

SURVEILLANCE WEEK 50 (December 9– December 15) 2007

This issue of the Ontario Influenza Bulletin provides information on the surveillance period from December 9 - December 15, 2007, (Week 50). The analysis for this issue occurred on Thursday December 20, 2007, therefore all data is current to that date unless otherwise specified.

Overall, influenza activity in Ontario during week 50, 2007 was slightly higher compared to week 49, 2007. Thirty-four sporadically occurring cases of influenza A and one sporadic case of influenza B were reported through iPHIS from health units. There were no new reports of institutional outbreaks of influenza. For week 50, the highest level of influenza activity was 'localized' reported from Toronto, while 'sporadic' activity was reported from North East, Central East, and Central West. The remaining regions in Ontario reported 'no activity' for influenza.

In Canada for week 49, influenza activity levels remained low; most regions across the country reported 'no activity'. Seventeen regions reported sporadic influenza activity and only 2 regions (in central Alberta and the Interior region of British Columbia) reported localized activity. Note: No data was received from the Toronto region in Ontario this week.[†]

Please note that the Bulletin will not be published next week due to the holiday season. However, please submit the influenza activity report for next week on Thursday December 27th. Week 51 activity levels will be included in the next published edition of the Bulletin. Activity levels will be reported for inclusion in FluWatch. On behalf of the staff at the MOHLTC, we would like to wish you and your family a healthy and joyous holiday season.

Tip of the month:

For health unit staff assigning influenza activity levels for their unit (Appendix C data), please note that for "sporadic activity", symptom onset dates for lab-confirmed cases must fall within the surveillance week on the reporting form. Onset date of symptoms, not the date of lab confirmation, is when activity occurs (please refer to footnote on pages 2 and 3 for episode date hierarchy).

Please refer to page 13 for report submission dates.

Table 1: Summary of confirmed influenza cases and institutional influenza outbreaks by health region (Week 50, 2007).

Confirmed influenza cases*	HEALTH REGION							TOTAL
	North West	North East	Eastern	Central East	Toronto	South West	Central West	
Influenza A	0	4	0	6	20	0	4	34
Influenza B	0	1	0	0	0	0	0	1
Influenza A & B	0	0	0	0	0	0	0	0
Total new cases	0	5	0	6	20	0	4	35
Institutional influenza outbreaks‡	0	0	0	0	0	0	0	0

SOURCE: MOHLTC [iPHIS, Health Unit Reports to PHD]

* Includes reports of sporadically occurring influenza through iPHIS, as well as cases in institutional outbreaks, with dates of onset in the surveillance period.

† These data have been obtained from the FluWatch report of the Public Health Agency of Canada for Week 49, 2007.

‡ Confirmed outbreaks in institutions with onset date of symptoms during the surveillance period.

SOURCE: MOHLTC [iPHIS, Health Unit Reports have been extracted using CRN at PHD]

* Cumulative case counts include late reports and records that are otherwise reconciled. Therefore, cumulative counts may not equal new cases plus previous cumulative value.

[†] Episode Date for a case corresponds to the earliest date on record for the case according to the iPHIS hierarchy (Symptom Date > Clinical Diagnosis Date > Specimen Collection Date > Lab Test Date > Reported Date)

[‡]Note that the case of influenza reported from Simcoe Muskoka District represents a case co-infected with Influenza A & B

Influenza Subtype(s):

During week 50, 2244 isolates were received by the Public Health Agency of Canada, with 47 testing positive for influenza A and 20 for influenza B. The majority of influenza A isolates (39) were from Ontario (83.0%), while three each (6.4%) were from Saskatchewan and British Columbia and one each (2.1%) were from Alberta and Quebec. The majority of influenza B isolates (18) were reported from Alberta (90.0%), while one each was from British Columbia and Quebec.*

Antigenic Characterization:

