## MANUAL REVISION RECORD

### Provincial-Oriented

#### Volume 5 – MTO General Conditions of Contract and General & Construction Specifications

This record should remain in the manual at all times. Revisions are numbered sequentially. This sheet should be filled in after each revision has been placed into the manual. It will quickly indicate to users whether the contents of the manual are up-to-date.

| REVISION<br>NUMBER | REVISION<br>DATE | ENTERED<br>BY              | REVISION<br>NUMBER | DATE       | ENTERED<br>BY              |
|--------------------|------------------|----------------------------|--------------------|------------|----------------------------|
| 1                  | April 2008       | Included in new<br>manuals | 25                 | April 2022 | Included in new<br>manuals |
| 2                  | Nov 2008         | Included in new<br>manuals | 26                 | Nov 2022   | Included in new<br>manuals |
| 3                  | Apr 2010         | Included in new<br>manuals | 27                 | Apr 2023   | Included in new<br>manuals |
| 4                  | Nov 2010         | Included in new<br>manuals | 28                 |            |                            |
| 5                  | Apr 2012         | Included in new<br>manuals | 29                 |            |                            |
| 6                  | Nov 2012         | Included in new<br>manuals | 30                 |            |                            |
| 7                  | Nov 2013         | Included in new<br>manuals | 31                 |            |                            |
| 8                  | Nov 2014         | Included in new<br>manuals | 32                 |            |                            |
| 9                  | April 2015       | Included in new<br>manuals | 33                 |            |                            |
| 10                 | Nov 2015         | Included in new<br>manuals | 34                 |            |                            |
| 11                 | April 2016       | Included in new<br>manuals | 35                 |            |                            |
| 12                 | Nov 2016         | Included in new<br>manuals | 36                 |            |                            |

**MTO GENERAL CONDITIONS OF CONTRACT**

|          |     |                                    |
|----------|-----|------------------------------------|
| Apr 2023 | 100 | MTO General Conditions of Contract |
|----------|-----|------------------------------------|

**DIVISION 1 - GENERAL SPECIFICATIONS**

|          |     |                                                                                                 |
|----------|-----|-------------------------------------------------------------------------------------------------|
| Nov 2019 | 106 | Electrical Work                                                                                 |
| Nov 2014 | 120 | Use of Explosives                                                                               |
| Apr 2023 | 127 | Schedule of Rental Rate for Construction Equipment, Including Model and Specification Reference |
| Nov 2016 | 180 | Management of Excess Materials                                                                  |
| Apr 2021 | 182 | Environmental Protection for Construction in and Around Waterbodies and on Waterbody Banks      |

**DIVISION 2 - GENERAL GRADING**

|          |     |                                                                                        |
|----------|-----|----------------------------------------------------------------------------------------|
| Apr 2019 | 201 | Clearing, Close Cut Clearing, Grubbing, and Removal of Surface and Piled Boulders      |
| Nov 2013 | 202 | Rock Removal by Manual Scaling, Machine Scaling, Trim Blasting, or Controlled Blasting |
| Apr 2023 | 203 | Rock Stabilization                                                                     |
| Nov 2014 | 206 | Grading                                                                                |
| Nov 2014 | 209 | Embankments Over Swamps and Compressible Soils                                         |
| Nov 2013 | 212 | Earth Borrow                                                                           |
| Nov 2014 | 220 | Wick Drain Installation                                                                |

**DIVISION 3 - PAVEMENT (FLEXIBLE AND RIGID)**

|          |     |                                                                                |
|----------|-----|--------------------------------------------------------------------------------|
| Nov 2018 | 301 | Restoring Unpaved Roadway Surfaces                                             |
| Nov 2022 | 304 | Single and Double Surface treatment                                            |
| Nov 2022 | 305 | Granular Sealing                                                               |
| Nov 2022 | 307 | Patching of Asphalt Pavement                                                   |
| Apr 2012 | 308 | Tack Coating and Joint Painting                                                |
| Apr 2023 | 311 | Asphalt Sidewalk, Driveway, Boulevard and Sidewalk Resurfacing                 |
| Apr 2018 | 312 | Asphalt Curb and Gutter Systems and Asphalt Surfacing of Gutters               |
| Apr 2021 | 313 | Hot Mix Asphalt - End Result                                                   |
| Nov 2015 | 314 | Untreated Subbase, Base, Surface, Shoulder, Selected Subgrade, and Stockpiling |
| Nov 2018 | 316 | Extruded Expanded Polystyrene Frost Heave Treatment                            |
| Apr 2021 | 317 | Temporary Hot Mix Pavement                                                     |

| <b>DATE</b> | <b>OPSS.PROV</b> | <b>TITLE</b>                                                                     |
|-------------|------------------|----------------------------------------------------------------------------------|
| Nov 2020    | 320              | Open Graded Drainage Layer                                                       |
| Nov 2014    | 330              | In-Place Full Depth Reclamation of Bituminous Pavement and Underlying Granular   |
| Nov 2015    | 331              | Full Depth Reclamation with Expanded Asphalt Stabilization                       |
| Apr 2021    | 332              | Hot In-Place Recycling                                                           |
| Nov 2015    | 333              | Cold In-Place Recycling                                                          |
| Nov 2015    | 335              | Cold In-Place Recycling with Expanded Asphalt                                    |
| Nov 2018    | 336              | Micro-Surfacing                                                                  |
| Nov 2017    | 337              | Slurry Seal                                                                      |
| Apr 2018    | 341              | Routing and sealing Cracks in Asphalt Pavement                                   |
| Nov 2015    | 342              | Grinding of Centreline and Shoulder Rumble Strips in Asphalt                     |
| Apr 2023    | 350              | Concrete Pavement and Concrete Base                                              |
| Apr 2023    | 351              | Concrete Sidewalk                                                                |
| Nov 2020    | 355              | Installation of Interlocking Concrete Pavers                                     |
| Nov 2014    | 363              | Repairing Rigid Pavement with Precast Concrete Slabs                             |
| Nov 2014    | 365              | Cross-Stitching Longitudinal Cracks in Concrete Pavement and Concrete Base       |
| Apr 2023    | 366              | Repairing Concrete Pavement and Concrete Base                                    |
| Apr 2023    | 369              | Sealing or Resealing of Joints and Cracks in Concrete Pavement and Concrete Base |

**DIVISION 4 - DRAINAGE, WATERMAINS, AND UTILITY**

|          |     |                                                                                                                        |
|----------|-----|------------------------------------------------------------------------------------------------------------------------|
| Nov 2015 | 401 | Trenching, Backfilling, and Compacting                                                                                 |
| Apr 2017 | 402 | Excavating, Backfilling, and Compacting for Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers          |
| Apr 2017 | 403 | Rock Excavation for Pipelines, Utilities, and Associated Structures in Open Cut                                        |
| Nov 2017 | 404 | Support Systems                                                                                                        |
| Nov 2017 | 405 | Pipe Subdrain                                                                                                          |
| Nov 2022 | 407 | Installation of New Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers                                  |
| Nov 2022 | 408 | Adjusting or Rebuilding Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers                              |
| Nov 2017 | 409 | Closed-Circuit Television (CCTV) Inspection of Pipelines                                                               |
| Nov 2022 | 410 | Pipe Sewer Installation in Open Cut                                                                                    |
| Nov 2022 | 411 | Cleaning and Flushing of Culverts, Pipe Sewers, Catch Basins, Maintenance Holes, Ditch Inlets, and Oil-Grit Separators |

| <b>DATE</b> | <b>OPSS.PROV</b> | <b>TITLE</b>                                                                               |
|-------------|------------------|--------------------------------------------------------------------------------------------|
| Nov 2022    | 421              | Pipe Culvert Installation in Open Cut                                                      |
| Nov 2022    | 422              | Installation of Precast Reinforced Concrete Box Culverts with Span 3m or Less in Open Cut  |
| Apr 2017    | 441              | Watermain Installation in Open Cut                                                         |
| Nov 2018    | 490              | Site Preparation for Pipelines, Utilities, and Associated Structures                       |
| Nov 2017    | 491              | Preservation, Protection, and Reconstruction of Existing Facilities                        |
| Nov 2018    | 492              | Site Restoration Following Installation of Pipelines, Utilities, and Associated Structures |
| Apr 2022    | 493              | Temporary Potable Water Supply Services                                                    |

**DIVISION 5 - MISCELLANEOUS**

|          |     |                                                 |
|----------|-----|-------------------------------------------------|
| Nov 2014 | 501 | Compacting                                      |
| Nov 2014 | 510 | Removal                                         |
| Nov 2018 | 511 | Rip-Rap, Rock Protection, and Granular Sheeting |

## **SECTION GC 1.0 - INTERPRETATION**

### **GC 1.01 Captions**

- .01 The captions appearing in these MTO General Conditions of Contract have been inserted as a matter of convenience and for ease of reference only and in no way define, limit, or enlarge the scope or meaning of these MTO General Conditions of Contract or any provision hereof.
- .02 In the event of a conflict of a reference to the number and caption of a section, subsection, clause, or paragraph, reference shall be made to the caption.

### **GC 1.02 Abbreviations**

- .01 The abbreviations listed on the left below are commonly found in the Contract Documents and represent the organizations and phrases listed on the right:

|        |                                                                            |
|--------|----------------------------------------------------------------------------|
| AASHTO | - American Association of State Highway Transportation Officials           |
| ANSI   | - American National Standards Institute                                    |
| ASTM   | - ASTM International - formerly American Society for Testing and Materials |
| AWG    | - American Wire Gauge                                                      |
| AWWA   | - American Water Works Association                                         |
| CGSB   | - Canadian General Standards Board                                         |
| CSA    | - CSA Group - formerly Canadian Standards Association                      |
| CVOR   | - Commercial Vehicle Operator's Registration                               |
| CWB    | - Canadian Welding Bureau                                                  |
| DSM    | - Designated Sources for Materials                                         |
| GC     | - MTO General Conditions of Contract                                       |
| MECP   | - Ministry of the Environment, Conservation and Parks                      |
| MOE    | - Ministry of the Environment, now MECP                                    |
| MOECC  | - Ministry of the Environment and Climate Change (Ontario), now MECP       |
| MTC    | - Ministry of Transportation and Communications, now MTO                   |
| MTO    | - Ontario Ministry of Transportation                                       |
| MUTCD  | - Manual of Uniform Traffic Control Devices, published by MTO              |
| OPS    | - Ontario Provincial Standards                                             |
| OPSD   | - Ontario Provincial Standard Drawing                                      |
| OPSS   | - Ontario Provincial Standard Specification                                |
| OTM    | - Ontario Traffic Manual                                                   |
| PDF    | - Portable Document Format                                                 |
| PEO    | - Professional Engineers Ontario                                           |
| SAE    | - SAE International - formerly Society of Automotive Engineers             |
| SSPC   | - Structural Steel Painting Council                                        |
| TRA    | - The Road Authority                                                       |
| UL     | - Underwriters Laboratories                                                |
| ULC    | - Underwriters Laboratories Canada                                         |

### **GC 1.03 Gender and Singular References**

- .01 References to the masculine or singular throughout the Contract Documents shall be considered to include the feminine and the plural and vice versa as the context requires.

### **GC 1.04 Ontario Provincial Standards**

- .01 Regardless of the publishing date on OPSSs and OPSDs contained in the OPS manuals and on a MTO website, the Standards applicable to this Contract are listed in the schedule of Provisions, Plans, Standard Drawings, Specifications, and MTO General Conditions of Contract, with the exception the version of OPSS 127 that is current at the time the work is carried out shall apply.

- .02 When an OPSS contains an appendix, the appendix is deleted in its entirety and is not invoked unless specified elsewhere in the Contract Documents. When an appendix is invoked, the information contained in the appendix shall form part of the specification.
- .03 When an OPS specification refers to the Canadian Highway Bridge Design Code; CSA Standard S6-00 or CSA Standard S6-06 or CSA Standard S6-14, it shall be deemed to mean CSA Standard S6:19.
- .04 When an OPS specification refers to the Ministry of the Environment (MOE) or Ministry of the Environment and Climate Change (MOECC), it shall be deemed to mean Ministry of the Environment, Conservation and Parks (MECP).
- .05 When an OPS specification refers to Material Safety Data Sheets (MSDS), it shall also be deemed to mean Safety Data Sheets (SDS).
- .06 When the Contract refers to an address listed in the left column of the following table; it shall be deemed to be the updated address:

| Address                                                                                                                                                        | Updated Address                                                                                                                   |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|

**GC 1.05****Ontario Traffic Manual**

- .01 All references in the Contract Documents to the MUTCD, including all Parts and Divisions thereof, or MTO Traffic Control Manual for Roadway Work Operations, or Traffic Control Manual for Roadway Operations Field Edition are hereby deleted and replaced by the following books of the Ontario Traffic Manual:
- Book 1 - Introduction to the Ontario Traffic Manual;
  - Book 1A - Illustrated Sign and Signal Display Index;
  - Book 1B - Sign Design Principles;
  - Book 1C - Positive Guidance Toolkit;
  - Book 5 - Regulatory Signs;
  - Book 6 - Warning Signs;
  - Book 7 - Temporary Conditions (and Temporary Conditions Field Edition);
  - Book 11 - Pavement, Hazard and Delineation Markings;
  - Book 12 - Traffic Signals.
- .02 Any reference in the Contract Documents to OTM shall be deemed to be the Ontario Traffic Manual Books 1, 1A, 1B, 1C, 5, 6, 7, 11, and 12.
- .03 The Contractor shall comply with the applicable requirements of the above OTM books.

**GC 1.06****Conflict of Interest**

- .01 The Contractor, any of the Subcontractors and any of their respective advisors, partners, directors, officers, employees, agents, and volunteers shall not engage in any activity or provide any services to the Minister where such activity or the provision of such services, creates a conflict of interest (actually or potentially in the sole opinion of the Minister) with the provision of services pursuant to this Contract. The Contractor acknowledges and agrees that it shall be a conflict of interest for it to use confidential information of the Crown relevant to the services where the Minister has not specifically authorized such use.
- .02 The Contractor shall disclose to the Minister, without delay, any actual or potential situation that may be reasonably interpreted as either a conflict of interest or a potential conflict of interest.
- .03 A breach of this section by the Contractor shall entitle the Minister to terminate the Contract, in addition to any other remedies that the Minister has in this Contract, in law or in equity.

**GC 1.07****Definitions**

For the purpose of this Contract, the following definitions apply:

**Abnormal Weather** means an extreme climatic condition characterized by wind speed, air temperature, precipitation, or snowfall depth, that is less than or greater than 1½ standard deviations from the mean determined from the weather records of the 25 years immediately preceding the tender opening date.

**Access Road** means a private road built or existing road used by the Contractor to gain access to the Work or to a source of material.

**Actual Measurement** means the field measurement of that quantity within the approved limits of the Work.

**Addendum** means an addition to or a change in the Contract Documents issued prior to tender closing.

**Additional Work** means work not provided for in the Contract and not considered by the Contract Administrator to be essential to the satisfactory completion of the Contract within its intended scope.

**Adjudication** means as defined under Part II.1 of the *Construction Act*.

**Aggregate** means gravel, sand, clay, earth, shale, stone, limestone, dolostone, sandstone, marble, granite, or rock other than metallic ores, slag, and clinkers.

**Agreement** means the signed document between the Minister or delegated representative and the Contractor for the performance of the Work included in the Contract Documents.

**Base** means a layer of Material of specified type and thickness placed immediately below the Pavement, driving surface, finished grade, curb with gutter, or sidewalk.

**Basic Holdback** means the statutory holdback, equal to 10% of the services or Materials as they are supplied under the Contract, required to be retained pursuant to the *Construction Act*.

**Bonds** means both the Contract Bonds and the Statutory Bonds prescribed in the Contract Documents.

**Business Day** means any Day which is not:

- a) A Saturday or a Sunday; or
- b) A Day observed as a holiday under the laws of the Province of Ontario or the federal laws of Canada applicable to the Province of Ontario.

**Certificate of Conformance** means a MTO form PH-CC-822 issued by an Engineer confirming that the specified components of the Work are in conformance with the Contract Documents.

**Change in the Work** means the deletion, extension, increase, decrease, or alteration of lines, grades, dimensions, quantities, methods, drawings, changes in the character of the work to be done, or Materials of the Work or part thereof, within the intended scope of the Contract.

**Change Order** means a written order to the Contractor covering contingencies, Extra Work, increase or decrease in Contract quantities, and additions or alterations to the plans or specifications, within the scope of the Contract and establishing the basis of payment. Also means, a written authorization covering Additional Work.

**Change Proposal** means a proposal by the Contractor for a modification to the Contract Documents that is expected to result in design improvement benefits or a reduction in costs or both, or Contract Time.

**Claim** means the submission of a dispute for review under the clause GC 3.15.01, Claim Review Process.

**Commercial Motor Vehicle** means as defined under Section 16 of the *Highway Traffic Act*, R.S.O. 1990, c. H.8, as amended (*Highway Traffic Act*).

**Commercial Source** means a place where Aggregate or a product containing Aggregate is made available for sale.

**Compensation Request** means a request submitted to the Contract Administrator, in writing, for a modification in payment and/or Contract Time from the original tender.

**Construction Act** means the *Construction Act*, R.S.O. 1990, c.C.30, as amended.

**Construction Signs** means all traffic control devices and signs, including vehicles, trailers, and the like that are provided to support signs, and equipment to supply sign lighting, but excludes Contract identification signs and Highway number markers, all as may be described in the OTM.

**Constructor** means for the purposes of, and within the meaning of the *Occupational Health and Safety Act*, R.S.O. 1990, c. O.1, as amended, the Contractor who executes this Contract.

**Contract** means the undertaking by the Owner and the Contractor to perform their respective duties, responsibilities, and obligations as prescribed in the Contract Documents.

**Contract Bonds** means the surety bonds executed by the Contractor and its Surety prescribed in the Contract Documents but does not include Statutory Bonds.

**Contract Administrator** means the person, partnership, or corporation designated by the Owner to be the Owner's representative for the purposes of the Contract.

**Contract Bulletin** means a publication of MTO on the MTO's website [www.raqs.merx.com](http://www.raqs.merx.com).

**Contract Completion** means the Work has passed all inspection and testing requirements, the Contractor has rectified all deficient Work, and the Contractor has fulfilled all obligations under the Contract, except warranty obligations.

**Contract Completion Certificate** means the certificate issued by the Contract Administrator at Contract Completion.

**Contract Documents** means the Agreement, Tender, MTO General Conditions of Contract, Standard Specifications and Standard Drawings, Special Provisions, Contract Drawings, Addenda incorporated into any aforementioned document, documents referenced in the aforementioned documents, and subsequent amendments to any of these documents made pursuant to the provisions of the Agreement.

**Contract Drawings** or **Contract Plans** mean drawings or plans provided by the Owner for the Work and without limiting the generality thereof may include soil profiles, foundation investigation reports, reinforcing steel schedules, aggregate sources lists, quantity sheets, and cross-sections.

**Contract Time** means the time stipulated in the Contract Documents for completion of the Work, including any extension of Contract Time made pursuant to the Contract Documents.

**Contractor** means the person, partnership, or corporation undertaking the Work as identified in the Agreement.

**Contractor's Intellectual Property** means Intellectual Property owned by the Contractor prior to its performance under this Contract or created by the Contractor during this Contract independently of the performance of Contractor obligations under this Contract.

**Controlling Operation** means any component of the Work that, if delayed, will delay the completion of the Work.

**Cut-off Date** means the date up to which a progress payment shall be made for work performed.

**CVOR Abstract** means a level 1 Commercial Vehicle Operator's Registration (CVOR) abstract obtained from MTO.

**CVOR Certificate** means a Commercial Vehicle Operator's Registration certificate issued under the *Highway Traffic Act*.

**CVOR Holder** means a person or company to whom a CVOR Certificate was issued that has not been cancelled nor currently under suspension.

**Daily Work Records** means daily records for any part of the Work detailing the work in question, names, and categories of workers and hours worked or on standby; types and quantities of Equipment and number of hours in use and/or on standby; and description and quantities of Material used.

**Day** means a calendar day.

**Decision** means a written response to a Compensation Request or a Claim issued to the Contractor, that includes the Rationale and any quantum.

**Earth Grade** means the earth surface, whether in cut or fill, as prepared for the Base or Subbase.

**Engineer** means a professional engineer licensed by the Professional Engineers Ontario to practice in the Province of Ontario.

**Environmental Incident** means an event such as a spill, discharge, emission, release, or escape of a material, pollutant, contaminant, deleterious substance, or dangerous good as defined in the legislation referenced in paragraph .01 of clause GC 7.13.02, Environmental Incident Management Under Legislation Protecting the Environment and Natural Resources.

**Equipment** means all machinery and equipment used for preparing, fabricating, conveying, or erecting the Work and normally referred to as construction machinery and equipment.

**Estimate** means a calculation of the quantity or cost of the Work or part of it, depending on the context.

**Extra Work** means Change in the Work.

**Finishing Work** means the Work to be completed after certification of substantial performance and prior to and necessary to be supplied or performed to complete the Contract.

**Finishing Work Deficiency List** means a list of deficiencies and Work yet to be completed, identified independently by the Contractor and the Contract Administrator.

**Grade** means the required elevation of work.

**Grade Line** means a reference line representing the Grade in profile or longitudinal section established for the control of work.

**Hand Tools** means tools that are commonly called tools or implements of the trade and include small power tools. Individually, a tool shall be considered as a Hand Tool where the maximum cost is \$400.

**Haul Road** means any public road excluding the road under Contract that forms part of a Material haul route.

**Highway** means a common and public highway any part of which is intended for or used by the general public for the passage of vehicles and includes the area between the lateral property lines thereof.

**Holdback for Finishing Work** means the statutory holdback, equal to 10% of the Finishing Work, required to be retained pursuant to the *Construction Act*.

**Inclement Weather** means weather conditions or conditions that result immediately there from that prevents the Contractor from proceeding with the Controlling Operation.

**Information Request** means a request submitted to the Contract Administrator, in writing, seeking clarification of or information regarding the Contract Documents.

**Inspector** means any person, partnership, or corporation appointed by the Contract Administrator to participate in the inspection of the Work and the Material to be used in the Work.

**Intellectual Property** means any intellectual, industrial, or other proprietary right of any type in any form protected under the laws of Canada, any foreign country, or any political subdivision of any country, including, without limitation, any intellectual, industrial, or proprietary rights protected by legislation, by common law, or at equity.

**Labour and Material Payment Bond** means the type of security furnished to the Owner to guarantee payment of prescribed debts of the Contractor covered by the bond.

**Lump Sum Item** means a tender item indicating a portion of the Work for which payment shall be made at a single tendered price. Payment is not based on a measured quantity, although a quantity may be given in the Contract Documents.

**Major Item** means any tender item that has a value, calculated on the basis of its actual or estimated tender quantity, whichever is the greater, multiplied by its tender unit price, which is equal to or greater than the lesser of:

- a) \$200,000; or
- b) 5% of the total tender value calculated on the basis of the total of all the estimated tender quantities and the tender unit prices.

**Manufacturer's Certificate of Conformance** means a MTO form PH-CC-821 issued by an Engineer confirming that the fabrication and required testing has been carried out on a component or product in conformance with the Contract Documents.

**Material** means material, machinery, equipment, and fixtures forming part of the Work.

**Newly Created Intellectual Property** means any Intellectual Property created by the Contractor in the course of performance of the Contractor's obligations under this Contract.

**Notice of Adjudication** means as defined under Part II.1 of the *Construction Act*.

**Notice to Proceed** means a MTO form PH-CC-702 issued by the Contract Administrator notifying the Contractor to proceed to the next operation.

**Owner** means the party to the Agreement for whom the Work is being performed, as identified in the Agreement, and includes, with the same meaning and import, "Authority."

**Pavement** means a wearing course or courses placed on the Roadway and consisting of asphaltic concrete, hydraulic cement concrete, or other bituminous surfaces.

**Performance Bond** means the type of security furnished to the Owner to guarantee completion of the Work according to this Contract and to the extent provided in the bond.

**Person** means an individual, corporation, partnership, joint venture, association, trust, pension fund, union, governmental agency, board, tribunal, ministry, commission, or department and the heirs, beneficiaries, executors, legal representatives, or administrators of a person to whom the context can apply according to law.

**Plan Quantity** means that quantity as computed from within the boundary lines of the Work as shown in the Contract Documents.

**Profile Grade** means the required elevation of the surface of the Base.

**Proper Invoice** means as defined in the *Construction Act*, supported by quantity of Work completed sheets, and that complies with the requirements of the Contract Documents.

**Quantity Sheet** means a list of the locations, estimated design quantities, and other details of Work to be completed for tender items.

**Quarried Rock** means material removed from an open excavation made in a solid mass of rock that was integral with the parent mass prior to removal.

**Quarry** means a place where Aggregate has been or is being removed from an open excavation made in a solid mass of igneous, sedimentary, or metamorphic rock or any combination of these that was integral with the parent mass prior to removal.

**Rate of Interest** means the prejudgment interest rate determined according to subsection 127 (2) of the *Courts of Justice Act*.

**Rationale** means the reason(s) given to explain a Decision, response, or action.

**Record Drawings** mean marked-up Contract Drawings prepared by the Contractor that show all differences, design changes, and deviations from the original Contract Drawings.

**Records** mean any books, payrolls, accounts, or other information that relate to the Work or any Change in the Work or Claims arising there from.

**Regional Operations Office** means the Operations Office in the MTO Region administering the Contract.

**Release from Warranty Certificate** means the certificate prepared by the Owner releasing the Contractor from all warranty obligations at the end of the last expiring warranty period.

**Request to Proceed** means a MTO form PH-CC-701 issued by the Contractor notifying the Contract Administrator that a component or stage of the work has been completed in conformance with the Contract Documents.

**Road Allowance** means the lands acquired at any time for use as a Highway.

**Roadbed** means that part of the Work which is designed to support the Roadway.

**Roadway** means that part of the Highway designed or intended for use by vehicular traffic and includes the shoulders.

**Rock Grade** means the rock surface, whether in cut or fill, that has been prepared for the Base or Subbase.

**Shoulder** means that portion of the Roadway between the edge of the travelled lane and the top inside edge of the ditch or fill slope.

**Special Provision** means special direction within the Contract Documents containing requirements particular to the Work.

**Standard** means, when used alone, the generic term for Standard Specifications and Standard Drawings.

**Standard Specification** or **Standard Drawing** means a standard practice required and stipulated by the Owner for performance of the Work.

**Statutory Bonds** means the surety bonds executed by the Contractor and its Surety and required to be furnished by Part XI.1 of the *Construction Act*.

**Subbase** means a layer of material of specified type and thickness between the Subgrade and the Base.

**Subcontractor** means a person, firm, or corporation undertaking the execution of a part of the Work by virtue of a contract with the Contractor.

**Subgrade** means the Earth Grade or Rock Grade.

**Substructure** means all of that part of a structure, including backwalls, wingwalls, and wing protection railings, below:

- a) The bearings of single and continuous span bridges.
- b) Skewbacks of arches and tops of footings of rigid frame bridges.

**Superintendent** means the Contractor's authorized representative in responsible charge of the Work.

**Superstructure** means all that part of a structure, excluding backwalls, wingwalls, and wing protection railings, above:

- a) The bearing seat of single and continuous span bridges.
- b) Skewbacks of arches and tops of footings of rigid frame bridges.

**Surety** means the person, partnership, or corporation, other than the Contractor, executing a bond provided by the Contractor.

**Time and Material** means costs calculated according to subsection GC 8.03, Payment on a Time and Material Basis.

**Total Bid Price** means the price submitted by the Contractor at tender closing.

**Utility** means a facility maintained by a municipality, public utility authority, or regulated authority and includes sanitary sewer, storm sewer, water, electric, gas, steam, data, telephone, and cable television services.

**Work** means the total construction and related services required by the Contract Documents.

**Working Area** means all the land and all the easements owned or acquired by the Owner for the construction of the Work.

**Working Day** means any Day:

- a) Except Saturdays, Sundays, and statutory holidays.
- b) Except a Day as determined on which the Contractor is prevented by weather or conditions resulting immediately thereafter, from proceeding with a Controlling Operation. For the purposes of this definition, this shall be a Day during which the Contractor cannot proceed with at least 60% of the normal labour and equipment force effectively engaged on the Controlling Operation for at least 5 hours.
- c) Except a Day on which the Contractor is prevented from proceeding with the Controlling Operation by reason of:
  - i. Any breach of Contract or prevention by the Owner, by any other Contractor of the Owner, or by any employee of any one of them.
  - ii. Non-delivery of Owner supplied materials.
  - iii. Any cause beyond the reasonable control of the Contractor that can be substantiated by the Contractor.

**Working Drawings or Working Plans** means any drawings or plans prepared by the Contractor for the execution of the Work and may, without limiting the generality thereof, include falsework and formwork plans, roadway protection plans, shop drawings, shop plans, or erection diagrams.

**Written Notice of Lien** means a Written Notice of Lien in the prescribed form pursuant to the *Construction Act*, given by a Person with a lien that identifies the payer and identifies the premises, and states the amount that the Person has not been paid and is owed to the Person by the payer.

## **GC 1.08 Substantial Performance**

.01 The Work is substantially performed:

- a) When the Work or a substantial part thereof has passed inspection and testing and is ready for use or is being used for the intended purposes; and
- b) When the Work to be performed under the Contract is capable of completion or, where there is a known defect, correction, at a cost of not more than:
  - i. 3% of the first \$1,000,000 of the Contract price;
  - ii. 2% of the next \$1,000,000 of the Contract price; and
  - iii. 1% of the balance of the Contract price.

.02 For the purposes of this Contract, when the Work or a substantial part thereof is ready for use or is being used for the purposes intended and the Owner and the Contractor agree not to complete the Work expeditiously, the price of the services or Materials remaining to be supplied and required to complete the Work shall be deducted from the Contract price in determining substantial performance.

**GC 1.09****Interpretation of Certain Words**

- .01 The words "acceptable," "approval," "authorized," "considered necessary," "directed," "required," "satisfactory," or words of like import shall mean approval of, directed, required, considered necessary, or authorized by and acceptable or satisfactory to the Contract Administrator unless the context clearly indicates otherwise.
- .02 The words "Ministry of Transportation," "ministry," and "Owner" and the abbreviations "MTO" and "MTC" shall mean the Ontario Ministry of Transportation.

**GC 1.10****Liens**

- .01 A lien is preserved when the claimant has given the Owner a copy of the claim for lien before the lien has expired pursuant to the *Construction Act*.
- .02 A preserved lien is perfected when the claimant commences an action in the courts to enforce the lien prior to the end of the period according to Section 36 of the *Construction Act*.
- .03 A preserved lien becomes a perfected lien by sheltering under a perfected lien in accordance with the rules of sheltering according to Subsection 36(4) of the *Construction Act*.
- .04 The Owner shall retain an amount sufficient to satisfy the amount of a lien set out in a Written Notice of Lien Form 1 of Ontario Regulation 303/18 of the *Construction Act* in accordance with Subsection 24(2) of the *Construction Act*.

## **SECTION GC 2.0 - CONTRACT DOCUMENTS**

### **GC 2.01 Reliance on Contract Documents**

- .01 The Owner warrants that the information furnished in the Contract Documents can be relied upon with the following limitations or exceptions:
  - a) The location of all mainline underground Utilities that affects the Work shall be shown to a tolerance of 1.0 m horizontal and 0.3 m vertical.
- .02 The Owner does not warrant interpretations of data or opinions expressed in any subsurface report available for the perusal of the Contractor and excluded from the Contract Documents
- .03 The Owner does not warrant any other information specifically excluded from this warranty.

### **GC 2.02 Order of Precedence**

- .01 In the event of any inconsistency or conflict in the contents of the following documents, such documents shall take precedence and govern in the following order:
  - a) Agreement
  - b) Addenda
  - c) Special Provisions
  - d) Contract Drawings
  - e) Standard Specifications
  - f) Standard Drawings
  - g) Tender
  - h) MTO General Conditions of Contract
  - i) Working Drawings

Later dates shall govern within each of the above categories of documents.

- .02 In the event of any conflict among or inconsistency in the information shown on Contract Drawings, the following rules shall apply:
  - a) Dimensions shown in figures on a drawing shall govern where they differ from dimensions scaled from the same drawing.
  - b) Drawings of larger scale shall govern over those of smaller scale.
  - c) Detailed drawings shall govern over general drawings.
  - d) Drawings of a later date shall govern over those of an earlier date in the same series.
- .03 In the event of any conflict in the contents of Standards the following order of precedence shall govern:
  - a) Ontario Provincial Standard Specifications and Standard Drawings
  - b) Other Standards referenced by OPSSs and OPSDs (e.g., CSA, CGSB, ASTM, and ANSI)
- .04 The Contract Documents are complementary, and what is required by any one, shall be as binding as if required by all.

## **SECTION GC 3.0 - ADMINISTRATION OF THE CONTRACT**

### **GC 3.01**

#### **Contract Administrator's Authority**

- .01 The Contract Administrator shall be the Owner's representative during construction and until the issuance of the MTO form PH-CC-895, Release from Warranty Certificate. All instructions to the Contractor including instructions from the Owner shall be issued by the Contract Administrator. The Contract Administrator shall have the authority to act on behalf of the Owner only to the extent provided in the Contract Documents.
- .02 All Claims, disputes, and other matters in question relating to the performance and the quality of the Work or the interpretation of the Contract Documents shall be referred to the Contract Administrator in writing by the Contractor. The Contract Administrator shall give a decision in writing within a reasonable time.
- .03 The Contract Administrator may inspect the Work for its conformity with the Contract Drawings and Standard Specifications and all drawings, and to record the necessary data to establish payment quantities under the schedule of tender quantities and unit prices or to make an assessment of the value of the work completed in the case of a lump sum price Contract.
- .04 The Contract Administrator shall approve the amounts owing to the Contractor under this Contract and shall issue certificates for payment in such amounts as provided for in section GC 8.0, Measurement and Payment.
- .05 The Contract Administrator shall, with reasonable promptness, review and take appropriate action upon the Contractor's submissions such as Working Drawings, product data, and samples according to the Contract Documents. Unless specified otherwise, the Contract Administrator shall respond to submissions requiring approval according to the Contract as soon as possible but not longer than 5 Business Days excluding any requests for extensions of Contract Time.
- .06 The Contract Administrator shall investigate all allegations of a change in the character of the Work made by the Contractor and issue appropriate instructions.
- .07 The Contract Administrator shall prepare and issue Change Orders.
- .08 The Contract Administrator shall be, in the first instance, the interpreter of the Contract Documents and the judge of the performance there under by both parties to the Contract. Interpretations and decisions of the Contract Administrator shall be consistent with the intent of the Contract Documents.
- .09 The Contract Administrator shall have the authority to reject work or Material which does not conform to the Contract Documents.
- .10 Defective work, whether the result of poor workmanship, use of defective Material, or damage through carelessness or other act or omission of the Contractor and whether incorporated in the Work or not, that has been rejected by the Contract Administrator as failing to conform to the Contract Documents shall be removed promptly from the Work by the Contractor and replaced or re-executed promptly according to the Contract Documents at no additional cost to the Owner.
- .11 Any part of the Work destroyed or damaged by such removals, replacements, or re-executions shall promptly be made good at no additional cost to the Owner.
- .12 If, in the opinion of the Contract Administrator, it is not expedient to correct defective work or work not performed according to the Contract Documents, the Owner may deduct from monies otherwise due to the Contractor the difference in value between the work as performed and that specified in the Contract Documents, the amount of which shall be determined in the first instance by the Contract Administrator.
- .13 Notwithstanding any inspections made by the Contract Administrator or the issuance of any certificates or the making of any payment by the Owner, the failure of the Contract Administrator to reject any defective work or Material shall not constitute acceptance of defective work or Material.

- .14 The Contract Administrator shall have the authority to temporarily suspend the Work for such reasonable time as may be necessary to facilitate the checking of any portion of the Contractor's construction layout or the inspection of any portion of the Work. There shall not be any extra compensation for this suspension of work.

### **GC 3.02 Working Drawings**

- .01 The Contractor shall arrange for the preparation of clearly identified and dated Working Drawings as specified in the Contract Documents.
- .02 The Contractor shall submit Working Drawings to the Contract Administrator with reasonable promptness and in orderly sequence so as to not cause delay in the Work. If either the Contractor or the Contract Administrator so requests, they shall jointly prepare a schedule fixing the dates for submission and return of Working Drawings. At the time of submission, the Contractor shall notify the Contract Administrator in writing of any deviations from the Contract requirements that exist in the Working Drawings.
- .03 The Contractor shall make any changes in Working Drawings that the Contract Administrator may require consistent with the Contract Documents and resubmit, unless otherwise directed by the Contract Administrator. When resubmitting, the Contractor shall notify the Contract Administrator in writing of any revisions other than those requested by the Contract Administrator.
- .04 The Contractor shall keep one set of the Working Drawings at the site at all times.

### **GC 3.03 Right of the Contract Administrator to Modify Methods and Equipment**

- .01 The Contractor shall, when instructed in writing, make alterations in the method, Equipment, or work force at any time the Contract Administrator considers the Contractor's actions to be unsafe or damaging to either the Work or existing facilities or the environment, at no additional cost to the Owner. The Contractor shall alter the sequence of operations on the Contract, when requested in writing, so as to avoid interference with other work.
- .02 Notwithstanding the foregoing, the Contractor shall ensure that all necessary safety precautions and protection are maintained throughout the Work.

### **GC 3.04 Emergency Situations**

- .01 The Contract Administrator has the right to determine the existence of an emergency situation and when such an emergency situation is deemed to exist, the Contract Administrator may instruct the Contractor to take action to remedy the situation. If the Contractor does not take timely action or, if the Contractor is not available, the Contract Administrator may direct others to remedy the situation.
- .02 If the emergency situation was the fault of the Contractor, the remedial work shall be completed at no additional cost to the Owner. If the emergency situation was not the fault of the Contractor, the Owner shall pay for the remedial work.

### **GC 3.05 Working Area**

- .01 The Contractor's sheds, site offices, toilets, other temporary structures, and storage areas for Material and Equipment shall be grouped in a compact manner and maintained in a neat and orderly condition at all times.
- .02 The Contractor shall confine construction operations to the Working Area so as not to interfere with public use. Should the Contractor require more space than that shown on the Contract Drawings, the Contractor shall obtain such space at no additional cost to the Owner.
- .03 The Contractor shall not enter upon or occupy any private property for any purpose, unless the Contractor has received prior written permission from the property owner.

**GC 3.06****Extension of Contract Time or Interim Completion Dates**

- .01 An application for an extension of Contract Time or interim completion dates shall be made in writing by the Contractor on the MTO form PH-CC-756, Compensation Request, to the Contract Administrator, as soon as the need for such extension becomes evident. The application for an extension of Contract Time shall enumerate the reasons and impact on the critical path schedule and state the length of extension required.
- .02 Circumstances suitable for consideration include the following:
  - a) Delays: See subsection GC 3.07, Delays.
  - b) Changes in the Work: See clause GC 3.10.01, Changes in the Work.
  - c) Additional Work: See clause GC 3.10.02, Additional Work.
- .03 The Contract Time shall be extended for such additional time as approved by the Contract Administrator.
- .04 The terms and conditions of the Contract shall continue for such extension of Contract Time.

**GC 3.07****Delays**

- .01 If the Contractor is delayed in the performance of the Work by:
  - a) War, blockades, or civil commotions; or
  - b) Errors in the Contract Documents; or
  - c) An act or omission of the Owner, Contract Administrator, other contractors, or anyone employed or engaged by them directly or indirectly, contrary to the provisions of the Contract Documents; or
  - d) A stop work order issued by a court or public authority, provided that such order was not issued as the result of an act or omission of the Contractor, or anyone employed or engaged by the Contractor directly or indirectly; or
  - e) The Contract Administrator giving notice under subsection GC 7.11, Suspension of Work; or
  - f) Abnormal Weather, provided that in the case of an application for an extension of Contract Time, due to the Abnormal Weather, the Contractor shall, with the Contractor's application, submit evidence from Environment Canada, together with detailed calculations in support of such application; or
  - g) Archaeological finds, or
  - h) The presence of species at risk as defined in the *Species at Risk Act* (S.C. 2002, c. 29) and/or the *Endangered Species Act*, S.O. 2007, c. 29 not otherwise identified in the Contract Documents,

then, the Contractor shall be granted an extension of Contract Time according to subsection GC 3.06, Extension of Contract Time or Interim Completion Dates, and shall be reimbursed by the Owner for reasonable costs incurred by the Contractor as the result of such delay.

- .02 To determine if the weather encountered during the term of the Contract constitutes Abnormal Weather, the weather records used for the calculation of the 25-year mean and standard deviation shall be from the Environment Canada weather station nearest to the location of the Work. The weather conditions measured in time periods of 3 consecutive Days within a 30-Day period, a calendar month, or 3 consecutive calendar months shall be used to determine the values for the calculations. No other time periods shall be considered.
  - a) For precipitation and snowfall, the values for each year shall be the total amount over the time period.
  - b) For wind and temperature, the values for each year shall be either the average highest or lowest value in the time period.
  - c) The same month or 3 month time period shall be used for each of the 25 years.

- d) For a consecutive 3-Day period within a 30-Day period, the 30-Day period shall begin 15 Days prior to the start of the weather event that is suspected to be abnormal. Only the highest or lowest 3-Day value within the same 30-Day period shall be used for each of the preceding 25 years.

- .03 If the Contractor is granted an extension of Contract Time, compensation for unabsorbed head office overhead shall be as follows:

$$HOOH = \left( \frac{Te(OCv \times 0.05)}{T} \right) - 0.05(FCv - OCv)$$

Where:

HOOH: means head office overhead payment

Te: means approved extension of Contract Time in Days less the Days between December 1 and May 15 inclusive (for Working Day Contracts elapsed Days for approved Working Days)

OCv: means Original Contract tender value in dollars

T: means original Contract Time less the Days between December 1 and May 15 inclusive (Days for completion date contracts or elapsed Days for Working Day Contracts)

FCv: means final Contract value in dollars excluding: incentive/disincentive payments, material bonus/penalty payments, asphalt cement index payments and fuel price adjustments

The head office overhead payment shall not be negative.

For the purposes of establishing the start date to calculate Contract durations, the date shown on the MTO form PH-CC-700, Permission to Start Work, shall be considered as the start date. No other payment shall be made for head office overhead.

Payment for unabsorbed head office overhead shall be made after the Contract Completion Certificate has been issued.

- .04 If the Work is delayed by labour disputes, strikes, or lock-outs, including lock-outs decreed or recommended to its members by a recognized contractor's association, of which the Contractor is a member or to which the Contractor is otherwise bound, which are beyond the Contractor's control, then:

- a) Where an industry-wide strike delays the Work, the Contractor shall be granted an extension of Contract Time but not financial compensation (i.e., the strike is considered to be an excusable and non-compensable delay). The Contractor shall make application and shall document the extent to which Controlling Operations were delayed by the strike.
- b) Incentives and disincentives shall apply to the revised interim and final completion dates.

- .05 If the Contractor's operations expose any items which may indicate an archaeological find, such as building remains, hardware, accumulations of bones, pottery, or arrowheads:

- a) The Contractor shall immediately notify the Contract Administrator and suspend operations within the area identified by the Contract Administrator.
- b) Work shall remain suspended within that area until otherwise directed by the Contract Administrator in writing, according to subsection GC 7.11, Suspension of Work.
- c) Any delay in the completion date of the Contract that is caused by such a cessation of construction operations shall be considered to be beyond the Contractor's control according to paragraph .01 of subsection GC 3.07, Delays.
- d) Any increases in the cost of the work to be done that are caused by such a cessation of construction operations shall be considered as a Change in the Work according to paragraph .01 of clause GC 3.10.01, Changes in the Work.
- e) Any work directed or authorized in connection with an archaeological find shall be considered as Changes in the Work according to clause GC 3.10.01, Changes in the Work.

- .06 If the Contractor encounters species at risk as defined in paragraph .01 of subsection GC 3.07, Delays, within the Working Area not otherwise identified in the Contract Documents, and that are likely to be impacted by the Contractor's operations:
- a) The Contractor shall immediately notify the Contract Administrator and suspend operations within the area identified by the Contract Administrator.
  - b) Work shall remain suspended within that area until otherwise directed by the Contract Administrator in writing, according to subsection GC 7.11, Suspension of Work.
  - c) Any delay in the completion date of the Contract that is caused by such a cessation of construction operations shall be considered to be beyond the Contractor's control according to paragraph .01 of subsection GC 3.07, Delays.
  - d) Any increases in the cost of the work to be done that are caused by such a cessation of construction operations shall be considered as a Change in the Work according to paragraph .01 of clause GC 3.10.01, Changes in the Work.
  - e) Any work directed or authorized in connection with the unexpected presence of species at risk shall be considered as Changes in the Work according to clause GC 3.10.01, Changes in the Work.

**GC 3.08 Assignment of Contract**

- .01 The Contractor shall not assign the Contract, either in whole or in part, without the written consent of the Owner.

**GC 3.09 Subcontracting by the Contractor**

- .01 The Contractor may subcontract any portion of the Work, but the total of all sublets shall not exceed 60% of the total tender value without the written consent of the Contract Administrator, subject to these MTO General Conditions of Contract and any limitations established by the Owner.
- .02 The Contractor shall notify the Contract Administrator, in writing on the MTO form PH-CC-742, Consent to Sublet, of the intention to subcontract where the subcontract comprises greater than 50% of the tender item value. Such notification shall identify the part of the Work, and the Subcontractor with whom it is intended.
- .03 The Contractor shall preserve and protect the rights of the parties under the Contract with respect to the work to be performed under subcontract and shall:
- a) Enter into agreements with the intended Subcontractors to require them to perform their work according to the Contract Documents; and
  - b) Be as fully responsible to the Owner for acts and omissions of the Contractor's Subcontractors and of persons directly or indirectly employed by them as for acts and omissions of persons directly employed by the Contractor.
- .04 Subcontracting shall not be construed to relieve the Contractor from any obligation under the Contract or to impose any liability upon the Owner. Nothing contained in the Contract Documents shall create a contractual relationship between a Subcontractor and the Owner.
- .05 The Contractor shall not subcontract any part of the Work to a Subcontractor that has submitted the lowest tender for the Contract, and has subsequently failed to enter into a Contract with the Owner. The Owner shall not be responsible or liable for any costs or damages of the Contractor arising from the need of the Contractor to substitute a Subcontractor.

## **GC 3.10 Changes in the Work and Additional Work**

### **GC 3.10.01 Changes in the Work**

- .01 The Owner or the Contract Administrator, where so authorized, may, by order in writing, make Changes in the Work without invalidating the Contract. The Contractor shall not be required to proceed with a Change in the Work until in receipt of a Change Order. Upon the receipt of such written order the Contractor shall proceed with the work and shall provide the Owner with a detailed cost estimate of the work described in the Change Order. The estimate shall identify the costs of salaries and wages, payroll burden, Equipment, Materials, and payments to Subcontractors. Alternatively, and with the agreement of the Contract Administrator, the Contractor may provide a cost estimate based on actual or revised Contract prices. The Contractor shall also estimate the impact on any incentives or disincentives.
- .02 The Contractor may apply for an extension of Contract Time according to the terms of subsection GC 3.06, Extension of Contract Time or Interim Completion Dates.
- .03 If the Changes in the Work relate solely to quantities, payment for the work shall be made according to the conditions specified in clause GC 8.01.02, Variations in Tender Quantities. If the Changes in the Work do not solely relate to quantities, then the Owner or the Contractor shall negotiate upwards or downwards the adjustment of the Contract price in respect of the Changes in the Work, or payment may be made according to subsection GC 8.03, Payment on a Time and Material Basis.
- .04 A Change Order price negotiation which remains unresolved more than 10 Days after the Contractor's submission of the detailed cost estimate for the Work described in the Change Order shall be resolved by the Contractor submitting a Compensation Request according to subsection GC 3.14, Compensation Request.
- .05 The undisputed value of Work performed as a result of a Change Order is eligible to be included in the progress payment certificate. The Owner shall compensate the Contractor for the direct cost of labour, Materials, Equipment and subcontracts. The interim payment shall be based on a mutually agreed lump sum pro-rated for the percentage of Work completed. In the case of a failure to reach agreement on the lump sum payment, the interim payment shall be calculated according to subsection GC 8.03, Payment on a Time and Material Basis.

### **GC 3.10.02 Additional Work**

- .01 The Owner or Contract Administrator, where so authorized, may request the Contractor to perform Additional Work without invalidating the Contract. If the Contractor agrees to perform Additional Work, the Contractor shall proceed with such work upon receipt of a Change Order establishing the basis of payment, the price, and the adjustment of Contract Time.

### **GC 3.10.03 Price Agreement Form**

- .01 If the Contractor and Contract Administrator agree on the basis of payment and price when appropriate, a price agreement, on the MTO form PH-CC-856, Price Agreement for Change in the Work, Extra Work, or Additional Work, shall be signed by both parties.

### **GC 3.10.04 Work Directive**

- .01 When there is a dispute respecting a proposed Change in the Work, and the Contractor does not proceed with the Work, the Owner may issue a MTO form PH-CC-857, Work Directive. Upon receipt of a Work Directive the Contractor shall proceed with the Work. The Contractor may pursue resolution of the dispute according to subsection GC 3.15, Dispute Resolution.

## **GC 3.11 Change Proposals After Contract Award**

### **GC 3.11.01 Definitions**

For the purpose of this subsection, the following definitions apply:

**Alternative Type of Material** means a substitute for a specified type of Material to be incorporated into a product and would involve a change that does not adversely affect the performance of the product.

**Design Change** means an alteration to a specified physical feature of a product or to the construction staging requirements that does not adversely affect the performance of the facility, and may include the use of an Alternative Type of Material that changes the physical dimensions of a product.

**Method Change** means an alteration to the specified means or process used to produce a product.

### **GC 3.11.02 Sharing of Cost Savings**

.01 The Contractor may propose cost-reducing Change Proposals after Contract award and gain a financial reward by receiving 50% of the savings resulting from a Change Proposal. If a Change Proposal is acceptable to the Owner, as determined by an Owner Change Proposal review team, the Contractor shall:

- a) Be reimbursed 100% for the agreed upon design/redesign cost as agreed upon at acceptance by the Owner in principle of a Change Proposal; and
- b) Receive payment of 50% of the net construction cost savings, as detailed in clause GC 3.11.05, Accepted Change Proposal Payment, resulting after preliminary design development at the Contractor's cost.

Items a) and b) are in addition to payment for the tendered cost for construction of a Change Proposal.

.02 Standard submission forms and guidelines for their completion are available from the Contract Administrator.

### **GC 3.11.03 Conditions of Change Proposals**

#### **GC 3.11.03.01 Processing, General**

.01 Change Proposals under this provision shall be considered after award and when all applicable conditions are met. Change Proposals need not necessarily be completely equivalent to or meet specified requirements, except as otherwise specified in subsection GC 3.11, Change Proposals After Contract Award. Change Proposals shall be submitted on the applicable MTO forms and shall duplicate all the original text provided in the original standard forms.

.02 Acceptance or rejection of the Change Proposal shall be at the sole discretion of the Owner. The Owner shall advise the Contractor of the reasons for rejection of a Change Proposal according to clause GC 3.11.03.09, Time Periods for Review.

.03 Each proposed Change that affects a different set of Contract items shall be documented as a separate Change Proposal.

.04 Ongoing costs and future life costs shall be evaluated, as detailed and explained on the MTO forms, and shall be noted considering, as a minimum, a perpetual/infinite life cycle using present worth value analysis, using a constant dollars concept, and a discount rate of 6%.

- .05 Change Proposals that take advantage of any errors or omissions in the plans for the as-designed project, or discrepancies between the as-designed project and the Special Provisions covering alternate designs, shall not be accepted. In the event that any error, omission, or discrepancy is discovered, the Contractor shall immediately notify the Contract Administrator. Failure to notify the Owner shall constitute a waiver of all claims for misunderstandings, ambiguities, or other situations resulting from the error, omission, or discrepancy.
- .06 The Contractor shall be responsible for all costs arising in connection with errors in the quantities related to the Change Proposal.
- .07 The Owner shall not be liable to the Contractor for failure to accept or act upon any Change Proposal nor for any delays attributable to any such Change Proposal.
- .08 No extension of Contract Time shall be permitted unless detailed in a Change Proposal and accepted by the Owner.
- .09 The Contractor shall be responsible for obtaining all regulatory approvals resulting from any Change Proposal.
- .10 The Owner shall be the sole judge of whether any Change Proposal is consistent with Owner design policies and basic design criteria for the project.
- .11 The Contractor shall have no Claim against the Owner for any costs or delays due to the Owner's review or rejection of a Change Proposal, including but not limited to review for approval of designs, development costs, anticipated profits, or increased material or labour costs resulting from delays in the review of such Change Proposals.
- .12 If a Change Proposal is acceptable to the Owner, the Contractor shall construct the Change Proposal, and shall do the construction for the price bid for the Change Proposal identified by MTO as acceptable.
- .13 If the Change Proposal is acceptable in whole or in part, such acceptance shall be clarified by the Owner by means of a Change Order that shall specifically state that it is executed pursuant to subsection GC 3.11, Change Proposals After Contract Award.
- .14 Subcontractors may not submit a Change Proposal, except through the Contractor.
- .15 If the Owner accepts a design change, the Owner shall not give permission to proceed with such a Change Proposal until an agreement has been reached on the estimated value of the cost savings and on the Change Proposal design or redesign costs, or until there is a written agreement on a dispute resolution procedure to resolve any disagreement over the values. If a Change Proposal is rejected, no compensation shall be made for any costs associated with the Change Proposal, other than those accepted as part of a Change Proposal and/or other costs found to be acceptable to the Owner.
- .16 If the Owner already has under consideration certain revisions to the Contract or has approved certain changes in Standard Specifications or Standard Drawings for general use that are subsequently incorporated into a Change Proposal, the Owner shall reject the Change Proposal and shall proceed with such revisions, if the Owner so desires and without any obligation to the Contractor. At the Owner's discretion, such changes may be made under subsection GC 3.10, Changes in the Work and Additional Work.

#### **GC 3.11.03.02                      Incomplete Change Proposals**

- .01 The Owner reserves the right to reject any Change Proposal if the Change Proposal does not contain all required information or is not presented clearly. Without prejudice to this right, the Owner may request clarification when the intent of a Change Proposal is unclear. If supporting data is insufficient or unclear, this shall also be grounds for rejection of a Change Proposal.

**GC 3.11.03.03****Proposals for Design Changes**

- .01 When the Contract Documents do not contain a provision for a design change for a tender item, the Contractor's bid for the tender item shall be based on the specified/tendered design exclusive of any Change Proposal. Alternative designs presented under this provision may be proposed only after award. The Owner shall review the design Change Proposal and if the Change Proposal is acceptable to the Owner, the Contractor shall be responsible for the cost of all impacts on other construction item costs that are not included in the Change Proposal and for the schedule resulting from the Change Proposal.

**GC 3.11.03.04****Design Changes**

- .01 The situations described below are covered in OPSSs, and shall be used by the Owner to determine how a Change Proposal shall be handled:
- a) When the Contract contains provisions for acceptable alternative designs (e.g., pipe sewers, cast-in-place vs. precast maintenance hole, and culverts), the Contractor may proceed with any one of them with no need to negotiate cost savings after award based on this provision.
  - b) When the Contractor is specifically permitted in the Contract Documents to design an alternative to the design specified in the Contract (e.g., track protection, work sequence, or staging requirements), the Contractor shall perform the design, and the associated cost shall be deemed to be included in the related Contract prices. The design shall be subject to Owner review and, if the alternative design is not acceptable, it shall be changed to meet the Owner's requirements at no additional cost to the Owner or revert to the original design as directed by the Owner.
  - c) When the Contractor is responsible for the design of temporary work and no design has been provided in the Contract Documents, or the design provided by the Owner is not sufficiently detailed to permit construction (e.g., formwork and falsework, dewatering, trench shoring, and roadway protection), it shall be understood that the costs for such work were included in the Contractor's original tendered bid, and the Contractor shall assume all the risk associated with bidding and constructing the design.

**GC 3.11.03.05****Proposals for Method Changes**

- .01 When the Contract Documents do not contain a provision for a method change for the tender item, or when the Contractor proposes an alternative method to the specified method, the Owner shall, under this provision, receive, review, and accept or reject an alternate method only after award of the Contract. The Contractor shall assume all of the risk in bidding the tender item with an alternate method and in using the alternate method. If the alternative method is acceptable to the Owner, or is acceptable with modifications, the Contractor shall be paid according to the payment conditions of subsection GC 3.11, Change Proposals After Contract Award. If a Change Proposal is rejected, no additional compensation shall be made.
- .02 The Contractor shall not start work with a proposed method change until the Owner has given written permission.
- .03 When the Contractor proposes to change the construction staging scheme identified in the Contract Documents, and where these changes are deemed by the Contract Administrator to be a significant departure from the Contract Documents, the Contractor shall submit four copies of a traffic management plan that:
- a) Includes, as appropriate, the following documents:
    - i. Plan, profile, and cross-section drawings indicating the proposed changes to the horizontal and vertical alignment and any changes to the drainage; electrical; environmental; Pavement; structural; over-winter; work zone safety; and public safety, including pedestrian access, schemes for all affected construction and traffic stages.
    - ii. Revised signing and Pavement marking schemes.
    - iii. Revised detour, lane, or ramp closure schemes.
    - iv. A revised critical path schedule for the duration of the project.

- b) Maintains the minimum standards as used in the Contract Documents for:
  - i. Highway geometrics.
  - ii. Pavement structures (i.e., type, depth and granular depths).
  - iii. Illumination and traffic signals needs.
  - iv. Seasonal shutdown conditions.
  - v. Environmental protection (i.e., design measures, construction constraints and requirements and commitments in environmental documentation which may not be referred to in the Contract Documents).
- c) Clearly identifies geometric design criteria used for:
 

|                               |                             |
|-------------------------------|-----------------------------|
| i. Design speed.              | viii. Shoulder widths.      |
| ii. Vertical grades.          | ix. Grades for side slopes. |
| iii. Stopping sight distance. | x. Hazard offsets.          |
| iv. Vertical curves.          | xi. Barrier warrants.       |
| v. Horizontal curves.         | xii. Pavement crossfalls.   |
| vi. Superelevation.           | xiii. Shoulder crossfalls.  |
| vii. Lane widths.             |                             |
- d) Identifies any changes to the construction staging or traffic operations affecting municipal roadways to the Contract Administrator who shall notify the affected municipality. A minimum of 10 Business Days shall be provided to the municipality for their response.
- e) Complies with the pavement marking and signing standards of the OTMs.
- f) Complies with permitted time periods for lane and ramp restrictions and closures as specified in the Contract Documents.
- g) Complies with environmental constraints and requirements specified in the Contract Documents.
- h) Meets current MTO Standards.

#### **GC 3.11.03.06                      Proposals for Alternative Types of Materials or Material Sources**

- .01 The Contractor's Change Proposal for alternative types of Materials or Material sources shall include evidence that the Material or Material source meets the Owner's requirements in place at the time the Change Proposal is submitted.

#### **GC 3.11.03.07                      Proposal for a Combination of Design, Method, and Material Changes**

- .01 When the Contract Documents do not contain a provision for a design change for a tender item, other than that permitted by a Change Proposal, and the proposed design change requires a different method from that specified in the Contract Documents, the Change Proposal including the proposed method shall be considered a design change, and all the requirements of clause GC 3.11.03.03, Proposals for Design Changes, shall apply.

#### **GC 3.11.03.08                      Ownership and Copyright**

##### **GC 3.11.03.08.01                      Intellectual Property**

##### **GC 3.11.03.08.01.01                      Ownership of Intellectual Property**

- .01 The Owner shall be the sole proprietor of any Newly Created Intellectual Property. The Contractor irrevocably assigns to and in favour of the Owner, and the Owner accepts every right, title, and interest in and to all Newly Created Intellectual Property in the Change Proposal, immediately following the creation thereof, for all time and irrevocably waives in favour of the Owner all rights of integrity and other moral rights to all Newly Created Intellectual Property in the Change Proposal, immediately following the creation thereof, for all time. To the extent that the Change Proposal includes, in whole or in part, the Contractor's Intellectual Property, the Contractor grants to the Owner a licence to use that Contractor's Intellectual Property in the manner contemplated in clause GC 3.11.03.08.01, Intellectual Property, of these MTO General Conditions of Contract, the total consideration for which shall be a portion of the payment of the lump sum tender item price to the Contractor by the Owner.

**GC 3.11.03.08.01.02      Presumption Governing Ownership**

- .01 The presumption governing the Contract shall be that the Owner shall be the sole proprietor of any Intellectual Property in any form contained in the Change Proposal. If the Contractor's Intellectual Property forms any part of the Change Proposal, the Contractor shall notify the Owner in the Change Proposal. In the absence of any such notice, the presumption shall remain that the Owner is the sole proprietor of any Intellectual Property contained in the Change Proposal.

