza pandemic be undertaken.

Although Ontario got through SARS without any special emergency powers, the prospect of pandemic influenza brings home the need for such powers. Even if all the emergency measures taken during SARS were explicitly enshrined in emergency legislation, those measures would be hopelessly inadequate in the face of a much larger infectious attack such as pandemic influenza.

SARS infected hundreds of people and killed 44 in Ontario. While one death from infectious disease is one death too many, the overall burden of disease from SARS was much less than the 1918 Spanish flu pandemic and the prospect of future emergencies like an influenza pandemic.

The prospect of pandemic influenza or indeed any outbreak more serious even than SARS requires the enactment of emergency powers stronger than those available during SARS and available now.

It is impossible, as noted above, to draw a bright line between public health emergencies and other emergencies. It is therefore almost a misnomer to refer to “public health emergency powers” as if they were distinct from other powers required when an emergency like pandemic influenza overwhelms the public health system and the ordinary machinery of public safety. It is however convenient as a practical matter to refer to public health emergency powers when discussing those emergency powers that are particularly relevant to the public health aspects of any emergency.

The Commission asked the Ministry of Health and Long-Term Care for its position on powers required in the event of a public health emergency and the then Deputy Ministry of Health Mr. Phil Hassen, in a reply dated August 4, 2004, reproduced in Appendix H, made the following recommendations:

\ldots \text{[W]}ithin the framework of broader emergency response powers, we have been considering enhancements that may be required in our legislation to address specific program issues as they arise in (or prior to or

\textsuperscript{376} The Guardian, “Bird flu could put Britain in quarantine, warns scientist,” March 27, 2005.
after) any emergency. For example, we will be considering various ways of clarifying the authority to issue directives prior to, during, or after an emergency. This could be achieved by including a general provision in the *Ministry of Health and Long-Term Act*, or provisions in program specific legislation (i.e., legislation governing public hospitals, laboratories, long-term care facilities, etc.).

There is also the possibility of enhancing the ability of the Chief Medical Officer of Health to take action or provide directions as required in any circumstance relating to a public health emergency. A further complementary amendment is to provide a mechanism to expedite the registration of health care professionals in an emergency, and possibly before or after an emergency, to ensure that professionals registered in other jurisdictions could come to Ontario and practice on short notice. This would require amendments under the *Regulated Health Professions Act* and related legislation.

In addition to these potential changes, specific amendments to the *Health Protection and Promotion Act* are discussed in more detail below.

**Health Protection and Promotion Act**

The current *Health Protection and Promotion Act* ("HPPA") provides extensive powers to address public health issues throughout Ontario. As you know, over the coming year we would initiate changes that will enhance the role of the Chief Medical Officer of Health ("CMOH"), increasing the independence of that office through mandatory reports to the public and increasing the transparency of the appointment process. We hope to proceed with those amendments this fall.

In addition to those changes, we have identified a range of amendments that would work within the framework of broad emergency powers under the *EMA*. The key to the exercise of these powers would be the necessity of a declaration of an emergency under the *EMA* and any exercise of the powers would be subject to the constitutional safeguards under the *EMA*. The main goal of these amendments is to ensure that public health officials have the necessary, extraordinary powers under the *Health Protection and Promotion Act* to address a public health emergency if and when one is declared under the *EMA*. With those parameters in mind, we believe that the following amendments should be considered:
• Authorizing the CMOH to take such action as he or she considers appropriate to decrease the risk presented by the public health emergency.

• Adding new Order provisions to provide for:
  
  ° Mass immunization of individuals or populations, or requiring the isolation of persons where medical contraindications warrant exception from the required immunization;

  ° Decontamination in emergency situations, where such action is considered appropriate (decontamination orders are not currently found under the Act, but such procedures may be required for individuals or large groups in the event of a nuclear disaster); and

  ° Such other ‘orders as may be necessary in an emergency.

• Authorizing medical officers of health to enter any premises, including a private residence, without a warrant, where the medical officer has reasonable and probable grounds to believe there is a risk to health due to a health hazard or an infectious disease.

• Authorizing the Chief Medical Officer of Health to order collection, analysis, and retention of any laboratory specimen from any person, animal, plant, or anything the Chief Medical Officer of Health specifies, and to acquire previously collected specimens and test analyses from anyone, and to disclose the results of test analyses as the Chief Medical Officer of Health considers appropriate.

• Authorizing the Chief Medical Officer of Health to require any person, organization, government agency or other entity to report information to the Chief Medical Officer of Health as she or he considers necessary, to reduce prevent or eliminate the risk of the emergency.

• Requiring physicians and other regulated health professionals, hospital administrators and operators of other health care institutions to report such information as the medical officer of health considers necessary in the circumstances (at present, physicians and other regulated health professionals are required to report “such additional information” about a reportable or communicable disease case as the
medical officer of health considers necessary, under section 1(2) of Regulation 569 – Reports).

• Adding the Chief Medical Officer of Health to those currently protected from exposure to liability under the Act, such as medical officers of health and members of boards of health. (But note that this proposal would not be restricted to emergency situations.)

The Commission has taken the following approach to the powers sought in the Deputy Minister’s letter, and referred to in Dr. Basrur’s presentation to the Justice Policy Committee on August 18, 2004:

• As for directives, the Commission has recommended that the Health Protection and Promotion Act be amended to provide clear day to day authority to issue directives to health care facilities. Because of the government decision to pour provincial emergency powers into the general vehicle of Bill 138, the Commission recommends that Bill 138’s provisions be scrutinized to ensure that it includes the power to issue emergency directives of the kind here requested, particularly if the directive overrides some provision in program specific legislation of the kind noted (i.e., legislation governing public hospitals, laboratories, long-term care facilities, etc.).

• As for the “basket clause,” the Commission cannot in light of the powers now in the Health Protection and Promotion Act (see, for instance, s. 86) and those recommended in this report, recommend without further evidence a “basket clause” in the Health Protection and Promotion Act authorizing the Chief Medical Officer of Health to take such action as he or she considers appropriate to decrease the risk presented by the public health emergency. In the first place, the powers in s. 86 are already very wide. In the second place, the power requested is not restricted to matters similar to those already within the jurisdiction of the Chief Medical Officer of Health and is therefore a power without limits. In the third place, the government’s decision to proceed with Bill 138 suggests that any emergency “basket power” belongs in s. 7.0.2(3)12 of Bill 138.

• The power of registration and licensure is apparently addressed in s. 7.0.2(3)10 of Bill 138 which should be scrutinized to determine whether it provides the authority contemplated by the Ministry of
Health and Long-Term care. The licensure and registration for health professionals qualified to practice outside Ontario was identified to the Commission by a number of professional groups and health care institutions.

• As for compulsory mass immunization, the Commission suggests below that further analysis and evidence is required before this power is ripe for enactment as a permanent feature of our laws.

• Decontamination is addressed in the Commission’s recommendations above. The position of the Commission is that the powers associated with decontamination should be available without a declaration of emergency. If hundreds of people are covered with white powder that appears to be weaponized anthrax, immediate action is required without waiting for a provincial declaration of emergency.

• Powers of entry to a private dwelling without warrant are addressed in the Commission’s recommendations above as daily powers in the Health Protection and Promotion Act with the safeguards associated with the Supreme Court of Canada judgment in Feeney. If additional powers of entry are required in an emergency they should be addressed in Bill 138, which presently contains no such powers.

• The collection of laboratory samples is addressed in the Commission’s recommendations for daily Health Protection and Promotion Act powers. These powers apply only to samples already collected because any power to take bodily samples from a person without consent and without court order engages serious issues under the Charter of Rights. No such power is proposed in Bill 138.

• The disclosure of personal health information to the Chief Medical Officer of Health and medical officers of health is addressed in the Commission’s recommendations for increased daily powers in the Health Protection and Promotion Act. Emergency disclosure of personal health information is addressed in s. 7.0.2 (4) 11 of Bill 138 and also in s. 7.0.2 (9) and s. 7.0.2 (10) of Bill 138.

• Liability protection for the Chief Medical Officer of Health is addressed in the Commission’s recommendations under the Health Protection and Promotion Act.
This completes the list of public health emergency powers suggested by the Ministry of Health in the Deputy Minister’s letter of August 4, 2004, and referred to by Dr. Basrur in her appearance before the Justice Policy Committee on August 18, 2004.

Because the government has chosen the Bill 138 general power approach, it would be helpful to test the Bill 138 powers to ensure that they cover not only the matters addressed above but also the matters addressed specifically in the emergency public health legislation from other jurisdictions. The following list, which is non-exhaustive and overlaps some of the issues discussed above, is drawn from the Model State Emergency Health Powers Act in the U.S., the statutes of American jurisdictions and other Canadian provinces and from suggestions by those involved in the public health response to SARS:

**Examples of Temporary Compulsory Powers**

- Powers of the kind presently authorized under the *Health Protection and Promotion Act* for daily use, that are wider than those authorized for daily use.

- Compulsory procurement of facilities, supplies and materials.

- Power to ration medical supplies.

- Power to issue directives throughout the health care system that override existing legal provisions, e.g., patient transfer.

- Power to require services from facilities, institutions, and individuals.

- Power to take over and manage facilities.

- Power to destroy livestock.

- Power to evacuate buildings and neighbourhoods.

- Power for the safe disposal of human remains including any necessary override of related statutes such as the *Coroner’s Act*.

- Power for the safe disposal of infectious waste.

- Power to detain or to enter premises including dwelling places beyond that
authorized by *Health Protection and Promotion Act*.

- Power to obtain personal health information beyond that authorized by the *Health Protection and Promotion Act*.

- Power to override licensure requirements for health professionals and others.

- Power to support volunteers through compensation and insurance.

- Power to support those quarantined and isolated through compensation and other forms of assistance.

- Power to expand existing compensation schemes (e.g. OHIP) to provide for emergency services.

- Power to protect, from personal liability, individuals who act reasonably and in good faith, without denying existing rights of legal recourse against institutional employers.\textsuperscript{377}

\textsuperscript{377} For a good example of effective liability protection see *Health Protection and Promotion Act* s. 95 which now provides:

\begin{quote}
95. (1) No action or other proceeding for damages or otherwise shall be instituted against a member of a board of health, a medical officer of health, an associate medical officer of health of a board of health, an acting medical officer of health of a board of health or a public health inspector for any act done in good faith in the execution or the intended execution of any duty or power under this Act or for any alleged neglect or default in the execution in good faith of any such duty or power. R.S.O. 1990, c. H.7, s. 95 (1).

\textbf{Exception}

(2) Subsection (1) does not apply to prevent an application for judicial review or a proceeding that is specifically provided for in this Act. R.S.O. 1990, c. H.7, s. 95 (2).

\textbf{Board of health not relieved of liability}

(3) Subsection (1) does not relieve a board of health from liability for damage caused by negligence of or action without authority by a person referred to in subsection (1), and a board of health is liable for such damage in the same manner as if subsection (1) had not been enacted. R.S.O. 1990, c. H.7, s. 95 (3).

Compare and contrast this provision with the liability protection in the Attorney General's Draft Bill which provides:
Recommendation

The Commission therefore recommends that:

• Bill 138 be subjected to a fundamental legal and constitutional overhaul by the Attorney General who has indicated he is fully engaged in reviewing Bill 138 to ensure that it meets necessary legal and constitutional requirements.

• The government in its review of Bill 138 consider whether it adequately addresses the public health emergency powers referred to above.

Compulsory Mass Immunization: A Paradigm

The power of compulsory mass immunization is a paradigm for public health emergency powers. Compulsory mass immunization exemplifies the legal, policy and practical problems that must be addressed in every analysis of every proposed public health emergency power and any proposed general emergency power. The issue is addressed at greater length than other proposed public health emergency powers for two reasons. First, because it has attracted less policy analysis and discussion than other proposed powers such as the power to ration medical supplies. Second, because

11. (1) No action or other proceeding lies or shall be instituted against a person designated in subsection (3) for doing any act or neglecting to do any act under this Act or under any order under this Act.

(2) Despite subsection (1), a person described in subsection (3) is liable where a claim of gross negligence is proven in the carrying out of an act or in neglecting to carry out an act under this Act.

and the contrasting provision in Bill 138 which provides:

11. (1) No person designated under subsection (3) is liable for any act done in good faith in the exercise or performance or the intended exercise or performance of any power or duty under this Act or under an order made under this Act or for any neglect or default in the exercise or performance in good faith of such power or duty.

(2) Despite subsection (1), a person described in sub-section (3) is liable for an act done in the exercise or performance or the intended exercise or performance of any power or duty under this Act or under an order made under this Act or for any neglect or default in the exercise or performance of such power or duty where a claim of bad faith or gross negligence is proven.

423
it bristles with legal issues that typify any emergency proposal to interfere with individual liberties for the sake of the greater public good. The purpose of this section is not only to demonstrate that the power of mass compulsory immunization is not yet ripe for enactment, but also to demonstrate the type of legal, practical, and policy analysis that should be taken in respect of every proposed emergency power before it is enacted.

Mass immunization by order is a hot-button issue. It engages serious issues that require careful consideration.

Ontario officials seek the power to order mass immunization in a widespread public health emergency such as an influenza pandemic\textsuperscript{378} and to isolate those who cannot or will not be immunized.\textsuperscript{379} Mass immunization by order, particularly if refusal invites isolation or suspension from health care work or jail, is very different from voluntary immunization.

The question to be confronted is whether the evidence to support the power to order mass immunization, and the accompanying power to isolate or refuse work to those who decline, has been presented in any comprehensive fashion. It may be that a case for mass immunization by order can be made that adequately addresses the fundamental issues noted below. Until the evidence in support of such a case has been presented in a comprehensive fashion, it is difficult to say that this power, as opposed

\begin{flushleft}
\textsuperscript{378} Other potentials for mass immunization by order include bioterrorism attacks involving anthrax or weaponized smallpox.

\textsuperscript{379} Deputy Minister of Health Phil Hassen in his letter to the Commission of August 4, 2004 recommended the enactment, within the context of a broad emergency statute, of power to order:

Mass immunization of individuals or populations, or requiring the isolation of persons where medical contraindications warrant exception from the required immunization.

Chief Medical Officer of Health Sheela Basrur made the same point in her evidence before the Justice Policy Committee on August 18, 2004:

Additional authorities that probably will be necessary before we have such things as pandemic influenza would be an ability of the chief medical officer of health to make orders regarding mass immunization of individuals or populations. Right now, from SARS we had the experience that we needed to issue an order against classes of people, but there was no vaccine. What if there had been a vaccine? I would have had to order, maybe, vaccination one at a time. I'm not sure I have the authority to order vaccination even one at a time, much less against a class of people. If we think about a vaccine-preventable disease emergency, we need to have those provisions in place so we can take action pretty quickly to protect the healthy people from becoming sick.
\end{flushleft}
to a purely voluntary immunization programme with effective public education, is ripe for enactment at this time as a permanent feature of Ontario's law.

A prominent feature of the Model State Emergency Health Powers Act\(^{380}\), the power of

---

\(^{380}\) This American model statute has provoked some controversy because of its coercive powers. Initially released on October 2001, it was amended in December of that year.

An article in the New England Journal of Medicine stated:

On December 21, 2001, in response to criticisms of the model act … a revised version was released. No one any longer considers the act a “model.” Instead, it is now labeled a “draft for discussion.” The new version does “not represent the official policy, endorsement, or views” of anyone, including the authors themselves and the CDC. (Source: Annas, George J., Bioterrorism, Public Health and Civil Liberties. New England Journal of Medicine, Volume 346:1337-1342, April 25, 2002).

An article in Medical Student JAMA stated:

The MSEHPA has been criticized for vesting enormous powers in the nation’s governors; for allowing governmental authorities to seize and control private property during a public health emergency and not be held liable in case of their damage or destruction; for allowing the arrest, imprisonment, and forcible examination, vaccination, or medication of individuals without their consent and not be held liable in case of any injury or death; and for being vague in what defines a public health emergency. (Source: Joseph, George D, Uses of \textit{Jacobson v Massachusetts} in the Age of Bioterrorism, Medical Student JAMA, November 5, 2003).

The principal drafters of the Model State Emergency Health Powers Act concede that coercive measures like compulsory immunization are controversial, but may nevertheless be needed. In a commentary on the Act, they stated:

\textit{Managing Property and Protecting Persons.} Authorization for the use of coercive powers is the most controversial aspect of public health laws. Nevertheless, their use may be necessary to manage property or protect persons in a public health emergency … There may also be a need to exercise powers over individuals to avert significant threats to the public's health. Vaccination, testing, physical examination, treatment, isolation, and quarantine each may help contain the spread of infectious diseases. Although most people will comply with these programs during emergencies for the same reason they comply during non-emergencies (i.e., because it is in their own interests or desirable for the common welfare), compulsory powers may be needed for those who will not comply and whose conduct poses risks to others or the public health. These people may be required to yield some of their autonomy or liberty to protect the health and security of the community. (Source: Gostin, Lawrence O., James G. Hodge, Jr. \textit{The Model State Emergency Health Powers Act – Brief Commentary}, Seattle, WA: Turning Point National Program Office at the University of Washington, September 2002, pp. 11-2.)

The Model Act provides as follows: Section 603 Vaccination and Treatment. During a state of public health emergency the public health authority may exercise the following emergency powers over persons as necessary to address the public health emergency-
mass immunization by order is strikingly absent from Ontario proposals in Bill 138 and the staff discussion draft presented to the Justice Policy Committee on August 19, 2004 by counsel for the Attorney General’s Department.

Although vaccination statutes do not typically use words like “forced” or “compulsory”, immunization is not voluntary if refusal invites forced isolation, loss of employment or jail or suspension from school. Some immunization statutes provide forced vaccination by court order. Any kind of forced medical treatment attracts serious

(a) Vaccination To vaccinate persons as protection against infectious disease and to prevent the spread of contagious or possibly contagious disease.

(1) Vaccination may be performed by any qualified person authorized to do so by the public health authority.

(2) A vaccine to be administered must not be such as is reasonably likely to lead to serious harm to the affected individual.

(3) To prevent the spread of contagious or possibly contagious disease, the public health authority may isolate or quarantine, pursuant to section 604, persons who are unable or unwilling for reasons of health, religion, or conscience to undergo vaccination pursuant to this section.

381. Although enthusiasts might argue that mass immunization and every other conceivable emergency power is covered by the basket clauses that authorize “such other actions that may be necessary,” such arguments stretch the legal imagination.

382. As Mr. John Twohig told the Committee: “The central piece of material I want to give to you is a piece of draft legislation that we worked on, the so-called contingent legislation should an emergency occur—fortunately it did not occur—during the winter of 2004 …” See Justice Policy Committee, Public Hearings, August 19, 2004, p. 74.

384. Under s. 38(1)(c) of Alberta’s Public Health Act, R.S.A. 2000, c. P-37:

38(1) Where the Lieutenant Governor in Council is satisfied that a communicable disease referred to in section 20(1) has become or may become epidemic or that a public health emergency exists, the Lieutenant Governor in Council may do any or all of the following:

a) order the closure of any public place;

b) subject to the Legislative Assembly Act and the Senatorial Selection Act, order the postponement of any intended election for a period not exceeding 3 months;

c) in the case of a communicable disease order the immunization or re-immunization of persons who are not then immunized against the disease or who do not have sufficient other evidence of immunity to the disease.
legal issues\textsuperscript{385} even in the absence of extreme measures like those used in Boston during the smallpox epidemic at the turn of the last century. A disproportionate degree of vaccination was forced on immigrants, blacks, and homeless people.\textsuperscript{386}

Every imaginable threat from civil suits to cold-blooded murder when they got an opportunity to commit it, was made by the writhing, cursing, struggling tramps who were operated upon, and a lot of them had to be held down in their cots, one big policeman sitting on their legs and another on their heads, while the third held their arms, bared for the doctor.

Scientific evidence in favour of immunization is powerful\textsuperscript{387} and most pandemic

\begin{quote}
Amongst the orders available under Quebec’s \textit{Public Health Act}, R.S.Q., c. S-2.2, s.123 provides as follows:

Notwithstanding any provision to the contrary, while the public health emergency is in effect, the Government or the Minister, if he or she has been so empowered, may, without delay and without further formality, to protect the health of the population,

1) order compulsory vaccination of the entire population or any part of it against smallpox or any other contagious disease seriously threatening the health of the population and, if necessary, prepare a list of persons or groups who require priority vaccination; ...

Section 126 provides as follows:

If a person fails to submit to a vaccination ordered under section 123, a judge of the Court of Québec or of the municipal courts of the cities of Montréal, Laval or Québec having jurisdiction in the locality where the person is to be found may order the person to submit to the vaccination.

In addition, the judge may, if satisfied on reasonable grounds that the person will not submit to the vaccination and if of the opinion that the protection of public health warrants it, order that the person be taken to a specific place to be vaccinated.
\end{quote}

\textsuperscript{385} See the references below to cases in Ontario, Manitoba, and Alberta.

\textsuperscript{387} See, for instance, Elizabeth Rea and Ross Upshur, \textit{Semmelweiss Revisited; the ethics of infection prevention among health care workers} CMAJ May 15 2001; Richard E. Schabas, \textit{Mass Influenza Vaccination in Ontario: A Sensible Move} CMAJ 2001:161 (1):36-37; Dr. Schabas adds a note of caution when he says, after noting the arguments in favour of mass immunization, “There are admittedly many uncertainties in this argument. There is because, of course, universal immunization has never before been seriously attempted on this scale.”
influenza plans provide for its use as a primary means of containing an outbreak.\textsuperscript{388}

A strong body of scientific evidence establishes that immunization carries very little risk.

Vaccines are among the safest tools of modern medicine. Serious side effects are rare. For example, severe allergic reactions can occur, but they very rarely do. In Canada, this kind of reaction has occurred less than once in every one million doses of vaccine, and there are effective treatments for this condition. The dangers of vaccine-preventable diseases are many times greater than the risk of serious adverse reaction to the vaccine.\textsuperscript{389}

\textsuperscript{388} The Ontario Health Pandemic Influenza Plan states:

Vaccination is the primary means to prevent disease and death from influenza during an epidemic or pandemic. (Source: Ontario Health Pandemic Influenza Plan, May 2004, p. 37.)

The Canadian Pandemic Influenza Plan states:

In a pandemic, the current aim is to vaccinate the whole Canadian population over a period of four months on a continuous prioritized basis after receipt of the pandemic seed strain. This would require a minimum of 32 million monovalent doses (8 million doses per month) …

For vaccine program planning purposes it is important to be prepared to immunize 100% of the population; however the actual proportion of the population that will voluntarily seek vaccination will depend on public perception of risk and severity of the disease. Therefore the demand, manifest as clinic attendance, will likely vary between jurisdictions and within each jurisdiction as the pandemic evolves. Previous experience with outbreak related immunization clinics indicates that it would be prudent to prepare for an initial demand of 75% of the target population. It is recommended that planning activities also focus on delivering a two-dose program to ensure that the public health response is ready to deal with this possibility. (Source: Canadian Pandemic Influenza Plan, February 2004, p. 33.)

As for Guillain-Barré syndrome, the \textit{Canadian Immunization Guide, 6th Edition – 2002}, p. 125, stated:

Guillain-Barré syndrome (GBS) associated with influenza immunization has been observed in a minority of influenza seasons over the last two decades. Apart from the 1976-1977 swine flu season, the risk of GBS associated with influenza immunization is small. In a retrospective study of the 1992-93 and 1993-94 seasons in four U.S. states, the relative risk of GBS occurring within 6 weeks after influenza immunization, adjusted for age and sex, was 1.7 (95% confidence interval 1.0-2.8, \( p = 0.04 \)), suggesting slightly more than one additional case of GBS per million
Notwithstanding the long history of scientific evidence that vaccination is safe, there is an equally long history of opposition. The English Vaccination Act of 1853 provoked violent riots. Closer to home, Montrealers rioted all night against vaccination during the 1885 smallpox epidemic. Even today there is an element of skepticism. Some people doubt that every new vaccine is necessarily safe. They decline vaccination on grounds of conscience, medical risk or simply people vaccinated against influenza. In comparison, the morbidity and mortality associated with influenza are much greater.

Dr. Richard Schabas stated:

Despite these problems, the influenza vaccine works, and works well. In healthy adults its efficacy is between 70% and 90%. Serious side effects are very rare. Guillain-Barré syndrome, for example, is only a complication of the vaccine in a minority of influenza seasons, and even it occurs at a rate of about one in a million doses. (Schabas R.E., Mass influenza vaccination in Ontario: A sensible move. CMAJ. 2001 Jan 9; 164(1):36-7.)

391. For contemporary scepticism about mass immunization see the National Post op ed piece of November 22, 2004 by David Dehaas, Editor of M.D. Canada Magazine.
392. The existence of medical risk is recognized by s. 38 of Ontario’s Health Protection and Promotion Act which requires adverse vaccination reactions to be reported. The risk is evidenced in court cases where governments have been sued for rare yet devastating medical catastrophes following childhood vaccination. See Jacques Lapierre v. Attorney General for Quebec [1985] 1 S.C.R. 241. In the late 1980’s a catastrophic vaccination reaction was alleged and supported by significant scientific evidence but the causal connection between vaccination and injury was not ultimately proven in Rothwell v. Raes (1988), 66 O.R. (2d) 449 (H.C.J.), affd. (1990) 2 O.R. (3d) 332 (C.A.), application for leave to appeal dismissed (1991), 49 O.A.C. 398 n (S.C.C.), a case of post-pertussis vaccine encephalopathy involving severe brain damage and tragic retardation. Osler J. noted (at 515) that some jurisdictions have statutory compensation schemes for persons suffering neurological damage in close temporal association with vaccine administration and agreed with the comments of Krever J. in Ferguson v. Hamilton Civic Hospitals (1983), 40 O.R. (2d) 577 at 618-19: “I confess to a feeling of discomfort over a state of affairs, in an enlightened and compassionate society, in which a patient, who undergoes a necessary procedure and who cannot afford to bear the entire loss, through no fault of his and reposing full confidence in our system of medical care, suffers catastrophic disability but is not entitled to be compensated because of the absence of fault on the part of those involved in his care. While it may be that there is no remedy for this unfortunate and brave plaintiff and that this shortcoming should not be corrected judicially, there is, in my view, an urgent need for correction.”