The National Microbiology Laboratory (NML) has characterized 33 influenza viruses for the 2007-2008 influenza season: 18 A(H1N1), 6 A(H3N2) and 9 B viruses. All influenza A(H1N1) viruses were antigenically similar to A/Solomon Islands/3/2006. Of the 6 influenza A(H3N2) viruses characterized, 5 were antigenically similar to A/Wisconsin/67/2005 and 1 was antigenically similar to A/Brisbane/10/2007. One of the five A/Wisconsin-like viruses had reduced titer to A/Wisconsin/67/2005 reference antiserum. Of the 9 influenza B isolates characterized, 2 were antigenically similar to B/Malaysia/2506/2004 and 7 were antigenically similar to B/Florida/4/2006 (belonging to the B/Yamagata lineage).**

Antiviral Resistance:

Since the start of the season, the NML has tested 15 influenza A isolates (7 H1N1 and 8 H3N2) for amantadine resistance (from Ontario, Alberta and British Columbia). Six (40% or 6/15) of the isolates tested were resistant to amantadine (originating from Ontario and Alberta), all of which were H3N2 viruses. Of the 30 isolates tested for oseltamivir resistance (22 influenza A, 8 influenza B), none were found to be resistant.**

Note: The WHO recommends that the trivalent vaccine for the 2007-2008 season in the northern hemisphere (which includes Canada) contain an A/Solomon Islands (H1N1)-like virus; an A/Wisconsin (H3N2)-like virus; and a B/Malaysia-like virus.

* These data have been obtained from the Respiratory Virus Detection tables of Public Health Agency of Canada: Week 50, 2007.

** These data have been obtained from the FluWatch report of the Public Health Agency of Canada for Week 49, 2007.

Figure 1: Total number of influenza tests performed and percent of positive tests in Ontario reported to the Centre for Infectious Disease Prevention and Control (CIDPC), by report week.

* New outbreaks are those in which the date of onset of illness in the first case occurred and recorded through iPHIS in the current surveillance period; i.e. December 9 – December 15, 2007

** Season to date includes all outbreaks in which the date of onset of illness in the first case occurred from September 1, 2007 – December 15, 2007

[†] Combined outbreaks include outbreaks in which more than one non-influenza organism has been identified (e.g. RSV, parainfluenza, rhinovirus, etc.)

APPENDIX - I

Definitions for influenza activity levels:

No Data: No activity report corresponding to the surveillance week was received at the Ministry of Health and Long-Term Care Call Centre by the Tuesday (at 4 p.m.) following the end of the surveillance period.

No Activity: **No laboratory confirmed* influenza and NO outbreaks detected** within the health unit/ influenza surveillance area, within the prior week, although sporadically occurring ILI may or may not be present.†

Sporadic: Sporadically (infrequently) occurring **ILI and at least one lab-confirmed influenza* case with NO outbreaks** detected within the health unit area.†

Localized: sporadically occurring **ILI and lab-confirmed influenza* together with outbreaks of ILI** in schools and work sites, or laboratory-confirmed influenza in residential institutions occurring in < 50% of the health unit . Outbreaks affect a single and/or adjacent geographic area within the health unit jurisdiction, e.g. outbreaks in a nursing home and a school in close proximity to each other.†

Widespread: sporadically occurring **ILI and lab-confirmed influenza* together with outbreaks of ILI** in schools and work sites, or laboratory-confirmed influenza in residential institutions occurring in > 50% of the health unit. Outbreaks affect multiple and non-adjacent geographic areas within the health unit jurisdiction, such as two or more regions of the health unit, two or more municipalities, two or more electoral wards, etc.†

* Confirmation of influenza within the surveillance region at any time within the prior week

† Sub-regions within the province or territory as defined by the provincial/territorial epidemiologist

Influenza-Like Illness (ILI) Definitions:

A) ILI in the general population:

Acute onset of respiratory illness with fever and cough and with one or more of the following - sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

B) ILI/Influenza outbreaks:

Schools and work sites: greater than 10% absenteeism on any day, most likely due to ILI.

Residential institutions: two or more cases of ILI within a seven-day period, **including at least one laboratory confirmed case.**
