

SURVEILLANCE WEEKS 22 & 23 (May 30, 2010– June 12, 2010)

This issue of the Ontario Influenza Bulletin provides information on the surveillance period from May 30, 2010 to June 12, 2010 (Weeks 22 & 23). **All data are for weeks 22 & 23 unless otherwise specified.** Data extraction and analysis for this issue of the Bulletin occurred on June 16, 2010.

In order to enable our readers to better assess influenza activity in Ontario, we have combined various sources of information in the following table.

Assessment of Influenza Activity in Ontario

Measure	Assessment of measure compared to previous week (Lower, Similar, Higher)	Reasoning behind assessment
Laboratory Confirmed Cases	Similar	Zero influenza cases (0 pH1N1) reported in weeks 22 & 23, which is the same as week 21*. The percent positivity of laboratory tests for influenza A at the Toronto Public Health Laboratory was 0% for weeks 22 & 23. This is the same as week 21 (0%). Several other respiratory viruses continue to circulate in Ontario (Table 5).
Influenza A Outbreaks	No change	No new institutional influenza outbreaks were reported for the current reporting week.
Influenza Activity Levels Reported by Health Units	Lower	No health units reported 'sporadic' activity for the current reporting week.
ILI Consultation Rate reported by Sentinel Physicians	Similar	The overall ILI consultation rate has decreased slightly from 10.02/1,000 patient visits in Week 21 to 7.86/1,000 patient visits in Week 23. The ILI rate is lower than the average rate for week 23 from previous years.
Hospitalizations Among Lab Confirmed Cases of Influenza	No change	No new hospitalizations in influenza cases were reported from June 6 to June 12, which is the same as the previous week (May 30 to June 5).
Deaths Among Lab Confirmed Cases of Influenza	No change	No new deaths in influenza cases were reported from June 6 to June 12, which is the same as the previous week (May 30 to June 5).
OVERALL ASSESSMENT	Influenza activity in Ontario is <i>similar</i> compared to the previous week.	Overall, the indicators show that influenza activity was similar in weeks 22 & 23 compared to week 21.

*Counts from previous weeks may be updated and therefore may not match reports in earlier Bulletins

Ontario Influenza Bulletin, 2009-2010**Surveillance Weeks 22 & 23 (May 30, 2010 – June 12, 2010)**

Overall, influenza activity in Ontario during weeks 22 and 23, 2010, was **similar** when compared to week 21, 2010. Ontario health units reported no new confirmed cases of influenza for the current two weeks through the integrated Public Health Information System (iPHIS). During weeks 22 and 23, 2010, no new laboratory confirmed cases of pH1N1 were seen in Ontario. No new institutional influenza outbreaks were reported. For week 23, health units either reported no activity or did not report their activity level. The rate of influenza-like illness (ILI) in patients seen by sentinel physicians is similar to what is expected for this time of the year based on the average ILI rate reported in week 23 from previous years.

Publication of the Ontario Influenza Bulletin

The Bulletin will be published on alternate weeks until October 2010. Influenza activity level maps will be available on weeks the Bulletin is not published at:

http://www.health.gov.on.ca/english/providers/program/pubhealth/flu/flu_09/flumap_mn.html

For a definition of ILI activity levels and links to websites providing current influenza information from other sources, please refer to the attached Appendix- I. If you would like to provide feedback on the Bulletin, please contact Christine D'Souza (christine.dsouza1@ontario.ca, 416-212-5323) or Michael Whelan (michael.whelan@ontario.ca, 416-327-9174).

Table 1: Summary of confirmed influenza cases and institutional influenza outbreaks by health region (Weeks 22 & 23, 2009-2010)

* Includes reports of confirmed influenza through iPHIS, as well as cases in institutional outbreaks, with dates of onset for the first case in the surveillance period.

‡ Confirmed outbreaks in institutions with onset date of symptoms during the surveillance period.

** Includes indeterminate, untypeable and other subtypes.

Ontario Influenza Bulletin, 2009-2010

Surveillance Weeks 22 & 23 (May 30, 2010 – June 12, 2010)

The number of influenza A cases reported during the second wave of the pandemic began to increase in early September, with a maximum number of cases reported in week 44 (November 1-7, 2009). The maximum case volume observed to date in the 2009-2010 season has exceeded the maximum case volume in all of the past five influenza seasons (however in other influenza seasons, there has been less extensive testing). The number of cases of influenza A reported in week 21 of the 2009-2010 season is close to the number reported from previous seasons in the same week.

The number of influenza B cases reported to date for week 21 is close to the number reported in previous seasons but the total number of influenza B cases is lower in the 2009-2010 season than in previous seasons.