It is on the basis of tragic cases like this that any immunization plan should provide a no-fault compensation system for vaccine-injured patients.
because they object. These objections raise serious legal and moral considerations.

Ontario law required Bill Kotsopoulos, a North Bay ambulance paramedic, to submit himself to influenza vaccination on pain of suspension without pay if he refused. The rationale for the compulsory law was:

... widespread concerns that health care workers, during the course of their work, have the potential for acquiring and transmitting influenza to those under their care.

Mr. Kotsopoulos objected to compulsory vaccination because:

I have the ultimate right to give or withhold consent to an injection which invades my bodily and psychological integrity.

Section 7 of the *Canadian Charter of Rights and Freedoms* provides:

Everyone has the right to life, liberty and security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice.

Because Mr. Kotsopoulos refused to be vaccinated the hospital suspended him without pay and he sought a temporary court order to restore his job.

Mr. Justice Norman M. Karam on the basis of the evidence before him assumed that the compulsory immunization regulation was for the public good and that it would damage the public interest to interfere with it.

There was extensive evidence provided with respect to the public benefit flowing from influenza vaccination. Influenza is a viral infection that causes serious illness and can be fatal. Statistics provided by the respondents are that it leads to the hospitalization of approximately

---

75,000 people and results in the deaths of 6,500 in Canada annually. It is particularly dangerous to the elderly, often resulting in complications such as pneumonia and exacerbating heart and respiratory disease. The strength and strain of the virus varies from year to year, and as a result the genetic makeup of each year’s vaccine is different, in order to deal with the particular virus prevalent that year. Further evidence was provided that the immunization of health care workers is a necessary step in controlling the spread of the virus, and therefore the death and illness of patients exposed to them.

21 I am satisfied on the basis of the evidence provided to me, that influenza is an extremely infectious disease, often leading to hospitalization and death. It is particularly dangerous to the elderly. There is no question that paramedics in the course of their duties are often confronted with health situations involving the elderly. This regulation is clearly designed for no other purpose than to control the disease by taking steps to control its spread. Influenza vaccine is the primary defence in preventing its spread. Immunizing health care workers is one step in that direction. As earlier indicated, this Court, for the purpose of interlocutory proceedings, must therefore assume that the legislation is for the public good, and that any interference would damage the public interest.

The court on the other hand held that Mr. Kotsopoulos raised an important issue, whether his Charter rights were violated by the requirement that he submit to immunization on pain of job loss. He argued that immunization would create a risk to his health and a violation of his rights unjustified by any greater public good:

22 The applicant, who has never taken a flu shot, did adduce evidence that there is a risk to his health by immunization for influenza. Opinions were provided that there is a possibility of contracting various diseases through the flu vaccine. While the respondents disputed these allegations and offered evidence that such exposure creates very slight risk, there was an acknowledgement that some risk, however minuscule, does exist. The real issue is whether the applicant should be required, against his wishes, to expose himself to immunization, in the interests of what the Province sees as the necessity to protect the public. Whether the legislation can be justified on the basis that it intrudes upon the rights of an individual not to have substances introduced into his body against his will is a very important issue, but not one that can properly be dealt with
on an interlocutory application, in the absence of a complete constitutional review of all of the evidence available.

Mr. Kotsopoulos’s main argument was that reinstatement to his paramedic job would create no health risk to others:

¶ 23 The main argument raised by the applicant, for the purposes of this application, is that his temporary reinstatement is unlikely to increase the risk of influenza. Although there are province-wide protocols for hospitals and long-term facilities that recommend inoculations against influenza for all caregivers, only paramedics are required to be immunized. No other medical, emergency or critical care personnel are required by statute to obtain a flu shot. The evidence of the applicant is that up to one-third of all of the health care workers in the region have not been immunized against influenza. In addition, in that respect, is the exemption permitted for those paramedics providing a medical certificate establishing that they are medically contra-indicated. In this instance, there are three other paramedics exempted for that reason, at least two of whom are presently on the job, and another who is not working for an unrelated reason. The applicant argues therefore, that in light of these circumstances, his temporary reinstatement would not significantly increase the risk involved. In fact, Dr. Erika Abraham, whose affidavit has been filed on behalf of the respondents, acknowledged as much, when cross-examined for the purposes of this motion. She stated that permitting those paramedics who are contra-indicated to work, without being immunized, constituted an acceptable and minimal risk. Clearly, it follows that there is little difference should there be four instead of three or three instead of two.

The judge reviewed the Ministry of Health policy for gradual universal influenza immunization coupled with education of health care workers. Because the desired level of health care worker immunization had not been reached, the Ministry was exploring various policy and legislative solutions.

¶ 24 However, the evidence also indicates that the approach taken by the Ministry of Health has been to proceed gradually with a public program of universal influenza immunization, while at the same time recognizing the importance of the immunization of health care workers. The Rationale For Influenza Surveillance Protocol provides: “This protocol was developed in response to widespread concerns that health care
workers, during the course of their work, have the potential for acquiring and transmitting influenza to those under their care.” In a published report summarizing the 1998/99 flu season, Dr. Abraham stated:

“The main strategy of promoting the use of influenza vaccine among health care workers is health promotion and education. Despite the successes of these methods in some settings, the desired level of immunization has not been achieved in health care staff in institutions. In order to reach the targeted level of coverage of above 70%, several working groups of the Ministry of Health, medical officers of health and various professional associations are exploring policy and legislative solutions.”

For that purpose, it would appear that health care workers with the greatest high-risk exposure to patients have been targeted. I can only assume, on the evidence before me, that the requirement for immunization against influenza does not yet extend to all caregivers, such as nurses for example, or even to all paramedics, because at this stage, that is the Province’s overall strategy. Presumably this is due to the fact, as Dr. Abraham indicated in her cross-examination, that paramedics create the greatest risk to the spread of the disease, because their duties are not confined to a single health facility, but exposes them to many or all of them.

Mr. Justice Karam refused Mr. Kosopolous’s application for reinstatement because it raised serious issues that required more evidence than was available at the interim hearing.396

This case did not even touch upon the big question of mass immunization. It addressed only the very limited power to immunize health workers on pain of job loss.

396. An arbitration board in Re St. Peter’s Health Systems and Canadian Union of Public Employees, Local 778 (2001), 106 L.A.C. (4th) 170 (Charney), February 7, 2002 dealt with a chronic care geriatric facility public hospital dealing with old and frail inmates. It had 130 full time staff. A hospital regulation directed that if there is a flu outbreak, every staff member would either have a flu shot or Amantadine treatment or would be suspended from work without pay until the outbreak subsides. Fifteen grievors challenged the regulation. The board held that in the absence of a statutory requirement enforced vaccination like any other form of enforced medical treatment, was an assault, relying on the Supreme Court of Canada decision in Rodriguez v. British Columbia (Attorney General), [1993] 3 S.C.R. The opposite result was reached in Re Carewest and Alberta Union of Provincial Employees (2001), 104 L.A.C. (4th) 240 (Smith).” Where the arbitration board found that the employers policy of enforced vaccination was reasonable. a. “.”
if they refuse. Even this limited power is controversial. Some health workers find it singular and heavy-handed. One nurse said:

And it is imperative that all preventative measures be emphasized vis-à-vis the singular and heavy handed emphasis on mandatory immunization of staff.

Immunization is an integral part of our public health system\textsuperscript{397} which has the benefit of distinguished scientific advice.\textsuperscript{398} Ontario leads the way in annual voluntary adult influenza vaccination\textsuperscript{399} and its universal influenza vaccination plan has been hailed as a model for the world:\textsuperscript{400}

If a country cannot cope with interpandemic influenza, it is likely that the pandemic, when it does occur, will cause massive societal disruption … The steps needed to deal effectively with interpandemic influenza can

\textsuperscript{397} Section 5 of the Health Protection and Promotion Act, provides:

5. Every board of health shall superintend, provide or ensure the provision of health programs and services in the following areas:

1. Community sanitation, to ensure the maintenance of sanitary conditions and the prevention or elimination of health hazards.

2. Control of infectious diseases and reportable diseases, including provision of immunization services to children and adults …

See Ontario’s Immunization of School Pupils Act, R.S.O. 1990, c. I.1

\textsuperscript{398} The Ministry of Health and Long-Term Care established the Provincial Infectious Diseases Advisory Committee (PIDAC) to provide a single standing source of expert advice to the Chief Medical Officer of Health on infectious diseases for Ontario. PIDAC’s immunization subcommittee is chaired by Dr. Ian Gemmill, the Medical Officer of Health for the Kingston, Frontenac and Lennox and Addington Health Unit.

\textsuperscript{399} Ontario is the only jurisdiction in North America to make the influenza vaccine available free to all residents. Ontario’s universal influenza vaccination programme was announced on July 25, 2000. The province acquired 5.5 million doses of the vaccine for the 2004-5 flu season. According to “The Ontario Experience with Universal Vaccination,” a presentation by Dr. Karim Kurji, Associate CMOH, to the National Influenza Summit, Atlanta, Georgia, on April 2004, the programme appears to be increasing immunization rates in priority groups, including health care workers. The presentation stated that before the advent of the universal vaccination program, 20 per cent of hospital staff was immunized. By the 2003-4 flu season, this had risen to 55 per cent.

\textsuperscript{400} Institute of Medicine of the National Academies, \textit{Microbial Threats to Health: Emergence, Detection and Response}, (Washington, D.C.: 2003), p. 147
also help in preparing for an influenza pandemic. The new initiative promoting universal influenza vaccination in Ontario, Canada, can serve as a model for the world. If demonstrated to be effective, it should be expanded to other areas.

Despite this international acclaim, Ontario has not yet solved the limited problem of health worker immunization by order, let alone the bigger problems of mass immunization by order.

Health care workers are the first priority for immunization in every Canadian pandemic plan. If Ontario has not solved the limited problem of health worker immunization by order, is it ready to enact a sweeping power to immunize by order the entire population of 12 million? It is one thing to prove that compulsory vaccination of paramedics is a reasonable limit in a free and democratic society. It is a

401. Ontario is still struggling with the immunization of health workers. A report by Dr. Abraham on the 1998/99 flu season, introduced into evidence in the Kotospoulos case, noted that the desired level of immunization, a target of over 70%, had not been achieved in health care institutions. Recent influenza vaccine coverage data for staff and residents in Ontario hospitals and long term care facilities for 2003/2004 shows that 55% of hospital staff are covered while 84% of long term care staff are covered. (Source: Dr. Karim Kurji, Associate Chief Medical Officer of Health for Ontario, The Ontario Experience with Universal Vaccination National Influenza Vaccine Summit, Atlanta, April, 2004.)

402. The Ontario plan provides in part:

<table>
<thead>
<tr>
<th>PRIORITY GROUP</th>
<th>ESTIMATED NUMBER</th>
<th>RATIONALE</th>
<th>SUBGROUPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Health care workers, emergency medical services, public health workers</td>
<td>140,000 RNs/RPNs, 25,000 physicians, 7,000 public health workers</td>
<td>The health care and public health sectors are the first line of defense in a pandemic. An effective response depends on maintaining these services.</td>
<td>Health care workers in: • acute care hospitals • long term care facilities/nursing homes • private physicians’ offices • home care and other community care facilities • public health offices • ambulance and paramedic services • pharmacies • laboratories</td>
</tr>
</tbody>

403. Canadian Charter of Rights and Freedoms, Part I of the Constitution Act, 1982, being Schedule B to the Canada Act 1982 (U.K.) 1982, c. 11 provides as follows:

1. The Canadian Charter of Rights and Freedoms guarantees the rights and freedoms set out in it subject only to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society.

435
quantum leap to prove that compulsory vaccination of Ontario’s entire population of 12 million is a reasonable limit. If a case for the smaller power has not yet been established, can a case be made out for the much bigger power? Can the Attorney General give the government a legal opinion that any proposal for mass immunization by order complies with the Canadian Charter of Rights and Freedoms?

As Dr. Schabas notes above, universal immunization has never before been attempted even on a voluntary basis on the scale currently under way in Ontario. In the event of an influenza pandemic, it raises a host of issues. Will there be enough vaccine? Will every new vaccine be safe? How can safety be ensured? Can people who are low on the priority list go to court and argue their equality rights are infringed because they are deprived of a benefit given to others? What do you do with people who refuse vaccination; can you legally isolate them or jail them or suspend them from their jobs as health care workers? This last question engages the unresolved legal issues noted above. Any proposal for mass immunization by order must be very explicit about the legal consequences of refusal.

404. The objective of the Canadian Influenza Pandemic Plan is to “vaccinate the whole Canadian population over a period of four months on a continuous prioritized basis after receipt of the pandemic seed strain. This would require a minimum of 32 million monovalent doses (8 million doses per month).” For supply line difficulties caused by contamination at a vaccine manufacturing facility in Liverpool producing vaccine for the Chiron Corporation see John Treanor, M.D. Weathering the Influenza Vaccine Crisis N Engl J. Med 351:20 November 11, 2004.

405. “Mass immunization campaigns pose specific safety challenges, due to their objective of immunizing large populations over a short period of time and often being conducted outside the normal healthcare setting. Two of the most notable challenges are injection safety and adverse events following immunization (AEFI)”: Safety of Mass Immunization Campaigns Immunization Safety Priority Project, Department of Vaccines and Biologicals, W.H.O. As the Canadian Immunization Guide states: “No one in the field of public health takes the safety of vaccines for granted. Vaccine safety is an international concern. Information on possible safety concerns is communicated very rapidly among different countries. This careful monitoring ensures that public health authorities can act quickly to address concerns.” Canadian Immunization Guide 6th ed 2002 p. 46.

406. One dilemma was posed by Gregory Poland, chief of the vaccine research group at the Mayo clinic: “Long term care facilities are saying, ‘we have 100 residents and 60 health-care workers. We have 100 doses of vaccine. Who should get them?’ There’s no clear-cut answer.” Marilynn Larkin, Flu Vaccine: Will Scarcity Improve Compliance in USA? The Lancet Infectious Diseases v. 4 December 2004.

407. Vaccine shortage or apprehended crisis creates demand for immunization. The recent shortage of American influenza vaccine in October of 2004 “…unleashed a veritable frenzy… ‘Medical tourism’ has been one creative response to the vaccine shortage: Americans are paying U.S. $105 to take the high-speed ferry from Seattle, Washington, to Victoria, British Columbia, or are crossing other borders into Canada to get influenza vaccines.” (Source: European Molecular Biology Organization, Reports v. 6 no. 1 2005 p. 13.) The Journal of the American Medical Association Dec. 1 2004 v. 292 No. 21 p. 2582 noted: “Publicity surrounding the shortage has created demand even among lower-risk adults, further threatening the supply for those who need it most.”
This is not to say that every question must be completely resolved before proceeding. It is simply to say that as soon as any element of compulsion is introduced through an order for immunization, with a consequence like isolation or job suspension for those who refuse, the practical and policy and legal implications must be fully confronted before proceeding.

As for penalty, mass immunization by order is not set out as a power in any Ontario law and disobedience to such an order would attract no penalty. This chapter has referred repeatedly to consequences of refusal such as isolation or, for a health care worker, job suspension. But if mass immunization by order were enacted in Bill 138, the proposed emergencies bill now before the Legislative Assembly, failure to obey an immunization order would be punishable by a fine of up to $100,000.00 and imprisonment for up to one year. If mass immunization by order is enacted as part of a general emergency statute that carries a penalty for noncompliance, it ups the legal ante and requires very careful attention to the exemption procedures.

The most important question of all is whether mass immunization by order is enforceable. If even a small proportion of Ontario’s 12 million people decline vaccination, can the government realistically enforce the mass isolation of all those who refuse? Because the success of mass immunization depends on voluntary compliance and public confidence, public education is infinitely more important than legal compulsion.

---

408. Although a legal argument might be made that a generous reading of the general powers in the Health Protection and Promotion Act could support such an order, that argument would be a real stretch. An argument might also be made that mass immunization by order is authorized under the doctrine of inherent or common law powers discussed below.

409. The standard enforcement pattern for involuntary medical treatment in the Health Protection and Promotion Act requires an individual court hearing for each individual who it is sought to treat. Any proposal for mass immunization by order would have to be very clear as to the exact machinery of enforcement, its efficacy if there were thousands of refusals, and its viability in face of a legal challenge under the Charter of Rights.

410. Gregory Poland, chief of the vaccine research group at the Mayo clinic said of flu vaccine education “Despite 60 years of data on the efficacy and safety of the vaccine, ignorance – no inconvenience or cost – is what keeps health-care workers from being vaccinated…. We can’t continue to let fears and misperceptions prevent us from doing the right thing for our patients.” Marilynn Larkin, Flu Vaccine: Will Scarcity Improve Compliance in USA? The Lancet Infectious Diseases v. 4 December 2004. See also Carolyn S. Markey, R.N., Healthcare Worker Influenza Vaccination Home Healthcare Nurse v. 22 no. 9 September 2004: “Why aren’t more of our colleagues being immunized against flu? Reasons for not receiving influenza vaccine cited in several studies include: concern about side effects or vaccine safety, including the misperception that the injectable vaccine could cause the flu; perception of a low personal risk of contracting influenza; inconvenience; ignorance of the CDC recommendations; and dislike of needles…. ”
The World Health Organization identifies compulsory immunization as a difficult legal issue that requires a legal framework based on a transparent assessment and justification of the measures under consideration.\footnote{411}{“During a pandemic, it may be necessary to overrule existing legislation or (individual) human rights. Examples are the enforcement of quarantine (overruling individual freedom of movement), use of privately owned buildings for hospitals, off-license use of drugs, compulsory vaccination or implementation of emergency shifts in essential services. These decisions need a legal framework to ensure transparent assessment and justification of the measures that are being considered and to ensure coherence with international legislation (like the revised International Health Regulations).” (Source: W.H.O., “Influenza Pandemic Preparedness Checklist,” (Geneva: November 2004), p. 12.)}

What is required in any proposal for mass immunization by order, and indeed any other emergency power is an appropriate balance between the public interest in protecting the community from disease and the personal liberty of every individual to refuse state compulsion when fundamental freedoms are engaged.

It may be that a case for mass immunization by order can be made that adequately addresses the fundamental issues noted above. It may be that evidence is available to satisfy the Charter requirement that the measure is reasonably justified in a free and democratic society.\footnote{412}{For convenience, section one of the Charter is repeated below:}

Until such evidence has been presented in a comprehensive fashion, it is difficult to say that mass immunization by order, as opposed to a purely voluntary scheme, is ripe for enactment at this time as a permanent feature of Ontario’s law. Although a purely voluntary scheme would not raise the same issues, proposals for mass immunization by order involve some element of compulsion in the form of a consequence for refusal such as isolation or jail or suspension from work.

It must be emphasized again that every question need not be resolved completely before proceeding with legislation. It is simply to say that as soon as any element of compulsion is introduced through an order for immunization, with a consequence like isolation or jail or job suspension for those who refuse, the practical and policy and legal implications must be fully confronted before entrenching compulsory mass immunization as a permanent feature of our law.

\footnote{411}{“During a pandemic, it may be necessary to overrule existing legislation or (individual) human rights. Examples are the enforcement of quarantine (overruling individual freedom of movement), use of privately owned buildings for hospitals, off-license use of drugs, compulsory vaccination or implementation of emergency shifts in essential services. These decisions need a legal framework to ensure transparent assessment and justification of the measures that are being considered and to ensure coherence with international legislation (like the revised International Health Regulations).” (Source: W.H.O., “Influenza Pandemic Preparedness Checklist,” (Geneva: November 2004), p. 12.)}

\footnote{412}{For convenience, section one of the Charter is repeated below:}

1. The Canadian Charter of Rights and Freedoms guarantees the rights and freedoms set out in it subject only to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society.
If the government thinks that the power to order mass immunization instead of a purely voluntary programme is required in the interests of public safety, its obligation is to bring forward as soon as possible a detailed plan and body of evidence that will enable the Attorney General to give an opinion on the constitutional validity of such a power and to enable the Legislative Assembly and the public to assess its necessity.

If pandemic influenza threatens suddenly, pending the development of such a case, it is open to the government to bring forward an urgent statute with an early sunset clause to get through any immediate threat. There is however no justification to delay the production and presentation of the case for mass immunization by order. As the Justice Policy Committee was advised:

The time to consider emergencies is when you don't have one.\(^\text{413}\)

**Recommendations**

The Commission therefore recommends that:

- The power of mass compulsory immunization not be enacted as a permanent feature of Ontario’s law until the evidence has been presented in a comprehensive fashion.

- Every proposed emergency power, before its enactment, be thoroughly subjected to the legal, practical, and policy analysis exemplified by the above analysis of compulsory mass immunization and that the evidence in support of each power be presented in a comprehensive fashion before enactment.

- If the government decides it is necessary to enact any emergency power before there is time to subject it thoroughly to the legal, practical, and policy analysis exemplified by this analysis of compulsory mass immunization, that the government sunset any such provision for a period not to exceed two years in order to provide time for the required scrutiny.

\(^{413}\) John Twohig counsel from the policy branch of the Attorney General’s Department, in testimony to Justice Policy Committee, August 19, 2004 on August 19 2004, p. 181.
The government, as noted above, has expressed its intention to proceed with general emergency legislation along the lines suggested in Bill 138, *An Act to Amend the Emergency Management Act and the Employment Standards Act, 2000*, which received first reading on November 1, 2004 as a private member’s bill produced by the Standing Committee on Justice Policy after public hearings.

As noted above the Commission’s mandate does not cover general emergency legislation for war, famine, flood, ice storms and power blackouts and the government decision to proceed with Bill 138 is not within the Commission’s terms of reference. Because the government has chosen Bill 138 as the vehicle for all emergency legislation including public health emergency legislation the Commission must say something about Bill 138 as a vehicle for public health emergency powers and the government has invited the Commission to do so.\(^{414}\)

The thoughtful work of the Justice Policy Committee in its hearings and its production of its report and Bill 138 is a matter of public record. It need not be recounted here except to note that the people of Ontario owe a significant debt of gratitude to those members of the Legislative Assembly who worked so hard and to all of those who assisted them.

The strengths of the Committee process are obvious to anyone who has had an opportunity to review its proceedings. Certain legal concerns, flowing largely from the unusual process imposed on the Committee, are addressed in correspondence between the Commission and the government set out in Appendix H. The essence of the Commission’s concern is that the unusual process of proceeding to a draft bill of such profound legal importance, without prior policy and operational analysis by departments of government and without prior legal and constitutional scrutiny by the Attorney General deprived the Bill of the solid underpinnings that ordinarily precede the development of any important piece of legislation.

The work initiated by the Justice Policy Committee when they took the discussion draft bill from the Attorney General’s Department and considered it in light of the

---

\(^{414}\) Letter to the Commission from the Minister of Health and Long Term Care and the Minister of Community Safety and Correctional Services, received March 14, 2005 and reproduced in Appendix H.
Committee’s public hearings must now be completed. A sober second thought is now required. That sober second thought must be informed by the regular processes that the government skipped in its decision to proceed as it did.

As noted above, the first big question about Bill 138 is legal. Does it conform to the Charter and is it clear and workable from a legal point of view? The Commission has no mandate to give legal advice or opinions on the constitutionality of Bill 138 or any of its provisions. These legal questions can only be answered by the Attorney General whose exclusive authority on these questions is set out below.

Ontario’s emergency legislation will probably be challenged in court. A lot will be at stake in any court challenge. It will be a major blow to the integrity of the legislation should a court strike down as unconstitutional any part of the statute or any emergency order made under the statute. A successful court challenge in the middle of an emergency could have disastrous effects on the emergency response. A successful court challenge at any time would produce a cloud of uncertainty that might not disperse for years. The first delay in resolving the uncertainty could be the time it takes for a challenge to wend its way from the trial court to the Supreme Court of Canada. The second delay could come from the lengthy cycle that so often ensues when legislation is struck down on Charter grounds, sometimes referred to as a dialogue between the courts and the legislature. The courts strike it down, the legislature makes amendments to conform to the Charter, and then the whole cycle could start again with a new court challenge to the amendments.

It is therefore essential to ensure as much as possible that the legislation conforms with the Canadian Charter of Rights and Freedoms.

This job is at the heart of the responsibilities of the Attorney General and his Crown Law Officers. Firstly, because it is the responsibility of counsel for the Attorney General to defend any challenge to the legislation or the emergency order. Secondly, the common law and the Constitution Act, 1867\[415\] impose these duties, also set out in the Ministry of the Attorney General Act,\[416\] exclusively on the Attorney General.

\[416\] Ministry of the Attorney General Act R.S.O. 1990, c. M-17 s. 5:

The Attorney General,

(a) is the Law Officer of the Executive Council;
While the work of the Justice Policy Committee was impressive within the limits of the resources available to it, Bill 138 still requires fundamental review by the Attorney General before it can get a clean bill of health, legally and constitutionally. As noted above, the Attorney General has indicated that he is fully engaged in reviewing Bill 138 to ensure that it meets necessary legal and constitutional requirements. See the letter to the Commission of March 14, 2005 from the Minister of Health and Long-Term Care and the Minister of Community Safety and Correctional Services.