**GC 3.11.03.08.01.03      Contractor's Grant of Licence**

- .01 For those parts of the Change Proposal that are the Contractor's Intellectual Property, the Contractor grants to the Owner for the sole purposes of resolving or remedying any breach of the Contract Documents or this warranty by the Contractor or for the Owner to undertake maintenance, rehabilitation, reconstruction, or construction work, a perpetual, world-wide, non-exclusive, irrevocable, transferable, royalty-free, fully-paid-up right and licence to:
- a) Use, modify, reproduce, and distribute, in any form, the identified Intellectual Property; and
  - b) Authorize other Persons, including agents, contractors, or Subcontractors, to do any of the former on behalf of the Owner.
- .02 The Owner acknowledges and agrees that the Contractor's Intellectual Property is the property of the Contractor and is highly valuable, confidential, and material to the interests, business, and affairs of the Contractor and that disclosure thereof would be detrimental to the interests, business, and affairs of the Contractor. The Owner agrees to maintain the confidentiality of the Contractor's Intellectual Property and that, subject to a court order or except as specifically permitted by the terms of these provisions, the Owner shall not disclose the Contractor's Intellectual Property to any person for any reason whatsoever other than to those persons who actually need to have knowledge of the Contractor's Intellectual Property for the sole purposes of resolving or remedying any breach of the Contract Documents or this warranty or for the Owner to undertake maintenance, rehabilitation, reconstruction, or construction work. The confidentiality obligation of the Owner shall not apply to those elements of the Contractor's Intellectual Property that are currently or hereafter become generally available to the public, provided such public availability has not occurred as a result of the disclosure by the Owner in contravention of this provision.

**GC 3.11.03.08.01.04      No Restrictive Materials in Change Proposal**

- .01 The Contractor shall not incorporate into any Change Proposal anything that would restrict the right of the Owner to modify, further develop, or otherwise use the Change Proposal in any way that the Owner deems necessary, or that would prevent the Owner from entering into any contract with any contractor other than the Contractor for the modification, further development, or other use of the Change Proposal.

**GC 3.11.03.08.01.05      Assurances Regarding Moral Rights**

- .01 At the request of the Owner, at any time or from time to time, the Contractor shall execute and agree to cause its directors, officers, employees, agents, partners, affiliates, volunteers, or Subcontractors to execute an irrevocable written waiver of any moral rights or other rights of integrity in the applicable Change Proposal in favour of the Owner. Such waiver to be in the form provided by the Owner, and which waiver may be invoked without restriction by any person authorized by the Owner to use the Change Proposal.
- .02 The Contractor shall deliver such written waivers to the Owner within 10 Business Days of the receipt of the request from the Owner.

**GC 3.11.03.08.01.06 Further Assurances Regarding Copyright**

- .01 At the request of the Owner, at any time or from time to time, the Contractor shall execute and agree to cause its directors, officers, employees, agents, partners, affiliates, volunteers, or Subcontractors to execute a written assignment of copyright in the applicable Change Proposal to the Owner in the form provided by the Owner. The Contractor shall deliver such written assignments to the Owner within 10 Business Days of the receipt of the request from the Owner. The Contractor shall assist the Owner in preparing any Canadian copyright registration that the Owner considers appropriate. The Contractor shall obtain or execute any other document reasonably required by the Owner to protect the Intellectual Property of the Owner.

**GC 3.11.03.08.01.07 Owner May Prescribe Further Compliance**

- .01 The Owner reserves the right to prescribe the specific manner in which the Contractor shall perform its obligations relating to the Intellectual Property.

**GC 3.11.03.08.01.08 Survival**

- .01 The obligations contained in clause GC 3.11.03, Conditions of Change Proposals, shall survive the termination or expiry of the Contract.

**GC 3.11.03.08.02 Owner Rights**

- .01 In submitting a Change Proposal under this provision, the Contractor agrees to the following:
- a) All plans, drawings, design reports, procedures, and programs prepared, conceived of, or produced or caused to be prepared, conceived of, or produced and delivered by or on behalf of the Contractor as part of an acceptable Change Proposal (the "Proposal") shall be the sole property of the Owner, except as otherwise provided below. The Contractor covenants that the Owner shall be the sole owner of the Proposal, and that none of such Proposal shall infringe the copyright, patent, or other right of any other Person.

For the purposes of the *Copyright Act (Canada)*, the Contractor acknowledges that all Proposal shall be deemed to have been prepared under the direction and control of the Owner, and the copyright, except as otherwise provided below, shall belong to the Owner. The Contractor waives any moral rights it may have under the *Copyright Act (Canada)*, concerning the Proposal.

All patents, copyrights, and other industrial and Intellectual Property rights, including trade secrets, arising in relation to the Proposal, if any, are hereby assigned to the Owner for its use, excepting any third-party proprietary products, any licensed procedures, and any products licensed to a third-party. Change Proposals shall clearly identify any third-party proprietary products and licensed products and procedures to be used as a part of a Change Proposal. The Contractor shall take all reasonable steps, including the steps the Contractor takes to protect information, data, or other tangible and intangible property the Contractor owns and regards as proprietary or confidential, to ensure that such proprietary rights of the Owner are not violated.

The Contractor shall obtain all required assignments and releases of interest, acknowledgments, or waivers that the Owner considers necessary or advisable to transfer title and publication rights in and to the Proposal to the Owner, unless accepted otherwise.

- b) The Owner hereby grants the Contractor a non-exclusive, royalty-free licence to use the Proposal for any and all purposes.
- c) Without limitation, the Owner acknowledges that the Contractor shall have the right to use for the Contractor's own purposes outside of this Contract, any novel ideas and concepts developed by the Contractor.

- d) The Contractor shall not be liable in any manner whatsoever for the claims arising as a result of the use by the Owner of the Proposal in connection with projects other than this Contract. Further, the Contractor cannot warrant the fitness of or be responsible or liable for any Proposal that are only partially completed due to early termination or suspension of this Contract by the Owner, or if same have been altered, revised, modified, or amended without the written consent and knowledge of the Contractor or if such Proposal have been provided to the Owner on computer devices with removable storage and used on improper or incompatible computer processing equipment.
- e) The rights and privileges of the Owner, and the licence in favour of the Contractor provided for in these MTO General Conditions of Contract shall survive and shall not merge on the termination or other expiry of this Contract.

#### **GC 3.11.03.09 Time Periods for Review**

- .01 Any Change Proposal shall include/document the anticipated change in the construction schedule and shall account for and clearly indicate the desired and reasonable time period for review of same by the Owner. When there is no time period specified with the Change Proposal for review of designs, methods, or Working Drawings in the Contract Documents that are applicable to the Change Proposal, the Owner shall, unless it accepts the times suggested in the Change Proposal, review the Change Proposal expeditiously. The actual duration shall depend on the complexity of the Change Proposal; however, within 5 Business Days of receipt of the Change Proposal, the Owner shall notify the Contractor in writing:
  - a) If the Change Proposal requires clarification or further supporting information; and
  - b) Of the expected time period for review.
- .02 The Contractor shall be notified in writing of the acceptance or rejection of the Change Proposal not more than 20 Business Days after a fully documented and supported Change Proposal is received. If the Change Proposal is rejected, the reasons for the rejection shall be stated.
- .03 If the Owner fails to respond to the Change Proposals within the desired review time suggested in the Change Proposal or within the time stated in the notification in paragraph .01, b) of clause GC 3.11.03.09, Time Periods for Review, the Contractor shall consider the Change Proposal rejected, and shall have no claim against the Owner as a result thereof.

#### **GC 3.11.03.10 Risk Sharing/Warranty**

- .01 As part of a Change Proposal, the Contractor shall outline and thoroughly explain warranties and other measures offered to reduce the Owner's risks, thus encouraging adoption of a Change Proposal. Shared risks and all risks that the Contractor is not prepared to accept shall also be outlined.

#### **GC 3.11.04 Submission of Change Proposals**

- .01 The Contract Administrator shall be notified of the Contractor's intention to submit a Change Proposal at least 5 Business Days before a Change Proposal is submitted.
- .02 Change Proposals shall be identified as Change Proposals submitted under subsection GC 3.11, Change Proposals After Contract Award, and shall include a completed standard cover sheet, the MTO forms, and the following:
  - a) A description of the proposed Change Proposal, and the related design or redesign costs;
  - b) A detailed list of the Contract requirements that change, if the Change Proposal is adopted;
  - c) The tender items affected by the proposed changes, including any quantity variation, and any new items, applicable Standards, Special Provisions, and quantities;
  - d) A detailed estimate of the Contractor's cost of performing the work under the existing Contract, and under the proposed Change Proposals;
  - e) A description of the comparative advantages and disadvantages of the Change Proposals;
  - f) A revised construction schedule and an application for extension of Contract Time, if applicable; and

- g) Completed Owner's Standard Change Proposal Forms and procedures shall be used, and shall document and support, for acceptance/review purposes, any Change Proposals.
- .03 Any aspect of a Change Proposal that involves or may involve (e.g., preliminary Change Proposal designs prepared for approval in principle) doing work or an act that is within the practice of professional engineering shall be designed by an Engineer and shall bear the seal and signature of the Engineer. Whatever the Contract specifies regarding stamp occurrences for such design work, the same requirement shall apply to designs or redesigns for a Change Proposal.

#### **GC 3.11.05 Accepted Change Proposal Payment**

- .01 If a Change Proposal is acceptable to the Owner, the changes and payment related to the savings thereto shall be authorized by means of a Change Order to the Contract. Compensation to the Contractor shall be made as follows:
  - a) The Contractor's costs for development work (i.e., any preliminary work up to Owner acceptance in principle of a Change Proposal related to the Change Proposals) shall not be eligible for reimbursement.
  - b) The items for a Change Proposal shall become guaranteed maximum price items. Change proposal savings sharing shall be calculated as outlined in paragraph .01, c) of clause GC 3.11.05, Accepted Change Proposal Payment, and be shared equally between the Contractor and Owner; the Change Proposal design or redesign cost as agreed with MTO as acceptance in principle of the Change Proposal shall be fully reimbursed to the Contractor.
  - c) Change Proposal net construction cost savings change sharing payment shall be based on the following: the original directly related tendered construction price minus the price proposed (bid) to construct the Change Proposal and minus the cost of the Change Proposal design or redesign accepted by the Owner as a Change Proposal approval in principle. In addition to the shared savings payment total and the tendered price payment for the construction of redesigned Change Proposal work, the Contractor shall be reimbursed 100% for the price of the new Change Proposal design or redesign as agreed upon as acceptance of a Change Proposal in principle.
  - d) Unless otherwise specified in writing by the Contractor and agreed upon with the Owner, the Contractor's share of the change sharing savings shall be paid according to the following schedule: 50% of the Contractor's share of the agreed change sharing savings shall be paid as a part of the Owners progress payment following the Owner's acceptance of a Change Proposal in principle; the remaining Change Proposal costs shall be paid according to the percentage of Change Proposal work completed over the duration of the work of the Change Proposal. The Contractor shall indicate, as a part of the Change Proposal, what items shall be used for each Change Proposal, shall get agreement with the Owner regarding such items, and shall outline, in the Change Proposal, any payment schedule that differs from clause GC 3.11.05, Accepted Change Proposal Payment.
  - e) The Contractor may submit any Change Proposals for an approved Subcontractor provided that reimbursement shall be made by the Owner to the Contractor; the terms of the pass through to the Subcontractor shall have been satisfactorily negotiated between the Contractor and the Subcontractor, and be accepted by both before the Change Proposal is submitted to the Owner.

#### **GC 3.12 Notices**

- .01 The Contractor and the Owner shall provide each other with the mailing addresses, telephone numbers, facsimile terminal numbers, and email addresses for the Contract Administrator and the Superintendent at the commencement of the Work.
- .02 Any notice permitted or required to be given to the Owner or the Contractor shall be given according to the notice provision of the Agreement.
- .03 In the event of an emergency situation or other urgent matter the Contract Administrator or the Superintendent may give a verbal notice, provided that such notice is confirmed in writing.

- .04 Any document permitted or required to be given to the Contract Administrator or the Contractor in respect of the Work shall be deemed to have been given to and received by the addressee on the date of delivery, if delivered by hand or by electronic transmission, and on the third Business Day after the date of mailing, if sent by mail.

### **GC 3.13 Use and Occupancy of the Work Prior to Substantial Performance**

- .01 Where it is not contemplated elsewhere in the Contract Documents, the Owner may use or occupy the Work or any part thereof prior to substantial performance, provided that at least 30 Days written notice has been given to the Contractor.
- .02 The use or occupancy of the Work or any part thereof by the Owner prior to substantial performance shall not constitute an acceptance of the Work or parts so occupied. In addition, the use or occupancy of the Work shall not relieve the Contractor or the Contractor's Surety from any liability that has arisen, or may arise, from the performance of the Work according to the Contract Documents. The Owner shall be responsible for any damage that occurs because of the Owner's use or occupancy. Such use or occupancy of any part of the Work by the Owner does not waive the Owner's right to charge the Contractor liquidated damages according to the terms of the Contract.

### **GC 3.14 Compensation Request**

- .01 The Contractor shall submit a Compensation Request, to the Contract Administrator, on the MTO form PH-CC-756, Compensation Request, when the Contractor becomes aware of or ought to be aware of any of the following:
- a) A Change in the Work;
  - b) A need for an extension of Contract Time, according to subsection GC 3.06, Extension of Contract Time or Interim Completion Dates;
  - c) An unresolved Change Order price negotiation according to clause GC 3.10.01, Changes in the Work; or
  - d) Other compensation matters.
- .02 Notwithstanding that the Compensation Request is not resolved; the Contractor shall proceed with the Work in accordance with paragraph .01 of clause GC 7.01.08, Errors Relating to the Contract.
- .03 The Compensation Request shall include a description of the matter with specific references to the Contract Documents including the impacts to the Contractor.
- .04 If a Compensation Request relates to a submitted Information Request, the original Information Request shall be included with the Compensation Request submission.
- .05 If a Compensation Request is submitted as the result of an unresolved Change Order price agreement negotiation, the original Change Order shall be provided with the Compensation Request submission.
- .06 After the Compensation Request is submitted, the Contractor shall immediately:
- a) Begin to keep Daily Work Records relating to the Compensation Request as the Work is performed, according to clause GC 8.03.02, Daily Work Records.
  - b) Limit such Daily Work Records to the Work directly impacted by the Compensation Request.
  - c) Keep separate Daily Work Records for each individual Compensation Request.
- .07 The keeping of Daily Work Records by the Contractor and any process to review or comment on those records shall not be construed to be the Owner's acceptance of the Compensation Request to which the Daily Work Records relate.
- .08 Prior to the expiry of 60 Days from the date of receipt of the Compensation Request, the Contract Administrator shall issue a Decision.

- .09 If the Owner requests additional information from the Contractor to justify a Compensation Request, then the calculation of time set out to render a Decision shall cease from the date of the request, until the Contractor has provided the information or a statement that it does not intend to provide the information. This waiting period is limited to 10 Days. If no further information is received within that time frame, the Owner shall proceed with the review and issue the Decision; with the Contractor accepting the risk of the Owner making an adverse Decision by reason of the lack of the requested information.
- .10 If both parties mutually agree before the expiry of any time period specified for issuing a Decision, then the parties may extend such time to issue a Decision.
- .11 Where a Compensation Request Decision is not issued within the specified time period as may be extended by mutual agreement, the matter shall be assumed to be concluded, whereupon the Contractor may proceed to subsection GC 3.15, Dispute Resolution.
- .12 Upon receipt of a Compensation Request Decision, the matter shall be considered concluded, whereupon the Contractor may either accept the Decision or proceed to subsection GC 3.15, Dispute Resolution.
- .13 If the Contractor does not accept the Compensation Request Decision and elects to proceed to clause GC 3.15.01, Claim Review Process, the Compensation Request Decision becomes null and void for the purpose of the claim review process.

## **GC 3.15 Dispute Resolution**

### **GC 3.15.01 Claim Review Process**

- .01 In the event that a matter remains unresolved and the Contractor wishes to pursue a Claim through the claim review process, within 10 Days of receipt of the Contract Administrator's Decision regarding a Compensation Request, the Contractor shall provide a written notice of its intent to submit a Claim to the Manager, Contract Claims Office, Capital Program Delivery Branch (CPDB), Transportation Infrastructure Management Division (TIMD), which notice shall be referred to as the "initial notice".
- .02 Within 5 Days of receipt of the "initial notice" of Claim, the Manager, Contract Claims Office, Capital Program Delivery Branch, Transportation Infrastructure Management Division, shall either begin the review of the Claim or submit a Notice of Adjudication.
- .03 Both parties shall conduct, without prejudice, negotiations as part of the claim review process, and they agree not to disclose in any subsequent legal proceeding, any statements made, and documents or information obtained during the process that is not otherwise required to be disclosed by law.
- .04 Notwithstanding the use of the claim review process to resolve a dispute, the Contractor shall proceed with the Work to completion with due diligence and in an expeditious manner and such action shall not prejudice the Contractor in respect of the Claim. The Contractor is not relieved from complying with any direction, order, Change Order, or Work Directive that relates to the Claim.
- .05 In the event that a Compensation Request Decision is not accepted, and the Contractor wishes to pursue a Claim review, then within 20 Days of receipt of the Compensation Request Decision, the Contractor shall submit a notice of claim to the Manager, Contract Claims Office, Capital Program Delivery Branch, Transportation Infrastructure Management Division.
- .06 The notice of claim shall contain, as a minimum, enough information under the headings described below to permit a detailed review by the Contract Claims Office, Capital Program Delivery Branch, Transportation Infrastructure Management Division:
  - a) Date on which the circumstances arose that gave rise to the Claim.
  - b) Detailed description of the nature of the Claim with dates, location, Materials, and Equipment involved and any other items relevant to the Claim.

- c) Relevant provisions of the Contract which support the Claim and the reasons these provisions are relevant, including work affected by the Claim, areas of work incurring additional costs and the change from the tendered Contract.
  - d) Originally submitted Compensation Request and any additional information that was submitted in response to Contract Administrator requests.
  - e) A detailed summary of critical path schedule impacts shall be included along with supporting critical path schedule updates that have been previously submitted.
  - f) Summary of proven actual or estimated additional costs, including direct labour, Material, Equipment and Subcontractor costs.
  - g) Summary of proven indirect costs or estimated indirect costs, including standby, site overhead, and impact costs.
  - h) Copies of all supporting documentation and records of the Contractor applicable to the Claim, including:
    - i. Instruction notices.
    - ii. Change Orders.
    - iii. Daily Work Records as set out in clause GC 8.03.02, Daily Work Records.
    - iv. Email correspondence between the Contract Administrator/Owner and the Contractor
    - v. Production rates.
    - vi. Minutes of meetings.
  - i) Any other information deemed necessary or appropriate by the Contractor.
- .07 After the Contractor has filed the notice of claim, they shall be permitted to submit the following:
- a) Additional information that supports the Claim.
  - b) Updated, actual or additional cost information of items contained in the original notice of claim as those costs become available during the Claim review.
- .08 When the Contractor completes the work associated with the Claim and the Claim remains unresolved, then the Contractor shall provide details of the actual costing of the items detailed in the notice of claim in writing to the Manager, Contract Claims Office, Capital Program Delivery Branch, Transportation Infrastructure Management Division within 30 Days after completion of the affected work.
- .09 The Contractor is solely responsible for providing all the information required in the notice of claim.
- .10 The Contractor's failure to provide any notices as required shall result in the waiver of any Claim and the loss of compensation to the Contractor in respect of such Claim. However, if the Contractor provides the Owner with an explanation for the delay in providing this notice, which the Owner, in its sole discretion, can accept or reject for any reason, then, if the explanation is accepted, the Owner shall review the Claim according to the procedures set out herein. This provision shall not be interpreted so as to compel the Owner to review every Claim of the Contractor or any other person that does not comply with the requirements of the Contract, but rather is intended to allow the Owner the ability to consider those Claims that have failed to comply with the procedures and where the Owner, at its sole discretion, desires to consider such a Claim.
- .11 If the Manager, Contract Claims Office, Capital Program Delivery Branch, Transportation Infrastructure Management Division, elects to review the Claim then prior to the expiry of 75 Days from the receipt of a complete notice of claim, the Manager, Contract Claims Office, Capital Program Delivery Branch, Transportation Infrastructure Management Division, shall provide the Contractor with a written Decision.
- .12 If the Owner requests additional information from the Contractor to justify a Claim, then the calculation of time set out to render a Decision shall cease from the date of the request, until the Contractor has provided the information or a statement that it does not intend to provide the information. This waiting period is limited to 10 Days. If no further information is received within that time frame, the Owner shall proceed with the review and issue the Decision; with the Contractor accepting the risk of the Owner making an adverse Decision by reason of the lack of the requested information.

- .13 If both parties mutually agree before the expiry of any time period specified for issuing a Decision, then the parties may extend such time to issue a Decision.
- .14 Where a Decision is not issued within the specified time period as may be extended by mutual agreement, the matter shall be assumed to be denied, whereupon the dispute may proceed to Adjudication.
- .15 Upon receipt of the Claim Decision, the Contractor shall provide its written response to the Owner within 10 Days signifying a clear intention that they accept the Decision, disagree with the Decision and intend to pursue Adjudication or disagree with the Decision and intend to pursue further avenues of dispute resolution.

#### **GC 3.15.02                      Adjudication**

- .01 The parties agree that for the purpose of section 13.5(1) (1.) (2.) and (7.) of the *Construction Act*, a dispute does not arise in respect of those matters, and therefore a Notice of Adjudication shall not be given, until:
  - a) A Decision has been issued on a Compensation Request or;
  - b) Time to issue the Decision on the Compensation Request has expired.
- .02 If the Contractor initiated the claim review process after receipt of the Compensation Request Decision, the parties agree that the Contractor shall not give a Notice of Adjudication until:
  - a) A Decision has been issued on a Claim; or
  - b) Time to issue the Decision on the Claim has expired.
- .03 Pursuant to Section 13.7 of the *Construction Act*, a Notice of Adjudication posted to the website that is set up for adjudication purposes that is to be given to the Owner shall be immediately downloaded from the website and emailed to the Contract Administrator, the Area Head of Claims, and the Manager, Contract Claims Office. If an email is returned with an out of office reply, the Notice of Adjudication shall be immediately forwarded by email to the alternate named in the out of office reply.
- .04 The parties agree that:
  - a) Further to Section 13.5 of the *Construction Act* the expiry of the Adjudication period shall be 3 months after Contract Completion.
  - b) Further to Section 13.11 of the *Construction Act*, the documents for Adjudication shall include the Compensation Request, and if applicable, the notice of claim. Any offer of compensation made in response to a Compensation Request or offer of settlement made in response to a notice of claim are made on a confidential and without prejudice basis and shall not be mentioned in the Notice of Adjudication and shall be excluded from the documents for Adjudication and any further dispute resolution or legal proceedings.
  - c) Further to Section 13.13 of the *Construction Act*, the deadline for the adjudicator's determination shall be extended by 20 Days.

#### **GC 3.15.03                      Further Avenues of Dispute Resolution**

- .01 If the parties fail in their efforts to resolve the Claim, then the parties agree that prior to resorting to litigation they may explore further alternative dispute resolution methods that are acceptable to the Owner. The Contractor shall provide written notice to the Manager, Contract Claims Office, Capital Program Delivery Branch, Transportation Infrastructure Management Division, of the desire to explore further alternative dispute resolution methods within 20 Days of a Decision on a Claim. If the parties are unable to agree upon an alternative dispute resolution method and its terms within 75 Days of a request to explore alternative dispute resolution, then either party may resort to litigation.

## **SECTION GC 4.0 - OWNER'S RIGHTS AND RESPONSIBILITIES**

### **GC 4.01 Working Area**

- .01 The Owner shall acquire all property rights which are deemed necessary by the Owner for the construction of the Work, including temporary working easements, and shall indicate the full extent of the Working Area on the Contract Drawings.

### **GC 4.02 Management of Excess Materials**

- .01 The Owner shall identify in the Contract Documents the materials to be moved within or removed from the Working Area, and any characteristics of those materials which shall necessitate special materials management and disposition.
- .02 The Owner shall be responsible for any additional costs of removal, management, and disposition of any material not identified in the Contract Documents, or where conditions exist that could not have been reasonably foreseen at the time of tendering.

### **GC 4.03 Construction Affecting Railway Property**

- .01 When construction affects railway property, the Owner shall pay the costs of all flagging and other traffic control measures required and provided by the railway company within the Working Area.

### **GC 4.04 Default by the Contractor**

- .01 The Contractor shall be in default of the Contract if:
  - a) The Contractor fails to commence the Work or execute the Work properly or otherwise fails to comply with the requirements of the Contract to a substantial degree; or
  - b) If the Contractor is adjudged bankrupt or makes a general assignment for the benefit of creditors because of insolvency or if a receiver is appointed because of insolvency.

### **GC 4.05 Notification of Default**

- .01 The Owner shall give written notice of a default to the Contractor as soon as the Owner becomes aware of the alleged default, but failure to give such notice in a timely way shall not constitute acceptance of the default. The notice shall include instructions to correct the default within 5 Business Days.

### **GC 4.06 Contractor's Right to Correct a Default**

- .01 The Contractor shall have the right within the 5 full Business Days following the receipt of a notice of default to correct the default and provide the Owner with satisfactory proof that appropriate corrective measures have been taken.
- .02 If the correction of the default cannot be completed within the 5 full Business Days following receipt of the notice, the Contractor shall not be in default if the Contractor:
  - a) Commences the correction of the default within the 5 full Business Days following receipt of the notice;
  - b) Provides the Owner with an acceptable schedule for the progress of such correction; and
  - c) Completes the correction according to such schedule.

### **GC 4.07 Owner's Right to Correct Default**

- .01 If the Contractor fails to correct the default within the time specified in subsection GC 4.06, Contractor's Right to Correct a Default, or subsequently agreed upon, the Owner, without prejudice to any other right or remedy the Owner may have, may correct such default and deduct the cost thereof, as certified by the Contract Administrator, from any payment then or thereafter due to the Contractor.

**GC 4.08****Termination of Contractor's Right to Continue the Work**

- .01 Where the Contractor fails to correct a default within the time specified in subsection GC 4.06, Contractor's Right to Correct a Default, or subsequently agreed upon, the Owner, without prejudice to any other right or remedy the Owner may have, may terminate the Contractor's right to continue the Work in whole or in part by giving written notice to the Contractor.
- .02 If the Owner terminates the Contractor's right to continue with the Work in whole or in part, the Owner shall be entitled to:
- a) Take possession of the Working Area or that portion of the Working Area devoted to that part of the Work terminated;
  - b) Use the Contractor's Material within the Working Area which is intended to be incorporated into the Work, the whole subject to the right of third parties;
  - c) Withhold further payments to the Contractor with respect to the Work or the portion of the Work withdrawn from the Contractor until the Work or portion thereof withdrawn is completed;
  - d) Charge the Contractor the additional cost over the Contract price of completing the Work or portion thereof withdrawn from the Contractor, as certified by the Contract Administrator, and any additional compensation paid to the Contract Administrator for such additional service arising from the correction of the default;
  - e) Charge the Contractor a reasonable allowance, as determined by the Contract Administrator, to cover correction to the Work performed by the Contractor that may be required under subsection GC 7.18, General Warranty; and
  - f) Charge the Contractor for any damages the Owner may have sustained as a result of the default.

**GC 4.09****Final Payment to Contractor**

- .01 If the Owner's cost to correct and complete the Work in whole or in part is less than the amount withheld from the Contractor under subsection GC 4.08, Termination of Contractor's Right to Continue the Work, the Owner shall pay the balance to the Contractor as soon as the final accounting for the Contract is complete.

**GC 4.10****Termination of the Contract**

- .01 Where the Contractor is in default of the Contract, the Owner may, without prejudice to any other right or remedy the Owner may have, terminate the Contract by giving written notice of termination to the Contractor, the Surety, and any trustee or receiver acting on behalf of the Contractor's estate or creditors.
- .02 If the Owner elects to terminate the Contract, the Owner shall provide the Contractor and the trustee or receiver with a complete accounting to the date of termination.
- .03 If the Contract is terminated, the Owner shall publish the statutory notice of termination prescribed by Form 8 of Ontario Regulation 303/18 of the *Construction Act*, in the *Daily Commercial News* and the date of the termination of the Contract shall be the date specified in the statutory notice of termination for the Contract.

**GC 4.11****Continuation of Contractor's Obligations**

- .01 The Contractor's obligation under the Contract as to quality, correction, and warranty of the Work performed prior to the time of termination of the Contract or termination of the Contractor's right to continue with the Work in whole or in part shall continue to be in force after such termination.

**GC 4.12****Use of Performance Bond**

- .01 If the Contractor is in default of the Contract and the Contractor has provided a Performance Bond, the Owner may rely upon the Performance Bond and its conditions along with the Contract Documents.

**GC 4.13****Owner Audit**

- .01 The Owner may inspect, review, and audit all Records associated with the Contract, including the Contractor's and Subcontractor's Records relating to the Work and Changes in the Work and Claims, at any time up to 24 months after releasing payment of the final holdback. The Contractor shall complete and submit to the Contract Administrator, the MTO form PH-CC-762, Subcontractor's Consent to Audit, for each Subcontractor employed by the Contractor.
- .02 The Contractor shall supply certified copies of any part of the Contractor's Records whenever requested by the Owner.
- .03 Where the inspection, review, and audit reveals discrepancies in payment, the Contractor shall be advised immediately. The Contractor shall have the opportunity to dispute these discrepancies by immediately submitting a MTO form PH-CC-750, Request for Clarification.
- .04 Upon agreement with the results, any monies payable to the Contractor shall be payable within 28 Days. Interest back to the time the amount became payable shall not be paid.
- .05 Upon agreement with the audit results, any monies due to the Owner shall be payable within 28 Days together with interest due from the time the amount was over paid.

## **SECTION GC 5.0 - MATERIAL**

### **GC 5.01 Supply of Material**

- .01 All Material necessary for the proper completion of the Work, except that listed as being supplied by the Owner, shall be supplied by the Contractor. The Contract prices for the appropriate tender items shall be deemed to include full compensation for the supply and delivery of such Material.

### **GC 5.02 Quality of Material**

- .01 All Material provided by the Contractor shall be new, unless otherwise specified in the Contract Documents.
- .02 Material shall be supplied from sources identified in the MTO DSM available on TRA website <http://www.roadauthority.com> that is current at the time of supply of the product. If there are revisions to the DSM, these shall be posted on TRA website on the first Business Day of the months of February, April, June, August, October, and December. Material for which there is no category in the DSM shall be supplied according to the Contract Documents. Material which is not specified shall be of a quality best suited to the purpose required and the use of such Material shall be subject to the approval of the Contract Administrator.

Sources in the DSM have demonstrated their ability to produce material according to specified material specifications. However, the MTO does not warrant that these sources shall produce acceptable or sufficient Material for any contract. The Contractor shall make such independent investigation and examination as the Contractor deems necessary, to satisfy the Contractor as to the quality and quantity of the Material available from these sources, and to ensure that all Material supplied by them satisfies the requirements of the Contract Documents.

- .03 When specified in the Contract Documents or requested by the Contract Administrator, the Contractor shall make available for inspection or testing a sample of any Material to be provided by the Contractor.
- .04 The Contractor shall obtain for the Contract Administrator the right to enter upon the premises of the Material manufacturer or supplier to carry out such inspection, sampling, and testing as specified in the Contract Documents or as requested by the Contract Administrator.
- .05 The Contractor shall complete and submit, on MTO form PH-A-106, List of Materials from Designated Sources, to the Contract Administrator indicating where the Contractor intends to obtain the designated source materials for the Contract. The Contractor shall notify the Contract Administrator of the sources of supply of all Material sufficiently in advance of the Material shipping dates to enable the Contract Administrator to perform the required inspection, sampling, and testing.
- .06 The Owner shall not be responsible for any delays to the Contractor's operations where the Contractor fails to give sufficient advance notice to the Contract Administrator to enable the Contract Administrator to carry out the required inspection, sampling, and testing before the scheduled shipping dates.
- .07 Where the Standards require the Contractor to supply a Material designated by a trade or other name, the tender shall be based only upon supply of the Material so designated, which shall be regarded as the standard of quality required by the Standard.
- .08 Prior to the commencement of Work, the Contractor shall provide to the Contract Administrator a list of those products controlled under the Workplace Hazardous Material Information System (WHMIS) that the Contractor expects to use on the Contract. Related Material Safety Data Sheets shall accompany the submission. All containers used in the application of products controlled under WHMIS shall be labelled. The Contractor shall notify the Contract Administrator of changes to the list in writing and provide relevant Material Safety Data Sheets.

- .09 When a Material or Material source is deleted from the DSM list of pre-qualified Materials or Material sources after the tender opening date, the Owner shall be responsible for the extra costs of Material supply only, unless the Material production or Material source is controlled by the Contractor or Subcontractor. If the type of Material or Material source is pre-qualified after the date of tender opening, permission to use the Materials or Material sources shall not be given until an agreement has been reached on the estimated value of the cost savings to the Owner.
- .10 Within 24 hours written notice, the Contractor shall provide the Owner and/or the Contract Administrator full access to quality control laboratories at any time, and copies of all original inspection records, test results (including but not limited to, all supporting readings, measurements, laboratory worksheets and calculations), and other quality control documents.

### **GC 5.03 Rejected Material**

- .01 Rejected Material shall be removed from the Working Area expeditiously after the notification to that effect from the Contract Administrator. Where the Contractor fails to comply with such notice, the Contract Administrator may cause the rejected Material to be removed from the site and disposed of in what the Contract Administrator considers to be the most appropriate manner, and the Contractor shall pay the costs of disposal and the appropriate overhead charges.

### **GC 5.04 Owner Supplied Material**

#### **GC 5.04.01 Ordering of Excess Material**

- .01 Where Material is supplied by the Owner and where this Material is ordered by the Contractor in excess of the amount specified to complete the Work, such excess Material shall become the property of the Contractor on completion of the Work and shall be charged to the Contractor at cost plus 10% for administration.

#### **GC 5.04.02 Care of Material**

- .01 The Contractor shall, in advance of receipt of shipments of Material supplied by the Owner, provide adequate and proper storage facilities acceptable to the Contract Administrator; and, on the receipt of such Material, promptly place it in storage except where it is to be incorporated forthwith into the Work.
- .02 The Contractor shall be responsible for acceptance of Material supplied by the Owner, at the specified delivery point and for its safe handling and storage. If such Material is damaged while under the control of the Contractor, it shall be replaced or repaired by the Contractor at no expense to the Owner, and to the satisfaction of the Contract Administrator. If such Material is rejected by the Contract Administrator for reasons which are not the fault of the Contractor, it shall remain in the care and at the risk of the Contractor until its disposition has been determined by the Contract Administrator.
- .03 Where Material supplied by the Owner arrives at the delivery point in a damaged condition or where there are discrepancies between the quantities received and the quantities shown on the bills of lading, the Contractor shall immediately report such damage or discrepancies to the Contract Administrator who shall arrange for an immediate inspection of the shipment and provide the Contractor with a written release from responsibility for such damage or deficiencies. Where damage or deficiencies are not so reported, it shall be assumed that the shipment arrived in good order and any damage or deficiencies reported thereafter shall be made good by the Contractor at no extra cost to the Owner.
- .04 The full amount of Material supplied by the Owner in each shipment shall be accounted for by the Contractor and such Material shall be at the risk of the Contractor after taking delivery. Such Material shall not be used by the Contractor for purposes other than the Work under the Contract.
- .05 Empty reels, crates, containers, and other types of packaging from Material supplied by the Owner shall become the property of the Contractor when they are no longer required for their original purpose and shall be disposed of by the Contractor, unless otherwise specified in the Contract Documents.

- .06 The Contractor shall provide the Contract Administrator, immediately upon receipt of each shipment, copies of bills of lading, or such other documentation the Contract Administrator may require, to substantiate and reconcile the quantities of Material received.
- .07 Where Material supplied by the Owner is ordered and stockpiled prior to the award of the Contract, the Contractor shall, at no extra cost to the Owner, immediately upon commencement of operations, check the Material, report any damage or deficiencies to the Contract Administrator, and take charge of the Material at the stockpile site. Where damage or deficiencies are not so recorded by the Contractor, it shall be assumed that the stockpile was in good order when the Contractor took charge of it and any damage or deficiencies reported thereafter shall be made good by the Contractor at no extra cost to the Owner.

## **SECTION GC 6.0 - INSURANCE, PROTECTION, AND DAMAGE**

### **GC 6.01 Protection of Work, Persons, and Property**

- .01 The Contractor, the Contractor's agents, and all workers employed by or under the control of the Contractor, including Subcontractors, shall protect the Work, persons, and property from damage or injury, and shall be responsible for all losses and damage which may arise as the result of the Contractor's operations under the Contract unless indicated to the contrary below.
- .02 The Contractor is responsible for the full cost of any necessary temporary provisions and the restoration of all damage, where the Contractor damages the Work or property in the performance of the Contract. If the Contractor is not responsible for the damage that occurs to the Work or property the Contractor shall restore such damage, and such work shall be administered according to these MTO General Conditions of Contract.
- .03 The Contractor shall immediately inform the Contract Administrator of all damage and injuries which occur during the term of the Contract.
- .04 The Contractor shall not be responsible for loss and damage that occurs as a result of:
  - a) War;
  - b) Blockades and civil commotion;
  - c) Errors in the Contract Documents;
  - d) Acts or omissions of the Owner, the Contract Administrator, the Owner's agents, officers, and employees, or others not under the control of the Contractor but are within the Working Area with the Owner's permission.
- .05 The Contractor and the Contractor's Surety or Sureties shall not be released from any term or provision of any responsibility, obligation, or liability under the Contract or waive or impair any of the rights of the Owner, except by a release duly executed by the Owner.

### **GC 6.02 Indemnification**

#### **GC 6.02.01 General**

- .01 The Contractor shall indemnify and hold harmless the Owner and the Contract Administrator, the Owner's agents, officers, and employees from and against all claims, demands, losses, expenses, costs, damages, actions, suits or proceedings by third parties, hereinafter called "claims", directly or indirectly arising or alleged to arise out of the performance of or the failure to perform the Work, provided such claims are:
  - a) Attributable to bodily injury, sickness, disease, or death or to damage to or destruction of tangible property;
  - b) Caused by negligent acts or omissions of the Contractor or anyone for whose acts the Contractor may be liable; and
  - c) Made in writing within a period of 6 years from the date of substantial performance of the Work as set out in MTO form PH-CC-799, Certificate of Substantial Performance or, where so specified in the Contract, from the date of the Contract Completion Certificate.
- .02 The Contractor shall indemnify and hold harmless the Owner from all and every claim for damages, royalties, or fees for the infringement of any patented invention or copyright occasioned by the Contractor in connection with work performed or Material furnished by the Contractor under the Contract.
- .03 The Owner expressly waives the right to indemnity for claims other than those stated in paragraphs .01 and .02 of clause GC 6.02.01, General (Indemnification).

- .04 The Owner shall indemnify and hold harmless the Contractor, their agents, officers, and employees from and against all claims, demands, losses, expenses, costs, damages, actions, suits, or proceedings arising out of the Contractor's performance of the Contract that are attributable to a lack of or defect in title or an alleged lack of or defect in title to the Working Area.
- .05 The Contractor expressly waives the right to indemnity for claims other than those stated in paragraph .04 of clause GC 6.02.01, General (Indemnification).

**GC 6.03 Contractor's Insurance**

**GC 6.03.01 General**

- .01 Without restricting the generality of subsection GC 6.02, Indemnification, the Contractor shall provide, maintain, and pay for the insurance listed in these MTO General Conditions of Contract and specifically described under clause GC 6.03.02, Commercial General Liability Insurance, and clause GC 6.03.03, Automobile Liability Insurance, and such other insurance as may be specified in the Contract Documents.

**GC 6.03.02 Commercial General Liability Insurance**

- .01 Commercial general liability insurance on an occurrence basis for third-party bodily injury, personal injury, and property damage shall have an inclusive limit of not less than \$5,000,000 per occurrence with \$2,000,000 products and completed operations aggregate. The policy is to include the following:
- a) The Owner and the Contract Administrator as additional insured's with respect to liability arising in the course of performance of the Contractor's obligations under or otherwise in connection with the Contract Documents.
  - b) Contractual liability coverage.
  - c) Cross-liability clause.
  - d) Employer's liability coverage.
  - e) 30 Day written notice of cancellation, termination, or material change.
  - f) Non-owned automobile coverage, including standard contractual liability endorsement, with blanket coverage for hired automobiles.
- .02 The Contractor shall provide the Owner with proof of insurance required by these MTO General Conditions of Contract in the form of valid certificates of insurance acceptable to the Owner that references the Contract and confirms the required coverage, on or before the commencement of this Contract, and any renewal replacements on or before the expiry of any such insurance.
- .03 The Contractor shall submit annually on the anniversary of the execution of the Agreement to the Owner the proof of the continuation of the insurance as described in these MTO General Conditions of Contract or elsewhere in the Contract Documents in the form of valid certificates of insurance acceptable to the Owner that references the Contract and confirms the required coverage.
- .04 If the Contractor decides not to employ Subcontractors for operations requiring the use of explosives for blasting, pile driving or caisson work, or removal or weakening of support of property building or land, the certificate of insurance shall include the appropriate endorsements.
- .05 "Claims Made" insurance policies shall not be permitted.

**GC 6.03.03 Automobile Liability Insurance**

- .01 Automobile insurance in respect of licensed vehicles as per statutory requirements in Ontario shall have limits of not less than \$5,000,000 inclusive per occurrence for bodily injury, death, and damage to property, including accident benefits in the standard owner's form automobile policy providing third-party liability and accident benefits insurance and covering licensed vehicles owned or operated by the Contractor and endorsed to provide the Owner with not less than 30 Days written notice in advance of any cancellation, change, or amendment restricting coverage.

#### **GC 6.03.04                      Payment for Loss or Damage**

- .01 The Contractor shall be entitled to receive from the Owner, in addition to the amount due under the Contract, the amount at which the Owner's interest in restoration of the Work has been appraised, such amount to be paid as the restoration of the Work proceeds and according to the requirements of section GC 8.0, Measurement and Payment. In addition, the Contractor shall be entitled to receive from the payments made by the insurer the amount of the Contractor's interest in the restoration of the Work.
- .02 The Contractor shall be responsible for deductible amounts under the policies except where such amounts may be excluded from the Contractor's responsibility by the terms of this Contract.
- .03 In the event of loss or damage to the Work arising from the action of others, the Owner shall pay the Contractor the cost of restoring the Work as the restoration of the Work proceeds and according to the requirements of section GC 8.0, Measurement and Payment.

#### **GC 6.03.05                      Insurance Requirements and Duration**

- .01 Unless specified otherwise, the insurance shall be maintained continuously from the commencement of the Work until 10 Days following the date of Contract Completion Certificate, and with respect to completed operations coverage for a period of not less than 24 months from the date of Contract Completion Certificate, and thereafter to be maintained for a further period of 4 years.
- .02 The Contractor shall provide the Owner, on a form acceptable to the Owner, proof of insurance prior to commencement of the Work, signed by an officer of the Contractor and either the underwriter or the broker.
- .03 The Contractor shall, on request of the Owner, promptly provide the Owner with a certified true copy of each insurance policy exclusive of information pertaining to premium or premium bases used by the insurer to determine the cost of the insurance. The certified true copy shall include a signature by an officer of the Contractor and in addition, a signature by an officer of the insurer or the underwriter or the broker.
- .04 Unless specified otherwise the Contractor shall be responsible for the payment of deductible amounts under the policies.
- .05 If the Contractor fails to provide or maintain insurance as required in these MTO General Conditions of Contract or elsewhere in the Contract Documents, then the Owner shall have the right to provide and maintain such insurance and give evidence thereof to the Contractor. The Owner's cost thereof shall be payable by the Contractor to the Owner on demand.
- .06 If the Contractor fails to pay the cost of the insurance placed by the Owner within 30 Days of the date on which the Owner made a formal demand for reimbursement of such costs, the Owner may deduct the costs thereof from monies which are due or may become due to the Contractor.

#### **GC 6.04                              Bonding**

##### **GC 6.04.01                      General**

- .01 If the Total Bid Price is \$500,000 or more, the Contractor shall furnish the Owner with Statutory Bonds, being a Performance Bond and Labour and Material Payment Bond in accordance with the *Construction Act*.
- .02 Such Statutory Bonds shall be obtained from a Surety that is an insurer licensed under the *Insurance Act* to write surety and fidelity insurance.
- .03 The Contractor shall furnish the Owner with Contract Bonds as prescribed in the Contract Documents and satisfactory to the Owner.

- .04 Such Contract Bonds shall be obtained from a Surety that is an insurer licensed under the *Insurance Act* to write surety and fidelity insurance.

**GC 6.04.02                      Performance Bond**

- .01 With respect to the Statutory Bond for a Performance Bond, the Contractor shall furnish a Performance Bond using Form 32 of Ontario Regulation 303/18 of the *Construction Act* that is conditioned on the due performance of the terms of the Contract for the amount of 50% of the Total Bid Price.

**GC 6.04.03                      Labour and Material Payment Bond**

- .01 With respect to the Statutory Bond, the Contractor shall furnish a Labour and Material Payment Bond using Form 31 of Ontario Regulation 303/18 of the *Construction Act* that extends or guarantees payment protections to the Subcontractor and Persons supplying labour and Material to the Contract for the amount of 50% of the Total Bid Price.

## **SECTION GC 7.0 - CONTRACTOR'S RESPONSIBILITIES AND CONTROL OF THE WORK**

### **GC 7.01 General**

#### **GC 7.01.01 Site Visit**

- .01 The Contractor warrants that the site of the Work has been visited during the preparation of the tender and the character of the Work and all local conditions which may affect the performance of the Work are known.

#### **GC 7.01.02 Commencement of Work**

- .01 The Contractor shall not commence the Work nor deliver anything to the Working Area until the Contractor has received written permission, on MTO form PH-CC-700, Permission to Start Work, duly signed by the Contract Administrator.

#### **GC 7.01.03 Control and Responsibility**

- .01 The Contractor shall have complete control of the Work and shall effectively direct, supervise, and undertake quality control activities for the work so as to ensure conformity with the Contract Documents. The Contractor shall be responsible for construction means, methods, techniques, sequences, and procedures and for coordinating the various parts of the Work.
- .02 The Contractor shall have the sole responsibility for the design, erection, operation, maintenance, and removal of temporary structures and other temporary facilities and the design and execution of construction methods required in their use.
- .03 Notwithstanding paragraph .02 of clause GC 7.01.03, Control and Responsibility, where the Contract Documents include designs for temporary structures and other temporary facilities or specify a method of construction in whole or part, such facilities and methods shall be considered to be part of the design of the Work, and the Contractor shall not be held responsible for that part of the design or the specified method of construction. The Contractor shall, however, be responsible for the execution of such design or specified method of construction in the same manner that the Contractor is responsible for the execution of the Work.
- .04 Any Notice to Proceed by the Owner or its Contract Administrator of the Work and Materials of the Contractor does not relieve the Contractor from any responsibility or obligation for the proper performance of the Work in conformity with the requirements of the Contract Documents. As well, the Notice to Proceed imposes no liability upon the Owner or its Contract Administrator and is not to be interpreted as an approval or acceptance of the Work or the Materials by the Owner that the Work and Materials was completed or supplied in conformance with the Contract Documents.

#### **GC 7.01.04 Compliance with the Occupational Health and Safety Act**

- .01 The Contractor shall execute the terms of the Contract in strict compliance with the requirements of the *Occupational Health and Safety Act*, R.S.O. 1990, c. O.1 (*the Act*) and Ontario Regulation 213/91 (*Construction Projects*) and any other regulations under *the Act (the Regulations)* which may affect the performance of the Work, as the Constructor or employer, as the case may be. The Contractor shall ensure that:
- a) Worker safety is given first priority in planning, pricing, and performing the Work;
  - b) The Contractor's officers and supervisory employees have a working knowledge of the duties of a Constructor and employer under the Act and the provisions of the Regulations applicable to the Work, and a personal commitment to comply with them;
  - c) A copy of the most current version of the Act and the Regulations are available at the Contractor's office within the Working Area or, in the absence of an office, in the possession of the Superintendent responsible for the performance of the Work;

- d) Workers employed to carry out the Work possess the knowledge, skills, and protective devices required by law or recommended for use by a recognized industry association to allow them to work in safety;
  - e) The Contractor's supervisory employees carry out their duties in a diligent and responsible manner with due consideration for the health and safety of the workers; and
  - f) All Subcontractors performing part of the Work and their employees are properly protected from injury while they are at the work place.
- .02 When requested, the Contractor shall provide the Owner with a copy of its health and safety policy and program at the pre-start meeting and shall respond promptly to requests from the Owner for confirmation that its methods and procedures for carrying out the Work comply with *the Act* and *the Regulations*. The Contractor shall cooperate with representatives of the Owner and Ministry of Labour inspectors appointed to enforce *the Act* and *the Regulations* in any investigations of worker health and safety in the performance of the Work. The Contractor shall indemnify and save the Owner harmless from any additional expense that the Owner may incur to have the Work performed as a result of the Contractor's failure to comply with the requirements of *the Act* and *the Regulations*.
- .03 The Contractor shall immediately, upon receipt, provide the Owner a copy of all correspondence from the Ministry of Labour including but not limited to Project Forms, Stop Work Orders, or Certificates of Offence.
- .04 For work inside confined spaces, including box girder bridges, detailed written procedures addressing the confined space requirements of *the Act* and *Construction Projects*, shall be clearly posted at the project site and available to all personnel, including the Contractor's workers, the Contract Administrator, MTO personnel, and Ministry of Labour inspectors. The procedures shall include the rescue procedures to be followed during a rescue or evacuation of all personnel from an unsafe condition or in the event of personal injury. The Contractor shall have personnel trained in rescue procedures readily available on site.
- .05 Whenever the Contractor proposes to suspend a multi-support point work platform system from a permanent structure, the Contractor shall retain an Engineer to evaluate the structural adequacy of the permanent structure taking into account the loadings imposed by the work platform system and the actual condition of the structure during construction. The Engineer retained by the Contractor shall be deemed responsible for the structural integrity of the permanent structure in fulfilling the requirements of *the Act* and *the Regulations*.

Structural evaluation shall be according to CSA S6:19 and all Owner policies and standards. The design and operation of the multi-support point work platform system shall not have an adverse impact on the long-term durability of the structure and shall meet all operational constraints specified in the Contract Documents.

Two weeks prior to the installation of the multi-support point work platform system, the Contractor shall submit the following to the Contract Administrator for information purposes only:

- a) Three sets of Working Drawings of the work platform system signed and sealed by two Engineers. The loading imposed by the work platform system on the permanent structure shall be clearly shown on the Working Drawings.
- b) Three copies of the evaluation report of the permanent structure bearing the seal and signature of two Engineers. The evaluation report shall include a letter from the Engineers certifying that the permanent structure can safely carry the load imposed by the work platform system together with any other dead and live load that the structure is carrying during construction.

The Contractor shall not make any permanent alterations to the structure as part of the work platform system installation without written permission from the Owner.

**GC 7.01.05****Contractor's Representatives**

- .01 The Contractor shall have an authorized representative on the site while any work is being performed, to act for or on the Contractor's behalf. Prior to commencement of construction, the Contractor shall notify the Contract Administrator of the names, addresses, positions, and telephone numbers of the Contractor's representatives who can be contacted at any time to deal with matters relating to the Contract.
- .02 The Contractor shall designate a person to be responsible for traffic control and highway work zone safety. The designated person shall be a competent worker who is qualified because of:
  - a) Knowledge, training, and experience to perform the duties;
  - b) Is familiar with Book 7 of the OTM; and
  - c) Has knowledge of all potential or actual danger to workers and motorists.

Prior to the commencement of construction, the Contractor shall notify the Contract Administrator of the name, address, position, and telephone number of the designated person. The designated person may have other responsibilities, including other construction sites, and need not be present in the Working Area at all times.

- .03 The Contractor shall maintain a daily, hard bound diary of the signs in use for temporary and long-term traffic control. The diary shall be submitted with the final payment documents. For the duration of the Contract and within 24 hours of a request by the Contract Administrator, the Contractor shall provide the Contract Administrator full access to the diary. The following information shall be included in the diary:
  - a) A schematic of the location of each existing sign by station, offset, and height above pavement.
  - b) A schematic of the placement and re-location of all construction signs by station, offset, and height above pavement.
  - c) Traffic accidents, including time of inspection, location of incident, and photographs.
  - d) Time and date of daily sign inspections.

**GC 7.01.06****Assistance to the Contract Administrator**

- .01 The Contractor shall, at no additional cost to the Owner, furnish all reasonable aid, facilities, and assistance required by the Contract Administrator for the proper inspection and examination of the Work or the taking of measurements for the purpose of payment.
- .02 The Contractor shall submit quantities of Work completed to the Contract Administrator on a weekly basis, as a minimum, to facilitate reconciliation of quantities of Work completed.

**GC 7.01.07****Critical Path Schedule**

- .01 Initial and updated critical path schedules shall be prepared and submitted as detailed below:
  - a) Two paper copies and one electronic copy in the format of the scheduling software and readable by the scheduling software of the initial construction schedule shall be submitted to the Regional Operations Office within 7 Business Days of receipt of the acceptance of the tender.
  - b) One hard copy of the initial construction schedule shall also be submitted to the Contract Management Office, St. Catharines, with the executed copies of the Contract.
  - c) Where the Contractor has revised the initial construction schedule prior to the first site meeting, the revised construction schedule shall be submitted to the Contract Administrator at least 3 Business Days prior to the meeting.

- d) Two paper copies and one electronic copy in the format of the scheduling software and readable by the scheduling software of an updated schedule shall be prepared and submitted to the Contract Administrator not less than 3 Business Days prior to all regularly scheduled site meetings. All revisions shall be highlighted on the updated schedule. Updated schedules submitted shall reflect actual progress of the Work and any additions, deletions, or revisions to the Work that have arisen since the previous update. At regularly scheduled site meetings, the Contractor shall explain the revisions and any increase or decrease in resources required to complete the Work on time. At the Contract Administrator's request, and at no additional cost to the Owner, the Contractor shall submit an updated schedule within 7 Business Days of any major increase or decrease in quantities, or major change in the staging or perceived change in character of the Work.
- e) All copies shall be legible and shall show the date the schedule was prepared.

.02 The requirements for the construction schedule are detailed below:

- a) The critical path method shall be used to prepare and update the construction schedule. The initial and updated construction schedules shall consist of a time scaled network diagram with its related bar charts or a time scaled linear diagram.
- b) For Contracts with a specified number of Working Days, the construction time shown on the initial schedule shall not exceed the specified number of Working Days. The activities on the critical path shall assist the Contract Administrator in determining the Controlling Operation for the purpose of the charging of Working Days. The construction schedule shall include all non-working periods and appropriate allowances for Inclement Weather.
- c) For Contracts which specify a Contract Completion date, the construction time shown on the initial construction schedule shall not extend beyond the specified Contract Completion date. The construction schedule shall include all non-working periods and appropriate allowances for Inclement Weather.
- d) The construction schedule shall reflect operational constraints, interim completion dates, and other scheduling requirements specified in the Contract Documents.
- e) A delay for an activity shall be deemed to have occurred when the activity is not complete on its late finish date established by the construction schedule or it exceeds the specified number of Working Days or specified Completion Date for the Contract.

.03 The requirements for diagrams and bar charts are detailed below:

- a) The Contractor may select to submit initial and updated construction schedules in either logic diagram format with accompanying time scaled bar charts or time scaled linear diagrams.
- b) The Contractor shall select the activities so that the Work is identifiable and the progress of each activity can be determined. The Owner reserves the right to limit or increase the number of activities on the diagram.
- c) Each activity in the initial and updated construction schedules shall include a description of the operation and the number of Days allocated or actually used for it. When the duration of an activity is dependent on weather conditions, the number of Days allocated shall include an allowance for normal frequency of Inclement Weather. In addition, for Contracts which specify the number of Working Days for the Contract Time, the expected number of Working Days shall be shown for the activities on the critical path that may be subject to Working Day charges. When the activity has an associated tender item quantity, the approximate quantity shall also be shown.
- d) The construction schedule shall show the sequence and interdependence of all activities required to complete the Work under the Contract, including time for review of Working Drawings and mix design submissions, early start date, early finish date, and float times. All network connections used to create a logical schedule and the corresponding durations shall be shown. Activities on the critical path shall be identified clearly on the diagram.
- e) The time scale of the construction schedule may be divided into Days or weeks.

.04 The Contractor shall not be permitted to start work until a construction schedule, conforming to clause GC 7.01.07, Critical Path Schedule, is received by the Contract Administrator.

- .05 If, for any reason, the Contractor cannot produce an acceptable construction schedule within 30 Business Days of initial submission of the construction schedule, the Contractor shall be in default of the Contract.

**GC 7.01.08 Errors Relating to the Contract**

- .01 Where the Contractor finds any errors, inconsistency, or omissions relating to the Contract, the Contractor shall not proceed with the activity affected until receiving direction from the Contract Administrator.
- .02 The Contractor shall promptly report by an Information Request to the Contract Administrator on MTO form PH-CC-755, Information Request, as soon as the Contractor becomes aware of the need for information or clarification of the following:
- a) A situation that is different than represented in the Contract Documents;
  - b) A situation where the Contractor requires additional information; or
  - c) A situation where the Contractor believes the Contract Documents to be ambiguous.
- .03 The Information Request shall include a clear description of the situation with specific references to the Contract Documents.
- .04 Notwithstanding the submission of an Information Request, the Contractor shall proceed with the Work according to paragraph .01 of clause GC 7.01.08, Errors Relating to the Contract.
- .05 Prior to the expiry of 20 Days from the date of receipt of the Information Request or such longer time as the Contractor and the Owner may mutually agree, the Contract Administrator shall provide a written response to the Contractor.

**GC 7.01.09 Utilities**

- .01 The Contractor shall arrange with the appropriate Utility authorities for the stake out of all underground Utilities and service connections that may be affected by the Work. For ministry owned Utilities, the Contractor shall arrange with the Contract Administrator to have locates completed by the ministry or its agents at the start of the Work, and on Contracts lasting more than one construction season, at the end of seasonal shutdown periods. Locates of ministry owned Utilities at other times shall be the responsibility of the Contractor and at the Contractor's cost. The Contractor shall be responsible for any damage done to the underground Utilities by the Contractor's forces during construction. The Contractor shall also be responsible for any damage done to the service connections. The Contractor shall attend such meetings with the Contract Administrator to ensure coordination of activities among the Contractor and the Utility authorities for each Utility affected by the Contract.
- .02 In the case of damage to, or interference with any Utilities, pole lines, pipe lines, conduits, farm tiles, or other public or privately owned works or property, the Contractor shall immediately notify the Owner and the Contract Administrator of the location and details of such damage or interference.

**GC 7.01.10 Public Ceremony**

- .01 Only the Owner shall be permitted to make the first public announcements or hold the first public ceremonies about the award or acceptance of the Contract, project milestones, and Contract Completion. The Contractor shall not hold any public ceremony or make any public announcements about the above matters prior to the Owner doing so, without first obtaining the prior written approval of the Owner. The Contractor shall refer all media inquiries regarding such initial announcement and ceremonies to the Owner.
- .02 In paragraph .01 of clause GC 7.01.10, Public Ceremony, "project milestones" means any significant event in the completion of the Work, which includes the completion of a major component of the Work; the opening or closing of lanes, ramps, and structures; and any Work associated with incentives and disincentives described in the Contract Documents.

**GC 7.02****Layout**

- .01 Prior to commencement of construction, the Contract Administrator and the Contractor shall locate on site those property bars and benchmarks that are necessary to delineate the Working Area and to lay out the Work, as shown on the Contract Drawings.
- .02 The Contractor shall be responsible for the preservation of all property bars while the Work is in progress, except those property bars that require removal to facilitate the Work. Any property bars disturbed, damaged, or removed by the Contractor's operations shall be replaced under the supervision of an Ontario Land Surveyor, at no cost to the Owner.
- .03 The Contractor shall provide qualified personnel to layout and establish all lines and grades necessary for construction. The Contractor shall notify the Contract Administrator of any layout work carried out.
- .04 The Contractor shall assume full responsibility for alignments, elevations, and dimensions of each and all parts of the Work.
- .05 All stakes, marks, and reference points provided by the Contract Administrator shall be carefully preserved by the Contractor. In the case of their destruction or removal, such stakes, marks, and reference points shall be replaced by the Contractor at no cost to the Owner.
- .06 The Contract Administrator shall provide a grading report to establish grading cross-sections. During the progress of the work the Contractor shall notify the Contract Administrator forthwith of any errors, omissions, or inconsistencies in the geometric information and the controls provided by the Owner. This report contains all necessary information relating to distance and elevation for each station necessary for the construction of the Work.
- .07 Certification shall be required for the layout of the following components of the Work:
  - a) Bridges;
  - b) Retaining walls;
  - c) Culverts having a span of 5 m or more;
  - d) Tunnelling, excluding augered tunnels;
  - e) Sewers of 2 m diameter or more.

For each of the identified components above, the Contractor shall provide to the Contract Administrator, on MTO form PH-CC-811, Certification of the Component, over the seal and signature of either an Engineer or an Ontario Land Surveyor, the following:

- a) Certification of the final pile location before proceeding with footings.
  - b) Certification that the footings have been constructed to the designated lines and grades before proceeding with any work above the footings.
  - c) Final elevations of bridge seats and certification of span dimensions before proceeding with any work on the superstructure of each bridge.
  - d) Actual profiles on the beams before proceeding with any work on the deck of each bridge.
  - e) Certification of the final screed rail elevations before proceeding with the deck placement.
  - f) Certification that each of the identified components of the Work has been constructed to the designated lines and grades before the Contract Completion Certificate.
- .08 The Contractor shall supply the Owner with all as-constructed horizontal and vertical data related to the layout of the Work before the Contract Completion Certificate.
  - .09 The Contractor shall advise the Contract Administrator of the intended layout schedule at the weekly meeting by identifying the survey activities planned for the following week, including any miscellaneous surveying items.