*includes indeterminate, untypeable and other subtypes

Hospitalizations and deaths among influenza cases, Sep. 1, 2009 – June 12, 2010

As of June 12, 2010, a total of 2,222 hospitalizations were reported among influenza cases reported in Ontario for the 2009-2010 season. This represents a population-based incidence rate of 17.20 cases per 100,000 population. During this time frame, a total of 122 deaths were reported for a mortality rate of 0.94 cases per 100,000 population. Almost all of the hospitalizations (2,216/2,222) and deaths (120/122) were due to influenza A.

Ontario Influenza Bulletin, 2009-2010
Surveillance Weeks 22 & 23 (May 30, 2010 – June 12, 2010)
Influenza Subtype(s):

During weeks 22 & 23, a total of 1932 results of isolate testing were received by the Public Health Agency of Canada, with one testing positive for influenza A and none positive for influenza B. The one influenza A isolate was from Quebec (100.0%) .*

(Antigenic Characterization and Antiviral Resistance data are current as of May 5, 2010)

Antigenic Characterization (National):

Since September 1, 2009, National Microbiology Laboratory (NML) has antigenically characterized 851 pandemic H1N1 viruses and 17 seasonal influenza viruses (three A/H1N1, ten A/H3N2 and four B viruses) that were received from Canadian laboratories.

Pandemic Influenza A (H1N1):

Among the 851 pandemic influenza A (H1N1) viruses characterized, 847 (99.5%) were antigenically related to A/California/7/2009, which is the pandemic reference virus selected by WHO as a potential candidate for 2009 influenza A (H1N1) vaccine. Four viruses (0.5%) tested showed reduced titer with antisera produced against A/California/7/2009.

Seasonal Influenza A (H1N1):

Three seasonal influenza A/H1N1 viruses characterized were related to A/Brisbane/59/2007, which is the influenza A/H1N1 component for the 2009-2010 influenza vaccine.

Seasonal Influenza A (H3N2):

Of the ten H3N2 viruses, two seasonal influenza A (H3N2) virus characterized were related to A/Brisbane/10/2007, which is the influenza A/H3N2 component recommended for the 2009-10 influenza vaccine. Eight viruses were antigenically related to A/Perth/16/2009, which is the WHO recommended influenza A (H3N2) component for the 2010 -11 Northern Hemisphere vaccine formulation.

Influenza B:

Among the four influenza B viruses characterized, two were antigenically related to B/Brisbane/60/2008, which is the recommended influenza B component for the 2009-2010 influenza vaccine. One B virus was related to the previous vaccine virus B/Florida/4/2006 (Yamagata lineage) and one B virus was related to the 2007-2008 vaccine virus B/Malaysia/2506/2004 (Victoria lineage).

Antigenic Characterization (Provincial):

Since September 1, 2009, The National Microbiology Laboratory (NML) has antigenically characterized the following strains from Ontario: 295 influenza A/California/07/2009-like, 2 influenza B/Brisbane/60/2008-like and 1 influenza B/Malaysia/2506/2004-like.

Antiviral Resistance and Sensitivity (National):

a) Amantadine

Twenty-nine seasonal influenza A viruses (five H1N1 and 24 H3N2) and 1136 pandemic H1N1 viruses were tested for resistance to amantadine and found that one H1N1 virus, all 24 H3N2 viruses and all 1136 pandemic H1N1 viruses were resistant. Four seasonal H1N1 viruses were sensitive to amantadine.

b) Oseltamivir:

Twenty-three seasonal influenza viruses (six H1N1, thirteen H3N2 and four B) and 1079 pandemic H1N1 viruses were tested for resistance to oseltamivir. Six seasonal H1N1 isolates were resistant to oseltamivir. Of the 1079 pandemic H1N1 viruses tested, 1067 were sensitive to oseltamivir and 12 pH1N1 isolates were resistant to oseltamivir with the H275Y mutation. Twelve of the resistant cases were associated with oseltamivir treatment

c) Zanamivir:

Nineteen seasonal influenza viruses (two H1N1, thirteen H3N2 and four B) and 1057 pandemic H1N1 viruses were tested for resistance to zanamivir. All 19 seasonal influenza viruses and all 1057 pandemic H1N1 viruses were sensitive to zanamivir.