The job of the Attorney General is never an easy one because of the independent quasi-judicial duties associated with that office, and the independent constitutional obligation to ensure that both government legislation and government action are conducted according to law. This can bring the holder of that office into conflict with the political agenda of the government. Fortunately this province has a strong

(b) shall see that the administration of public affairs is in accordance with the law;

(c) shall superintend all matters connected with the administration of justice in Ontario;

(d) shall perform the duties and have the powers that belong to the Attorney General and Solicitor General of England by law or usage, so far as those duties and powers are applicable to Ontario, and also shall perform the duties and have the powers that, until the Constitution Act, 1867 came into effect, belonged to the offices of the Attorney General and Solicitor General in the provinces of Canada and Upper Canada and which, under the provisions of that Act, are within the scope of the powers of the Legislature;

(e) shall advise the Government upon all matters of law connected with legislative enactments and upon all matters of law referred to him or her by the Government;

(f) shall advise the Government upon all matters of a legislative nature and superintend all Government measures of a legislative nature;

(g) shall advise the heads of the ministries and agencies of Government upon all matters of law connected with such ministries and agencies;

(h) shall conduct and regulate all litigation for and against the Crown or any ministry or agency of Government in respect of any subject within the authority or jurisdiction of the Legislature;

(i) shall superintend all matters connected with judicial offices;

(j) shall perform such other functions as are assigned to him or her by the Legislature or by the Lieutenant Governor in Council. R.S.O. 1990, c. M.17, s. 5.

417. This is one reason why Sir Patrick Hastings, a former Attorney General for the United Kingdom said “Being an Attorney General as it was in those days is my idea of hell.” Sir Patrick Hastings. The Autobiography of Sir Patrick Hastings, London, William Heinemann 1948 at p. 236. The first lesson learned by every new Attorney General is the cautionary tale of Hastings, a rising political star and
tradition that the Attorney General stands up for what is legally right whether or not it is politically expedient and that the government takes the Attorney General’s advice on matters having to do with the legal and constitutional integrity of government legislation and government action. No Cabinet can be reminded too often that any government that ignores the Attorney General’s advice does so at its peril.

That is why the Attorney General’s review of Bill 138 is so fundamentally necessary in order to give the members of the Legislative Assembly and the public the assurance of legal and constitutional integrity.

The second big question about Bill 138 is whether it covers all the powers that might reasonably be required in a public health emergency or the public health aspects of a wider emergency. Does Bill 138 provide adequate legal authority for the operational measures that may reasonably become necessary in an emergency? The operational aspects of these questions can only be answered by those government departments that have to make the legislation work in the field when an emergency strikes. The legal aspects of these questions, once more, can only be answered by the Attorney General.

Because it would be unwise for the reasons noted above to have one set of laws for public health emergencies and a different set of laws for all other emergencies, and because the government has chosen Bill 138 as the vehicle for emergency laws, Bill 138 requires examination to ensure that it contains all the authority necessary to deal with public health emergencies. These specific public health emergency powers, listed above, must be reviewed operationally within government to see if they are necessary and to see if further specific powers are required. Once the government has decided what powers are required for public health emergencies, the Attorney General must examine the powers in Bill 138 to see if they cover what is needed or if they require expansion to deal with the identified needs of public health emergencies.

One example of the many issues that require legal and policy analysis is the problem of legal liability from lawsuits arising out of emergency action.

brilliant lawyer whose political career ended in ruins in 1924 when the government fell because he allegedly took political advice from the government about the conduct of a criminal prosecution As a later Attorney General put it: “The truth of the allegations remains disputed but this case has long served as a warning to later Law Officers and to governments.” As Dingle Foot, Solicitor General during the Wilson administration put it quite simply: ‘The Campbell case should have taught governments not to interfere with the Law Officers.’ Politics, Public Interest and Prosecutions – A View by the Attorney General 13th Annual Tom Sargent Memorial Lecture: An address by the Right Hon. The Lord Goldsmith, Q.C., Her Majesty’s Attorney General, London, 20 November 2001.
The problem of personal liability under the *Health Protection and Promotion Act* is addressed above, in Chapter 1, in respect of extending to the Chief Medical Officer of Health and all professional advisers and public health workers the same personal protection now afforded to the medical officer of health by s. 95 of the *Health Protection and Promotion Act*. The differences between this form of liability protection, the liability protection suggested in the discussion draft bill from the Attorney General’s Department, and the liability protection suggested in Bill 138 are noted above. While these issues are legally complicated, people and organizations who help out in an emergency either voluntarily or by responding to an emergency order are entitled to know where they stand. Concerns about liability were put to the Commission by a number of organizations:

… it would be most helpful to have legislation that limits claims brought forward as a result of actions taken by employers at the direction of the defined authority in emergency situations.

Protection from liability for health care sector providers and government authorities with respect to acts performed in good faith in responding to the emergency, and in implementing health emergency plans.

If nurses are expected to follow specific government, hospital or other orders during an emergency, they should be provided immunity from disciplinary, civil and other legal proceedings. We recommend that nurses be provided such immunity where their conduct constitutes a good faith attempt to carry out an order in an emergency.

The issue of liability during an emergency was also raised by Dr. Bonnie Henry, in her submissions before the Justice Policy Committee:

If I could make a comment on that, I think one of the things we learn over and over again in a crisis is that you can never do just enough. If you stop the outbreak, you’ve done way too much and you overreacted; if you don’t stop the outbreak, you clearly didn’t do enough. I don’t think there’s any way to legislate the ability to do things in good faith. It’s a really difficult situation that we’re put into. We’re now dealing with at least three class-action lawsuits, none of which, thankfully, has been certified
yet and all of which name the city of Toronto for doing too much. I’m 
actually quite proud of doing too much, the perception that we did too 
much. I think we did what we needed to do under very trying circum-
stances, and understanding that the need to protect people from lawsuits for doing what they feel is right and what is supported as right or – I’m 
not being very articulate – what is being done to the best of their ability and knowledge to try and control a situation that’s extremely dangerous, needs to be enshrined in legislation. People who are asked by the govern-
ment to help, to provide advice, whether their advice is taken or not, need to be protected from liability. I don’t think the Good Samaritan Act is the same concept. I think the Good Samaritan Act is pretty good, for what it does. It protects people for different situations.\footnote{418}

Whatever competing model the government decides to take in respect of protection against liability from lawsuits, concerns such as those expressed above must be addressed one way or the other. Whatever the government’s choice, those who express these concerns are entitled to know exactly where they stand.

All the Commission can do, lacking any mandate in respect of general emergency legislation like Bill 138, is to point to some problems with Bill 138 as a vehicle for public health emergency problems and to identify some areas where the Bill 138 powers may not provide all the authority necessary.

**Bill 138: Power to Override Ontario Laws**

Bill 138 provides, with one exception,\footnote{419} that emergency orders prevail over every other Ontario law. Subsection 7.0.6 (1) provides:

> In the event of a conflict between an order made under section 7.4 and any statute, regulation, rule, by-law or order, the order under section 7.4 prevails.

This power is awesome. One provincial official described it, accurately, as grandiose. An emergency order could override laws such as the *Habeas Corpus Act*,\footnote{420} the

Legislative Assembly Act, the Human Rights Code, the Elections Act, and the Courts of Justice Act. An emergency order could override any law that promotes the public good or protects individual rights. Any such proposal requires the most searching scrutiny.

The override power in Bill 138 is not only awesome but it also differs significantly from the approach in other emergency statutes.

Not all provincial emergency statutes contain clear override provisions. See for instance Saskatchewan’s Emergency Planning Act and New Brunswick’s Emergency Measures Act. It would be helpful to be provided with a full legal analysis by the Attorney General of the extent to which the emergency legislation of other provinces contains override provisions and how such provisions compare with those in Bill 138.

To take one example of the kind of analysis required, the override provisions in the emergency legislation of Manitoba and Alberta, by explicit language, limit the overrides to other legislation of the provincial legislature.

Manitoba’s Emergency Measures Act provides that where there is a conflict between an emergency order of the minister and “a provision of, or an order made under, any other Act of the Legislature,” the minister’s order prevails. Alberta’s Disaster Services Act is particularly notable in that s. 18(5) first confines the override to other provincial statutes, and then excludes certain of those statutes from the override:

425. In Robert Bolt’s play “A Man for All Seasons” Sir Thomas More makes a famous plea for the protection of laws as a shelter for the nation and its people:

“This country’s planted thick with laws from coast to coast … and if you cut them down …d’you really think you could stand upright in the winds that would blow then?”

426. This is a convenient place to note that Ontario’s existing emergency management act contains a limited power for the government to override temporarily laws that set limits for compensation and benefits, in order to provide more services, benefits, or compensation to victims of an emergency than the limits ordinarily imposed in non-emergency situations. Emergency Management Act R.S.O. 1990, c. E-9, s. 7.1 (7).
429. C.C.S.M. c. E-80, s. 21(2).
18(5) Unless otherwise provided for in the order for a declaration of a state of emergency, where

(a) an order for a declaration of a state of emergency is made, and

(b) there is a conflict between this Act or a regulation made under this Act and any other Act or regulation, other than the *Alberta Bill of Rights* or the *Human Rights, Citizenship and Multiculturalism Act* or a regulation made under either of those Acts,

this Act and the regulations made under this Act, during the time that the order is in effect, shall prevail in Alberta or that part of Alberta in respect of which the order was made.

The override power in Bill 138 is less clear. Does the word “rule” in s. 7.0.6(1) reflect an intention to override rules of common law? If not, this should be made clear. Does the word “order” in s. 7.0.6(1) reflect an intention to override the order of a court or labour tribunal or Human Rights tribunal or of the Legislative Assembly? If not, this should be made clear.

Another issue is the extent of the double override in Bill 138 in respect of the power to compel from any person any information that is thought by the government to be necessary for emergency management. Bill 138 provides that emergency orders may be made in respect of such compulsory disclosure:

7.0.2(4) 11. Subject to subsection (9), the requirement that any person disclose information that in the opinion of the Lieutenant Governor in Council may be necessary in order to prevent, respond to or alleviate the effects of the emergency.

...  

7.0.2(9) The following rules apply with respect to an order under paragraph 11 of subsection (4):

1. An order prevails over any other Act or regulation.

2. Information that is subject to the order must be used to prevent, respond to or alleviate the effects of the emergency and for no other purpose.
3. Information that is subject to the order that is personal information within the meaning of the *Freedom of Information and Protection of Privacy Act* shall be destroyed as soon as is practicable after the emergency is terminated.

This power to compel anyone to disclose any information demanded by the government raises two concerns.

One concern is technical. It is unclear why the power to compel information inserts a limited override (s. 7.0.2 (9) 1.) into a wider override (7.0.6 (1)). It is doubly unclear to the point of confusion why the two overrides are different. The information override prevails over any other Act or regulation. The wider override prevails over any statute, regulation, rule, by-law or order. It is a mystery why the language of the two overrides is different. It is unclear whether they work together or which one prevails in case of conflict.

The more important concern is the extent of the power to compel anyone to disclose any information demanded by the government. On its face it would apply to the confidential sources of journalists and to confidential information entrusted to lawyers by their clients. It may be argued on the basis of general legal principles that the power does not override any common law privilege against disclosure. But Bill 138 does not say so. If Bill 138 does not compel disclosure of confidential journalistic sources or solicitor client confidences, either Bill 138 should say so or the Attorney General should say so. It is essential before Bill 138 is enacted that people know whether they may refuse to disclose confidential information or the identity of its source or whether, if they refuse to disclose it, they will be liable to the penalty provided by Bill 138, a fine of up to $100,000 and a term of imprisonment for up to a year for every day on which the refusal continues.\(^{431}\)

\(^{431}\) Subsection 7.0.12(1) provides:

(1) Every person who fails to comply with an order under subsection 7.0.2(4) or who interferes with or obstructs any person in the exercise of a power or the performance of a duty conferred by an order under that subsection is guilty of an offence and is liable on conviction,

(a) in the case of an individual, subject to clause (b), to a fine of not more than $100,000 and for a term of imprisonment of not more than one year;

(b) in the case of an individual who is a director or officer of a corporation, to a fine of not more than $500,000 and for a term of imprisonment of not more than one year; and

(c) in the case of a corporation, to a fine of not more than $10,000,000.
It seems reasonable to provide some kind of override. If you have to empty out a hospital to make room for SARS cases and send some patients immediately to long-term care facilities, it makes sense to override temporarily the patients’ right to consider and ponder and choose which long-term care facility they prefer.

Specific examples of the need for such override were brought to the Commission’s attention in a series of submissions from organizations who addressed the question in light of the lessons they learned in SARS. Concerns about any power to override collective agreements and safety regulations are addressed specifically below. What this list provides is evidence that those who will have to respond to a future emergency need clarity in respect of any override provision:

Specific legislation that clearly defines which act supersedes another in given situations will be important. For example, does the need to access personal health information during outbreak conditions supersede the Privacy Legislation?

———

The relevant pieces of legislation need to make clear which legislation takes precedence, for example Occupational Health and Safety versus Privacy versus Emergency measures.

———

Clear indications of when and how provisions of the emergency health legislation would trump other legislation enactments that apply to the health care sector in non-emergency situations …

… we consider it particularly important that health emergency legislation consider how the legal duties of public hospitals and other health Separate offence

(2) A person is guilty of a separate offence on each day that an offence under subsection (1) occurs or continues.

Increased penalty

(3) Despite the maximum fines set out in subsection (1), the court that convicts a person of an offence may increase a fine imposed on the person by an amount equal to the financial benefit that was acquired by or that accrued to the person as a result of the commission of the offence.
providers, as provided for in other legislation, will be temporarily suspended during the emergency. Any change in “normal” legal duties must be made with a view to facilitating the most efficient, objective, and scientifically supported response to the emergency. Particular statutes of importance to the hospital sector that must be considered include, among others:

1. Public Hospitals Act and its regulations, especially the Hospital Management Regulation;

2. Various employment-related statutes, such as the Occupational Health and Safety Act;

3. Commitment to the Future of Medicare Act, 2004 (Bill 8);

4. Personal Health Information Protection Act, 2004, sections 1 - 72 of which come into force on November 1, 2004;

5. Regulated Health Professionals Act, 1991 and related professions Acts; and

———

Legislative power should be integrated for the duration of the emergency to enable directives at all jurisdictional levels at the declaration of a state of emergency by the federal parliament or provincial legislature. Such legislation needs to suspend the responsibilities of health care facility Boards of Directors under, for example, the Corporations Act and collective agreements, for the duration of the emergency.

———

Suspension of legislative/regulatory requirements – Any emergency legislation must clearly provide for the suspension of existing legislative and regulatory requirements, where appropriate. For example, during SARS, the challenge of discharging patients to long-term care facilities was exacerbated by regulatory requirements that stipulate that transfers could not be made to facilities that were not on the patient’s list of preferred facilities.
Legislation should specifically provide that the declaration of a provincial emergency and/or special health emergency does not suspend collective agreements. The parties to collective agreements should be required to comply with them, subject to terms that are specifically negotiated under an emergency plan …

… There should be specific provisions stating that the declaration of an emergency and/or special health emergency does not permit the circumvention of occupational health and safety obligations and legislation.

Legislation should specifically provide that the declaration of a provincial emergency and/or special health emergency does not abrogate any legal rights, except those expressly identified. While the declaration of an emergency does not currently suspend collective agreements or otherwise limit employees’ rights, hospitals took that position during the SARS crisis and, accordingly, a specific legislative provision is required …

… It should be specifically provided that the declaration of an emergency and/or special health emergency does not permit the circumvention of occupational health and safety obligations and legislation.

This is a convenient place to note that Bill 138 makes no reference to collective agreements. The draft discussion bill provided to the Justice Policy Committee by the Attorney General’s Department contained an explicit provision that emergency orders would override collective agreements.\(^\text{432}\) That power is strikingly absent from Bill 138.\(^\text{433}\) Bill 138 neither expressly overrides collective agreements in the manner

---

432. Section 7.4(10) provides: “No contract, collective agreement, lease, license or other non-legislative instrument shall be interpreted so as to prevent the carrying out of an order under this section.”

433. The Justice Policy Committee may have addressed the issue indirectly when it said in its Report: “In a declared emergency … it is necessary to ensure that help is available, while at the same time acknowledging: (i) statutory and contractual employment, labour and occupational health and safety standards ….” … “The Committee recommends that the government seek to facilitate the development of protocols under which management and employees can deal with the extraordinary circumstances of an emergency.” See: Standing Committee on Justice Policy, \textit{Report on the Review of Emergency Management Law in Ontario}, (November 2004), p.7.
proposed in the draft discussion bill, nor expressly preserves them from the general override in s. 7.0.6(1) as it does with occupational health and safety laws. It may be that Bill 138 leaves collective agreements in limbo. It is a legal question, whether or not the present override in Bill 138 would override collective agreements through the power to override statutes that provide for collective bargaining rights. This is an issue too important to leave to legal debate once an emergency arises. It must be clear to employers and employees whether or not emergency orders override collective agreements. This is another legal area that requires clarification from the Attorney General.

The Commission therefore recommends that the Attorney General, in the review of Bill 138, clarify whether or not the override power in s. 7.0.6(1) affects collective agreements.

In one particular respect the override power is deficient and dangerous. It is not reasonable to override the foundational laws that underpin Ontario’s democratic legal system including laws such as the *Habeas Corpus Act*, the *Legislative Assembly Act*, the *Human Rights Code*, the *Elections Act*, and the *Courts of Justice Act*. The line might not be perfectly clear in respect of every statute. The *Elections Act* is a good example. Alberta provides a power to delay an election for up to three months in face of a disease epidemic or other public health emergency. It is a political ques-

---

38 (1) Where the Lieutenant Governor in Council is satisfied that a communicable disease referred to in section 20(1) has become or may become epidemic or that a public health emergency exists, the Lieutenant Governor in Council may do any or all of the following:

(a) order the closure of any public place;

(b) subject to the Legislative Assembly Act and the Senatorial Selection Act, order the postponement of any intended election for a period not exceeding 3 months;

(c) in the case of a communicable disease order the immunization or re-immunization of persons who are not then immunized against the disease or who do not have sufficient other evidence of immunity to the disease.

(2) Where an election is postponed under subsection (1), the order shall name a date for holding the
tion for the government and the Legislative Assembly exactly how far the override should intrude into foundational legal statutes such as the *Elections Act*. The Commission recommends thorough scrutiny and amendment of the override provision to protect our foundational legal statutes against emergency override.

The override goes to the essential character of the powers themselves and should be tightly connected with them through its position in the statute. It should not be necessary to comb through the statute to find this extraordinary power, now relegated to an obscure position in the statute some 20 provisions after the grant of power. The Commission recommends that this override power be given a more prominent place in the statute by putting right after the enumerated powers.

The Commission recommends that the Attorney General review Bill 138 to ensure that the extent of the override, combined with the vague and open ended nature of the powers including the basket clause, does not constitute a constitutionally impermissible delegation of legislative power to public officials.  

**Recommendations**

The Commission therefore recommends that:

- The Attorney General in the review of Bill 138 clarify whether or not the override power in s. 7.0.6(1) affects collective agreements.

- The Attorney General undertake a thorough scrutiny and amendment of the override provision to protect our foundational legal statutes such as the *Habeas Corpus Act*, the *Legislative Assembly Act*, the *Human Rights Act*.

---

nominations or polling, or both of them, and nothing in the order adversely affects or invalidates anything done or the status of any person during the period of time between the date of the order and the completion of the election.

(3) Where a person refuses to be immunized pursuant to an order of the Lieutenant Governor in Council, the person shall be subject to this Part with respect to the disease concerned as if the person were proven to be infected with that disease.

Code,\textsuperscript{444} the \textit{Elections Act},\textsuperscript{445} and the \textit{Courts of Justice Act}\textsuperscript{446} against emergency override.

- It be made clear whether a journalist or lawyer who refuses to disclose confidential information or the identity of its source is liable to the penalty provided by Bill 138, a fine of up to $100,000 and a term of imprisonment for up to a year for every day on which the refusal continues.

- The override power be given a more prominent place in the statute by putting right after the enumerated powers.

- The Attorney General review Bill 138 to ensure that the extent of the override, combined with the vague and open ended nature of the powers including the basket clause, does not constitute a constitutionally impermissible delegation of legislative power to public officials.

\textbf{Bill 138: Trigger, Criteria and Limitations}

Bill 138 provides for the making of a declaration of emergency, and for the exercise of emergency powers contingent on such a declaration. Both the declaration of emergency, the “trigger”, and the ensuing power to make orders are hedged around with conditions and requirements.

The trigger conditions which are set out in s.7.0.1(3):

\begin{quote}
Declaration of emergency

7.0.1 (1) Subject to subsection (3), the Lieutenant Governor in Council or the Premier, if in the Premier’s opinion the urgency of the situation requires that an order be made immediately, may by order declare that an emergency exists throughout Ontario or in any part of Ontario.
\end{quote}

\begin{quote}
Criteria for declaration
\end{quote}

\begin{itemize}
\item \textsuperscript{444} R.S.O. 1990, c. H-19.
\item \textsuperscript{445} R.S.O. 1990, c. E-6.
\item \textsuperscript{446} R.S.O. 1990, c. C-43.
\end{itemize}
(3) An order declaring that an emergency exists throughout Ontario or any part of it may be made under this section if there is an emergency that is such that,

(a) it requires immediate action to prevent, reduce or mitigate a danger of major proportions that could result in serious harm to persons or substantial damage to property; and

(b) the action cannot be undertaken using the resources normally available to a ministry of the Government of Ontario or an agency, board or commission or other branch of the government.

These provisions represent a clear intention to place reasonable limits on the exercise of emergency powers. What is not so clear is why the author chose these particular legal drafting techniques. As a Yale law professor noted,

Drafting these provisions is a tricky business.\(^\text{447}\)

What is most striking about the trigger provisions is the way in which they combine subjective and objective conditions. On the one hand, subsection (1) requires subjective condition that the decision-maker be of the “opinion” that a situation is sufficiently urgent to require a declaration of emergency. On the other hand, subsection (3) then imposes two objective “criteria”: the emergency must be such that “immediate action” is required, and it must be such that action cannot be taken using the resources normally available. In other words, before an emergency can be declared, the decision-maker must not only be satisfied that an emergency exists, he or she must also attempt to establish both that the threat is such as to require immediate action, and that the action “cannot be undertaken using the resources normally available,” whatever may be meant by that ambiguous phrase.

The trigger provision used in Bill 138 can be contrasted with the trigger provisions found in other emergency statutes. For example, Alberta’s *Disaster Services Act*\(^\text{448}\) simply requires (at s. 18(1)) that the Lieutenant Governor be “satisfied” that an emergency exists or may exist before a declaration to that effect can be made. A simi-

---

\(^{447}\) Bruce Ackerman, Sterling Professor of Law and Political Science, Yale University, The Emergency Constitution (2004) 113 Yale Law Journal 1029 at p. 1058.

lar approach is adopted in British Columbia’s *Emergency Program Act*. Subsection 9(1) provides that once the Minister or Lieutenant Governor in Council is “satisfied” that an emergency exists, a declaration of emergency can be made.

The objective criteria surrounding the trigger power in Bill 138 are not only unusual, they are also problematic. Not only will valuable time be lost in attempting to satisfy the criteria, it will probably be lost in a pointless exercise. Even if the decision-maker had the luxury of time, would it always be possible, before the fact, to determine that “immediate action” is indeed required to prevent “a danger of major proportions”?

These problems noted above reappear when one turns from the emergency trigger to the emergency powers. The conditions surrounding the exercise of the principal powers are set out in s. 7.0.2(2):

Criteria for emergency orders

7.0.2 (2) If an emergency is declared under section 7.0.1, the Lieutenant Governor in Council may make such orders as the Lieutenant Governor in Council considers necessary and essential in the circumstances to prevent, reduce or mitigate serious harm to persons or substantial damage to property,

(a) if the harm or damage will be alleviated by the order; and

(b) if there is no reasonable alternative to the order.

Limitations on emergency order

(3) Orders made under this section are subject to the following limitations:

1. The actions authorized by an order shall be exercised in a manner which limits their intrusiveness. …

Two features of these provisions are worth noting. First, s. 7.0.2(2) effectively establishes a second set of barriers to the making of an emergency order. In other words, before making an emergency order, the Lieutenant Governor must not only satisfy

the conditions attaching to the declarations of an emergency as set out in s. 7.0.1(3), he or she must also satisfy the conditions which attach to the making of emergency orders as set out in s. 7.0.2(2).

Second, the conditions imposed on the making of an emergency order use a mixture of subjective and objective standards. In this connection two observations may be made:

- The exercise of the power itself is purely subjective ("considers necessary and essential") with no requirement of objective reasonableness (such as "on reasonable grounds") or even subjective reasonableness (such as "he considers reasonable"); and

- The limitations on the power are objective and very strict. They require not that the orders be based on reasonable grounds, but that they be objectively correct in the sense that it must be objectively proven that the harm or damage will in fact be alleviated by the order and it must be objectively proven that there is no reasonable alternative to the order.

The strategy adopted in Bill 138 can be contrasted to the strategy used in other jurisdictions.

As has been noted, Alberta’s *Disaster Services Act*\(^450\) requires (at s. 18(1)) that the Lieutenant Governor be “satisfied” that an emergency exists or may exist. However, once the subjective condition surrounding the declaration has been satisfied, and the declaration has been made, no further conditions are imposed on the making of emergency orders. The power to make orders is conferred on the designated Minister, and s. 19(1) provides that he or she “may do all acts and take all necessary proceedings including the following ....”

Again, as has been noted, British Columbia’s *Emergency Program Act*\(^451\) requires (at s. 9(1)) that once the Minister or Lieutenant Governor in Council is “satisfied” that an emergency exists before a declaration to that effect can be made. Thereafter the Minister is free (pursuant to s. 10(1)) to make an emergency order at his or her discretion; no further conditions need be satisfied.

---

The approach adopted in these jurisdictions ensures that once the decision-maker meets the precondition to the making of a declaration of emergency, he or she is then free to respond in the manner dictated by the circumstances of that emergency, without first ensuring that a further set of conditions is met.

The approach adopted in the emergency portion of Saskatchewan’s *Public Health Act* is more structured. The Minister is empowered to issue a remedial order where he or she “believes, on reasonable grounds” both that a serious public health threat exists, and that the order is necessary to remedy the threat.