- .10 For the grading layout, stakes 25 mm x 50 mm x 600 mm, minimum, shall be installed left and right of centreline at or near the right-of-way limits and in the areas where additional staking is required, (e.g., intersections, bridges, and on horizontal and vertical curves). Staking intervals shall be as specified in Table 7.02-1 and Table 7.02-2. The only data to be shown on these stakes shall be profile grade, off-set distance from centreline, and station location. The Contractor shall erect butterfly rods or batter boards at grade stake locations.
- .11 The Contractor shall provide a complete set of off-set stakes with finished grade and stations for the following components of the Work:
  - a) Drainage Items - Sewers, road culverts, entrance culverts, maintenance hole, and similar items.
  - b) Pavement Items - Concrete base, concrete pavement, stabilized base, asphalt, Pavement, and similar items. Fine grading stakes shall be used for this work when Pavement items form part of grading or granular work.
  - c) Miscellaneous Items - Sidewalk, curb and gutter, slope paving, structures, fencing, noise barrier, lighting, guide rail barrier, rip-rap, and similar items as required by the Owner.
- .12 For fine grading layout, including paving, fine grading stakes 25 mm x 50 mm x 600 mm in size shall be installed left and right of the control line at or near the Subgrade Shoulder break. These stakes shall be installed at an interval of 30 m or less where the Contract Administrator deems appropriate, on horizontal and vertical curves, widening of intersections, and similar locations. The only data to be shown on these stakes shall be Profile Grade, elevation, off-set distance from the control line, and station.
- .13 For resurfacing layout, offset stakes shall be installed left or right of the control line and at or near the edge of Shoulder at an interval of 50 m or less. The only data to be shown on the stake shall consist of the final Pavement elevation, off-set distance from the control line, and station.

#### **GC 7.03                      Damage by Vehicles or Other Equipment**

- .01 If at any time, in the opinion of the Contract Administrator, damage is being done or is likely to be done to any Roadway or any improvement thereon, within or outside the Working Area, by the Contractor's vehicles or other Equipment, whether licensed or unlicensed, the Contractor shall, on the direction of the Contract Administrator and at no extra cost to the Owner, make changes or substitutions for such vehicles or Equipment, alter loadings, or in some other manner, remove the cause of such damage to the satisfaction of the Contract Administrator.

#### **GC 7.04                      Excess Loading of Motor Vehicles**

- .01 Where a vehicle is hauling Material, in whole or in part upon a Highway, and where motor vehicle registration is required for such vehicle, the Contractor shall not cause or permit such vehicle to be loaded beyond the legal limit specified in the *Highway Traffic Act*, whether such vehicle is registered in the name of the Contractor or otherwise, except where there are designated areas within the Working Area where overloading is permitted. The Contractor shall bear the onus of weighing disputed loads.
- .02 Vehicles hauling Materials shall be accompanied by an MTO form SR-E-121, Record of Allowable Gross Weight certificate. The legal limit shall be the vehicle's registered gross weight or the allowable gross weight, whichever is less. The Contractor shall ensure that a copy of the Record of Allowable Gross Weight form is left with the weigh person for Owner use.

**GC 7.05****Use of Construction Equipment and Unlicensed Vehicles**

- .01 Unlicensed vehicles and construction equipment, with the exception of rock trucks, shall not travel, work, or stop within 4 m of a lane carrying traffic, except where construction operations necessitates the Working Area be less than 4 m from the traffic in which case, the Contractor shall erect delineators along the edge of the travelled lane, according to paragraph .01 of subsection GC 7.08, Maintaining Roadways and Detours.
- .02 The use of unlicensed rock trucks on facilities open to public traffic shall be permitted only when hauling rock material within the construction zone and subject to the following:
  - a) For unlicensed rock trucks that are less than 3.2 m wide and equipped with foot operated brakes, headlights, and front and rear turn signals, flagging is required at entrance and exit points to warn public traffic.
  - b) For all other unlicensed rock trucks, flagging is required at entrance and exit points and either pilot vehicles or flagging is required along the route to warn public traffic and control movement.
- .03 The use of unlicensed vehicles and construction equipment on bridges under construction and bridges within the Working Area shall be subject to the following requirements:
  - a) Loading shall not exceed the limits specified elsewhere in the Contract Documents.
  - b) Unlicensed vehicles and construction equipment that comply with the legal load limits specified in the *Highway Traffic Act* may be used. Except as noted in paragraph .03, c) of subsection GC 7.05, Use of Construction Equipment and Unlicensed Vehicles, the Contractor shall not cause or permit such vehicles to be loaded beyond the legal limit specified in the *Highway Traffic Act*, including bridge postings and load restrictions. The Contractor shall provide proof of load weight to the Contract Administrator for any disputed loads.
  - c) Unlicensed vehicles and construction equipment that is overloaded in terms of the *Highway Traffic Act* or track propelled equipment greater than 30 tonnes, which the Contractor proposes to drive over bridges under construction and bridges within the Working Area shall be subject to approval. The Contractor shall submit to the Contract Administrator a description and detailed configuration of every such equipment and a certificate, signed and sealed by an Engineer. The certificate shall list the site numbers of every bridge that may be traversed by the subject equipment and state that each Engineer has evaluated, according to the requirements of CSA S6:19, every bridge listed, and that each bridge can safely support all loads.
- .04 Unless specified otherwise in the Contract Documents, pile driving equipment shall not be permitted to operate on bridges.

**GC 7.06****Carrier Safety Compliance****GC 7.06.01****Contractor Operation of a Commercial Motor Vehicle**

- .01 Where the Contractor is a Commercial Vehicle Operator's Registration (CVOR) Holder who intends to operate a Commercial Motor Vehicle in the performance of the Contract or in the haulage of Materials to, on, or from the Working Area, the Contractor shall provide to the Owner a copy of the Contractor's CVOR Abstract as follows:
  - a) The first CVOR Abstract shall be provided to the Owner before the Contractor operates a Commercial Motor Vehicle in the performance of the Contract or in the haulage of Materials to, on, or from the Working Area, and
  - b) CVOR Abstracts shall be submitted to the Owner:
    - i. Annually in October.
    - ii. Periodically upon request anytime during the period of the Contract.

The search date recorded on any CVOR Abstract shall not exceed 30 Days from the date that it is provided to the Contract Administrator.

- .02 If at any time the Contractor holds an unsatisfactory or conditional CVOR rating, the Contractor shall advise the Contract Administrator within 72 hours:
- a) The Contractor's Commercial Motor Vehicles shall not operate in the performance of the Contract or in the haulage of materials to or from the Working Area while the Contractor holds an unsatisfactory CVOR rating.
  - b) The Contract Administrator may permit a Contractor with a Conditional CVOR rating to operate their vehicles in the performance of the Contract or in the haulage of materials to or from the Working Area, subject to the following performance criteria:
    - i. Within 10 Days of having a Conditional CVOR Rating, the Contractor produces an approved plan confirming that drivers and vehicles safety programs are in place to ensure compliance with the safety rating requirement, the *Highway Traffic Act*, and *National Safety Code*; and
    - ii. Achieve a satisfactory, satisfactory unaudited, or excellent safety rating under the MTO Carrier Safety Rating Program and have a violation rate of under 70% within 12 months of the date the plan is submitted to the Owner, or show improvement in the Carrier's Safety Performance over the term of the Contract by reducing the Carrier's pointable accidents, pointable convictions and out of service inspections.

Where a Contractor fails to achieve the performance criteria outlined above, the Contract Administrator may require the Contractor to subcontract all work requiring a CVOR Certificate and the Contractor's bidding privileges on future work with the Owner may be affected.

Paragraph .02, b), i. and ii. of clause GC 7.06.01, Contractor Operation of a Commercial Motor Vehicle, are in addition to any carrier interventions or sanctions imposed through the MTO CVOR program.

#### **GC 7.06.02 Subcontractor and Other Operation of a Commercial Motor Vehicle**

- .01 Prior to any CVOR Holder operating a Commercial Motor Vehicle in the performance of the Contract or in the haulage of material to, on, or from the Working Area, the Contractor shall examine the CVOR Abstract of every CVOR Holder with whom the Contractor intends to subcontract, directly or indirectly, to operate a Commercial Motor Vehicle in the performance of the Contract or in the haulage of materials to, on, or from the Working Area. The Contractor shall provide the Contract Administrator with the CVOR Holder's name and CVOR Certificate number of all Subcontractors.

The search date of any CVOR Level 1 Abstract shall not exceed 30 Days from the date that it is provided to the Contractor.

The Contractor shall retain copies of all CVOR Abstracts for examination by the Owner, upon request.

- .02 The CVOR Holder shall not hold a dormant or inactive CVOR certificate at any time during the period of the Contract.

The Contractor shall, at all times throughout the duration of the Contract, ensure that no CVOR Holder with an unsatisfactory CVOR rating works, directly or indirectly, for the Contractor in the operation of a Commercial Motor Vehicle in the performance of the Contract or in the haulage of materials to, on, or from the Working Area. The Contractor shall require Subcontractors, in turn, to require compliance with subsection GC 7.06, Carrier Safety Compliance, from any Person with whom they contract.

If a CVOR Holder holds an unsatisfactory CVOR rating at any time during the period of the Contract, the Contractor shall inform the Contract Administrator, in writing, within 72 hours of becoming aware, having exercised all due diligence, of such CVOR Holder having an unsatisfactory CVOR rating.

The Contract Administrator may permit a Subcontractor with a conditional CVOR rating to operate their vehicles subject to the following:

- a) Within 10 Days of having a conditional CVOR record, the Subcontractor produces an approved plan confirming that drivers and vehicles safety programs are in place to ensure compliance with the safety rating requirement, the *Highway Traffic Act*, and *National Safety Code*; and

- b) Achieve a satisfactory, satisfactory unaudited, or excellent safety rating under the ministry's Carrier Safety Rating Program and have a violation rate of under 70% within 12 months of the date the plan is submitted to the Owner, or show improvement in the Carrier's Safety Performance over the term of the contract by reducing the Carrier's pointable accidents, pointable convictions, and out of service inspections.

Where a Subcontractor fails to achieve the performance criteria above the Contractor shall within 1 month replace the Subcontractor or CVOR Holder and the Contractor's bidding privileges on future work with the Owner may be affected.

Paragraph .02, a) and b) of clause GC 7.06.02, Subcontractor and Other Operation of a Commercial Motor Vehicle, are in addition to any carrier interventions or sanctions imposed through the MTO CVOR program.

#### **GC 7.07 Condition of the Working Area**

- .01 The Contractor shall maintain the Working Area in a tidy condition and free from the accumulation of debris, other than that caused by the Owner or others.
- .02 During night work, the Contractor shall ensure that the work zone is adequately illuminated to the Contract Administrator's satisfaction for work operations and inspections and the advance warning to traffic.
- .03 The Contractor shall take such steps as may be necessary to control dust resulting from the Contractor's operations or by public traffic, where it is the Contractor's responsibility to maintain a road through the Work, such that it does not:
  - a) Affect traffic;
  - b) Enter surface waters; or
  - c) Escape beyond the right-of-way to cause a nuisance to residents, businesses, or Utilities.

#### **GC 7.08 Maintaining Roadways and Detours**

- .01 Where an existing Roadway is affected by construction, it shall be kept open to traffic, and the Contractor shall, except as otherwise provided in subsection GC 7.08, Maintaining Roadways and Detours, be responsible for providing and maintaining a road through the Work for the duration of the Work, whether along an existing Highway, including the road under construction, or on detours within or adjacent to the Highway according to the OTM.
- .02 The Contractor shall not be required to maintain a Roadway through the Working Area before the Contractor has commenced the Work, or during seasonal shutdown or within any sections of the Roadway where a 12-month general warranty period has commenced. Responsibility for maintenance shall be transferred between the Contractor and the Owner at the commencement of the Work, and the start and end of each seasonal shutdown period. A MTO form PH-CC-771-A, Highway Maintenance Transfer Agreement - Ministry to Contractor and MTO form PH-CC-771-B, Highway Maintenance Transfer Agreement - Contractor to Ministry, prepared by the Contract Administrator, which identifies the date and time that responsibility for maintenance shall be transferred between parties shall be executed by both the Contract Administrator and Contractor prior to the actual turnover date. The Contractor shall not be required to commence any maintenance activities until the turnover date identified on the executed Highway Maintenance Transfer Agreement.

If there is an emergency situation within the Working Area, the Owner may request a third-party maintenance Contractor to provide traffic control and other work necessary to allow reopening of the Roadway to traffic. The Contractor shall coordinate work with the maintenance Contractor and assist as needed.

A minimum of 5 Business Days prior to an anticipated transfer date of responsibility for maintenance, the Contract Administrator, Contractor, and a representative of the Owner's maintenance contractor shall perform a pre-turnover field inspection. The pre-turnover field inspection shall identify deficiencies within the right-of-way and the anticipated timeframe for correction. The Contract Administrator shall be the sole judge on whether or not the noted deficiencies require correction prior to, or after, the turnover date. Provided that the Contractor was given advance written notice of the pre-turnover inspection date, the Contractor shall not delay commencement of the Work or the assumption of responsibility for maintenance because of the existence of deficiencies.

Where work under the Contract is discontinued for any extended period including seasonal shutdown, the Contractor shall, when directed by the Contract Administrator, open and place the Roadway and detours in a passable, safe, and satisfactory condition for public travel. The Contractor shall not be responsible for snow, ice, and frost control on the travelled lanes of the Highway. The Contractor shall be responsible for any snow or ice removal necessary to proceed with the work including behind temporary barriers or other devices, and accumulations that are a result of the Ministry's snow, ice, and frost control measures. The Contractor agrees that snow, ice, and frost control activities of the Ministry's maintenance contractors shall take precedence over the construction within the work zone and agrees not to obstruct any snow, ice, and frost control activities of the Ministry's maintenance contractors.

- .03 The Contractor shall ensure that the Roadway affected by construction is clear of debris. All debris on the travelled portion of the Roadway shall be removed as soon as possible after detection. Debris on the Shoulder shall be removed within 24 hours.
- .04 Where only localized and separated sections of the Highway are affected by the Contractor's operations, the Contractor shall not be required to maintain intervening sections of the Highway until such times as these sections are located within the limits of the Highway affected by the Contractor's general operations under the Contract.
- .05 The Owner shall bear the cost of maintaining, in a satisfactory condition for public traffic, a Roadway through the Working Area. The Contractor shall bring any defects to the attention of the Contract Administrator as soon as they are identified. Such defects include potholes, distortions, pavement edge loss, washouts, drop-offs, and soft or wet areas. Compensation for all labour, Equipment, and Materials to address such defects shall be at the Contract prices appropriate to the work and, where there are no such prices, at negotiated prices. Notwithstanding the foregoing, the cost of providing an operated grader, required to maintain the surface of such Roadways, shall be deemed to be included in the prices bid for the various tender items and no additional payment shall be made.
- .06 Compliance with the foregoing provisions shall in no way relieve the Contractor of obligations under subsection GC 6.01, Protection of Work, Persons, and Property, dealing with the Contractor's responsibility for losses and damage.
- .07 The Contractor shall ensure that earth, mud, aggregate, and other construction debris are not tracked onto the Roadway by construction vehicles.

#### **GC 7.09 Access to Properties Adjoining the Work and Interruption of Utility Services**

- .01 At all times, the Contractor shall provide the following to properties adjoining the Working Area at no additional cost to the Owner:
  - a) Pedestrian and vehicular access; and
  - b) Continuity of Utility services.
- .02 At all times, the Contractor shall provide access to fire hydrants and water and gas valves located in the Working Area at no additional cost to the Owner.
- .03 Where any interruptions in the supply of Utility services are required and are authorized by the Contract Administrator, the Contractor shall give the affected property owners notice according to subsection GC 7.13, Notices by the Contractor, and shall arrange such interruptions so as to create a minimum of interference to affected property owners.

## **GC 7.10 Approvals and Permits**

### **GC 7.10.01 General**

- .01 Except as specified in paragraph .02 of clause GC 7.10.01, the Contractor shall obtain any permits, licenses, certificates, and registrations required for the performance of the Work that are in force at the date of tender closing.
- .02 The Owner shall obtain and pay for the necessary plumbing and building permits.
- .03 The Contractor shall arrange for all necessary inspections.

### **GC 7.10.02 Water Taking**

- .01 The Owner has obtained from the Ministry of the Environment, Conservation and Parks (MECP) one or more draft Permits to Take Water required by the *Ontario Water Resources Act*, R.S.O 1990, c O.40, and these shall be posted under "Contract Attachments" in the Registry, Appraisal and Qualification System (RAQS) listing of the Contract, as applicable.
- .02 When water taking activities are eligible for registration on the MECP Environmental Activity and Sector Registry (EASR) in accordance with O. Reg. 63/16 - Registrations under Part II.2 of the *Environmental Protection Act* - Water Taking, required supporting technical reports shall also be posted under "Contract Attachments" in the RAQS listing of the Contract, as applicable. Some water taking activities eligible for registration on the MECP EASR may have been included in draft permit(s) and as such no supporting technical reports shall be required or provided.
- .03 No later than 5 Business Days after the pre-work meeting, the Contractor shall submit all information required by MECP according to the cover letter attached to draft permit(s) to the attention of the applicable MECP Regional Office Water Resources Supervisor.
- .04 MECP will issue the permit(s) and Director's Orders under the *Environmental Protection Act*, R.S.O. 1990, c. E.19, exempting water taking activities from registration when they have been included in a permit, as applicable, within 15 Business Days of receipt of all required information from the Contractor.
- .05 The Contractor shall be responsible for the registration of any other water taking activities on the EASR, the acquisition of additional Permits to Take Water, and any required supporting technical reports not provided by the Owner, except when required due to a Change in the Work.
- .06 No later than 2 Business Days prior to the commencement of water taking, the Contractor shall submit a copy of the appropriate Permits to Take Water and Director's Orders, as applicable, and shall provide confirmation of registration of any water taking activities, to the Contract Administrator.

## **GC 7.11 Suspension of Work**

- .01 The Contractor shall upon written notice from the Contract Administrator, discontinue or delay any or all of the Work. The Work shall not resume until the Contract Administrator issues such written direction. Delays in these circumstances, shall be administered according to subsection GC 3.07, Delays.

## **GC 7.12 Contractor's Right to Stop the Work or Terminate the Contract**

- .01 If the Owner is adjudged bankrupt or makes a general assignment for the benefit of creditors because of insolvency or if a receiver is appointed because of insolvency, the Contractor may terminate the Contract, without prejudice to any other right or remedy the Contractor may have, by giving the Owner or receiver or trustee in bankruptcy written notice.

- .02 If the Work is stopped or otherwise delayed for a period of 30 Days or more under an order of a court or other public authority and provided that such order was not issued as the result of an act or fault of the Contractor or of any Person directly employed or engaged by the Contractor, the Contractor may terminate the Contract, without prejudice to any other right or remedy the Contractor may have, by giving the Owner written notice.
- .03 The Contractor may notify the Owner in writing, with a copy to the Contract Administrator, that the Owner is in default of contractual obligations if the Owner fails to comply with the requirements of the Contract to a substantial degree.
- .04 The Contractor's written notice to the Owner shall advise that if the default is not corrected in the 7 Days immediately following the receipt of the written notice the Contractor may, without prejudice to any other right or remedy the Contractor may have, stop the Work or terminate the Contract.
- .05 If the Contractor terminates the Contract under the conditions set out in subsection GC 7.12, Contractor's Right to Stop the Work or Terminate the Contract, the Contractor shall be entitled to be paid for all work performed according to the Contract Documents and for any losses or damage as the Contractor may sustain as a result of the termination of the Contract.

### **GC 7.13 Notices by the Contractor**

#### **GC 7.13.01 Advance Notice**

- .01 Before any or all of the Work is carried out that may affect the property or operations of any owner or agency of government or any individual, company, partnership or corporation, including a municipal corporation or any board or commission thereof, and in addition to such notices of the commencement of specified operations as are prescribed elsewhere in the Contract Document, the Contractor shall give at least 48 hours advance written notice of the date of commencement of such work to the individual person, company, partnership, corporation, board, or commission so affected.

#### **GC 7.13.02 Environmental Incident Management Under Legislation Protecting the Environment and Natural Resources**

- .01 The Contractor shall be in strict compliance with the requirements of the following legislation, as amended, regarding Environmental Incidents under the control of the Contractor or that are a result of the Contractor's operations:
  - a) *Environmental Protection Act*, R.S.O. 1990, c. E.19
  - b) *Fisheries Act*, R.S.C. 1985, c. F.14
  - c) *Technical Standards and Safety Act*, 2000, S.O. 2000, c. 16
  - d) *Pesticides Act*, R.S.O. 1990, c. P.11
  - e) *Ontario Water Resources Act*, R.S.O. 1990, c. O.40
  - f) *Transportation of Dangerous Goods Act*, 1992 (S.C.1992, c. 34)
- .02 The requirements of the legislation listed in paragraph .01 of clause GC 7.13.02, Environmental Incident Management Under Legislation Protecting the Environment and Natural Resources, include but are not restricted to:
  - a) Immediate containment of the material, pollutant, contaminant, deleterious substance, or dangerous good;
  - b) Immediate notification of the Environmental Incident to the proper authority; and
  - c) Cleanup and restoration of the environment to preconditions.
- .03 The Contractor shall possess a plan demonstrating that Environmental Incidents shall be managed to satisfy the requirements of paragraphs .01 and .02 of clause GC 7.13.02, Environmental Incident Management Under Legislation Protecting the Environment and Natural Resources.

- .04 The Contractor shall also be responsible for informing the Contract Administrator forthwith of:
  - a) An Environmental Incident when it occurs; and
  - b) Any actions taken or intended to be taken by the Contractor regarding the Environmental Incident.
- .05 Within 48 hours of an Environmental Incident, the Contractor shall provide to the Contract Administrator, on MTO form PH-CC-818, Incident Notification Form, details of such incident.
- .06 The Contractor shall indemnify and save the Owner harmless from any additional expense that the Owner may incur to have the Work performed as a result of the Contractor's failure to comply with the requirements of the legislation listed in paragraph .01 of clause GC 7.13.02, Environmental Incident Management Under Legislation Protecting the Environment and Natural Resources.

#### **GC 7.14 Obstructions**

- .01 Except as otherwise noted in these MTO General Conditions of Contract, the Contractor assumes all the risks and responsibilities arising out of any obstruction encountered in the performance of the Work and any traffic conditions, including traffic conditions on any Highway or road giving access to the Working Area caused by such obstructions, and the Contractor shall not make any claim against the Owner for any loss, damage, or expense occasioned thereby.
- .02 Where the obstruction is an underground Utility such as a telephone cable, watermain, gas main or sewer or other man-made object, the Contractor shall not be required to assume the risks and responsibilities arising out of such obstruction, unless the location of the obstruction is shown on the plans or described in the specifications and the location so shown is within the tolerance specified in paragraph .01, a) of subsection GC 2.01, Reliance on Contract Documents, or unless the presence and location of the obstruction has otherwise been made known to the Contractor or could have been determined by the visual site investigation made by the Contractor according to these MTO General Conditions of Contract.
- .03 During the course of the Contract, it is the Contractor's responsibility to consult with Utility companies or other appropriate jurisdictions for further information in regard to the exact location of these Utilities, to exercise the necessary care in construction operations, and to take such other precautions as are necessary to safeguard the Utilities from damage.

#### **GC 7.15 Limitations of Operations**

- .01 Except for such work as may be required by the Contract Administrator to maintain the Working Area in a safe and satisfactory condition, the Contractor shall not carry on operations under the Contract on Sundays without permission in writing from the Owner.
- .02 The Contractor shall cooperate with other contractors, Utility companies, and the Owner and they shall be allowed access to their work or plant at all reasonable times.

#### **GC 7.16 Cleaning Up Before Contract Completion**

- .01 Upon attaining substantial performance of the Work, the Contractor shall remove surplus materials, Hand Tools, Equipment not required for the performance of the remaining work. The Contractor shall also remove all temporary works and debris other than that caused by the Owner or others and shall leave the Work and Working Area clean and suitable for occupancy by the Owner unless otherwise specified.
- .02 The Work shall not be deemed to have reached Contract Completion until the Contractor has removed surplus materials, Hand Tools, Equipment. The Contractor shall also have removed debris, other than that caused by the Owner or others.

#### **GC 7.17 Record Drawings**

- .01 The Contractor shall provide three hard copies and one digital file, in PDF format, of Record Drawings prior to Contract Completion.

- .02 Record Drawings shall show all differences, design changes, and deviations from the original Contract Drawings in red with references to the Contractor's survey and quality control inspection records beside each entry.

#### **GC 7.18 General Warranty**

- .01 Unless otherwise specified in the Contract Documents for certain Materials or components of the Work, the Contractor shall be responsible for the proper performance of the Work only to the extent that the design and specifications permit such performance. The onus is on the Contractor to show through engineering analysis that the design and specifications are deficient for the proper performance of the Work.
- .02 Subject to the previous paragraph, the Contractor shall correct promptly at no cost to the Owner, defects or deficiencies in the Work that appear during the period of 12-months after the date of substantial performance as set out in the Certificate of Substantial Performance or such longer periods as may be specified for certain Materials or components of the Work. The Owner shall promptly give the Contractor written notice of observed defects or deficiencies. The Contractor shall submit a comprehensive repair proposal, including traffic control measures, to the Owner within 15 Days of receiving written notification of the defects or deficiencies.

Notwithstanding the above, on Contracts lasting more than 1 construction season, the Owner shall allow the 12 month general warranty period to commence prior to the date of substantial performance for complete sections of Roadways that have been completed in their entirety, have a value of greater than \$5,000,000, and are in use by public traffic. In such cases, the Contractor shall apply in writing to the Owner for approval of the start dates of the general warranty for the selected sections of completed Roadways. The written request shall be submitted to Contract Administrator no later than 10 Days prior to the proposed general warranty start dates and include details as to the limits, location, and start date requested. If a request is granted, the Contractor shall correct promptly at no cost to the Owner, defects or deficiencies in the completed section of Roadway, which appear during the period of 12-months after the date of commencement of the warranty on the completed section of Roadway

- .03 The Contractor shall correct or pay for damage resulting from corrections made under the requirements of paragraph .02 of subsection GC 7.18, General Warranty.

#### **GC 7.19 Accounts Payable**

- .01 The Contractor shall pay the Rate of Interest after 28 Days on accounts payable to the Owner at the Rate of Interest.

#### **GC 7.20 Stockpiling of Material**

- .01 The Contractor shall not stockpile material weighing more than 1.5 kPa on spans of bridges in which concrete removal has commenced for rehabilitation.
- .02 In cases other than stipulated in paragraph .01 of subsection GC 7.20, Stocking of Material, the Contractor shall not stockpile material weighing more than:
  - a) 5 kPa on decks of highway bridges unless specified otherwise in the Contract Documents.
  - b) 2 kPa on decks of pedestrian bridges unless specified otherwise in the Contract Documents.

## **SECTION GC 8.0 - MEASUREMENT AND PAYMENT**

### **GC 8.01 Measurement**

#### **GC 8.01.01 Quantities**

- .01 Quantities for progress payments shall be construed and held to be approximate. The final quantities for the issuance of the Contract Completion Certificate shall be based on the measurement of the Work completed.
- .02 Measurement of the quantities of the Work shall be either by Actual Measurement or by Plan Quantity as indicated in the Contract Documents. Adjustments to Plan Quantities shall normally be made by modifying boundary lines and grades of the work on the plans to calculate new adjusted Plan Quantities but may, where appropriate, be made using Actual Measurements. Those items identified on the tender by the notation (P) in the unit column shall be paid according to the Plan Quantity. Items where the notation (P) does not occur shall be paid according to Actual Measurement or lump sum.

#### **GC 8.01.02 Variations in Tender Quantities**

- .01 When it appears that the quantity of work to be done or Material to be supplied by the Contractor or both under a unit price tender item may exceed or be less than the tender quantity, the Contractor shall proceed to do the work or supply the Material or both required to complete the tender item and payment shall be made for the actual amount of work done or Materials supplied or both at the unit prices stated in the tender except as provided below:
  - a) In the case of a Major Item, when the quantity of work performed or Material supplied by the Contractor or both exceeds the tender quantity by more than 15%, either party to the Contract may make a written request to the other party to negotiate a revised unit price for that portion of the Work performed or Material supplied or both which exceeds 115% of the tender quantity. The negotiation shall be carried out as soon as reasonably possible. Any revision of the unit price shall be based on the actual cost of doing the work or supplying the Material or both under the tender item plus a reasonable allowance for profit and applicable overhead.
  - b) In the case of a Major Item, when the quantity of work performed or Material supplied by the Contractor or both is less than 85% of the tender quantity, the Contractor may make a written request to negotiate payment for the portion of actual overheads and fixed costs applicable to the amount of the underrun in excess of 15% of the tender quantity. For purposes of the negotiation, the overheads and fixed costs applicable to the item are deemed to have been prorated uniformly over 100% of the tender quantity for the item. Overhead costs shall be confirmed by a statement certified by the Contractor's senior financial officer or auditor and may be audited by the Owner.

Alternatively, where both parties agree, an allowance equal to 10% of the unit price on the amount of the underrun in excess of 15% of the tender quantity shall be paid. Written requests for compensation shall be received no later than 180 Days after Contract Completion.
- .02 When it appears that the amount of work to be done or Material to be supplied by the Contractor or both under a lump sum concrete item may exceed or be less than the amount shown in the Contract Documents, the Contractor shall proceed to do the work or supply the Material or both required to complete the tender item and payment shall be made on the basis of the lump sum price shown in the tender except as provided below:
  - a) Where the theoretical quantity as determined from the design dimensions of the structure components exceeds the estimated quantity of concrete stated in the Contract Documents by more than 3% and when such increase does not result from a change in design made according to paragraph .01 of clause GC 3.10.01, Changes in the Work, then the Contractor may make a written request to the Contract Administrator to negotiate the compensation payable for that portion of the concrete that exceeds 103% of the estimated quantity. The negotiation shall be carried out as soon as reasonably possible. Any increase in the compensation shall be based on the actual cost of supplying and placing that portion of the concrete which exceeds 103% of the estimated quantity plus a reasonable allowance for profit and overhead.

- b) Where the theoretical quantity as determined from the design dimensions of the structure components is less than 97% of the estimated quantity of concrete stated in the Contract Documents and where such difference does not result from a change in design made according to paragraph .01 of clause GC 3.10.01, Changes in the Work, then the Contract Administrator may make a written request to the Contractor to negotiate the compensation payable for the item to reflect the change in quantity. The negotiation shall be carried out as soon as reasonably possible. Any decrease in compensation shall be based on the estimated value of the amount of underrun in excess of 3% of the estimated quantity and shall include a reasonable allowance for profit and overhead.

- .03 The Contractor or the Contract Administrator may dispute the quantity that is specified for payment on a Plan Quantity basis. The dispute shall be supported by calculations, drawings, and any other evidence indicating why the Plan Quantity is believed to be in error. If the Plan Quantity is found to be in error, payment shall be made according to the adjusted Plan Quantity.

## **GC 8.02 Payment**

### **GC 8.02.01 Non-Resident Contractor**

- .01 The Contractor shall obtain all necessary approvals, consents, permits, licences, certificates, registrations, and other authorizations prior to execution of the Contract.
- .02 The Contractor shall ensure that all Subcontractors the Contractor proposes to use for carrying out any of the Work required by the Contract and who are non-resident in Ontario have obtained all necessary approvals, consents, permits, licences, certificates, registrations, and other authorizations prior to execution of the subcontract.

### **GC 8.02.02 Price for Work**

- .01 Prices for the Work shall be full compensation for all labour, Equipment, and Material required to do the work. The term "all labour, Equipment, and Material" shall include Hand Tools, supplies, and other incidentals.
- .02 Payment for work as shown or detailed in the Contract Documents not specifically detailed as part of any one item and without specified details of payment shall be deemed to be included in the item with which it is associated.
- .03 Payment adjustments determined according to the Contract Documents shall be applied to the payment due to the Contractor.

### **GC 8.02.03 Advance Payments for Material**

- .01 The Owner shall make advance payments for Material intended for incorporation in the Work upon the written request of the Contractor and according to the following terms and conditions:
  - a) In advance of receipt of the shipment of the Material, the Contractor shall, arrange for adequate and proper storage facilities and notify the Contract Administrator of the location of the facilities.
  - b) The value of Aggregates, processed and stockpiled, shall be assessed by the following procedure:
    - i. **Sources Other Than Commercial**
      - (A) Granular A, B, and M shall be assessed at the rate of 60% of the tendered unit price.
      - (B) Coarse and fine aggregates for hot mix asphalt and surface treatment shall be assessed at the rate of 25% of the tendered unit price multiplied by the tonnage of each Aggregate in stockpile. Prior to payment, the Contractor shall provide test results and mix designs to demonstrate that the materials are capable of producing a mix design conforming to the Contract Documents.
    - ii. **Commercial Sources** - Payment for separated coarse and fine aggregates shall be considered at the same rate as sources other than commercial, when such Materials are stockpiled at a commercial source. Advance payments for other materials located at a Commercial Source shall not be made.

- c) Payment for all other Materials, unless specified otherwise elsewhere in the Contract Documents, shall be based on an invoice identifying the Contract and marked as "paid" and signed by the Material supplier. In the event of Materials supplied by a Subcontractor, the Contractor shall provide the original Material supplier invoice marked as paid and signed by the Material supplier and an invoice from the Subcontractor marked as paid and signed by the Subcontractor.
- d) The payment for all Materials shall be prorated against the appropriate tender item by paying for sufficient units of the item to cover the value of the Material. Such payment shall not exceed 80% of the tendered unit price for the item.
- e) All Materials for which the Contractor wishes to receive advance payment shall be placed in the designated storage location within the Province of Ontario, immediately upon receipt of the Material and shall thenceforth be held by the Contractor in trust for the Owner as collateral security for any monies advanced by the Owner and for the due completion of the Work. The Contractor shall not exercise any act of ownership inconsistent with such security or remove any Material from the storage locations, except for inclusion in the Work, without the consent of the Contract Administrator, in writing. The Contractor shall arrange for a lease agreement with any private property owner where such Material is to be stored on MTO form PH-CC-733, Owner Tenancy and Access Agreement, granting the Owner tenancy and access for any storage location on private property for the sum of \$1.
- f) Such Materials shall remain at the risk of the Contractor who shall be responsible for any loss, damage, theft, improper use, or destruction of the Material, however so caused.

#### **GC 8.02.04 Certification and Payment**

##### **GC 8.02.04.01 Progress Payment Certificate**

- .01 The Contractor shall submit an application for progress payment monthly after starting the Work on the Contract. The application for progress payment shall be for Work completed at the agreed to monthly Cut-off Date.

Within 7 Days following the agreed to monthly Cut-off Dates, the Contractor shall submit an updated application to the Contract Administrator.

The updated application shall contain two parts as follows:

##### **Part 1 - A Proper Invoice** which shall contain:

- a) Contractor's name and address;
- b) Date of the Proper Invoice and the period for Work performed;
- c) Information identifying the Owner and Contract number for Work performed;
- d) A description, including quantity where appropriate, of Work performed;
- e) The amount payable for the Work performed and the payment terms;
- f) The name, title, telephone number, and mailing address of the Person to whom payment is to be sent; and
- g) Tender item numbers, description, unit of measurement, original tender quantity, agreed upon changes to the tender quantity, total quantity completed to date, quantity completed previous Proper Invoice, quantity completed this period, unit price, dollars this period, and total dollars to date.

Subtotals shall be detailed for tender items, approved Change Orders, and payment adjustments as specified in the Contract Documents.

The tender item information appearing on the Proper Invoice shall conform exactly with those as shown in the bid tender document.

**Part 2 - Quantity of Work Completed Sheets** detailing:

- a) Tender item numbers, sub-item numbers, unit of measurement, location description, original tender quantity, agreed upon changes to the quantity, total quantity completed to date, quantity completed previous Proper Invoice, quantities completed and reconciled with the Contract Administrator for this period.

The tender item information appearing on the quantity of Work completed sheets shall conform exactly with those provided in the bid tender document. The quantity of Work completed sheet information shall be sufficient to allow the Contract Administrator to verify and confirm the Work on the Proper Invoice for payment.

Proper Invoices and quantity of Work completed sheets shall be submitted in hard-copy or digital format. For payment purposes, the Contract Administrator shall review the updated application for progress payment within 7 Days of receipt for completeness and to verify the quantities of Work have been completed as specified in the Contract Documents.

Applications for progress payments containing deficiencies, errors, or non-compliance with the Contract Documents shall be deemed to contain an invoice that does not meet the requirements of a Proper Invoice and shall be returned to the Contractor for correction.

The Owner shall pay the Proper Invoice no later than 28 Days after receiving the Proper Invoice.

**GC 8.02.04.02 Payment Adjustment for Changes in the Fuel Price Index**

- .01 The Owner shall adjust the payment to the Contractor based on changes to the Owner's fuel price index. The fuel price index shall be calculated by the Ontario Ministry of Energy and shall be based on the rack price, including taxes, of diesel fuel. The fuel price index shall be published monthly in the Owner's Contract Bulletin for each calendar month and shall reflect the previous month's prices. The Contractor shall use this index when calculating flow through to truckers, Subcontractors, and shippers and suppliers.
- .02 A payment adjustment, excluding any payments for Changes in the Work and Additional Work, shall be calculated monthly and applied to the monthly progress payment.
- .03 It is agreed by the parties to the Contract that it is impracticable and difficult to ascertain actual fuel consumed on the Contract, and the parties hereto agree that for the purpose of calculating the total fuel price adjustments, the amount of fuel consumed shall be determined using the rates in Table 8.02.04.02-1. The payment provided for the items listed in Table 8.02.04.02-1 shall be deemed to be for all Work.
- .04 Payments provided under clause GC 8.02.04.02, Payment Adjustment for Changes in the Fuel Price Index, shall be used to compensate all trucks, Subcontractors, and shippers and suppliers performing any Contract Work or delivering material for the Contract including items not listed in Table 8.02.04.02-1.
- .05 The compensation provided through this provision shall also be used for the purpose of providing fuel price adjustment compensation to suppliers and shippers. Should the Contractor be required by a supplier to negotiate and provide fuel price adjustment compensation to any party providing Materials to the Contract, the Owner shall not provide any compensation for this purpose in addition to that provided through these MTO General Conditions of Contract.
- .06 Fuel Price Adjustment Calculation
  - a) The Contractor's payment adjustment for each month shall be calculated using the following formula:

$$Cfpa = (Ctem) \times \frac{(I - Bc)}{100}$$

Where:

Cfpa = fuel price adjustment paid to Contractor or Owner, in dollars

Ctem = total estimated monthly fuel consumption

I = progress payment month fuel price index (for the month that the work was completed in)

Bc = fuel price index in the month that the Contract was advertised for tender

- b) The progress payment month fuel index shall be published the first Friday of every month in the Owner's Contract Bulletin.
- c) The total monthly fuel consumption shall be calculated by multiplying the consumption rates in Table 8.02.04.02-1 by the work accomplished in the current month for each applicable item and totalling the volume in litres.
- d) Only tender item quantities or work done at the tender item price shall be included in the calculation.

.07 Payment Certificate Documentation

- a) When (I-Bc) (progress payment month fuel price index - advertising month fuel price index) is positive, the Contractor shall receive a payment.
- b) When (I-Bc) (progress payment month fuel price index - advertising month fuel price index) is negative the Owner shall receive a credit.
- c) The Contractor shall show the fuel price adjustment as a line item on each progress payment certificate and the final payment certificate. The item shall be called fuel price adjustment.

.08 Fuel Price Adjustment Flow Through

- a) The Contractor agrees to adjust the payment to each trucker hired directly by the Contractor for execution of part of the Work according to the following formula:

$$Tfpa = (Tmpp) \times \frac{(I - Bt)}{Bt} \times 0.17$$

Where:

Tfpa = fuel price adjustment paid to trucker, in dollars

Tmpp = monthly payment to trucker, in dollars

Bt = fuel price index in the month that the Contract with the trucker was entered into either verbally or in writing

I = progress payment month fuel price index (for the month that the work was completed in)

The fuel price adjustment paid to each trucker (Tfpa) shall be calculated for each calendar month and may be positive or negative.

- b) The Contractor agrees to adjust the payment to each Subcontractor according to the following formula:

$$Sfpa = (Smpp) \times \frac{(I - Bs)}{Bs} \times \frac{Fn}{100}$$

Where:

Sfpa = fuel price adjustment paid to the Subcontractor, in dollars

Smpp = monthly progress payment to the Subcontractor, in dollars

Bs = fuel price index in the month that the Contract with the Subcontractor was entered into either verbally or in writing

I = progress payment month fuel price index (for the month that the work was completed in)

Fn = fuel consumption factor as negotiated between the Contractor and the Subcontractor as a percentage of the value of the subcontract

- c) The Contractor shall report the negotiated fuel consumption factor (Fn) on MTO form PH-CC-744, Fuel Consumption Listing Subcontractor, listing all subcontracts, and the corresponding negotiated fuel consumption factor. The form shall be updated monthly or as changes and additions arise.
- d) The Contractor also agrees that each subcontract shall contain a requirement that the Subcontractor shall make a fuel price adjustment to each trucker hired directly by the Subcontractor for execution of part of the work according to the same formula and conditions used by the Contractor to make fuel price adjustments to truckers, and provide such confirmation on MTO form PH-CC-745, Fuel Consumption Tracking Subcontractor, for each trucker.

#### **GC 8.02.04.03 Certification of Subcontract Completion**

- .01 Before the Work has reached the stage of substantial performance; the Contractor may notify the Contract Administrator, in writing that a subcontract is completed satisfactorily and ask that the Contract Administrator certify the completion of the subcontract.
- .02 The Contract Administrator shall determine if the subcontract has been satisfactorily completed with all required inspections and testing required for the subcontract work and, if the Contract Administrator so determines, shall certify completion using MTO form PH-CC-797, Certificate of Completion of Subcontract.
- .03 Within 7 Days of the date the subcontract is certified complete, the Contract Administrator shall give a copy of the certificate to the Contractor and to the Subcontractor concerned.

#### **GC 8.02.04.04 Subcontract Statutory Holdback Release Certificate and Payment**

- .01 At the time of issuance of the Certificate of Completion of Subcontract, the Contract Administrator shall:
  - a) Prepare a subcontract completion payment certificate showing:
    - i. The final prices for items;
    - ii. The amount of holdback monies;
    - iii. The amount due the Contractor.
  - b) Provide to the Contractor, the subcontract completion payment certificate within 10 Days of the date the subcontract was certified complete, for the Contractor to sign and return within 5 further Days. The Contract Administrator shall release to the Subcontractor through the Contractor the 10% holdback retained by the Owner in respect of the work covered by the said subcontract after being certified completed and providing that all lien claims that may be claimed against the holdback for the subcontract work have been expired or been satisfied or discharged, or otherwise provided for according to the *Construction Act*, and providing that the Contractor has furnished to the Contract Administrator a statutory declaration in a form supplied by the Owner that the said Subcontractor has discharged all liabilities incurred by the Subcontractor in carrying out the said subcontract.
- .02 The Contractor shall make payment of the said subcontract to the Subcontractor concerned pursuant to the *Construction Act*.
- .03 Release of holdback monies by the Owner in respect of a subcontract according to the foregoing shall not relieve the Contractor or its Surety of any of their responsibilities.
- .04 Payment for subcontracts certified complete pursuant to the Contract and the *Construction Act*, including the payment of the statutory holdback, shall be made no later than 120 Days of the date on which the Work was certified complete, when all the liens have been satisfied according to Section 25 of the *Construction Act*.

**GC 8.02.04.05****Certificate of Substantial Performance**

- .01 Application for substantial performance by the Contractor shall be submitted in the form of a letter, accompanied with:
- a) An application for payment at substantial performance in a form satisfactory to the Contract Administrator for all work to date, the amount of the 10% holdback, and the amount due.
  - b) A release, on MTO form PH-CC-817, Application for Substantial Performance/Contract Completion, by the Contractor releasing the Owner from all further claims related to the Contract qualified by stated exceptions such as outstanding work or matter arising out of subsection GC 3.14, Compensation Request, or subsection GC 3.15, Dispute Resolution.
  - c) A statutory declaration, on MTO form PH-CC-817, Application for Substantial Performance/Contract Completion, that all liabilities incurred by the Contractor and the Subcontractors in carrying out the Contract have been discharged except for the statutory holdbacks properly retained.
  - d) A satisfactory Certificate of Clearance from the Workplace Safety and Insurance Board.
- .02 Upon written application by the Contractor for substantial performance, the Contract Administrator shall conduct an inspection of the Work to determine if the Work is substantially performed and the date for substantial performance. The Contractor's application shall detail non-conformances, defects to be rectified, and Work yet to be completed. After inspection, the Contract Administrator shall provide a list of deficiencies and Work yet to be completed in addition to the Contractor's list. The Contractor's list of non-conformances, defects, and Work yet to be completed together with the Contract Administrator's list of same shall be combined and referred to as Finishing Work. All deficiencies and Work to be completed from the Finishing Work Deficiency List shall be completed prior to Contract Completion. Any additional defects and deficiencies for Work previously accepted as substantially performed shall be completed within 60 Days of Contract Completion, unless prevented by winter weather conditions; in such case, the defects and deficiencies shall be corrected by June 15<sup>th</sup> of the following year. Defects and deficiencies on Work completed after substantial performance shall be completed prior to Contract Completion.
- .03 Upon verifying that the Contract has been substantially performed, the Contract Administrator shall issue a Certificate of Substantial Performance and shall set out in the Certificate of Substantial Performance the date on which the Contract was substantially performed and within 7 Days after the signing the said certificate the Contract Administrator shall provide a copy to the Contractor.
- .04 Upon receipt of a copy of the Certificate of Substantial Performance, the Contractor shall arrange to have the certificate published in a construction trade newspaper and the Contractor shall provide to the Contract Administrator proof that the certificate was published. Where the Contractor fails to publish a Certificate of Substantial Performance within 7 Days of receiving the certificate, the Owner shall publish the certificate in the *Daily Commercial News* and charge the Contractor \$1,000 for the costs of advertising and administration. Subject to the *Construction Act*, the 60-Day lien period shall start on the date the Certificate of Substantial Performance is published.
- .05 Except as otherwise provided for in Section 31 of the *Construction Act*, the 60-Day lien period prior to the payment of statutory holdback shall commence from the date of publication of the Certificate of Substantial Performance as provided for in paragraph .04 of clause GC 8.02.04.05, Certificate of Substantial Performance.

**GC 8.02.04.06****Substantial Performance Payment and Statutory Holdback Release Payment**

- .01 Upon receipt of the application for payment at substantial performance, the Contract Administrator shall check the application and advise the Contractor of any discrepancies. Any of these discrepancies that are unresolved prior to the expiry of the lien period shall be treated as set-offs.
- .02 Subject to any outstanding liens and permissible set-offs, the Owner shall issue payment, including the release of the Basic Holdback on the Work completed, within 28 Days, where all the liens have expired or been satisfied, discharged or otherwise provided for pursuant to the *Construction Act*.

- .03 In addition to any permissible set-offs, Holdback for Finishing Work shall be retained at the rate of 10%, on all Work performed after the date of the Certificate of Substantial Performance.
- .04 If the Contract provides for a completion schedule that is longer than 1 year, Total Bid Price is greater than \$10,000,000 and there are no outstanding liens, the Contractor may request payment of the retained Basic Holdback on an annual basis. When a request is received, the Owner shall issue payment to reduce the holdback on work done from 10% to 2½%, plus the amount of the Owner's set-offs, provided that the Contract had not been substantially performed and the estimated value of the work performed is greater than 60% of the original tender value for a Contract having an expected duration of two construction seasons or less, or 40% for a Contract having an expected duration of more than two construction seasons.
- .05 The holdback may not be released to the Contractor within the timeline according to clause GC 8.02.04.06, Substantial Performance Payment and Statutory Holdback Release Payment, when Form 6 of Ontario Regulation 303/18 of the *Construction Act* is provided to the Contractor to indicate notice of non-payment of holdback and published by the Owner in the *Daily Commercial News* as provided in Section 27.1 of the *Construction Act*. The Contract Administrator shall notify the Contractor, in writing, of its publication no later than 3 Days after the publication of the notice of non-payment.
- .06 Within 3 Days after receiving Form 6 of Ontario Regulation 303/18 of the *Construction Act* from the Contract Administrator, the Contractor shall notify the affected Subcontractor(s) providing a copy of the notice.
- .07 Payments for Work certified as substantially performed, including release of holdback, shall be made no later than 135 Days of the date of publication of substantial performance. The Owner shall release the holdback at the end of the 60-Day lien period providing all liens are expired or been satisfied, discharged or otherwise provided according to the *Construction Act*. This payment shall be made within 28 Days of the expiry of the 60-Day lien period and subject to Subsection 26.1 of the *Construction Act*.

#### **GC 8.02.04.07                      Certificate of Contract Completion**

- .01 Application for Contract Completion may be requested by the Contractor once all services and Material required by the Contract have been supplied, exclusive of any warranties, and shall be submitted in the form of a letter, accompanied with:
  - a) An application for payment at Contract Completion in a form satisfactory to the Contract Administrator for all work to date, the amount of the 10% holdback, and the amount due the Contractor.
  - b) A release, on the MTO form PH-CC-817, Application for Substantial Performance/Contract Completion, by the Contractor to the Contract Administrator releasing the Owner from all further claims related to the Contract qualified by stated exceptions (e.g., outstanding submissions or matters arising out of subsection GC 3.14, Compensation Request, or subsection GC 3.15, Dispute Resolution).
  - c) A statutory declaration, on MTO form PH-CC-817, Application for Substantial Performance/Contract Completion, by the Contractor to the Contract Administrator that all liabilities incurred by the Contractor and Subcontractors in carrying out the Contract have been discharged, except for the statutory holdbacks properly retained.
  - d) A satisfactory Certificate of Clearance from the Workplace Safety and Insurance Board.
- .02 Upon confirming the Contract is complete, the Owner shall issue a Certificate of Contract Completion on the MTO form PH-CC-890, Certificate of Contract Completion, and shall set out in the form the date on which the Contract was completed (date of Contract Completion) and within 7 Days after the signing the said certificate, the Owner shall provide a copy to the Contractor. A Certificate of Substantial Performance shall also be provided, if not previously requested by the Contractor.

- .03 If the Contractor has not applied for or received a Certificate of Substantial Performance, upon receipt of a copy of the Certificate of Contract Completion and the Certificate of Substantial Performance, the Contractor shall arrange to have the Certificate of Substantial Performance published in a construction trade newspaper and the Contractor shall provide to the Contract Administrator proof that the certificate was published. When the Contractor fails to publish a Certificate of Substantial Performance within 7 Days of receiving the certificate, the Owner shall publish the certificate in the *Daily Commercial News* and charge the Contractor \$1,000 for the costs of advertising and administration. Subject to the *Construction Act*, the 60-Day lien period shall start on the date the certificate is published.
- .04 The Certificate of Contract Completion may be issued although not all required Contractor submissions have been provided. The Contractor shall provide all outstanding submissions (e.g., test results, Record Drawings, and manuals) within 20 Business Days of the date of Certificate of Contract Completion. It is anticipated the Owner shall incur damages after such time should the submissions not be received within the above time. The parties agree that liquidated damages of \$400 per Day shall be charged to the Contractor for each Day after 20 Business Days of the date of Certificate of Contract Completion until all submissions have been received.
- .05 Upon receipt of the application for payment at Contract Completion, the Contract Administrator shall check the application and advise the Contractor of any discrepancies. Any of these discrepancies that are unresolved prior to the expiry of the 60-Day lien period shall be treated as a set-off.
- .06 Subject to any outstanding liens and permissible set-offs, the Owner shall issue payment, including the release of any Holdback for Finishing Work on the Work completed, within 28 Days, where all the liens have expired or been satisfied, discharged or otherwise provided for pursuant to the *Construction Act*.

**GC 8.02.04.08 Interest**

- .01 Interest due the Contractor is based on simple interest and is calculated using the applicable Rates of Interest.

**GC 8.02.04.09 Interest for Late Payment**

- .01 When the Contractor has complied with the requirements of the Contract and when payment by the Owner to the Contractor for Work performed, monies to be paid upon the determination resulting from an Adjudication, or for release of the statutory holdback is delayed by the Owner, then the Contractor shall be entitled to interest upon the late payment for Work performed or for the release of the statutory holdback at the Rate of Interest.

**GC 8.02.04.10 Interest for Compensation Requests and Claims**

- .01 Where a Compensation Request and any subsequent Claims are submitted according to the time limits and/or procedure according to subsections GC 3.14, Compensation Request, and GC 3.15, Dispute Resolution, the Owner shall pay the Contractor the Rate of Interest on the amount of the agreed upon price for the Work or on the amount of the settled Claim. The Rate of Interest shall commence from a date 28 Days following the established Cut-off Date which immediately follows the completion of the Work to which the negotiation applies

**GC 8.02.04.11 Owner's Set-Off**

- .01 Subject to Section 26 and Subsection 27.1 of the *Construction Act* and pursuant to Section 12 of the *Construction Act*, the Owner shall retain from monies owing to the Contractor under the Contract an amount sufficient to cover all debts, claims, or damages related to the Contract, any outstanding or disputed liabilities the cost to remedy deficiencies, the reduction in value of substandard portions of the Work, claims for damages by third-parties that have not been determined in writing by the Contractor's insurer, undetermined claims by the Owner according to paragraph .01, a), and paragraph .02, a), of clause GC 8.01.02, Variations in Tender Quantities, and any assessment due the Workplace Safety and Insurance Board.
- .02 Under these circumstances the Owner shall give the Contractor notice.

#### GC 8.02.04.12

#### Contract Completion, Statutory Holdback Release and Final Payment

- .01 The Owner shall release the statutory holdback so as to discharge all claims in respect of the statutory holdback where all liens that may be claimed against the Holdback for Finishing Work have expired or been satisfied, discharged or otherwise provided according to the *Construction Act*.
- .02 Final payment including payment of statutory holdback shall be made no later than 120 Days from the date of Contract Completion upon the expiry of all liens or upon the liens being satisfied, discharged or otherwise provided for pursuant to the *Construction Act*.

#### GC 8.03

#### Payment on a Time and Material Basis

##### GC 8.03.01

##### Definitions

For the purpose of subsection GC 8.03, Payment on a Time and Material Basis, the following definitions apply:

**Actual Payroll Burden** means the payments in respect of the following list of items. No other items shall be permitted in the calculation of the Contractor's Actual Payroll Burden.

- a) **Vacation** means the Contractor's paid time off for vacation earned in each year calculated at salary cost, including overtime, according to the Contractor's policy.
- b) **Sick Leave** means the Contractor's paid time off due to sickness, accident, or injury or specific personal and family issues such as bereavement leave, jury duty, and similar leaves. Such paid time off is according to Contractor's policy and calculated at salary cost.
- c) **Statutory Holidays** means the Contractor's paid time off according to Ontario law and established custom.
- d) **Training** means the Contractor's paid time for employees to maintain and increase their level of skills pertaining to their position.
- e) **Employment Insurance** means the Contractor's portion of employment insurance premiums incurred according to the Employment Standards Act.
- f) **Group Life Insurance** means the premium paid by the Contractor to employee group life and short and long term disability insurance plans.
- g) **Employer Health Tax** means the premium incurred by the Contractor for the year according to the Employer Health Tax Act of Ontario.
- h) **Group Medical Plan** means the premium paid by the Contractor for group health insurance plans providing coverage of health care costs not covered by the basic government health plan.
- i) **Workplace Safety and Insurance Board** means the WSIB premium incurred by the Contractor for the year according to Workplace Safety and Insurance Act.
- j) **Contractor Pension Plan** means the Contractor's pension plan cost, including the cost of funding the pension benefits earned by employees and cost of services of third-parties incurred for the pension plan.
- k) **Canada Pension Plan** means the Contractor's portion of Canada pension plan contribution incurred according to the Canada Pension Plan Act or its equivalent for non-residents.
- l) **Union Contributions** means the premium paid by the Contractor to a union according to active collective agreements. Items such as Industry Funds paid to a Trustee and Legal Benefits identified in such agreements are to be included under this item.

**Cost of Labour** means the amount of wages, salary, travel expenses, travel time, room and board, and Actual Payroll Burden paid or incurred directly by the Contractor to or in respect of labour and supervision actively and necessarily engaged on the Work on a Time and Material Basis based on the recorded time and hourly rates of pay for such labour and supervision but shall not include any payment or costs incurred for general supervision, administration, or management time spent on the entire Work or on any wages, salary, or Actual Payroll Burden for which the Contractor is compensated by any payment made by the Owner for Equipment.

Travel expenses, travel time, and room and board shall be justified by the Contractor and, if requested, the Contractor shall supply the Owner with proof of the expenditure. Reasonable costs for room and board shall only be paid if the Work on a Time and Material Basis extends the time that the Contractor's labour is on-site or if the Contractor hires labour that is not normal to the Contract and room and board is charged.

**Cost of Material** means the cost of Material purchased or supplied from stock and valued at current market prices for the purpose of carrying out Work on a Time and Material Basis by the Contractor or by others when such arrangements have been made by the Contractor for completing the Work on a Time and Material Basis, as shown by itemized invoices.

**Mark-Up** means the amount of administrative overhead and project overhead costs incurred by the Contractor and an amount for profit. Administrative overheads and project overheads include but are not limited to the following:

Advertising, amortization, association and convention fees, audit and accounting fees, bad debt, bank charges and interest, building repairs - head office, capital tax, computer costs, donations, freight and express, insurance - liability and property, interest on long term debt, licences and permits - non Equipment related, management bonuses, management fees subcontracts, management salaries, municipal taxes, office and land - rent or lease, performance, labour and Material bonds, pit rehabilitation - commercial, plans, postage, printing and stationary, promotions, radio, Hand Tools or equipment that are tools of the trade, clothing allowance, sundry, supplies - operation, Utilities: telephone, heat, light, and water, and vehicles repairs - light trucks and autos.

**Operated Rented Equipment** means Rented Equipment rented or leased for which an operator is provided by the supplier of the Equipment and for which the rent or lease includes the cost of the operator.

**Rented Equipment** means Equipment that is rented or leased from an individual, firm, or corporation that is not a related entity or associated corporation with common ownership to the Contractor as defined by the *Income Tax Act*, [R.S.C., 1985, c. 1 (5th Supp.)], and is accepted by the Contract Administrator.

**Standby Time** means any period of time that is not considered Working Time and that together with the Working Time does not exceed 10 hours in any one Working Day and during which time a unit of Equipment cannot practically be used on other Work and remains on the site in order to continue with its assigned task and during which time the unit is in fully operable condition.

**The 127 Rate** means the rate for a unit of equipment as listed in OPSS 127, Schedule of Rental Rates for Construction Equipment, Including Model and Specification Reference, which is current at the time the Work is carried out or, for Equipment that is not so listed, the rate that has been calculated by the Owner, using the same principles as used in determining The 127 Rates.

**Work on a Time and Material Basis** means Changes in the Work and Additional Work approved by the Contract Administrator for payment on a Time and Material basis. The Work on a Time and Material Basis shall be subject to all the terms, conditions, Standards, and provisions of the Contract.

**Working Time** means each period of time during which a unit of Equipment of necessity and is actively engaged on a specific operation and the first 2 hours of each immediately following period, during which the unit is not so engaged but during which the operation is otherwise proceeding and during which time the unit cannot practically be transferred to other Work and remains on the site in order to continue with its assigned tasks and during which time the unit is in a fully operable condition.

#### **GC 8.03.02                      Daily Work Records**

- .01 Daily Work Records reporting the labour and Equipment employed and the Material used shall be prepared by the Contractor's representative. The Daily Work Records shall be signed each Day by both the Contractor's representative and the Contract Administrator. The Contract Administrator will note disagreements on the Daily Work Record prior to signing and return a copy to the contractor. These records shall be used for the basis of payment.

- .02 Daily Work Records shall report the labour and Equipment employed, both working time and downtime, and the Material used on MTO form PH-CC-754, Daily Work Record. Daily Work Records shall include a brief description of the work being carried out and location of such work.
- .03 For each Day that a Daily Work Record is required under these provisions, the Contractor shall deliver daily to the Contract Administrator's representative at the working area a Contractor signed copy of the Daily Work Record.
- .04 The Contractor's failure to keep or deliver Daily Work Records or to keep complete Daily Work Records may limit the Contractor's ability to recover its costs.

#### **GC 8.03.03 Payment for Work**

- .01 Payment as herein provided shall be full compensation for all labour, Equipment, and Material to do the Work on a Time and Material Basis, except where there is agreement to the contrary prior to the commencement of the Work on a Time and Material Basis.
- .02 Payment for labour, rented Equipment, and operated rented Equipment intended for use on other Work but has been idled due to the circumstances giving rise to the Work on a Time and Material Basis shall be negotiated according to subsection GC 3.14, Compensation Request. Consideration shall be given to removing the labour and Equipment from the site until the idled Work can be resumed.