Antiviral Resistance and Sensitivity (Provincial):

a) Amantadine

Of the 315 pH1N1 isolates tested, all were resistant to amantadine. Two H3N2 isolates were also resistant to amantadine.[†]

b) Oseltamivir

Of the 313 influenza pH1N1 isolates from Ontario tested at NML, 4 were resistant to oseltamivir. One seasonal influenza A/H1N1 virus was also resistant. Of 770 Ontario isolates tested provincially by the OAHPP 15, representing 5 patients, were resistant to oseltamivir.[‡] Three influenza B isolates were sensitive to oseltamivir.

c) Zanamivir

All 306 pH1N1 isolates tested were sensitive to zanamivir. Three influenza B isolates were sensitive to zanamivir.

* New outbreaks are those in which the date of onset of illness in the first case occurred and recorded through iPHIS in the current surveillance period; i.e. May 30, 2010 – June 12, 2010

** Season to date includes all outbreaks in which the date of onset of illness in the first case occurred up to Week 23.

[†] Combined outbreaks include outbreaks in which more than one non-influenza organism has been identified (e.g. RSV, parainfluenza, rhinovirus, etc.)

Figure 8: Institutional influenza outbreaks in Ontario by onset of illness in the first case: Total outbreaks up to and including Week 23 by subtype*

Source: Ontario Ministry of Health and Long-Term Care, integrated Public Health Information System (iPHIS) database, extracted [16/06/2010]

*School outbreaks are not included in this chart.

Figure 9: Influenza Activity* levels in Ontario by health unit for Week 23, 2010

SOURCE: MOHLTC [Provincial Influenza Activity Report (Appendix C) Database]

* Influenza activity levels are assigned by local public health units and reported to the MOHLTC by the Tuesday following the end of the surveillance week at 4 pm. Activity levels are assigned based on laboratory confirmations, ILI reports from various sources, and laboratory confirmed institutional outbreaks. Please refer to detailed definitions for the 2009-2010 season included in the Appendix-1]

Figure 10: Influenza incidence rates and counts in Ontario by health unit for Weeks 22 and 23, 2010

Source: Ontario Ministry of Health and Long-Term Care, integrated Public Health Information System (iPHIS) database, extracted [16/06/2010]

Figure 11: Average influenza-like illness (ILI) consultation rate (per 1,000 patient visits) reported by sentinel physicians* in Ontario up to the 2009-10 surveillance season, by report week, compared to Ontario average† (1999/2000 to 2007/08 seasons).

Source: Public Health Agency of Canada

* Sentinel physician information is reported to Public Health Agency of Canada, 73 sentinels reported in week 23.

† No data available for mean rate in previous years for weeks 21 to 39 (1999-2000 through 2004-2005 seasons). During weeks 20-39, 2002-2003/2004-2005 seasons, ILI is reported once every two weeks, on even weeks only.

Since Week 23, 2009, the number of sentinel physicians has increased, which might affect ILI rate starting from week 23.

Figure 12: Average influenza-like illness consultation rate (per 1,000 patient visits) by health unit as reported by sentinel physicians* in Ontario, for Week 23.

Source: Public Health Agency of Canada

* Sentinel physicians report ILI and patient data to the Public Health Agency of Canada; 73 sentinels reported this week of which all were matched to a health unit and represented in the above map.

Note: The small numbers of sentinel physicians reporting at the local level can make the ILI rates unstable. Please interpret these data correspondingly.

Table 8: Average influenza-like illness consultation rate (per 1,000 patient visits) by age group as reported by sentinel physicians* in Ontario, for Week 23.

Age Category	0 – 4	5 – 19	20 – 64	65 +	Unknown	TOTAL
ILI Sum	3	1	11	0	0	15
ILI Consultation Rate (per 1,000 patient visits)	26.09	5.13	9.62	0.00	0.00	7.86

Source: Public Health Agency of Canada

Sentinel physician information is reported to the Public Health Agency of Canada; 73 sentinels reported this week.

Ontario Influenza Bulletin, 2009-2010

Surveillance Weeks 22 & 23 (May 30, 2010 – June 12, 2010)

Immunization Monitoring Program ACTive (IMPACT) is a paediatric hospital-based national active surveillance network for adverse events following immunization and selected infectious diseases in children, including influenza-associated pediatric hospitalizations and complements the [Canadian Adverse Event Following Immunization Surveillance System](#) (CAEFISS). It involves 12 Canadian centres, two of which are in Ontario (Children's Hospital of Eastern Ontario in Ottawa and the Hospital for Sick Children, Toronto).

Reports of adverse events following immunization are reported to the Vaccine Safety Unit at the Immunization Division of the Public Health Agency of Canada. Note that the number of IMPACT hospitalizations presented in this week's bulletin has been updated with the latest data received from PHAC.

Figure 13: Number of influenza A related hospitalizations in Ontario reported through IMPACT up to Week 23, by onset date.