The strategy adopted in Ontario’s Bill 138 is different yet again. In one respect it is closer to that adopted in Saskatchewan’s *Public Health Act 1994*, than to that adopted in Alberta’s *Disaster Services Act* or British Columbia’s *Emergency Program Act*: having declared an emergency, Ontario’s Lieutenant Governor in Council must then satisfy further conditions before making an emergency order. However, unlike Saskatchewan’s statute the conditions imposed employ not only subjective, but also, as noted above, objective requirements. Therein lies the problem. This approach will make it difficult, in some cases impossible, to say whether or not any given order is legal. Because of course it is impossible to tell in advance whether, to use the language of s. 7.0.2(2), the harm will be “alleviated,” or whether there is “no reasonable alternative.”

The objective requirements imposed by s. 7.0.2(2)(a) and (b) require perfect prescience on the part of the emergency decision-maker. Although hindsight may be 20-20, it will be impossible for any Premier or cabinet minister to be sure in advance that he or she is perfectly right in what they propose to do. And this is likely to be especially true in the circumstances in which the decision to invoke the power will be made. In the heat of an emergency, like the fog of war, things are not always clear. Is the virus spreading? Do a cluster of patients have SARS or something else? Is it necessary or reasonable to close a hospital even though the extent of simmering undiagnosed disease is yet unclear? What are the risks if the disease spreads into the community because the hospital remains open? Emergencies present risks of unknown proportion and solutions of uncertain success. To require objective correctness is to require the impossible and to straitjacket emergency officials who may need to act very quickly in face of a threat of unknown proportions. No lawyer and no judge would be able to say whether or not any particular emergency order under Bill

---

138 is or is not legal within the strict limits of its strict criteria.

Similar problem flows from the requirements set out in s. 7.02 (3) 1 and 2. The former provides that actions authorized by an order “shall be exercised in a manner which limits their intrusiveness.” Not only is this requirement objective, it is also ambiguous. The latter provides that an order shall only apply to the areas of the Province “where it is necessary.” Once more the standard is objective and therefore impossible to implement. An order that appears reasonable and necessary in the face of an unknown threat may prove, after the fact, to have been unnecessary. It is not fair to judge emergency actions solely on the basis of hindsight.

The problems with objective standards of this sort are apparent. They not only require great powers of prescience but they also ignore the practical realities of emergency management. As noted above, the precautionary principle and the hard earned lessons of the past tell us that it may be necessary to overreact in face of a threat that turns out later to be less serious than anyone thought at the time.

The application of an objective standard not only hinders emergency response but it also invites lawsuits based on hindsight that unfairly judges the emergency responder not on what he or she did at the time, but on what turned up later, after the dust had settled.

To enact an objective trigger for an emergency declaration, and objective limitations for the exercise of emergency authority is to ignore the problem of hindsight. Objective standards require courts, when judging the legality of emergency action afterwards, to examine the declaration and the orders in hindsight on the basis of what proved later to be actually necessary rather than judging them on the basis of how things reasonably appeared at the time. In the fog of emergency, like the fog of war, objective standards do not work. As one military historian noted:

> Once a dramatic event takes place, it always appears to have been predictable because hindsight tells the historian which clues were vital, which insignificant, and which false. The unfortunate general who must act without the benefit of hindsight is much more likely to err.453

To take an example closer to home, Dr. Young at the SARS Commission public hearings addressed the problem that an emergency may require decisive action in the face of many unknown facts:

... when we called the provincial emergency, we were dealing with an outbreak where we did not know for sure that it was a virus, we did not know for certainty what virus it was, we did not know what symptoms and what order of symptoms SARS presented with. We had a vague idea that some of the symptoms might include fever and cough. We did not, for example, for some period of time, realize that about 30 per cent of patients also could present with diarrhea. We did not know how long it incubated for. We did not know with certainty whether it was droplet spread or whether it was airborne. We did not know when it was infectious. We did not have a diagnostic test for it and still do not have an accurate diagnostic test. We had no way of preventing it, we had no vaccine and we had no treatment. What we had was an illness with many unknowns and virtually no knowns. 454

Objective standards of the kind imposed by Bill 138, as noted above, prevent the application of the precautionary principle, so vital to public protection and so strongly relevant to public health emergencies:

The absence of full scientific certainty shall not be used as a reason for postponing decisions where there is a risk of serious or irreversible harm. 455

Where there is reasonable evidence of an impending threat to public health, it is inappropriate to require proof of causation beyond a reasonable doubt before taking steps to avert the threat. 456

This is not to suggest that conditions should not be imposed on the use of emergency powers. Conditions will however be more realistic if, as in the case of Saskatchewan's Public Health Act, they have a subjective focus on what the decision-maker might reasonably be expected to know or understand in the circumstances. When a community defends itself against an apparently deadly threat of unknown proportions it cannot be expected to weigh its response with precision.

454. SARS Commission, Public Hearings, September 30, 2003, p. 34.
A helpful analogy can be drawn to the traditional direction given to juries in cases of self defence:

… a person defending himself cannot weigh to a nicety the exact measure of his necessary defensive action. If a jury thought that in a moment of unexpected anguish a person attacked had only done what he honestly and reasonably thought was necessary that would be the most potent evidence that only reasonable defensive action had been taken.\footnote{457. J. C. Smith, \textit{Justification and Excuse in the Criminal Law}, Hamlyn Trust 1989 p. 108; quoting Lord Morris of Borth Y Gest in Palmer [1971] 1 All E.R. 1077 at 1088.}

Again and again judges have told juries in cases of self defence that it is not fair to judge defensive action by objective standards alone. Words like the following have been used:

None of us can measure with any precision what degree of force is excessive or what degree of force we have to use to protect ourselves or someone else. It all depends on what is happening at the time and what we reasonably think is happening. An American Chief Justice said that detached reflection cannot be demanded in the face of an uplifted knife. An English Chief Justice said that one does not use jeweller’s scales to measure reasonable force. As our own Supreme Court says, a person who reasonably feels threatened with serious bodily harm or death cannot be expected to weight with nicety the exact measure of responsive force.

The actions of public officials who defend us against emergencies should be judged by no harsher standards than the actions of those who defend themselves against personal aggression.

The test should not be whether an emergency action turns out in hindsight to have been necessary. The test should be whether the emergency action was taken in the honest and reasonable belief that it was necessary in the circumstances as they appeared at the time.

With respect to the precise content of the suggested standard, some guidance can be found in the legal concept of “reasonable apprehension,” a concept which has stood the test of time. It is the underlying principle that governs the extent of police powers.
In an often quoted passage setting out the extent of police power to take action to protect the public, it was described in the following terms:

The first duty of a constable is always to prevent the commission of a crime if a constable reasonably apprehends that the action of any person may result in a breach of the peace, it is his duty to prevent that action. It is his general duty to protect life and property, and the general function of controlling traffic on the roads is derived from this duty.

Although closely connected to the concept of reasonable and probable grounds, the test of reasonable apprehension focuses more on the reasonableness of the officer’s belief than the existence of objective proof that his belief is in fact correct. See, for instance, Schroeder J.A. in *R. v. Joseph Advent* [1957] O.J. no. 442:

One of the principal duties of a police officer is to prevent breaches of the peace which he reasonably apprehends and the important question in this case is whether or not there were reasonable and probable grounds for the police to entertain the belief that the accused and those with whom he was associated were about to commit a breach of the peace or that there was danger of their committing an assault on the drivers of the approaching trucks if their conduct was not controlled.

**Recommendation**

The Commission therefore recommends that:

- The structure and content of the limitations and criteria for the declaration of emergency and the exercise of emergency powers be reviewed with a view to the development of a standard based on the decision-maker’s reasonable apprehension that the exercise of the power is necessary in the circumstances.

---

458. *Halsbury’s Laws of England*, 3rd ed., vol. 30 p. 129. This passage has been quoted in countless cases including *R. v. Waterfield et al.* [1964] 1 Q.B. 164, per Lord Widgery at p. 188. The latter was, for years, the leading English case on police powers and is to this day invoked regularly in Canada. See *R. v. Clayton* [2005] O.J. No. 1078, (C.A.), per Doherty J.A. at para 35.
Bill 138: Power to Implement Emergency Plans

The power in s. 7.0.2 (4) 1. to “implement emergency plans” is at best ambiguous and at worst lacking in transparency. A close examination suggests that it may confer powers intended by no one.

459. “The implementation of any emergency plans formulated under section 3, 6, 8 or 8.1.” incorporates by reference the contents of the plans formulated under sections 3, 6, 8, or 8.1. Section 3 (1) provides that “Every municipality shall formulate an emergency plan governing the provision of necessary services during an emergency and the procedures under and the manner in which employees of the municipality and other persons will respond to the emergency and the council of the municipality shall by by-law adopt the emergency plan.” Section 6 which provides that every Cabinet Minister and every agency head shall formulate an emergency plan “governing the provision of necessary services during an emergency and the procedures under and the manner in which Crown employees and other persons will respond to the emergency. Section 8, the nuclear emergency section provides that Cabinet shall “formulate an emergency plan respecting emergencies arising in connection with nuclear facilities.” Section 8.1 provides a wide power in the Solicitor General to “formulate emergency plans” in respect of non-nuclear emergencies. All of these powers to “formulate emergency plans” come home to roost in the acutal details of what gets written into these plans. Section 9 provides what a plan may provide:

9. An emergency plan formulated under section 3, 6 or 8 shall,

(a) in the case of a municipality, authorize employees of the municipality or, in the case of a plan formulated under section 6 or 8, authorize Crown employees to take action under the emergency plan where an emergency exists but has not yet been declared to exist;

(b) specify procedures to be taken for the safety or evacuation of persons in an emergency area;

(c) in the case of a municipality, designate one or more members of council who may exercise the powers and perform the duties of the head of council under this Act or the emergency plan during the absence of the head of council or during his or her inability to act;

(d) establish committees and designate employees to be responsible for reviewing the emergency plan, training employees in their functions and implementing the emergency plan during an emergency;

(e) provide for obtaining and distributing materials, equipment and supplies during an emergency;

(e.1) provide for any other matter required by the standards for emergency plans set under section 14; and

(f) provide for such other matters as are considered necessary or advisable for the implementation of the emergency plan during an emergency. R.S.O. 1990, c. E.9, s. 9; 2002, c. 14, s. 13.
The section provides:

(3) the Lieutenant Governor in Council may make orders in respect of the following:

1. The implementation of any emergency plans formulated under section 3, 6, 8 or 8.1.

Although it is true that emergency statutes commonly contain a provision such as this, a plain reading raises the question as to what exact power it confers. The words of the section convey no picture of what is intended or what is legally authorized. On its face the provision seems innocuous, a sensible form of words that attracts deference to some reasonable, pre-planned administrative arrangements. But the devil is in the details. Arguably what the provision really provides, through the opaque technique of incorporation by reference, is a series of blank cheques which authorize public officials to do anything they see fit so long as it is written down in some plan. The plans referred to in this provision contain:

- procedures to be taken for safety or evacuation;
- procedures to obtain and distribute materials, equipment, and supplies;
- any other matter required by emergency plan standards under s. 14;\textsuperscript{460}
- such other matters as are considered necessary or advisable for the implementation of the emergency plan during an emergency.

It does not stretch the imagination to envisage the wide fields of power opened up by this provision. Arrest, confiscation, conscription, forced medical treatment, indeed any power imaginable could be written into any of these plans with the stroke of a pen. This would enable public officials to exercise any power they wished so long as they wrote it down beforehand.

\textsuperscript{460} Section 14 provides a blank cheque within a blank cheque. It provides that “The Solicitor General may make regulations setting standards for the development and implementation of emergency management programs under sections 2.1 and 5.1 and for the formulation and implementation of emergency plans under sections 3 and 6.” This represents a further delegation of power to the Minister of Public Safety to write into emergency plans whatever powers he may see fit from time to time, without limitation.
It is at first sight difficult to see why such a power is necessary or appropriate in an emergency powers statute. It adds a wild card to the entire list of enumerated powers that follow in s. 7.0.2(4) of Bill 138. Through the technique of incorporation by reference it delegates a limitless range of unspecified powers to government officials. It lacks transparency.

It may be that this provision is an historical artifact that harkens back to the Premier’s power under the *Emergency Management Act* to implement emergency plans. That section, which would be repealed under the new emergency statute, provides:

7. (1) The Premier of Ontario may declare that an emergency exists throughout Ontario or in any part thereof and may take such action and make such orders as he or she considers necessary and are not contrary to law to implement the emergency plans formulated under section 6 or 8 and to protect property and the health, safety and welfare of the inhabitants of the emergency area. R.S.O. 1990, c. E.9, s. 7 (1). [emphasis added]

Absent from the proposed power to implement emergency plans is the safeguard that restricts emergency response to actions that are not contrary to any existing law. The omission of this safeguard exacerbates the blank cheque nature of proposed s. 7.0.2(4)1. That said, even if this safeguard were restored by an amendment to the power in s. 7.0.2(4)1 to implement emergency plans, the lack of transparency would remain.

**Recommendations**

The Commission therefore recommends that:

- The power to implement emergency plans be amended to ensure that it confers no powers other than those explicitly set out in Bill 138.

- Bill 138 be amended to provide that every emergency plan requires protocols for safe and speedy court access developed in consultation with the judiciary, and that the Courts of Justice Act be amended to ensure an early hearing for any proceeding under or in respect of emergency legislation or any action taken under it.

- The Attorney General’s Department scrutinize Bill 138 intensely for trans-
transparency to ensure that it confers no hidden powers and that all powers
conferred are clearly set out on the face of the statute.

Bill 138: Basket Clause

At the end of its list of emergency powers, Bill 138 provides a “basket clause” to catch
and include any power similar to those expressly provided, that may prove necessary:

7.0.2 (3), the Lieutenant Governor in Council may make orders in
respect of the following:

...

12. Consistent with the powers authorized in this subsection, the taking
of such other actions or implementing such other measures as the
Lieutenant Governor in Council considers necessary in order to prevent,
respond to or alleviate the effects of the emergency.

Most emergency statutes contain such a clause. In some cases it is appended as an
introduction to the list of conferred powers.461 For example, s.10(1) of British
Columbia’s Emergency Program Act begins by providing that after a declaration of
emergency,

… the minister may do all acts and implement all procedures that the
minister considers necessary to prevent, respond to or alleviate the effects
of an emergency or a disaster, including any or all of the following….

In other cases it appears at the end of the list as free-standing power. For example, s.
18(1) of Saskatchewan’s Emergency Planning Act462 sets out a list of powers to be exer-
cised by the Minister in the event of a declaration of emergency. The last of these is as
follows:

… do all acts and take all proceedings that are reasonably necessary to
meet the emergency.

Bill 138 uses an approach similar to that followed in the Saskatchewan legislation but with one crucial difference, Bill 138 does not impose any reasonableness standard. Indeed the requirement of reasonable grounds is strikingly absent from Bill 138 as a whole. It is true, as has been noted, that the power to make emergency orders is conferred by s. 7.0.2(2) is made conditional on the requirement that the decision-maker must first determine that there is no “reasonable alternative” to the order. However, it is suggested that this is an inadequate alternative. As noted in the section on “Trigger, Criteria and Limitations,” not only does it require inordinate powers of prescience, but it also represents an unusual departure from the ordinary language of “reasonable grounds” or “reasonable apprehension” that is so familiar and well-tested in our law.

**Recommendation**

The Commission therefore recommends that:

- The basket clause s. 7.0.2(4) be reviewed on the same basis as that recommended above for the trigger and criteria and limitations, the basis of reasonable apprehension.

**Bill 138: Occupational Health and Safety**

Bill 138 exempts occupational health and safety laws from the override power. The emergency powers trump every Ontario law except health and safety laws:

7.0.6 (1) In the event of a conflict between an order made under section 7.0.2 and any statute, regulation, rule, by-law or order, the order under section 7.0.2 prevails.

---

463. Criteria for emergency orders

7.0.2(2) If an emergency is declared under section 7.0.1, the Lieutenant Governor in Council may make such orders as the Lieutenant Governor in Council considers necessary and essential in the circumstances to prevent, reduce or mitigate serious harm to persons or substantial damage to property,

(a) if the harm or damage will be alleviated by the order; and

(b) if there is no reasonable alternative to the order.
Preservation of duties and rights

(4) Despite subsection (1), nothing in this Act or in an order made under it abrogates any duties that are imposed and rights that are provided under the *Occupational Health and Safety Act*.

The discussion draft statute from the Attorney General’s Department did not contain this provision that preserves every occupational health and safety regulation from the force of every emergency order. The exemption was added by the Justice Policy Committee when it drafted Bill 138. The Justice Policy Committee had heard strong arguments that safety regulations should remain in force during an emergency and should not be overriden by emergency orders.

Marcelle Goldenberg, a lawyer with the Service Employees International Union, told the Justice Policy Committee:

> Until the Ontario government can guarantee the health and safety of workers, it cannot force them to perform emergency work of an unknown nature. SEIU believes the province should not legislate a statutory provision empowering the Lieutenant Governor to direct any person or member of a class of persons to render services of a type that the person may reasonably be qualified to perform in emergency situations.464

> Until health care workers are assured that they will receive the proper training and personal protective equipment for the infectious diseases they must encounter, they cannot be ordered by any authority to put their lives on the line.465

Risa Pancer, a lawyer with the Canadian Union of Public Employees, told the Justice Policy Committee:

> We are also, though, putting in it how we’re going to deal with occupational health and safety concerns, that the act will apply and every-

one will have the right to raise concerns during an emergency and feel no fear of retaliation.\textsuperscript{466}

Leah Casselman, president of the Ontario Public Services Employees Union, referred in her testimony to recommendations her union has made to the Commission on,

\begin{itemize}
  \item the need to protect employees’ rights and collective agreements during emergencies.
  \item avoiding the circumvention of employers’ occupational health and safety obligations.\textsuperscript{467}
\end{itemize}

These powerful arguments reflect the concerns of front line health care workers who were exposed to risk during SARS. They lack confidence in existing occupational and health safeguards. They lack confidence in the operation of the machinery of enforcement in place during SARS. In light of these concerns they cannot accept any legislative measure that appears to erode whatever safety protection they now have, inadequate though it may be.

These concerns, as noted above, are a major part of the Commission’s ongoing investigation and will be addressed in the Commission’s final report. It is enough to say at this time that nothing in the evidence examined so far suggests to the Commission that it would be wise to enact a complete emergency override of occupational health and safety laws.

The health and safety of emergency workers is a fundamental element of every emergency response. One of the strongest lessons from SARS is that the health and safety of health care workers and other first responders is paramount in a public health emergency. SARS demonstrated that emergency response can be seriously hampered by high levels of illness or quarantine among health care workers. As Dr. Young has said:

\begin{quote}
  Certainly one of my priorities is occupational health and safety of the first responders, whether they are hospital workers or whether they’re fire or police, or farm workers in the case of avian flu.\textsuperscript{468}
\end{quote}

\textsuperscript{466} Justice Policy Committee, October 14, 2004, p. 364.
\textsuperscript{467} Ibid, p. 356.
\textsuperscript{468} Justice Policy Committee, Public Hearings, August 3, 2004, p. 17.
Those who favour a limited override of some safety regulations point out that they may contain minor technical provisions that do not directly protect workers, provisions that might be overridden in an emergency without affecting worker safety.

If such provisions exist, and if they would unreasonably impair emergency response, and if it would not endanger workers to override these provisions, the burden of persuasion is on those who would argue that some safety provisions may be safely overridden.

The solution, to any concern that occupational health and safety laws might impede emergency response, is not to enact a blunt override of those laws. Emergency orders will not work if they leave workers deep concern for their personal health and safety. The deepest concern of workers in an infectious outbreak is not their own safety but the safety of their families and those they may infect if not properly protected.

Emergency orders that do not meet these concerns cannot be enforced.

To override occupational health and safety laws would eliminate even the restricted rights of first-responders to refuse unsafe work at a time when other protective measures might also be weakened. In such a hazardous environment, such a draconian measure would be impossible to enforce. Health care workers and other front-line responders may decide in future emergencies, as so many did so heroically during SARS, to accept heightened levels of personal risk voluntarily. But no one, no matter how dedicated and conscientious, should or can be legally coerced to work in an unsafe work environment that they believe will harm themselves and their families. And as a practical matter such legal coercion would be impossible to enforce.

Doris Grinspun, executive director of the Registered Nurses Association of Ontario, has stated:

… you cannot really mandate people to work. Yes, you can put the legislation, all right, but people can call and say, “I am sick” – one way or another … When some refused [during SARS], they were afraid of the protection. So, again, let’s be prepared for how we protect not only our nurses but doctors and others, and we will have fewer and fewer refusals.469

---

The Justice Policy Committee, in its *Report on the Review of Emergency Management Law in Ontario*, stated:

Emergencies put special stress on workers and employers where work is temporarily interrupted, or otherwise affected by the emergency. In a declared emergency under the *Emergency Management Act* it is necessary to ensure that help is available, while at the same time acknowledging (i) statutory and contractual employment, labour, and occupational health and safety standards, and (ii) issues under the *Human Rights Code*.

12. The Committee recommends that the government seek to facilitate the development of protocols under which management and employees can deal with the extraordinary circumstance of an emergency.

13. The Committee recommends that the government review labour and employment legislation with a view to ensuring that the tools needed to respond adequately to a provincial emergency are available.  

The Commission agrees that it is important to have mechanisms in place to deal with any health and safety workplace issues that may arise during a future public health emergency in order to:

- Prevent situations from developing that would leave health care and other front-line workers with no choice but to seriously consider refusing work; and

- Develop effective means for workplace parties to work out thorny issues that might arise during an emergency.

These points were made by both management and labour.

Janet Beed, the chief operating officer of the Ontario Hospital Association, has stated:

Labour issues will always be contentious, but if you have a health crisis, labour issues need to have been considered long before the crisis occurs.

You can appreciate that there are many issues. What we learned from SARS is that what is needed is a process to bring together the various partners – union, management, government, ministries, associations – to address these very complex systemic and legal issues, but we need to do that long before the crisis hits. When the crisis hits, we need timely action; we don't need bringing a group together that hasn't worked together before or has only worked in distant relationships. Bringing that group together in anticipation and setting up a set of ideologies and legislative requirements will help.471

One union in a written submission to the Commission, recommended:

1. The Public Hospitals Act should be amended to provide that each hospital should have in place a health emergency plan in advance of any emergency. Where the hospital is unionized, the health emergency plans should be negotiated with unions through collective bargaining to address issues affecting the employment conditions of health care workers. Issues to be bargained and included in the health emergency plan should include:

   a. deployment of staff during an emergency;

   b. scheduling and hours of work for health care workers during an emergency;

   c. pay for health care workers during an emergency, including any entitlement to emergency premiums and protection from financial disadvantage caused by the emergency;

   d. plans for staffing an emergency, including whether staffing should occur on a voluntary basis and whether those who volunteer should be entitled to premium pay;

   e. training health care workers for the implementation of emergency plans, both in advance of any emergency and during the emergency;

   f. training health care workers for additional health and safety issues arising during an emergency;

g. management of health care worker stress during an emergency;

h. protection of occupational health and safety standards during an emergency;

i. impact of restrictions on health care worker employment during an emergency (e.g. restrictions placed on those who work in more than one facility);

j. impact on health care workers caused by the shut-down of facilities, including in terms of compensation;

k. workers requiring particular accommodation during an emergency, for example, pregnant workers or immunosuppressed workers;

l. workers required to be placed in quarantine during an emergency;

m. long-term impact on health care workers caused by the emergency; and

n. vacation entitlement during an emergency.

Some of the above issues, such as those dealing with compensation, should be bargained between central parties, while other issues, for example scheduling and hours of work, should be bargained locally according to principles determined by the central parties.

Another union in a submission to the Commission said this:

… early in SARS, an ad hoc committee to address issues arising out of SARS workplaces was established by the MOHLTC. It was comprised of representatives of the MOHLTC, the Ministry of Labour, the Workplace Safety and Insurance Board (WSIB), the OHA, various affected hospitals and most of the health-care unions, including [the union] …

The committee met once or twice a week, either in person or by teleconference, between April 1, and June 2003. It discussed such issues as staffing, health and safety, movement of staff between facilities and compensation. The committee did have serious limitations. It did not
know about, or approve, the enhancements given to staff by hospitals. In addition, it did not solve many of the communication problems that existed during SARS. [Union] representatives were frustrated that many of their questions were not answered and that crucial information was not available to them, in spite of committee meetings.

However, on the positive side, the committee did discuss and approve creative staffing solutions to the SARS crisis. For instance, rather than enhancing pay, it concluded that it was preferable to shorten working hours for nurses working in SARS units with no reduction in pay. In addition, the committee worked out the details of a government initiated Compassionate Assistance Program that provided compensation to nurses who suffered financial loss due to the impact of SARS …

During a health emergency a provincial ad hoc committee, similar to the one operating during SARS, should be struck to deal with ongoing issues. The committee should include representation from all unions with affected members. Each hospital should also strike an ad hoc committee that has union representation. This committee should also include representation from the public health sector to facilitate the integration and coordination of response between hospitals and public health services.

As noted above it is the position of the Commission that the onus is on those who favor the power to suspend occupational health and safety protections during an emergency to prove their case. Thus far, they have not done so. What is needed during an emergency, instead of a blunt override of occupational health and safety protections, is a pre-planned, pre-existing process to sort out quickly any workplace issues that touch on occupational health and safety.

**Recommendation**

The Commission therefore recommends that:

- Every emergency plan provide for a process to facilitate advance planning to address potential workplace health and safety issues and to work out those issues when they arise.
Bill 138: The Problem of Concurrent Powers

It is important to ensure that Bill 138, in conferring new emergency powers, does not take away any existing powers that might be used in an emergency such as the powers in the Health Protection and Promotion Act, the Police Services Act and other Ontario statutes, and ancillary and inherent powers such as those used to evacuate 218,000 Mississauga residents after the 1979 chlorine gas train derailment.

The Commission recommends that Bill 138 explicitly provide that it does not derogate from any of these existing powers that might be used in an emergency.