#### **GC 8.03.04 Payment for Labour**

- .01 The Owner shall pay the Contractor for labour used on each Time and Material basis at 100% of the Cost of Labour. Payroll Burden shall not be applied to room and board and or travel expenses when calculating the Cost of Labour.
- .02 Payments in respect of Payroll Burden shall be made at the following rates:
  - a) Union workers - 40% of the wages and salary portion of the Cost of Labour.
  - b) Non-union workers - 30% of the wages and salary portion of the Cost of Labour.
  - c) Alternatively, the Contractor's external auditor shall complete, sign, and submit a copy of the Contractor's Actual Payroll Burden. The following shall apply when this option is used:
    - i. Actual Payroll Burden shall be calculated using MTO form PH-CC-819, Actual Payroll Burden, and only those items stated under clause GC 8.03.01, Definitions, shall be included.
    - ii. MTO form PH-CC-819, Actual Payroll Burden, shall be completed by the Contractor's external auditor and filed with the Contract Management Office, St Catharines.
    - iii. The Actual Payroll Burden shall be filed annually and shall be applied from April 1 of each year to March 31 of the following year. The Actual Payroll Burden can be adjusted once annually upon submission of a revised MTO form PH-CC-819, Actual Payroll Burden, completed by the Contractor's external auditor.
    - iv. The Owner shall apply union workers or non-union workers Payroll Burden whichever is applicable, to Contractors failing to provide an annual update by April 1 of the current year. Once MTO form PH-CC-819, Actual Payroll Burden, is received, the Owner shall apply the new rate from the date of receipt of an acceptable Actual Payroll Burden to March 31 of the following year.
    - v. The Contractor's Actual Payroll Burden rate shall apply universally to all labour areas across the province.
  - d) At the Owner's discretion, a review of the Actual Payroll Burden may be conducted, in which case, the Actual Payroll Burden so determined at the time of the review shall be applied to all Work on a Time and Material Basis affected. Upon request, the Contractor shall make available all records in support of the Actual Payroll Burden calculation submitted.

#### **GC 8.03.05 Payment for Material**

- .01 The Owner shall pay the Contractor for Material at 100% of the cost of the Material.

**GC 8.03.06 Payment for Equipment**

**GC 8.03.06.01 Working Time**

- .01 The Owner shall pay the Contractor for the Working Time of all Equipment other than Rented Equipment and Operated Rented Equipment used on the Work on a Time and Material Basis at The 127 Rate.
- .02 The Owner shall pay the Contractor for the Working Time of Rented Equipment used on the Work on a Time and Material Basis at 110% of the Rented Equipment invoice price. The Contractor shall obtain approval from the Contract Administrator prior to the use of the Rented Equipment, if 110% of the invoice price is greater than The 127 Rate.
- .03 The Owner shall pay the Contractor for the Working Time of Operated Rented Equipment used on the Work on a Time and Material Basis at 110% of the Operated Rented Equipment invoice price. The Contractor shall obtain approval from the Contract Administrator prior to the use of the Operated Rented Equipment, if 110% of the invoice price is greater than The 127 Rate.
- .04 When Equipment is transported solely for the purpose of the Work on a Time and Material Basis to or from the Working Area on a Time and Material basis, payment shall be made by the Owner only in respect of the transporting units. When Equipment is moved under its own power it shall be deemed to be Working. The method of moving Equipment and the rates shall be subject to the approval of the Contract Administrator.

**GC 8.03.06.02 Standby Time**

- .01 The Owner shall pay the Contractor for Standby Time of all Equipment other than Rented Equipment and Operated Rented Equipment at 50% of The 127 Rate.
- .02 The Owner shall pay for Rented Equipment and Operated Rented Equipment at 100% of the invoice price where it is necessary to retain Equipment in the Working Area for extended periods agreed to by the Contract Administrator.

**GC 8.03.06.03 Payment for Work by Subcontractors**

- .01 Where the Contractor arranges for Work on a Time and Material Basis, or a part of it, to be performed by Subcontractors on a Time and Material basis and has received approval prior to the commencement of the Work according to the requirements of subsection GC 3.09, Subcontracting by the Contractor, the Owner shall pay the cost of Work on a Time and Material Basis by the Subcontractor calculated as if the Contractor had done the work on a Time and Material basis.

**GC 8.03.06.04 Mark-Up on Work on a Time and Material Basis**

- .01 Payment for Mark-Up on Work on a Time and Material Basis shall be made at the following rates:
  - a) Contractor Mark-Up
    - 15% applied to the total payment for labour, Rented Equipment, Operated Rented Equipment, and Material when the Work on a Time and Material Basis was completed by the Contractor.
  - b) Subcontractor Mark-Up
    - 15% applied to the total payment for labour, Rented Equipment, Operated Rented Equipment, and Material when the Work on a Time and Material Basis was completed by the Subcontractor.
  - c) Contractor Mark-Up on Subcontractors Work on a Time and Material Basis:
    - 10% mark-up allowed on Subcontractor's total labour, Equipment, and Material after Subcontractor Mark-Up is applied. If Work on a Time and Material Basis is assigned or sublet to a related entity or associated corporation with common ownership to the Contractor as defined by the *Income Tax Act* [R.S.C., 1985, c. 1 (5th Supp.)], then the Contractor Mark-Up is not permitted. The application of associated rules under the *Income Tax Act* [R.S.C., 1985, c. 1 (5th Supp.)] is extended to include partnerships.

**GC 8.03.06.05****Submission of Invoices**

- .01 At the start of the Work on a Time and Material Basis, the Contractor shall provide the applicable labour and Equipment rates not already submitted to the Contract Administrator during the course of the Work. The Contractor shall provide documented proof of labour and Equipment rates when requested by the Contract Administrator.
- .02 A separate MTO form PH-CC-796, Time and Material Summary for Payment, shall be completed for Contractor and Subcontractor Work on a Time and Material Basis. Each completed form shall include the Change Order number and covering dates of the Work on a Time and Material Basis and shall itemize separately payment for labour, payment for Materials, and payment for Equipment. Invoices for Materials, Rented Equipment, and other charges incurred by the Contractor on the Work on a Time and Material Basis shall be included with each summary.
- .03 Each month the Contract Administrator shall include with the monthly progress payment certificate, the costs of the Work on a Time and Material Basis incurred during the preceding month all according to the Contract administrative procedures and the Contractor's invoice of the Work on a Time and Material Basis.
- .04 The final MTO form PH-CC-796, Time and Material Summary for Payment, shall be submitted by the Contractor within 60 Days after the completion of the Work on a Time and Material Basis.

**GC 8.04****Release from Warranty**

- .01 At the expiry of the last warranty period and after correction of all deficiencies, the Owner shall issue to the Contractor the MTO form PH-CC-895, Release from Warranty Certificate.

**GC 8.05****Records**

- .01 The Contractor shall maintain and keep accurate Records relating to the Work, Changes in the Work, and Claims arising there from in sufficient detail to support the total cost of the Work, Changes in the Work, and Claims. The Contractor shall preserve all such original Records until 12 months after the Release from Warranty Certificate is issued or until all claims have been settled, whichever is longer. The Contractor shall require that Subcontractors preserve all original Records pertaining to the Work, Changes in the Work, and Claims arising there from for a similar period of time.
- .02 If, in the opinion of the Contract Administrator, Daily Work Records are required, the Contractor shall complete such Daily Work Records for the Work or such specific part of the Work requested.

**GC 8.06****Taxes and Duties**

- .01 Where a change in Canadian Federal or Provincial taxes occurs after the date of tender closing for this Contract, and this change could not have been anticipated at the time of bidding, the Owner shall increase or decrease Contract payments to account for the exact amount of tax change involved.
- .02 Claims for compensation for additional tax cost shall be submitted by the Contractor to the Contract Administrator on MTO form, PH-CC-725, Tax Change Statement. Such claims for additional tax costs shall be submitted not later than 30 Days after the date of completion of the Work.
- .03 Where the Contractor benefits from a change in Canadian Federal or Provincial taxes, the Contractor shall submit a statement of such benefits to the Contract Administrator on MTO form, PH-CC-725, Tax Change Statement. This statement shall be submitted not later than 30 Days after the date of completion of the Work.
- .04 The Contract Administrator reserves the right to make deductions from regular progress payments to compensate for the estimated benefit from decreased tax costs. Such deductions shall be set-off from Contract payments pending receipt of the statement itemizing the benefits that have resulted from a decrease in tax costs at which time the final payment adjustment shall be determined.

.05 The Contractor shall add the HST to all invoices and Proper Invoices

**GC 8.07 Liquidated Damages**

.01 When liquidated damages are specified in the Contract and the Contractor fails to complete the Work according to the Contract, the Contractor shall pay such amounts as are specified in the Contract Documents.

## GC TABLES - List of Tables

**TABLE 7.02-1**  
**Layout Intervals and Measurement Accuracy for Construction Survey - Layout**

| Activity                                                                                                                                                                                                                                               | Interval     | Measurement Accuracy |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|----------------------|
| Layout:<br>- Rock<br>- Earth<br>(With the exception of plus sections, layout is normally at the same interval as the cross-sections/grade calculations. This may be varied when extreme changes in horizontal and vertical alignment are encountered.) | 10 m<br>25 m | -                    |
| Maximum for setting structure footing grades                                                                                                                                                                                                           | 10 m         | -                    |
| Set structure grades                                                                                                                                                                                                                                   | -            | 1 mm                 |
| Adjustment to slope stake distances to allow for grubbing losses                                                                                                                                                                                       | -            | 300 mm               |
| Set grades for earth grading                                                                                                                                                                                                                           | -            | 10 mm                |
| Set grades for granular                                                                                                                                                                                                                                | -            | 5 mm                 |
| Layout stake offset for curb and gutter (2 m but may be varied to suit conditions.)                                                                                                                                                                    | -            | -                    |
| Stake layout for curb and gutter (May be necessary to reduce for very sharp curves.)                                                                                                                                                                   | 10 m         | -                    |
| Set curb and gutter grades                                                                                                                                                                                                                             | -            | 1 mm                 |
| Staking maximum for layout of a radius, intersections                                                                                                                                                                                                  | 3 m          | -                    |
| Layout stake (2 m offset) for concrete pavement                                                                                                                                                                                                        | -            | -                    |
| Set concrete pavement grades                                                                                                                                                                                                                           | -            | 1 mm                 |

**TABLE 7.02-2**

| 7  | Select Subgrade Material (SSM)                                |       | 1.0 l/t                       |
| 8  | Granular A, B, O, and RSS Backfill                            | 9     | 1.9 l/t                       |
| 9  | All Asphalt Pavement, except Superpave FC2 Pavement           | 10    | 11.5 l/t                      |
| 10 | Superpave FC2 Pavement                                        | 10    | 14.3 l/t                      |
| 11 | Concrete Pavement                                             |       | 4.9 l/m <sup>2</sup>          |
| 12 | Structural Concrete                                           | 3     | 5.5 l/m <sup>3</sup>          |
| 13 | Tall Wall, any non-precast barrier wall, including asymmetric |       | 3.2 l/m                       |
| 14 | Milling by m <sup>2</sup> Items                               | 4     | 0.4 l/m <sup>2</sup>          |
| 15 | Milling by tonne Items                                        | 5     | 3.0 l/t                       |
| 16 | Pulverize                                                     |       | 0.2 l/m <sup>2</sup>          |
| 17 | Cold In Place Recycling                                       |       | 0.4 l/m <sup>2</sup>          |
| 18 | Concrete Removal, all complete structural concrete            | 6     | 1.0 l/m <sup>3</sup>          |
| 19 | Concrete Removal, concrete base and pavements                 |       | 0.9 l/m <sup>2</sup>          |
| 20 | Asphalt Removal                                               | 7     | 0.4 l/m <sup>2</sup>          |
| 21 | Piling & Caissons                                             |       | 5.0 l/m                       |
| 22 | Sewers & Drainage                                             | 8     | 8.0 l/m                       |
| 23 | Rock Supply                                                   |       | 1.4 l/m <sup>3</sup>          |

Notes:

1. Also includes the tender item Earth Excavation for Structures when the quantity is greater than 100 m<sup>3</sup>.
2. If the Contract has a Rock Excavation item but not the Rock Embankment item, the diesel fuel consumption rate for Rock Excavation shall be 2.2 l/m<sup>3</sup>.
3. Structural concrete is normally a lump sum item that has no quantity listed in the Contract Documents. The Contract Administrator shall calculate the quantity for this item or get concrete ticket summary sheets for this item. This item does not include deck joint assemblies or modifications, concrete patches, or precast units. Includes the following items:
  - concrete in deck
  - concrete in substructure
  - concrete in culverts
  - high performance concrete in deck
  - concrete in footing, structure
  - concrete in substructure and retaining wall
  - high performance concrete in sub structures
  - concrete in structure
  - concrete in approach slab
  - high performance concrete in barrier walls
  - concrete in parapet walls
4. Includes the following items:
  - removal of asphalt pavement from concrete surfaces
  - removal of asphalt pavement, partial depth
  - removal of asphalt pavement from concrete surfaces on structures
  - reclaim asphalt pavement, full depth
  - remove asphalt pavement and salvage; full depth
  - reclaim asphalt pavement, full depth over concrete
5. Includes the following items:
  - reclaim asphalt pavement, partial depth
  - remove asphalt pavement and salvage, partial depth
6. Includes the following items:
  - removal of bridge structures
  - concrete removal, full depth
  - concrete removal, complete deck
7. Includes the following items:
  - removal of asphalt pavement
8. Sewers and drainage is to be applied to sewers that are 300 mm in diameter or larger. Subdrains do not receive compensation. Catchbasins with a single stub outlet receive no compensation nor do flexible pipe culverts.
9. 60% of the Diesel Fuel Consumption Rate shall apply to the production and stockpiling of Granular A, B, O, and RSS Backfill. 40% of the Diesel Fuel Consumption Rate shall apply to Granular A, B, O, and RSS Backfill supplied from existing stockpiles that are the property of the Owner.
10. When measurement for payment of asphalt is by square metre, for the purpose of fuel price index payment adjustment calculation, square metre asphalt quantities shall be converted to tonnage ( $T_{mix}$ ) using the following formula, rounded to one decimal according to LS-100:
$$T_{mix} = [BRD_s \times (TD/1000) \times A_{mix}]$$
Where:
  - $BRD_s = 2.50 \text{ t/m}^3$
  - $TD = \text{average asphalt thickness from core measurements, mm}$
  - $A_{mix} = \text{quantity of asphalt placed, m}^2$

## **GENERAL SPECIFICATION FOR ELECTRICAL WORK**

## Ontario Ministry of Transportation Publications

Electrical Engineering Manual, Volume 2, Electrical Maintenance

Ontario Traffic Manual (OTM):  
Book 7 - Temporary Conditions

## Electrical Safety Authority (ESA)

Ontario Electrical Safety Code

### 106.03 DEFINITIONS

For the purpose of this specification, definitions in the Ontario Electrical Safety Code and the following definitions apply:

**Cable** means a solid or stranded, bare or insulated metal conductor (wire) or group of conductors enclosed in a common jacket or twisted to form a group.

**Down Time** means the time during which an electrical system is de-energized or not under full operation.

**Duct** means a circular pipe or conduit for the mechanical protection of cables.

**Electrical Chamber** means a chamber for placing and maintaining conductors, cables, ducts, or electrical equipment. A general name for electrical maintenance holes and handholes.

**Electrical Maintenance Hole** means a subsurface chamber large enough for a person to enter that allows facilities for placing and maintaining underground conductors, cables, and associated apparatus.

**Electrical Work** means any work associated with the installation, modification, removal, inspection, or testing of electrical system components, including work required for all auxiliary concrete, mechanical, metallic, or non-electrical components required for the work.

**Electrician** means a person in possession of a certificate of qualification for the trade of Electrician, Construction and Maintenance, 309A, issued by the Ministry of Training, Colleges and Universities, Ontario.

**Emergency Maintenance or Emergency Repairs** means an activity required to repair unexpected failure of electrical equipment components that requires immediate action and takes precedence over routine maintenance activities for the duration of the emergency.

**Energized** means electrically live.

**ESA** means Electrical Safety Authority.

**High Mast Lighting Equipment** means high mast poles complete with luminaire raising and lowering devices consisting of ring assemblies complete with tenon arms, shrouds, external or internal drive mechanisms, and pole anchorage assemblies.

**Highway Lighting System** means a system of luminaires, poles, sign luminaires, underpass illumination, cables, power supply equipment, control system, and all associated materials required to provide illumination on a highway, roadway, or associated appurtenances.

**IMSA** means International Municipal Signal Association.

**Luminaire** means a complete lighting unit consisting of a lamp or lamps together with the parts designed to distribute the light, to position and protect the lamps, and to connect the lamps to the power supply.

**Nighttime** means the time during which the ambient natural horizontal illuminance at ground level is less than 15 lux.

**Non-Routine Maintenance** means activity required to repair unexpected failure of equipment components. It requires immediate action.

**Pad** means a concrete footing with a level surface used to mount electrical equipment or for a temporary installation that could be made of wood.

**Power Supply Equipment** means electrical equipment installed to provide a source of power for electrical systems and includes transformation, switching, and control equipment.

**Power Distribution System** means the electrical system comprised of electrical cables, conduit, maintenance chambers, enclosure (with switching and control devices) and associated equipment that distribute electrical power from the utility provider or power generating equipment (e.g. solar, wind, UPS and portable generator) to the electrical equipment.

**Routine Maintenance** means ongoing preventive maintenance activities according to the manufacturer's recommendations and the Owner's maintenance standards and includes the periodic adjustment of the electrical system components to correct deviations from the system specifications resulting from normal operation of the system.

**Service Manuals** means the full literature, drawings, directives, instructions, and procedures issued by the supplier or manufacturer of any system component for the purposes of assembly, installation, operation, preventive maintenance, or emergency maintenance of the system component.

**Signalized Intersection** means an intersection or junction of roadways or crosswalks or both where the vehicular and pedestrian traffic is controlled by a traffic signal system.

**Switchover** means the act of closing down an electrical system and bringing a new or modified electrical system into operation.

**System Components** means all hardware and software components, devices, parts, and materials included in the electrical work supplied and installed under a Contract, including all spare parts supplied by the Contractor.

**Temporary** means work that is done to serve a specific function and removed on the same Contract as it was placed.

**Traffic Signal System** means a system of traffic signal equipment, poles, traffic signal controllers, traffic signal actuation and interconnection equipment, and all associated materials required to regulate vehicular and pedestrian traffic.

**Underpass Illumination** means any work required for the installation of luminaires on the ceilings, walls, beams, abutments, or piers of a bridge or retaining walls.

## **106.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **106.04.01 Submission Requirements**

#### **106.04.01.01 Electrical Equipment Working Drawings**

Working Drawings shall be submitted for the electrical equipment as specified in Table 1.

Six sets of Working Drawings (three hardcopy and three digital copy) shall be submitted to the Contract Administrator. The digital copies shall be provided in PDF format, unlocked, printable, and editable. Each digital copy shall be provided on a USB mass storage device (e.g. USB flash drive).

Working Drawings for luminaires shall consist of manufacturer's catalogue information and photometric data. Working Drawings for all other items shall include all information required in the Contract Documents.

Working Drawings for all items shall include all information required in the applicable Owner's material specification.

Materials and dimensions shown on the final Working Drawings shall not be changed without approval of the Contract Administrator. Resubmission of Working Drawings showing any changes to the final Working Drawings is required.

## **106.05 MATERIALS**

All electrical materials, equipment, components, or completed assemblies of components shall be approved according to the Ontario Electrical Safety Code.

## **106.07 CONSTRUCTION**

### **106.07.01 Qualification of Workers**

#### **106.07.01.01 Contractor's Representative**

A representative, who is experienced in the electrical work to be performed, shall be appointed to represent the Contractor.

The Contractor's representative shall attend such meetings required by the Owner to coordinate services affected by the Contract.

#### **106.07.01.02 Contractor's Workers**

The Contractor or electrical subcontractor shall be a licensed electrical contractor according to the Electricity Act and shall use workers qualified to do the electrical work according to the following:

- a) All electrical and advanced traffic management system work shall be performed by or under the direct personal supervision of an electrician.
- b) Traffic signal and traffic signal control equipment installation, inspection, and testing shall be performed by an electrician who has successfully completed one of the following:
  - i. Levels 1 and 2 of the IMSA Traffic Signal Technician Certification Program
  - iii. 170-332 IMSA/MTO Certification Program

- c) All high mast lighting installation, inspection, and testing shall be performed by an electrician who has successfully completed training from the manufacturer(s).
- d) All locates for electrical systems and advanced traffic management systems shall be performed by a licenced electrician who has successfully completed cable locate training.
- e) All electrical testing and inspection work shall be performed by an electrician.

Effective April 1, 2023, all roadway lighting installation, inspection, and testing shall be performed by an electrician who has successfully completed the IMSA Roadway Lighting Technician Level 1 certification program.

The Contract Administrator may request at any time that the Contractor provide proof that the individual performing or supervising the electrical work is an electrician. If such a person is not present, the Contract Administrator may direct the Contractor to cease all electrical work until an electrician, with proof of such, is on site to perform or supervise the electrical work.

#### **106.07.01.03 High-Voltage Work**

High-voltage work shall be performed by qualified personnel.

#### **106.07.02 Work to be Inspected by Electrical Safety Authority**

All electrical work is subject to inspection by the ESA. The Contractor shall perform all work associated with inspection or re-inspection by the ESA. This work includes, but is not limited to the following:

- a) Arranging and coordinating all visits to the construction site by the ESA's inspectors.
- b) Correcting all defects identified by the ESA.
- c) Submitting all applications for inspection.
- d) Obtaining all permits.
- e) Obtaining all certificates.
- f) Obtaining all connection authorizations from the ESA.
- g) Payment of fees.
- h) Performing any other work that may be required under the Ontario Electrical Safety Code.

#### **106.07.03 Work to be Coordinated with Others**

MTO is not a member of Ontario One Call and Ontario One Call shall not be relied upon to provide any information regarding the ministry's electrical systems and advanced traffic management systems.

The Contractor shall coordinate for the following work:

- a) Electrical power supply connection and disconnection by the electrical power supply authority.
- b) Communication connection and disconnection by the communication provider(s).
- c) Mounting of any electrical equipment on a pole or any structure owned by or under the jurisdiction of a Utility authority.

- d) Mounting of any electrical equipment in close proximity to or requiring modification of any plant owned by a Utility authority, private person, or other company.

The Contractor shall notify the Contract Administrator in writing at least 15 Business Days prior to commencing the above work. A detailed breakdown of the required Utility work and the corresponding Utility cost to complete the work, along with a Utility contact name, address, and telephone number, shall be provided to the Contract Administrator.

Utility invoices shall be paid by the Contractor. The Contractor shall submit proof of payment and the Utility invoices for the above noted work to the Contract Administrator for reimbursement.

Obtaining all connection authorizations and layouts shall be completed by the Contractor.

The Contractor shall provide two copies of all Utility service layouts to the Contract Administrator.

The Contract Administrator and the Owner's electrical coordinator shall be notified a minimum of 72 hours in advance of all service layout meetings with an electrical power supply authority. The Contractor shall obtain electrical power supply billing account details from the Contract Administrator and provide them to the electrical power supply authority.

The Contractor shall locate all of the electrical systems and advanced traffic management systems within the limits of the Contract. The Contractor shall complete all locates on the Owner's electrical systems and advanced traffic management systems required for the Contractor to do the Work. The Contractor shall not rely on the Owner to complete the locates.

#### **106.07.04                      Traffic Signal Systems**

##### **106.07.04.01                  General**

Testing of signal displays and switch on for operation of traffic signals shall be under police supervision. Switch on and switchover for operation is not permitted on Mondays, Fridays, Saturdays, Sundays, and statutory holidays.

##### **106.07.04.02                  Existing Traffic Signal Systems**

Except when the Contract requires modifications to existing traffic signal systems, the Contractor shall perform the operations with the existing traffic signal systems undisturbed and fully operational. When traffic signal systems are to be installed and the existing traffic signal system is to be removed or modified, the new traffic signal system shall be installed independently of the existing system such that short duration switchover from one system to the other is effected without appreciable down time.

##### **106.07.04.03                  New Traffic Signal Systems Activation**

A new traffic signal system at a location not previously signalized shall be initially switched on for operation according to the following requirements:

- a) For the testing of circuitry and components, operation of the system shall take place with signal head covers in place.
- b) The Contract Administrator shall be given a minimum of five Days notice of when the system shall be ready for operation and 24 hours notice prior to completion of the work. Confirmation is to be given that the work shall be done as scheduled.
- c) The Contractor shall complete all preliminary system testing as specified in the Contract Documents and all repairs or replacement of defective components prior to final energizing.

**106.07.04.04****Traffic Signal Systems Switchover**

A new traffic signal system installed to replace an existing traffic signal system shall be initially switched on for operation according to the following requirements:

- a) The Contract Administrator shall be given a minimum of three Days notice of when the system switchover shall be done, and 24 hours notice prior to completion of the work. Confirmation is to be given that the work shall be done as scheduled.
- b) All preliminary system testing shall be completed as specified in the Contract Documents and all adjustments or replacement of defective electrical equipment in the new system completed prior to system switchover.
- c) For the testing of circuitry and components, operation of the new signal system shall take place with the covers for the new signal head in place and the existing signal system operational.
- d) Signal heads of the existing traffic signal system shall be covered and covers shall be removed from the new signal heads with both systems de-energized. Traffic shall be under police supervision during this operation.

**106.07.04.05****Maintenance of Traffic Signal Systems****106.07.04.05.01****General**

All routine, non-routine, and emergency maintenance work shall be performed as required on all traffic signal systems for public use within the limits of the Contract.

The initial traffic signal timing shall be programmed into the traffic signal controller as directed by the Contract Administrator up to a maximum of four times. The traffic signal controller shall be set up by performing all programming, setting all timing controls and switch settings, and setting any other controller operational parameters obtained from the Contract Administrator. The Contractor shall verify to his own satisfaction that the revised signal timing is consistent and complete.

At any time during the Contract, the Contract Administrator reserves the right to review the timing and operations of the traffic signal system and the Contractor shall implement any changes to the operation settings and timings requested by the Contract Administrator.

All traffic signal system components shall be maintained in good working condition according to the Contract Documents and all routine maintenance and emergency repairs shall be provided as required.

On call local emergency repair service shall be provided 24-7 for the duration of the Contract, including seasonal shutdown. Emergency repairs shall be required whenever there is a failure or cessation of the operation of any component or components of the traffic signal system.

Each time emergency repair work is performed on a traffic signal system, the Contractor shall notify the Contract Administrator within 72 hours of the completion of the emergency repair work.

Any traffic signal timing not included in the original Contract Documents shall be approved by the Owner before it is installed in a traffic signal controller.

Routine, non-routine, and emergency maintenance shall be according to the manufacturers' recommendations and the Electrical Engineering Manual, Volume 2.

**106.07.04.05.02****Notification and Record Keeping - Traffic Signal Systems**

The Contractor shall clearly identify in writing the designated contact person and alternate for liaison with the Contract Administrator. The Contract Administrator shall designate representatives and alternates as contact persons for the Owner.

A logbook shall be maintained and kept in the traffic signal field cabinet or at a location agreed upon with the Owner. The logbook shall record any fieldwork performed on the traffic signal system, including the replacement of any hardware, changes to the software, or changes to the configuration, phasing, or timing parameters. The time and date of each entry in the logbook shall be signed by the individual making the entry.

**106.07.04.06****Traffic Signal Pre-Activation Meeting**

A minimum of 48 hours prior to the planned activation of each set of traffic signals, the Contractor shall coordinate and attend an on-site quality control meeting with the Contract Administrator. As a minimum, the following individuals shall attend the meeting:

- a) Contractor's on-site representative
- b) Pavement marking sub-contractor representative
- c) Electrical sub-contractor representative
- d) Contract Administrator
- e) Contract Administrator's electrical inspection staff
- f) Contractor's person responsible for traffic control and highway work zone safety
- g) Owner's electrical coordinator, traffic representative, and electrical quality assurance representative

The purpose of this meeting is to ensure that the Contractor clarifies the roles and responsibilities of all parties involved in the traffic signal activation, that all advanced work is complete, and to confirm that all required arrangements have been made in order to ensure that the activation proceeds smoothly and expeditiously. The Contractor shall prepare the agenda for the meeting and record the minutes to be distributed to all attendees.

As a minimum agenda, the following shall be addressed:

- a) General
  - i. Confirm the name and position of the person responsible for coordinating traffic control during the signal activation.
  - ii. Confirm that arrangements have been made with the appropriate police authority to provide traffic control.
  - iii. Confirm that all the work has been constructed as specified in the Contract Documents and is in accordance with the signed legal drawing (PHM-125). Any deficiencies shall be brought to the attention of the Contract Administrator.
  - iv. Confirm the date and time of the traffic signal activation.
- b) Pavement Marking
  - i. Confirm the name and position of the person responsible on site for carrying out the pavement markings.

- ii. Confirm that the pavement markings have been pre-marked as specified in the Contract Documents and are according to the signed legal drawing (PHM-125).
- iii. Review the Contract Drawings for the pavement markings that shall be in place on the day of signal activation.

c) Electrical

- i. Confirm that the Contract Administrator shall be in receipt of all traffic signal inspection and test reports prior to the activation of the signals.
- ii. Confirm that all vehicle detection is positioned as required and functioning correctly.
- iii. Confirm that all accessible pedestrian signals and actuation are positioned as required and functioning correctly.

**106.07.05 Maintenance of Highway Lighting Systems**

**106.07.05.01 General**

All routine, non-routine, and emergency maintenance work shall be performed on all highway lighting systems for public use within the limits of the Contract, until the issuance of the Contract Completion Certificate by the Contract Administrator.

The Contractor shall maintain all lighting systems located within the limits of the Contract in full nighttime operation. The Contractor shall perform all routine, non-routine, and emergency maintenance work required to maintain the lighting systems. Suitable combinations of existing, temporary, or new lighting systems may be used to achieve the required performance, safety, and reliability of the lighting system. The Contractor shall provide routine, non-routine, and emergency maintenance service during seasonal shutdown. Routine, non-routine, and emergency maintenance work shall be according to the Electrical Engineering Manual, Volume 2.

**106.07.05.02 Notification and Record Keeping - Highway Lighting Systems**

The Contractor shall clearly identify in writing the designated contact person and alternate for liaison with the Contract Administrator. The Contract Administrator shall designate representatives and alternates as contact persons for the Owner.

A logbook shall be maintained and kept in the highway lighting system field cabinet or at a location agreed upon with the Owner. The logbook shall record any fieldwork performed on the highway lighting system, including the replacement of any hardware, changes to the software, or changes to the configuration or timing parameters. The time and date of each entry in the logbook shall be signed by the individual making the entry.

**106.07.06 Temporary Electrical Work**

All temporary electrical work specified in the Contract Documents shall be installed and made ready for operation prior to opening the associated traffic lanes or sidewalks that the work is intended to serve.

**106.07.07 Layout of Electrical Equipment**

All equipment shall be installed at locations detailed in the Contract Documents.

Layout for stations and offsets of concrete pads and footings, electrical chambers, and poles shall not exceed a tolerance of  $\pm 100$  mm.

The Contractor shall ensure there are no Utility conflicts, both overhead and underground, with any pole locations prior to starting any excavation or pole installation work. Underground ducts and cables shall not be located within 600 mm of guide rail.

#### **106.07.08                      Adjustment of Electrical Equipment**

All luminaires, traffic signal heads, optical lens assemblies, photoelectric controllers, and other devices shall be adjusted according to the Contract Documents. Luminaires shall be adjusted under nighttime operational conditions and in the presence of the Contract Administrator.

#### **106.07.09                      Open Excavations**

Excavations within 4.0 m of the edge of travelled roadway shall not be left open overnight.

#### **106.07.10                      Quality Control**

##### **106.07.10.01                  General**

Tests and inspections on electrical equipment shall be according to the appropriate specifications covering the work.

The Contractor is responsible for all pre-installation and proof of performance testing and inspections for electrical work. Each time the Contractor is to perform an inspection or test, the Contract Administrator shall be notified 48 hours prior to commencing the inspection or test.

##### **106.07.10.01.01              Pre-Installation Testing and Inspection**

Pre-installation testing and inspection of electrical work shall include all testing and inspection of system components, including testing of mock-ups, prototype testing, and normal factory production testing undertaken on behalf of the Contractor prior to the installation of such components.

##### **106.07.10.01.02              Proof of Performance Testing and Inspection**

Proof of performance testing and inspection of electrical work shall include all testing and inspection of system component installations into the work in order to verify the physical and operational features of each part of the system components and electrical subsystems.

A Request to Proceed shall be submitted to the Contract Administrator after the completion of testing and inspection work as specified in the Contract Documents. The next operation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

##### **106.07.10.02                  High-Voltage System Testing**

All high-voltage cable and electrical equipment shall be tested according to the Contract Documents.

One copy of test results and one copy of the cable and electrical equipment manufacturer's test report shall be submitted to the Contract Administrator.

#### **106.07.11                      Documentation**

##### **106.07.11.01                  General**

Documentation, including Working Drawings, catalogue sheets, calculations, drawings, diagrams, test print-outs, photographs, manufacturer's instructions, service manuals, and text shall be provided by the Contractor to a level of detail such that it assures the Contract Administrator that the system components that the Contractor is furnishing are according to the requirements of the Contract Documents. The documentation shall also be used to provide records for future operational and maintenance activities.

The Contractor shall submit, as part of the service manuals, a dated and signed form of inspection of each item of work.

#### **106.07.11.02                      Test Results and Inspection Reports**

Test results and inspection reports shall be submitted to the Contract Administrator. Inspection reports shall include the completed checklist and any material observations made at the time of the inspection.

The documentation shall include the method of testing and inspecting of each item. The method of testing and inspecting shall ensure that the functional, physical, and environmental aspects of the contract specifications are demonstrated.

The documentation shall include all quantitative information generated as part of the testing and inspecting work, including meter readings, screen displays, charts, and any other numerical or graphical data.

The documentation shall present the results of all tests and inspections in a format that is logical and easily understood.

Test results and inspection reports shall be submitted to the Contract Administrator within 48 hours of completion of the inspection or test detailing:

- a) The installation and operation of the system components on an item-by-item basis.
- b) Clear detailed illustrations, including control layouts, displays, schematic diagrams, and all other information, required to correctly operate a fully functional unit as well as the maintenance and service aspects of the system components.
- c) The model number, suggested and actual settings, and options as installed and configured for each piece of electrical equipment.
- d) Sections that completely describe the theory of operation using block diagrams and schematic drawings.
- e) Diagnostic and repair procedures for corrective maintenance of the unit, assembly and disassembly instructions and drawings, layout drawings showing location of all components, and complete components listing showing component type, ratings, cost, and acceptable manufacturers. Complete schematic diagrams to the component level.
- f) Fully described adjustments and alignment procedures and provide descriptions of expected signals at all test points and outputs.
- g) The specifications of system components performance.

#### **106.07.11.03                      Service Manuals**

Service manuals shall be provided for the items specified in Table 1.

Each service manual shall be assembled in three-ring binders of 75 mm maximum thickness and shall be indexed item by item. Several items may be covered in a single binder. The manual shall document in detail the installation and operation of the system components on an item-by-item basis. It shall contain clear detailed illustrations, including layout of controls, displays, schematic diagrams, and all other information required to correctly operate a fully functional unit as well as the maintenance and service aspects of the system components. The model numbers, with installed options and installed settings shall be clearly shown.

The manual shall provide sections that completely describe the theory of operation using block diagrams and schematic drawings. The manual shall include diagnostic and repair procedures for corrective maintenance of the unit; assembly and disassembly instructions and drawings; layout drawings showing location of all components; and complete components listing showing component type, ratings, cost, and acceptable manufacturers. Complete schematic diagrams to the component level shall be provided. The manual shall fully describe all adjustments and alignment procedures and provide descriptions of expected signals at all test points and outputs. Detailed specifications of the performance of system components shall be provided.

The Contractor is responsible for generating the required documentation in the event that it is not available from the manufacturer.

The manual shall detail, at the system engineering level, the procedures for installation of software on a given computer system. The manual shall also address the operation of the software at three different levels: beginner (trainee), intermediate (operator), and advanced (systems engineer).

#### **106.07.11.04                      Submission of Documentation**

The Contractor shall submit to the Contract Administrator three hardcopies and three digital copies of the following documentation:

- a) All documentation required under the Documentation subsection.
- b) Record Drawings at the completion of the Contract. All deviations and design changes from the original design shall be marked accurately on the record drawings in red along with any required explanatory notes. The location of the underground facilities on the record drawings shall be drawn accurately and correctly with stations, offsets and tie down points.
- c) Any documents or drawings that are resubmitted.
- d) All ESA inspection certificates and any other third-party inspection certificates.

#### **106.07.11.05                      Quality of Documentation**

The documentation shall be of professional quality, including machine- or hand-printed text, inked or CAD produced drawings, and photographic material, if applicable.

The digital files shall be provided in PDF format, unlocked, printable, and editable. Each digital copy shall be provided on a USB mass storage device (e.g. USB flash drive).

#### **106.07.12                          Restoration**

The site of all electrical works shall be restored to original or better condition than existed prior to the works or as specified in the Contract Documents.

#### **106.07.13                          Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**106.08****QUALITY ASSURANCE**

Electrical equipment requiring the submission of Working Drawings, as detailed in the Design and Submission Requirements section, is subject to inspection by the Owner's representative prior to shipping of the electrical equipment. The inspection shall take place at the manufacturer's factory or at the supplier's place of business. The Owner's representative shall be informed when the electrical equipment fabrication is approximately 80% and 100% complete and suitable arrangements shall be made for any required inspection.

All electrical work is subject to random inspection by the Owner's representative. The Owner's representative may witness any testing performed by the Contractor.

Upon notification, any Owner's representative (e.g., electrical coordinator, quality assurance representative) shall have access to the working area for the purpose of inspection and testing of electrical installations.

**106.10****BASIS OF PAYMENT**

Payment at the Contract price for the tender items that require general electrical work shall be full compensation for all labour, Equipment, and Material to do the general electrical work.

When the Contract contains separate tender items for work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

**106.10.01****Contractor's Workers**

When the Contract Administrator directs the removal of staff or the cessation of electrical work, no extra payment shall be made by the Owner for any costs incurred by the Contractor as a result of such direction.

**106.10.02****Work to be Inspected by Electrical Safety Authority**

The work resulting from the inspection or re-inspection of electrical work by the ESA, except for correcting defects that are the direct result of compliance with the Owner's design of the work, shall be at no extra cost to the Owner.

**106.10.03****Traffic Signal Systems**

The activation of traffic signals, including police supervision, shall be at no extra cost to the Owner.

**106.10.04****Maintenance Costs**

When the Owner performs maintenance work resulting from inadequate workmanship on systems installed by the Contractor or defective materials supplied by the Contractor, the actual costs of the maintenance work shall be charged to the Contractor.

**106.10.05****Temporary Work**

Payment for temporary items shall be made at the rate of 80% of the Contract price upon acceptance of the installation, and the remaining 20% of the Contract price shall be paid upon acceptance of the removal work.

**TABLE 1**  
**Submission Requirements for Working Drawings and Service Manuals**

| Item                                                                                      | Submission Requirements |                 |
|-------------------------------------------------------------------------------------------|-------------------------|-----------------|
|                                                                                           | Working Drawings        | Service Manuals |
| Luminaires                                                                                | Y                       | Y               |
| High-voltage switches and fuses                                                           | Y                       | -               |
| Transformers                                                                              | Y                       | -               |
| Distribution assemblies                                                                   | Y                       | Y               |
| Supply control cabinet assemblies                                                         | Y                       | Y               |
| Traffic signal control cabinet assembly                                                   | Y                       | Y               |
| Anchorage assemblies                                                                      | Y                       | -               |
| High mast lighting equipment (i.e., poles, raising and lowering equipment)                | Y                       | Y               |
| Advanced Traffic Management Systems equipment                                             | Y                       | Y               |
| Traffic data collection systems equipment                                                 | Y                       | Y               |
| Traffic detection systems equipment (e.g. loop detectors, cameras, radar detectors, etc.) | -                       | Y               |
| Accessible pedestrian signals                                                             | Y                       | Y               |
| PXO systems equipment                                                                     | Y                       | Y               |
| Solar powered equipment                                                                   | Y                       | Y               |
| Electric vehicle charging systems equipment                                               | -                       | Y               |
| Maintenance camera systems equipment                                                      | -                       | Y               |
| Uninterruptible Power Supply (UPS)                                                        | Y                       | Y               |
| Animal detection systems equipment                                                        | Y                       | Y               |
| Access gate systems equipment                                                             | Y                       | Y               |
| Cathodic Protection systems equipment                                                     | Y                       | Y               |
| Flasher Beacon systems equipment (e.g. school zones, animal detection, intersections)     | Y                       | Y               |
| Roadway weather information systems equipment                                             | Y                       | Y               |
| Traffic signal controllers                                                                | -                       | Y               |
| Flasher mechanisms                                                                        | -                       | Y               |
| Conflict monitors                                                                         | -                       | Y               |
| Load switches                                                                             | -                       | Y               |
| DC isolators                                                                              | -                       | Y               |
| AC isolators                                                                              | -                       | Y               |
| Thermostat panel                                                                          | -                       | Y               |

## **GENERAL SPECIFICATION FOR THE USE OF EXPLOSIVES**

---

|--------------|-------------------|
| <b>120-A</b> | <b>Commentary</b> |
|--------------|-------------------|

#### **120.01 SCOPE**

This specification covers the requirements for the use of explosives.

##### **120.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **120.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **120.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Ministry of Transportation Publications**

Ontario Traffic Manual (OTM):  
Book 7 - Temporary Conditions

### **Department of Fisheries and Oceans (DFO) Publication**

Guidelines for the Use of Explosives in or Near Canadian Fisheries Waters, 1998

### **International Society of Explosives Engineers (ISEE)**

Performance Specifications for Blasting Seismographs, 2011 Edition

## **120.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Blaster** means a competent person knowledgeable, experienced, and trained in the handling, use, and storage of explosives and their effect on adjacent property and persons.

**Blast Monitoring Consultant** means a consulting engineering firm with a minimum of 5 years experience related to blasting retained by the Contractor to provide blast monitoring services. The blast monitoring consultant shall be a third party that is not owned or corporately affiliated with the Contractor responsible for the Work.

**Consulting Engineering Firm** means a firm or an individual that has been issued a Certificate of Authorization and a Consulting Engineer designation by the Professional Engineers Ontario.

**Designated Blast Area** means the area where the Contractor has notified, in writing, and provided information to all Utilities, public and private property owners, and as the area where the Contractor has made arrangements to evacuate all persons whose safety might be threatened by the blasting operation.

**Fish Habitat** means as defined by the Fisheries Act.

**Flyrock** means rock that becomes airborne as a direct result of a blast.

**Peak Particle Velocity (PPV)** means the maximum component velocity in millimetres per second that ground particles move as a result of energy released from explosive detonations.

**Pre-Blast Survey** means a detailed record, accompanied by film or video, as necessary, of the condition of private or public property, prior to the commencement of blasting operations.

## **120.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **120.04.01 Design Requirements**

A blast design shall be prepared by an individual or firm with a minimum 5 years experience and be certified by an Engineer. The blast design shall include, as a minimum, the following:

- a) Design PPV and design peak sound pressure level at 250 m radius from the area of the blast or nearest Utility, residence, structure, or facility.
- b) Number, pattern, orientation, spacing, size, and depth of drill holes.
- c) Collar and toe load, number and time of delays, and mass and type of charge per delay.
- d) Setback distances to affected fish habitat.
- e) The explosive products to be used.
- f) The designated blast area.

### **120.04.02 Submission Requirements**

The following shall be submitted to the Contract Administrator:

- a) A minimum of 2 weeks prior to the use of explosives:
  - i. The name and statement of experience of the firm carrying out the blasting.
  - ii. The name of the blaster including a record of experience and safety training.
  - iii. The name of the individual or firm responsible for the blast design, including a record of experience and statement of qualifications.
  - iv. A letter from an Engineer certifying the design.
  - v. The name of the blast monitoring consultant, including a record of experience and a record of qualifications.
  - vi. A certificate of insurance indemnifying the Owner from all claims and damages arising from the use of explosives.

- b) A minimum of 48 hours prior to the use of explosives:
- i. A letter signed by the Engineer certifying the blast design indicating the areas for which the blast design has been completed.
  - ii. A letter signed by the blaster indicating receipt of the blast design and agreement that the blasting shall be according to the design.
  - iii. A letter signed by the Contractor certifying that a pre-blast survey has been carried out in accordance with the Pre-Blast Survey subsection and a copy of the pre-blast survey.
  - iv. A copy of the blast design, including all items shown in the Design Requirements subsection.
  - v. The designated blast area.
  - vi. A blasting schedule.
  - vii. A list of all locations to be monitored.
  - viii. Proof of calibration of all monitoring equipment.
- c) Upon request, any blasting permits, approvals, and agreements required for the use of explosives or to carry out blasting operations.

## **120.05 MATERIALS**

### **120.05.01 Explosives**

Only explosive products approved for use in Canada shall be used.

## **120.06 EQUIPMENT**

### **120.06.01 Detonation Apparatus**

Detonation apparatus shall be of the type approved by the detonation system manufacturer for the type of blasting operation to be undertaken. All apparatus shall be kept in working order and shall be thoroughly inspected before and after each blasting operation.

All wiring connected to electrical detonation apparatus shall be properly insulated.

### **120.06.02 Monitoring Equipment**

All monitoring equipment shall be capable of measuring and recording ground vibration PPV up to 200 mm/s in the vertical, transverse, and radial directions. The equipment shall have been calibrated within the last 12 months either by the manufacturer or other qualified agent. Proof of calibration shall be submitted to the Contract Administrator prior to commencement of any monitoring operations.

Monitoring equipment shall be according to ISEE Performance Specifications for Blasting Seismographs.

## **120.07 CONSTRUCTION**

### **120.07.01 General**

Blasting shall be carried out only during daylight hours and at a time when atmospheric conditions provide clear observation of the blast when practical from a minimum distance of 1,000 m. Blasting shall not be conducted on Sundays, statutory holidays, or during electrical storms.

Blasting shall not be carried out within 30 m of concrete placed less than 72 hours when the ambient temperature falls below 20 °C or for 36 hours when the ambient temperature is continuously greater than 20 °C, unless otherwise authorized by the Contract Administrator.

Protection of fish and fish habitat shall be according to the Guidelines for the Use of Explosives in or Near Canadian Fisheries Waters.

#### **120.07.02 Radio-Frequency Hazards**

Prior to blasting, investigations shall be done to determine if radio-frequency hazards exist. When such hazards exist, necessary precautions shall be taken.

#### **120.07.03 Pre-Blast Survey**

A pre-blast survey shall be prepared for all buildings, Utilities, structures, water wells, and facilities likely to be affected by the blast and those within 150 m of the location where explosives are to be used. The standard inspection procedure shall include the provision of an explanatory letter to the owner or occupant and owner with a formal request for permission to carry out an inspection.

The pre-blast survey shall include, as a minimum, the following information:

- a) Type of structure, including type of construction and if possible, the date when built.
- b) Identification and description of existing differential settlements, including visible cracks in walls, floors, and ceilings, including a diagram, if applicable, room-by-room. All other apparent structural and cosmetic damage or defect shall also be noted. Defects shall be described, including dimensions, wherever possible.
- c) Digital photographs or digital video or both, as necessary, to record areas of significant concern.

Photographs and videos shall be clear and shall accurately represent the condition of the property. Each photograph or video shall be clearly labelled with the location and date taken.

A copy of the pre-blast survey limited to a single residence or property, including copies of any photographs or videos that may form part of the report shall be provided to the owner of that residence or property, upon request.

#### **120.07.04 Notification**

##### **120.07.04.01 General**

A minimum of 15 Business Days prior to blasting, the Contractor shall provide written notice to Utilities and all owners and tenants of improved property within 500 m of the right-of-way in the vicinity of the blast. The notice shall include a blasting schedule, information about the audible blast warning system, and contact name for questions or other concerns.

The Contractor shall ensure that a competent person is available to receive, document, and deal with public inquiries before and after blasting operations.

A minimum 48 hours prior to blasting, sufficient detail regarding the blasting operations shall be provided to NAV Canada.

##### **120.07.04.02 Utilities**

Authorities of all likely affected Utilities shall be notified a minimum of 72 hours prior to blasting.

##### **120.07.04.03 Properties**

Not more than 5 Business Days and not less than 4 hours prior to each blast, the Contractor shall provide notice of the blasting schedule to all owners and tenants of buildings or facilities within 150 m of the blast.

All blasts scheduled for the following 7 Days may be included in one notice. The notice shall include information about the audible blast warning system.

When blasting operations may incur property damage or require temporary evacuation, notification shall include evacuation information and instructions. The Contractor shall take all reasonable steps to ensure that the property owner acknowledges, by their signature, that they have received the information and shall comply with any evacuation requirements. When such signature is withheld, the Contractor shall maintain records showing the date and time that the information was delivered.

## **120.07.05                      Monitoring**

### **120.07.05.01                  General**

The Contractor shall employ a blast monitoring consultant to carry out monitoring for PPV, peak sound pressure levels, and water overpressures as required. During each blast, ground vibration PPV and the peak sound pressure level shall be monitored at 250 m from the area of the blast or at the closest portion of any Utility, residence, structure, or facility. Water overpressure in affected fish habitats shall be monitored adjacent to the shore closest to the blast. The monitoring equipment shall be repositioned as required.

### **120.07.05.02                  Ground Vibration**

Ground vibration as measured by PPV shall be limited to the maximum levels shown in Table 1. Should readings from any two consecutive blasts exceed these values or any single reading exceed these values by more than 30 mm/s, the blast operation shall cease until a revised blast design, certified by the Engineer, has been submitted to the Contract Administrator.

### **120.07.05.03                  Water Overpressure**

Instantaneous pressure change as measured by water overpressure in or near fish habitat shall not exceed 100 kPa.

### **120.07.05.04                  Trial Blasts**

The Contractor shall confirm the suitability of the blast design for the ground vibration PPV limits and sound pressure levels by carrying out a minimum of three limited test blasts at locations agreed upon by the Contract Administrator and the Contractor. The trial blasts shall be carried out with appropriate blast vibration and noise level monitoring equipment. Based on the results, the initial blast design shall be revised as necessary.

## **120.07.06                      Protective Measures**

Immediately prior to the blast, the designated blast area shall be cleared of all vehicular and pedestrian traffic.

All traffic shall be stopped and prevented from entering the area until the blaster gives permission. Traffic control shall be according to the Ontario Traffic Manual, Book 7. Signs shall be posted to inform the public of blasting operations and to turn off radio transmitters. Audible blast warning devices, capable of alerting workers and the public up to a radius of 1,000 m, shall be used before and after blasting.

Blasting mats or other suitable means of controlling flyrock shall be used to limit potential hazardous effects of the blast.

**120.07.06.01****Protection of Utility Lines**

Where temporary rearranging and shielding of utility lines are detailed within the Contract Documents, such temporary rearranging and shielding is the minimum protection required. The Contractor shall remain responsible for any unauthorized disruptions of service and any damage to utilities arising out of the Contractor's work, notwithstanding such protection. The Utility authorities shall carry out the temporary rearranging and shielding of lines as detailed within the Contract Documents and more extensive rearranging and shielding if requested to do so by the Contractor. The cost of all such protective measures, together with the cost of restoring the lines to their original state and location, shall be at the expense of the Contractor, and shall be billed to the Contractor by the Utility authority.

Notwithstanding the preceding paragraph, the Utility authorities shall, subject to the Contractor's obligation under the Contract to assume responsibility for disruption of services and damage, consider alternative measures which the Contractor may suggest. Such alternative measures, if approved by the Utility authorities in writing, shall be provided at the Contractor's expense and billed to the Contractor by the Utility authority.

Whenever, in the opinion of the Utility authority, standby crews are necessary during blasting operations, the Contractor shall make the necessary arrangements with the Utility authority and the cost of such crews and equipment shall be billed to the Contractor by the Utility authority. These measures shall apply to those utilities located within all rock blasting areas.

**120.07.07****Records**

A post-blast record shall be prepared and signed by the blaster for each blast completed. The post-blast record shall report the following conditions and be made available to the Contract Administrator for site review:

- a) The date, time, and location of the blast.
- b) The wind direction and approximate speed at the time of the blast.
- c) The general atmospheric conditions at the time of the blast.
- d) The actual blast details.
- e) PPV, peak sound pressure level, and water overpressure results of each blast.

A report summarizing the results of the ground vibration and peak sound pressure levels shall be submitted to the Contract Administrator at the end of each work day that blasting was carried out.

**120.07.08****Damage**

Upon completion of blasting or immediately following the receipt of a complaint, a site condition survey shall be performed to determine if any damage has resulted. The Contractor shall record all incidents of any damage or injury, which shall be reported immediately in writing to the Contract Administrator. All other complaints shall be reported to the Contract Administrator in writing within 24 hours of receipt. Each complaint report shall include the name and address of the complainant, time received, and description of the circumstances that led to the complaint.

**120.07.09****Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**120.10****BASIS OF PAYMENT**

Payment at the Contract price for the appropriate tender items that requires the use of explosives shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract contains separate items for work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

The cost of standby crews and equipment required by Utility authorities shall be the responsibility of the Contractor.

**120.10.01****Claims**

The Contractor shall be responsible for the management of all claims and payment arising from the hauling, handling, use of, and storing of explosives and all effects, directly or indirectly related to the blasting operation.

**Appendix 120-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

**127.01****SCOPE**

This specification covers equipment rental rate compensation for work on a Time and Material Basis. The calculated rate represents the cost of owning and operating the equipment and is made up of direct and indirect costs such as fuel, oil, lubrication, field repairs, overhaul, depreciation, financing, storage, insurance, overhead, and profit.

The rental rates in this schedule are hourly, unless otherwise stated, and do not include the cost of the operator.

The information was compiled from manufacturers, equipment dealers and distributors, and contractors and is based on equipment specifications for standard models, including all necessary attachments to perform the work. Adjustments shall not be made to the rental rate due to optional components that may increase the weight, capacity, or power of a piece of equipment.

Except for Subsection 127.02.09, Hoisting Equipment, the rates listed cover the range of all equipment up to the next highest increment. When a piece of equipment falls in between listed categories, with respect to weight or capacity, the lower rental rate shall apply. For Subsection 127.02.09, Hoisting Equipment, when the size of the equipment falls between the increments shown, the rental rate is to be determined by a straight- line interpolation and rounded to the nearest five cents.

The rental rates reflect the existing tax situations as they pertain to the purchase of equipment at the date of publication.

Section 127.03, Manufacturers' Model, Specification, and Capacity Reference Guide, covers a partial listing of manufacturers' equipment model or specification numbers, with appropriate capacity and power ratings. This guide is provided for reference purposes only to assist in determining the appropriate ratings listed in Section 127.02, Schedule of Rental Rates for Construction Equipment.

The rental rates are reviewed annually; therefore, any errors, omissions, or additional suggestions or amendments should be addressed in writing to:

**127.02.10.05                      Universal Piling Machine, Including Attachment**

|                  |          |
|------------------|----------|
| Power Rating, kW |          |
| < 450            | 759.10   |
| 450              | 1,019.95 |
| 570              | 1,277.00 |

**127.02.11                          DRILLING EQUIPMENT**

Note: Use Manufacturer's Model, Specification, and Capacity tables to determine power rating for hydraulically driven rotary drilling equipment.

**127.02.11.01                      Mechanical Drilling Equipment, Truck Mounted, Including Auger And Crowd And Power Pack**

|           |        |
|-----------|--------|
| Power, kW |        |
| 80        | 269.90 |
| 120       | 528.70 |

**127.02.11.02                      Mechanical Drilling Equipment, Crawler Mounted, Including Auger**

|           |        |
|-----------|--------|
| Power, kW |        |
| 95        | 282.40 |
| 113       | 419.35 |
| 130       | 511.80 |

**127.02.11.03                    Hydraulic Drill Rig**

|           |          |
|-----------|----------|
| Power, kW |          |
| 185       | 651.60   |
| 250       | 924.85   |
| 350       | 1,075.25 |
| 430       | 1,410.80 |
| 570       | 1,825.85 |

Note: Base rate includes initial casing up to 20 m, teeth, and auger. Replacement auger teeth not included.

**127.02.11.04                    Mechanical Drilling Equipment, Crane Mounted Attachment, Including Auger**

|           |        |
|-----------|--------|
| Power, kW |        |
| 110       | 102.90 |
| 200       | 134.15 |

**127.02.11.05                    Horizontal Earth Boring Equipment**

|                  |        |
|------------------|--------|
| Power Rating, kW |        |
| 20               | 57.35  |
| 50               | 101.95 |
| 100              | 151.55 |
| 200              | 312.60 |

Note: Base rate includes 20 m auger and cutting head.

**127.02.11.06                    Trenchless Directional Drill, Track Mounted**

|                      |        |
|----------------------|--------|
| Operating Weight, kg |        |
| 1,000                | 144.45 |
| 7,000                | 319.00 |
| 12,000               | 429.20 |
| 20,000               | 552.40 |

**127.02.11.07                    Hydraulic Rock Drill, Including Power Pack, Excluding Drill Steel And Bits**

|              |        |
|--------------|--------|
| Diameter, mm |        |
| 75           | 252.15 |
| 125          | 328.75 |
| 150          | 616.70 |

**127.02.11.08                    Tieback Drill Rig, Hydraulic, Dual Head**

|           |        |
|-----------|--------|
| Power, kW |        |
| < 140     | 232.90 |
| 140       | 374.40 |

Note: Base rate includes initial casing, drilling, augering components up to 20 m.

|                                |                                            |        |

### **APPENDICES**

#### **180-A Commentary**

#### **180.01 SCOPE**

This specification covers requirements for the management of excess materials.

Where the management of excess material requirements of other Ontario Provincial Standard Specifications differs from this specification, the requirements of this specification will take precedence.

##### **180.01.01 Specification Significance and Use**

This specification has been developed for use in provincial-oriented Contracts. The administration, testing, and payment policies, procedures, and practices reflected in this specification correspond to those used by the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **180.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **180.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

OPSS 206      Grading  
OPSS 209      Swamp Excavation

### **Ontario Provincial Standard Specification, Material**

OPSS 1004      Aggregates - Miscellaneous

### **Canadian and Provincial Statutes**

Environmental Protection Act, R.S.O. 1990, c.E.19 & R.R.O. 1990, Regulation 347  
Transportation of Dangerous Goods Act, 1992, S.C. 1992, c. 34  
Fire Protection and Prevention Act, 1997, S.O. 1997, CHAPTER 4

## **180.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Bituminous Pavement** means any combination of asphaltic material and aggregate, excluding asbestos modified asphaltic material.

**Commercial Waste** means waste described as commercial waste in Regulation 347, under the Environmental Protection Act, Ontario.

**Concrete** means concrete mixtures produced with Portland cement and may include blended hydraulic cement, supplementary cement materials, spent debris and silica sand abrasive blasting media from abrasive cleaning of concrete and reinforcing steel, and concrete brick and block and associated mortar. It may include embedded steel and excludes asbestos modified Portland cement concrete mixtures.

**Disposable Fill** means excess material other than that disposed of at a certified disposal site and that is managed in berms and mounds and as fill other than in road embankments.

**Earth** means earth as defined in OPSS 206.

**Excess Material** means material removed under the Work specified in the Contract Documents for which management is not specified and includes surplus and unsuitable materials.

**Fabricated Metal and Plastic Products** means metal and plastic products such as culverts, fence materials, and guide rails. It does not include containers, other packaging materials, storage tanks, septic tanks and ancillary equipment associated with sanitary sewage systems, septic systems, and fuel or lubricant dispensing and storage systems.

**Groundwater** means subsurface water and water that occurs beneath the water table in soils and rock formations that are fully saturated.

**Manufactured Wood** means wood that is not entirely natural wood.

**Masonry** means clay brick and associated mortar.

**Natural Wood** means stumps, trunks, branches, debris from tree and shrub removal, and wood products that are not treated, coated, or glued.

**Non-Hazardous Solid Industrial Waste** means waste described as non-hazardous solid waste in Regulation 347, under the Environmental Protection Act, Ontario.

**Re-Use** means using, processing, re-processing, or recycling of excess material into a construction material or other useful product and managed by these means for the Contract and other work.

**Rock** means rock as defined in OPSS 206.

**Subject Waste** means waste defined as subject waste in Regulation 347, under the Environmental Protection Act, Ontario.

**Swamp Material** means swamp material as defined in OPSS 209.

**Waste** means excess material that is not managed by re-use, open burning, or as disposable fill and includes any excess material.

**Waterbody** means waterbody as defined in OPSS 182.

## **180.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **180.04.01 Submission Requirements**

#### **180.04.01.01 Notification of Site Selection, and Property Owner Release**

A copy of the completed MTO form PH-CC-181, Site Selection Notification for Stockpiling Materials Managed Through Re-Use, or MTO form PH-CC-182, Site Selection Notification for Material Managed as

Disposable Fill or both shall be submitted to the Contract Administrator and the property owner at least two weeks prior to the use of the property. These forms are not required for property owned by the Owner or designated for use in the Contract Documents.