Source: Public Health Agency of Canada

*Note: The number of IMPACT hospitalizations presented reflect the latest data received at the time of publication, thus lower numbers of cases reported in recent weeks may be attributed in part to reporting delays.

APPENDIX - I

Definitions for influenza activity levels:

No Data: No activity report corresponding to the surveillance week was received at the Ministry of Health and Long-Term Care Call Centre by the Tuesday (at 4 p.m.) following the end of the surveillance period.

No Activity: **No laboratory-confirmed* influenza and NO outbreaks detected** within the health unit/ influenza surveillance area, within the prior week, although sporadically occurring ILI may or may not be present.†

Sporadic: Sporadically (infrequently) occurring **ILI and at least one lab-confirmed influenza* case with NO outbreaks** detected within the health unit area.†

Localized: sporadically occurring **ILI and lab-confirmed influenza* together with outbreaks of ILI** in schools§ and work sites, or laboratory-confirmed influenza in residential institutions occurring in < 50% of the health unit. Outbreaks affect a single and/or adjacent geographic area within the health unit jurisdiction, e.g. outbreaks in a nursing home and a school in close proximity to each other.†

Widespread: sporadically occurring **ILI and lab-confirmed influenza* together with outbreaks of ILI** in schools and work sites, or laboratory-confirmed influenza in residential institutions occurring in > 50% of the health unit. Outbreaks affect multiple and non-adjacent geographic areas within the health unit jurisdiction, such as two or more regions of the health unit, two or more municipalities, two or more electoral wards, etc.†

* Confirmation of influenza within the surveillance region at any time within the prior week

† Sub-regions within the province or territory as defined by the provincial/territorial epidemiologist

§Health units have been requested to consider laboratory confirmed pH1N1 outbreaks in camps in their region when evaluating ILI activity levels

Influenza-Like Illness (ILI) Definitions:

A) ILI in the general population:

Acute onset of respiratory illness with fever and cough and with one or more of the following - sore throat, arthralgia, myalgia, or prostration which could be due to influenza virus. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

B) ILI/Influenza outbreaks:

Schools and work sites: greater than 10% absenteeism on any day, most likely due to ILI.

Residential institutions: two or more cases of ILI within a seven-day period, **including at least one laboratory confirmed case.**

Weekly Ontario Influenza Activity Map

SOURCE: MOHLTC [Provincial Influenza Activity Report (Appendix C) Database]

Influenza Activity levels are assigned by local public health units and reported to the MOHLTC every week. Activity levels are assigned based on laboratory confirmation of influenza, influenza like illness (ILI) reports from various sources including hospitals, institutions experiencing respiratory infection outbreaks, physicians' offices, etc.

Activity level definitions for the 2009-10 influenza season are as follows:

No Data: No activity report corresponding to the surveillance week was received at the Ministry of Health and Long-Term Care Call Centre by the Tuesday (at 4 p.m.) following the end of the surveillance period. **No Activity:** **No laboratory-confirmed* influenza and NO outbreaks detected** within the health unit/ influenza surveillance area, within the prior week, although sporadically occurring ILI may or may not be present.† **Sporadic:** Sporadically (infrequently) occurring ILI and **at least one lab-confirmed influenza* case with NO outbreaks** detected within the health unit area.† **Localized:** sporadically occurring **ILI and lab-confirmed influenza* together with outbreaks of ILI** in schools§ and work sites, or laboratory-confirmed influenza in residential institutions occurring in < 50% of the health unit. Outbreaks affect a single and/or adjacent geographic area within the health unit jurisdiction, e.g. outbreaks in a nursing home and a school in close proximity to each other.† **Widespread:** sporadically occurring **ILI and lab-confirmed influenza* together with outbreaks of ILI** in schools and work sites, or laboratory-confirmed influenza in residential institutions occurring in > 50% of the health unit. Outbreaks affect multiple and non-adjacent geographic areas within the health unit jurisdiction, such as two or more regions of the health unit, two or more municipalities, two or more electoral wards, etc.†

* Confirmation of influenza within the surveillance region at any time within the prior week

† Sub-regions within the province or territory as defined by the provincial/territorial epidemiologist

§ Health units have been requested to consider laboratory confirmed pH1N1 outbreaks in camps in their region when evaluating ILI activity levels

Note: The Weekly Ontario Influenza Activity Map will be posted on this site bi-weekly, alternating with the *Ontario Influenza Bulletin* (which contains the Influenza Activity map), until the end of October, 2010. As of November 5, 2010, the *Ontario Influenza Bulletin* will be published weekly.