The continuing existence of these separate and concurrent streams of power should not become a trap for the emergency responder faced with a choice of powers to accomplish the same end. What is needed is a way to prevent the two different streams of authority from forcing an emergency responder, who must act in a hurry, to stop and wait for lawyers to debate which power is more appropriate. So long as the emergency response is justified by law it should not matter which overlapping stream of authority was chosen.

For instance the existence of concurrent powers under the Health Protection and Promotion Act and Bill 138 may create uncertainty about the preferable choice of power and may force emergency responders to ponder which power to use. If I use the wrong power, will my action be invalid? Will I suffer consequences? Do I use the Health Protection and Promotion Act’s s. 87 to seize the motel as a temporary isolation facility, or do I use the powers in Bill 138 (assuming they have been amended to make them compulsory)? What are the legal consequences of each choice? These are questions that emergency responders should not have to ask themselves.

The responder should not have to scratch his head and take legal advice as to the precise differences between these overlapping powers. So long as the action is authorized by one statute or the other, the responder should be able to go ahead with confidence and just do it. And the responder should be able to avoid legal challenges based on legalistic pigeonholes. Emergency responders should not have to spend hours under cross examination in a later court challenge answering questions like: Did you do it under the Health Protection and Promotion Act? If so, did you dot this i and cross this t? Did you do it under Bill 138? If so, did you dot these other i’s and cross these other t’s? The way to avoid these problems down the line is to provide that the emergency action is valid so long as it is authorized by law, no matter which legal pigeonhole it might best fit.
Recommendations

The Commission therefore recommends that:

• Bill 138 be amended to provide:

• That Bill 138 does not derogate from the powers authorized by any Ontario Statute or any ancillary or inherent authority;

  ° That no order made or action purportedly taken under Bill 138 shall be set aside on grounds it is not authorized by the Act if the order or action is authorized by some other Ontario statute or inherent or ancillary power; and

  ° That no order made or action taken in response to a declared emergency under the purported authority of any Ontario statute or inherent or ancillary power shall be set aside for lack of legal authority if the order or action is authorized under Bill 138.

Conclusion and Summary of Recommendations

For the reasons above, the Commission recommends that:

• Emergency legislation require that every government emergency plan provide a basic blueprint for the most predictable types of compensation packages and that they be ready for use, with appropriate tailoring, immediately following any declaration of emergency.

• Bill 138 provide explicitly for a process to ensure the integration of all emergency plans and the requirement that every emergency plan specify clearly who is in charge and who does what.

• Bill 138 be examined to determine and clarify whether the supply chain powers in s. 7.0.2(4) 7, 8, and 9 are intended to authorize compulsory seizure and expropriation of property and, if explicitly compulsory, what provisions should be made for compensation, administrative procedures, or other safeguards.
• All powers proposed in Bill 138 be examined to remove ambiguity of the sort that appears in s. 7.0.2(4) 7, 8 and 9 to ensure there is no lack of clarity as to the intended purpose and legal effect of any proposed power.

• For the reasons set out above and the reasons advanced by the Minister, the Commission recommends against the enactment of separate public health emergency legislation. For the same reasons the Commission recommends that Bill 138 make it clear that the special powers available in an emergency are in addition to the powers in the Health Protection and Promotion Act and the declaration of an emergency does not prevent the continuing use of the Health Protection and Promotion Act health protection powers.

• Emergency legislation provide that the Chief Medical Officer of Health has clear primary authority in respect of the public health aspects of every provincial emergency including:
  
  ° Public health emergency planning;
  
  ° Public communication of health risk, necessary precautions, regular situation updates;
  
  ° Advice to the government as to whether an emergency should be declared, if the emergency presents at first as a public health problem;
  
  ° Strategic advice to the government in the management of the emergency;
  
  ° Advice to the government as to whether an emergency should be declared to be over, and emergency orders lifted, in respect of the public health measures taken to fight the emergency;
  
  ° Advice to the government in respect of emergency orders of a public health nature and emergency orders that affect public health e.g. ensuring that gasoline rationing does not deprive hospitals of emergency supplies;
  
  ° Delegated authority in respect of emergency orders of a public health nature; and
  
  ° Such further and other authority, of a nature consistent with the author-
ity referred to above, in respect of the public health aspects of any emergency.

- Emergency legislation provide that the Chief Medical Officer of Health shall exercise his or her authority, so far as reasonably possible, in consultation with the Commissioner of Emergency Management and other necessary agencies. Conversely, the Commission recommends that emergency legislation provide that the Commissioner of Emergency Management, on any matter affecting public health, shall exercise his or her authority so far as reasonably possible in consultation with the Chief Medical Officer of Health.

- Bill 138 be subjected to a fundamental legal and constitutional overhaul by the Attorney General who has indicated he is fully engaged in reviewing Bill 138 to ensure that it meets necessary legal and constitutional requirements.

- The government in its review of Bill 138 consider whether it adequately addresses the public health emergency powers referred to above.

- The power of mass compulsory immunization not be enacted as a permanent feature of Ontario’s law until the evidence has been presented in a comprehensive fashion.

- Every proposed emergency power, before its enactment, be thoroughly subjected to the legal, practical, and policy analysis exemplified by the above analysis of compulsory mass immunization and that the evidence in support of each power be presented in a comprehensive fashion before enactment.

- If the government decides it is necessary to enact any emergency power before there is time to subject it thoroughly to the legal, practical, and policy analysis exemplified by this analysis of compulsory mass immunization, that the government sunset any such provision for a period not to exceed two years in order to provide time for the required scrutiny.

- The Attorney General in the review of Bill 138 clarify whether the override power in s. 7.0.6(1) affects collective agreements.

- The Attorney General undertake a thorough scrutiny and amendment of the override provision to protect our foundational legal statutes such as the
Habeas Corpus Act,472 the Legislative Assembly Act,473 the Human Rights Code,474 the Elections Act,475 and the Courts of Justice Act against emergency override.

• It be made clear whether a journalist or lawyer who refuses to disclose confidential information or the identity of its source is liable to the penalty provided by Bill 138, a fine of up to $100,000 and a term of imprisonment for up to a year for every day on which the refusal continues.

• The override power be given a more prominent place in the statute by putting it right after the enumerated powers.

• The Attorney General review Bill 138 to ensure that the extent of the override, combined with the vague and open ended nature of the powers including the basket clause, does not constitute a constitutionally impermissible delegation of legislative power to public officials.477

• The structure and content of the limitations and criteria for the declaration of emergency and the exercise of emergency powers be reviewed with a view to the development of a standard based on the decision-maker’s reasonable apprehension that the exercise of the power is necessary in the circumstances;

• The power to implement emergency plans be amended to ensure that it confers no powers other than those explicitly set out in Bill 138.

• Bill 138 be amended to provide that every emergency plan requires protocols for safe and speedy court access developed in consultation with the judiciary, and that the Courts of Justice Act be amended to ensure an early hearing for any proceeding under or in respect of emergency legislation or any action taken under it.

• The Attorney General’s Department scrutinize Bill 138 intensely for transparency to ensure that it confers no hidden powers and that all powers conferred are clearly set out on the face of the statute.

• The basket clause s. 7.0.2(4) be reviewed on the same basis as that recommended above for the trigger and criteria and limitations, the basis of reasonable apprehension.

• Every emergency plan provide for a process to facilitate advance planning to address potential workplace health and safety issues and to work out those issues when they arise.

• Bill 138 be amended to provide:
  - That Bill 138 does not derogate from the powers authorized by any Ontario Statute or any ancillary or inherent authority.
  - That no order made or action purportedly taken under Bill 138 shall be set aside on grounds it is not authorized by the Act if the order or action is authorized by some other Ontario statute or inherent or ancillary power.
  - That no order made or action taken in response to a declared emergency under the purported authority of any Ontario statute or inherent or ancillary power shall be set aside for lack of legal authority if the order or action is authorized under Bill 138.
Conclusion and Summary of Recommendations

For the reasons above, noted in the executive summary, the Commission recommends\(^{478}\) that:

Medical Independence and Leadership

- The *Health Protection and Promotion Act* be amended to transfer the powers in ss. 82 through 85 (power over assessors) to the Chief Medical Officer of Health.

- The Minister’s power under s. 79 of the *Health Protection and Promotion Act*, to establish and direct public health laboratory centres be transferred from the Minister to the Chief Medical Officer of Health, until such time as the establishment of the Ontario Health Protection and Promotion Agency and the transfer of power over the laboratories in accordance with the recommendations of the Walker Report.

- The *Health Protection and Promotion Act* be amended to transfer the power in s. 102(2) (enforcement powers) to the Chief Medical Officer of Health.

- The *Health Protection and Promotion Act* be amended to remove from s. 102(1) the Minister as a listed person who may exercise that power.

- The *Health Protection and Promotion Act* be amended to transfer the powers in s. 80 (power over inspectors) to the Chief Medical Officer of Health.

---

\(^{478}\) The Commission’s recommendations, if accepted, will have to be put into statutory language by Legislative Counsel, an officer of the Legislative Assembly, with the assistance of departmental lawyers. Although the recommendations sometimes use statutory language they are not offered as statutory amendments but only as a basis for the drafting language chosen by Legislative Counsel to achieve their intent and purpose.
• The powers in s. 78 (appointment of inquiry) and in s. 87 (commandeering buildings for use as temporary isolation facilities) remain as they are, to be exercised by the Minister of Health and Long-Term Care.

• The *Health Protection and Promotion Act* be amended to provide for every local medical officer of health a degree of independence parallel to that of the Chief Medical Officer of Health. This would include:

  ° Giving the local medical officers of health the same reporting duties and authority as the Chief Medical Officer of Health:

    ■ To report every year publicly on the state of public health in the unit. This report must be provided to the local board of health and the Chief Medical Officer of Health 30 days prior to it being made public; and

    ■ To make any other reports respecting the public’s health as he or she considers appropriate, and to present such a report to the public or any other person, at any time he or she considers appropriate.

  ° Protecting the independence of the local medical officer of health by providing that no adverse employment action may be taken against any medical officer of health in respect of the good faith exercise of those reporting powers and duties.

• The powers now assigned by law to the medical officer of health are assigned concurrently to the Chief Medical Officer of Health.

• These concurrent powers shall be exercised by the medical officer of health in the local region, subject to the direction of the Chief Medical Officer of Health.

• Public health emergency planning, preparedness, mitigation, management, recovery, coordination and public health risk communication at the provincial level be put under the direct authority of the Chief Medical Officer of Health under the *Health Protection and Promotion Act*.

• Public health emergency planning, preparedness, mitigation, management, recovery, coordination and public health risk communication under the direction of the local medical officer of health be added to the list of manda-
tory public health programmes and services required by s. 5 of the *Health Protection and Promotion Act*.

- The Emergency Management Unit of the Ministry of Health and Long-Term Care be moved to the Public Health Division with its Director reporting directly to the Chief Medical Officer of Health.

- The *Health Protection and Promotion Act* be amended to require that each local board of health and each medical officer of health provide to the Chief Medical Officer of Health a copy of their general public health emergency plan and any incident specific plans and ensure that the Chief Medical Officer of Health has, at any time, the most current version of those plans.

- Section 95 (protection from personal liability) of the *Health Protection and Promotion Act* should be amended to extend its protection to everyone employed by or providing services to a public health board or the provincial Public Health Division, everyone from the Chief Medical Officer of Health, to its expert advisors, to public health employees in the field.

Local Governance

- The province, by the end of the year 2007, after the implementation of the recommendations of the pending public health capacity review, decide whether the present system can be fixed with a reasonable outlay of resources. If not, funding and control of public health should be uploaded 100 per cent to the province.

- The Ministry of Health and Long-Term Care enforce the *Health Protection and Promotion Act* to ensure the protection of the medical officer of health from bureaucratic and political encroachment in the administration of public health resources and to ensure the administrative integrity of public health machinery under the executive direction of the medical officers of health. In particular, the Ministry of Health and Long-Term Care should:

  - Amend and strengthen s. 67 of the *Health Protection and Promotion Act* to ensure that those whose duties relate to the delivery of public health services are directly accountable to, and under the authority of, the medical officers of health, and that their management cannot be delegated to municipal officials;
• Take enforcement actions in respect of violations of s. 67;

• Amend the *Health Protection and Promotion Act* to clearly state that the medical officer of health is the chief executive officer of the board of health; and

• Amend the *Health Protection and Promotion Act* to provide local medical officers of health a degree of independence parallel to that of the Chief Medical Officer of Health, as set out in Chapter 1 of this Report.

• Section 7 of the *Health Protection and Promotion Act* be amended to provide that the Minister, on the advice of the Chief Medical Officer of Health shall publish standards for the provision of mandatory health programmes and services, and every board of health shall comply with the published standards that shall have the force of regulations.

• The *Health Protection and Promotion Act* be amended to require by law the regular monitoring and auditing, including random spot auditing, of local health units to ensure compliance with provincial standards. The results of any such audits should be made public so citizens can keep abreast of the level of performance of their local health unit.

• The *Health Protection and Promotion Act* be amended to ensure that the greater funding and influence of the province in health protection and promotion is reflected in provincial appointments to local boards of health. Also to ensure that the qualifications required of members of boards of health include experience or interest in the goals of public health. In particular, the Ministry of Health and Long-Term Care should:

  • appoint a majority of the members of each local board, to reflect the greater proportion of provincial public health funding and influence;

  • amend the *Health Protection and Promotion Act* to provide that where cabinet has not by Order in Council, the vacancy shall be filled by an appointment made directly by the Chief Medical Officer of Health;

  • amend the *Health Protection and Promotion Act* to require that those appointed to boards of health possess a demonstrated experience or interest in the goals of public health – to prevent the spread of disease and protect the health of the people of Ontario – and that they be
broadly representative of the community to be served; and

- consider an amendment to the *Health Protection and Promotion Act* to clarify the roles and priorities of health board members, the first priority being compliance with the *Health Protection and Promotion Act* and the mandatory public health standards.

- The Ministry of Health and Long-Term Care introduce a package of governance standards for local boards of health with reference to those sources referred to above, such as the Scott and Quigley governance framework.

### HPPA Tuneup

- The four present categories of disease: infectious, communicable, reportable, and virulent, be simplified and reduced to two categories with clear boundaries and clear legal consequences.

- The *Health Protection and Promotion Act* be amended to clarify whether the powers contained in the various parts of the Act apply outside of the Part of the Act in which the power is contained. For example, does s. 13 apply in the case of a communicable disease?

- The Ministry of Health and Long-Term Care consider whether the definition of “health hazard” needs to be updated or expanded.

- The Ministry of Health and Long-Term Care review the numerous standards of intervention contained in the Act, examples of which are noted above, with a view to amending the Act to simplify and rationalize the apparently haphazard and overlapping standards for intervention, and to ensure that whether there is a hard trigger or a soft trigger, it should be rationally connected to the power being wielded.

- Section 22 of the *Health Protection and Promotion Act* be amended to adjust the standard of intervention to provide that the medical officer of health can take necessary action without the criminal or quasi-criminal standard of objective proof on reasonable and probable grounds.

- The Ministry of Health and Long-Term Care, in consultation with the public health community, examine the issue of any practical difficulties of
administering s. 22, with a view to make it more effective for those who rely on its powers.

• The *Health Protection and Promotion Act* be amended to provide that an order made under s. 22, in respect of a person infected with a communicable disease, is valid in any health unit in Ontario.

Stronger Health Protection Powers

• The role and authority of public health officials in relation to hospitals be clearly defined in the *Health Protection and Promotion Act* in accordance with the following principles:
  
  ° The requirement that each public health unit have a presence in hospital infection control committees should be entrenched in the Act; and

  ° The authority of the local medical officers of health and the Chief Medical Officer of Health in relation to institutional infectious disease surveillance and control should be enacted to include, without being limited to, the power to monitor, advise, investigate, require investigation by the hospital or an independent investigator, and intervene where necessary.

• The Ministry of Health and Long-Term Care, in consultation with the Provincial Infectious Diseases Advisory Committee, and the wider health care and public health communities, define a broad reporting trigger that would require reporting to public health where there is an infection control problem or an unexplained illness or cluster of illness.

• Whether or not a workable trigger can be defined for compulsory reporting, a provision be added to the *Health Protection and Promotion Act*, to provide that a physician, infection control practitioner or hospital administrator may voluntarily report to public health officials the presence of any threat to the health of the population.

• The *Health Protection and Promotion Act* be amended to include powers similar to those set out in Quebec’s *Public Health Act*, to allow for early intervention and investigation of situations, not limited to reportable or communicable diseases, that may pose a threat to the health of the public.
• The *Health Protection and Promotion Act* be amended to clarify and regularize in a transparent system authorized by law, the respective roles of the Chief Medical Officer of Health and the medical officer of health, in deciding how a particular case should be classified.

• The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health to issue directives to hospitals, medical clinics, long-term care facilities, and all other health care providers, private or public, in respect of precautions and procedures necessary to protect the public's health. All directives should be issued under the signature of the Chief Medical Officer of Health alone.

• The Ministry of Health and Long-Term Care appoint a working group of health care professionals from various institutions who are tasked, and paid, to translate the directives into a form that can be understood and applied by staff, without altering the content of the message. The Commission recommends further the development of an educational programme to ensure that everyone affected by the directives knows how they work, what they mean and how they should be applied.

• The Ministry of Health and Long-Term Care, in consultation with the affected health care communities, develop feedback machinery driven by health care workers in the field, to ensure the directives are clear and manageable from a practical point of view in the field.

• The *Health Protection and Promotion Act* and the directives provide explicitly that they in no way diminish the procedures and precautions required by the circumstances that prevail in any particular institution, that they represent the floor, not the ceiling, of medical precaution, and do not relieve any institution of the obligation to take further precautions where medically indicated.

• The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health or a medical officer of health to order temporarily detained for identification any person who refuses to provide their name, address and telephone contact information when required to do so for the purpose of identifying those who are leaving, or have been in a place of infection. The detained person unless immediately released, must be brought before a justice as soon as possible and in any event within 24 hours for a court hearing. This power is to be backed up by the ultimate power of...
arrest with police assistance if necessary in the case of non-cooperation.

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health or a medical officer of health to order the temporary detention of, for the purpose of a court hearing, any person suspected of having been exposed to a health hazard, and who refuses to consent to decontamination. The detained person must be brought before a justice as soon as possible and in any event within 24 hours. This power is to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

- The *Health Protection and Promotion Act* be amended to authorize the Chief Medical Officer of Health or a medical officer of health to order the temporary detention of anyone who there is reason to suspect is infected with an agent of a virulent disease, for the purposes of obtaining a judicial order authorizing the isolation, examination or treatment of the person, pursuant to s. 35 of the *Health Protection and Promotion Act*. The detained person must be brought before a justice as soon as possible and in any event within 24 hours. This power is to be backed up by the ultimate power of arrest with police assistance if necessary in the case of non-cooperation.

- The *Health Protection and Promotion Act* be amended to provide for a court to authorize, by warrant, entry into a private dwelling, by a medical officer of health or specially designated public health official with police assistance, for the purpose of enforcing an order under s. 35 of the Act.

- The *Health Protection and Promotion Act* be amended to provide that a medical officer of health or specially designated public health official with police assistance may under exigent circumstances enter a dwelling-house for the purpose of apprehending a person where there are reasonable and probable grounds to believe that a basis for a s. 35 warrant exists and reasonable grounds to believe that the delay required to obtain such a warrant might endanger the public’s health. The detention must be the subject of a court hearing as soon as possible and in any event within 24 hours.
Reporting Infectious Disease

- The *Health Protection and Promotion Act* be amended to repeal, in the duty of a physician to report to the medical officer of health, the distinction between hospital patients and non-hospital patients. This may be achieved by deleting from s. 25(1) the words “who is not a patient in or an out-patient of a hospital.”

- The Ministry of Health and Long-Term Care require each hospital, long-term care facility, nursing home, home for the aged, community care access centre, private medical or health services clinic, and any health care institution, to establish an internal system to ensure compliance with the reporting obligations set out in the *Health Protection and Promotion Act*.

- The definition of “practitioner” in the *Health Protection and Promotion Act* be amended to coincide with that set out in the *Personal Health Information Protection Act*.

- The list of “institutions” as defined in s. 21(1) of the *Health Protection and Promotion Act*, be amended to coincide with that set out in the *Personal Health Information Protection Act*.

- The *Health Protection and Promotion Act* be amended to ensure consistency between those who are defined as “health information custodians” under the *Personal Health Information Protection Act* and those who have reporting obligations under the *Health Protection and Promotion Act*.

- The *Health Protection and Promotion Act* be amended to authorize the Minister of Health and Long-Term Care to amend the definition of “practitioner” or “institution” by regulation.

- The *Health Protection and Promotion Act* be amended to include a provision similar to the provisions in Quebec’s *Public Health Act*, by which the Quebec public health director may order any person, any government department or any body to immediately communicate to the public health director or give the public health director immediate access to any document or any information in their possession, even if the information is personal information or the document or information is confidential.
• This power should be broadly defined, to enable the Chief Medical Officer of Health to require any person, organization, institution, government department or other entity, to provide information, including personal health information, to the Chief Medical Officer of Health, for the purposes of investigating and preventing the spread of infectious disease.\textsuperscript{479}

• The \textit{Health Protection and Promotion Act} be amended to authorize the Chief Medical Officer of Health to order the collection, analysis and retention of any laboratory specimen from any person, animal, plant or anything the Chief Medical Officer of Health specifies, and to acquire previously collected specimens and test analysis from anyone, and to disclose the results of test analysis as the Chief Medical Officer of Health considers appropriate for the purpose of investigating and preventing the spread of infectious disease.\textsuperscript{480} This power, however, should be subject to the following restrictions:

\begin{itemize}
  \item It should not include the power to take a bodily sample or specimen directly from a person without their consent or, absent consent, without court order. The power should only apply to specimens already taken;
  \item The collection should be limited to the purpose of investigating and preventing the spread of infectious disease. The specimen should be used only for this express purpose; and
  \item The power should not override any other provisions of the Act, which set out a specific process for the obtaining of samples.
\end{itemize}

• The \textit{Health Protection and Promotion Act} be amended to require that in the case of specific diseases, designated by regulation, information be reported “immediately” by telephone to the local medical officer of health, and that such report be followed up in writing within 24 hours;

• The \textit{Health Protection and Promotion Act} be amended to require that as in the case of those diseases not designated for immediate reporting, a written

\begin{footnotes}
\item[479] As noted above, this is not drafting language. The use of the term “infectious disease” is intended to include but not be restricted to diseases already designated as communicable, reportable or virulent under the \textit{Health Protection and Promotion Act}. The provision should be defined broadly enough to cover bioterrorism risks. It should not, however, extend to every health risk, such as obesity or other lifestyle problems.
\item[480] \textit{Ibid.}
\end{footnotes}
report must be provided to the local medical officer of health within 24 hours.

- Subsection 1(2) of Regulation 569 be expanded to apply to any person who makes a report under the Health Protection and Promotion Act. Thus any person who gives information in accordance with a duty under the Health Protection and Promotion Act, shall, upon the request of the medical officer of health, give to the medical officer of health such additional information respecting the reportable disease or communicable disease, as the medical officer of health considers necessary.

- This portion of Regulation 569 (s. 1(2), additional information) be moved to the Act itself, to form an integral part of the reporting obligations set out in the Act and to ensure that the power is protected, absent legislative debate, from subsequent amendment.

- Amendments to the Health Protection and Promotion Act and Regulations be preceded by consultation with the public health community who have to apply them in the field.

- Local public health officials and the Public Health Division, in collaboration and consultation with hospitals, other health care institutions and professional organizations, develop a standardized form and means for reporting under the Health Protection and Promotion Act.

- The standardized reporting include clarity around to whom the report must be made, and to clearly confirm that the chain of transmission goes from the hospital and health care facilities, to the local health units, to the province, so as to avoid multiple requests for information.

- The Ministry of Health and Long-Term Care, Public Health Division, in collaboration with local medical officers of health, health care facilities and professional organizations, engage in broad-based education of reporting requirements under the Health Protection and Promotion Act and that such education be maintained on a regular basis.

- The Health Protection and Promotion Act be amended to require public health authorities to report to a hospital or any other health care facility, including family medical clinics, any information in the hands of public health that suggests a reportable disease may have been acquired through
exposure at that site.

- Section 39(2) of the *Health Protection and Promotion Act* be amended to include an exception permitting public health officials to provide hospitals and other health care facilities, with the personal health information of persons about whom a report is made, where they are of the opinion that the information may reduce the risk of exposure or transmission to staff, patients or visitors.

Privacy and Disclosure

- Section 39 of the *Personal Health Information Protection Act* be amended to include:

  ° A health information custodian shall disclose personal health information about an individual, to the Chief Medical Officer of Health or a medical officer of health if the disclosure is required under the *Health Protection and Promotion Act*.

- Subsection 39(2) of the *Health Protection and Promotion Act* be amended to allow an exception to s. 39(1) to permit the disclosure of the name of or any information that will or is likely to identify a person in respect of whom an application, order, certificate or report is made in respect of a communicable disease, by the Chief Medical Officer of Health or a medical officer of health to any person where it is necessary to investigate or prevent the spread of a communicable disease.

- Subsection 39(2) of the *Health Protection and Promotion Act* be amended to allow an exception to s. 39(1) to permit the disclosure of the name of or any information that will or is likely to identify a person in respect of whom an application, order, certificate or report is made in respect of a communicable disease, by the Chief Medical Officer of Health or a medical officer of health to a public health authority as described in s. 39(2)(b) of the *Personal Health Information Protection Act*.

- The *Personal Health Information Protection Act* be amended to provide that nothing in the Act prevents a health information custodian from providing personal health information to the Chief Medical Officer of Health or a medical officer of health, pursuant to the *Health Protection and Promotion Act*. 

492
12. Conclusion and Summary of Recommendations

- The *Health Protection and Promotion Act* and the *Personal Health Information Protection Act* be amended to state that in the event of any conflict between the two statutes, the duties in the *Health Protection and Promotion Act* prevail.