At the completion of such work, a completed copy of the MTO form PH-CC-183, Property Owner's Release, shall be provided to the Contract Administrator.

**180.04.01.02                      Verification of Management by Disposal as Non-Hazardous Solid Industrial or Commercial Waste**

When excess material is managed by disposal as non-hazardous solid industrial or commercial waste, a copy of the weigh ticket or receipt provided by the disposal site operator shall be submitted to the Contract Administrator on a weekly basis. When such documentation is not available, written confirmation that the waste has been received shall be obtained from the operator of the disposal site and submitted to the Contract Administrator within two weeks after disposal activities are complete.

Within three weeks of the completion of all disposal activities associated with the work, a completed copy of the MTO form PH-CC-184, Waste Quantity Report, shall be submitted to the Contract Administrator and shall account for all excess material managed by disposal as solid non-hazardous industrial or commercial waste.

**180.04.01.03                      Notification of Forest Resource Licensees**

Forest resource licensees identified in the Contract Documents shall be notified at least two weeks prior to commencement of open burning.

**180.04.01.04                      Environmental Compliance Approval**

When Environmental Compliance Approval(s)/Certificates of Approval for a Waste Management System or a Waste Disposal Site are required, a copy of such approval shall be submitted to the Contract Administrator prior to transporting excess material or waste from the Working Area.

**180.04.01.05                      Subject Waste Documentation**

For each subject waste specified in the Contract Documents that is being shipped from the Working Area to a waste disposal site, the following shall be completed:

- a) The Contract Administrator shall be notified at least two weeks prior to the first shipment of subject waste, and at least 24 hours prior to each subsequent shipment of subject waste.
- b) A Regulation 347 manifest with Part B completed by the carrier for each truckload of subject waste, shall be submitted to the Contract Administrator for Part A completion. Copies #1 and #2 of the manifest with Part A and B completed shall be retained by the Contract Administrator and the remaining copies #3 to #6 returned to the carrier.
- c) Copy #6 of the Regulation 347 manifest shall be submitted to the Contract Administrator at the mailing address indicated on Part A of the manifest, within four weeks of the shipment of subject waste from the Working Area.

For each subject waste that is generated by the Contractor's operations and that is not specified in the Contract Documents that is being shipped from the Working Area to a waste disposal site, the following documentation shall be submitted to the Contract Administrator.

- a) Prior to shipment of the subject waste:

- i. Test results from testing to determine the Regulation 347 waste class and characteristics of the subject waste from the Canadian Association for Laboratory Accreditation (CALA) accredited laboratory selected by the Contractor;
- ii. Notification from the Ministry of the Environment and Climate Change (MOECC) Hazardous Waste Information Network (HWIN) of the registration of the subject waste to obtain a Regulation 347 Generator Registration Number (GRN); and
- iii. A duplicate of Copy #2 of the Regulation 347 manifest with Parts A and B completed and signed by the generator and carrier respectively.

b) After shipment of the subject waste:

- i. Notification of payment of all registration, manifest, and tonnage fees associated with the shipment from the MOECC HWIN;
- ii. A duplicate of Copy #6 of the Regulation 347 manifest with Part C completed and signed by the receiver; and
- iii. Notification of de-activation of the Regulation 347 GRN in the MOECC HWIN.

A record of all test sample numbers and sample dates shall be kept and submitted to the Contract Administrator upon request.

#### **180.04.01.06 Excess Material Audit or Inventory Document**

When an excess material audit or inventory is imposed by statute or is a condition specified in the Contract Documents, a copy of the audit or inventory documents shall be provided to the Contract Administrator.

#### **180.04.01.07 Alternative Management Condition Approvals**

When certain excess material is to be managed according to the conditions approved in writing by the local District office of the MOECC and such conditions differ from those specified in Table 1, a copy of such approval shall be submitted to the Contract Administrator at least two weeks prior to commencement of the work governed by the condition.

### **180.07 CONSTRUCTION**

#### **180.07.01 Conditions on Management of Excess Material - General**

Management of excess material shall be as described in Tables 1 and 2 and the appropriate subsections of this specification, unless prior alternative management conditions are approved in writing by the MOECC.

When an excess material is a mixture of materials, it shall be managed in compliance with the most stringent conditions associated with any of the constituent excess material.

When excess material includes asbestos waste, the asbestos waste shall be managed as specified in the Contract Documents.

Excess materials shall not be permitted in waterbodies, and environmentally sensitive areas as identified in the Contract Documents, except when re-used according to the appropriate Ontario Provincial Standard.

#### **180.07.02 Conditions on Management by Re-Use**

Management of excess material by re-use for incorporation into the Work or for other designated re-use shall be as specified in the Contract Documents.

Management by re-use shall otherwise be outside the Owner's property.

Distance separations described in Table 2 do not apply for the following:

- a) Re-use of excess materials for the same purpose.
- b) Re-use of bituminous pavement, concrete, and masonry within a road right-of-way.
- c) Re-use of concrete as aggregate in bituminous pavement.
- d) Re-use of concrete as rip-rap, gabion stone, or rock protection according to the requirements of OPSS 1004.

Except cutting for construction purposes, excess material consisting of manufactured wood shall not be reprocessed.

#### **180.07.03                      Conditions on Management as Disposable Fill**

Management of excess material as disposable fill, including sidecasting of swamp material, within the Owner's property and on other property designated in the Contract Documents shall be as specified in the Contract Documents.

Natural wood and debris from open fires may be managed as disposable fill only within a road right-of-way or on property with a boundary common to a road right-of-way, both within the Contract limits.

Such material shall be top covered by at least 300 mm of earth or topsoil.

#### **180.07.04                      Conditions on Management by Open Burning**

Management of excess material by open burning is permitted only when specified in the Contract Documents. Where management by open burning is permitted, it shall be subject to the following conditions and conducted according to the Fire Protection and Prevention Act, 1997 where it applies, and with any applicable, local, municipal by-law(s):

- a) A permit from the Ministry of Natural Resources and Forestry (MNRF) under the Fire Protection and Prevention Act, and/or applicable local or municipal by-law shall be obtained by the Contractor for open burning, as required.
- b) Open burning is prohibited in areas subject to a restricted fire zone order as issued by MNRF or to a smog alert advisory as issued by MOECC.

#### **180.07.05                      Conditions on Management by Disposal as Non-Hazardous Solid Industrial or Commercial Waste**

Management of excess material by disposal as non-hazardous solid industrial or commercial waste at receiving sites designated in the Contract Documents shall be as specified in the Contract Documents.

When receiving sites are not specified in the Contract Documents for management by disposal as non-hazardous solid industrial or commercial waste, such material shall be disposed of at sites identified by the Contractor.

Non-hazardous solid industrial or commercial waste shall be transported from the Working Area directly to a site that has an Environmental Compliance Approval/ Certificate of Approval for a Waste Disposal Site that is valid for non-hazardous solid industrial or commercial waste.

#### **180.07.06 Conditions on Management by Stockpiling**

Management of excess material by stockpiling within the Owner's property and on other property designated in the Contract Documents shall be as specified in the Contract Documents.

Stockpiling shall otherwise be outside the Owner's property.

Stockpiles of bituminous pavement, concrete, and masonry shall be separated according to Table 2 unless either of the following occurs:

- a) Stockpiles are located within a road right-of-way or on property with a boundary common to a right-of-way, both within the Contract limits for a period not exceeding 120 Days.
- b) Stockpiles are located within a provincial or municipal works yard or in a commercially licensed pit or quarry.

For all other excess materials, where Table 1 indicates that stockpiling is subject to management conditions in Table 2, such management conditions shall only apply to stockpiles that are to be in place for a period exceeding 120 Days.

#### **180.07.07 Conditions on Management by Disposal as Subject Waste**

When an excess material is identified as a dangerous goods waste, or a subject waste specified in the Contract Documents, management shall be as follows:

- a) Subject waste shipments shall be manifested and transported directly to a certified waste disposal site.
- b) When the subject waste is also a dangerous good as defined in the Transportation of Dangerous Goods Act (TDGA), the carrier shall provide all necessary TDGA labels and placards.

When an excess material generated by the Contractor's operations may be subject waste and it is not specified in the Contract Documents, the Contractor shall be responsible to manage it according to the following:

- a) Conduct sampling and testing using a laboratory certified by the CALA selected by the Contractor to determine whether it is subject waste and to determine the Regulation 347 waste class and characteristics.
- b) Register all subject waste in the MOECC HWIN and obtain a Regulation 347 GRN for disposal.
- c) Package and label all subject waste for transportation and disposal.
- d) Arrange for shipment of all subject waste to a certified waste disposal site using a certified carrier.
- e) Complete Part A of a Regulation 347 manifest including the GRN obtained from the MOECC HWIN and provide the manifest to the certified carrier for completion of Part B.
- f) Provide a duplicate of Copy #2 of the Regulation 347 manifest to the Contract Administrator with Parts A and B completed and signed.
- g) Pay all registration, manifest and tonnage fees associated with subject waste disposal in the MOECC HWIN.

- h) De-activate the GRN in the MOECC HWIN after shipment of all subject waste to a certified waste disposal site is complete and acceptance of the subject waste is acknowledged by the receiver completing and signing Part C of the Regulation 347 manifest.
- i) Provide a duplicate of Copy #6 of the Regulation 347 manifest to the Contract Administrator upon receipt from the receiver.

When an excess material is tested and found not to be a dangerous good waste or a subject waste, it shall be managed by disposal as Non-Hazardous Solid Industrial or Commercial Waste according to this specification.

#### **180.10 BASIS OF PAYMENT**

Payment for the management of excess material shall be included in the tender items requiring such management and shall include all costs associated with acquiring approvals, releases, and agreements.

Payment for the management of excess material that is subject waste generated by the Contractor's operations and not specified in the Contract Documents by the Owner, and is in addition to the cost of disposal as non-hazardous, solid industrial, or commercial waste, shall be administered as a Change in the Work, with provisions subject to testing to verify that the excess material is subject waste.

**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

## **Canadian and Provincial Policy**

Fisheries and Oceans Canada Code of Practice: End-of-Pipe Fish Protection Screens for Small Water Intakes in Freshwater

Fisheries and Oceans Canada Protocol for the Detection of Fish Species at Risk in Ontario Great Lakes Area (OGLA)

Fisheries and Oceans Canada Protocol for the Detection and Relocation of Freshwater Mussel Species at Risk in Ontario Great Lakes Area (OGLA)

## **182.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Aquatic Species at Risk** means a fish and/or a freshwater mussel species provincially or federally listed as extirpated, endangered, threatened species or species of special concern.

**Cofferdam** means a temporary enclosure constructed within a waterbody to allow the enclosed area to be pumped out, creating a dry work environment.

**Deleterious Substance** means as defined by the Fisheries Act.

**Entrainment** means when a fish is drawn into a water intake and cannot escape.

**Endangered Species Act Permit** means as defined by the Endangered Species Act.

**Fish** means as defined by the Fisheries Act.

**Fish Habitat** means as defined by the Fisheries Act.

**Fish Salvage** means the physical relocation of fish from the work area.

**Fish Screen** means a device designed to prevent fish from swimming or being drawn into a water intake pipe.

**Fisheries Act Authorization** means as defined by the Fisheries Act.

**Fisheries Assessment Specialist** means an individual who meets the requirements of the Fisheries Assessment specialty and is registered on MTO's Consultant Registry.

**Fisheries Contracts Specialist** means an individual who meets the requirements of the Fisheries Contracts specialty and is registered on MTO's Consultant Registry.

**Freshwater Mussel** means as defined by the Fisheries Act.

**High-Water Level** means the elevation of the top of the bank of the channel. In watercourses this refers to the "bank-full channel" which is often the 1:2 year flood flow return level. In inland lakes and wetlands, it refers to those parts of the waterbody bed and banks that are frequently flooded by water that leaves a mark on the adjacent land and where the natural vegetation changes from predominately aquatic vegetation to terrestrial vegetation.

**Impingement** means when an entrapped fish is held in contact with the intake screen and is unable to free itself.

**In-Water Work** means any work, activity or undertaking occurring at or below the high-water level that may impact the waterbody bed or flow in the waterbody.

**In-Water Work Timing Windows** means a restriction to in-water work related to an activity during certain periods to protect fish and freshwater mussels from impacts of works or undertakings in and around waterbodies during critical life stages.

**Licence to Collect Fish for Scientific Purposes** means as defined in Part IV of Ontario Regulation 664/98, under the Fish and Wildlife Conservation Act.

**Mitigation Measures** means measures to reduce the spatial scale, duration, or intensity of harmful impacts to fish and fish habitat when such impacts cannot be avoided.

**Riparian Vegetation Areas** means trees, shrubs and other vegetation on waterbody bank from the high-water level upland for 30 metres.

**Sediment** means soils or other surface material transported by wind or water as a result of erosion.

**Species at Risk Act Permit** means as defined in the Species at Risk Act.

**Waterbody** means any permanent or intermittent, natural or constructed body of water including lakes, ponds, wetlands and watercourses.

**Waterbody Bank** means the land adjacent to a waterbody from the high-water level to the top of slope.

**Waterbody Bed** means the bottom and sides of the waterbody over which the water flows, up to the high-water level.

**Watercourse** means a stream, creek, river, or channel including ditches, in which the flow of water is permanent, intermittent, or ephemeral.

## **182.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **182.04.01 Submission Requirements**

#### **182.04.01.01 Licences and Permits**

A Licence to Collect Fish for Scientific Purposes shall be obtained from the Ontario Ministry of Natural Resources and Forestry (MNRF) to conduct a fish salvage prior to any in-water works.

Copies of all permits and licences obtained from regulatory agencies shall be submitted to the Contract Administrator upon receipt.

#### **182.04.01.02 Fisheries Specialists**

When a fisheries specialist(s) is required, the name(s) of the fisheries contracts specialist(s) and, if applicable, fisheries assessment specialist(s), shall be provided to the Contract Administrator a minimum of 10 Business Days prior to the commencement of work at each location where specialist oversight is specified.

## **182.05 MATERIALS**

All Materials used to provide environmental protection shall not contain any deleterious substances.

## **182.06 EQUIPMENT**

All Equipment used for the work in and around waterbodies or on waterbody banks shall at all times be free of excess or leaking fuel, lubricants, coolant and any other deleterious substances that could enter the waterbody.

## **182.07 CONSTRUCTION**

### **182.07.01 General Requirements**

In addition to the environmental protection requirements specified elsewhere in the Contract Documents, all Work shall be controlled to provide effective waterbody and fish habitat protection. If fish are observed in the work area during construction the work shall cease, and the fish salvaged.

The Work shall be according to all mitigation measures specified in the Contract Documents.

Unless specified in the Contract Documents, waterbodies shall not be permanently diverted, relocated, blocked, or filled.

Unless specified in the Contract Documents, the removal of woody debris, rocks, sand or other materials from the waterbody bed and banks shall not be permitted.

When practicable, work shall be scheduled to avoid wet or windy periods that may increase erosion and sedimentation.

### **182.07.02 Operation of Equipment in and around Waterbodies or on Waterbody Banks**

Equipment shall arrive on site in clean condition and is to be maintained free of fluid leaks.

Unless specified in the Contract Documents, Equipment shall not enter a waterbody and shall be operated on dry land above the high-water level, on ice, or from a floating barge in a manner that minimizes disturbance to the waterbody banks.

Equipment refueling and maintenance shall take place at locations as far away as practicable from a waterbody and in a manner that prevents any sediment and other deleterious substances from entering a waterbody. An emergency spill kit shall be kept on site to address any fluid leaks or spills from Equipment.

### **182.07.03 Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control shall be according to OPSS 517.

### **182.07.04 Preservation of Riparian Vegetation**

Riparian vegetation removal shall be no more than one third (1/3) of the total woody riparian vegetation within 30 metres of the high-water level of a waterbody. Vegetative root masses found within the waterbody banks shall remain undisturbed unless specified in the Contract Documents.

Existing trails, roads or cut lines shall be used wherever possible as access routes to avoid disturbance to waterbody banks and riparian vegetation areas. Equipment travel paths, stockpile areas and staging areas, within the vicinity of the crossing, shall be established to minimize impacts to riparian vegetation.

When practicable, riparian vegetation in the right-of-way shall be altered by hand.

#### **182.07.05 Erosion and Sediment Control**

The installation, monitoring, maintenance, and removal of temporary erosion and sediment control measures shall be according to OPSS 804 and OPSS 805.

Erosion and sediment control measures shall be in place prior to any soil disturbance and shall remain effective at all times, including seasonal and other shut down periods.

Site isolation measures (i.e. cofferdams, turbidity curtains) shall be installed prior to any in-water work activities taking place and shall remain effective at all times to allow the Contractor to work in a manner that prevents sediment from entering into a waterbody.

Measures for managing water being pumped and/or diverted from the site shall be according to OPSS 517.

#### **182.07.01 Restoration of Disturbed Areas**

All disturbed areas shall be immediately restored after a disturbance or upon completion of the work in or around waterbodies, waterbody banks, and riparian vegetation areas. The disturbed areas shall be restored to an equivalent or better condition than existed prior to the commencement of construction.

All disturbed areas on waterbody banks and riparian vegetation areas shall be stabilized with effective temporary erosion and sediment control measures as specified in the Contract Documents and maintained until vegetation is established.

All vegetative cover shall be applied as specified in the Contract Documents and according to OPSS 803.

Materials for the restoration of waterbody beds shall not be obtained from below the high-water level of any waterbody unless specified in the Contract Documents.

#### **182.07.07 Contaminant and Spills Management**

All stockpiled materials, including but not limited to excavated overburden and topsoil, excess materials, construction debris and containers shall be stored and stabilized in a manner that prevents them from entering any waterbody.

All materials such as paint, primers, blasting abrasives, concrete, rust, solvents, degreasers, grout, or other chemicals shall not enter a waterbody.

All building materials used in and around a waterbody or on waterbody banks shall be handled and treated in a manner to prevent the release or leaching of substances into a waterbody that may be deleterious to fish.

All waste materials (e.g., dredging spoils, construction waste and materials, commercial logging waste, uprooted or cut aquatic plants, accumulated debris) shall be contained and stabilized above the high-water level of nearby waterbodies to prevent re-entry.

#### **182.07.08 Fish Protection**

##### **182.07.08.01 Timing of In-Water Works**

All in-water work construction activities shall comply with the in-water works timing windows specified in the Contract Documents.

#### **182.07.08.02 Fish Salvage**

Fish stranded by the Work or found in the work area during construction shall be salvaged and relocated according to the Licence to Collect Fish for Scientific Purposes, unless specified in the Contract Documents. If fish cannot be safely relocated, the local MNRF office shall be consulted prior to fish salvage commencing to determine a suitable relocation site.

Fish exclusion measures (i.e. block nets) shall be used to prevent fish from re-entering work areas. If the fish exclusion measures fail, additional fish salvage activities shall be performed to relocate the fish from the work areas prior to recommencing construction. All fish exclusion measures shall be removed once the works in the area has been completed.

All fish shall be handled as little as possible and in a manner that minimizes stress and shall prevent the death of fish.

All persons conducting electrofishing shall possess a valid Ontario Electrofishing Certification.

#### **182.07.08.03 Reporting Species at Risk**

When an aquatic species at risk (protected under the federal Species at Risk Act (SARA) or the Ontario Endangered Species Act (ESA) is incidentally captured during fish salvage activities, the individual that incidentally captured the aquatic species at risk shall take a digital photograph according to Fisheries and Oceans Canada's Protocol for the Detection of Fish Species at Risk in Ontario Great Lakes Area (OGLA). Once the digital photograph has been taken, the species shall be released immediately. The digital photograph shall be reported and emailed to the Contract Administrator and the appropriate regulatory agency, (i.e. MECP for ESA, and Fisheries and Oceans Canada (DFO) for SARA).

All mortalities of species protected under SARA or ESA associated with the fish salvage activities shall be reported to the Contract Administrator, and the appropriate regulatory agency, immediately upon being discovered. Mortalities shall be vouchered according to Fisheries and Oceans Canada Protocol for the Detection of Fish Species at Risk in Ontario Great Lakes Area (OGLA) and/or Protocol for the Detection and Relocation of Freshwater Mussel Species at Risk in Ontario Great Lakes Area (OGLA).

#### **182.07.08.04 Fish Screens**

Any water intakes or outlet pipes in fish bearing waters shall have screens to prevent entrainment or impingement of fish and shall follow the measures as outlined in Fisheries and Oceans Freshwater Code of Practice: End-of-Pipe Fish Protection Screens for Small Water Intakes in Freshwater.

#### **182.07.05 Fisheries Specialist Services**

When oversight by a fisheries specialist is required for a location as specified in the Contract Documents, a fisheries contracts specialist shall be retained to provide the following services.

- a) Work with construction personnel to protect fish and fish habitat;
- b) Work with construction personnel in the development of waterbody and fisheries protection strategies and plans, when specified in the Contract Documents;
- c) Liaise with the Owner, the Contract Administrator, and, as necessary, Regulatory Agency representatives regarding Fisheries Act authorization requirements;
- d) Be on-site to inspect the installation, function and decommissioning (as appropriate) of all temporary and permanent mitigation measures as specified in the Contract Documents and including providing field fit advice and necessary corrective actions for issues of non-compliance;

- e) Inspect erosion and sediment control measures within 24 hours after a rain event;
- f) Provide immediate notification to the Contractor and Contract Administrator of any release of a deleterious substance or any unauthorized harmful impacts to fish or where there is imminent danger to fish or any of these potentially occurring;
- g) Complete and submit all monitoring documentation as specified in Table 1;
- h) Fish salvage, as necessary, under a Licence to Collect Fish for Scientific Purposes; and
- i) Review Change Proposals for compliance with the Fisheries Act. If a fisheries assessment is required, it shall be conducted by a fisheries assessment specialist.

#### **182.07.09 Contingency Measures**

When an environmental protection measure is found to be ineffective, corrective actions shall be taken immediately including repair or replacement of the measure to ensure waterbody and fish habitat protection.

#### **182.07.10 Management of Excess Materials**

Management of excess material shall be according to the Contract Documents.

#### **182.10 BASIS OF PAYMENT**

Payment at the Contract price for the appropriate tender items that require fisheries protection and mitigation measures shall include full compensation for all labour, Equipment, and Material to do the work.

**201.01 SCOPE**

This specification covers the requirements for the removal of trees, brush, bushes, stumps, windfalls, surface boulders, and piled boulders.

**201.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**Ontario Provincial Standard Specifications, Construction**

OPSS 206      Grading

**Ontario Government Publications**

Crown Forest Sustainability Act, 1994, S.O. 1994, c. 25

## **201.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Clearing** means the cutting of all standing trees, brush, bushes, and other vegetation to a maximum height of 300 mm above original ground level and the removal of felled materials and windfalls.

**Close Cut Clearing** means the cutting of all standing trees, stumps, brush, bushes, and other vegetation at original ground level and the removal of felled materials and windfalls.

**Grubbing** means the removal of all stumps, roots, embedded logs, debris, and secondary growth.

**Piled Boulders** means any cobbles, boulders, or rock fragments that have been placed in fencerows or piles.

**Rock** means rock as defined in OPSS 206.

**Surface Boulder** means any boulder or rock fragment that measures 200 mm or greater in any one dimension, extends a minimum of 200 mm above original ground, and can be removed without excavation.

## **201.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **201.04.01 Submission Requirements**

#### **201.04.01.01 Crown Forest**

Crown forest, as defined by the Crown Forest Sustainability Act, shall not be cut until a permit has been obtained from the Ministry of Natural Resources and Forestry (MNRF).

## **201.07 CONSTRUCTION**

### **201.07.01 General**

Trees measuring 150 mm or more in diameter, measured 1.0 m above ground, shall be cut, limbed, and stacked for collection by others. Cut trees shall not be stacked in or transported through areas identified as being environmentally sensitive in the Contract Documents or elsewhere by an Authority.

When specified in the Contract Documents, cut trees shall be stacked outside and adjacent to the right-of-way for the property owner, adjacent to and between the stations listed.

Within Crown Land areas specified in the Contract Documents for clearing and close cut clearing, marketable timber shall be made available for purchase from the Contractor to the holder of the sustainable forest licence. All cut and stacked trees shall be cut into lengths agreed to by the Contractor and the sustainable forest licence holder, but in no case exceeding 5.0 m.

All timber not purchased by others or stacked for adjacent landowners is excess material.

The work shall not damage or disturb the area outside the areas specified in the Contract Documents.

When work is done in or near waterbodies or waterbody banks, the work shall be according to the Contract Documents.

#### **201.07.02 Clearing**

The work shall consist of clearing all areas of earth excavation, earth surfaces to be covered by embankments up to and including 1.2 m in height, and any other areas specified in the Contract Documents.

#### **201.07.03 Close Cut Clearing**

The work shall consist of close cut clearing all earth surfaces to be covered by embankments greater than 1.2 m in height, and any other areas specified in the Contract Documents.

#### **201.07.04 Grubbing**

The work shall consist of grubbing all areas of earth excavation, earth surfaces to be covered by embankments up to and including 1.2 m in height, and any other areas specified in the Contract Documents.

Grubbing is not required in swamps.

Mechanical stump cutters are permitted, provided the entire root structure is removed.

Depressions remaining after grubbing shall be backfilled with suitable earth material and compacted to avoid settlement.

When clearing has been previously completed by others, all secondary growth, brush, and debris shall be removed.

Piled boulders and surface boulders that are not specified in the Contract Documents for removal and lie within areas to be grubbed shall be removed.

#### **201.07.05 Removal of Surface Boulders and Removal of Piled Boulders**

The work shall consist of the removal of surface boulders and removal of piled boulders within the areas specified in the Contract Documents.

Depressions remaining after removal shall be backfilled with suitable earth material and compacted to avoid settlement.

#### **201.07.06 Mechanical Stump Cutting**

The work shall consist of mechanical cutting of stumps to a depth of 150 mm below original grade, as specified in the Contract Documents.

#### **201.07.07 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **201.09 MEASUREMENT FOR PAYMENT**

#### **201.09.01 Actual Measurement**

Measurement shall be by area or by each, as specified in the Contract Documents.

**201.09.01.01                      Clearing, Close Cut Clearing, and Grubbing**

Measurement of clearing, close cut clearing, and grubbing shall be by area or by each, as specified in the Contract Documents.

**201.09.01.01.01                  By Area**

Removal shall be measured by area in a horizontal plane in hectares or square metres.

**201.09.01.01.02                  By Each**

For measurement purposes, a count shall be made of the trees or stumps removed.

**201.09.01.02                      Removal of Surface Boulders and Removal of Piled Boulders**

Removal shall be measured by area in a horizontal plane in hectares or square metres.

**201.09.01.03                      Mechanical Stump Cutting**

For measurement purposes, a count shall be made of the stumps removed by mechanical cutting.

**201.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**201.10                                BASIS OF PAYMENT**

**201.10.01                          Clearing - Item  
Close Cut Clearing - Item  
Grubbing - Item  
Removal of Surface Boulders - Item  
Removal of Piled Boulders - Item  
Mechanical Stump Cutting - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Areas designated for removal of piled boulders that lie within areas specified in the Contract Documents for either grubbing or removal of surface boulders shall be paid separately with no deduction from the grubbing or surface boulder removal item.

Removal of individual boulders that are 1 m<sup>3</sup> and greater in volume, shall be paid as rock excavation according to OPSS 206.

|--------------|-------------------|
| <b>202-A</b> | <b>Commentary</b> |
|--------------|-------------------|

**202.01 SCOPE**

This specification covers the requirements for removing rock by manual scaling, machine scaling, trim blasting, or controlled blasting.

**202.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **202.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **202.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

OPSS 206      Grading

## **202.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Controlled Blasting** means cushion blasting, line drilling, and pre-shearing as defined in OPSS 206.

**Grubbing** means as defined in OPSS 206.

**Mucking** means as defined in OPSS 206.

**Rock Cut Sounding** means any non-destructive method using mechanical or electronic devices to acoustically determine areas where rock is partially or completely detached from the main rock mass.

**Rock Face** means as defined in OPSS 206.

**Scaling** means as defined in OPSS 206.

**Trim Blasting** means a blasting technique involving the drilling of a single row of closely-spaced holes along the excavation limits, loading them with light, well-distributed charges, completely stemmed, and simultaneously firing the charges.

**Wall Control Blasting** means as defined in OPSS 206.

## **202.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **202.04.02 Submission Requirements**

A minimum of 5 Business Days prior to beginning the Work, the name and contact number of the on-site person that is responsible for the Work being carried out (i.e., foreman) and a written statement showing that the person has had at least 5 years of related work experience, including dates, and has taken all appropriate safety training shall be submitted to the Contract Administrator.

## **202.06 EQUIPMENT**

### **202.06.01 Lifting Equipment**

Lifting equipment shall consist of a two-person aerial lift, crane, or other equipment suitable to access the Work.

### **202.06.02 Drilling Equipment**

Drilling equipment shall consist of a hydraulic track drill or other suitable drilling equipment acceptable to the Contract Administrator and capable of producing holes accurately and uniformly across the top of a rock cut to the depth specified in the Contract Documents.

### **202.06.03 Backhoe Excavator**

Backhoe excavators shall have a minimum operating weight of 30,000 kg and shall be capable of operating to a minimum height of 10 m.

### **202.06.04 Hoe-Ram Excavator**

A backhoe excavator shall be equipped with a minimum 5,200 Joule hydraulic impact hammer.

## **202.07 CONSTRUCTION**

### **202.07.01 General**

The work of the removal of rock by scaling or blasting or both shall include the following:

1. All equipment, including any lifting equipment, materials, and labour that is:
  - a) necessary to gain access to the rock removal locations specified in the Contract Documents.
  - b) required by the Owner to obtain access to any areas where:
    - i. the Work is being inspected;
    - ii. quantities are to be measured; or
    - iii. quality assurance and acceptance procedures are being conducted.

2. All associated mucking, hauling, and management of rock material.

Removal of rock shall always be carried out in such a manner as to minimize fracturing and all other disturbance to the surrounding rock beyond the removal limits specified in the Contract Documents.

All blasting, including the use of explosives, shall be as specified in the Contract Documents.

## **202.07.02                      Scaling**

### **202.07.02.01                  General**

Scaling shall consist of the complete removal of all loose and partially-detached rock at the locations and heights specified in the Contract Documents.

Scaling shall begin at the top of the rock cut and progress to lower elevations as the work proceeds. As the scaling progresses, care shall be taken to avoid undercutting the upper sections of the scaled rock cut.

The scaling crew shall be in continuous full-time radio contact with the foreman to permit direct and immediate control.

Each day, the scaling crew shall inspect the rock cut:

- a) prior to the start of work and remove any identified loose or visually unstable rock that may endanger workers.
- b) prior to shutdown and remove any identified loose or visually unstable rock that may endanger the traveling public.

### **202.07.02.02                  Manual Scaling**

The work of manual scaling shall consist of the complete removal of all loose and partially-detached rock at the locations and heights specified in the Contract Documents by the manual scaling work unit and in addition to all of the other items specified in the Contract Documents, shall also include the following:

- a) Rock cut sounding.
- b) Scaling of the rock cut with hand tools and hand-held machine tools.

Manual scaling may include blasting with small quantities of explosives, but only when specified as an option in the Contract Documents.

As a minimum, the manual scaling work unit shall consist of the following:

- a) Two labourers that are experienced in doing scaling work at the heights required in the Contract and have taken the appropriate safety training.
- b) All tools and materials required for the performance of the work.

### **202.07.02.03                  Machine Scaling**

The work of machine scaling shall consist of the complete removal of all loose rock and partially-detached rock at the locations and heights specified in the Contract Documents by the machine scaling work unit and in addition to all of the other items specified in the Contract Documents, shall also include the following:

- a) Grubbing.
- b) Rock cut sounding.
- c) Scaling of the rock cut.

As a minimum, the machine scaling work unit shall consist of the following:

- a) Either a:
  - i) Backhoe excavator equipped with a narrow scaling/ditching bucket and hydraulic thumbs; or
  - ii) Hoe-ram excavator.
- b) Backhoe and hoe-ram excavator operators with experience in machine scaling work.
- c) All tools and materials required for the performance of the work.

### **202.07.03 Trim Blasting or Controlled Blasting**

#### **202.07.03.01 General**

The work of trim blasting or controlled blasting shall consist of drilling and blasting to remove the rock specified for removal in the Contract Documents, while minimizing damage to the surrounding rock.

Any loosened or partially-detached rock shall be properly scaled, as specified in the Scaling subsection.

#### **202.07.03.02 Trim Blasting**

In addition to all of the other items specified in the Contract Documents, the work of trim blasting shall also include locating and drilling 50 mm diameter vertical holes along the perimeter of the specified trim at a maximum spacing of 750 mm or at a spacing approved by the Contract Administrator.

#### **202.07.03.03 Controlled Blasting**

In addition to all of the other items specified in the Contract Documents, the work of controlled blasting shall also include the appropriate wall control blasting techniques, as specified for rock face in OPSS 206.

#### **202.07.04 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

When possible, excess rock material shall be managed within the right-of-way by slope flattening at locations approved by the Contract Administrator or as specified in the Contract Documents.

### **202.09 MEASUREMENT FOR PAYMENT**

#### **202.09.01 Actual Measurement**

##### **202.09.01.01 Rock Excavation, Manual Scaling**

Measurement of rock excavation by manual scaling shall be by time in hours that the scaling crew is in effective operation.

Effective operation shall not include the time taken for the management and disposal of the materials generated by the scaling operation.

**202.09.01.02                      Rock Excavation, Machine Scaling**

Measurement of rock excavation by machine scaling shall be the cumulative sum of the time in hours that each individual scaling unit is working on the site in effective operation.

Effective operation shall not include the time taken for the management and disposal of all materials generated by the scaling operation or for the construction of any associated ramps.

**202.09.01.03                      Rock Excavation, Trim Blasting**

Measurement of rock excavation by trim blasting shall be by vertical length in metres of drilling required.

**202.09.01.04                      Rock Excavation, Controlled Blasting**

Measurement of rock excavation by controlled blasting shall be by volume in cubic metres of rock measured in-place.

**202.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**202.10                                BASIS OF PAYMENT**

**202.10.01                          Rock Excavation, Manual Scaling - Item  
Rock Excavation, Machine Scaling - Item  
Rock Excavation, Trim Blasting - Item  
Rock Excavation, Controlled Blasting - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**Appendix 202-A, November 2013**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

## 203.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Basal Plane** means a planar discontinuity within a rock mass along which one portion of the mass could slide over another.

**Cold Weather** means those conditions when the air temperature is less than or equal to 10 °C. It is also considered to exist when the air temperature is at or is likely to be less than 10 °C within 96 hours after concrete placement. Temperature refers to shade temperature.

**Concrete Buttress** means a structurally reinforced concrete structure designed to support rocks.

**Centralizer** means a device to support and position the tendon and sleeves in the drill hole throughout the bond length of the tendon so that a minimum grout cover is achieved.

**Dry Mix Shotcrete** means shotcrete which is the prebagged dry material is mixed and placed into a stream of compressed air. The material is carried by the compressed air through a delivery hose to the nozzle where water is added. Water is added to the mixture as it is jetted from the nozzle.

**Hot Weather** means those conditions when the air temperature is greater than or equal to 28 °C. It is also considered to exist when the air temperature is at or is likely to be greater than 28 °C within 24 hours after the shotcrete operation. Temperature refers to shade temperature.

**Nozzleperson** means the qualified worker on the shotcrete crew who has obtained ministry approval for shotcrete nozzleperson certification who manipulates the nozzle, controls consistency, and controls final disposition of the material.

**Rock Bolting** means the pinning of a rock block or rock mass in-situ using anchoring agent or cement grouted steel bars.

**Saturated Surface Dry** means concrete or rock face that is fully saturated without free standing water.

**Wet Mix Shotcrete** means shotcrete in which all of the materials, including water, are mixed before introduction into the delivery hose. Compressed air is introduced to the material flow at the nozzle.

## **203.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **203.04.01 Submission Requirements**

#### **203.04.01.01 Mix Design for Shotcrete**

The submission of the shotcrete mix design including all supporting documentation shall be according to OPSS 931, with additional documentation showing the steel fibre manufacturer's name, type, product name and fibre content, if applicable.

#### **203.04.01.02 Mix Design for Concrete Buttress**

Concrete mix design submissions shall be according to OPSS 1350.

#### **203.04.01.03 Shotcrete Equipment**

The submission of the shotcrete equipment shall be according to OPSS 931.

#### **203.04.01.04 Nozzleperson**

The submission of the nozzlepersons shall be according to OPSS 931.

#### **203.04.01.05 Cold Weather Protection**

The submission of the cold weather protection shall be according to OPSS 931.

#### **203.04.01.06 Hot Weather Shotcreting**

The submission of the hot weather shotcreting shall be according to OPSS 931.

#### **203.04.01.07 Curing**

The submission of the curing for shotcrete shall be according to OPSS 931.

#### **203.04.01.08 Rock Bolting**

The following rock bolting information shall be submitted to the Contract Administrator, for information purposes, a minimum of 2 weeks prior to starting the work:

- a) The name and statement of experience of the persons or firm(s) responsible for installing and testing the rock bolts.
- b) The name of the firm supplying the rock bolts.
- c) The mill certificates for the rock bolts to be used.
- d) The name of the firm supplying the anchoring agent, if applicable.
- e) The type, date of manufacture, set time and dimensions of the anchoring agent, the drill hole diameter, and the installation methodology to be used.
- f) The type of grout and installation methodology for grouted rock bolts, if applicable.

#### **203.04.01.09 Steel Fibres**

Test reports from the steel fibre manufacturer, for the physical properties of the steel fibres, including tensile strength, according to ASTM A820 shall be submitted to the Contract Administrator at least 2 weeks prior to the use of the product. The steel fibre diameter and length shall be included in the report.

#### **203.04.01.10 Flexural Toughness of Steel Fibre-reinforced Shotcrete**

For steel fibre-reinforced shotcrete, test report for flexural toughness according to ASTM C1550 shall be submitted to the Contract Administrator at least 2 weeks prior to the placement of the shotcrete. Test specimens shall be prepared using the same materials and mix design as the shotcrete to be used in the work. Test results shall not be more than 6 months old at the time of submission. Testing shall be carried out by an independent laboratory, acceptable to the Owner, and certified by the Canadian Council of Independent Laboratories (CCIL) - Concrete Certification or equivalent qualification programme acceptable to the Owner.

The test report shall indicate that the flexural toughness meets the minimum requirement specified in the Contract Documents.

### **203.05 MATERIALS**

#### **203.05.01 Admixtures**

Admixtures shall be according to OPSS 1303.

#### **203.05.02 Aggregates**

Aggregates shall be according to OPSS 1002, except the nominal maximum aggregate size shall be 13.2 mm.

### **203.05.03 Anchors**

Anchors for the attachment of the welded steel wire reinforcement to the rock face shall be of adequate length, diameter, and grade to resist a pull-out force of 1.0 kN. The anchors shall be according to ASTM F1554 and the galvanizing according to ASTM F2329.

When stainless welded steel wire reinforcement is used, anchors and tie wires shall be made of the same type of stainless steel according to ASTM F593.

### **203.05.04 Burlap**

Burlap shall be according to OPSS 1306.

### **203.05.05 Concrete Buttress**

Cast-in-place concrete buttress shall be according to OPSS 1350 with a minimum 28-Day compressive strength of 30 MPa.

Steel reinforcement, mechanical connectors, and associated hardware shall be according to OPSS 905.

### **203.05.06 Cementing Material**

Cementing materials shall be according to OPSS 1301 and CSA A3001.

### **203.05.07 Formwork**

Formwork shall be according to OPSS 919.

### **203.05.08 Grout Tubes**

Grout tubes shall have an adequate inside diameter to enable the grout to be pumped to the bottom of the drill hole. The grout tubes shall be able to withstand a pressure of 1 MPa.

### **203.05.09 Proprietary Patching Materials**

Proprietary patching materials shall be from the Owner's prequalified product list. The list of proprietary patching materials shall be obtained from the Contract Administrator.

### **203.05.10 Rock Bolts**

#### **203.05.10.01 General**

Rock bolts shall be a minimum 25M reinforcing steel bars according to OPSS 1440 with a minimum yield strength of 400 MPa and a minimum length of 3.0 m, unless otherwise specified elsewhere in the Contract Documents. Rock bolts shall be fully threaded bars or bars threaded at one end and provided with a face plate of at least 100 x 100 mm in area with a nut and beveled or spherical washers as recommended by the manufacturer.

The steel for nuts shall be according to ASTM A563. Washers shall be according to ASTM F436. Face plates shall be according to CSA G40.21.

Rock bolt shall be hot-dip galvanized according to ASTM A123 and all other rock bolt components shall be hot-dip galvanized according to ASTM F2329.

The minimum yield strength of the rock bolt components shall be as specified in the Contract Documents.

### **203.05.10.02                    Anchoring Agent for Rock Bolts**

The anchoring agent for rock bolts shall be supplied in cartridges containing a polyester resin with a catalyst that has a maximum gel time of 15 minutes. Fully cured anchoring agent shall have a minimum compressive strength of 50 MPa and a minimum tensile strength of 15 MPa. Resin with an expired shelf life shall not be used.

### **203.05.10.03                    Grout for Rock Bolts**

Portland cement-based grout shall be a proprietary pre-bagged, non-metallic, shrinkage compensating grout placed according to the manufacturer's specifications. The grout shall be mixed, handled, and cured according to the manufacturer's specifications.

The grout shall have a minimum compressive strength of 20 MPa at 7 Days and a minimum compressive strength of 30 MPa at 28 Days when tested according to CSA A23.2-1B.

The grout shall bleed less than 2% after allowing the grout to stand for 1 hour when tested according to CSA A23.2-1B.

### **203.05.11                        Rock Drains**

Rock drains shall consist of slotted polyvinyl chloride (PVC) pipe according to ASTM D1784 and have a minimum internal diameter of 19 to 25 mm, inclusive.

### **203.05.12                        Rock Shotcrete**

#### **203.05.12.01                    General**

Shotcrete shall have a minimum 28-Day compressive strength of 35 MPa. The shotcrete mix shall contain 8% silica fume by mass of total cementing materials.

Steel fibres or welded steel wire reinforcement shall be used in the shotcrete, as specified in the Contract Documents. When steel fibre-reinforced shotcrete is specified in the Contract Documents, the minimum flexural toughness when tested at 28-Days according to ASTM C1550 shall be a minimum of 400 joules at 40 mm deflection.

Dry mix shotcrete shall be used, unless otherwise specified in the Contract Documents.

#### **203.05.12.02                    Additional Requirements for Dry Mix Shotcrete**

The dry shotcrete mix shall be supplied pre-bagged and unopened. Each bag shall be stamped with the following:

- a) Name of the manufacturer;
- b) Mix identification;
- c) Manufacturer's batch number; and
- d) Date of packaging.

The pre-bagged mix shall contain cementing materials and aggregates. When specified in the Contract Documents, the pre-bagged mix shall contain the steel fibres. The bags shall be maintained in a dry condition up to the time of use and shall be stored within a temperature range of 10 °C to 30 °C.

Material from bags that contain lumps of hydrated shotcrete or appear to be frozen or otherwise damaged shall not be used in the work. The pre-bagged mix shall be used within 6 months of the date of packaging.

### **203.05.12.03 Additional Requirements for Wet Mix Shotcrete**

Silica fume shall be added to the concrete mix in the form of a blended cement containing silica fume.

When steel fibre for wet mix shotcrete is specified in the Contract Documents:

- a) The steel fibres shall be added to the ready-mix concrete truck at the plant when the shotcrete is delivered using trucks; or
- b) The pre-bagged mix shall contain the steel fibres when the shotcrete is produced using pre-bagged material.

### **203.05.13 Steel Fibres**

Fibre reinforcement shall be steel fibres with a minimum tensile strength of 1,100 MPa when tested according to ASTM A820. The steel fibre shall be bent or deformed low-carbon, cold-drawn steel wire, Type I according to ASTM A820.

### **203.05.14 Tie Wire**

Tie wire shall be according to OPSS 905.

### **203.05.15 Water**

Water used for production, fog-misting, curing, and pre-soaking of burlap shall be according to OPSS 1302.

### **203.05.16 Welded Steel Wire Reinforcement**

The welded steel wire reinforcement shall be welded galvanized or stainless steel according to OPSS 1440 and shall have 100 mm x 100 mm openings fabricated from 4 mm diameter galvanized wires or stainless steel. Galvanized steel wire shall be according to ASTM A1064. Stainless steel wire reinforcement shall be in according to ASTM A1022.

## **203.06 EQUIPMENT**

### **203.06.01 Shotcreting**

#### **203.06.01.01 Compressor - Air Blasting**

The compressor for air blasting shall have a minimum capacity of 14.2 m<sup>3</sup>/min. The compressed air shall be free from oil and other contaminants according to ASTM D4285.

#### **203.06.01.02 Fog Misting Equipment**

Fog misting equipment for the curing of shotcrete shall be according to OPSS 904.

#### **203.06.01.03 Hand Finishing Equipment**

Where hand finishing is required, only magnesium, wood, or sponge rubber floats shall be used.

#### **203.06.01.04 Mixers**

Mixers for dry mix process or wet mix process shall be according to OPSS 931.

The dry mix process shall be used, unless otherwise specified in the Contract Documents.

## **203.07 CONSTRUCTION**

### **203.07.01 Rock Bolting**

#### **203.07.01.01 Drilling of Rock Bolt Holes**

Holes for rock bolts shall be drilled with the diameter recommended by the anchoring agent manufacturer for the sizes of the rock bolts at the locations specified in the Contract Documents. For cement grouted rock bolts, holes shall be drilled as specified in the Contract Documents.

Holes shall be drilled in a direction angled downward in order to connect the basal planes and to a depth such that when the rock bolt is fully inserted it protrudes 70 mm + 20 mm from the rock or shotcrete surface.

The drill holes shall be thoroughly cleaned with compressed air prior to the installation of the anchoring agent or grout.

#### **203.07.01.02 Installation of Rock Bolts**

The holes shall be filled with the anchoring agent or grout to ensure complete encapsulation of the rock bolt and an adequate bond along the full length of the drill hole while allowing some overflow.

Centralizers shall be maintained in position during installation.

Rock bolts shall be installed according to the anchoring agent manufacturer's installation instructions or as specified in the Contract Drawings. For the resin anchor, during the insertion of the rock bolt in the hole, the bolt shall be steadily rotated by means of a pneumatic tool and suitable coupling attached to the threaded end of the bolt according to the anchoring agent manufacturer recommendations. The rotation shall be continued after the bolt has been inserted for a further 15 seconds or according to the recommendations of the anchoring agent manufacturer and the bolt shall then be maintained in position until the anchoring agent has hardened.

After the rock bolts are fully inserted into the drill holes in a vertical or inclined rock face, the rock bolts shall be maintained in position to prevent any further loss of resin while the anchoring agent is setting.

Grout shall be pumped or poured through the grout tube until the hole is filled.

The face plate, washer and nut shall be pneumatically fastened to the rock bolts at angles of less than 30 degrees from the perpendicular, in order to provide full contact of the face plate with the rock or shotcrete bearing surface and nominal tensioning of the bolt.

Rock bolts in holes that are not completely filled with anchoring agent or which protrude from the hole by an amount greater or less than the length specified shall not be accepted and shall be replaced at a location as close to the original bolt as possible.

#### **203.07.01.03 Quality Control Testing of Plastic Grout**

##### **203.07.01.03.01 General**

Field testing of grout shall be performed by a person holding either of the following certifications:

- a) CCIL Certified Concrete Testing Technician;
- b) ACI Concrete Field Testing Technician, Grade 1; or
- c) CSA Standard Concrete Field Testing Technician.

This person shall have a valid original card issued by the certifying agency in their possession at all times.

Bleeding shall be measured according to CSA A23.2-1B after allowing to stand for 1 hour.

#### **203.07.01.03.02          Acceptance of Plastic Grout**

The Contractor shall be responsible for all quality control inspection and testing required to ensure that plastic grout meets the specified requirements for bleed water and is mixed, handled, and cured according to manufacture's specifications.

Grout which does not meet the specified requirements for bleed water or manufacturer's specifications for mixing, handling, and curing shall be rejected.

After each Day's work, a daily summary shall be submitted to the Contract Administrator. The daily summary shall include volume of grout used, bleed water test results and shall identify rejected material.

#### **203.07.01.04          Material Sampling and Testing**

##### **203.07.01.04.01          Compressive Strength of Grout**

The Contractor shall cast, cure, and transport grout cubes for compressive strength testing at 7 Days and 28 Days by the Owner.

Every time a set of acceptance grout cubes is cast, a second set of grout cubes shall be cast for referee testing purposes.

Grout cubes for compressive strength testing for acceptance and for referee testing purposes shall be cast, cured, and transported according to CSA A23.2-1B. Referee grout cubes shall be cured and transported to the Regional Quality Assurance Laboratory, along with the acceptance grout cubes. A set of grout cubes shall consist of three 50 mm in dimension cubes, at each specified age.

Test information shall be recorded on MTO form PH-CC 322, Concrete Construction Report, and submitted with each set of the grout cubes.

The Contractor shall continuously record and monitor air temperature immediately adjacent to the grout cubes during the field-curing period. The maximum time interval for recording the temperature shall be every 15 minutes. Curing temperature records shall be submitted to the Contract Administrator at the completion of the field-curing period.

##### **203.07.01.04.02          Testing of Rock Bolts**

Rock bolt tests shall be conducted as specified in the Contract Documents to demonstrate the performance of the rock bolts by axial pull tests using a calibrated hollow hydraulic jack.

The rock bolt pull testing shall be carried out according to ISRM Suggested Method for Rock Anchorage Testing in the presence of the Contract Administrator. The axial tensioning equipment shall consist of a hollow plunger type hydraulic jack with a minimum capacity of 200 kN, a hydraulic pump, pressure gauges, displacement gauges capable of measuring displacements of 0.0025 cm, and all necessary accessory items for carrying out the rock bolt performance tests.

Rock bolts that fail to meet the acceptance requirement shall be reinstalled and tested at no additional cost to the Owner.

## **203.07.02 Rock Shotcreting**

### **203.07.02.01 Operational Constraints**

The Contract Administrator shall be notified of the intent to apply shotcrete a minimum of 3 Business Days prior to the commencement of the shotcreting operation.

A MTO form PH-CC-701, Request to Proceed, shall be submitted to the Contract Administrator at the completion of the surface preparation operation and prior to the commencement of the application of shotcrete.

The application of shotcrete shall not proceed until a MTO form PH-CC-702, Notice to Proceed, has been received from the Contract Administrator.

No shotcrete shall be placed until all curing materials, and, in cold weather, all cold weather protection materials have been delivered to the site.

Shotcreting shall not be carried out when the air temperature or existing rock face temperature is less than 10 °C or is likely to be less than 10 °C, or is greater than 30 °C or likely to be greater than 30 °C throughout the duration of the shotcreting operation unless cold weather protection is provided according to the Contractor's submitted plan.

Prior to shotcreting, the Contractor shall demonstrate to the Contract Administrator that the substrate temperatures meet the Contract requirements by measuring the substrate temperatures using a contact thermometer, and recording them.

Shotcrete shall not be placed against frozen surfaces. All surfaces against which shotcrete is to be placed shall be free of standing water. Shotcrete shall be protected from contact with rain or snow.

The air in contact with the shotcreted surfaces shall be maintained at temperatures greater than 10 °C for a minimum of 96 hours after the application of shotcrete. Unvented heaters shall not be used.

Shotcreting operations shall be suspended during weather conditions that may adversely affect the quality of the work. This includes but is not limited to wind causing segregation of ingredients, rain or snow.

Prior to seasonal shutdown, operations shall be scheduled in such a manner as to ensure that the shotcreting operations are completed in all areas where surface preparation has commenced.

### **203.07.02.02 Surface Preparation**

All rock surfaces against which shotcrete is to be placed shall be clean, solid and free from loose or unsound rock, vegetation or other organic materials, and any foreign substances or other debris. All dust and loose material shall be removed using compressed air. Additional methods for surface preparation may be required and shall be approved by the Contract Administrator.

Prior to the application of shotcrete:

- a) The area to be shotcreted shall be maintained in a wet condition for a minimum period of 2 hours; prior to the application of the shotcrete.
- b) Excess water shall be removed from the rock surface using compressed air to reach a saturated surface dry condition.

### **203.07.02.03 MTO Nozzleperson Certification Program**

Shotcreting shall be carried out by a nozzleperson who has successfully participated in the MTO Shotcrete Nozzleperson Certification Program that is valid for the current construction season. Notwithstanding this prequalification, the nozzleperson shall be replaced when in the opinion of the Contract Administrator, acceptable quality of work is not achieved or maintained.

#### **203.07.02.04                    Placing**

All necessary measures shall be taken during shotcrete application to guard against damage, including damage to passing vehicles which may be caused by excessive rebounding of shotcrete material.

The specified thickness of the shotcrete shall be a minimum of 100 mm, unless otherwise specified in the Contract Documents.

During the application of the shotcrete, a steady continuous flow of shotcrete shall be maintained.

For dry mix shotcrete, any pre-dampened mixture which is not utilized within 30 minutes, shall be rejected and shall not be incorporated into the work. When wet mix shotcrete is transported to the site by means of agitating or mixing equipment, discharge of the shotcrete shall be completed within 1.5 hours after introduction of the mixing water to the cement and aggregates, except when the air temperature is greater than 28 °C and the concrete temperature is greater than 25 °C, the concrete shall be discharged within 1 hour after the introduction of the mixing water. Use of retarders does not change the specified concrete discharge time.

The total required depth of shotcrete shall be placed within the same Day once the shotcrete placement has commenced for an area.

Shotcrete shall be applied so that there is no sagging or separation of the material in place.

All rebound and overspray material shall be removed as the work proceeds. Rebound, overspray or waste material shall not be worked back into the shotcrete or salvaged and re-used.

#### **203.07.02.05                    Curing**

Shotcrete shall be moist cured for a minimum period of 4 Days. Curing for at least the first 24 hours of the curing period shall be by fog mist.

Application of fog mist shall begin immediately after application of the final layer of shotcrete or, where hand finishing is specified, immediately after finishing of the shotcrete.

For the remainder of the moist curing period, moist curing shall be by means of fog mist or wet burlap.

When wet burlap is used, the burlap shall be placed in a manner that will ensure that it is in full contact with the surface of the shotcrete for the full duration of the curing period. Curing with burlap and water shall be according to OPSS 904.

#### **203.07.02.06                    Cold Weather Protection**

Cold weather protection shall be according to OPSS 931.

#### **203.07.03                        Material Sampling and Testing**

##### **203.07.03.01                    Sampling for Acceptance Testing of Compressive Strength and Thickness of Shotcrete**

Core samples for acceptance testing of 28-Day compressive strength and thickness shall be removed from the shotcrete at locations randomly selected by the Contract Administrator. Core samples shall be obtained for acceptance testing in the presence of the Contract Administrator.

The lot size, subplot size and number of cores per subplot shall be according to the Quality Assurance section.

#### **203.07.03.02                    Coring**

Coring shall be carried out according to CSA A23.2-14C when the shotcrete is between 7 to 10 Days of age. Cores shall be 75 mm in diameter and full depth.

To avoid cutting reinforcing steel, all embedded steel and rock drains in the area shall be located, using a covermeter, prior to taking any cores. Cores for compressive strength testing may contain welded steel wire reinforcement but shall not contain reinforcing steel.

Each core shall be marked legibly with durable ink immediately after removal with the following information:

- a) Contract number.
- b) Lot number.
- c) Sublot number.
- d) Location of each individual core.
- e) Date of shotcrete placement.
- f) Date of extraction.

Cores shall be placed in a plastic bag, sealed to prevent loss of moisture and provided to the Contract Administrator along with MTO Form PH-CC-433-A, Concrete Mix Design Submission Form A, of the concrete mix design and the MTO form PH-CC-340, Field Sample Data Sheet – Concrete, on which the field data for the cores is recorded, for testing by the Owner.

Core holes shall be filled according to OPSS 1350.

#### **203.07.03.03 Preparation for Sounding Acceptance Testing**

The Contract Administrator shall be notified in writing when the shotcrete is ready for the sounding acceptance testing. The sounding acceptance testing of the shotcrete shall be completed on the final shotcreted layer by the Contract Administrator.

Provisions shall be made for access to the site and to all areas of the shotcreted face for sounding acceptance testing.

#### **203.07.04 Field Inspection for Cracks**

The Contractor shall inspect all concrete to identify and document any cracks including, their location, width, and density. The results of the inspection shall be reported to the Contract Administrator.

Based on criteria in the Field Inspection of Completed Work clause, the Contractor shall identify areas requiring repair or replacement and shall identify the limits of such repair or replacement. This information shall be provided to the Contract Administrator along with a proposal for remedial action to be taken. No repairs shall proceed until the proposal has been accepted by the Contract Administrator in writing. Repair of cracks shall be according to OPSS 932 and shall be completed after the curing period has elapsed.

#### **203.07.05 Rock Drains**

When rock drain holes are specified in the Contract Documents, the holes shall be drilled to depths of 3.0 m at an inclination of approximately 10 degrees above the horizontal and throughout the shotcrete layer at 2.0 m to 3.0 m centres.

The drain holes shall then be lined with tightly-fitted PVC pipe that protrudes approximately 25 mm to 75 mm outside of the shotcreted face.

#### **203.07.06 Concrete Buttress**

Rock cavities shall be filled with reinforced concrete at locations as specified in the Contract Documents.

Construction of concrete buttress shall be according to OPSS 904.

Dowels shall be installed into the existing rock face as specified in the Contract Documents on a grid pattern and to depths as specified in the Contract Drawings.

The concrete face shall have a smooth surface.

#### **203.07.07                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **203.08                              QUALITY ASSURANCE**

#### **203.08.01                      Acceptance of Grout for Rock Bolting**

Grout for rock bolting shall be acceptable if all of the requirements of this specification are met, including:

- a) 7-Day compressive strength;
- b) 28-Day compressive strength;
- c) Mixing, handling and curing according to manufacturer's specifications; and
- d) There are no defects detected by inspection according to the Field Inspection subsection.

Unacceptable lots or sublots shall be deemed rejectable.

#### **203.08.02                      Acceptance of Rock Shotcrete**

Shotcrete shall be acceptable if all of the requirements of this specification are met, including:

- a) 28-Day compressive strength;
- b) Thickness; and
- c) There are no defects detected by inspection according to the Field Inspection subsection.

Unacceptable lots or sublots shall be deemed rejectable.

#### **203.08.03                      Field Inspection**

##### **203.08.03.01                  Field Inspection for Rock Bolting**

The Contract Administrator will inspect the plastic grout or anchoring agent during the application process and will reject all or a portion of the work based on the presence of one or more of the defects and deficiencies identified below:

- a) Failure to mix, handle and cure of the grout according to manufacturer's specifications.
- b) Excessive bleeding of grout.
- c) Failure to completely fill the hole or rock bolts which protrude from the hole by an amount greater or less than the length specified.
- d) Improper cleaning of the drilled holes.

If plastic grout or anchoring agent is rejected by the Contract Administrator, the work shall stop and all necessary measures to correct deficiencies shall be taken.

### **203.08.03.02                    Field Inspection for Rock Shotcreting**

The Contract Administrator will inspect the plastic shotcrete during the application process and will reject all or a portion of the work based on the presence of one or more of the defects and deficiencies identified below:

- a) Failure to achieve specified surface profile.
- b) Failure to remove all loose and unsound material prior to pre-wetting.
- c) Failure to adequately pre-wet or achieve a saturated surface dry condition of the rock face prior to application of the shotcrete.
- d) Failure to properly control and remove build-up of shotcrete overspray and rebound.
- e) Incomplete consolidation around reinforcing steel, welded wire mesh, rock drains and anchors.
- f) Excessive shotcrete rebound.
- g) Incorporation of sand lenses, excessive voids, delaminations, sags, and sloughing.
- h) Failure to apply shotcrete to the required line, grade, and tolerance.

If plastic shotcrete is rejected by the Contract Administrator, the work shall stop and all necessary measures to correct deficiencies shall be taken.

### **203.08.03.03                    Completed Work**

The Contract Administrator will inspect the completed work and any cores removed from the work and will reject all or a portion of the work based on the presence of one or more of the defects and deficiencies identified below:

- a) Debonded or hollow-sounding areas.
- b) Porous or rebound material visible in cores or in the placed shotcrete.
- c) Areas which have visibly sagged in cores or in the placed shotcrete.
- d) Cracks with a width greater than 0.3 mm where the linear measurement of the crack is 2 m or greater per square meter area.

Cracks greater than or equal to 0.3 mm in width shall be repaired according to this specification, if the linear measurement of the crack per square metre is less than 2 m.

### **203.08.04                    Acceptance of Thickness and Compressive Strength of Rock Shotcrete**

#### **203.08.04.01                    Lot Size**

A lot shall consist of the total quantity of shotcrete in the Contract Documents. Each lot shall be divided into sublots of approximately equal size and no greater than 100 m<sup>2</sup>.

The Contract Administrator will determine the subplot size prior to the commencement of the shotcreting operation.

#### **203.08.04.02                    Basis of Acceptance**

##### **203.08.04.02.01                    General**

The thickness and 28-Day compressive strength of shotcrete shall be determined based on the average results for three cores removed from each subplot.

