Week #15: Week Ending April 13, 2002

Influenza Activity in Ontario

There were 98 cases of influenza A, and 20 cases of influenza B reported in the province for the week April 13, 2002. The reported upper respiratory isolates included: 32 respiratory syncytial virus (RSV), 1 parainfluenza type 1 (PIV1), and 5 adenovirus (Table 1).

In Ontario, institutional outbreaks continue to decline this week. Only 9 outbreaks were reported, and were detected by either rapid testing or viral culture. The following health units reported influenza A outbreaks: Haldimand-Norfolk, Thunder Bay, Toronto, Waterloo, Wellington-Dufferin-Guelph, and Windsor-Essex.

Due to a temporary transmission delay with RDIS, all data from the Health Units has not been updated in Table 2. The data in Table 2 is accurate only up until week #10.

Correction: To-date, Ottawa Health Unit has had a total of 18 outbreaks, which is lower than what has been recorded. This revision has been reflected in Table 1 and Table 3.

The total number of institutional outbreaks to-date in Ontario is 195 (Tables 1, 2, and 3).

Table 1. Comparison of Influenza Activity for the 2000-01 and 2001-02 Influenza Surveillance Seasons

Indicator	2000-01 Season	2001-02 Season
	Week Ending April 14, 2001	Week Ending April 13, 2002
	Season-to-date	Season-to-date
*Laboratory Surveillance (isolates) Total	840	1662
Influenza A	394	1067
Influenza B	446	595

Vaccine and Strain Characterization

(Up to April 9, 2002) In Ontario, of the influenza samples sent for sub-typing to the National Microbiology Laboratory at Health Canada, 61 were A/Panama/2007/99(H3N2)-like isolates, 81 were B/Hong Kong/22/01-like isolates, and 2 were B/Sichuan/379/99-like (Table 4).

The B/Hong Kong/22/01-like viruses are antigenically different from current vaccine strains and the current vaccine is expected to provide limited cross-protection against these viruses. The A(H3N2), A(H1) and B/Sichuan/379/99-like viruses are similar to the current vaccine strains.

This year's influenza vaccine B component provides protection mainly against B/Yamagata/16/88-like viruses, but as several studies have shown, this strain also provides some protection against the B/Victoria/504/2000-like viruses. The type A strains identified in Canada, and in Ontario, are included in the current season's vaccine.

Table 4. Season-to-date Strain Identification and Characterization In Canada, 2001-02*

Province/Territory	Strain Characterization	# of Strains Identified-to-date
Newfoundland	A/Panama/2007/99(H3N2)-like	14
Prince Edward Island	A/Panama/2007/99(H3N2)-like	4
Nova Scotia	A/Panama/2007/99(H3N2)-like	10
	B/Hong Kong/22/01-like	1
New Brunswick	A/Panama/2007/99(H3N2)-like	8
Quebec	A/Panama/2007/99(H3N2)-like	50
	B/Sichuan/379/99-like	1
	B/Hong Kong/22/01-like	4
Ontario	A/Panama/2007/99(H3N2)-like	61
	B/Sichuan/379/99-like	2
	B/Hong Kong/22/01-like	81
Manitoba	A/Panama/2007/99(H3N2)-like	8
	(H1N2)-like	2
Saskatchewan	A/Panama/2007/99(H3N2)-like	31
	(H1N2)-like	2
Alberta	A/Panama/2007/99(H3N2)-like	29
	A/New Caledonia/20/99 (H1N1)-like	1
	(H1N2)-like	5
	B/Hong Kong/22/01-like	10
British Colombia	A/Panama/2007/99(H3N2)-like	42
	B/Sichuan/379/99-like	1
	B/Hong Kong/22/01-like	4
Yukon	A/Panama/2007/99(H3N2)-like	2
NorthWest Territories	0	0
Nunavut	A/Panama/2007/99(H3N2)-like	5
		Total
	A/Panama/2007/99(H3N2)-like	267
	A/New Caledonia/20/99 (H1N1)-like	1
	(H1N2)-like	9

Federal FluWatch Sentinel Physician Surveillance Activity in Ontario

The rate of influenza-like illness (ILI) reported through the Federal FluWatch system was 12 per 1,000 patients seen.

Laboratory Confirmations and Influenza Activity in the Rest of Canada

Regions of Nova Scotia reported widespread influenza activity and regions of Ontario, Manitoba, Saskatchewan, Alberta and British Columbia reported localized activity. In general the number of reported outbreaks is declining. Sentinel physicians reported 24 cases of influenza-like illness (ILI) per 1000 patient visits, which is the expected rate for this time of year. Health Canada received 1697 reports of laboratory tests for influenza: 307 (18%) were positive for influenza A and 16 (1%) were positive for influenza B. The National Microbiology Laboratory antigenically characterized 323 influenza isolates to date this season: 228 were A(H3N2); six were A(H1); four were B/Sichuan/379/99-like, and 85 were B/Hong Kong/22/01-like. Of the six A(H1) isolates identified antigenically, five were characterized by genetic analysis to be a new influenza A(H1N2) strain. The H1N2 strains were identified from specimens taken since December 2001 from patients in Alberta (1), Saskatchewan (2) and Manitoba (2). The majority of B/Hong Kong/22/01-like viruses were identified from specimens taken in Ontario. The B/Hong Kong/22/01-like viruses are antigenically different from the current vaccine strains and the current vaccine is expected to provide limited cross-protection against these viruses. The A(H3N2), A(H1) and B/Sichuan/379/99-like viruses are similar to the current vaccine strains.

Influenza Activity in the United States

During week 14 (March 31 – April 6, 2002), 123 (11.7%) of 1,052 respiratory specimens tested by World Health Organization (WHO) and National Respiratory Virus Surveillance System (NREVSS) laboratories were positive for influenza. The overall proportion of patient visits to sentinel physicians for influenza-like illness (ILI) was 1.4%, which is below the national baseline of 1.9%. The proportion of deaths attributed to pneumonia and influenza was 7.8%, which is below the epidemic threshold of 8.0% for week 14. Eight state and territorial health departments reported regional influenza activity, 33 reported sporadic activity, and 8 reported no influenza activity.