- The *Personal Health Information Protection Act* be amended to provide that where a good faith disclosure is made to the Chief Medical Officer of Health or a medical officer of health, in reliance on the *Health Protection and Promotion Act*, the health information custodian will be exempt from liability.

- The Ministry of Health and Long-Term Care, in consultation with the appropriate community, establish procedures for the fast-tracking of approval of access to personal health information for the purposes of urgently required research, to enable health care custodians to provide access to data in a timely manner, without fear of violating privacy legislation.

- The Chief Medical Officer of Health review, and if necessary strengthen, the internal protocols and procedures now in place to ensure effective privacy safeguards for personal health information received by public health authorities.

Whistleblower Protection

- The *Health Protection and Promotion Act* be amended to provide health care workers whistleblower protection in accordance with the following principles:

  - It applies to every health care worker in Ontario and to everyone in Ontario who employs or engages the services of a health care worker;

  - It enables disclosure to a medical officer of health (including the Chief Medical Officer of Health);

  - It includes disclosure to the medical officer of health (including the Chief Medical Officer of Health) of confidential personal health information;
• It applies to the risk of spread of an infectious disease and to failures to conform to the *Health Protection and Promotion Act*;

• It prohibits any form of reprisal, retaliation or adverse employment consequences direct or indirect;\(^{481}\)

• It requires only good faith on the part of the employee; and

• It not only punishes the violating employer but also provides a remedy for the employee.\(^{482}\)

Quarantine

• Emergency legislation require that every government emergency plan provide a basic blueprint for the most predictable types of compensation packages and that they be ready for use, with appropriate tailoring, immediately following any declaration of emergency.

• The *Health Protection and Promotion Act* be amended to provide that it is a mandatory public health standard for each local medical officer of health to develop under the guidance of the Chief Medical Officer of Health a local plan in consultation with employers, educators, community groups, businesses, emergency responders, and health care facilities to ensure that plans are in place to ensure that those quarantined in the future have timely and adequate information, and the support necessary to encourage and enable them to comply with quarantine.

• The *Health Protection and Promotion Act* be amended to add a provision similar to s. 6(1) of the *SARS Assistance and Recovery Strategy Act*, to apply to infectious diseases as identified by the Chief Medical Officer of Health. The amendment should provide, in respect of such a disease, that a person is entitled to a leave of absence without pay where he or she is unable to work

---

\(^{481}\) Although specific types of reprisal could be listed, as in Ontario’s workplace legislation, the listing of specific examples can shift the focus from the strong general prohibition to any gaps in the examples that can be found by an ingenious lawyer or administrator. It is therefore recommended that the prohibition remain general.

\(^{482}\) As noted above, the punishment recommended for an employer who violates the protection is a fine of up to $50,000.00 where the employer is a natural person and $250,000.00 where the employer is not a natural person.
as a result of investigation or treatment related to the disease, or because he or she is subject to quarantine or isolation. The amendment should also protect those who are unable to work because they are needed to provide care or assistance to a spouse, child, grandparent, sibling or relative who is dependent on the employee for care and assistance.

- Section 22(5.0.1) be amended to provide that the power to order and enforce the isolation of a group must, wherever practicable, be preceded by such degree of consultation with the group as is feasible in the circumstances.

- Section 106 of the Health Protection and Promotion Act be amended to provide that in the case of a class order made under s. 5.0.2, service is effective when notice of the class order is posted and the order may be enforced as soon as it is brought to the actual attention of the person affected.

- The word “quarantine” be introduced to the Health Protection and Promotion

483. Section 6 (1) provides:

During the period beginning March 26, 2003 and ending on a day specified by proclamation of the Lieutenant Governor under subsection 1(2), an employee is entitled to a leave of absence without pay for any day or part of a day during which he or she falls into one or more of the following categories:

1. The employee is unable to work because he or she is under individual medical investigation, supervision or treatment related to SARS.

2. The employee is unable to work because he or she is acting in accordance with a SARS related order under section 22 or 35 of the Health Protection and Promotion Act.

3. Subject to subsections (2) to (4), the employee is unable to work because he or she is in quarantine or isolation or is subject to a control measure in accordance with SARS related information or directions issued to the public, a part of the public or one or more individuals, by the Commissioner of Public Security, a public health official, a physician or a nurse or by Telehealth Ontario, the Government of Ontario, the Government of Canada, a municipal council or a board of health, whether through print, electronic, broadcast or other means.

4. The employee is unable to work because of a direction given by his or her employer in response to a concern of the employer that the employee may expose other individuals in the workplace to SARS.

5. The employee is unable to work because he or she is needed to provide care or assistance to an individual referred to in subsection (5) because of a SARS related matter that concerns that individual. 2003, c. 1, s. 6 (1).
Act as a defined legal term to correspond to the universal popular understanding of that word as used during SARS.

Legal Access And Preparedness

- The *Health Protection and Promotion Act* be amended to eliminate the complex appeal process, rife with delay, in respect of an appeal by the subject of an order from a decision of the Health Services Appeal and Review Board, and provide an appeal as of right directly to the Court of Appeal with no prior requirement to secure leave to appeal.

- The Ministry of Health and Long-Term Care consider whether the Health Services Appeal and Review Board is a necessary step in the complex hearing and review process in the *Health Protection and Promotion Act* or whether some other system should be enacted.

- The *Health Protection and Promotion Act* be amended to simplify the complex and restrictive appeal process in respect of appeals from provincial court to the Superior Court and then to the Court of Appeal but only if a judge of the Court of Appeal grants leave to appeal on special grounds on a question of law alone. This process could be simplified by eliminating the intermediate appeal to the Superior court and the restricted leave to appeal to the Court of Appeal or both.

- The multiplicity of procedures in respect of the enforcement of Orders made under Part IV (communicable diseases) and Part VII (administration) of the *Health Protection and Promotion Act*, be replaced by a single, simple, codified procedure in the Superior Court.

- The *Health Protection and Promotion Act* be amended to provide the Superior Court, when ordering compliance with a public health obligation, with a full range of remedial power, including the power to make mandatory orders.

- The *Health Protection and Promotion Act* be amended to consolidate and codify all provisions in respect of court enforcement and access to judicial remedies in respect of communicable diseases into one seamless system or powers and procedures.
• The *Health Protection and Promotion Act* be amended to include special procedures such as *ex parte* procedures for interim and temporary orders, video and audio hearings, and other measures to prevent the court process from becoming a vector of infection.

• The *Rules of Civil Procedure* be amended to include a clear, self-contained and complete code of procedure for public health enforcement and remedies in respect of communicable diseases.

• A consequential amendment to the *Courts of Justice Act* provide that proceedings in respect of the *Health Protection and Promotion Act* enforcement and remedies in respect of communicable diseases shall be heard at the earliest opportunity.

• The *Health Protection and Promotion Act* be amended to provide that an order under s. 35 may be directed to any police service in Ontario where the person may be found, and the police service shall do all things reasonably able to be done to locate, apprehend, and deliver the person in accordance with the order.

• The judiciary be asked to establish court access protocols in consultation with the public health legal community.

• The *Health Protection and Promotion Act* be amended to provide that an order under s. 35 may be directed to any police service in Ontario where the person may be found, and the police service shall to all things reasonably able to be done to locate, apprehend, and deliver the person in accordance with the order.

• The Ministry of Community Safety and Correctional Services and the Ministry of the Attorney General, together with public health officials, establish protocols and plans for the enforcement of orders under the *Health Protection and Promotion Act* and the involvement of police officers in that process.

• Legal preparedness be an integral component of all public health emergency plans.
Emergency Legislation

- Emergency legislation require that every government emergency plan provide a basic blueprint for the most predictable types of compensation packages and that they be ready for use, with appropriate tailoring, immediately following any declaration of emergency.

- Bill 138 provide explicitly for a process to ensure the integration of all emergency plans and the requirement that every emergency plan specify clearly who is in charge and who does what.

- Bill 138 be examined to determine and clarify whether the supply chain powers in s. 7.0.2(4) 7, 8, and 9 are intended to authorize compulsory seizure and expropriation of property and, if explicitly compulsory, what provisions should be made for compensation, administrative procedures, or other safeguards.

- All powers proposed in Bill 138 be examined to remove ambiguity of the sort that appears in s. 7.0.2(4) 7, 8 and 9 to ensure there is no lack of clarity as to the intended purpose and legal effect of any proposed power.

- For the reasons set out above and the reasons advanced by the Minister, the Commission recommends against the enactment of separate public health emergency legislation. For the same reasons the Commission recommends that Bill 138 make it clear that the special powers available in an emergency are in addition to the powers in the Health Protection and Promotion Act and the declaration of an emergency does not prevent the continuing use of the Health Protection and Promotion Act health protection powers.

- Emergency legislation provide that the Chief Medical Officer of Health has clear primary authority in respect of the public health aspects of every provincial emergency including:
  - Public health emergency planning;
  - Public communication of health risk, necessary precautions, regular situation updates;
  - Advice to the government as to whether an emergency should be
declared, if the emergency presents at first as a public health problem;

- Strategic advice to the government in the management of the emergency;

- Advice to the government as to whether an emergency should be declared to be over, and emergency orders lifted, in respect of the public health measures taken to fight the emergency;

- Advice to the government in respect of emergency orders of a public health nature and emergency orders that affect public health e.g. ensuring that gasoline rationing does not deprive hospitals of emergency supplies;

- Delegated authority in respect of emergency orders of a public health nature; and

- Such further and other authority, of a nature consistent with the authority referred to above, in respect of the public health aspects of any emergency.

- Emergency legislation provide that the Chief Medical Officer of Health shall exercise his or her authority, so far as reasonably possible, in consultation with the Commissioner of Emergency Management and other necessary agencies. Conversely, the Commission recommends that emergency legislation provide that the Commissioner of Emergency Management, on any matter affecting public health, shall exercise his or her authority so far as reasonably possible in consultation with the Chief Medical Officer of Health.

- Bill 138 be subjected to a fundamental legal and constitutional overhaul by the Attorney General who has indicated he is fully engaged in reviewing Bill 138 to ensure that it meets necessary legal and constitutional requirements.

- The government in its review of Bill 138 consider whether it adequately addresses the public health emergency powers referred to above.

- The power of mass compulsory immunization not be enacted as a permanent feature of Ontario’s law until the evidence has been presented in a comprehensive fashion.
• Every proposed emergency power, before its enactment, be thoroughly subjected to the legal, practical, and policy analysis exemplified by the above analysis of compulsory mass immunization and that the evidence in support of each power be presented in a comprehensive fashion before enactment.

• If the government decides it is necessary to enact any emergency power before there is time to subject it thoroughly to the legal, practical, and policy analysis exemplified by this analysis of compulsory mass immunization, that the government sunset any such provision for a period not to exceed two years in order to provide time for the required scrutiny.

• The Attorney General in the review of Bill 138 clarify whether the override power in s. 7.0.6(1) affects collective agreements.

• The Attorney General undertake a thorough scrutiny and amendment of the override provision to protect our foundational legal statutes such as the _Habeas Corpus Act_, the _Legislative Assembly Act_, the _Human Rights Code_, the _Elections Act_, and the _Courts of Justice Act_ against emergency override.

• It be made clear whether a journalist or lawyer who refuses to disclose confidential information or the identity of its source is liable to the penalty provided by Bill 138, a fine of up to $100,000 and a term of imprisonment for up to a year for every day on which the refusal continues.

• The override power be given a more prominent place in the statute by putting it right after the enumerated powers.

• The Attorney General review Bill 138 to ensure that the extent of the override, combined with the vague and open ended nature of the powers including the basket clause, does not constitute a constitutionally impermissible delegation of legislative power to public officials.

---

• The structure and content of the limitations and criteria for the declaration of emergency and the exercise of emergency powers be reviewed with a view to the development of a standard based on the decision-maker's reasonable apprehension that the exercise of the power is necessary in the circumstances;

• The power to implement emergency plans be amended to ensure that it confers no powers other than those explicitly set out in Bill 138.

• Bill 138 be amended to provide that every emergency plan requires protocols for safe and speedy court access developed in consultation with the judiciary, and that the Courts of Justice Act be amended to ensure an early hearing for any proceeding under or in respect of emergency legislation or any action taken under it.

• The Attorney General’s Department scrutinize Bill 138 intensely for transparency to ensure that it confers no hidden powers and that all powers conferred are clearly set out on the face of the statute.

• The basket clause s. 7.0.2(4)12 be reviewed on the same basis as that recommended above for the trigger and criteria and limitations, the basis of reasonable apprehension.

• Every emergency plan provide for a process to facilitate advance planning to address potential workplace health and safety issues and to work out those issues when they arise.

• Bill 138 be amended to provide:
  - That Bill 138 does not derogate from the powers authorized by any Ontario Statute or any ancillary or inherent authority.
  - That no order made or action purportedly taken under Bill 138 shall be set aside on grounds it is not authorized by the Act if the order or action is authorized by some other Ontario statute or inherent or ancillary power.
  - That no order made or action taken in response to a declared emergency under the purported authority of any Ontario statute or inherent or ancillary power shall be set aside for lack of legal authority if the order or action is authorized under Bill 138.
Appendix A: First Interim Report
Summary of Recommendations

A Broken System

SARS showed that Ontario’s public health system is broken and needs to be fixed. Despite the extraordinary efforts of many dedicated individuals and the strength of many local public health units, the overall system proved woefully inadequate. SARS showed Ontario's central public health system to be unprepared, fragmented, poorly led, uncoordinated, inadequately resourced, professionally impoverished, and generally incapable of discharging its mandate.

The SARS crisis exposed deep fault lines in the structure and capacity of Ontario’s public health system. Having regard to these problems, Ontario was fortunate that SARS was ultimately contained without widespread community transmission or further hospital spread, sickness and death. SARS was contained only by the heroic efforts of dedicated front line health care and public health workers and the assistance of extraordinary managers and medical advisors. They did so with little assistance from the central provincial public health system that should have been there to help them.

These problems need urgently to be fixed.

Reasons for Interim Report

The work of this Commission will continue until I am satisfied that the necessary evidence has been reviewed. Because government decisions about fundamental changes in the public health system are clearly imminent, this interim report on the public health lessons of SARS is being issued at this time instead of awaiting the final report. This interim report is based on the evidence examined to date and is not intended as the last word on this aspect of the Commission’s investigation.

The fact that the Commission must address public health renewal on an interim basis is not to say it is more important than any other urgent issue such as the safety and
protection of health care workers. It is simply a case of timing. The Commission continues to interview health care workers, SARS victims, the families of those who died, and those who fought the outbreak. Their story and the story of SARS will be told in the Commission's final report.

For an update on the Commission's ongoing work see Appendix A.

**Twenty-One Principles for Reform**

The lessons of SARS yield 21 principles for public health reform:

1. Public health in Ontario requires a new mandate, new leadership, and new resources.

2. Ontario public health requires renewal according to the principles recommended in the Naylor, Kirby, and interim Walker reports.

3. Protection against infectious disease requires central province-wide accountability, direction, and control.

4. Safe water, safe food, and protection against infectious disease should be the first priorities of Ontario's public health system.

5. Emergency planning and preparedness are required, along with public health infrastructure improvements, to protect against the next outbreak of infectious disease.

6. Local medical officers of health and public health units, the backbone of Ontario public health, require in any reform process a strong focus of attention, support, consultation and resources.

7. Reviews are necessary to determine if municipalities should have a significant role in public health protection, or whether accountability, authority, and funding should be fully uploaded to the province.

8. If local boards of health are retained, the province should streamline the processes of provincial leadership and direction to ensure that local boards comply with the full programme requirements established by the province for infectious disease protection.
9. So long as the local boards of health remain in place: The local medical officer of health should have full chief executive officer authority for local public health services and be accountable to the local board. Section 67 of the Health Protection and Promotion Act should be enforced, if necessary amended, to ensure that personnel and machinery required to deliver public health protection are not buried in the municipal bureaucracy.

10. Public health protection funding against infectious disease should be uploaded so that the province pays at least 75 per cent and local municipalities pay 25 per cent or less.

11. A transparent system authorized by law should be used to clarify and regularize the roles of Chief Medical Officer of Health and the local medical officer of health in deciding whether a particular case should be designated a reportable disease.

12. The Chief Medical Officer of Health, while accountable to the Minister of Health, requires the independent duty and authority to communicate directly with the public and the Legislative Assembly whenever he or she deems necessary.

13. The operational powers of the Minister of Health under the Health Protection and Promotion Act should be removed and assigned to the Chief Medical Officer of Health.

14. The Chief Medical Officer of Health should have operational independence from government in respect of public health decisions during an infectious disease outbreak. Such independence should be supported by a transparent system requiring that any Ministerial recommendations be in writing and publicly available.

15. The local medical officer of health requires independence, matching that of the Chief Medical Officer of Health, to speak out and to manage infectious outbreaks.

16. The operational powers of the local medical officer of health should be reassigned to the Chief Medical Officer of Health, to be exercised locally by the medical officer of health subject to the direction of the Chief Medical Officer of Health.
17. An Ontario Centre for Disease Control should be created as support for the Chief Medical Officer of Health and independent of the Ministry of Health. It should have a critical mass of public health expertise, strong academic links, and central laboratory capacity.

18. Public health requires strong links with hospitals and other health care facilities and the establishment, where necessary, of an authoritative hospital presence in relation to nosocomial infections. The respective accountability, roles and responsibilities of public health care and health care institutions in respect of infectious outbreaks should be clarified.

19. Ontario and Canada must avoid bickering and must create strong public health links based on cooperation rather than competition to avoid the pitfalls of federal overreaching and provincial distrust.

20. The Ontario government must commit itself to provide the necessary resources and leadership for effective public health protection against infectious disease.

21. Public health requires strong links with nurses, doctors and other health care workers and their unions and professional organizations.

It is expected that the final report of the Walker expert panel will recommend a detailed prescriptive blueprint for many of the operational details of a renewed system. Such operational details are beyond the scope of this interim report. Some of the issues that will drive these details are discussed in the report.

Hindsight

Everything said in this report is said with the benefit of 20-20 hindsight, a gift not available to those who fought SARS or those who designed the systems that proved inadequate in face of a new and unknown disease.

It is important to distinguish between the flaws of public health systems and the skill and dedication of those who worked within them. To demonstrate the weakness of Ontario’s public health infrastructure is not to criticize the performance of those who worked within systems that proved inadequate in hindsight. The Commission recognizes the skill and dedication of so many individuals in the Ontario public health system and those
volunteers from Ontario and elsewhere who worked beyond the call of duty. Twenty-four-hour days were common. They faced enormous workloads and pressures in their tireless fight, in a rapidly changing environment, against a deadly and mysterious disease.

It is my hope that those who worked on the front lines and in public health in Ontario during SARS will accept that I have approached the flaws of the system with the utmost respect for those who gave their all to protect the public. We should be humbled by their efforts.

In this interim report I have attempted to avoid, and I invite the reader to avoid, the unfair use of hindsight to judge the actions of those who struggled so valiantly in the fog of battle against the unknown and deadly virus that is SARS.

**What Went Right**

The litany of problems listed below reflect weaknesses in central public health systems. These weaknesses hampered the work of the remarkable individuals who eventually contained SARS. The problems of SARS were systemic problems, not people problems. Despite the deep flaws in the system, it was supported by people of extraordinary commitment.

The strength of Ontario’s response lay in the work of the people who stepped up and fought SARS. What went right, in a system where so much went wrong, is their dedication. It cannot, however, be said that things went right because SARS was eventually contained. It does nothing for those who suffered from SARS or lost loved ones to SARS to say that the disease which caused their suffering was ultimately contained. For the families of those who died from SARS and for all those who suffered from it, little if anything went right. This enormous toll of suffering requires that the Ontario government commit itself to rectify the deep problems in the public health system disclosed by SARS.

**The Decline of Public Health**

The decline of public health protection in Ontario began decades before SARS. No government and no political party is immune from responsibility for its neglect.

It is troubling that Ontario ignored so many public health wake-up calls from Mr. Justice Krever in the blood inquiry, Mr. Justice O’Connor in the Walkerton Inquiry,
from the Provincial Auditor, from the West Nile experience, from pandemic flu planners and others. Despite many alarm calls about the urgent need to improve public health capacity, despite all the reports emphasizing the problem, the decline of Ontario's public health capacity received little attention until SARS. SARS was the final, tragic wake-up call. To ignore it is to endanger the lives and the health of everyone in Ontario.

Lack of Preparedness: The Pandemic Flu Example

When SARS hit, Ontario had no pandemic influenza plan. Although SARS and flu are different, the lack of a pandemic flu plan showed that Ontario was unprepared to deal with any major outbreak of infectious disease.

Had a pandemic flu plan been in place before SARS, Ontario would have been much better prepared to deal with the outbreak. The failure to heed warnings about the need for a provincial pandemic flu plan, and the failure to put such a plan in place before SARS, reflects a lack of provincial public health leadership and preparedness.

Lack of Transparency

Because there was no existing plan in place for a public health emergency like SARS, systems had to be designed from scratch. Ad hoc organizations like the epidemiological unit (Epi Unit) and the Science Committee were cobbled together. Procedures and protocols were rushed into place including systems like the case review, or adjudication process, that grew up to determine whether a particular case should be reported as SARS. Because SARS was such a difficult disease to diagnose, there were no reliable lab tests and knowledge about the disease was rapidly evolving, there were disagreements from time to time as to whether a particular case was SARS.

Although well meaning, this system lacked clear lines of accountability and in particular it lacked transparency.

To avoid this problem in the future the Commission recommends that the respective roles of the Chief Medical Officer of Health and the local medical officers of health, in deciding whether a particular case should be designated as a reportable disease, should be clarified and regularized in a transparent system authorized by law.
Lack of Provincial Public Health Leadership

Few worked harder during SARS than Dr. Colin D’Cunha, the Chief Medical Officer of Health for Ontario and Director of the Public Health Branch in the Ontario Ministry of Health and Long-Term Care. He demonstrated throughout the crisis a strong commitment to his belief of what was in the public interest. Dr. D’Cunha is a dedicated professional who has devoted his career to the advancement of public health. For the brief reasons set out in the report Dr. D’Cunha turned out in hindsight to be the wrong man in the wrong place at the wrong time.

While it may be due to misunderstandings or a simple difficulty on the part of Dr. D’Cunha to communicate effectively, there is a strong consensus on the part of those colleagues who worked with him during the crisis that his highest and best public calling at this time is in an area of public health other than direct programme leadership. This general concern has undoubtedly been reflected in the government’s decision to provide him with other opportunities within his area of expertise.

Because Dr. D’Cunha no longer holds the office of Chief Medical Officer of Health it might be asked why it is necessary in this interim report to deal with his leadership during SARS. The answer is that the public has a right to know what happened during SARS and that obliges me to make whatever findings I am taken to by the evidence. The story of what happened during SARS cannot be told without some reference to the difficulties that arose in respect of Dr. D’Cunha’s leadership.

I cannot fairly on the evidence before me make any finding of misconduct or wrongdoing by Dr. D’Cunha. The underlying problems that arose during SARS were systemic problems, not people problems. Because the underlying problems were about inadequate systems and not about Dr. D’Cunha, it would be unfair to blame him or make him a scapegoat for the things that went wrong.

It is impossible to say, in the end result, that Dr. D’Cunha’s difficulties made any ultimate difference in the handling of the crisis. Although his colleagues were frustrated by his approach to things, the crisis was to a large extent managed around him. It is hard to say that the overall result of the SARS crisis would have been different with someone else at the helm.
Lack of Perceived Independence

The Commission on the evidence examined thus far has found no evidence of political interference with public health decisions during the SARS crisis. There is, however, a perception among many who worked in the crisis that politics were at work in some of the public health decisions. Whatever the ultimate finding may be once the investigation is completed, the perception of political independence is equally important. A public health system must ensure public confidence that public health decisions during an outbreak are free from political motivation. The public must be assured that if there is a public health hazard the Chief Medical Officer of Health will be able to tell the public about it without going through a political filter. Visible safeguards to ensure the independence of the Chief Medical Officer of Health were absent during SARS. Machinery must be put in place to ensure the Actual and apparent independence of the Chief Medical Officer of Health in decisions around outbreak management and his or her ability, when necessary, to communicate directly with the public.

Lack of Public Health Communication Strategy

The problems of public communication during SARS are addressed thoughtfully in the Naylor Report and the Walker Interim Report. The Commission endorses their findings and their recommendations for the development of coherent public communication strategies for public health emergencies.

There is no easy answer to the public health communications problems that arose during SARS. On the one hand, if there are too many uncoordinated official spokespeople the public ends up with a series of confusing mixed messages. On the other hand, as Mr. Tony Clement the Minister of Health during SARS pointed out to the Commission, any attempt to manage the news by stifling important sources of information will not only fail but will also lead to a loss of public confidence and a feeling among the public that they are not getting the straight goods or the whole story. What is needed is a pre-planned public health communications strategy that avoids either of these extremes.

Poor Coordination with Federal Government

Problems with the collection, analysis and sharing of data beset the effort to combat SARS. While many factors contributed to this, strained relations between the three levels of government did not help matters.
The lack of federal-provincial cooperation was a serious problem during SARS. This lack of cooperation prevented the timely transmission from the Ontario Public Health Branch of vital SARS information needed by Ottawa to fulfill its national and international obligations. Although recollections differ as to the responsibility for this lack of cooperation, the underlying problems were the lack of pre-existing protocols, agreements, and other machinery to ensure the seamless flow of necessary information and analysis, combined with a possible lack of collaborative spirit in some aspects of the Ontario response.

The inherent tensions between the federal and provincial governments must be overcome by a spirit of cooperation around infectious disease surveillance and coupled with the necessary machinery to ensure in advance that the vital information will flow without delay. It is clearly incumbent on both levels of government to ensure that the breakdown that occurred during SARS does not happen again.

A Dysfunctional Public Health Branch

The Commission has heard consistent reports that the Public Health Branch of the Ministry of Health had become dysfunctional both internally and in terms of its relationships with the local public health units.