#### **203.08.04.02.02      Thickness**

Each core shall be measured for length prior to trimming. Four measurements rounded to the nearest millimetre shall be made around the perimeter of each core to determine the actual shotcrete thickness. These measurements shall be taken at the ends of two perpendicular diameters.

The thickness of hardened shotcrete shall be determined according to LS-410. The thickness of a subplot shall be considered acceptable when it meets the following requirements:

- a) The average of the three thickness measurements shall be minimum of 100 mm.
- b) No individual thickness measurement shall be less than 75 mm.

#### **203.08.04.02.03      Compressive Strength**

The 28-Day compressive strength shall be determined according to LS-410. The 28-Day compressive strength of a subplot shall be considered acceptable when it meets the following requirements:

- a) The average of the three 28-Day compressive strength tests shall be greater than or equal to 35 MPa.
- b) No individual compressive strength test shall be less than 4.0 MPa below the specified strength.

Sublots with an average compressive strength greater than or equal to 31 MPa and less than 35 MPa shall be considered unacceptable and may be permitted to remain in the Work with a payment adjustment, when the Owner is in agreement. The payment adjustment shall be calculated and applied according to the Basis of Payment section. Sublots with a compressive strength test result less than 31 MPa shall be removed and replaced.

#### **203.08.04.02.04      Referee Testing**

Referee testing for a subplot may only be invoked by the Contractor within 3 Business Days of receiving the test results for that subplot.

Referee testing of 28-Day compressive strength or thickness for a subplot shall be done on a new set of three cores removed by the Contractor within 24 hours of invoking the referee testing. Cores for referee testing for each disputed subplot shall be taken in the presence of the Contract Administrator at a location no more than 1 m from the location that each of the disputed acceptance cores were removed. The core size, and core extraction and timing of delivery to the referee laboratory shall be according to the Coring clause.

Referee testing shall be carried out according to the test method specified in the Acceptance Testing of Thickness and Compressive Strength of Rock Shotcrete clause.

The referee laboratory shall be designated by the Owner based on the applicable roster. Referee test results shall be forwarded to the Contractor as they become available.

Referee testing of 28-Day compressive strength or thickness for a subplot shall be done on a new set of three cores removed by the Contractor within 24 hours of invoking the referee testing. Cores for referee testing for each disputed subplot shall be taken in the presence of the Contract Administrator at a location no more than 1 m from the location that each of the disputed acceptance cores were removed. The core size, and core extraction shall be according to the Coring clause.

If the difference between the referee test result and the acceptance test result is less than or equal to the confirmation value, then the acceptance test result is confirmed, and the acceptance test result shall be used in the determination of acceptance and payment for the shotcrete. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed, and the acceptance test result shall be disregarded and not used in the determination of acceptance and payment.

The confirmation value for confirming the compressive strength acceptance test result shall be the greater of 10% of the specified compressive strength, or 10% of the compressive strength acceptance cores, expressed to one decimal place.

The confirmation value for confirming the thickness acceptance test result shall be the greater of 10% of the specified thickness, or 10% of the thickness of the acceptance cores, expressed to the nearest millimetre.

The cost of referee testing shall be as specified in the Contract Documents. When the referee result confirms the acceptance test results, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

#### **203.08.05                      Acceptance of Compressive Strength of Grout**

##### **203.08.05.01                      Lot Size**

The lot size shall represent all the grout produced during one day of production.

##### **203.08.05.02                      Basis of Acceptance**

The 7-Day and 28-Day compressive strength shall be determined according to CSA A23.2-1B. The 7-Day and 28-Day compressive strength of a lot shall be considered acceptable when it meets the minimum requirements of this specification.

Lots with a compressive strength less than the minimum requirements of this specification shall be removed and replaced.

##### **203.08.05.03                      Referee Testing**

Referee testing for a lot may only be invoked by the Contractor within 3 Business Days of receiving the test results for that lot.

The referee testing process for grout compressive strength is based on duplicate grout cubes cast at the same time as the acceptance grout cubes.

The referee laboratory shall be designated by the Owner based on the applicable roster. Referee test results shall be forwarded to the Contractor as they become available.

If the difference between the referee test result and the acceptance test result is less than or equal to the confirmation value, then the acceptance test result is confirmed, and the acceptance test result shall be used in the determination of acceptance and payment for the concrete. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed, and the acceptance test result shall be disregarded and not used in the determination of acceptance and payment.

The confirmation value for confirming the acceptance test result shall be the greater of 10% of the specified strength or 10% of the strength of the acceptance grout cubes, expressed to one decimal place.

The cost of referee testing shall be as specified in the Contract Documents. When the referee result confirms the acceptance test results, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

#### **203.08.06                      Sounding Acceptance Testing**

The sounding acceptance testing shall consist of hammering at 300 mm centres and any areas of concern, to detect any hollow sounding or debonded areas.

Areas of shotcrete that are determined by the Contract Administrator to be inadequately bonded shall be removed and replaced.

**203.08.07 Concrete Buttress**

Acceptance of concrete buttress shall be according to OPSS 904.

**203.09 MEASUREMENT FOR PAYMENT**

**203.09.01 Actual Measurement**

**203.09.01.01 Rock Bolting**

For measurement purposes, a count shall be made by the Contract Administrator of the number of rock bolts installed.

**203.09.01.02 Rock Shotcrete**

Measurement shall be by area in square metres of shotcrete.

**203.09.01.03 Rock Drains**

For measurement purposes, a count shall be made by the Contract Administrator of the number of rock drains installed.

**203.09.01.04 Concrete Buttress**

Measurement shall be by volume in cubic metres of the reinforced concrete placed.

**203.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**203.10 BASIS OF PAYMENT**

**203.10.01 Rock Bolting - Item  
Rock Shotcreting - Item  
Rock Drains - Items  
Concrete Buttress - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Replacement of unacceptable rock bolts and rock shotcreting shall be carried out at no additional cost to the Owner.

**203.10.01.01 Payment Adjustment for Shotcrete**

The payment adjustment factor ( $Pr_i$ ) for the compressive strength of each shotcrete subplot will be calculated by the following equation:

$$Pr_i = 1.0 - (0.525 - 0.015S)$$

Where:

S = The average 28-Day compressive strength (MPa) for each shotcrete subplot. (For the purpose of calculating the payment adjustment for shotcrete, a value of 35 MPa shall be used for “S” when the average compressive strength is greater than or equal to 35 MPa.)

The payment adjustment factor for the lot (Pr) is calculated by the following equation:

$$Pr = \frac{(Pr_1 \times LQ_1) + (Pr_2 \times LQ_2) \cdots (Pr_n \times LQ_n)}{(LQ_1 + LQ_2 \cdots LQ_n)}$$

Where:

$Pr_i$  = Payment adjustment factor for subplot i.

$LQ_i$  = Quantity of subplot i (m<sup>3</sup>)

n = The total number of sublots.

The total payment adjustment (Pa) for the lot is calculated by the equation:

$$Pa = \text{Quantity} \times \text{Tender Unit Price} \times Pr$$

### **APPENDICES**

|              |                   |
|--------------|-------------------|
| <b>206-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **206.01 SCOPE**

This specification covers the requirements for grading, including earth and rock excavation and embankment construction, rock face, and the management of excavated materials.

#### **206.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **206.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **206.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## **206.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Angle of Repose** means the maximum angle measured from the horizontal at which fill remains stable.

**Backslope** means the slope in a cut between the invert of the roadside ditch and the point where the slope intersects original ground.

**Benching** means the keying into existing slopes by excavating horizontal planes. Benching also means the stepping of cut slopes at intermediate levels in deep cuts.

**Berm** means an extension of an embankment constructed to a lower height and designed to provide road embankment stability.

**Bulking Factor** means the ratio of the volume of rock material following excavation, placement, and compacting to the original in situ volume of the same material. The bulking factor for rock shall be 1.35. For rock excavation quantities identified as shatter, the bulking factor shall be 0.35.

**Cushion Blasting** means the placing of a single row of lightly-loaded closely-spaced holes along the excavation limits as specified in the Contract Documents and firing them coincident with the main excavation blast as the last delay sequence to remove rock inside the cut limits.

**Ditching** means the excavation in earth or rock for all water courses. The term shall include roadside ditches, all excavation lying beyond the end of drainage structures, and stream and watercourse diversions and corrections.

**Earth** means all soils, except those defined as rock, and excludes stone masonry, concrete, and other manufactured materials.

**Embankment** means the material placed within the sideslopes; below the top of subgrade; and above the original ground, excavated base, or theoretical bottom, as applicable, to the limits as specified in the Contract Documents. Widening, flattening, or other placement of material adjacent to or on top of sideslopes beyond that specified in the Contract Documents is excluded.

**Existing Rock Surface** means either the rock surface that is exposed at ground level prior to the beginning of the Contract or the rock surface that is exposed after the overburden above it has been removed during the Contract.

**Frontslope** means the slope in a cut section between the edge of shoulder and the invert of the roadside ditch.

**Grubbing** means the removal of all stumps, roots, embedded logs, debris, and secondary growth.

**Line Drilling** means the placing of a single row of very closely-spaced holes without explosives along the rock excavation limits as specified in the Contract Documents.

**Mucking** means the picking up of broken rock prior to haulage.

**Overbreak** means any broken, displaced, or loosened rock that originates outside the designated rock excavation limits as specified in the Contract Documents, regardless of whether that rock has been excavated, displaced, or loosened due to the inherent character of the rock formation itself or due to any other cause.

**Pre-Shearing** means the placing of a single row of closely-spaced lightly-loaded holes along the rock excavation limits as specified in the Contract Documents that are fired simultaneously before and independently of the main excavation blast. Pre-shearing is sometimes referred to as pre-splitting.

**Reclaimed Asphalt Pavement (RAP)** means the processed hot mix asphalt material that is recovered by partial or full depth removal.

**Reclaimed Concrete Material (RCM)** means removed or processed old Portland cement concrete.

**Roadside Ditch** means a ditch with one of its slopes coincident with the road frontslope.

**Rock** means natural beds or massive fragments of the hard, stable, cemented part of the earth's crust, either igneous, metamorphic, or sedimentary in origin, that may or may not be weathered and includes boulders having a volume of 1 m<sup>3</sup> or greater.

**Rock Face** means the uniform, relatively planar, maintenance-free, vertical or near vertical rock surface between the top of the existing rock surface and the designated rock or ditch grade line that is generally characterized by noticeable drill hole traces and a minimum of blast-induced fractures beyond the rock excavation limits.

**Rock Surplus** means the rock excavation original tender quantity multiplied by the bulking factor, plus the volume of rock material excavated from all other items as specified in the Contract Documents, minus the rock embankment original tender quantity. Rock overbreak and rock materials resulting from scaling are specifically excluded.

**Scaling** means the removal of loose, broken, or overhanging rock fragments from an existing rock surface or the removal of loose, broken, or overhanging rock fragments from a rock face that remain in place after the rock has been blasted and mucked.

**Shale** means a fine-grained, low strength, sedimentary rock that undergoes rapid deterioration on exposure.

**Shatter** means fractured rock broken by the use of explosives or mechanical means and left in place.

**Sideslope** means the slope in a fill between the edge of shoulder and the point where the slope intersects original ground.

**Spall** means a rock fragment, chip, or splinter from a rock surface created by weathering, stress relief, blasting, or a combination thereof.

**Stripping** means the excavation of the upper layer of soil, that is predominantly organic, too soft, or wet and otherwise unsuitable for the construction of embankments that is done prior to and usually independent of earth excavation or the placement of fill materials or both.

**Tolerance** means a construction working tolerance only that is considered to be:

a) Minus when it is:

- i. narrower than the Contract standard when pertaining to horizontal dimensions as measured from centreline, or
- ii. lower in elevation than the Contract standard when pertaining to vertical dimensions.

b) Plus when it is:

- i. wider than the Contract standard when pertaining to horizontal dimensions as measured from centreline, or
- ii. higher in elevation than the Contract standard when pertaining to vertical dimensions.

**Wall Control Blasting** means a blasting method using carefully-spaced and aligned drill holes intended to produce a relatively flat, maintenance-free, rock surface or rock face as specified in the Contract Documents. Wall control blasting techniques are cushion blasting, line drilling, and pre-shearing.

## **206.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **206.04.01 Submission Requirements**

#### **206.04.01.01 Rock Material Management Plan (RMMP)**

For each construction stage, the following information shall be submitted to the Contract Administrator a minimum of 5 Business Days prior to undertaking the work of rock excavation or rock embankment:

- a) A plan for rock excavation corresponding to the station intervals as specified in the Contract Documents. The plan shall identify the volume in cubic metres of the following:
  - i. In-situ rock prior to blasting with shatter quantity shown separately.
  - ii. Excavated rock available calculated by applying the bulking factor to the quantity of in-situ rock prior to blasting, less the quantity of shatter.
  - iii. Excavated rock to be placed in rock embankment.
  - iv. Excavated rock within the Contract limits to be processed into granular material or other aggregates as specified in the Contract Documents.
  - v. Excavated rock to be used for other purposes in completing the Work, such as rock protection, rip rap, or river stone and the types and locations of that Work.
  - vi. Excavated rock not incorporated into the Work and the locations and uses of that material.
- b) A plan for the construction of rock embankments that identifies each location and volume in cubic metres where the material is going to be supplied to the corresponding station intervals as specified in the Contract Documents.
- c) The locations and volume in cubic metres for the sources where rock materials are obtained for the rock supply item.
- d) The location and volume in cubic metres for each source when additional rock or granular material or both are required to complete the Work.
- e) The amount of rock surplus, if any, during the applicable construction stage.

The Contractor shall be solely responsible for the assumptions and the reasonableness of the RMMP.

In addition, for each construction stage, on a monthly basis, an updated RMMP shall be submitted to the Contract Administrator which shall include an ongoing tabulation of all rock materials that have been removed by the Contractor from the rock excavation or not incorporated in embankments, shown as a cumulative reduction in rock surplus.

The work of rock excavation or rock embankment shall not commence until the RMMP in accordance with the above requirements is submitted.

#### **206.04.01.02 Trial Section for Modified Layer Compaction Method**

If the Contractor wishes to request to use the modified layer compaction method as specified in the Modified Layer Compaction Method clause, a detailed plan shall then be submitted in writing to the Contract Administrator a minimum of 48 hours prior to commencing any work on the required trial section. The plan shall include full details of the placing of material and its compaction, including layer thickness; number and type of compaction units and number of passes.

**206.06 EQUIPMENT**

**206.06.01 Tractor Bulldozer - Crawler Type for Rock Embankment Construction**

Tractor bulldozer, crawler type for rock embankment construction required in the General clause of the Rock Embankments clause shall have a minimum net flywheel power of 200 kW.

**206.06.02 Rollers for Shale Embankment Construction**

Sheepsfoot, packall, padfoot, or tamping foot rollers required for the construction of shale embankments shall weigh a minimum of 18 tonnes and vibratory steel drum or pneumatic-tired rollers shall weigh a minimum of 9 tonnes.

**206.07 CONSTRUCTION**

**206.07.01 General**

**206.07.01.01 Removal of Ice, Snow, and Frozen Ground**

The Contractor shall remove and dispose of all ice, snow, and frozen material from all earth, rock, or granular surfaces prior to placing fill and from all earth, rock, or granular materials being used for backfill, embankments, or any other construction purposes.

**206.07.01.02 Compaction**

Earth and granular materials shall be compacted according to OPSS 501.

For compaction purposes, reclaimed asphalt pavement (RAP) or reclaimed concrete material (RCM) or both shall be treated as earth or rock when such material is respectively included in an earth embankment or a rock embankment.

**206.07.01.03 Earth Borrow**

When earth borrow is specified in the Contract Documents, it shall be according to OPSS 212.

**206.07.01.04 Tolerances - General**

In the event of a conflict between meeting horizontal grading tolerances and meeting vertical grading tolerances, the vertical grading tolerances shall take precedence.

**206.07.01.04.01 Tolerances for Earth**

Upon completion, all earth grade surfaces, excluding swamp excavations, shall be shaped to the grades and cross-sections as specified in the Contract Documents within the following tolerances:

- a) Vertical grading tolerances for the finished earth subgrade within the limit of the roadway:

+ 30 mm  
- 30 mm

- b) Horizontal grading tolerances for the vertical faces of excavations to be backfilled:

+ 100 mm  
- 0 mm

- c) Horizontal grading tolerances for ditch slopes, excluding roadside ditches:

+ 300 mm  
- 0 mm

Sideslopes beyond the plus tolerance may be accepted by the Contract Administrator when they are not detrimental to the work.

- d) Vertical grading tolerances for all ditching in earth:

+ 30 mm  
- 30 mm

- e) Horizontal grading tolerances for the backslopes in earth cut sections:

+ 300 mm  
- 300 mm

Backslopes beyond the plus tolerance may be accepted by the Contract Administrator when they are not detrimental to the work.

- f) Horizontal grading tolerances for each sideslope in earth embankment construction:

+ 300 mm  
- 0 mm

- g) Horizontal grading tolerances for roadside ditch frontslopes in earth cut sections:

+ 30 mm  
- 0 mm

Irrespective of compliance with the above tolerances, the completed slopes shall present a uniform appearance.

#### **206.07.01.04.02 Tolerances for Rock**

Completed rock grade surfaces shall be shaped to the grades and cross-sections as specified in the Contract Documents within the following tolerances:

- a) Vertical grading tolerances for the finished rock subgrade within the limits of the roadway:

For cut sections:

+ 30 mm  
- 100 mm

For fill sections:

+ 30 mm  
- 75 mm

Excavation below the minus tolerances may be accepted by the Contract Administrator when it is not detrimental to the work and is brought up to grade as specified in the Rock Excavation, Grading clause.

- b) Horizontal grading tolerances for vertical rock face cut limits:

+ 0 mm  
- 300 mm

Final faces beyond the plus tolerance may be accepted by the Contract Administrator when they are not detrimental to the work.

- c) Horizontal grading tolerances for sloped rock face cut limits:

+ 300 mm  
- 300 mm

- d) Horizontal grading tolerances for ditch slopes, excluding roadside ditches:

+ 300 mm  
- 0 mm

Excavation beyond the plus tolerance may be accepted by the Contract Administrator when the Owner deems it is not detrimental to the work or contribute to additional rock surplus.

- e) Vertical grading tolerances for all ditching in rock cuts:

+ 30 mm  
- 30 mm

Excavation below the minus tolerance may be accepted by the Contract Administrator when it is not detrimental to the work.

- f) Horizontal grading tolerances at the top of each sideslope of rock embankment construction:

+ 300 mm  
- 0 mm

## **206.07.02                      Drainage**

Excavation operations shall be performed in a manner to avoid water saturation of embankment material and roadway foundation material and to avoid leaving undrained pockets in excavations by providing effective drainage during all stages of the work.

In excavations below subgrade and in stripping operations when provision for surface drainage is impractical, backfill materials shall be placed as soon as possible following the excavation work.

Ditching required to provide for drainage of an embankment shall be completed in advance of the embankment construction. Ditches in roadway cuts shall be constructed as soon as possible to provide drainage from the cuts. Ditches located above and beyond roadway cuts shall be constructed prior to excavating adjacent cuts. When pipe subdrains are required in the bases of roadway cuts, such work shall be carried out at the time that the roadside ditches are being constructed.

**206.07.03                      Excavation and Grading**

**206.07.03.01                Earth Excavation - Grading**

**206.07.03.01.01          General**

The work shall include excavating, hauling, handling and placing, shaping, compacting, trimming of earth material, applying temporary cover, and the management of excavated and excess materials as specified in the Contract Documents.

The work shall also include the excavation and removal of pipes and culverts smaller than 200 mm in diameter and expanded polystyrene insulation when located within the limits of the earth excavation, grading work.

Suitable and non-excess earth material excavated from roadway cuts, ditching, and other associated sites shall be used in earth grading and embankment construction, unless otherwise specified in the Contract Documents.

**206.07.03.01.02          Stripping**

Except when swamp treatment is required, the original ground shall be stripped at the locations and to the depths specified elsewhere in the Contract Documents.

Material meeting the requirements of topsoil according to OPSS 802 that is required for re-use shall be stockpiled as specified in the Contract Documents. Other material obtained from stripping shall be managed as specified in the Management of Excavated Materials clause.

**206.07.03.01.03          Excavation Below Subgrade**

Unsuitable materials, other than material excavated from swamps, shall be removed below the subgrade to the lengths, widths, and depths as specified in the Contract Documents. The resulting excavation shall be backfilled with material acceptable to the Contract Administrator and compacted according to OPSS 501.

**206.07.03.01.04          Swamp Excavation**

Swamp excavation shall be according to OPSS 209.

**206.07.03.01.05          Backfilling of Overexcavated Areas**

When overexcavation occurs, the overexcavated area shall be backfilled with granular material according to OPSS 1010 and compacted according to OPSS 501 at no additional cost the Owner. With the exception of frontslopes and when boulders are encountered in the excavated slopes, backfilling shall not be permitted to obtain the required slopes for excavations.

When boulders are encountered in the excavated slopes, the boulders shall be removed at the direction of the Contract Administrator and the resulting cavity or cavities shall be backfilled with properly-compacted granular material according to OPSS 1010.

**206.07.03.02                Rock Excavation - General**

Except where shatter is required, drilling shall not be performed outside of or extend beyond the design excavation limits as specified in the Contract Documents.

The use of explosives for rock excavation shall be as specified in the Contract Documents.

All excavated rock, including rock materials resulting from overbreak and scaling, except the quantity of rock surplus, shall be placed in embankments.

Any excavated rock remaining after constructing the embankments shall be managed as specified in the Management of Excavated Materials clause.

#### **206.07.03.02.01      Rock Excavation - Grading**

The work shall include drilling and blasting to obtain the required rock excavation and shatter, mucking, and bringing to grade any overexcavation. Hauling shall only be part of the work when the excavated material is part of the rock surplus or is in excess of the rock embankment requirements.

When rock is to be excavated, all overlying stumps, roots, and vegetation shall be managed as excess material as specified in the Contract Documents. When earth overlies the rock to be excavated, the earth shall be removed. This work shall be performed sufficiently in advance of any blasting or rock excavation operations to allow rock cross-sections to be taken.

Scaling shall be carried out during mucking. All rock fragments or boulders either within or outside the excavated areas that are likely to slide or roll down rock cuts or are otherwise deemed to be unstable by the Contract Administrator shall be removed. Cut ditches shall be excavated at the same time as the main excavation.

Excavation below grade in rock cuts shall be brought to grade within the specified tolerances with rock shatter or other approved material at no additional cost to the Owner.

Rock in roadway cuts shall be shattered to a uniform minimum depth of 300 mm below the theoretical rock subgrade for the full width of the cut, including the ditch.

Rock scaling and the removing of all overbreak and scaled materials shall be included in the rock excavation, grading item, unless a rock face item is included in the Contract Documents.

#### **206.07.03.02.01.01      Shale**

Shale shall be excavated using methods appropriate for the site conditions. Side slopes in shale shall be as specified in the Contract Documents. Rock face and subgrade shatter are not required in shale.

#### **206.07.03.02.02      Rock Face**

The work shall include drilling and blasting using one or more wall control blasting techniques to produce the rock face required in the Contract Documents and all associated scaling, mucking, hauling and management of all overbreak and scaled rock as specified in the Management of Excavated Materials clause.

The Contractor shall decide the required spacing, diameter, and loading of all drill holes for wall control blasting in order to ensure a uniform shear face between the holes and to meet the tolerance requirements stated in the Tolerances for Rock clause for rock face. In no case shall the diameter and spacing of these holes be more than 100 mm and 0.75 m centre-to-centre, respectively,

The Contractor shall also decide the required spacing, diameter, and loading of the adjacent line of production drill holes located inside the controlled blasting limits in order to ensure that wall control blasting is able to produce the required rock face.

However, in no case shall any portion of a production drill hole be within 0.75 m of the line formed by the drill holes for wall control blasting.

#### **206.07.03.03                      Excavation for Widening**

Excavation that is adjacent to the travelled portion of the roadway shall at no time be in advance of the backfilling operation by a distance greater than the limits as specified in the Contract Documents. Any such excavation shall be backfilled and compacted with material as specified in the Contract Documents, prior to closing down operations each day.

#### **206.07.03.04                      Excavation for Pavement Widening**

The work shall include excavating a trench adjacent to the existing pavement to the widths and depths as specified in the Contract Documents. Excavated material shall be spread on the adjacent shoulders and slopes.

#### **206.07.03.05                      Management of Excavated Materials**

Excavated materials shall be used within the Contract limits as specified in the Contract Documents.

When the Contract Administrator has deemed that the Contractor's sequence of operations, inadequate drainage measures, or handling processes or all have caused earth materials that were identified in the Contract Documents as being suitable for embankment or other construction purposes to become unsuitable for such purposes then, at no additional cost to the Owner, the Contractor shall either condition that material until it is suitable or manage it as excess material as specified in the Contract Documents and, if necessary, replace it with an equivalent volume of earth borrow. When the Contractor's operations have caused the material to become unsuitable due to excessive moisture content, conditioning may then involve re-working the material as necessary or spreading out the material in layers or both so that the material is thin enough to allow it to sufficiently dry out.

Quantities of unsuitable earth as specified in the Contract Documents and deemed suitable for use by the Contract Administrator at the time of excavation shall be used to offset borrow quantities.

Rock excavated from within the right-of-way (ROW) may be used for aggregate production up to the rock surplus quantity.

Earth or rock that is surplus to embankment requirements may be placed adjacent to the embankments by widening embankments, flattening side slopes, or constructing berms if optional cross sections or locations or both have been specified for such material in the Contract Documents or as requested by the Contractor and agreed to, in writing, by the Contract Administrator.

Surplus material may only be used within the Contract limits with the written consent of the Contract Administrator.

Surplus materials that cannot be accommodated as above and unsuitable materials shall be managed as excess material as specified in the Contract Documents.

#### **206.07.03.06                      Provision for Temporary Cover**

Cover used in temporary applications shall be applied according to OPSS 804 to areas as specified in the Contract Documents.

#### **206.07.04                          Rock Supply**

The work shall include any required clearing, grubbing, and stripping of the source; construction and maintenance of access roads; excavating and hauling of rock materials, regardless of whether the hauling is to the Contract limits or for rock surplus; and source rehabilitation.

The rock surplus quantity, if any, is an entitlement of the Contractor. Excavated rock may be removed for the Contractor's purposes or disposed of as the Contractor deems appropriate up to the rock surplus quantity as the staging of the work allows. All materials removed from rock excavation and not placed in rock embankment shall be deemed to be removed as part of the Contractor's rock surplus quantity.

All materials removed as part of the rock surplus quantity shall be accurately measured as specified in the Measurement of Rock Surplus clause and recorded by the Contractor at no additional cost to the Owner. Whenever such measurements are to be taken, the Contractor shall inform the Contract Administrator at least 1 Business Day in advance of such measurements.

All weighing of materials shall be as specified in the Contract Documents.

Within 7 Business Days of the Contractor taking a set of measurements, the Contractor shall:

- a) Provide the Contract Administrator with a copy of those measurements and the calculations based on those measurements.
- b) Advise the Contract Administrator, in writing, that the locations where the measurements were taken are ready for verification.

In the event that the Contract Administrator chooses to verify those measurements, such verification shall be undertaken within 3 Business Days of the Contract Administrator being advised that the locations are ready for verification and for those 3 Days, the Contractor shall not:

- a) Place rock on or remove rock materials, as the case may be, from the measured locations; or
- b) Impede the Contract Administrator in any way during the verification of those measurements.

#### **206.07.04.01                      Measurement of Rock Surplus**

Rock removed as part of the rock surplus quantity shall be measured by the Contractor and verified by the Contract Administrator as specified in the Rock Supply subsection using one or more of the following 4 methods given below:

- a) Weighed Aggregate Production Quantity

All locations to be used for stockpiling processed aggregates shall be identified in writing to the Contract Administrator no less than 3 Business Days prior to production.

At each stockpile location, the Contractor shall complete an accurate survey of the initial ground elevations subject to verification by the Contract Administrator prior to any materials, including materials used for a granular pad, are placed at that location.

All aggregate materials removed from each stockpile within the Contract limits shall be weighed by the Contractor for reconciliation with the rock surplus quantity by converting the mass to a bulked broken rock volume using a factor of 0.519 m<sup>3</sup>/tonne.

Once all of the aggregates have been removed, each stockpile shall be re-surveyed by the Contractor, the measurements verified by the Contract Administrator, and the volume of material remaining determined by the Contractor.

Quantities of rock used for aggregate production and quantities of materials remaining in aggregate stockpiles shall be deducted from the rock surplus quantity.

Any materials that are added to an aggregate production stockpile within the Contract limits that do not come from rock that was excavated on the Contract shall be weighed by the Contractor and subtracted from the weighed aggregate quantity provided. If such materials are not weighed or the Contract Administrator was not given sufficient notice or opportunity by the Contractor to verify the weight of those materials, then no deduction shall be made for those materials.

b) Stockpile Volume

Excavated rock forming part of the rock surplus may be measured in stockpiles constructed by the Contractor. The Contractor shall inform the Contract Administrator, in writing, of the location where each stockpile is to be established a minimum of 3 Business Days prior to commencing any work at that stockpile location. Disposal sites shall be treated as stockpiles.

At each stockpile location, the Contractor shall complete an accurate survey of the initial ground elevations and allow the Contract Administrator to verify those measurements prior to any rock materials are placed at that location.

Once the stockpile has been completed, the stockpile shall then be resurveyed by the Contractor, the measurements verified by the Contract Administrator, and the final volume determined by the Contractor. The Contractor shall not remove any rock material from any such stockpile prior to completion of its final survey and verification by the Contract Administrator.

With the exception of excavated rock placed in rock embankment, the quantity of all other excavated rock placed within the Contract limits (e.g., for widening of pre-existing embankments, construction of access roads, crane bases, etc.) shall be measured in the same manner as the stockpiles described above. Such quantities shall be deducted from the rock surplus quantity.

At the request of the Contract Administrator, the Contractor may be required to conduct backhoe or other subsurface investigations in the Contract Administrator's presence to determine if compressible soils are present at the Contractor's proposed stockpile locations. Backfilling of such investigated areas shall be carried out using properly-compacted material acceptable to the Contract Administrator.

If the Contractor Administrator deems that compressible soils are present, the Contractor shall then re-locate the proposed stockpile or the Contractor shall install monitoring devices at the affected location. Each monitoring device shall consist of a circular 1.0 m diameter 6 mm thick steel plate with a 3.0 m length of 50 mm diameter steel pipe securely welded vertically to the centre of the plate. Whenever the level of rock placement surrounding the monitoring device is vertically within 300 mm of the top of a monitoring device, successive 3.0 m lengths of 50 mm diameter steel pipe shall be welded to the top of that device. The length of each new section shall be added to the original elevation. The Contractor shall be paid to supply and place each monitoring device as specified in the Contract Documents. Any monitoring devices damaged during placement of materials shall be replaced at no additional cost to the Owner.

The Contractor shall survey the top of each monitoring device prior to rock material placement. The Contractor shall resurvey the top of each monitoring device when the placement of rock materials is complete. Both sets of measurements shall be verified by the Contract Administrator. If the difference in elevation between the two surveys is greater than 300 mm, the initial ground elevations for this location shall then be lowered universally by the difference in monitoring device elevation. When more than one monitoring device is placed at a given location, the differences in elevations shall be averaged together.

The Contractor shall ensure that the Contract Administrator has free and unencumbered access to any location where excavated rock is being placed.

c) Weighed Broken Rock

Excavated rock forming part of the rock surplus quantity shall be weighed by the Contractor prior to exiting the Contract limits. The Contract Administrator shall be informed, in writing, at least 2 Business Days in advance that such rock materials are to be weighed as rock surplus, the specific locations where the broken rock material is to be obtained, and the locations where it is to be placed.

Excavated rock weighed as part of the rock surplus shall be converted to a bulked broken rock volume using a factor of 0.519 m<sup>3</sup>/tonne.

d) In-situ Measure of Distinct Rock Cut

Excavated rock from distinct rock cut locations may be removed as part of the rock surplus specified in the Contractor's RMMP. A distinct rock cut location shall be one that begins with and ends at points of zero rock excavation. The excavated rock shall be used in its entirety as rock surplus material from distinct rock cuts and shall not be split between Contract rock embankment requirements and the rock surplus quantity. This quantity shall be the quantity of the distinct rock cut in cubic meters, multiplied by the bulking factor.

**206.07.05 Embankments**

Only materials that are specified in the Contract Documents for use in embankments shall be used, unless approved by the Owner, in writing, prior to placement.

Materials shall not be placed over either frozen earth or ice surfaces. Ice, frozen earth, or other unsuitable materials shall not be incorporated into embankments.

RAP materials used in embankments shall be surplus to the recycling requirements of the Contract.

The Contractor shall notify the Contract Administrator, in writing, when an embankment has been completed to the dimensions that are as specified in the Contract Documents, at least 3 Business Days prior to the Contractor places any topsoil or any other material on the embankment slopes.

**206.07.05.01 Earth Embankments**

**206.07.05.01.01 General**

Material for earth embankments shall be deposited and spread in uniform layers for the full width of the embankment, except as otherwise permitted for berms. Each layer shall be compacted prior to the succeeding layer is placed. The lower portion of side hill or sloping sections shall be similarly constructed in layers and compacted until the full width surface of the specified cross-section is obtained. The embankment shall be completed thereafter with full width layers or as staged construction allows.

The construction of a core through the embankment and the subsequent completion of the embankment are prohibited, except when core construction is permitted in swamps according to OPSS 209.

Boulders, cobbles, and fragments of rock, RAP, and RCM over 150 mm in their maximum dimension shall not be placed within 300 mm of the surface of the earth grade.

Boulders, cobbles, and fragments of rock, RAP, and RCM up to 0.5 m<sup>3</sup> may be incorporated into an earth embankment provided:

- a) They are placed only in the bottom layer of the embankment.
- b) The maximum dimension of the largest particle shall not exceed 800 mm.

- c) They are not located within 300 mm of the final embankment side slopes.
- d) They are not located within 1.0 m of the surface of the earth grade.

Topsoil placed on earth embankments shall be according to OPSS 802.

Berms may be constructed separately, but shall be completed prior to the road embankment is built to a higher level than the berm.

Any excavation necessary for establishing compaction results throughout any embankment or any trial areas such as the one described in the Modified Layer Compaction Method clause shall be done by hand and the excavated areas shall be backfilled with the same material or material otherwise acceptable to the Contract Administrator and properly re-compacted by the Contractor.

#### **206.07.05.01.02 Layer Compaction Method**

Earth embankments shall be built using the layer compaction method, unless otherwise specified in the Contract Documents or the requirements specified in the Modified Layer Compaction Method clause have been met.

In the layer compaction method, the embankment material shall be spread out in uniform full width layers not more than 300 mm in depth prior to compaction. Each layer shall be shaped and compacted to the line and cross-section as specified in the Contract Documents prior to the succeeding layer is placed.

All boulders, cobbles, fragments of rock, RAP, and RCM shall have a maximum vertical dimension after placement, not greater than the fully compacted layer depth.

When the ground cannot support construction equipment using this method then, at the discretion of the Contract Administrator, the first layer may be increased in thickness as specified in the Modified Layer Compaction Method clause.

#### **206.07.05.01.03 Modified Layer Compaction Method**

The modified layer compaction method may be used if the Contract Administrator deems that it is practical to construct an earth embankment or a portion of an earth embankment in thicker lifts than that specified in the Layer Compaction Method clause.

In this case, the embankment material shall be spread out in uniform full width layers not more than 600 mm in depth prior to compaction. Each layer shall be shaped and compacted to the line and cross-section specified prior to the succeeding layer is placed.

All boulders, cobbles, and fragments of rock shall have a maximum vertical dimension when placed not exceeding the modified layer depth. All RAP and RCM shall have a maximum vertical dimension after placement not exceeding 300 mm.

Prior to placing any material, the Contractor shall provide proof to the Contract Administrator of the ability of the proposed method to achieve the specified density by means of a trial section consisting of a single uniform lift covering a minimum area of 400 m<sup>2</sup> as specified in the Trial Section for Modified Layer Compaction Method clause. The location and extent of the trial section shall be acceptable to the Contract Administrator.

When it has been successfully demonstrated to the Contract Administrator that compaction can be achieved throughout the entire lift based on the acceptance requirements for a control strip specified in OPSS 501, the procedure that the Contractor used shall then be permitted for the remainder of the work to which it is applicable. Any excavation, backfilling, and re-compaction necessary for establishing the compaction results within the trial section shall be carried out by the Contractor.

If at any time, test results show that the permitted procedure is no longer producing the required degree of compaction, a new trial section shall then be constructed. In this case, the Contractor shall propose changes in the procedure to satisfy the requirements of this specification. Such changes shall be proposed in writing to the Contract Administrator prior to commencing work on the new trial area. Otherwise, the Contractor shall revert back to the layer compaction method as specified in the Layer Compaction Method clause.

## **206.07.05.02                      Rock Embankments**

### **206.07.05.02.01                  General**

The work shall include hauling, placement, and compaction of excavated rock.

Excavated rock used to construct rock embankments shall be obtained from within the Contract limits. If there is insufficient material to complete the rock embankments, the additional material shall then be provided and paid for under the rock supply item.

All rock from other items as specified in Contract Documents shall be used to construct rock embankments.

Rock embankments shall be constructed by placing embankment materials full width in successive uniform layers.

For rock embankments other than shale, the layers shall not exceed 1.5 m thickness prior to compaction. Material in each layer shall be fully compacted prior to the succeeding layer is placed. Each rock fill layer shall be compacted with a tractor bulldozer, crawler type as specified in the Tractor Bulldozer - Crawler Type for Rock Embankment Construction subsection. The minimum number of complete passes shall be 6 and the maximum number of passes shall be 8. A complete pass shall be defined as 100% coverage of the layer surface. The maximum speed of the equipment during each pass shall be 3.2 km/h.

For all rock embankments, materials shall be placed in their final position by blading. End dumping or depositing of rock over the end of any layer by hauling equipment is not permitted, except as otherwise noted below. Each layer shall be levelled in place and compacted to minimize voids and bridging of large rock fragments within the embankment.

Rock fragments exceeding a maximum of 1.0 m in any dimension shall be well distributed throughout the embankment. Rock fragments up to a maximum of 3.0 m in any dimension may be incorporated into the embankment, provided that the rock fragments are less than two-thirds the remaining embankment height when measured from the bottom of the oversized rock fragment at the point of placement to the top of the rock embankment, and shall be sufficiently spaced to allow free access of the specified equipment to compact the intervening fill.

Placement and compaction in layers is not required when rock is placed under water. In this case, end dumping may be used. However, end dumping shall only be used to an elevation of 1.0 m above the water level that is present at the time of placement. After that, the rock embankment shall be constructed using the equipment and method specified in the paragraphs above. The materials shall be well distributed to form a solid embankment constructed to full width as the work progresses or as staged construction allows.

When a rock embankment is constructed in a wet area such as swamps with full, partial, or no excavation, the direction of the rock placement shall be so that mud waves generated by the rock placement are able to move away from the embankment. Mud waves shall be displaced or removed to prevent their entrapment below or within the embankment.

End dumping from the top of the embankments may also be carried out at locations as specified in the Contract Documents when narrow and relatively shallow widening of an existing embankment is required for the shoulder portion of the highway.

The top surface of the embankment shall be chinked with rock fragments and spalls to form the subgrade prior to the placement of the roadway subbase in order to minimize voids and prevent migration of the subbase material into the rock fill.

Care shall be taken to avoid large boulders and rock fragments protruding above the average embankment surface within a distance of 3 m beyond the edge of shoulder.

With the written approval of the Contract Administrator, dumping of surplus rock over the sides of rock embankments by the Contractor is permitted as follows:

- a) After the rock embankments have been completed to the grades and tolerances specified in the Contract Documents and all such measurements have been verified by the Contract Administrator.
- b) Only in areas that do not affect features that are located within the right-of-way (e.g., ditches, culverts, and signs) or the right-of-way limits and shall not detrimentally affect stability or drainage or cause other potentially negative impacts.
- c) At the direction of the Owner.

#### **206.07.05.02.02            Shale Embankments**

Shale embankment materials shall be deposited and spread in uniform layers for the full width of the embankment. Layers shall not exceed 450 mm in thickness prior to compaction. When a harder, more durable rock (e.g., limestone) is present as an integral part of a shale formation, no pieces shall be placed in the embankment that after placement are greater than 150 mm measured vertically or greater than 600 mm measured parallel to the embankment layers, respectively.

Compaction of each layer shall be in two stages using equipment specified in the Rollers for Shale Embankment Construction subsection. In the first stage, a minimum of 2 passes shall be made with a static sheepsfoot, packall, padfoot, or tamping foot type roller. In the second stage, a minimum of 2 passes shall be made with a vibratory steel drum or pneumatic-tired roller. The maximum speed of rollers shall not exceed 5 km/hr.

#### **206.07.06                    Rock Backfill to Structure**

When rock backfill to structures is specified, the rock backfill shall only be comprised of rock fragments no larger than 250 mm in their greatest dimension and free of all debris, earth, topsoil, wood, chemical, or other contamination.

Rock backfill shall be placed in a manner that the structure is not damaged. Dumping of rock backfill against a structure shall not be permitted.

#### **206.07.07                    Quality Control**

##### **206.07.07.01                Grade Checks**

The Contractor shall be responsible for carrying out all quality control (QC) grade checks to ensure that horizontal and vertical grading tolerances are met.

A competent survey crew shall carry out grade checks on all finished earth and rock grade surfaces. QC of earth and rock grade surfaces shall be based on horizontal and vertical grading tolerances as specified in the Tolerances for Earth and Tolerances for Rock clauses, respectively. The grade shall be certified at the stations and offsets shown in the grading templates or where grading templates are not available, at the frequency requirements specified for the layout elsewhere in the Contract Documents.

#### **206.07.07.01.01            Submission of Grade Checks**

The Contractor shall submit all grade checks relating to horizontal and vertical grading tolerances, including all non-compliances, to the Contract Administrator within 2 Business Days following completion of the grade.

When grading templates are available, the Contractor shall sign and certify on the grading template that the components of the work indicated on that template have been correctly constructed to the specified line and grade tolerances. If a template is not available, then the Contractor shall complete, sign, and submit MTO form PH-CC-820 to the Contract Administrator.

#### **206.07.07.02            Compaction Quality Control**

The Contractor shall use Method B according to OPSS 501 for quality control of compaction.

#### **206.07.08                Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **206.08                    QUALITY ASSURANCE**

#### **206.08.01                Grade Checks**

The Owner may conduct random QA grade checks to verify horizontal and vertical grading tolerances.

Provided that the Owner's grade checks conform to those determined by the Contractor, no action shall be taken. If discrepancies between QA and QC grade checks occur, the Owner may then conduct additional QA grade checks at the Owner's discretion.

If the finished grade or cross-section is found to be outside the specification limits specified in the Tolerances - General clause, then:

- a) The Contract Administrator shall notify the Contractor.
- b) The Contractor shall be charged for each station where the finished grade is outside of the specification limits, at the rate specified in the Finished Grade Checks Outside Specification Limits subsection.
- c) The Contractor shall then bring the earth or rock grade surface to within the specified tolerances for grade, at no additional cost to the Owner.

**206.09 MEASUREMENT FOR PAYMENT**

**206.09.01 Actual Measurement**

**206.09.01.01 Earth Excavation, Grading**

Measurement for earth excavation, grading shall be the in-place volume of earth in cubic metres computed from field measurements of cross-sections taken both prior to grubbing and upon completion of the work.

When benching is required to key-in new fills into existing slopes, the quantity of materials that are excavated as part of that operation shall not be included in the measurement for payment.

**206.09.01.01.01 Overbuilding, Earth**

When the Contract requires earth borrow, the quantity of material placed beyond the earth grading tolerances shall be deducted from the measured quantity of earth borrow on a cubic metre for cubic metre basis, with no correction for changes in the density of the material.

**206.09.01.02 Excavation for Pavement Widening**

Measurement of excavation for pavement widening shall be the horizontal length in metres along each edge of the existing pavement when widening is specified in the Contract Documents.

**206.09.01.03 Rock Excavation, Grading**

**206.09.01.03.01 General**

Measurement of rock excavation, grading shall be the in-place volume in cubic metres computed from field measurements of cross-sections bounded by the original rock line after the earth overburden has been removed and the theoretical rock face and the bottom excavation limits designated in the Contract Documents. Where shatter is specified, the bottom of the cut shall be 300 mm below the designated rock grade.

The quantity of rock excavation shall also include:

- a) All shatter that is specified in the Contract Documents.
- b) Any rock that is excavated beyond the limits that are as specified in the Contract Documents at the Contract Administrator's written instructions.

**206.09.01.03.02 Overbuilding, Rock**

When the Contract has a rock supply item, the quantity of excavated rock placed beyond the rock grading tolerance at the top of subgrade and beyond the angle of repose for rock fills shall be deducted from the rock surplus quantity on a cubic metre for cubic metre basis with no correction for changes in density of the material.

**206.09.01.03.03 Boulders**

Measurement of each boulder classified as rock shall be by volume in cubic metres computed on the basis of the product of the actual rock measurement of the 3 maximum rectilinear dimensions in metres of the boulder.

#### **206.09.01.04                      Rock Face**

Measurement of rock face shall be by area of the rock face in square metres.

#### **206.09.01.05                      Rock Supply**

The quantity of rock supply shall be determined in cubic metres either at the end of a distinct stage or at the end of the Contract.

The quantity shall be determined as one of the following:

- a) The rock surplus quantity less the quantities of rock materials removed as part of the rock surplus and measured as specified in the Measurement of Rock Surplus clause.
- b) The quantity of rock materials determined by the Contract Administrator required to complete the embankments.
- c) The total of both a) and b).

At the discretion of the Contract Administrator, earlier access to the rock supply item may be granted; however, the quantities shall be reconciled at the end of the stage or Contract.

The rock supply quantity shall be measured in-situ by the Contractor in neat lines at the source. The in-situ volume shall be the rock supply quantity divided by the bulking factor.

For rock materials supplied under the rock supply item for the completion of rock embankments, any rock materials remaining at the rock supply source after rock embankment construction has been completed or otherwise used on the Contract as specified in the Management of Excavated Materials clause, shall be paid for as specified in the Rock Supply subsection under the Basis of Payment section.

The Contract Administrator shall be informed in writing 2 Business Days prior to commencing drilling operations at the rock supply source or 2 Business Days prior to removing rock from the rock pile or both. The Contract Administrator reserves the right to verify any measurements at any source. The Contractor shall give the Contract Administrator complete access to all such sources.

#### **206.09.01.06                      Rock Embankment**

Measurement of rock embankment shall be by volume in cubic metres of rock embankments. Adjustments to the Plan Quantity shall be limited to those supported with topographic survey information.

#### **206.09.02                              Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **206.10                                      BASIS OF PAYMENT**

#### **206.10.01                              Earth Excavation, Grading - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Payment for earth grade checks, including provision of all labour, Equipment, and Material to conduct quality control testing shall be included in the Contract price as part of the work of earth excavation, grading.

#### **206.10.02                      Excavation for Pavement Widening - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract Administrator directs that material excavated under this item is to be handled other than as specified in the Excavation for Pavement Widening clause, then such material shall be managed in accordance with the Contract Documents and treated as a Change in the Work.

Material used to backfill the excavation shall be paid for at the Contract price for the tender item of the type of material used.

#### **206.10.03                      Rock Excavation, Grading - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When a rock face item is not included in the Contract, rock scaling and the removing of all overbreak and scaled materials shall be included in the rock excavation, grading item.

When a rock embankment item is not included in the Contract, the work of rock embankment shall be included in the rock excavation, grading item.

When excavated rock is to be used for any other Contract item work (e.g., rock embankment, granular materials, or rip-rap), the hauling costs are deemed to be included in payment for the work associated with the appropriate tender item. However, when excavated rock is not to be used for any other Contract item work, the hauling costs are then deemed to be included in payment for the work under the rock excavation, grading item.

Payment for rock grade checks, including provision of all labour, Equipment, and Material to conduct quality control testing, shall be included in the Contract price as part of the work of rock excavation, grading.

When drilling, blasting, and mucking are required as a part of the work for this tender item, the following progress payments shall be made:

- a) 33% of the progress volume for drilling.
- b) 33% of the progress volume for blasting.

#### **206.10.04                      Rock Face - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

On completion of drilling and blasting, a progress payment of 50% of this tender item shall be made.

On completion of mucking, a progress payment of an additional 25% of this tender item shall be made.

When the Contract does not contain a separate tender item for rock face, the Contract price for rock excavation, grading, shall include full compensation for all labour, Equipment, and Material to do the work of rock face.

#### **206.10.05                      Rock Supply - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work, and all costs for fees and royalties.

When drilling, blasting, and mucking are required as a part of the work for this tender item, the following progress payments shall be made:

- a) 33% of the progress volume for drilling.
- b) 33% of the progress volume for blasting.

The unit price tendered for this item is excluded from the provisions specified in the Contract Documents for renegotiation of unit prices.

For rock materials supplied under the rock supply item for completion of rock embankments as specified in the Contract Documents, any rock materials remaining at the rock supply source after completion of all rock excavation and rock embankment construction shall be paid at 50% of the tender unit rate for rock supply.

As specified in part b) of the Measurement of Rock Surplus clause, the Contractor shall be paid \$400.00 for each monitoring device used to monitor compressible soils, regardless of the number of additional pipe sections that are required.

#### **206.10.06                      Rock Embankment - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract does not contain a separate tender item for rock embankment, the Contract price for rock excavation, grading shall include full compensation for all labour, Equipment, and Material to do the work of rock embankment.

#### **206.10.07                      Backfill for Overexcavation**

Payment shall not be made for backfill of any overexcavation in excess of the specified tolerances.

#### **206.10.08                      Backfill for Subexcavation**

Material used to backfill subexcavations and transition or grade point treatments shall be paid for at the Contract price for the tender item of material used.

#### **206.10.09                      Finished Grade Checks Outside Specification Limits**

As specified in the Grade Checks subsection of the Quality Assurance section, for each station where the QA grade check of the finished grade is outside of specification limits, the Contractor shall be charged \$250.00.

**Appendix 206-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

### **APPENDICES**

|              |                   |
|--------------|-------------------|
| <b>209-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **209.01 SCOPE**

This specification covers the requirements for the construction of embankments over swamps and compressible soils using the excavation, floatation, or displacement method.

#### **209.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **209.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **209.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

|          |                                                                                   |
|----------|-----------------------------------------------------------------------------------|
| OPSS 201 | Clearing, Close Cut Clearing, Grubbing, and Removal of Surface and Piled Boulders |
| OPSS 206 | Grading                                                                           |
| OPSS 212 | Earth Borrow                                                                      |

### **Ontario Provincial Standard Specifications, Material**

|           |                                                                    |

| OPSS 1010 | Aggregates - Base, Subbase, Select Subgrade, and Backfill Material |
| OPSS 1860 | Geotextiles                                                        |

## **209.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Displacement Method** means to build the embankment directly on the swamp such that the underlying swamp material is displaced away from the embankment fill.

**Earth** means earth as defined in OPSS 206.

**Floatation Method** means to build the embankment directly on the swamp minimizing the displacement of the swamp material.

**Rock** means rock as defined in OPSS 206.

**Swamp Material** means the material within the swamp excavation, floatation, or displacement limits, except rock, masonry, natural wood, and manufactured products. Wood that has decomposed and breaks down readily upon handling shall be considered swamp material.

**Swamp Wave** means the swamp material that is displaced as a result of placement of embankment material.

## **209.05 MATERIALS**

### **209.05.01 Embankment Material**

Embankment material shall consist of earth, rock, select subgrade material, or other material specified in the Contract Documents.

#### **209.05.01.01 Earth Borrow**

Earth borrow shall be according to OPSS 212.

#### **209.05.01.02 Select Subgrade Material**

Select subgrade material shall be according to OPSS 1010.

#### **209.05.02 Geotextiles**

Geotextiles shall be according to OPSS 1860 and be of the type, class, and filtration opening size (FOS) range specified in the Contract Documents.

## **209.06 EQUIPMENT**

### **209.06.01 Rented Swamp Excavator**

The type of swamp excavator equipment shall be as specified in the Contract Documents.

The minimum size and requirements shall be a 26,500 kg crawler mounted hydraulic backhoe with a minimum 12 m reach and a 1 m<sup>3</sup> bucket or a 40,000 kg crawler mounted dragline with a 1.15 m<sup>3</sup> bucket. The bucket shall be suitable for swamp excavation.

#### **209.06.02 Spreading, Levelling, and Compacting Equipment**

When the floatation method is used, spreading, levelling, and compacting equipment shall be restricted to a gross weight that is not detrimental to the structural integrity of the root mat.

## **209.07 CONSTRUCTION**

### **209.07.01 General**

The work of embankment construction shall be carried out using one or more of the following methods specified in the Contract Documents:

- a) Excavation Method
- b) Floatation Method

c) Displacement Method

**209.07.02 Clearing and Close Cut Clearing**

Prior to beginning embankment construction, the required clearing and close cut clearing shall be completed according to OPSS 201.

**209.07.03 Excavation Method**

The work shall include the excavation of all material, except rock, from within the limits specified in the Contract Documents and the handling, placing, shaping, trimming, and hauling of excavated material.

Excavation shall be to the full width and full depth in one operation prior to backfilling.

Excavated material shall be placed clear of the sides of the embankment limits and any drainage facilities. The operations of excavating and backfilling shall be carried out simultaneously.

**209.07.03.01 Embankment Construction and Backfill**

Backfill shall be placed according to OPSS 206. However, when wet conditions exist, backfill material other than rock may be placed up to 600 mm above water level without compaction.

Embankment material placed subsequent to the backfill material shall be placed according to OPSS 206.

**209.07.04 Floatation Method**

The work shall consist of controlled placement of embankment material, removal of surcharges specified in the Contract Documents from above the subgrade, and hauling and incorporating of the surcharge material into the work according to OPSS 206.

**209.07.04.01 Swamp Waves**

Swamp waves shall not be excavated or otherwise disturbed.

**209.07.04.02 Embankment Construction**

The embankment shall be constructed according to OPSS 206, except that vibratory compaction equipment shall not be used within 1.0 m of the original surface of the swamp.

Each layer shall be built using an outside to inside sequence by keeping the outer one-third portions of the layer at least 30 m ahead of the centre portion.

**209.07.04.03 Geotextile**

When geotextile is to be placed, the area specified in the Contract Documents for geotextile shall be close cut cleared and cleared of objects that may damage the geotextile. Close cut clearing shall be carried out in such a manner as not to damage the structural integrity of the root mat.

The placement operation shall be such that the geotextile is not exposed to daylight for more than 72 hours.

Adjacent sections of the geotextile shall be overlapped a minimum of 1.0 m or shall be sewn together according to OPSS 1860.

Should the geotextile be damaged, it shall be repaired by placing a piece of geotextile large enough to cover the damaged section meeting the above requirements for overlapping.

If the geotextile is damaged due to the Contractor's operation during embankment construction, the embankment material shall be removed from the geotextile.

#### **209.07.05 Displacement Method**

The work shall consist of controlled placement of the embankment material, excavation of swamp waves and displaced material, removal of surcharges specified in the Contract Documents, and hauling and incorporating of this material into the work according to OPSS 206.

#### **209.07.05.01 Embankment Construction**

The embankment shall be built in such a manner as to displace as much of the material underlying the embankment as possible. An inside to outside construction sequence shall be used, keeping the inside one-third portion 30 m ahead of the outside portions.

When a stable platform has been established, embankment material placed 300 mm above original ground shall be placed according to OPSS 206.

#### **209.07.06 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

Manufactured products shall not be used in the right-of-way.

Excavated swamp material shall be used as much as possible within the right-of-way adjacent to an embankment and conforming to standard right-of-way offset. This shall be done by widening embankments, flattening side slopes, and constructing modified cross-sections as specified in the Contract Documents. Such material shall be trimmed to provide smooth contours and to provide drainage.

The volume of excavated material to be used within the Contract limits or designated areas shall be as specified in the Contract Documents.

### **209.09 MEASUREMENT FOR PAYMENT**

#### **209.09.01 Actual Measurement**

#### **209.09.01.01 Excavation**

Measurement shall be by volume in cubic metres by the method of average end areas. The quantity for payment shall be the lesser of the following:

- a) Actual excavation.
- b) Excavation to the length, width, and depth as specified in the Contract Documents.

#### **209.09.01.02 Rental of Swamp Excavation Equipment**

Measurement shall be by time in hours that the equipment is actually engaged in the work.

When the excavated material has been placed in a location that will not interfere with subsequent excavation, measurement shall not be made for the handling required in grading, levelling, and trimming of such material.

### **209.09.01.03                    Select Subgrade Material**

Measurement shall be by mass in tonnes or by volume in cubic metres as specified in the Contract Documents.

#### **209.09.01.03.01                Cubic Metre Measurement**

When measurement of select subgrade material is in cubic metres, one of the following methods, as specified in the Contract Documents, shall be used to calculate the volume of the material:

##### **a) End Area Method**

Volume of material shall be measured in their original location and computed in cubic metres by the method of average end areas.

Original cross-sections shall be taken after the area has been cleared, grubbed, and stripped of unsuitable surface material. These operations shall be completed a minimum of 3 Working Days in advance of excavation to allow for the required cross-sectioning.

##### **b) Truck Box Method**

Material shall be measured in cubic metres, loose, by predetermined truck box capacities. The predetermined capacity of each truck shall be that computed from its box dimensions.

Each truck shall be uniquely and readily identifiable.

### **209.09.01.04                    Geotextile**

Measurement shall be by area, in place, in square metres, with no allowance for overlaps.

### **209.09.02                        Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **209.10                            BASIS OF PAYMENT**

### **209.10.01                        Excavation**

Payment for swamp excavation shall be at the Contract price for the tender item Earth Excavation, Grading, according to OPSS 206.

Payment shall not be made for the removal of materials that slide or slough inside the excavation limits.

#### **209.10.02                        Rental of Swamp Excavation Equipment, Dragline - Item Rental of Swamp Excavation Equipment, Hydraulic Backhoe - Item**

Payment at the Contract price for the above tender items shall be full compensation for furnishing and operating the minimum size equipment specified, including mats when necessary, for the excavation and for the management of the material adjacent to the excavation.

When the Contract Administrator approves the use of larger equipment, the Contract price per hour shall be adjusted by adding to the Contract price the difference between the rate set out in the Contract Documents for the minimum size equipment specified and the rate set out in the Contract Documents for the larger equipment to be employed.

**209.10.03                      Floatation and Displacement Method**

Payment shall not be made for swamp material displaced by floatation or displacement.

**209.10.04                      Select Subgrade Material - Item  
Geotextile - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Repairs to geotextile damaged by the Contractor's operation shall be at no additional cost to the Owner.

**209.10.05                      Management of Swamp Material Excavated by Equipment Rental**

All costs associated with the management of material are deemed to be included in the Contract unit price for rental of equipment.

Material resulting from the operation of the above equipment shall be managed as specified in the Contract Documents.

**Appendix 209-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

|--------------|-------------------|
| <b>212-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **212.01 SCOPE**

This specification covers the requirements for earth borrow.

#### **212.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **212.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **212.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## **212.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Access Road** means a private road built or an existing road used by the Contractor to gain access to the Work or to a source of material.

**Borrow** means earth material acquired from outside the right-of-way to complete the Work.

**Haul Road** means any public road, excluding the road under Contract, that forms part of a material haul route.

**Quality Assurance (QA)** means a system or series of activities carried out by the Owner to ensure that materials received from the Contractor meet the specified requirements.

**Referee Testing** means testing of a material attribute for the purpose of resolving acceptance issues at the request of the Contractor or the Owner.

## **212.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **212.04.01 Submission Requirements**

A minimum of 14 Days prior to borrow material being used in the Work, the Contractor shall provide a list of intended borrow sources and the tonnage that is expected to be used from each source to the Contract Administrator.

A minimum of 48 hours prior to the placement of borrow in the Work, the following shall be submitted to the Contract Administrator:

- a) Written proof for the right to occupy and operate each borrow source, including all appropriate permits.
- b) Identification and description of any frost-susceptible materials that the Contractor intends to use as borrow and a detailed plan describing where the Contractor intends to use it.

## **212.05 MATERIALS**

### **212.05.01 Earth Borrow**

Earth borrow shall consist of earth as defined in OPSS 206 and shall be free from organic and foreign material.

Earth borrow with at least 50% of its particles by mass between 5 and 75  $\mu\text{m}$  in size, as determined using LS-702, shall be considered frost-susceptible.

## **212.07 CONSTRUCTION**

### **212.07.01 General**

The work required for borrow shall include clearing, grubbing, and stripping of a borrow source according to OPSS 201 and 206; construction and maintenance of access roads; maintenance and restoration of haul roads; excavating, hauling, placing, and compacting borrow; and borrow source rehabilitation.

The construction of embankments and backfill areas with borrow shall be according to OPSS 206 and OPSS 401, respectively.

Frost-susceptible material shall not be placed in the following areas:

- a) Within the zone between the frost penetration depth specified elsewhere in the Contract Documents and the final grade that will be established within the roadway upon completion of construction.
- b) In any other areas, specified elsewhere in the Contract Documents.

When borrow is stockpiled prior to use, material from different sources shall be stockpiled separately from each other.