A lack of respect for the Public Health Branch was evident in the responses from outside Ontario and from elements of the Ontario public health system at the local level. When SARS hit, leadership was not forthcoming from a Public Health Branch that turned out to be dysfunctional.

Lack of Central Public Health Coordination

Under the Health Protection and Promotion Act, local medical officers of health were responsible for the local response to SARS. It was to the province however, to the Public Health Branch in the Ministry of Health, that the local public health units looked for guidance. Unfortunately many medical officers of health felt there was no coordinated effort at the Public Health Branch to facilitate the SARS response at the local level. For many in the field it seemed as though the Branch was a silo, disconnected from the field, rather than a partner or a resource.

Many local medical officers of health felt abandoned during SARS, devoid of support and guidance. The Branch’s failure to coordinate and guide the local health units was
already a big problem before SARS. It turned out to be a harbinger of the problems that arose during SARS.

**Lack of Central Expertise**

The outbreak was managed, of necessity, around the Public Health Branch of the Ministry of Health and Long-Term Care rather than through it. The critical mass of professional expertise one would expect in a crucial branch of government in a province the size of Ontario simply did not exist, either in the number of experts or their depth of experience. Key operational groups had to be put together on the run and individual experts had to be recruited from the field to fill this void. Machinery such as the Science Committee and the Epi Unit were run on almost a volunteer drop-in basis because there was no depth of expertise in the Branch itself.

SARS demonstrated that our most valuable public health resources are human resources and that Ontario lacked a critical mass of expertise at the provincial level. It is crucial to the success of any public health reform initiatives in Ontario that there be a high level of expertise at both the local and central levels of public health. Ontario cannot continue to rely on the goodwill and volunteerism of others to protect us during an outbreak. Many of those who came forward to work at the provincial level during SARS were disheartened by the problems they saw and a few expressed doubts whether they would be willing to come forward again, particularly if the problems are not addressed. Examples abound of centres of excellence for disease control: British Columbia, Quebec, and Atlanta, among others. Ontario needs to learn from their example. Without a critical mass of the right professionals public health reform, no matter how well-reasoned and well-resourced, has no chance of success.

**No Established Scientific Backup**

In March 2003, the Public Health Branch in Ontario had neither the capacity nor the expertise to handle an outbreak of the magnitude of SARS. Neither was there any provincial plan to rapidly bring together the necessary experts to provide scientific advice to those managing the outbreak. One outside expert, brought in to help manage the crisis, noted that Ontario simply didn't have the machinery, people or the leadership at the central level:

> It was abundantly clear to everyone who sat in on teleconferences that Ontario was scrambling, didn't have the infection control expertise, at
least the amount of expertise. There were superb infection control people there … it’s clear they were unable to pull together the data that was required for them and us to try to understand what’s going on. It was abundantly clear that there was no obvious concerted leadership of the outbreak at least as we could see … It was obvious to all of us that Ontario was in substantial trouble.

Consequently, the Ministry of Health had to turn to experts outside of government for advice and direction. While it is not unusual that outside experts would be consulted during an outbreak, the lack of planning meant that the core expert groups had to be thrown together in haste without adequate planning or organization.

**Lack of Laboratory Capacity**

Before SARS, concerns had been raised about the capacity of the Ontario Central Public Health Laboratory (provincial laboratory). Despite these warnings, it was not prepared to deal with an outbreak of this magnitude. There were only two medical microbiologists in the laboratory, who were responsible for the entire province.

To make it worse, the Ministry of Health and Long-Term Care, in the fall of 2001, had laid off its PhD level scientists at the provincial laboratory. These scientists were engaged in the diagnosis and surveillance of new and emerging infections as well as research and development.

Within government, there seemed to be a complete lack of understanding of the importance of the work done by scientists at the provincial laboratory. At the time of the layoffs, a Ministry of Health spokesman was quoted as saying:

> Do we want five people sitting around waiting for work to arrive? It would be highly unlikely that we would find a new organism in Ontario.

It is unnecessary, in light of SARS, to bring the irony of this statement to the attention of the reader. Less than two years later, SARS struck Ontario. The provincial laboratory did not have the capacity to deal with SARS.

Despite earlier warnings, the Ontario Central Public Health Laboratory proved inadequate during SARS. It is essential that the provincial laboratory be revitalized with the necessary physical and human resources.
No Provincial Epidemiological Unit

When SARS hit Ontario, the Ministry of Health's Public Health Branch was totally unprepared to deal with an outbreak of this nature. To start with, it had no functioning epidemiological unit (Epi Unit).

The Science Committee needed epidemiological data about the transmission of the disease and whether control measures were effective. It needed answers to a number of vital questions: How was the outbreak progressing? What was the incubation period? How long were people infectious? What were the risks in hospital?

Although an Epi Unit was cobbled together as the outbreak unfolded, its work was hampered by the lack of planning and support systems.

It was a major failure of Ontario's public health system that no such unit was in place when SARS struck. The development of fully resourced epidemiological capacity is vital to protect Ontario against outbreaks of infectious disease. In the absence of major reform, Ontario may not be able in a future outbreak to draw on the extraordinary volunteer resources that helped so much in the spring of 2003.

Inadequate Infectious Disease Information Systems

The fight against SARS was hampered by the lack of an effective reportable disease information system. When SARS hit Ontario neither the provincial Public Health Branch nor the local public health units had any information system capable of handling a disease like SARS. The existing system, known as Reportable Disease Information System, or RDIS, was disease-specific and not flexible enough to handle new diseases.

Until the Epi Unit was up and running, there was no way to coordinate the work of local public health units into a common reporting structure. This delay turned out to be a critical problem. By the time the Epi Unit was established, individual health units were married to their own individual methods of collecting and reporting data. As a result, they were unable and disinclined to change their systems mid-stream, despite problems created by the diverse manner in which the data was being collected and reported.

Because of systemic weaknesses, the Toronto Public Health unit, which had the majority of the SARS cases, relied on a paper-based system of case tracking. This
nightmarish system generated cardboard boxes spilling over with paper, all of which had to be collated and analyzed by hand.

The Commission endorses the specific recommendations in the Naylor Report and the Walker Interim Report to address the deficiencies in the federal and Ontario infectious disease information systems.

Should SARS or some other infectious disease hit Ontario tomorrow, the province still has no information system, accessible by all health units, capable of handling an outbreak. The first unheeded wake-up call was the Provincial Auditor’s report in 1997. The second unheeded wake-up call was West Nile. If it takes Ontario as long to respond to SARS as it did to those earlier wake-up calls, the province will be in serious trouble when the next disease strikes.

**Overwhelming and Disorganized Information Demands**

The problem of information flow was not restricted to the lack of the necessary information technology systems. Confusion, duplication, and apparent competition prevailed in the work of those in the central apparatus who sought information from local public health units and hospitals. These unfocused demands consumed valuable time of public health and hospital staff, distracted them from urgent tasks at hand, and impaired their ability to get on with the work of fighting the disease.

SARS caught Ontario with no organized system for the transmission of case information to those who needed it to fight the outbreak. There was no order or logic in the frenzied, disorganized, overlapping, repetitious and multiple demands for information from hospitals and local public health units. Requests would go out simultaneously to many people for the same piece of information. The work of front line responders in hospitals and health units was seriously impaired by this constant and unnecessary harassment.

**Inadequate Data**

The data produced by the jerry-built system through the frenzy of information demands often proved to be inadequate. Accurate data of high quality was vital to the experts on the Science Committee who had to provide evidence- and science-based direction for the management of SARS. Because so much about the disease was unknown, case-specific information was vital and sound decisions could not be made.
without adequate data of the necessary quality.

The Science Committee never reached the point where it received adequate data in a timely manner, including information about contacts of those with SARS. Consequently, it was difficult to judge the effectiveness of control measures such as quarantine.

The Epi Unit and the local health units were often unable to provide adequate and timely data. While there is disagreement among those involved as to the amount of data being provided, what is clear is that the experts and officials who needed the data did not get what they needed when they needed it. The information systems and support structures were simply not in place. In the absence of this necessary machinery, not even the hardest work and greatest expertise of those who came forward to staff the Epi Unit and the Science Committee could overcome the obstacles.

**Duplication of Central Data Systems**

Because there was no standard information system for the Public Health Branch and all the local public health units, each individual health unit developed their own data collection system during SARS. The lack of a single, effective, accessible information system, combined with a constant, intense demand for information from a number of different people and groups, resulted in chaos.

Duplicate data systems sprung up at the Ministry of Health. For example, one group in the Ministry ran a system intended to track the situation in hospitals. This group collected data separate from the Epi Unit, but the numbers reported by this Ministry group often differed widely from the numbers reported by the Epi Unit.

The proliferation of data systems, and the confusion and burdens it created, was an inevitable consequence of Ontario’s lack of preparedness for a major outbreak of infectious diseases.

Failure to prioritize public health emergency preparedness, and to devise one central system for the collection and sharing of infectious disease data was a major problem during SARS. Although work has been done since SARS to improve the situation, there is no such system now in place to protect us from a future outbreak. Unless this problem is addressed, duplicate systems will spring up again as people scramble to devise their own information systems in the absence of systems put in place before the next outbreak hits.
Blockages of Vital Information

There was a perception among many who fought SARS that the flow of vital information to those who urgently needed it was being blocked or delayed for no good reason.

What is striking is that the various groups appear honestly to believe that they communicated the information to each other. Yet clearly there were significant gaps in the transfer of information between Toronto Public Health and the province, between the provincial Epi Unit and the Science Committee, and between Ontario and the Federal government. It is impossible to determine the precise source of the data blockages.

It does not matter whose perception, in the fog of battle against the disease, was correct. The bottom line is that the lack of clarity around the flow of communication and the reporting structure, the absence of a pre-existing epidemiological unit coordinated with the local health units and the absence of clear public health leadership above the Epi Unit provided an environment in which the crucial elements of the fight against SARS were disconnected from each other. Despite the best efforts of individuals attached to all of the groups involved, they simply could not connect effectively.

Legal Confusion

The fight against SARS was marked by the lack of clarity of existing laws that impacted on the public health system. Although the Commission cannot at this interim stage make specific recommendations for legislative reform in Ontario, a few things should be said about the general need for work in this area. Areas of concern include the following:

- Who legally was in charge of the outbreak?
- Who had the ultimate responsibility for the classification of a case: the local jurisdiction or the province?
- What was the legal authority for issuing directives to hospitals?
- What were the consequences of not following those directives?
• What specific information had to be transmitted, by whom, when and to whom?

• To what extent could public officials and private experts share data and for what purpose?

• Who was obliged to notify relatives that a family member was classified as a suspect or probable case?

• Did privacy rights prevent the sharing of information necessary to fight the outbreak?

While protection of patient confidentiality is a key consideration in any data sharing agreement or legislation, it should not in the future hinder the vital communication of data to the extent it did during SARS. Notwithstanding the strong privacy concern demonstrated by many of those who fought the outbreak, a number of families affected by SARS reported that they felt their privacy had nonetheless been violated because personally identifying information somehow made it into the media. It is ironic that although privacy concerns restricted the flow of vital information between agencies fighting the outbreak, they were not always effective to keep personal information from the media.

Whatever the precise path of legislative reform, privacy, while vital, should not impede the necessary sharing between agencies and governments of information required to protect the public against an outbreak of infectious disease.

The Commission during the course of its investigation will continue to address issues around the need for legislative changes identified in the lessons learned from SARS.

Public Health Links With Hospitals

SARS was largely a hospital spread infection. Although there was some spread in households and doctors offices, and a limited element of community spread, most of the transmission took place in hospitals.

There are significant weaknesses in the links between public health and hospitals and there is lack of clarity as to the respective accountability and authority of public health and hospitals in a hospital-based outbreak.
Public health should have strong links with hospitals and establish where necessary an authoritative hospital presence in relation to nosocomial infection. The respective accountability, roles and responsibilities of public health and health care institutions in respect of infectious outbreaks should be clarified.

Public Health Links with Nurses, Doctors and Others

Public health links with nurses, doctors, other health care workers and their unions and professional organizations were often ineffective during SARS.

This section of the report illustrates specific problems that arose from this general failure and points to the need for a better system to ensure that public health develops better links and communication systems with the key participants in the health care system.

Lack of Public Health Surge Capacity: The Toronto Example

The sudden demands imposed by SARS on local public health units were overwhelming. The hardest hit jurisdiction was Toronto, where the cases snowballed with each passing day of the outbreak. While the same was true of other public health units, Toronto is selected as an example because it had the greatest number of cases.

Despite the reassignment of public health staff from other jobs, and despite the influx of workers from other health units to help out, Toronto public health was at times overwhelmed by the staggering workload which included:

- Approximately 2,000 case investigations. Each took an average of nine hours to complete.
- More than 23,000 people identified as contacts.
- Of these, 13,374 placed in quarantine.
- More than 200 staff working on the SARS hotline.
- Over 300,000 calls received on the hotline.
- On the highest single day, 47,567 calls.
Despite the best efforts of so many, the systems for redeployment proved inadequate. SARS demonstrated the need to create surge capacity by planning in advance so that every available worker can be redeployed where necessary.

The Case of the Federal Field Epidemiologists

The federal government sent a number of Health Canada employees to work in the field to help with containment efforts. In the early days of the outbreak they sent three federal field epidemiologists to Toronto, often referred to as the field epi’s, who brought a badly needed level of expertise to the provincial response. Unfortunately, the lack of clarity concerning their deployment and, from time to time, the tasks that they were asked to perform led to problems and ultimately contributed to the decision by Health Canada to pull them back from Ontario.

The case of the federal field epidemiologists demonstrates many of the underlying problems of Ontario’s SARS response noted above: poor coordination among levels of government, poor coordination of Ontario’s public health response, and above all a lack of any advance plan for outbreak management.

Improvements Since SARS

This section of the report describes the steps taken to fix the problems disclosed by SARS.

These pending and proposed improvements exemplify an obvious present desire to fix the public health problems revealed by SARS. It is beyond the Commission’s mandate to evaluate or monitor these initiatives. The government’s efforts to ensure the province will not again be confronted by the same problems that arose during SARS will be effective only if it dedicates adequate funds and makes a long-term commitment to reform of our public health protection systems. As in most areas of human endeavour, actions speak louder than words. Only time will tell whether the present commitment will be sustained to the extent necessary to protect Ontario adequately against infectious disease.

Naylor, Kirby, Walker

These three reports share a common vision for the renewal of our public health
systems through increased resources, better federal-provincial and inter-agency cooperation, and system improvements. They bear close study and great consideration. Their methodology and approach are sound and their recommendations are solidly based in their respective expertise. Based on the evidence it has seen, the Commission endorses the major findings and recommendations of all three studies.

**Federal-Provincial Cooperation**

Too many good ideas in this country have been destroyed by mindless federal-provincial infighting. The most noble and appealing proposals for reform falter so often in Canada simply because of the inherent bureaucratic and political mistrust between the two levels of government. If a greater spirit of federal-provincial cooperation is not forthcoming in respect of public health protection, Ontario and the rest of Canada will be at greater risk from infectious disease and will look like fools in the international community. While there are hopeful signs that more cooperation will be forthcoming, it will take hard work from both levels of government to overcome the lack of coordination demonstrated during SARS.

Ontario and Canada must avoid bickering and must create strong public health links based on cooperation rather than competition, avoiding the pitfalls of federal overreaching and provincial distrust

**Independence And Accountability**

There is a growing consensus that a modern public health system needs an element of independence from politics in relation to infectious disease surveillance, safe food and safe water, and in the management of infectious outbreaks.

Whatever independence may be required by the Chief Medical Officer of Health for public health decisions during an outbreak and for the right to speak out publicly whenever necessary, he or she should remain accountable to the government for overall public health policy and direction and for the expenditure of public funds.

The proposed power to report directly to the public, combined with independence in relation to the management of infectious outbreaks, provides a significant measure of independence to the Chief Medical Officer of Health. It ensures that on important public health issues the Chief Medical Officer of Health cannot be muzzled and that the public can get a direct sense of emerging public health problems without passing
through any political filters. It ensures both the reality and the public perception that the management of infectious disease outbreaks will be based on public health principles and not on politics.

The Commission therefore recommends:

- Subject to the guarantees of independence set out below, the Chief Medical Officer of Health should retain a position as an Assistant Deputy Minister in the Ministry of Health and Long-Term Care.

- The Chief Medical Officer of Health should be accountable to the Minister of Health with the independent duty and authority to communicate directly with the public by reports to the Legislative Assembly and the public whenever deemed necessary by the Chief Medical Officer of Health.

- The Chief Medical Officer of Health should have operational independence from government in respect of public health decisions during an infectious disease outbreak, such independence supported by a transparent system requiring that any Ministerial recommendations be in writing and publicly available.

- The local medical officer of health should have the independence, matching that of the Chief Medical Officer of Health, to speak out and to manage infectious outbreaks.

The Public Health Ping-Pong Game

Public health in Ontario including protection against infectious disease is delivered primarily through 37 local Boards of Health, which are largely controlled by municipal governments. Public health funding has gone back and forth like a ping-pong ball between the province and the municipalities.

So long as the municipalities fund public health to a significant degree, public health will have to compete with other municipal funding priorities. Communicable disease control is a basic public necessity that can affect the entire province if a disease gets ahead of the controls. Infectious disease control should not have to compete against potholes for scarce tax dollars.

There is no scientific way to determine the appropriate degree of provincial funding upload for infectious disease surveillance and control. Although a case can be made
for 100-per-cent funding upload, the persuasive views of a number of local Medical Officers of Health suggest that it would be sensible to upload infectious disease control to a provincial contribution of at least 75 per cent.

Opinions will differ as to how the funding formula should be changed, and whether and how much coordinating or direct power over public health should be uploaded to the province. The one thing on which everyone will agree is that the shifting of funding and accountability back and forth between the province and the municipalities has impaired the stability of Ontario’s public health system. It is time to stop the ping-pong game and to begin an era of stable public health funding relationships between the province and the municipalities.

**One Local Funding Problem**

This section of the report demonstrates in exquisite detail the problems that can arise through the present system of local funding of public health and the disinterest shown by some municipal politicians in the public interest in effective public health protection.

This story painfully reveals the importance of ensuring that funding for local health activities is not left to the mercies of any intransigent local council that fails to live up to its legal responsibilities in respect of public health protection. Basic protection against disease should not have to compete for money with potholes and hockey arenas. Even if most municipalities respect their public health obligations under the *Health Protection and Promotion Act*, it only takes one weak link to break the chain of protection against infectious disease. Should an infectious disease outbreak spread throughout Ontario, the municipality that cannot or will not properly resource public health protection may be the weak link that affects the entire province and beyond.

**The Municipalities’ Funding Dilemma**

All municipalities are affected by the underlying difficulty of funding any provincial programme from the local municipal property base. SARS and West Nile showed that infectious disease protection has to be approached at a provincial level. It is anomalous to fund a provincial programme like infectious disease control from the limited municipal tax base. In a submission to the Commission, the Association of Municipalities of Ontario makes a persuasive case for the province and the municipal-
ities to sit down together and agree on the best structure to fund infectious disease protection and the best process for getting there.

One Local Story: Parry Sound

SARS was not restricted to Toronto. This section outlines the response to SARS by the local hospital, the West Parry Sound Health Centre and the local public health unit. It demonstrates the lack of provincial public health support to a local community faced with SARS and the difficulties caused by the inability of many local public health units to attract and retain permanent a medical officer of health.

If the present system of local control over public health and infectious disease is to be maintained, it is essential that machinery be put in place to ensure continuous unbroken oversight and authority in every public health unit in Ontario supported by the necessary cadre of public health professionals.

An Ontario Centre for Disease Control

A consensus has developed that some kind of separate “CDC Ontario” is needed, with strong academic links, in order to provide a critical mass of medical, public health, epidemiological, and laboratory capacity and expertise. Structural models abound for such an organization, from the British Columbia Centre for Disease Control (B.C. CDC), to the Institut national de santé publique du Québec, to the federal model proposed in the Naylor Report, and even to the United States Centres for Disease Control (CDC) itself. It is expected that the final Walker Report will make detailed and prescriptive recommendations for the structure and mandate of such an organization.

While it is beyond the scope of this interim report to address this issue in the detailed fashion expected from the final Walker report, a few observations are in order.

First, the structure of the new agency or centre, which will combine advisory and operational functions, must reflect the appropriate balance between independence and accountability whether it is established as a Crown corporation or some other form of agency insulated from direct Ministerial control.

Second, it should be an adjunct to the work of the Chief Medical Officer of Health and the local medical officers of health, not a competing body. SARS showed that
there are already enough autonomous players on the block who can get in each other’s way if not properly coordinated. There is always a danger in introducing a semi-autonomous body into a system like public health that is accountable to the public through the government. The risk is that such a body can take on a life of its own and an ivory tower agenda of its own that does not necessarily serve the public interest it was designed to support.

Third, it must be made clear from the beginning that the agency is not an end in itself but exists only to support public health.

The success of centres such as the CDC in Atlanta and the CDC in British Columbia flows largely from a widespread recognition that these institutions house the very best of the best. The authority they have comes from their recognition as centres of excellence that can be counted on to work collaboratively with local agencies. To achieve this authority and success an Ontario Centre for Disease Control will require considerable resources and a strong commitment from government to maintain those resources. It will only work if it has the resources to attract recognized experts and to provide them with the best technology and equipment and optimal support to perform their work. It will take years to build a reputation for excellence and anything less than a 100 per cent commitment to this long-term goal will surely result in failure.

Public Health Restructuring

Whenever a system proves wanting it is tempting to blame its problems on structure and to embark on a course of reorganization, or centralization, or regionalization, or decentralization. It must be remembered that organizational charts do not solve problems. The underlying problems of public health in Ontario have to do with a lack of resources, years of neglect, and lack of governmental priority. These problems developed during the regimes of successive governments and no government or political party is immune from responsibility for the decline of public health protection. These problems will not be fixed by drawing boxes on paper around public health units and moving them into other boxes. The underlying problems will only be solved by a reversal of the neglect that has prevailed for so many years throughout the regime of so many different governments headed by all three political parties.

That being said some attention must be given to the best way to structure and organize the delivery of public health in Ontario. This section discusses the respective
merits of different approaches to the restructuring of Ontario’s system of public health protection.

Greater Priority for Infectious Disease Control

SARS made it clear that our public health system must give greater priority to protection against infectious disease. It is equally clear, however, that our entire public health system cannot be reorganized around one disease like SARS. Many diseases produce more sickness and mortality than SARS, and the task of plugging the holes demonstrated by SARS cannot be permitted to detract public health from the task of preventing those afflictions that comprise a higher burden of disease than SARS and other infectious diseases.

While it would be wrong to downgrade the long-term importance of health promotion and population health, the immediate threat posed by any infectious outbreak requires that a dominant priority must be given to protecting the public against infectious disease. It does not disrespect the advocates of health promotion to say that the immediate demands of public safety require that public health, as its first priority, looks after its core business of protecting us from infectious disease.

The tension in public health, between priority for infectious disease control and priority for long-term population health promotion, including the prevention of chronic lifestyle diseases, is not going to go away. There is no point in arguing which is more important, because they are both important. There are however five basic reasons why protection against infectious disease should be the first basic priority of our public health system.

The first is that the threat from infectious disease is direct and immediate. The second is that an outbreak of infectious disease, if not controlled, can bring the province to its knees within days or weeks, a threat not posed by lifestyle diseases. The third is that infectious disease catches the direct attention and immediate concern of the public in a way that long-term health promotion does not. It is essential in an infectious disease outbreak that the public be satisfied that they are getting solid information from the government and that everything possible is being done to contain the disease. The fourth is that infectious disease prevention requires an immediate overall response because it moves rapidly on the ground and spreads quickly from one municipality to another and from province to province and country to country, thus engaging an international interest. The fifth is that health promotion depends largely on partnerships outside the health system between public health and local community agencies.
like schools and advocacy groups, allies and resources not available to infectious
disease control which must stand largely on its own.

For these five reasons safe water, safe food, and protection against infectious
disease should be the first priorities of Ontario’s public health system.

Central Control Over Health Protection

An uncontrolled outbreak of infectious disease could bring the province to its knees. The province-wide consequences of a failure in infectious disease control are simply too great for the province to delegate infectious disease protection to the municipal level without effective measures of central provincial control. There is little machinery for direct central control over infectious disease programmes. The existing machinery to enforce local compliance with provincial standards is cumbersome and underused. Better machinery is needed to ensure provincial control over infectious disease surveillance and control.

During a disease outbreak the international community and organizations like the World Health Organization look for reassurance and credibility to the national and provincial level, not to the particular strength of any local public health board or the particular credibility of any local Medical Officer of Health. Viruses do not respect boundaries between municipal health units. The chain of provincial protection against the spread of infectious disease is only as strong as the weakest link in the 37 local public health units. A failure in one public health unit can spill into other public health units and impact the entire province and ultimately the entire country and the international community. When dealing with a travelling virus, concerns about local autonomy must yield to the need for effective central control.

If the Health Protection and Promotion Act were amended to provide that:

- The powers now assigned by law to the medical officer of health are reassigned to the Chief Medical Officer of Health, and

- The powers reassigned to the Chief Medical Officer of Health shall be exercised by the medical officer of health in the local region, subject to the direction of the Chief Medical Officer of Health,

it would leave to the local medical officers of health a clear field to exercise the same powers they have always exercised, subject to ultimate central direction.
Under the old system, such a re-arrangement of powers might raise serious concerns of loss of autonomy on the part of the local medical officer of health including the spectre of political influence from Queen's Park on local public health decisions. While concerns about local autonomy will never go away in any centralized system, the new independence of the Chief Medical Officer of Health and the medical officer of health should go a long way to allay such concerns.

A further sensible measure to allay these concerns, and to further protect against the perception of political interference with public health decisions, would be to remove from the Minister of Health under the Act the direct operational power in cases of health risk, such powers to be assigned to the Chief Medical Officer of Health.