#### **212.07.02                      Owner's Properties**

Unless otherwise specified, material shall not be supplied from the Owner's properties.

#### **212.07.03                      Clearing, Grubbing, and Stripping**

Borrow sources shall be cleared, grubbed, and stripped of any unsuitable materials. These operations shall be completed a minimum of 3 Working Days in advance of any excavation where cross-sections are required.

Stripped material shall be piled sufficiently back from the face of the pit or quarry to prevent the contamination of the face material. The stripped material shall be piled such that the distance from the face being worked to the stripped material shall be:

- a) For pits, at least equal to the depth of the face or 5 m, whichever is the greater distance.
- b) For quarries, at least 5 m.

#### **212.07.04                      Haul Roads**

Inspection of all haul roads prior to construction use shall be undertaken jointly by the Contract Administrator, the Contractor, and the owner of the haul road.

All required restoration work shall be performed when haul roads are damaged due to hauling operations.

Acceptable material shall be chosen and properly placed on the haul road to:

- a) Provide safe passage and control of traffic at all times; and
- b) Repair that road to the pre-contract condition upon completion of the hauling operations both to the satisfaction of the Contract Administrator and the owner of the road.

#### **212.07.05                      Borrow Source Rehabilitation**

The borrow source shall be rehabilitated to comply with all applicable federal, provincial, and municipal requirements.

#### **212.07.06                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **212.08                              QUALITY ASSURANCE**

#### **212.08.01                      General**

The Contract Administrator reserves the right to visually inspect borrow and reject any borrow material that does not meet the requirements specified herein and elsewhere in the Contract Documents.

All samples shall be obtained and delivered to the QA laboratory according to the Contract Documents. The data to be included with all samples shall be according to the requirements of the MTO form PH-D-10.

**212.08.02****Acceptance of Earth Borrow**

At the discretion of the Owner, the Quality Assurance (QA) laboratory designated by the Owner may carry out QA testing for the purposes of ensuring that earth borrow being placed above the frost penetration depth in the areas listed in the General subsection of the Construction section is not frost-susceptible.

For earth borrow material being placed within the frost penetration depth in the areas specified above, lots may be established at the discretion of the Contract Administrator, in accordance with the schedule shown in Table 1. In addition, any single lot or series of lots may be terminated and a new lot or series of lots re-established, at the discretion of the Contract Administrator.

A minimum of one randomly-obtained duplicate sample shall be obtained from each lot. Additional samples may also be taken at the discretion of the Contract Administrator. In the event that the Contractor is unavailable to take a designated sample for a lot, then no further earth materials from that lot shall be placed above the frost penetration depth until the designated sample is taken.

The Contract Administrator shall document and seal each sample container according to the Contract Documents.

For each duplicate sample, one sample shall be tested for QA purposes and the remaining sample shall be retained for referee testing, if necessary.

If a sample is found to contain more than 50% of its particles by mass between 5 and 75  $\mu\text{m}$  when tested in accordance with LS-702, the Contract Administrator shall then notify the Contractor, in writing, within 2 Business Days of receiving the results, that any material within that lot represented by that sample including any material already within the Work or in stockpiles is frost susceptible and not acceptable for use above the frost penetration depth, wherever specified in the Contract Documents.

In addition, any of the material within that lot which has already been placed within the areas listed in the General subsection of the Construction section shall be removed at no additional cost to the Owner.

**212.08.02.01****Referee Testing**

The Contractor may invoke referee testing for any lot by submitting a written request to the Contract Administrator within 2 Business Days following notification from the Contract Administrator that the sampled material has been determined to be frost-susceptible.

The retained duplicate QA sample shall be used for referee testing. However, if a referee sample is not available, the Contractor shall then be responsible for obtaining a new sample from a location to be decided on by the Contract Administrator, at no additional cost to the Owner.

Referee testing shall be carried out, as specified herein and elsewhere in the Contract Documents.

All referee test results for a lot shall replace the respective QA tests for acceptance of the applicable lot and the referee results shall be binding on both the Owner and the Contractor.

## **212.09 MEASUREMENT FOR PAYMENT**

### **212.09.01 Actual Measurement**

#### **212.09.01.01 Earth Borrow**

Measurement of earth borrow shall be by volume in compacted cubic metres, excluding the volume of any boulders that cannot be accommodated in the Work.

Earth borrow shall be measured at the Contract site using the method of average end areas and surveyed cross-sections taken both prior to and after the placement of the material in the Work.

However, for borrow quantities that are less than 1,000 m<sup>3</sup>, in areas where surveying may be impractical such as where borrow is being placed in areas of standing water, or where materials that are not designated as borrow are being placed and compacted in the same area and at the same time as borrow, then the truck box method may be used, at the discretion of the Contract Administrator.

In this case, each truck carrying borrow shall be readily-identifiable and the loose volume that it contains shall be calculated based on an estimated percentage of the truck box capacity which has been pre-determined from measurements taken by the Contract Administrator. The Contract Administrator shall then determine the compacted in-place volume of the borrow by dividing the estimated volume of the material within the truck box by an appropriate bulking factor determined by the Owner.

## **212.10 BASIS OF PAYMENT**

### **212.10.01 Earth Borrow - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Removal and replacement of localized soft spots identified by the Contract Administrator or removal of unacceptable material or both shall be at no additional cost to the Owner.

The Owner shall be responsible for the cost of referee testing, provided that the referee test results show that the material meets the applicable specifications. Otherwise, the Contractor shall be responsible for the costs.

#### **212.10.02 Haul Roads**

Payment at the Contract price for the appropriate tender items used to perform maintenance and restoration of haul roads shall be full compensation for all labour, Equipment, and Material to maintain and restore haul roads.

When the Contract does not include the appropriate tender items, prices shall be negotiated.

#### **212.10.03 Access Roads**

No separate or additional payment shall be made for the cost of construction and maintenance of access roads.

**TABLE 1**  
**Lot Schedule for Sampling and Testing Earth Borrow**  
**Placed Above the Frost Penetration Depth**

| Expected Quantity<br>from Each Source<br>m <sup>3</sup>                                                                                                                                                                                                                                                                                                                                   | Lot Size                                                                                         |

**Appendix 212-A, November 2013**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

**Designer Action/Considerations**

| <b>220.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for the supply and installation of wick drains, including granular blanket.

#### **220.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **220.01.02                      Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **220.02                              REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

**220.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Certificate of Conformance** means a document issued by the Quality Verification Engineer confirming that the specified components of the Work are in accordance with the requirements of the Contract Documents.

**Geotechnical Instrumentation** means equipment used to monitor the progress of settlement, displacement, and pore water pressure measurements and includes such equipment as piezometers, settlement cells, standpipes, settlement profilers, inclinometers, and settlement rods.

**Granular Blanket** means a layer of free draining granular material used to provide drainage of excess pore pressures due to soil consolidation.

**Quality Verification Engineer (QVE)** means an Engineer retained by the Contractor qualified to provide the services specified in the Contract Documents.

**Recognized Specialist Subcontractor** means a subcontractor retained by the Contractor that has proven satisfactory experience in work of this type and magnitude and has completed a minimum of five wick drain installation projects in the last five years.

**220.04 DESIGN AND SUBMISSION REQUIREMENTS****220.04.01 Submission Requirements****220.04.01.01 Qualifications**

Prior to the commencement of the Work, the qualifications of the recognized specialist subcontractor shall be submitted to the Contract Administrator.

At least one month prior to commencing the installation of wick drains, the qualifications of the QVE undertaking the certification of the work shall be submitted to the Contract Administrator.

**220.04.01.02 Materials**

At least 3 weeks prior to the installation of wick drains, the Contractor shall submit to the Contract Administrator the following:

- a) A minimum one metre sample of the wick drain.
- b) The manufacturer's technical specifications indicating that the materials meet the requirements shown in Table 1.
- c) A certificate for each production lot supplied indicating that the wick drain supplied was produced and tested according to the requirements shown in Table 1.

The Contractor shall have test results available for the aggregates to be used in the work. At the request of the Contract Administrator, the Contractor shall make available or submit quality control test results. When more than one aggregate source is used for supplying material, test data from each source shall be submitted separately.

#### **220.04.01.03                      Installation Procedures**

At least 3 weeks prior to the installation of wick drains, the Contractor shall submit to the Contract Administrator the details of the sequence and method of installation outlining the following:

- a) Size, type, weight, maximum pushing force, and configuration of the installation rig.
- b) Dimensions of the mandrel to be used.
- c) Details of wick drain anchorage.
- d) Detailed description of proposed installation procedures.
- e) Alternative methods for overcoming obstructions.
- f) Methods for splicing wick drains.

#### **220.04.01.04                      Certificates of Conformance**

The following certificates of conformance shall be signed and sealed by the QVE and shall be submitted to the Contract Administrator:

- a) At least 3 weeks prior to the installation of wick drains, a certificate of conformance stating that the equipment, materials, and procedures are capable of achieving successful wick drain installation according to the requirements of the Contract Documents.
- b) Upon completion of the wick drain installation and prior to the placement of any overlying material, a final certificate of conformance stating that the work has been carried out according to the submitted installation procedures and the requirements of the Contract Documents.

### **220.05                                      MATERIALS**

#### **220.05.01                                  Wick Drains**

Wick drains shall be prefabricated and shall consist of a continuous plastic drainage core wrapped in a non-woven geotextile. The geotextile, core, and composite wick drain shall meet the requirements shown in Table 1.

All wick drains shall be free of defects, rips, holes, and flaws.

#### **220.05.02                                  Granular Blanket**

The granular blanket shall be Granular B, Type I, Type II, or Type III, according to OPSS 1010, except that 100% shall pass the 37.5 mm sieve.

### **220.06                                      EQUIPMENT**

The equipment used to install wick drains shall be of the type that minimizes the disturbance to the drainage blanket or the native subsoil during the installation operation.

Falling weight impact hammers shall not be permitted.

## **220.07 CONSTRUCTION**

### **220.07.01 Operational Constraints**

When a site is designated as an environmentally sensitive area, jetting techniques shall not be permitted.

Wick drains shall be installed subsequent to the construction of the granular blanket and prior to the installation of monitoring instruments and placement of any overlying material. Wick drains shall be protected by a minimum of 2 m of earth fill or 4 m of rock fill before the ground freezes. Wick drains shall not be installed in frozen ground.

Installation of the wick drains shall be coordinated with the placement of geotechnical instrumentation as specified in the Contract Documents. Wick drains shall be installed in a manner that does not disturb geotechnical instrumentation already in place. Geotechnical instrumentation damaged as a result of Contractor's activities shall be replaced by the Contractor.

### **220.07.02 Transportation and Storage**

During transportation and storage, the wick drain materials shall be protected from damage.

The storage area shall be so that the wick drain materials are protected from sunlight, dirt, dust, mud, debris, and all other detrimental substances.

### **220.07.03 Granular Blanket**

The granular blanket shall be placed subsequent to the excavation of unsuitable material and any backfilling specified in the Contract Documents.

The granular blanket shall be placed and compacted to the limits and grades specified in the Contract Documents.

The granular blanket shall be placed according to the earth embankment requirements of OPSS 206 and compacted to a minimum 90% of its maximum dry density measured according to OPSS 501.

When the granular blanket is placed under water, it shall be placed by end dumping.

### **220.07.04 Trial Wick Drains**

Prior to the installation of wick drains within the areas designated in the Contract Documents, the Contractor shall demonstrate that the proposed materials, equipment, and installation method produce a satisfactory wick drain installation in accordance with these specifications. The Contractor shall install a minimum of 10 trial wick drains at permanent installation locations designated by the Contractor Administrator.

Provided the trial wick drains are installed to the satisfaction of the Contract Administrator, they shall be incorporated as part of the permanent installation.

The QVE shall monitor the wick drain installation on a full-time basis. If at any time the QVE considers that the method of installation does not produce a wick drain that satisfies the contract requirements, the method or equipment or both, as necessary, shall be altered to comply with the requirements of the Contract Documents.

**220.07.05                      Installation**

**220.07.05.01                  General**

Wick drains shall be installed to the depths specified in the Contract Documents.

Wick drains shall be installed using a mandrel advanced through the granular blanket and the underlying soil. The mandrel shall protect the wick drain material from damage during installation and shall be withdrawn after the installation of the wick drain. The mandrel shall be provided with an anchor plate to prevent soil from entering the bottom of the mandrel during installation and to anchor the bottom of the wick drain at the required depth at the time of mandrel removal. The projected cross-sectional area of the mandrel and anchor combination shall not exceed 7,700 mm<sup>2</sup>.

Augering or vibratory equipment may be used within the granular blanket and underlying soils to facilitate the installation of wick drains. The use of augering or vibratory equipment shall not extend more than 1 m into the soil to be consolidated.

**220.07.05.02                  Layout**

Wick drains shall be located and staked out by the Contractor. The spacing of the wick drains shall not vary more than 150 mm from the spacing specified in the Contract Documents.

**220.07.05.03                  Vertical Alignment**

Wick drains shall be installed vertically, within a tolerance of not more than 10 mm per 500 mm. The Contractor shall maintain a suitable method of verifying the vertical alignment of the mandrel and of determining the depth of the wick drain at all times.

**220.07.05.04                  Splices**

Splices in the wick drain shall be made so as to ensure continuity and to prevent reduction in the wick drain discharge capacity. Splices shall be a minimum of 150 mm in length.

**220.07.05.05                  Cut-Off**

The wick drain shall be cut at the surface of the granular blanket so that at least a 150 mm length protrudes above the top of the granular blanket at each wick drain location.

**220.07.05.06                  Obstructions**

Where obstructions are encountered below the working surface that cannot be penetrated by the wick drain installation equipment, the Contractor shall complete the wick drain from the elevation of the obstruction to the working surface and notify the Contract Administrator. At the direction of the Contract Administrator, the Contractor shall attempt to install a new wick drain within a 500 mm radius of the obstructed wick drain. A maximum of two attempts shall be made as directed by the Contract Administrator.

**220.07.06                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**220.08 QUALITY ASSURANCE**

**220.08.01 Certificate**

Certificates for each production lot indicating that the wick drain supplied was produced and tested according to the requirements of this specification shall be provided by the manufacturer for all wick drains delivered to the Contract.

**220.08.02 Rejected Drains**

Wick drains that are damaged or that do not meet the requirements of this specification shall be rejected and replaced. Replacement wick drains shall be installed within a 500 mm radius from the location of the rejected wick drain, as directed by the Contract Administrator.

**220.09 MEASUREMENT FOR PAYMENT**

**220.09.01 Actual Measurement**

**220.09.01.01 Wick Drains**

Measurement shall be by length in metres for all accepted wick drains, including the protruding portion up to 150 mm per installation.

Properly installed obstructed wick drains and replacement wick drains shall be measured for payment.

**220.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**220.10 BASIS OF PAYMENT**

**220.10.01 Wick Drains - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Geotechnical instrumentation damaged as a result of the Contractor's activities shall be replaced at no additional cost to the Owner.

Payment shall not be made for rejected wick drains or delays or expenses incurred by the Contractor as a result of improper or unacceptable material or installation.

All labour, Equipment and Material required for the granular blanket shall be paid for with the appropriate road base or subbase item, Granular B Type I, Granular B Type II, Granular B Type III, as specified.

**TABLE 1**  
**Wick Drain Property Requirements**

| Component            | Property   |                               | Test Method                   | Unit              | Requirement                       |
|----------------------|------------|-------------------------------|-------------------------------|-------------------|-----------------------------------|
| Core                 | Physical   | Material                      | --                            | --                | Polypropylene, Studded or Grooved |

### 301.03

### DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Restored Surface** means unpaved roadway surfaces prepared to the required grades and density and ready for a subsequent cover of granular or surfacing courses.

**Scarification** means uniform loosening of the roadway surface to remove damaged areas such as ravelling and potholes.

**Surfacing Course** means any wearing course or courses placed on the roadway and consisting of hot mix asphalt (HMA), Portland cement concrete, bituminous cold mix, or surface treatment.

**Unpaved Roadway Surface** means surfaces that are typically existing granular, but may include sub-grade soil surfaces.

### 301.07

### CONSTRUCTION

#### 301.07.01

#### Method

Restoring roadway surfaces shall consist of the following:

- a) The scarification of the existing surface specified in the Contract Documents to a depth sufficient to remove potholes but not less than 75 mm.
- b) Restoring or reshaping the scarified material.
- c) Compaction of the scarified materials according to OPSS 501.
- d) Ensuring that the restored surface is within tolerance.

The scarified surface shall be maintained to the profile, cross-section, and density specified in the Contract Documents until Contract Completion or, if applicable, until any subsequent granular or surfacing course is completed.

Prior to scarification, roadway surfaces not more than 150 mm above grade shall be loosened and the materials removed to grade. Materials loosened from the roadway surface and reshaped or incorporated during the restoring operation shall not require loading, hauling, or moving other than by blading.

Contaminated or otherwise, unsuitable material, encountered during restoring operations shall be removed to a depth not greater than 150 mm and replaced with Granular A, according to OPSS 1010, and then compacted according to OPSS 501.

#### 301.07.02

#### Surface Tolerances

The surface of the unpaved roadway shall be restored to the specified tolerances for the following types of surfacing courses.

##### 301.07.02.01

##### Granular Courses

The restored surface shall not deviate more than the following:

- a) 30 mm from the specified grade and cross-section.

- b) 30 mm at any place as measured in any direction with a 3 m straight edge when the work is to prepare the subgrade for granular courses.
- c) 15 mm at any place as measured in any direction with a 3 m straight edge when the work is to prepare the granular surface for granular courses.

#### **301.07.02.02 Bituminous Courses**

The restored surface shall not deviate more than the following:

- a) 30 mm from the specified grade and cross-section.
- b) 30 mm at any place as measured in any direction with a 3 m straight edge when the work is to prepare the subgrade to receive full depth HMA.
- c) 10 mm at any place as measured in any direction with a 3 m straight edge when the work is to prepare the granular surface to receive HMA.

#### **301.07.02.03 Portland Cement Concrete Courses**

The restored surface shall not deviate more than the following:

- a) 10 mm from the specified grade and cross-section.
- b) 10 mm at any place as measured in any direction with a 3 m straight edge when the work is to prepare a granular surface to receive concrete pavement or concrete base.

#### **301.07.03 Surface Widths**

The restored surface width shall be as specified in the Contract Documents.

#### **301.07.04 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **301.09 MEASUREMENT FOR PAYMENT**

#### **301.09.01 Actual Measurement**

##### **301.09.01.01 Restoring Roadway Surfaces**

Measurement of restored roadway surfaces shall be by area in square metres.

##### **301.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **301.10 BASIS OF PAYMENT**

#### **301.10.01 Restoring Roadway Surfaces - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**301.10.02                      Water**

Payment for water for compaction shall be according to OPSS 501.

**301.10.03                      Additional Materials**

Payment for additional granular materials shall be according to OPSS 314.

**CONSTRUCTION SPECIFICATION FOR  
SINGLE AND DOUBLE SURFACE TREATMENT**

**304.01 SCOPE**

This specification covers the requirements for surface preparation, application of bituminous binder, and application of aggregate for single and double surface treatment.

**304.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**Ontario Provincial Standard Specifications, Material**

OPSS 1006     Aggregates - Surface Treatment  
OPSS 1103     Emulsified Asphalt

**Ontario Ministry of Transportation Publications**

MTO Forms:  
PH-CC-349     Bituminous Material Product Sample Form

### **304.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Appurtenances** mean maintenance hole, catch basin, valve chamber, and water valve covers and similar Utility access covers located within the paved portion on the roadway.

**Binder** means an emulsified asphalt with or without polymer modification used to bind aggregates.

**Double Lap** means the coverage produced from the application of binder where the binder from each spray bar nozzle overlaps the binder application from the adjacent nozzle by one half.

**Double Surface Treatment** means two successive single surface treatments.

**End Nozzle** means a spray bar nozzle which delivers binder to the inside half of a standard spray pattern.

**Single Surface Treatment** means a single application of bituminous binder followed by a single application of Class 1, Class 2, Class 3, Class 4, Class 5, or Class 6 aggregate.

**Triple Lap** means the coverage produced from the application of binder where the binder from each spray bar nozzle overlaps the binder application from the adjacent nozzle by two thirds.

### **304.05 MATERIALS**

#### **304.05.01 Aggregates**

Aggregates shall be according to OPSS 1006 and as specified in the Contract Documents.

#### **304.05.02 Binders**

Binders shall be according to OPSS 1103.

### **304.06 EQUIPMENT**

#### **304.06.01 Binder and Aggregate Application Rate**

The following equipment shall be supplied for the determination of binder and aggregate application rates:

- a) A portable electronic balance with the following characteristics:
  - i. five digit display,
  - ii. accuracy to 0.1%,
  - iii. capacity 10 kg,
  - iv. minimum platform size of 300 mm by 400 mm.
- b) Sheet metal trays, each 500 mm x 500 mm inside dimension  $\pm 1$  mm, with sides 7 mm in height  $\pm 1$  mm. The sheet metal shall be a minimum of 18 gauge (approximately 1.3 mm) with soldered corners.

- c) One 5 kg test mass.
- d) A carpenter's level for levelling the balance.

#### **304.06.02                      Mechanical Aggregate Spreader**

The mechanical aggregate spreader shall be designed and manufactured to be self-propelled and capable of continuously and uniformly distributing aggregate at the specified application rate.

#### **304.06.03                      Pilot Vehicle**

The pilot vehicle shall be equipped according to the requirements of the OTM, Book 7.

#### **304.06.04                      Pressure Distributor**

The pressure distributor shall be designed and manufactured to spray binder on the road surface. The pressure distributor shall be capable of applying binder at the specified rates and in a continuous and uniform manner both longitudinally and transversely for a full lane width at variable speeds.

#### **304.06.05                      Rollers**

##### **304.06.05.01                  General**

Rollers shall be ballasted according to the manufacturer's recommendations.

##### **304.06.05.02                  Pneumatic-Tired Rollers**

Pneumatic-tired rollers shall be self-propelled and be according to Table 1. The wheels shall be mounted with smooth tread rubber tires. Tire inflation pressure shall be a minimum of 350 kPa when the tires are cold. All tires shall have equal pressure. Each roller shall be equipped with a suitable tire pressure gauge for checking tire inflation pressure.

##### **304.06.05.03                  Steel Drum Rollers**

Steel drum rollers shall be single drum vibratory rollers according to Table 2 and shall be operated in the static mode, if the drum is not rubber coated. Drive wheels shall not mark the aggregate.

#### **304.06.06                      Rotary Power Brooms**

Brooms shall be capable of cleaning gravel, sand, dirt, and other debris from the roadway surface.

### **304.07                          CONSTRUCTION**

#### **304.07.01                      Operational Constraints**

Surface treating operations shall not be carried out when the ambient temperature at the work location is less than 10 °C or where climatic or site conditions preclude the curing of the binder.

The application of binder and aggregate shall terminate one hour before sunset.

Surface treatment shall not be carried out prior to May 15<sup>th</sup> south of a line through Pembroke, Magnetawan, and Pointe au Baril Station or prior to June 1<sup>st</sup> north of the line.

Surface treatment shall not be carried out after September 1<sup>st</sup> except with the approval of the Contract Administrator. Surface treatment may be extended to September 30<sup>th</sup> provided a high float emulsion is used.

#### **304.07.02                      Surface Preparation**

Existing bituminous surfaces shall be clean and free of all debris and standing water before application of binder.

Where a binder is to be applied on a granular surface, the surface shall be free of standing water and shall be prepared by dampening, fine grading, and compacting immediately prior to the application of the binder. The surface shall be finish rolled to ensure a compacted smooth and float free surface.

#### **304.07.03                      Binder Application Temperatures**

Binder application temperatures shall be according to OPSS 1103.

#### **304.07.04                      Application of Binder**

After the surface has been prepared, the binder shall be uniformly sprayed on the road surface at the specified application rate. When binder is to be applied to two adjacent lanes, the application of binder on the initial pass shall be done without the use of an end nozzle. When binder is applied to the adjacent lane, the nozzle positioned closest to the first application of binder shall be an end nozzle.

The spray bar height shall be adjusted to ensure that there is triple lap of the binder application. A written request may be submitted to the Contract Administrator to allow the use of a double lap application.

Longitudinal joints shall be constructed to ensure full coverage on the centreline.

The application of binder shall terminate at the same station for both lanes at the end of each Day.

All Roadway appurtenances within the area to be surfaced shall be properly covered and protected immediately prior to the surface treatment.

#### **304.07.05                      Application of Aggregate**

Aggregate shall be uniformly applied at the rate specified. The distance between the pressure distributor and the spreader shall be less than or equal to 30 m.

If excess aggregate is present when constructing a double surface treatment, the excess shall be removed prior to the second application of binder.

#### **304.07.06                      Rolling**

Immediately after spreading, the aggregate shall be rolled with a minimum of two pneumatic-tired rollers. The entire treated area shall receive two passes from each pneumatic-tired roller.

When the surface treatment is placed on a prepared granular grade, one pneumatic-tired roller shall be replaced by a steel drum roller. The entire treated area shall receive two passes from the pneumatic-tired roller and one pass from the steel drum roller.

Rollers shall be operated at such a speed as to prevent aggregate pick-up, but in no case shall the speed of rollers exceed 10 km/h.

All rolling shall be completed within 300 m of the aggregate spreader. When the combination of rollers is not sufficient to maintain the completed rate of progress, additional rollers shall be used.

#### **304.07.07 Traffic Convoy**

When as specified in the Contract Documents, traffic shall be convoyed according to the OTM, Book 7.

The pilot vehicle shall guide one-way traffic through or around construction. The maximum speed of the convoy shall be 30 km/h. Convoying shall be maintained until such time as the surface treatment is able to carry traffic without damage.

#### **304.07.08 Protection of the Work**

Signs indicating fresh surface treatment, or similar wording, shall be erected at the limits of the Working Area and any intersections throughout the Working Area immediately after placement of surface treatment and shall remain in place for a minimum of 72 hours.

#### **304.07.09 Material Sampling and Testing**

##### **304.07.09.01 Binder**

Binder field samples shall be obtained and provided for testing purposes as specified in the Contract Documents.

The work shall include sampling, labelling, packaging, and making arrangement with Contract Administrator for delivery of samples to the laboratory designated in the Contract Documents within 2 Business Days of sampling.

A lot shall be deemed to be the quantity of work completed with a shipment (truck tank) of binder. A sample of binder shall be taken at the job site from each shipment of binder and this sample shall represent the lot.

Each binder sample shall consist of a minimum size of two full 4-litre samples of material. The sample containers shall be new triple tight cans with lids or suitable plastic containers of similar capacity which can be closed to prevent any leakage.

Sample containers shall be supplied and filled, leaving only sufficient space to allow for liquid expansion. The sample shall be taken from a sampling spigot on the transfer line, or, if one is not available, from the end of the transfer line. Each sample shall be taken after sufficient material has been drawn from the truck tank to purge the transfer line.

The sample shall be identified using a MTO PH-CC-349, Bituminous Material Product Sample Form, obtained from the Contract Administrator. In addition, the form shall be placed on each pail and labelled as "A1 of 2" or "A2 of 2". The form is only for use by the Owner in the identification of the sample for Contract administration purposes.

##### **304.07.09.02 Aggregates**

Aggregate samples shall be provided for testing purposes as specified in the Contract Documents.

##### **304.07.09.03 Determination of Binder and Aggregate Application Rates**

The application rate for the binder and the aggregate shall be as specified in the Contract Documents.

Compliance to the specified application rates of binder and aggregate shall be demonstrated to the Contract Administrator. At the Contract Administrator's option, this compliance may include a minimum 300 m one lane width trial section to ensure that the binder and aggregate are applied at the specified rate.

#### **304.07.09.03.01            Sampling Frequency**

Field sampling shall be carried out in the presence of the Contract Administrator to determine the binder application rates:

- a) at the start of each Day's work. If two distributors are provided, the binder application rate of one distributor shall be determined at this time.
- b) when approximately half of the total Day's production is completed. If two distributors are provided, the binder application rate of the second distributor shall be determined at this time.

Field sampling shall be carried out to determine the aggregate application rates at the start of each Day's work.

#### **304.07.09.03.02            Procedure**

Each section of road used to obtain the application rates shall be a maximum of 50 m in length. Field sampling shall be conducted in the presence of the Contract Administrator to determine the binder and aggregate application rates as follows:

- a) Set up and level the balance in a firm location protected from the wind.
- b) Check the tolerance of the balance with the 5 kg test mass.
- c) Obtain the tare mass (in kg to three decimal places) of two clean trays and record.
- d) Place the two trays in the centre of the lane being treated approximately 30 cm apart and parallel to the centreline.
- e) Remove the first tray after the binder has been sprayed and before the aggregate has been applied.
- f) Remove the second tray after the binder and aggregate have been applied and before rolling.
- g) Obtain and record the gross mass (in kg to three decimal places) of each tray.
- h) Carefully patch the marks left by the trays using the binder and aggregate as specified in the Contract Documents. The patches shall be rolled.
- i) Clean the trays for reuse.

#### **304.07.09.03.03            Calculations**

The calculations specified in Table 3 shall be performed in the presence of the Contract Administrator:

#### **304.07.10                    Remedial Work**

Damaged areas shall be repaired until such time as the work has been accepted by the Contract Administrator.

#### **304.07.11                    Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

## **304.08 QUALITY ASSURANCE**

### **304.08.01 Acceptance**

#### **304.08.01.01 Binder**

Acceptance of the binder shall be based on testing conducted by the Owner or the Owner's agent according to OPSS 1103.

The Contract Administrator shall determine the acceptability of each lot according to OPSS 1103. Lots that are not acceptable shall be removed and replaced or accepted with a payment adjustment.

If the Contractor elects to repair the lot in lieu of a payment adjustment, the lot shall be repaired and re-evaluated to the satisfaction of the Contractor Administrator.

#### **304.08.01.02 Binder Application Rate**

The binder application rate is acceptable when the rate is within a tolerance of + 5% of the specified rate. Otherwise, the binder application rate is unacceptable, and work shall stop. Field sampling shall be repeated in a maximum of 50 m sections until one of the following is obtained:

- a) When two consecutive acceptable binder test results are obtained, work may proceed.
- b) When four unacceptable binder test results are obtained before two consecutive acceptable test results, the pressure distributor shall be permanently removed from the Working Areas.

#### **304.08.01.03 Aggregate Application Rate**

The aggregate application rate is acceptable when the rate of aggregate application is within a tolerance of +10% of the specified rate. Otherwise, the aggregate application rate is unacceptable and work shall stop. Work may proceed when the application rate has been adjusted to the desired rate.

## **304.09 MEASUREMENT FOR PAYMENT**

### **304.09.01 Actual Measurement**

#### **304.09.01.01 Binder**

Measurement of binder shall be by mass in kilograms.

#### **304.09.01.02 Class 1, 2, 3, 4, 5 or 6 Aggregate**

Measurement of aggregate shall be by mass or volume as specified in the Contract Documents

##### **304.09.01.02.01 By Mass**

Measurement of aggregate shall be by mass in tonnes.

##### **304.09.01.02.02 By Volume**

Measurement of aggregate shall be by volume in cubic metres, loose, by predetermined truck capacities. The predetermined capacity of each truck shall be that computed from its box dimensions.

Loading of each truck shall be kept to not less than the predetermined capacity. It is not permitted to load trucks in excess of this capacity to allow for bulking, and no deduction shall be made for any settlement of the load during transportation, provided that such settlement is not caused by spillage or leakage.

Each truck shall be uniquely and readily identifiable.

#### **304.09.01.03                      Traffic Convoy**

Measurement for traffic convoy shall be in hours based on the number of hours that the pilot vehicle is convoying traffic.

### **304.10                                      BASIS OF PAYMENT**

**304.10.01                              Binder "type" - Item**  
**Class 1 Aggregate - Item**  
**Class 2 Aggregate - Item**  
**Class 3 Aggregate - Item**  
**Class 4 Aggregate - Item**  
**Class 5 Aggregate - Item**  
**Class 6 Aggregate - Item**  
**Class 1 Aggregate, From Stockpile - Item**  
**Class 2 Aggregate, From Stockpile - Item**  
**Class 4 Aggregate, From Stockpile - Item**  
**Class 6 Aggregate, From Stockpile - Item**  
**Traffic Convoy - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Payment for any lot of binder which does not meet all Contract requirements shall be subject to a payment adjustment, except when the lot sample has been arranged for delivery within 2 Business Days of sampling and testing is not started within 14 Days of sampling.

A calculated payment adjustment shall be determined, through a system of adjustment points based on test results for any lot sample when tested providing the sample remains in a condition suitable for testing. Where more than one test result is available on any one sample, the test result with the least deviation from the specification limit shall be used to calculate the payment adjustment. The payment adjustment percentage for the lot is the total number of adjustment points for each sample divided by 25.

A fixed payment adjustment of 20% of the Contract price shall be made for lots for which the following conditions apply:

- a) The lot sample contains insufficient material for testing; or
- b) The lot sample does not remain in a condition suitable for testing within 14 Days after sampling (e.g., broken emulsion or foam-over during distillation).

#### **304.10.02                              Adjustment Points for Emulsified Asphalt Binders**

The total number of adjustment points shall be equal to the summation of the number of units that each test deviates from the specification limits times the multiplier as specified in Table 4, plus:

- a) 1000 adjustment points for failure of the particle charge test when the binder type is RS-2, CRS-2, RS-2P, or CRS-2P, HFMS-2(ON) and;

- b) 200 adjustment points for failure of the coating ability and water resistance test when the binder type is HF-100S, HF-150S, HF-250S, HFMS-2(ON), HF-100SP, HF-150SP or HFMS-2P(ON).

Prior to the summation, all adjustment points shall be rounded to one decimal place according to LS-100.

**TABLE 1**  
**Requirements for Pneumatic-Tired Rollers**

| <b>Roller Class</b> | <b>Minimum Mass<br/>t</b> | <b>Minimum Mass per Tire<br/>kg</b> |
|---------------------|---------------------------|-------------------------------------|

### 305.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Lot** means a specific quantity of material or a specific amount of construction obtained from a single source and produced by the same process.

### 305.05 MATERIALS

#### 305.05.01 Sealers

Sealers may consist of one or more of the following materials:

- a) Type I: Emulsified asphalt primer shall be according to OPSS 1103.
- b) Type II: Solvent-free emulsified asphalt shall be according to OPSS 1103.
- c) Type III: Tall oil pitch (TOP) emulsion shall be according to OPSS 2510.

### 305.06 EQUIPMENT

#### 305.06.01 Pressure Distributor

The pressure distributor used for sealer application shall be according to OPSS 304 and shall include an attachment for hand spraying, when applicable.

#### 305.06.02 Rollers

Rollers shall be steel-drum or pneumatic-tired according to OPSS 304.

## **305.07 CONSTRUCTION**

### **305.07.01 Operational Constraints**

A sealer shall only be applied when:

- a) The ambient temperature is a minimum of 5 °C and rising.
- b) The designated area to be sealed is not frozen.
- c) Precipitation is not occurring or imminent.
- d) A minimum period of 24 hours has passed after precipitation has stopped for Type III emulsion application.
- e) The surface is free of standing water.
- f) The wind is not strong enough to cause drifting of sealer spray.
- g) The shoulder is smooth and is according to the crossfall and grade specified in the Contract Documents.

### **305.07.02 Surface Preparation**

Prior to applying sealer, the granular shoulder shall be rolled with a minimum of two passes, as soon as is practical. The shoulder rounding surface shall not be rolled.

Granular materials to be sealed with Type I or Type II sealers shall be uniformly dampened immediately prior to application of sealer.

The moisture content of granular materials to be sealed with a Type III sealer shall be according to the manufacturer's recommendations.

### **305.07.03 Application**

The sealer types and the locations where they shall be used are as specified in the Contract Documents.

Sealers shall be uniformly applied in all areas using a pressure distribution system.

Sealer application rates and temperatures shall be according to Table 1.

Sealers shall be overlapped a minimum of 100 mm onto adjacent paved surfaces.

All other application requirements shall be according to the manufacturer's recommendations and the application performed to the satisfaction of the Contract Administrator.

### **305.07.04 Material Sampling and Testing**

#### **305.07.04.01 General**

The general requirements of samples for quality assurance, referee and other testing by the Owner shall be as specified in the Contract Documents.

Arrangement shall be made with the Contract Administrator for delivery of samples to the laboratory as specified in the Contract Documents within 2 Business Days of sampling.

#### **305.07.04.02                      Sampling**

The Contract Administrator shall randomly-choose one sample of sealer from the designated truck tanker representing each lot.

Duplicate samples shall be taken from a sampling spigot on the transfer line or, if one is not available, from the end of the transfer line. Each sample shall be taken after sufficient material has been drawn from the truck tank to purge the transfer line. Sample containers shall be filled, leaving sufficient space to allow for expansion.

Sample containers for each portion of each duplicate sample shall be triple tight one-litre cans for Type III sealers or triple tight four-litre pails, or suitable plastic containers of similar capacity that can be closed to prevent any leakage for Type I or Type II sealers.

Identification tags, provided by the Contract Administrator, shall be attached to each sample container.

#### **305.07.05                              Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **305.08                                      QUALITY ASSURANCE**

#### **305.08.01                              General**

The Owner reserves the right to make inspections, take samples, and perform quality assurance (QA) tests, at such times and locations as the Owner may consider necessary.

#### **305.08.02                              Acceptance of Granular Sealer**

##### **305.08.02.01                      Lot Size**

Lot sizes shall be according to Table 2. If the remaining quantity after completing a lot is less than one-half the quantity for a complete lot, then that quantity shall be added to the previous lot. Otherwise, the remaining quantity shall form its own lot.

##### **305.08.02.02                      Sealer Quality**

One of duplicate samples shall be tested for material properties by the QA laboratory according to OPSS 1103 for Type I and Type II sealers, and OPSS 2510 for Type III granular sealers, respectively.

A lot of sealer shall be deemed to be acceptable, if all the test results and other requirements according to OPSS 1103 for Type I and Type II sealers, and OPSS 2510 for Type III granular sealers are respectively met.

A lot of sealer not meeting all the sealer quality requirements shall be subjected to a payment adjustment according to the Payment Adjustments for Sealers clause.

The Owner shall be responsible for all costs associated with QA testing for acceptance.

##### **305.08.02.03                      Referee Testing**

Referee testing may be invoked for one or more tested attributes of a lot by submitting a written request to the Contract Administrator, within 2 Business Days following notification that the sealer does not meet the requirements of this specification.

The referee laboratory shall be designated by the Owner. The other duplicate sample representing the lot shall be tested according to OPSS 1103 for Type I and Type II sealers, and OPSS 2510 for Type III granular sealers, respectively.

All referee test results for any lot shall replace the respective QA tests for acceptance of the applicable lot and shall be binding on both the Owner and the Contractor.

If a lot is not accepted based on the referee test results:

- a) The lot shall be subject to a payment adjustment according to the Payment Adjustments for Sealers clause; and
- b) The Contractor shall be responsible for the cost of the referee testing of that lot, including the cost of transporting the samples to the referee laboratory, at the rates specified in the Contract Documents.

When the referee results indicate that the refereed lot is acceptable, the Owner shall bear the cost.

### **305.08.03 Repairs**

The Contract Administrator shall visually inspect the work to determine if the completed work contains any of the following defects:

- a) Uneven application of sealer.
- b) Surface damage.
- c) Flushing.
- d) Bleeding.
- e) Contamination.

Any defects identified shall be repaired to the approval of the Contract Administrator.

Defects other than uneven application of sealer shall be repaired by removing all defective areas of sealed granular material, then replacing it with clean, compacted Granular A according to OPSS 1010 and OPSS 501.

All repaired areas and uneven application of sealer shall be resprayed with the same sealer type or a sealer with a lower sealer type number, as originally specified in the Contract Documents.

## **305.09 MEASUREMENT FOR PAYMENT**

### **305.09.01 Granular Sealing**

#### **305.09.01.01 Actual Measurement**

Measurement shall be by the area sealed in square metres or by mass in kilograms of sealer used, as specified in the Contract Documents.

#### **305.09.01.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurements shall be based on the units shown in the clause under Actual Measurement.

## **305.10 BASIS OF PAYMENT**

### **305.10.01 Granular Sealing**

#### **305.10.01.01 Granular Sealing - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work, subject to payment adjustment.

Granular sealing damaged by the Contractor's operations or identified by the Contract Administrator as being inadequately treated shall be repaired and resprayed.

Granular sealing damaged by others shall be repaired and resprayed and shall be administered as a Change in the Work.

#### **305.10.01.02 Payment Adjustments for Sealers**

##### **305.10.01.02.01 General**

Payment for any lot of sealer that does not meet all Contract requirements shall be subject to a payment adjustment. A calculated payment adjustment shall be determined through a system of adjustment points based on the test results for any lot sample, provided the sample remains in a condition suitable for testing.

Adjustment points related to the test results for each test shall be individually rounded to one decimal place according to LS-100.

The total number of adjustment points for the tested sample representing a lot shall be divided by 25 to obtain the payment adjustment, expressed as a percentage for the lot.

A fixed adjustment of 50% of the Contract price shall be made for lots to which at least one of the following conditions apply:

- a) The lot sample contains insufficient material for testing; or
- b) The lot sample does not remain in a condition suitable for testing for 14 Days after sampling (e.g., broken emulsion or foam over during distillation).

##### **305.10.01.02.02 Adjustment Points for Type I and Type II Sealers**

For each lot, the total number of adjustment points shall be equal to the summation of the number of units that each test deviates from the specification limits times the multiplier specified for each test in Table 3, plus:

- a) 1,000 adjustment points, if the test result for the ASTM D7402, the particle charge test, fails to meet the requirement according to OPSS 1103; and
- b) 1,000 adjustment points, if the test result for ASTM D6930, the storage stability test, 24 hour, fails to meet the requirement according to OPSS 1103.

##### **305.10.01.02.03 Adjustment Points for Type III Sealers**

For each lot, the total number of adjustment points shall be equal to 62.5 for every 0.1% less than 8% solids for the sample tested according to the procedure given in OPSS 2510 plus an additional 1,000 adjustment points, if the material is determined to be anionic according to the Particle Charge Test, ASTM D7402.

**TABLE 1**  
**Application Rates and Temperatures**

| Type of Sealer                                                                                                                                                                                                                                                                                                              | Application Rate (kg/m <sup>2</sup> ) |                             | Application Temperature           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|-----------------------------|-----------------------------------|
|                                                                                                                                                                                                                                                                                                                             | Hand-Sprayed Areas                    | Machine-Applied/Other Areas |                                   |
| I                                                                                                                                                                                                                                                                                                                           | 3.4                                   | 2.6                         | At Manufacturer's Recommendations |
| II                                                                                                                                                                                                                                                                                                                          |                                       |                             |                                   |
| III                                                                                                                                                                                                                                                                                                                         | 5.5                                   | 4.5<br>(Note 1)             | Ambient Temperature<br>(Note 2)   |
| Notes:<br>1. Type III sealers shall be applied in 2 coats with 12% solids or 3 coats with 8% solids for emulsions to deliver a total of 4.5 kg/m <sup>2</sup> .<br>2. Type III sealers shall not be applied if there is any chance that the ambient temperature will reach 0 °C or below within 24 hours after application. |                                       |                             |                                   |

#### **307.01 SCOPE**

This specification covers the requirements for patch repairs to asphalt pavement using emulsified asphalt patching material, or proprietary cold patching material (PCPM).

#### **307.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Material**

OPSS 1153    Emulsified Asphalt Patching Material and Proprietary Cold Patching Material

#### **307.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Binder** means the approved bituminous binding material conforming to the manufacturer's product specification.

**Proprietary Cold Patching Material (PCPM)** means a cold patching mix consisting of binder and aggregates, and manufactured by a specific company at their terminal, without further blending or modification prior to distribution to the work site.

#### **307.04 DESIGN AND SUBMISSION REQUIREMENTS**

##### **307.04.01 Submission Requirements**

Submission requirements for emulsified asphalt patching material or PCPM shall be according to OPSS 1153.

#### **307.05 MATERIALS**

##### **307.05.01 Emulsified Asphalt Patching Material**

Emulsified asphalt patching material shall be according to OPSS 1153.

##### **307.05.02 Proprietary Cold Patching Material**

The PCPM shall be according to OPSS 1153.

#### **307.06 EQUIPMENT**

##### **307.06.01 Placement and Compaction**

Method, equipment, and hand tools used for placing and compaction of patching material shall ensure durable work.

#### **307.07 CONSTRUCTION**

##### **307.07.01 General**

Asphalt repairs using patching material shall be carried out at the locations specified in the Contract Documents.

##### **307.07.02 Stockpiling**

If stockpiling of patching material is required, stockpiles shall be built to a maximum height of 3 m, and at locations specified in the Contract Documents or agreed between Contractor and Contractor Administrator. Stockpiles shall be constructed in such a manner that compaction, other than by the weight of the material itself, shall not result.

Equipment shall not be run over the surface of the stockpile.

##### **307.07.03 Delivery**

The mixture shall be transported in vehicles with smooth metal boxes in good and leak-proof condition, previously cleaned of all foreign materials.

Truck boxes shall be lightly coated with a uniform application of a release agent just prior to loading. If liquid agent is used, the truck boxes shall be drained after each application and prior to loading.

#### **307.07.04 Surface Preparation**

The surface on which the patching material is placed shall be free of dirt, sand, foreign matter and loose material. Standing water in the repair area shall be removed prior to placement of patching material, or follow the manufacturer's installation instructions if PCPM is used.

#### **307.07.05 Placement and Compaction**

##### **307.07.05.01 General**

At the time of use, stockpiled patching material shall exhibit uniform coating, good cohesion and workability.

During the patching operation the mixture placed shall adhere to the adjacent surfaces.

For repairs, patching material shall be placed in the repair area and compacted as specified in the Contract Documents. Placement and compaction of the patching material shall be sufficient to meet the requirements according to the Surface Appearance subsection.

For repairs greater than 50 mm in depth, the patching material shall be placed in lift thicknesses of maximum 50 mm in depth and each lift shall be compacted prior to the addition of the next lift.

#### **307.07.06 Surface Appearance**

After placement and final compaction of the patching material, patches shall be free of defective areas, including, but not limited to wheel track marking, ravelling, uneven surface, and fat spots.

#### **307.07.07 Material Sampling and Testing**

Patching material samples shall be provided when requested by the Owner. Samples may be requested before or during the construction. The samples shall be taken from the stockpile, truck, or during placement of the material.

Samples required for stripping resistance, workability, and cohesion testing shall be a minimum 25 kg. Samples required for extraction and gradation testing shall be a minimum 15 kg.

All samples shall be obtained, labeled and packaged in the presence of the Contract Administrator. Sample containers shall be supplied and shall be metal containers equipped with a wire handle and a tight fitted lid. Samples shall be labelled with the following information:

- a) Contract Number.
- b) Sampling date.
- c) Mixture type and name.
- d) Sampling location.
- e) Manufacturer's name.
- f) Contractor's name.
- g) Weather conditions at the time of sampling.
- h) Sampler's name.

Completed samples shall be submitted to the Contract Administrator for delivery to the Owner's designated laboratory.

#### **307.07.08 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **307.08 QUALITY ASSURANCE**

#### **307.08.01 Acceptance**

The Contract Administrator shall determine the acceptance of all patching work based on all of the following:

- a) Visual observation of the patching material - During the time of patching, the mix used shall exhibit uniform coating, good cohesion, and workability.
- b) Surface appearance of the patch at the time of patching - All patches after final compaction shall be free of defective areas, including, but not limited to wheel track marking, raveling, uneven surface, and fat spots. Areas showing such defects shall be deemed rejectable.
- c) Continuity with adjacent surfaces.
- d) Conformance of the patching materials to the mixture property testing requirements - Test results for stripping resistance, workability and cohesion not meeting the mixture property testing requirements according to OPSS 1153 shall be deemed rejectable.

#### **307.08.02 Testing**

Patching material samples may be taken and tested by the Owner to ensure the material is according to OPSS 1153 and this specification.

The Owner may request the Contractor to provide test results showing that the patching material possesses the mixture property testing requirements according to OPSS 1153.

#### **307.08.03 Rejection**

All material and patches rejected by the Contract Administrator shall be removed and replaced. The replaced portion of the work shall meet the requirements of this specification.

### **307.09 MEASUREMENT FOR PAYMENT**

#### **307.09.01 Actual Measurement**

##### **307.09.01.01 Emulsified Asphalt Patching Material Proprietary Cold Patching Material**

Measurement of patching material shall be by mass in tonnes.

**307.10 BASIS OF PAYMENT**

**307.10.01 Emulsified Asphalt Patching Material - Item  
Proprietary Cold Patching Material - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

## **CONSTRUCTION SPECIFICATION FOR TACK COATING AND JOINT PAINTING**

### **308.01 SCOPE**

This specification covers the requirements for the placement and acceptance of tack coating, and joint painting.

#### **308.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

### **308.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

### **308.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

#### **Ontario Provincial Standard Specifications, Construction**

OPSS 313 Hot Mix Asphalt - End Result

#### **Ontario Provincial Standard Specifications, Material**

OPSS 1103 Emulsified Asphalt

#### **Ontario Ministry of Transportation Publications**

MTO Laboratory Testing Manual:

LS-200 Penetration of Bituminous Materials

LS-216 Residue by Distillation

#### **ASTM International**

D 3665-07e1 Standard Practice for Random Sampling of Construction Materials

#### **American Association of State Highway and Transportation Officials (AASHTO)**

T40-02 (2006) Sampling Bituminous Materials

### 308.03

### DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Binder Course** means a HMA course between a surface course and either a granular base course or stabilized base course, an existing pavement, or another HMA binder course.

**Hot Mix Asphalt (HMA)** means hot mixed, hot laid asphaltic concrete. The terms are used interchangeably. HMA may include recycled or specialty mixes.

**Independent Laboratory** means as defined in OPSS 313.

**Joint** means a vertical contact between a new HMA pavement course and any HMA pavement or any rigid object that exists at the time the new HMA is laid.

**Lot** means a specific quantity of material or a specific amount of construction.

**Protection Board** means a durable panel specifically designed to provide an interface protection barrier between the HMA and the asphalt waterproofing membrane.

**Quality Assurance (QA)** means a system or series of activities carried out by the Owner to ensure that materials received from the Contractor meet the requirements specified in the Contract Documents.

**Surface Course** means the HMA wearing course of any flexible or composite pavement.

### 308.04

### DESIGN AND SUBMISSION REQUIREMENTS

#### 308.04.01

#### Submission Requirements

At least 5 Days prior to the first use of tack coat or joint painting material on the Contract, the Contractor shall submit documentation to the Contract Administrator identifying the proposed supplier and applicator of the product. With this, the Contractor shall submit material safety data sheets and any other information for the safe handling and storage of the product.

Proposals for the use of alternative tack coat and joint painting material, including the use of SS-1 emulsified asphalt with a dilution rate lower than 50%, shall be submitted in writing to the Contract Administrator at least 7 Days prior to the intended use of the alternate product.

The Contractor's proposal shall include the following:

- a) The reason for the use of the alternate material.
- b) Material safety data sheet and any other information for the safe handling, transportation and storage of the product.
- c) Testing protocols to be used in confirming the properties of the material.
- d) Typical test results.
- e) Required application rates.
- f) Cost implications for the use of the alternate product.

The Contract Administrator shall review this proposal and shall respond in writing within 5 Days of receiving it, with either accepting the use of the alternate product or not accepting its use with rationale. The alternate product shall not be used until the Contract Administrator has granted permission in writing.

## **308.05 MATERIALS**

### **308.05.01 Tack Coat and Joint Painting Material**

Tack coat and joint painting material shall consist of SS-1 emulsified asphalt diluted with an equal volume of water. The undiluted material shall be according to OPSS 1103.

## **308.06 EQUIPMENT**

### **308.06.01 Tack Coat Distributors**

For main lane paving, tack coat shall be applied using self-propelled or tow-along pressure distributors capable of applying the product at the specified rate and in a continuous and uniform manner both longitudinally and transversely for the full lane width. The distributors shall be equipped with a volume-metering system of sufficient sensitivity to measure the quantity of tack coat dispensed, measurable to within four or five litres. The accuracy of the metering system shall be certified by the manufacturer and this certificate shall be made available to the Contract Administrator upon request. Alternatively, the metering system shall be accompanied by documentation confirming that it was calibrated within the past 12 months by the manufacturer, or its authorized representative, and such documentation shall be made available to the Contract Administrator upon request.

The use of a hand-held pressure applicator is acceptable for tack coating protection board and small irregularly shaped areas such as tapers.

### **308.06.02 Joint Painting Distributors**

A hand-held pressure applicator shall be used for joint painting.

## **308.07 CONSTRUCTION**

### **308.07.01 Application of Tack Coat**

Surfaces to be tack coated shall be free of standing water and contamination, such as mud, loose aggregate, or debris. Protection board shall be dry and clean when the tack coat is applied.

Tack coat shall be placed sufficiently ahead of the paving operation to allow for curing. Paving and construction equipment shall not be permitted onto the tack coat until it has broken and set. Tack coat shall be applied ahead of the paver to accommodate not more than 2 hours of production of HMA. Hot mix shall not be placed on tack-coated areas until the tack coat has cured to a proper condition of tackiness. Traffic shall be prevented from travelling upon the tack coat.

Tack coat shall be applied to the following:

- a) Protection board.
- b) Existing pavement surfaces including, but not limited to, hot mix and Portland cement concrete.
- c) Milled pavement surfaces.

- d) Expanded asphalt surface.
- e) Cold-in-place recycled surfaces.

and others as may be specified in the Contract Documents.

#### **308.07.01.01 Tack Coat Rate of Application**

The diluted emulsion shall be applied at the rate of 0.35 kg/m<sup>2</sup> to all existing pavement surfaces, milled pavement surfaces, expanded asphalt surfaces, and any binder course surface that has been left open to traffic over at least one winter. For cold-in-place recycled surfaces and new surfaces that have been paved in the same calendar year, the rate of application shall be 0.20 kg/m<sup>2</sup>. The rate of application on protection board shall be 0.50 kg/m<sup>2</sup>.

When the Contractor's proposal to use an alternative tack coat product or dilution rate has been accepted, the application rates shall be in accordance with the submitted request.

#### **308.07.02 Application of Joint Painting**

Faces at which joints are made shall be painted with a thin, uniform, and continuous coating of joint painting material to the satisfaction of the Contract Administrator. The joint between pavement lanes paved in echelon is not required to be painted. The joint between pavement lanes paved with an infrared joint heater shall not be painted.

#### **308.07.03 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **308.08 QUALITY ASSURANCE**

#### **308.08.01 General**

The Contract Administrator shall determine the acceptability of tack coat and joint painting.

All visually defective material or work shall be rejected by the Contract Administrator irrespective of any test results. Such defective material and work shall not be incorporated into the finished work.

#### **308.08.01.01 Basis of Product Acceptance**

Acceptance of tack coat product shall be based on quality assurance test results conducted by the Owner's designated lab, subject to the conditions specified herein. Testing by a referee laboratory may be invoked by the Contractor.

For acceptance purposes, a minimum of one test for residue by distillation, percent by mass in accordance with LS-216, and one penetration test on the residue in accordance with LS-200 shall be performed by the Owner's QA laboratory on the diluted product for each subplot of tack coat. Test results shall be submitted to the Contractor as they become available to the Contract Administrator.

#### **308.08.01.02 Laboratory Proficiency**

The laboratory conducting the QA testing shall participate successfully in the MTO correlation program for emulsion testing prior to and during the time of paving.

### **308.08.01.03                      Samples for Testing**

Samples for testing shall be representative of the material being used and shall be obtained at the paving site in accordance with AASHTO T40 and ASTM D 3665. QA samples obtained for acceptance purposes and for referee testing shall be obtained at the paving site. All required samples for acceptance and referee purposes shall be acquired at the same time in locations selected by the Contract Administrator.

The minimum quantity of each of the QA and referee samples shall be 1 litre. The Contractor shall obtain, package, and transport all QA and referee samples to the Owner's designated QA laboratory. Only new containers shall be used for sampling purposes. QA and referee samples shall be delivered at the same time, in a condition suitable for testing, and within 2 Business Days of sampling.

### **308.08.01.04                      Lot and Sublot Sizes**

The entire quantity of tack coat used on the Contract shall be divided into one to three lots with one lot for each specified application rate. The lots shall be divided into sublots, typically comprising the quantity used to cover an area of 40,000 m<sup>2</sup>. The Contract Administrator in consultation with the Contractor shall determine the actual sublot sizes. A sublot may be terminated at the Contractor Administrator's option when hot mix placement for the Contract ceases for a period of 20 Days.

### **308.08.01.05                      Product Acceptance**

Tack coat product acceptance is based on the results of the residue by distillation test according to LS-216 on the diluted product for each sublot, as well as the weighted mean of all such tests. The weighted lot mean for the product percent residue (WM<sub>pro</sub>) shall be calculated using the following equation:

$$WM_{pro} = [(PR_1 \times A_1) + (PR_2 \times A_2) + \dots + (PR_n \times A_n)] / [A_1 + A_2 \dots + A_n]$$

Where:

|                 |   |                              |
|-----------------|---|------------------------------|
| PR <sub>n</sub> | = | Percent Residue for sublot n |
| A <sub>n</sub>  | = | the area of sublot n         |
| n               | = | the number of sublots        |

The percent residue by distillation for each sublot shall not be less than 20% for the result to be included in the calculation of the weighted mean. Sublots with percent residue less than 27.5% shall be accepted into the work, with a payment reduction determined using WM<sub>pro</sub> and Table 1.

### **308.08.01.06                      Referee Testing**

Testing by an independent laboratory for the percent residue is available to the Contractor for any sublot of tack coat.

Referee testing may only be invoked if the Contractor has taken and delivered all referee samples in a condition suitable for testing. In addition, referee testing shall be permitted only if it is invoked within 2 Business Days of the Contractor receiving the test results for the sublot in question.

If referee testing is requested, the referee laboratory shall be designated by the Contract Administrator from a list maintained by the Owner for this purpose. The Contract Administrator shall arrange for the transfer of all referee samples to be tested to the referee laboratory.

The results of the referee testing shall be binding on both parties and shall be used in the calculation of the payment factor. The cost of the referee testing is specified elsewhere in the Contract. It shall be borne by the Contractor if the percent residue as determined by the referee laboratory is less than 27.5%.

**308.08.01.07                      Acceptance**

**308.08.01.07.01                      Acceptance of Tack Coat Application Rate**

The acceptance of tack coat application rate shall be based on settings determined by the Contractor of the equipment on the pressure distributors. When requested, such settings shall be verified by the Contract Administrator.

Tack coat application shall be visually uniform. Areas of insufficient or non-uniform tack coat coverage shall be re-sprayed by the Contractor at no additional cost to the Owner. Where tack coating is performed using hand-held devices, the visual appearance of such areas shall be consistent with the adjacent areas of machine applied material.

**308.08.01.07.02                      Acceptance of Joint Painting Application Rate**

The joint painting shall provide a thin, uniform, and continuous coating to the satisfaction of the Contract Administrator.

**308.09                                      MEASUREMENT FOR PAYMENT**

**308.09.01                                      Plan Quantity Payment**

**308.09.01.01                                      Tack Coat**

Measurement shall be by Plan Quantity Payment by area in square metres.

**308.10                                      BASIS OF PAYMENT**

**308.10.01                                      Tack Coat - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work, except that payment for joint painting shall be made under the appropriate hot mix tender item.

Payment for tack coating of concrete surfaces completed in association with bridge deck waterproofing shall be included in the bridge deck-waterproofing item. Payment for tack coating of the protection board shall be paid under the tack coat item.

The payment reduction for each lot of tack coat shall be calculated using the following equation:

Payment Reduction = Total area tack coated x Price x 0.5 [1.00 - Product Payment Factor]

No payment shall be made for sublots with percent residue less than 20%. The results for the remaining sublots in the lot shall be analyzed for the weighted mean for the product percent residue and the product quality payment factor determined from Table 1.

The price shall be the tender item price for the specified product or the negotiated price of the alternate product, if the Owner accepted the use of that product.

**TABLE 1**  
**Product Quality Payment Factors**

| <b>% Residue - Weighted Lot Mean (WM<sub>pro</sub>)</b> | <b>Product Quality Payment Factor</b> |
|---------------------------------------------------------|---------------------------------------|
| $\geq 27.5$                                             | 1.00                                  |
| 20.0 - 27.4                                             | 0.75                                  |

**311.01 SCOPE**

This specification covers the requirements for the construction of asphalt sidewalk, driveway and boulevard on prepared base and for the resurfacing of existing sidewalk.

**311.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**Ontario Provincial Standard Specifications, Construction**

OPSS 102                      Weighing of Materials

**Ontario Provincial Standard Specifications, Material**

OPSS 1103                  Asphalt Emulsion  
OPSS 1151                  Superpave and Stone Mastic Asphalt Mixtures

## **311.05 MATERIALS**

### **311.05.01 Hot Mix**

The hot mix for this work shall conform to OPSS 1151 except that the final mix gradation may be altered by the Engineer to adjust the percentage of coarse aggregate.

### **311.05.02 Asphalt Emulsion**

The asphalt emulsion shall be undiluted SS-1 and shall conform to OPSS 1103.

## **311.06 EQUIPMENT**

### **311.06.01 Roller**

A hand operated roller weighing not less than 135 kg or an approved power roller shall be used.