These measures are proposed to strengthen provincial control over public health protection with adequate safeguards to ensure the political independence of the Chief Medical Officer of Health and the local medical officer of health in relation to infectious disease control.

Without stronger measures to ensure central provincial control of infectious disease control whenever necessary, Ontario will be left with inadequate protection against potential public health disasters.

**Political Will**

A reformed public health system requires a major injection of resources. The Naylor, Kirby, and interim Walker reports analyzed the need for a critical mass of scientific and medical expertise, more capacity to educate, recruit, and retain public health professionals, increased laboratory capacity, and improved technology. Further recommendations are expected in the final Walker report. Significant financial resources will be needed to give Ontario’s public health system any reasonable capacity for protection against infectious disease.

The decline of public health protection in Ontario reflects a consistent lack of political will, over the regime of many successive governments and all three political parties, to bring up to a reasonable standard the systems that protect us against infectious disease.

Competition for tax dollars is fierce. It is not easy in a time of fiscal constraint for any government to make additional funds available for any public programme. It will require significant political will on the part of the Minister of Health and the Ontario
government to commit the funds and the long-term resolve that are required to bring our public health protection against infectious disease up to a reasonable standard.

It would be very easy, now that SARS is over for the time being, to put public health reform on the back burner. It is a general habit of governments to respond to a crisis by making a few improvements without fixing the underlying problems responsible for the crisis. It would be a tragedy if that turned out to be the case with SARS. As the Naylor Report pointed out:

SARS is simply the latest in a series of recent bellwethers for the fragile state of Canada’s … public health systems. The pattern is now familiar. Public health is taken for granted until disease outbreaks occur, whereupon a brief flurry of lip service leads to minimal investments and little real change in public health infrastructure or priorities. This cycle must end.490

Ontario, as demonstrated in this interim report, slept through many wake-up calls. Again and again the systemic flaws were pointed out, again and again the very problems that emerged during SARS were predicted, again and again the warnings were ignored.

The Ontario government has a clear choice. If it has the necessary political will, it can make the financial investment and the long-term commitment to reform that is required to bring our public health protection against infectious disease up to a reasonable standard. If it lacks the necessary political will, it can tinker with the system, make a token investment, and then wait for the death, sickness, suffering, and economic disaster that will come with the next outbreak of disease.

The strength of the government’s political will can be measured in the months ahead by its actions and its long-term commitments.

490. National Advisory Committee on SARS and Public Health, Learning from SARS: Renewal in Public Health in Canada (Health Canada: October 2003) p. 64. (Subsequent footnotes will refer to this report as the Naylor Report.)
Appendix B: What Has Been Done

In June 2004, two months after the release of the Commission’s first interim report and of the Walker panel’s final report, the government unveiled Operation Health Protection, a three-year plan to fix the weaknesses in the public health system exposed by SARS.

The Ministry has recently updated the Commission on the status of efforts to revive the public health system. While this Appendix summarizes the Ministry’s information on the progress to date in implementing key initiatives, it is beyond the Commission’s mandate or resources to monitor their implementation.

Operation Health Protection announced that a new Health Protection and Promotion Agency will be created by 2006/7. It stated:

Within two years, Operation Health Protection will be anchored by an independent health protection and promotion agency similar to those operating in British Columbia, Québec and at the Centers for Disease Control and Prevention in Atlanta. This new Ontario Health Protection and Promotion Agency will support the CMOH and provide expert scientific leadership.

Its responsibilities will include:

- Specialized public health laboratory services that will ensure that all health practitioners receive timely and relevant information to support health surveillance;

- Infection control and communicable disease information and centralized support for professionals in “the field”;

- Emergency preparedness assistance and support in the form of scientific and technical advice, and a modern and timely alert system;
- Risk communications that will enhance the rapid exchange of information between health care practitioners, institutions and the Ministry about potential health crises;

- Research and knowledge transfer through linkages with research, academic and health care institutions; and

- Reporting through the CMOH on the health status of Ontarians, and emergent health threats and risks.\footnote{491}{Operation Health Protection, p. 5.}

The Ministry advises the Commission that a task force to help design and develop the agency has been struck, and its terms of reference confirmed and approved. The task force is expected to present initial recommendations to the Ministry by the spring of 2005 and make final recommendations by the fall of 2005.

One of the key weaknesses identified during SARS was the woeful lack of public health laboratory capacity in Ontario, a shortcoming that seriously hampered the response to the deadly outbreak. After years of neglect, SARS demonstrated that the Central Public Health Laboratory was severely under-staffed, poorly resourced, inadequately equipped, and badly led.

In response, Operation Health Protection stated that the Ministry intended to address the staffing issues, modernize the public health laboratory system and integrate it into the new Health Protection and Promotion Agency: It stated:

Central to the establishment of the Agency is the modernization of Ontario’s Central Public Health Laboratory and the public health laboratory system. Laboratories are a key element of an effective public health system. They are often the first indication of evidence of a reportable or communicable disease, a point of verification in the diagnosis of many diseases for which surveillance is essential, including infectious diseases.

The Agency Implementation Task Force will also guide an operational review of the public health laboratory system to align the available testing services with what is required. This will also help determine the functional and procedural enhancements needed to ensure that the system performs at optimal levels on a daily basis as well as during an outbreak.
This review will be completed over the next few months. Formal linkages are already being strengthened and technological infrastructure has recently been created within the Ministry and the Central Public Health Laboratory to improve communication and information exchange.

Our goal is to ensure a state-of-the-art public health laboratory system in Ontario. In order to strengthen the province’s laboratory capacity and to prepare for co-locating appropriate functions of the Central Public Health Laboratory with the Agency, we will enhance the medical capacity of the public health laboratory system, beginning with the addition of a senior medical director and additional medical microbiologist.492

The Ministry has advised that it has issued a Request for Proposals for an operational review of the public health laboratory system. The review is to have a number of key areas of focus including corporation organization and infrastructure and business practices and policies. With regards to staffing levels, the Ministry also advises that approval has been given for the recruitment of medical microbiologists and a medical director for the Central Public Health Laboratory. Recruitment is at the interview stage. In addition, the Ministry has advised that the Public Health Division is developing a closer functional relationship with the public health laboratory system.

The Commission’s first interim report and the Walker panel’s final report both recommended increasing the role and independence of the Chief Medical Officer of Health.

Operation Health Protection stated:

As the most senior public health official in Ontario, the CMOH must be able to provide leadership while at the same time be able to speak publicly about public health issues. In addition, the CMOH must have an appropriate level of independent authority to act quickly and decisively in situations that pose risks to the health of Ontarians. To this end, over the coming year we will initiate legislative changes to increase the independence of the CMOH. Furthermore, the CMOH will be given the responsibility of providing an annual report on the health of Ontarians.493

---

On October 14, 2004, Bill 124, aimed at strengthening the role and independence of the Chief Medical Officer of Health, was introduced in the Ontario Legislature. It received Royal Assent on December 16, 2004. Under Bill 124, the Chief Medical Officer of Health can only be removed from office for cause on the address of the Legislative Assembly; some operational powers in the Health Protection and Promotion Act were reassigned from the Minister to the Chief Medical Officer of Health; the Chief Medical Officer of Health was given the authority to issue any reports on public health issues that he or she felt were appropriate; and the Chief Medical Officer of Health was mandated to issue one report each year on the state of public health in Ontario. The first report is expected in the 2005-6 fiscal year.

The SARS Commission and the Walker Panel both commented on the Public Health Division's lack of internal resources and capacity. In addressing these concerns, the Ministry has advised that an external organizational review has been completed. To strengthen the Division's internal capabilities, recruitment has begun for an Associate Chief Medical Officer of Health and Director of the Division's Infectious Diseases Branch (formerly known as the Division's Public Health Branch), and for six senior medical consultants. The Ministry indicates that a commitment has been made to rebuild public health capacity through the promotion of public health careers, the enhancement of training for public health professionals, the development of models for the effective utilization of human resources during an emergency and supporting strategies to increase full-time employment for nurses and other health care workers.

A committee has been created to review the capacity of local public health units. An interim report is expected in the summer of 2005 with the final report released in December 2005. Chaired by Dr. Susan Tamblyn, former medical officer of health for the Perth District Health Unit, the Capacity Review Committee is to advise the Chief Medical Officer of Health on the following:

- Core capacities required (such as infrastructure, staff, etc.) at the local level to meet communities' specific needs (based on geography, health status, health need, cultural mix, health determinants, etc.) and to effectively provide public health services (including specific services such as applied research and knowledge transfer);

- Issues related to recruitment, retention education and professional development of public health professionals in key disciplines (medicine, nursing, nutrition, dentistry, inspection, epidemiology, communications, health promotion, etc.).
• Identifying operational, governance and systemic issues that may impede the delivery of public health programs and services;

• Mechanisms to improve systems and programmatic and financial accountability;

• Strengthening compliance with the *Health Protection and Promotion Act*, associated Regulations and the Mandatory Health Programs and Services Guidelines;

• Organizational models for Public Health Units that optimize alignment with the configuration and functions of the Local Health Integration Networks, primary care reform and municipal funding partners; and staffing requirements and potential operating and transitional costs.

The government says it expects to fully implement the Capacity Review Committee’s recommendations by the 2006-7 fiscal year.

Adequate funding for local public health was an important issue raised in the wake of SARS. To address this, the province’s share of local public health funding rose in January 2005 from 50 per cent to 55 per cent. It will rise to 65 per cent in 2006 and to 75 per cent in 2007.

Responding to numerous concerns about the Mandatory Health Programs and Services Guidelines, the Public Health Division intends to conduct a review of the Mandatory Health Programs and Services Guidelines. The review will consider emerging health issues, best practices, new science, as well as lessons learned from Ontario’s experiences with Walkerton, West Nile virus and SARS.

SARS demonstrated the need to have a permanent panel of experts to advise the Chief Medical Officer of Health on the prevention and containment of infectious disease outbreaks. In an effort to fill this need, Operation Health Protection stated:

The Ministry is creating a permanent central expert body – the Provincial Infectious Disease Advisory Committee (PIDAC) – to continue the development of standards and guidelines for health professionals and organizations faced with infectious disease outbreaks. Membership of the committee will bring together broad expertise from across the health care sector. The Committee will also advise on research priorities, emergency preparedness and immunization programs. PIDAC will help create
The Ministry recently advised that the Provincial Infectious Diseases Advisory Committee (PIDAC) has been established. Its key role will be to advise the Chief Medical Officer of Health on prevention, surveillance and control measures necessary to protect the people of Ontario from infectious diseases. PIDAC also provides the Chief Medical Officer of Health with advice on issues such as standards and guidelines for infection control, emergency preparedness for an infectious disease outbreak, protocols to prevent and control infectious diseases, and immunization programmes. Subcommittees have been created for surveillance, immunization and infection control. PIDAC has completed a best practice manual for the prevention and control of *Clostridium difficile* in health care facilities. PIDAC is currently co-chaired by Dr. David Williams, Medical Officer of Health for Thunder Bay District, and Dr. Dick Zoutman, Chief of the Department of Medical Microbiology and Medical Director of Infection Control Services, Kingston General Hospital.

The Ministry advises that foundational work is also under way to implement and assess a small number of regional infection control networks. Implementation of networks across the province is expected to be completed by the fiscal year 2006-7. As well, a steering committee has been created to develop tools for standardized and accessible infection control education to front line health care workers.

In the view of many, including the Commission, the fight against SARS was hampered by a lack of an effective reportable disease information system. To address this issue, the Ministry has pledged to implement a federally funded outbreak management system called the Integrated Public Health Information System or iPHIS. Operation Health Protection stated:

> A key component of this comprehensive public health information system is the Ministry’s integrated Public Health Information System (iPHIS). This system builds on the federal initiative to integrate public health information and data systems across Canada, and will enhance both Public Health Unit reporting of reportable diseases and ability to manage outbreaks. Through iPHIS, health units will forward information on cases of reportable diseases to the Ministry, where it will be collected and quickly analyzed and interpreted to identify unusual and

---

unexpected instances of infectious disease. This analysis will then be provided back to the Public Health Units to guide their activities and follow-up. Phase 1 (Testing and Evaluation) of the iPHIS implementation plan is complete and Phase 2 (Outbreak Management and Ontario Enhancements) will begin in November of this year. Within one year, iPHIS will be fully implemented in all Public Health Units for communicable disease reporting, contact tracing, and quarantine management.  

We are informed by the Ministry that full deployment of the iPHIS system is expected to be completed by the end of 2005.

The Emergency Management Unit (EMU) is overseeing the development of the Ontario Health Pandemic Influenza Plan, which was first issued in May 2004. The Commission understands that a steering committee, and a number of subcommittees and working groups, have been established to refine the plan. The Public Health subcommittee and related working groups, for example, have developed draft guidelines for laboratory surveillance during a pandemic. The Operations subcommittee and related working groups, for their part, are developing a provincial framework for the delivery of necessary health services during a pandemic.

The Ministry has told the Commission that efforts are also under way to develop a pan-governmental approach to pandemic planning. A series of exercises are planned in 2005 in collaboration with Health Canada and the other provinces and territories to test parts of the Canadian Pandemic Influenza Plan.

Additionally, the EMU is working on a smallpox emergency response plan, business continuity plans, the health component of the Foreign Animal Disease Plan and a radiation health response plan. It has also participated in a number of emergency management exercises. EMU also participated in a number of emergency management exercises in 2004.

In January 2005, the government announced a $13.5 million programme to help hospitals respond to chemical, biological, radiological and nuclear emergencies. Funds will be used to purchase self-contained decontamination tents, build emergency stockpiles of equipment and supplies, train staff and conduct emergency exercises.  

495. Ibid, p. 22.
Efforts are also being made to improve accountability and enforcement in the delivery of public health services and programmes.

In a newly released financial planning and accountability guide for boards of health and health unit staff, the Ministry’s Public Health Division has advised that it will actively enforce compliance with the Mandatory Health Programs and Services Guidelines.

According to the guide, the Ministry is also implementing a performance measurement system for local public health units. This system – together with grant request documents and related reporting requirements – are intended to strengthen the Ministry’s ability to monitor program funding and service delivery. In describing transfer payment accountability, the guide stated:

Transfer payments involve an agreement between the Province and the applicable health unit. The Ministry must ensure that prior to advancing any provincial funds to health units, signed agreements are in place that:

- Bind the health unit to achieve specific, measurable results per the Mandatory Health Programs and Services Guidelines;
- Require health units, as a condition of funding to have in place governance and administrative structures and processes necessary to ensure prudent and effective management of public funds;
- Require health units to provide periodic reports on financial status and relevant financial and program results achieved;
- Clearly establish the province’s right to require independent verification of reported information by independent professionals;
- Limit the obligations of the province according to the terms of programs approved by Cabinet; and
- Permit the recovery of provincial funds and/or the discontinuance of ongoing funds in the event of health unit non-performance.
Monitoring and Reporting

The Ministry is required to obtain and review information on the status of health unit eligibility and performance and identify non-compliance with agreements and the failure of health units to demonstrate continued eligibility.

Complementing these initiatives is an increased role of the Auditor General (formerly called the Provincial Auditor.) The aforementioned guide advised boards of health and health unit staff that Bill 18, An Act Respecting the Provincial Auditor, received Royal Assent in November 2004. It expands the mandate of the Auditor General to conduct discretionary value-for-money\textsuperscript{497} audits of local boards of health. Section 9.1 of the Act states:

9.1(1) On or after April 1, 2005, the Auditor General may conduct a special audit of a grant recipient with respect to a reviewable grant received by the grant recipient directly or indirectly on or after the date on which the Audit Statute Law Amendment Act, 2004 receives Royal Assent.

Exception

(2) Subsection (1) does not apply with respect to a grant recipient that is a municipality.

\textsuperscript{497} According to the web site of the Auditor General: "An extremely important part of the Auditor General’s mandate is the value-for-money component. Value-for-money audits are assessments of whether or not money was spent with due regard for economy and efficiency and whether appropriate procedures were in place to measure and report on the effectiveness of government programs. Under the Auditor General Act, the Office is required to report to the Legislature significant instances where it is observed that the government is not fulfilling its responsibilities in these areas. To fulfill its value-for-money mandate, the Office annually conducts audits of selected ministry or agency programs and activities. Major programs and activities are generally audited every five years or so. Every year, senior management of the Office consider a number of risk factors when selecting which programs to audit in the coming audit period. These factors include: the results of previous audits, the total revenues or expenditures at risk, the impact of the program or activity on the public, the inherent risk due to the complexity and diversity of operations, the significance of possible issues that may be identified by an audit, and the costs of performing the audit in relation to the perceived benefits. The results of value-for-money audits are reported on in the Auditor General’s Annual Report and constitute a large portion of that document. As well, of all the observations that the Auditor General reports on, value-for-money findings tend to attract the largest proportion of media coverage and interest from the public and from the Standing Committee on Public Accounts.” (See http://www.auditor.on.ca/english/aboutus/whatwedo_frame.html).
However, while the Auditor General does not have the mandate to audit municipalities, s. 9.2 of the Act does provide the following authority with regards to municipal grants:

9.2(1) The Auditor General may examine accounting records relating to a reviewable grant received directly or indirectly by a municipality.

(2) The Auditor General may require a municipality to prepare and submit a financial statement setting the details of its disposition of the reviewable grant.

The Ministry indicated that it has also established the Public Health e-Health Council, cochaired by Dr. Basrur and Dr. George Pasut, the Medical Officer of Health for Simcoe County. The council has 14 members, including physician, hospital, continuing care and laboratory representatives. The council’s mandate is to provide a forum for the discussion of e-health issues in the public health sector and to provide leadership and advice in resolving them.
Appendix C: Commission Process and Ongoing Work

The Commission was appointed by Order in Council dated June 10, 2003. Some preliminary interviews were conducted in June and July\(^{498}\) and the work got fully under way in August after premises were secured and a small core of staff had been retained.

On April 15, 2004, the Commission provided to the Minister of Health an interim report titled “SARS and Public Health in Ontario.” That interim report was based upon the public health aspects of the SARS crisis that had emerged from the evidence obtained during the course of investigation to that date.

Following the release of the first interim report, the Commission continued to interview witnesses and review documents. That work will continue beyond this second interim report in order to tell the public the story of SARS, what happened, what went right, what went wrong, and what lessons emerge from the entire experience. The specific terms of reference, to be addressed in the final report, are set out in Appendix F. These issues include, among others, infection control in hospitals, health worker protection and occupational health and safety in hospitals. Many who contracted SARS and who lost family members to SARS have spoken to the Commission with particular concerns, which will be addressed in the final report.

For this interim report, in addition to the interviews, the Commission in July, sent letters to 55 institutions and individuals, including hospitals, public health units, professional organizations and government. Many responded with thoughtful insights and recommendations. The responses provide invaluable information and great assistance to the Commission. Not all have been incorporated in this interim report. Some recommendations were outside the scope of this interim report and will be considered for the final report.

\(^{498}\) During June and into July the health care system was still dealing with SARS patients and public health authorities were still dealing with SARS issues. It was required by the terms of reference, and by common sense, that the investigation be conducted in a manner that does not impede ongoing efforts to isolate and contain SARS.
Most of the Commission’s investigation takes place through confidential interviews. Over 400 interviews have been held on the condition that those interviewed will not be identified by name in the report and that their disclosure to the Commission is confidential and not subject to private or public access.

The Commission is grateful to those who have come forward to provide information and in particular to the many who suffered from SARS and lost family members to SARS, who shared their stories despite the pain of reliving their suffering and loss. The Commission will speak to more SARS victims in the months ahead including those who lost loved ones to SARS.

The Commission will continue to conduct interviews in the months to come. Anyone who wishes to speak to the Commission should contact Commission Counsel, Mr. Douglas Hunt, Q.C., (416-212-6868) or Assistant Commission Counsel, Ms. Jennifer Crawford (416-212-6867).

In addition to the private interviews, the Commission held six days of public hearings. The first round of public hearings were held on September 29, 30 and October 1 at the St. Lawrence Market (North Market) in Toronto. The second round of hearings were held on November 17, 18 and 19, at the St. Lawrence Hall, in Toronto. Everyone who asked to present to the Commission was given an opportunity to be heard. Over one hundred people spoke publicly during these six days of public hearings.

Transcripts of the presentations, along with some of the power point presentations and written submissions provided to the Commission by presenters during the public hearings, are available for public viewing at the Commission web site: www.sarscommission.ca.

There is no deadline for the completion and submission of the final report. The work will continue until the Commissioner is satisfied that all necessary evidence has been reviewed and that the terms of reference have been fulfilled. For further information or future updates on the work of the Commission, please visit our web site at www.sarscommission.ca.
Appendix D: Letter of Appointment

Ministry of Health
and Long-Term Care

Office of the Minister
10th Floor, Hepburn Block
80 Grosvenor Street

June 10, 2003

The Honourable Mr. Justice Archie G. Campbell
130 Queen Street West
Toronto, ON M5H 2N5

Dear Mr. Justice Campbell:

This letter will confirm your appointment as an independent Investigator, pursuant to section 78 of the Health Protection and Promotion Act, to investigate the recent introduction and spread of Severe Acute Respiratory Syndrome (SARS). I would like to express my thanks for your valuable input into the development of the Terms of Reference for this inquiry, a copy of which is appended hereto.

As you are aware, persons who disclose information to you in the course of your investigation will be protected from any adverse employment action, pursuant to Section 9.1(1) of the Public Inquiries Act.

As indicated in the Terms of Reference, you will deliver your reports to me and I will release them to the public. You will receive resources and support staff through the Ministry of the Attorney General, pursuant to paragraph 7 of the Terms of Reference.

In accordance with the attached Order in Council, all Government ministries, agencies, boards and commissions and their employees have been directed to co-operate with your investigation and to respect its independence.

On behalf of the Government and the people of Ontario, I thank you for agreeing to accept this most important mandate.

Yours very truly,

Tony Clement
Minister
Appendix E: Order in Council

Ontario
Executive Council
Conseil exécutif

On the recommendation of the undersigned, the Lieutenant Governor, by and with the advice and concurrence of the Executive Council, orders that:

WHEREAS the Minister of Health and Long-Term Care has appointed the Honourable Mr. Justice Archie G. Campbell to investigate the recent introduction and spread of Severe Acute Respiratory Syndrome (“SARS”) pursuant to section 78 of the Health Protection and Promotion Act;

WHEREAS the Minister of Health and Long-Term Care has provided Mr. Justice Campbell terms of reference for the investigation in a letter dated June 10, 2003;

WHEREAS persons who disclose information to Justice Campbell in the course of his investigation will be protected from any adverse employment action;

AND WHEREAS it is desirable to support Mr. Justice Campbell’s investigation and to mandate full co-operation with him by all Government ministries, boards, agencies and commissions:

ALL Government Ministries, Boards, Agencies and Commissions, and their employees, shall assist Mr. Justice Campbell to the fullest extent in order that he may carry out his investigation;

ALL Government Ministries, Boards, Agencies and Commissions shall respect the independence of the investigation;

THE Attorney General shall furnish Mr. Justice Campbell with the resources and support referred to in paragraph 7 of the terms of reference for the investigation.

Recommended: _______________________________ Concurred: _______________________________
Minister of Health and Long-Term Care 
Chair of Cabinet

Approved and Ordered: June 10, 2003

Date

O.C./Décret 1230/2003

545
Appendix F: Terms of Reference

Independent SARS Commission
Terms of Reference

1. The subject matter of the investigation shall be:

   (a) how the SARS virus was introduced here and what measures, if any, could have been taken at points of entry to prevent its introduction;

   (b) how the SARS virus spread;

   (c) the extent to which information related to SARS was communicated among health care workers and institutions involved in dealing with the disease;

   (d) whether health care workers and patients in health care treatment facilities and long-term care facilities were adequately protected from exposure to SARS, having regard for the knowledge and information available at the time;

   (e) the extent of efforts taken to isolate and contain the virus and whether they were satisfactory or whether they could have been improved;

   (f) existing legislative and regulatory provisions related to or that have implications for the isolation and containment of infectious diseases, including the quarantine of suspected carriers;

   (g) any suggested improvements to provincial legislation or regulations, and any submissions that the Province of Ontario should make concerning desirable amendments to federal legislation or regulations; and,

   (h) all other relevant matters that Mr. Justice Campbell considers necessary to ensure that the health of Ontarians is protected and promoted and that the risks posed by SARS and other communicable diseases are effectively managed in the future.
2. The investigation shall be conducted in a manner that does not impede ongoing efforts to isolate and contain SARS.

3. Mr. Justice Campbell may request any person to provide relevant information or records to him where he believes that the person has such information or records in his, hers or its possession or control.

4. Mr. Justice Campbell shall hold such public or private meetings as he deems advisable in the course of his investigation.

5. Mr. Justice Campbell shall conduct the investigation and make his report without expressing any conclusion or recommendation regarding the civil or criminal responsibility of any person or organization, without interfering in any ongoing criminal, civil or other legal proceedings, and without making any findings of fact with respect to civil or criminal responsibility of any person or organization.

6. Mr. Justice Campbell shall produce an interim report at his discretion and deliver it to the Minister of Health and Long-Term Care who shall make the report available to the public. Upon completion of his investigation, Mr. Justice Campbell shall deliver his final report containing his findings, conclusions and recommendations to Minister of Health and Long-Term Care who shall make such report available to the public.

7. To conduct his investigation Mr. Justice Campbell shall be provided with such resources as are required, and be authorized by the Attorney General and shall have the authority to engage lawyers, experts, research and other staff as he deems appropriate, at reasonable remuneration approved by the Ministry of the Attorney General.

8. The reports shall be prepared in a form appropriate for release to the public, pursuant to the Freedom of Information and Protection of Privacy Act.

9. These terms of reference shall be interpreted in a manner consistent with the limits of the constitutional jurisdiction of the Province of Ontario.

In the event that Mr. Justice Campbell is unable to carry out any individual term of his mandate, the remainder of these terms of reference shall continue to operate, it being the intention of the Minister of Health and Long-Term Care that the provisions of these terms of reference operate independently.