## **311.07 CONSTRUCTION**

### **311.07.01 General**

The hot mix shall be placed on the prepared base or on the surface of the existing sidewalk to line, grade, and dimensions as shown in the Contract. The prepared base shall be dry, well compacted and approved by the Engineer before work commences.

Hot mix shall not be placed unless the surface is dry and the air temperature is at least 7 °C. Hot mix shall not be dumped faster than it can be properly raked and screeded.

Areas inaccessible to the roller shall be compacted with hand operated hot tampers.

The sidewalk, driveways and boulevard shall not be opened to pedestrians or vehicles until the mix has cooled sufficiently to prevent deformation.

Forms or other approved means shall be used to obtain proper line and neat uniform edges.

### **311.07.02 Sidewalk Resurfacing**

The surface of the existing sidewalk on which asphalt is to be placed shall be thoroughly cleaned. Loose and broken material shall be removed from locations designated in the Contract and disposed of outside the contract limits.

Sound concrete and/or asphalt surfaces which are to remain shall be uniformly sprayed with SS-1 Emulsion at the rate of 0.5 kg/m<sup>2</sup>. The emulsion shall form a continuous film over the surface and shall be allowed to dry until it reaches the required state of tackiness before the resurfacing course is laid.

### **311.07.03 Tolerances**

The surface, after compaction, shall be smooth and true to the established grade and of a uniform texture.

The surface of the finished sidewalk, driveway and boulevard shall be free from depressions exceeding 5 mm as measured with a 3 m straight edge placed anywhere on the sidewalk parallel to the centreline.

**311.09 MEASUREMENT FOR PAYMENT**

**311.09.01 Actual Measurement**

**311.09.01.01 Asphalt Sidewalk  
Asphalt Driveway  
Asphalt Boulevard  
Sidewalk Resurfacing**

Measurement will be of the area in place in square metres.

**311.09.02 Plan Quantity Measurement**

**311.09.02.02 Asphalt Sidewalk  
Asphalt Driveway  
Asphalt Boulevard  
Sidewalk Resurfacing**

Measurement is by Plan Quantity, as may be revised by Adjusted Plan Quantity, of the horizontal area in square metres.

**311.09.03 Hot Mix**

Measurement for payment of hot mix designated for this work shall be in tonnes conforming to OPSS 102.

**311.10 BASIS OF PAYMENT**

**311.10.01 Asphalt Sidewalk - Item  
Asphalt Driveway - Item  
Asphalt Boulevard - Item  
Sidewalk Resurfacing - Item**

Payment at the contract price for the above tender item(s) shall be full compensation for all labour equipment and materials to do the work.

**311.10.02 Hot Mix**

Hot mix designated for this work will be paid for at the contract price for the appropriate hot mix tender item.

**CONSTRUCTION SPECIFICATION FOR  
ASPHALT CURB AND GUTTER SYSTEMS AND  
ASPHALT SURFACING OF GUTTERS**

### **312.03 DEFINITIONS**

For the purpose of this specification the following definitions apply:

**Curb and Gutter** means curb, gutter or combinations of curb and gutter.

**Curb and Gutter Systems** means curb and gutter, setbacks, gutter outlets, concrete spillways, bullnoses or any combination of them, including catch basin frames and grates which lie within the flow lines of the curb and gutter system.

### **312.05 MATERIALS**

#### **312.05.01 Hot Mix**

Asphaltic concrete shall be according to OPSS 1151. The type of hot mix asphalt (HMA) shall be as specified in the Contract Documents.

#### **312.05.02 Emulsified Asphalt**

Emulsified asphalt shall be undiluted SS-1 according to OPSS 1103.

### **312.06 EQUIPMENT**

#### **312.06.01 Asphalt Paver**

The asphalt paver shall be equipped with a template capable of obtaining the cross section specified in the Contract Documents.

#### **312.06.02 Roller**

The hand-operated roller shall weigh not less than 135 kg.

#### **312.06.03 Asphalt Curb Machine**

The asphalt curb machine shall be equipped with a template capable of obtaining the cross section specified in the Contract Documents.

### **312.07 CONSTRUCTION**

#### **312.07.01 General**

The HMA specified shall be placed on the prepared base or on the surface of the existing curb and gutter to the lines, grade, and dimensions specified in the Contract Documents.

Asphalt curb and gutter may, at the Contractor's option, be placed integrally with an adjacent lane of HMA. The placement of the curb and gutter shall be done using a curb attachment on the paver.

HMA shall be compacted using a roller. Areas inaccessible to the roller shall be compacted by hand operated hot tampers.

### **312.07.02                      Operational Constraints**

Operational constraints for the placing of HMA for asphalt curb and gutter construction shall be according to OPSS 313.

Asphalt curb and gutter shall not be placed unless the ambient air temperature is at least 2 °C.

### **312.07.03                      Foundation and Backfill**

The foundation shall be excavated, backfilled, and compacted to the grade and shape required to allow for placement of the HMA curb and gutter system to the line, grade, and dimension specified in the Contract Documents.

Excavation and embankment construction shall be according to OPSS 206.

Granular base and granular backfill construction shall be according to OPSS 314.

### **312.07.04                      Surface Preparation of Gutter**

The surface of the asphalt or concrete gutter on which asphalt is to be placed shall be cleaned of all dirt, loose and broken materials. The sound asphalt or concrete gutter shall be sprayed with emulsified asphalt at the rate of 0.5 kg/m<sup>2</sup>. The application of emulsion shall extend onto the pavement for a width of 0.15 m. The emulsion shall form a continuous film over the surface and shall be allowed to cure until it reaches the required state of tackiness before the asphalt surfacing is placed.

### **312.07.05                      Finishing**

After the compacted HMA has cooled to ambient temperature, the exposed vertical surfaces of the asphalt curb and gutter system shall be sprayed to 0.15 m beyond the front edge with emulsified asphalt at a rate of 0.5 kg/m<sup>2</sup>. The emulsion shall be applied before the surface becomes contaminated with any material.

### **312.07.06                      Tolerances**

The surface after compaction shall be of uniform texture, smooth and true to the line, grade, and dimensions specified in the Contract Documents. The surface shall be free from depressions exceeding 5 mm as measured from the bottom edge of a 3 m straight edge placed anywhere along the surface of the HMA and parallel to the edge.

### **312.07.07                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **312.09                              MEASUREMENT FOR PAYMENT**

### **312.09.01                      Actual Measurement**

#### **312.09.01.01                  Asphalt Curb and Gutter Asphalt Surfacing of Gutters**

Measurement shall be by length in metres along the flow line of the gutter and will be of the total length of curb and gutter. Such measurements shall include the spaces occupied by setbacks, gutter outlets and frames and grates.

**312.09.01.02                      Asphalt Spillways**

Measurement of asphalt spillways shall be by length in metres along the flow line from the end of the gutter outlet to the spillway termination.

**312.09.01.03                      Asphalt Gutter Outlets**

For measurement purposes, a count shall be made of the number of setbacks and gutter outlets installed without separation into types.

**312.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**312.10                                BASIS OF PAYMENT**

**312.10.01                          Asphalt Curb and Gutter - Item  
Asphalt Surfacing of Gutters - Item  
Asphalt Spillways - Item  
Asphalt Gutter Outlets - Item**

Payment at the Contract price for the above item(s) shall be full compensation for all labour, Equipment and Material to do the work.

**312.10.02                          Hot Mix**

Hot mix designated for this work shall be paid for at the Contract price for the appropriate hot mix asphalt tender item.

**312.10.03                          Granular Materials**

Granular materials required for the work shall be paid for at the Contract price for the appropriate granular tender item.

### **313.01 SCOPE**

This specification covers the requirements for the placement, compaction, and acceptance of hot mix asphalt (HMA).

This specification also covers the requirements for the placement, compaction, and acceptance of HMA produced using warm mix asphalt (WMA) technology when the tender item title includes “Warm Mix”.

## 313.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Ambient Air Temperature** means the air temperature measured in the shade and away from the paving operations.

**Anti-Stripping Treatment (AST)** means as defined in OPSS 1151.

**Asphalt Cement (AC)** means asphalt binder as defined in OPSS 1101.

**Attribute** means one of the following properties: designated large sieve (DLS), 4.75 mm sieve, 75 µm sieve, AC content, air voids, lift thickness, VMA, draindown, or compaction.

**Binder Course** means a HMA course between a surface course and either a granular base course or stabilized base course, an existing pavement, or another HMA binder course.

**Crack** means a break in the pavement surface, a separation of the pavement or aggregates at the surface of the pavement, and separation of pavement joints, and includes breaks and separations previously repaired by sealing.

**Design Lift Thickness ( $T_D$ )** means the thickness in millimetres as specified in the Contract Documents of:

- a) A specified lift of asphalt mix measured by square metres, or
- b) For multiple binder course lifts of the same tender item, it means the combined specified thicknesses in millimetres of the successive binder course lifts of the same tender item, at the same location measured by square metres.

**Designated Large Sieve (DLS)** means a sieve size specifically designated for each mix type for gradation testing. The designated sieve for the following mix types is:

- a) 25.0 mm for Superpave 37.5;
- b) 19.0 mm for Superpave 25.0;
- c) 12.5 mm for SMA 19.0 and Superpave 19.0;
- d) 9.5 mm for SMA 12.5 and Superpave 12.5, 12.5FC 1 and 12.5FC 2; and
- e) 4.75 mm for SMA 9.5 and Superpave 9.5.

**Draindown** means that portion of SMA mixture, fines and AC, that separates and flows downwards through the mixture.

**Fat Spot** means an area of pavement where asphalt mastic has migrated to the surface creating a substantially blacker area than the surrounding pavement.

**Field Adjustment to the Job Mix Formula** means a change in the target gradation, AC content, or both of a mix, within limits as specified in the Contract Documents without a redesign of the HMA, resulting in an adjusted JMF.

**Hot Mix Asphalt (HMA)** means hot mixed, hot laid asphaltic concrete and includes mix produced using WMA technologies. HMA may include recycled or specialty mixes.

**Hot Mix Asphalt Miscellaneous** means HMA that is placed in areas other than the roadway as specified in the Contract Documents.

**Job Mix Formula (JMF)** means the percentage passing on each designated sieve of the total mass of aggregate and the amount of AC as a percentage by mass of the mixture that are based on mix design procedures as specified in the Contract Documents.

**Joint** means a vertical contact between a HMA pavement course and any HMA pavement or any rigid object that exists at the time the HMA is laid.

**Levelling Course** means a HMA course of variable thickness used for correcting crossfall and profile deficiencies in the existing pavement prior to placing a HMA binder or surface course. Levelling course may also be referred to as a padding course.

**Lift Thickness** means the thickness in millimetres, measured according to LS-294, of:

- a) A single lift of asphalt mix measured by square metres, or
- b) For multiple binder course lifts of the same tender item, it means the combined thickness of all placed and compacted successive binder course lifts of the same tender item, at the same location measured by square metres.

**Loose Mix** means a representative sample of uncompacted HMA for testing mix properties.

**Lot** means a specific quantity of Material or a specific amount of construction.

**Mean** means the arithmetic average of the test results within a lot.

**Mid-Lane Segregation** means a continuous or discontinuous longitudinal “streak” of segregation, typically no greater than 300 mm in width located anywhere across the width of the lane.

**Mix Properties** means the AC content, gradation, air voids, and VMA.

**Other Segregation** means discrete areas or patches of regular, irregular, or chevron shape segregation.

**Outlier** means a test result that for a specific significance level is determined by statistical analysis not to be part of the test result population.

**Padding** means a HMA layer used to eliminate transverse and longitudinal irregularities on an existing surface before placing the binder or surface course.

**Paving in Echelon** means two or more pavers are used to pave multiple adjacent lanes simultaneously.

**Payment Adjustment Sieves** means the DLS, 4.75 mm, and 75 µm gradation sieves.

**Percent within Limits (PWL)** means an estimate of the percentage of the lot that is within specification limits, determined by using the mean and standard deviation of the lot.

**Performance Graded Asphalt Cement (PGAC)** means as defined in OPSS 1101.

**Quality Assurance (QA)** means a system or series of activities carried out by the Owner to ensure that Materials received from the Contractor meet the requirements as specified in the Contract Documents.

**Quality Control (QC)** means a system or series of activities carried out by the Contractor to ensure that Materials supplied to the Owner meet the requirements as specified in the Contract Documents.

**Random Sample** means a sample from a location chosen by the Contract Administrator based on random numbers such that any portion of a lot or subplot has an equal probability of being selected.

**Reclaimed Asphalt Pavement (RAP)** means the processed HMA material that is recovered by partial or full depth removal.

**Segregation** means a condition of the pavement characterized by areas with comparatively coarser or finer texture than that of the surrounding pavement, with severity levels:

- a) Slight Segregation - a pavement matrix is in place between the coarse aggregate particles; however, there are slightly more, coarse aggregate particles in comparison with the surrounding acceptable mix.
- b) Medium Segregation - the pavement has significantly more, coarse aggregate particles than the surrounding acceptable mat and usually exhibits some lack of surface matrix.

- c) **Severe Segregation** - the pavement appears very coarse, with coarse aggregate particle against coarse aggregate particle and the pavement has little or no matrix.

**Small Quantity Lot** means any lot with one or two sublots.

**Standard Deviation** means the square root of the value determined by summing the squares of the difference between each test result and the mean of the test results divided by the number of test results minus one.

**Stone Mastic Asphalt (SMA)** means HMA consisting of a gap graded, stone-on-stone coarse aggregate skeleton with an asphalt cement-rich mortar.

**SMA Mixes** means SMA 9.5, SMA 12.5, and SMA 19.0.

**Straight Edge** means a straight edge made of metal with a level recessed in its upper surface parallel to the lower edge.

**Superpave** means a system for specifying material components and asphalt mix design using the Superpave gyratory compactor. It is an acronym for Superior Performing Asphalt Pavements.

**Surface Course** means the HMA wearing course of any flexible or composite pavement.

**Through Lane** means a traffic lane not intended for entering or exiting the roadway and does not include shoulders. Where there is more than one roadway, through lane refers to the traffic lane for the higher-class roadway. Freeway to freeway ramps, HOV lanes, and truck climbing lanes are considered through lane.

**Vertical Surface** means all edges of concrete curbs, catch basins, appurtenances, longitudinal joints, and transverse joints for application of joint painting material.

**Voids** means air voids and voids in mineral aggregate (VMA).

**Warm Mix Asphalt (WMA)** means warm mixed, warm laid asphaltic concrete produced using technologies that allow for the mixing, handling and compaction of the asphaltic concrete mixture at a temperature typically 20 to 50 °C lower than conventional HMA.

**Waxed-based WMA Technology** means a WMA technology that uses in whole or in part synthetic natural wax components.

## **313.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **313.04.01 Submission Requirements**

Prior to the start of paving, the purchase price of the AC, in the form of a purchase order or other document signed by the Contractor's senior financial officer, shall be submitted to the Contract Administrator.

If there is intent to store HMA production in a silo, the planned times of HMA production shall be submitted to the Contract Administrator with one Business Day advance notice.

Prior to the start of paving on bridge decks, the mass of the rollers, except for Class V rollers, to be used on bridge decks shall be submitted to the Contract Administrator in writing. The minimum compaction temperature for HMA or WMA recommended by the AC supplier shall also be submitted to the Contract Administrator in writing.

A copy of the Technical Data Sheet and Safety Data Sheet of the release agent(s) shall be submitted to the Contract Administrator.

### **313.05 MATERIALS**

#### **313.05.01 Hot Mix Asphalt**

The HMA shall be according to OPSS 1151. Asphalt cement, tack coat, anti-stripping treatments, release agents, and other additives shall be compatible with the other components of the HMA.

#### **313.05.02 Tack Coat**

Tack coat shall be according to OPSS 308.

#### **313.05.03 Release Agents**

No release agents shall be used that may adversely affect the quality or performance of the HMA. Release agents shall be used according to the proprietary requirements.

Petroleum based release agents, excess water, or excess release agents shall not be used.

#### **313.05.04 Warm Mix Asphalt**

The WMA shall be according to OPSS 1151 and the following:

The mix shall be produced at a facility capable of producing the mix according to the WMA technology supplier's instructions for the use of their WMA technology. All information required for the proper preparation, handling, storage, and use of the WMA materials shall be obtained from the WMA technology supplier.

The use of waxed-based or sulfur-based WMA technologies shall not be permitted.

#### **313.05.05 Grit for Stone Mastic Asphalt**

Grit for SMA shall be as specified in the Contract Documents.

### **313.06 EQUIPMENT**

#### **313.06.01 Rollers**

A Class R Roller is a self-propelled pneumatic-tired roller.

A Class S Roller is self-propelled steel-drum, tandem, or three-wheel roller.

A Class V Roller is a self-propelled vibratory roller specifically designed for HMA compaction having either dual vibratory rolls or a combination of vibratory roll and pneumatic tires with a contact area equal to or greater than 70% of the roll width.

#### **313.06.01.01 Rollers for Granular Grade Preparation**

Finish rolling for granular grade shall be accomplished using, as a minimum:

- a) A Class S roller with a minimum mass of 7 tonnes and minimum mass of 3.5 kg per mm total roll width,  
or

- b) A Class V roller with a drum width of at least 1.2 m.

#### **313.06.01.02                      Rollers on Bridge Decks**

Compaction shall be accomplished using, as a minimum:

- a) A Class S roller with a minimum mass of 9 tonnes and minimum mass of 4.5 kg per mm total roll width, and
- b) A Class R roller with a minimum mass of 18 tonnes and minimum mass of 2,500 kg per tire.

If Class V rollers are used, they shall be used in static mode.

At the Contract Administrator's request, rollers shall be weighed in the presence of the Contract Administrator or a representative.

#### **313.06.02                      Diamond Grinding**

A diamond grinder shall be power-driven, self-propelled, and designed for grinding HMA. It shall be equipped with a grinding head with at least 50 diamond blades per 300 mm of shaft. The grinding head shall be at least 1.2 m wide. The grinder shall be equipped with the capability to adjust the depth, slope, and crossfall to remove HMA to the required profile and shall also include a slurry pick-up system.

### **313.07                      CONSTRUCTION**

#### **313.07.01                      Quality Control**

The QC procedures shall be conducted to ensure HMA meets the requirements of the Contract Documents. Interpretation of QC inspections, test results, and measurements and the determination of any action to be taken shall be carried out to ensure that the work is according to the requirements of the Contract Documents.

A single sample for QC purposes may be obtained at the same time and location as QA acceptance samples. No additional loose mix samples shall be taken from the placed mix.

Up to three cores may be taken in each surface lot for additional samples for QC purposes. For binder courses, obtainment of one thickness core from each subplot for each binder lift shall be permitted prior to placement of the surface course. Cores shall not be spaced closer than one metre from any other core. If further additional samples are required, a written request shall be made to the Contract Administrator and samples shall only be taken upon written approval of the Contract Administrator. All sample locations shall be restored as specified in the Contract Documents.

#### **313.07.02                      Laboratory Correlations**

On request, the Contract Administrator shall provide the opportunity to conduct a correlation of mix properties or compaction or both between the QA and QC laboratories prior to placement of HMA. The correlation may occur once for each mix type and shall be a maximum of three samples per mix type.

The Contract Administrator shall be provided with the samples and all information required to conduct the correlation testing. The Contract Administrator shall submit the QA test results on completion of the correlation testing.

### **313.07.03                      Preparation of Foundation and Existing Pavement**

Prior to placing any course of HMA on:

- a) A granular grade, a Class S roller or an equivalent Class V roller shall be used to finish roll the grade ahead of the paver. The granular grade after rolling shall be a compacted, smooth, float-free surface, free from contamination of foreign materials. Any distortion that will impact the specified thickness of the pavement to be placed shall be repaired.
- b) The HMA or concrete surfaces, the HMA and concrete surfaces shall be clean and free of all loose, broken, and foreign materials.
- c) Milled surfaces, the milled surface shall be clean of all loose, broken, and foreign materials and shall be swept with a power broom.

The existing surface being prepared by milling or padding or a combination, shall be prepared such that each lift can be placed and compacted to the thickness as specified in the Contract Documents, provided such corrections do not reduce the thickness of existing pavement materials or underlying materials by more than 5 mm below the general profile of the surrounding existing unground or unmilled pavement surface.

### **313.07.04                      Correction of Pavement Beneath Surface Courses**

Corrections may be made to any pavement course underlying the surface course by padding, milling, grinding, or a combination in order to meet the surface smoothness requirements. A plan shall be submitted to the Contract Administrator identifying the limits and types of corrections. The correction work shall be subject to approval of the Contract Administrator. Padding shall be completed using a mix type acceptable to the Owner. The thickness of those pavements after milling or grinding shall not be reduced by more than 5 mm below the general profile of the surrounding unground or unmilled pavement surface. The milled surface shall not exceed 25 mm from ridge to ridge, and the ridge to valley depth of the milled surface shall not exceed 10 mm.

### **313.07.05                      Tack Coat**

Tack coat shall be applied to surfaces according to OPSS 308 prior to placing HMA.

### **313.07.06                      Transportation of Hot Mix Asphalt**

Truck boxes used to transport HMA shall be clean and, if required, lightly coated with a uniform application of a release agent. Truck boxes shall be drained after each application and before loading.

### **313.07.07                      Placing Hot Mix Asphalt**

#### **313.07.07.01                  Operational Constraints**

Paving shall not be carried out if the roadbed is frozen. When placing the mixture on a granular grade, the granular grade shall not be saturated and shall be free of standing water. The surface of a pavement upon which HMA is to be placed shall be clean and dry at the time of HMA placement.

For paving on bridge decks, a HMA course shall not be placed over the waterproofing membrane and protection board until a minimum 4 hours has elapsed following completion of the waterproofing system or until the waterproofing system has set sufficiently that the integrity of the waterproofing system is not jeopardized. After completion of the waterproofing system and prior to paving, a Request to Proceed shall be submitted to the Contract Administrator. Paving shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

A HMA course shall not be placed upon a previously laid course until the temperature of the previous course is 50 °C or less. For a HMA lift thickness of 60 mm or less, this temperature shall be measured at the surface. For a HMA lift thickness greater than 60 mm, this temperature shall be measured internally.

The HMA binder courses shall be not placed unless the ambient air temperature is at least 2 °C. The HMA surface courses shall not be placed unless the ambient air temperature is at least 7 °C.

Public traffic shall not be permitted on freshly laid HMA until the temperature of the mat is 50 °C or less.

When WMA is used, the WMA technology supplier's recommendations for placing the WMA mix shall be followed. Placement and compaction temperatures of WMA shall be according to the WMA technology supplier's recommendations but shall also meet the operational constraints listed in this clause.

A lot shall be closed before paving begins on a different lot using the same tender item, the same mix design or both; unless otherwise allowed by the Contract Administrator.

### **313.07.07.02                      Paving**

#### **313.07.07.02.01                General**

Levelling, binder, and surface courses shall be laid by means of mechanical self-propelled pavers. Prior to roller compaction, obvious defects in the HMA placed shall be corrected. Irregularities in the alignment and grade along the outside edges shall be corrected. Excess HMA shall not be cast onto the surface of the freshly laid mat. After final compaction of each course the surface shall be smooth and true to the established crown and grade, uniform in texture and shall be free of any defects, including but not limited to, cracks, segregation, fat spots, oil spills, chatter, and roller marks.

If actions fail to prevent continued medium or severe segregation regardless of cause, the Contract Administrator may instruct to cease paving until the problem has been corrected.

All through lane paving courses shall be completed prior to the placement of adjacent sideroads, speed change lanes, and other paved areas.

The HMA shall be placed and compacted to the thickness as specified in the Contract Documents for each lift.

At the end of each completed portion of the lanes and prior to opening them to traffic, the ends of completed sections of HMA course shall be temporarily ramped down to the existing pavement according to the Temporary Ramp Downs clause.

If paving is being carried out under lane closures, paving shall be completed to the same station for the full pavement width, including paved shoulders, prior to the roadway being reopened to traffic except as noted in the Partial Paving of Full Pavement Width clause.

#### **313.07.07.02.02                Paving in Echelon**

For the purpose of laying levelling, binder and surface courses as specified in the Contract Documents, paving in echelon may be used as an option.

When paving in echelon, the pavers shall be operated at the same time within 60 m of the next paver so that a hot joint is obtained between the lanes of HMA being placed. Should one paver break down while placing levelling, binder, or surface course, the Contract Administrator may permit the Day's work to be completed with the remaining paver only.

### **313.07.07.02.03          Paving on Bridge Decks**

The temperature of the HMA immediately after spreading shall be equal to or greater than the minimum temperature recommended by the AC supplier. When the HMA is produced using WMA technology, the temperature of the WMA immediately after spreading shall be equal to or greater than the minimum temperature recommended by the WMA technology supplier. Breakdown rolling shall commence immediately after spreading.

### **313.07.07.02.04          Paving Widening and Irregular Sections**

The HMA shall be placed in widenings such that the top of the compacted HMA is placed flush with the top of the existing pavement. When stepped joints are specified in the Contract Documents, the layers placed in the widening shall be placed flush with the top of each step in separate operations. HMA shall be placed in the widening using equipment specially designed for this purpose.

In turnouts, driveways, and other irregular sections, other methods may be used to spread and finish the HMA, such methods shall be subject to the approval of the Contract Administrator.

### **313.07.07.02.05          Partial Paving of Full Pavement Width**

Partial paving of the full pavement width is permitted except when one or more of the following conditions exist:

- a) When the ramping height would be greater than 50 mm,
- b) At the longitudinal edges that will form the hot joint of lanes to be paved in echelon when specified under the Paving in Echelon clause, or
- c) The pavement slope would cause water to accumulate at the edge of the ramping and extend onto an adjacent lane or shoulder that will be open to traffic.

When partial paving of the full pavement width is permitted, temporary longitudinal and transverse ramp downs shall be placed regardless of the difference in height elevations between adjacent pavement surfaces.

### **313.07.07.02.06          Temporary Ramp Downs**

The HMA courses shall be temporarily ramped down to the existing pavement at a slope not steeper than 50H:1V transversely. Transverse ramp downs shall not form part of the permanent pavement and shall be removed prior to paving of the adjacent section.

Where longitudinal ramp downs are permitted or if, due to unforeseen circumstances such as equipment breakdown occurring during paving, paving cannot be completed to the same station across the full pavement width, the HMA course shall be temporarily ramped down to the existing pavement at a slope of 10H:1V. Only one temporary longitudinal ramp down shall be in place across the width of the pavement at any time. The temporary longitudinal ramp down shall not form part of the permanent pavement and shall be removed prior to paving the adjacent section. The adjacent paving shall be completed such that the ramping is not in place more than five Days, unless a written request is submitted to the Contract Administrator and a written approval is provided by the Contract Administrator allowing the ramp downs to remain in place for more than five Days.

Loose particles generated during construction of the longitudinal or transverse ramp downs or both shall be removed from the roadway surface prior to re-opening the roadway to traffic. Temporary ramp downs shall remain intact and in place until they are removed prior to paving the adjacent section.

Temporary ramp downs shall be removed to produce a straight clean vertical surface for the full depth of the course prior to paving the adjacent lane or shoulder. After removal of the temporary longitudinal ramp down, traffic shall not be permitted to cross over the vertical surface at the longitudinal edge before the adjacent paving is completed.

### **313.07.07.03                      Longitudinal and Transverse Joints**

#### **313.07.07.03.01                      General**

All joints shall be made to obtain a complete bond between the two pavement edges and a smooth riding surface. The existing or previously placed pavement edge shall be a straight clean vertical surface for the full depth of the course. Where ramping or damage has occurred, trimming shall be required. All dirt or other foreign material and all loose material shall be removed from all vertical surfaces.

#### **313.07.07.03.02                      Longitudinal Joints**

The longitudinal joints shall be parallel to the lane and visually uniform longitudinally. The width of subsequent courses shall be staggered to an offset of 150 to 300 mm so that longitudinal joints do not coincide. The longitudinal joints in the surface course shall be offset 50 mm from the edge of the demarcation between the lanes as specified in the Contract Documents.

#### **313.07.07.03.03                      Transverse Joints at Limits of Paving**

Joints between HMA pavement laid under this Contract and existing HMA courses not laid under the Contract shall be constructed as follows:

- a) Where a binder course is placed flush against an existing HMA pavement and a butt joint is to be made, the existing pavement shall be trimmed back to form a straight vertical surface.
- b) Where a surface course is placed flush against an existing HMA pavement, a butt joint shall be prepared by removing the existing pavement to the full depth of the existing surface course to form a straight vertical surface and for a longitudinal distance not less than 5 m so that the surface course placed has a thickness equal to the full depth of the existing surface course over the 5 m section.
- c) Where a binder course and surface course are not placed flush against an existing HMA pavement, the binder course shall be feathered out removing the existing surface course to a minimum depth of not less than 40 mm to form a straight vertical surface and for a longitudinal distance not less than 5 m so that the surface course placed has a minimum thickness of 40 mm over the 5 m section.
- d) Where multiple courses are placed flush against an existing HMA pavement, the joint for each course shall be offset at least 150 mm from the joint on the course below.

At the limits of paving, the placement width of the HMA pavement shall match the width of the existing adjacent pavement.

#### **313.07.07.04                      Compaction**

Compaction of the HMA shall be conducted using appropriate methods and equipment to provide a uniformly compacted mat as specified in the Contract Documents. Class R rollers shall not be used to compact SMA.

At all places not accessible to rollers, the HMA shall be compacted by mechanical self-powered gas-, electric-, or air-powered equipment.

#### **313.07.07.05                      Gritting of Stone Mastic Asphalt**

Hot grit shall be embedded in the SMA surface as specified in the Contract Documents.

#### **313.07.08                      Field Adjustments to the Job Mix Formula**

Adjustment to the JMF to more closely reflect the mix being produced shall be permitted. The number of field adjustments to the JMF shall be limited to three for each mix design submitted, one prior to the start of production and a maximum of two during production. Field adjustments to the JMF shall be limited in scope such that the net impact of all field adjustments to the JMF does not exceed any of the maximum field adjustments to the JMF in Table 1 in comparison to the original JMF submitted under the current mix design.

JMF adjustments shall not be permitted once placement of the specific mix type has been completed. The adjusted JMF shall be submitted in writing on a form supplied by the Contract Administrator. Upon receipt of the JMF adjustment submission, the Contract Administrator shall give a written confirmation of receipt of the adjusted JMF. Within one Business Day of receipt of the JMF adjustment, the Contract Administrator shall give written notice confirming conformance to the Contract requirements or advising of any non-conformance. The revised JMF may be applied to the lot being placed at the time the confirmation of receipt of the revised JMF is issued and the previous lot, if requested by the Contractor as part of the written submission for a JMF change. If this request is not made, the revised JMF shall only apply to the lot placed after receipt of the revised JMF.

#### **313.07.09                      Sampling**

##### **313.07.09.01                      Asphalt Cement**

Samples of the AC shall be taken according to OPSS 1101.

When the selected WMA technology requires that additives be added to the AC, the samples for acceptance of the AC shall be taken after the additive has been added.

##### **313.07.09.02                      Hot Mix Asphalt Aggregates for Density Testing**

Samples for RAP and the aggregates identified in the mix design for each mix type using methods as specified in the Contract Documents shall be procured. The first set of samples shall be taken no later than 10 Days prior to the start of production of the first lot of HMA. Subsequent samples shall be taken immediately following the completion of 15,000 tonnes  $\pm$  1,000 tonnes of mix production and thereafter at further intervals of 20,000 tonnes as required. The aggregate and RAP sampling program shall be established in consultation with the Contract Administrator prior to paving. If the sampling interval needs to be reduced to reflect changes in the aggregate properties, the Contract Administrator shall be notified and samples shall be taken as warranted only when directed by the Contract Administrator.

A set of two samples shall be taken. One of these samples shall be for QA testing and the other shall be for referee testing. Samples for QA and referee testing shall be obtained concurrently.

Each sample shall be clearly identified as to the date of sampling, the lot number, and the tender item hot mix tonnage being produced when the sample was taken.

##### **313.07.09.03                      Hot Mix Asphalt Mix Properties**

Samples shall be appropriately labelled with the Contract number, highway number, Region, lot number, subplot number, mix type, lift number, station, and date and time of sampling.

Each random sample location or the tonnage from which the sample is to be taken shall be as designated by the Contract Administrator. A set of two samples shall be taken as per Table 2. One of these samples shall be for QA testing and the other shall be for referee testing. Samples for QA and referee testing shall be obtained concurrently.

When the mass of the sample does not meet the requirements of Table 2, the sample shall be discarded and a new one taken immediately.

The SMA sample for draindown testing shall coincide with one of the other subplot samples as designated by the Contract Administrator. The samples shall be transferred to a clean stainless steel bowl or pan of suitable size, immediately after splitting, for delivery to the QA laboratory.

If the Owner's QA laboratory chooses LS-292 for each mix design, two sets of samples shall be provided consisting of:

- a) 2 one-litre cans of AC,
- b) 25 kilograms of each aggregate type, and
- c) 1 kilogram of baghouse fines, if used in the mix design.

One sample is for Owner's QA testing and the other for referee testing for the purpose of ignition oven calibration, including aggregate correction factors. The samples shall be submitted to the Owner's QA laboratory at least five Business Days prior to the start of paving with the applicable HMA type. If materials have changed from the mix design, an additional two sets of samples as detailed above shall be provided.

#### **313.07.09.04                      Compaction**

Upon completion of each subplot, the Contract Administrator shall submit in writing notification of each random sample location. Pavement core samples shall be obtained in duplicate from each subplot no later than the next Business Day after the completion of the subplot. Each core shall meet the following requirements:

- a) Have a minimum nominal diameter of 150 mm and a maximum nominal diameter of 200 mm, and
- b) Consist of the full layer being sampled and at least one underlying layer, if one is present.

Cores shall not be taken within 250 mm of a longitudinal or transverse joint or the edge of pavement. Cores for compaction shall not be taken on bridge decks.

Each set of samples shall be taken from the same lane, same transverse offset, and at a spacing of  $1.0 \text{ m} \pm 0.1 \text{ m}$  between each individual core edge.

Cores shall not be damaged during coring operations or in transit. If a core is damaged, a replacement core shall be extracted at a location adjacent to the original core.

Core samples shall also include design lift thickness on the label. The lot and subplot numbers shall be clearly marked with a permanent marker on all compaction cores.

HMA and compaction requirements for filling the sample holes shall be the same as the adjacent undisturbed pavement. Sample holes shall be cleaned, dried, and filled and then compacted using a mechanical self-powered gas-, electric-, or air-powered compactor immediately after sampling.

A one litre sample of the release agent(s) shall be delivered to the Contract Administrator upon request.

**313.07.09.05****Warm Mix Asphalt**

Samples of WMA shall be obtained at the paver from sublots according to Table 2 for moisture sensitivity testing. The sublots are to be selected randomly from the sublots identified for mix properties by the Contract Administrator. These samples shall be designated for QA testing for moisture sensitivity according to AASHTO T 283. A complete sample data sheet shall accompany the samples. The data sheet shall also identify corresponding mix properties lot/sublot number and that the samples are for moisture sensitivity testing. Moisture sensitivity testing is required for information only.

**313.07.09.06****Lift Thickness**

For HMA tender items measured by square metres, single cores consisting of all lifts placed shall be used to evaluate the lift thickness of all lifts. Sample locations shall be determined based on the surface area of the upper most lift placed as specified in the Contract Documents.

All areas of hot mix paving as specified in the Contract Documents, including paved shoulders, shall be sampled for lift thickness with the following exceptions:

- a) Detours and other temporary pavement.
- b) Hot mix asphalt miscellaneous.
- c) Bridge decks.

Upon completion of each subplot of the upper most lift specified, the Contract Administrator shall submit in writing notification of the location to be used for sampling. After the completion of the subplot of the upper most lift specified, one pavement core sample shall be obtained from each subplot no later than the next Day. This one core shall be used for both QA and referee testing.

Each core shall have a nominal diameter of 50 mm and shall consist of all the specified hot mix lifts placed in the subplot and at least one underlying hot mix layer if one exists. Each core shall have its vertical side cored perpendicular to the upper surface of the core. Each sample shall be placed in a suitable container to protect the sample integrity during transport and until testing. The subplot number shall be clearly marked with a permanent marker on each core. In addition, the sample documentation as specified in the Contract Documents shall also note the number of lifts for which the thickness measurements are required and mix type for each.

No replacement thickness cores shall be obtained for QA or referee testing. When a core thickness is reported as "indeterminate", a new 150 mm core shall be taken centered over the subplot's previously taken 50 mm core.

Holes resulting from the removal of thickness core samples shall be cleaned, dried, and filled with a material acceptable to the Contract Administrator immediately after sampling.

**313.07.10****Identification of Warm Mix Asphalt Paving Limits**

When WMA is used, GPS coordinates for the WMA paving limits shall be submitted to the Contract Administrator no later than seven Days after completion of WMA paving.

**313.07.11****Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **313.08 QUALITY ASSURANCE**

### **313.08.01 Acceptance Criteria**

Acceptance of HMA shall be based on the following criteria:

- a) AC Physical Requirements
- b) Mix Properties and Compaction
- c) Surface Tolerance
- d) Surface Appearance
- e) Surface Smoothness
- f) Lift Thickness
- g) Geometrics and Longitudinal Joint Location

#### **313.08.01.01 Asphalt Cement Physical Requirements**

The Contract Administrator shall determine the acceptability of the AC according to OPSS 1101 and requirements as specified in the Contract Documents.

When the selected WMA technology requires that additives be added to the AC, acceptance of the AC shall be based on the samples that contain the WMA additive subject to the conditions as specified in the Contract Documents. An allowance request may be made for the impact of the WMA and AST on a PGAC grade for QA or referee purposes provided that when production begins a complete AASHTO M 320 test results for the following is submitted to the Contract Administrator:

- a) AC with WMA and AST at the percentage identified in the mix design.
- b) AC without the additives.

The combined allowance shall be limited to a maximum 2 °C colder than the high temperature grade or a maximum of 2 °C warmer than the low temperature grade.

#### **313.08.01.02 Mix Properties and Compaction**

##### **313.08.01.02.01 Lot Size**

##### **313.08.01.02.01.01 General**

Before HMA production for the tender item starts, a discussion with the Contract Administrator shall happen regarding their determination of the size and location of the lots and sublots. Guidelines for the breakdown of the tender item quantity into lots are as listed in Table 3.

When only one or two sublots are completed at the end of paving for the tender item due to a change in the JMF or when a delay of more than 20 Business Days occurs in placing the complete lot, the test results obtained shall be considered as part of the previous lot and the previous lot shall then have 11 or 12 sublots. When only 3 to 9 sublots are completed due to the above circumstances, then the 3 to 9 sublots shall be considered as a lot.

When a delay of more than 20 Business Days occurs in placing the complete lot and this lot shall be completed during the same calendar year, a request in writing prior to the end of the 20 Business Days may be submitted to the Contract Administrator that the lot be continued upon the resumption of paving for that tender item. If the request is not made or is not accepted by the Contract Administrator, the lot shall be terminated and evaluated for acceptance.

#### **313.08.01.02.01.02      Optional Surface Trial**

When the surface hot mix tender item is 5,000 tonnes or more, an optional trial of one lot, not exceeding 500 tonnes, with one subplot shall be permitted. The trial shall be placed in a binder course, and the lift thickness shall not be greater than 60 mm. If this optional trial is chosen, the Contract Administrator shall be advised in writing prior to placing the trial lot. The optional trial shall not be placed in a critical location such as bridge decks. The optional trial lot will be treated as a small quantity lot for basis of acceptance and payment.

#### **313.08.01.02.01.03      Lot Size for Bridge Decks**

Hot mix placed on a bridge deck should be treated as a separate lot. Where hot mix is placed in multiple stages, each stage shall be treated as a separate lot.

The lot shall be either a single subplot or divided into three approximately equal sublots as determined by the Contract Administrator in consultation with the Contractor.

#### **313.08.01.02.01.04      Lot Size for Tonnage Tender Items**

Lot size is generally 5,000 tonnes. Sublots are generally 500 tonnes, however, subplot sizes may be adjusted to ensure a minimum of three sublots per lot.

When the tender item quantity is less than 1,000 tonnes, the lot(s) shall be divided into at least three sublots as determined by the Contract Administrator, unless such division is deemed impractical by mutual agreement.

#### **313.08.01.02.01.05      Lot Size for Square Metre Tender Items**

For lift thicknesses in the order of 40 to 55 mm, lot size is generally 40,000 m<sup>2</sup> with sublots of 4,000 m<sup>2</sup>, however, subplot sizes may be adjusted to ensure a minimum of three sublots per lot. For lift thicknesses in the order of 60 to 100 mm, the lot size would generally be adjusted to 25,000 m<sup>2</sup> with sublots of 2,500 m<sup>2</sup>.

When the tender item quantity is less than 4,000 m<sup>2</sup>, the lot(s) shall be divided into at least three sublots as determined by the Contract Administrator, unless such division is deemed impractical by mutual agreement.

#### **313.08.01.02.02      Acceptance Testing**

The Owner shall conduct tests, carry out calculations, and provide values according to Table 4. The Contractor shall be provided with results from the completed tests.

The QA laboratory shall conduct density tests for RAP and aggregates identified in the mix design for each mix type using methods as specified in the Contract Documents.

When new aggregate samples are received, QA density testing on the new aggregate samples shall be conducted and the calculation of VMA for the subsequent lot(s) shall be based on the densities of the most recent QA samples submitted. When a change in aggregate density is noted, a request shall be made to the Contract Administrator that new samples be obtained between routine random samples. It shall also be stated in the sample request if the current lot will be closed or if the lot will be completed and the new density tests results will not be used for calculation of VMA until the next lot. The submitted request shall meet Contract Administrator's satisfaction prior to changes being made to sampling.

### **313.08.01.02.03            Basis of Acceptance**

Acceptance for all mixes for mix properties and compaction is based on the lot PWL for each attribute, excluding VMA. PWL shall be determined using lot test results, LS-101, and lower and upper limits as specified in Table 5. The PWL of the lot for each criterion shall be used to determine the payment adjustment factor from Table 6. If the PWL is less than 50% for AC content, air voids or compaction, or less than 25% for any payment adjustment sieve, the lot is rejectable and shall be subject to repair or payment adjustment. VMA shall meet the minimum mix design requirements according to OPSS 1151 for each lot and payment shall be based on the lot mean as specified in the Payment Factor for Voids clause. If the VMA payment factor is less than 0.500, the lot shall be considered rejectable. SMA lots shall be considered rejectable if the draindown is more than 0.3%.

Small quantity lots shall not be subject to payment adjustment unless the mix is rejectable. Acceptance for these lots shall be on a subplot by subplot basis. The subplot shall be considered acceptable if the AC content, gradation, air voids, and compaction of each subplot comply with the limits specified in Table 5, and the VMA shall be no more than 0.50% below the design minimum. Mix that does not comply with the requirements shall be considered rejectable.

The Contract Administrator shall determine if a rejectable lot may remain in the work without repairs. When the Contract Administrator has determined that a rejectable lot may remain in the work without repair, the lot shall be subjected to an additional payment adjustment reflecting the extent of the non-conformance as determined by the Contract Administrator. If repair of the lot is chosen in lieu of a payment adjustment or if the Contract Administrator determines that a rejectable lot requires repair, the lot shall be repaired and re-evaluated as specified in the Repairs for Mix Properties and Compaction clause.

### **313.08.01.02.04            Referee Testing**

A single request for referee testing for a given lot can only be invoked within five Business Days after the Contract Administrator's calculated QA payment factors for that lot have been received. Referee testing for aggregate density can only be invoked within five Business Days after the QA test results for aggregate density have been received.

For mix properties and compaction, a request may be made for testing by a referee laboratory for the entire lot or a maximum of two sublots from that lot. For all sublots in the referee request, referee testing shall fall into one of three categories:

- a) Mix properties only,
- b) Compaction only, or
- c) Mix properties and compaction.

A request may be made for referee testing for determining the draindown of a SMA sample.

The referee laboratory shall use the same test method as the QA laboratory except that when the QA laboratory chooses LS-292, the referee laboratory shall use that method provided the calibration requirements are met. If they are not met, the referee laboratory shall use LS-282.

When referee testing of mix properties is invoked, the referee laboratory shall conduct all necessary testing with the exception of the combined aggregate density which shall be supplied by the Contract Administrator.

When referee testing for compaction is invoked, the referee laboratory shall determine the MRD of the referee loose mix sample for the subplot and this value shall be used in the calculation of compaction for the referee core.

The results generated by the referee laboratory shall be used to re-evaluate the lot to determine the payment factors for the acceptance of the disputed properties for the disputed lots of HMA. The referee test results are binding on both the Owner and the Contractor.

#### **313.08.01.02.05           Outliers in Referee Results**

Where an entire lot of three or more sublots has been referee tested, an individual value for any attribute of a subplot's test result excluding VMA may be questioned. The request shall be made within three Business Days after receiving all the test results for the lot and only when the payment factor for the attribute with an outlier is less than 1.0. The validity of the questioned attribute shall be ascertained in accordance with ASTM E 178 using a T test at a 10% significance level.

If the T test procedure shows that the questioned value of the attribute is not an outlier then the test result shall be used in the calculations. If the T test procedure shows that the questioned value of the attribute is an outlier then the test result for the subplot shall be checked for mathematical errors. If there are no mathematical errors, the subplot with the outlier is treated as a lot with one subplot and the remaining sublots shall form a separate lot with no further consideration for outliers.

If only two sublots remain, the two sublots shall be treated as two separate lots each with one subplot.

#### **313.08.01.03           Surface Tolerance**

The surface tolerances of any pavement surface shall be such that when tested with a 3 m straight edge placed anywhere including the edge of the pavement and in any direction on the surface except across the crown or drainage gutters, there shall not be a gap between the bottom of the straight edge and the surface of the pavement:

- a) Greater than 6 mm for all binder courses, levelling courses, and padding, or
- b) Greater than 3 mm for all surface courses.

Traffic control shall be provided, as required, for the Owner to conduct surface tolerance measurements. All tolerance-related repairs shall be carried out according to the Repairs subsection.

Longitudinal joints shall be constructed such that the elevation difference across the longitudinal joints shall not exceed 5 mm when measured with a straight edge placed on the asphalt surface with the higher elevation and overhanging the joint by not more than 50 mm. All joints which exceed the 5 mm tolerance shall be repaired such that the tolerance is met.

#### **313.08.01.04           Surface Appearance**

The HMA deemed by visual appearance to have flushing, bleeding, segregation, fat spot, surface damage, cracking, chatter, or surface contamination but not limited to these, shall be considered deficient material or work. Traffic control shall be provided for all surface appearance assessments. Deficient material, mixture, and work shall be removed and replaced, or repaired, or assessed a payment reduction.

##### **313.08.01.04.01           Segregation**

The HMA exhibiting medium or severe mid-lane segregation shall be assessed a payment reduction or shall be repaired at the discretion of the Contract Administrator.

From the time the Contract Administrator provides notification of mid-lane segregation, a maximum of 500 tonnes of HMA may be placed to demonstrate the effectiveness of any repairs or adjustments or both made to a defective paver. The repairs or adjustments or both shall be demonstrated to the Contract Administrator. If the repairs or adjustments or both to the paver do not eliminate mid-lane segregation to the satisfaction of the Contract Administrator within the allowable 500 tonnes of HMA, then the use of that paver shall be discontinued.

Other segregation shall be addressed in accordance with the following:

- a) Slightly segregated mix shall be accepted into the work with no payment reduction.
- b) Medium segregation in levelling courses or padding with a thickness greater than 40 mm and binder courses shall normally be left in place with no payment reduction. Any areas of medium segregation that deteriorates prior to being overlaid by another pavement course shall be repaired at no cost to the Owner.
- c) Medium segregation in surface courses shall be assessed a payment reduction or repaired at the discretion of the Contract Administrator.
- d) Severely segregated mix shall be repaired by removal and replacement.

Levelling courses and padding with a total thickness less than 40 mm, bullnoses, and tapers that were not machine-laid and any areas of handwork shall not be assessed based on segregation but based on other workmanship-related problems. However, if they deteriorate prior to being overlaid by another pavement course, the Contract Administrator shall assess the causes of the deterioration before determining responsibility for the cost of repairs.

#### **313.08.01.04.02            Challenging Severity of Segregation**

A challenge in writing of the severity of any segregated area assessed as either medium or severe may be submitted within five Business Days of receiving the Owner's first visual assessment. The written challenge shall list the dimensions and assessment of the severity of each disputed segregated area.

For Contracts with up to 30,000 tonnes of HMA, a maximum of two separate written challenges for each tender item shall be permitted. For Contracts with more than 30,000 tonnes of HMA, a maximum of four separate written challenges for each tender item shall be permitted. Each written challenge may involve more than one disputed segregated area.

The Owner or a representative of the Owner, who did not carry out the original assessment and who is not the Contract Administrator, shall make a second visual assessment of the disputed areas. All necessary surface preparations and traffic control shall be provided so that this second visual assessment shall be carried out within five Business Days after the Contract Administrator has received the written challenge. The results of that second visual assessment shall be binding on both the Owner and Contractor.

A further challenge may be made to the Owner's second visual assessment of the segregation severity, if the segregation has occurred in any one of the mixes listed in Table 7. Such a challenge shall be made in writing within five Business Days of receiving the Owner's second visual assessment. Such a challenge shall be resolved by the Owner or a representative of the Owner determining the Macrottexture Ratio, according to LS-317. All necessary surface preparations and traffic control shall be provided during the field measurements for Macrottexture Ratio. Table 7 shall be used with the Macrottexture Ratio to determine the degree of severity and the disposition of the disputed area of segregation. The Macrottexture Ratio results shall be binding on both the Owner and the Contractor.

#### **313.08.01.05            Acceptance Criteria for Surface Smoothness**

The acceptability of surface smoothness shall be as specified in the Contract Documents.

### **313.08.01.06 Lift Thickness for Square Metre Tender Items**

#### **313.08.01.06.01 Lot Size**

The Contract Administrator shall determine the size and location of the lots and sublots for thickness before hot mix production for the tender item starts.

There shall be one lot consisting of all square metre tender items when the entire Contract has the same number of lifts and tender items throughout. There shall be a separate lot for areas with:

- a) Different number of lifts,
- b) Different tender items, or
- c) Both.

Each lot shall be divided into sublots, corresponding to the area of the upper most lift, which generally is the surface course. Sublots shall normally be 2,000 m<sup>2</sup> in size. A minimum of three sublots are required for each lot.

#### **313.08.01.06.02 Acceptance Testing**

The Owner shall conduct tests, carry out calculations, and provide values according to Table 4. A copy of each lift thickness measurement for each lift placed at each sample location upon completion of the subplot measurement shall be provided by the Contract Administrator.

#### **313.08.01.06.03 Basis of Acceptance**

The acceptance of lift thickness is based on subplot lift thickness measurements and lot mean lift thickness of the tender item. The Contract Administrator shall calculate the thickness payment adjustment for the lot once all measurements for the lot have been completed.

Sublot lift thickness shall be acceptable if they are equal to or greater than the minimum subplot lift thickness as specified in Table 8 for the tender item's  $T_D$ .

The subplot shall be deemed rejectable and shall be repaired if:

- a) The lift thickness measurement is less than the minimum subplot lift thickness as specified in Table 8, or
- b) For successive binder lifts of the same tender item, the combined lift thickness for these successive lifts is less than the minimum subplot lift thickness as specified in Table 8.

When a lift thickness lot contains any subplot that is deemed rejectable, the lot is rejectable until the subplot has been repaired and re-evaluated as acceptable. When the Contract Administrator allows a rejectable subplot to remain in place without repair, the subplot shall be subjected to a payment reduction according to the Payment Adjustment for Lift Thickness clause. A subplot lift thickness measurement for a rejectable subplot that receives a payment reduction shall not be used to assess the lot mean for the tender item.

The Contract Administrator shall calculate the lot mean lift thickness for each tender item to one decimal point and the lot thickness payment adjustment based on all the subplot lift thickness measurements in the lot, according to LS-100 and Table 9. If the lot mean lift thickness for the surface course tender item is less than 85% of the  $T_D$  the lot is rejectable.

The Owner shall determine if a rejectable lot may remain in the work without repairs. When the Owner has determined that a rejectable lot may remain in the work without repair, the lot shall be subjected to a payment reduction as determined by the Owner.

#### **313.08.01.06.04 Referee Testing**

An individual lift thickness measurement may be challenged by requesting referee testing in writing to the Contract Administrator within five Business Days after receiving the subplot lift thickness measurement. An opportunity shall be permitted to view the re-measurement of the QA designated pavement core for that subplot at an alternative Owner designated laboratory together with the Owner's representative. The re-measurement shall include the individual lift thickness that was challenged and shall also include any other lifts or combination of lifts in the core. The re-measured lift thickness measurements shall be considered binding and shall replace the original lift thickness measurements for assessment of all lifts measured for the core.

#### **313.08.01.07 Geometrics and Longitudinal Joint Location**

##### **313.08.01.07.01 General**

After final compaction, the HMA shall be smooth and true to the design profile and cross-section and constructed to the design width.

##### **313.08.01.07.02 Pavement Width**

The Contract Administrator shall conduct random spot checks of the width of each binder and surface course HMA lift for acceptance. Offset stakes shall be provided and maintained on both sides of the roadway, or other identifiers acceptable to the Contract Administrator, for use in checking the pavement width at 25 m maximum intervals until the Contract Administrator advises that the stakes or identifiers are no longer required.

The width of each lift shall be accepted provided:

- a) The outside edges of the lanes and the paved shoulders are parallel to the centreline and visually uniform.
- b) The width across all the adjacent lanes from the outside edge to outside edge is not less than the sum of the specified lane widths, and
- c) The width of the paved shoulders is not less than the paved shoulder width as specified in the Contract Documents.

If the width is not acceptable at any location, the Contract Administrator shall provide notification in writing that the pavement is rejectable. A written proposal for corrective action shall be submitted to the Contract Administrator within three Business Days of receiving the notification.

##### **313.08.01.07.03 Longitudinal Joint Location**

Longitudinal joints not meeting the Contract requirements shall be removed and replaced or assessed a payment reduction.

#### **313.08.02 Repairs**

##### **313.08.02.01 General**

All repairs shall be performed at no additional cost to the Owner. No repairs are permitted prior to completion of a lot.

All transverse joints in surface course repairs shall butt up to a full depth vertical surface. Repairs shall consist of the removal and replacement of the full thickness of the hot mix lift or the placement of an overlay when permitted by the Contract Administrator. A paver shall be used in carrying out the repair.

Repairs shall be full lane or full shoulder width except where localized repairs are allowed as specified in the Contract Documents.

The materials and the construction of repairs shall meet the acceptance criteria and other requirements as specified in the Contract Documents.

The limits and type of repairs shall be subject to the approval of the Contract Administrator and shall be approved prior to the repair being carried out.

Any damage to waterproofing system on bridge decks shall be repaired according to OPSS 914. The limits and type of waterproofing repair shall be subject to the approval of the Contract Administrator and shall be approved prior to the repair being carried out.

Repairs of an urgent nature, including moderate to very severe aggregate loss, moderate to very severe flushing, and wheel track rutting 16 mm in depth or greater shall be repaired within seven Days, unless extended by mutual agreement.

Except for urgent repairs, repairs shall be completed within 60 Days or prior to seasonal shutdown each year, whichever is the lesser, unless extended by mutual agreement.

#### **313.08.02.02 Repairs for Mix Properties and Compaction**

For a lot that is not rejected repairs may be chosen in lieu of accepting a payment adjustment, if the total payment factor for the lot is less than 0.940. When the Contract Administrator requires a rejectable lot to be repaired or repairs are chosen in lieu of accepting a payment adjustment, the areas of HMA in a lot that are to be repaired shall be determined subject to the minimum lengths and widths as specified in the Contract Documents. Each repair area shall include at least one of the loose mix or compaction core sample locations or both representing that subplot.

The minimum length of a single-repair to one lane shall be 250 m. The minimum length of a single-repair that extends over more than one lane shall be 250 lane-metres and no portion of the single-repair in a lane shall be less than 125 m in length.

The minimum limits of each repair shall be at least 125 lane-metres from the location of the loose mix or compaction core or both that represents the subplot; otherwise, a repair limit shall coincide with one end of the subplot when the sample location is less than 125 lane-metres from it. If the proposed limit of a single-repair falls within the proposed limit of another single-repair, the overlap shall count towards the 250 lane-metre minimum for both repairs. Repair areas within a single lane shall be separated by at least 100 m. If the delineation of repair areas results in patches less than 100 m apart, these repair areas shall be re-established to form a continuous repair.

A list and sketch identifying the proposed locations of the repairs shall be submitted to the Contract Administrator for review at least five Business Days prior to the intended start of the repair work. Each subplot and single-repair shall be uniquely labelled. Overlapping repair areas and discontinuous portions of a single-repair shall be labelled so that they are readily identified with their single-repair.

Prior to the repair, slab samples or cores shall be taken for testing of mix properties or compaction or both in the unrepaired area within 1 m of the limits of each end of the repair area. Additional samples or cores shall not be permitted to be taken beyond these locations until after QA or referee testing demonstrates that the remaining Material in the subplot proposed for repair is deemed to be rejectable. If the proposed repair limit coincides with the beginning of a subplot that is being left unrepaired, samples are not required at this location. Sufficient material shall be obtained for testing by the Owner's QA laboratory and for possible referee testing.

Testing shall demonstrate that the remaining Material in the subplot proposed for repair is not rejectable. To determine if the mix is rejectable, the mix properties and compaction shall comply with the basis of acceptance of a small quantity lot. If the Material is deemed to be rejectable, the proposed limit of the repair shall be extended by a minimum of 25 m, and the sampling and testing repeated. The repair area selected shall incorporate the location used for obtaining samples that shall be used to confirm that the remaining mix is not rejectable. If the repair proposal results in the removal of at least half the subplot tonnage, the Contract Administrator may waive testing demonstrating the suitability of the remainder of that subplot.

The unrepaired sublots combined with the unrepaired areas of any repaired sublots shall comprise one lot and shall be assessed based on the loose mix and core samples representing the unrepaired sublots. When a repaired subplot consists of two or more separate unrepaired areas, the Contract Administrator shall decide whether to combine these unrepaired areas as one subplot or to consider each unrepaired area as a separate subplot. If there are only one or two sublots in a lot that are not repaired, the Contract Administrator shall include those sublots as part of the previous or next lot.

The mix used for the repair shall comprise a separate lot or, prior to beginning any repair, the Contract Administrator in conjunction with the Contractor may decide to include it as part of the current lot being produced. The repaired area shall be tested for all criteria and re-evaluated for acceptance.

The two reconfigured lots shall be accepted at the full Contract price, subjected to a payment adjustment according to the Payment Adjustment for Mix Properties and Compaction clause, or rejected.

#### **313.08.02.03                      Repairs for Surface Tolerance**

All areas not meeting the surface tolerance requirements shall be repaired by diamond grinding to a maximum of 5 mm or removed and replaced. Slurry produced from diamond grinding shall be removed from the site and managed as specified in the Contract Documents. The repaired areas shall be re-evaluated for surface tolerance acceptance by means of a 3 m straight edge as specified in Surface Tolerance clause.

#### **313.08.02.04                      Repairs for Segregation**

Repairs for segregation shall meet the requirements of the General Repairs clause. In binder courses, localized repairs for mid-lane segregation less than 300 mm in width are permitted.

#### **313.08.02.05                      Repairs for Thickness**

Any repairs solely to correct for excess lift thickness shall not be permitted.

The minimum length of a repair is the entire length of the subplot being repaired.

Acceptance for lift thickness of the repaired subplot shall be based on the individual subplot lift thickness measurement and the lot thickness payment adjustment shall be calculated based on the re-evaluated subplot measurement.

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Measurement of HMA by area shall be the horizontal area in square metres in place.

The quantities of HMA used for temporary ramp downs shall not be measured for payment. The removal of HMA used for temporary ramp downs shall not be measured for payment.

#### **313.09.01.01.02      Tonne to Square Metre Conversion**

When the unit of measure for a HMA tender item is square metres, and the Contract Documents refer to a quantity of mix for that tender item in tonnes and the Contract Documents do not already modify the quantity to relate to square metres, the Contract Administrator shall determine the theoretical HMA quantity in square metres ( $Q_A$ ) that shall replace the non-payment tonnage quantity ( $Q_t$ ) references as follows:

$$Q_A = Q_t / [0.975 \times BRD_{MD} \times (T_D/1000)] \quad (\text{Formula 1})$$

Where:

- $BRD_{MD}$  = the bulk relative density in  $t/m^3$ , provided in the submitted HMA mix design, the  $Q_A$  is calculated for
- $T_D$  = the design thickness, in millimetres, of the mix
- $Q_t$  = non-payment tonnage quantity referred to elsewhere in the Contract Documents for the mix under the measurement by square metre tender item

### **313.09.01.01.03 By Mass**

Measurement of HMA by mass shall be in tonnes according to the requirements of the Contract Documents.

The quantities of HMA used for temporary ramp downs shall not be measured for payment. The removal of HMA used for temporary ramp downs shall not be measured for payment.

### **313.09.01.02 Hot Mix Asphalt Miscellaneous**

Measurement of HMA Miscellaneous shall be by area in square metres, regardless of the number of lifts placed.

### **313.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement is based on the units shown in the clauses under Actual Measurement. The Plan Quantity shall not be adjusted due to any of the exceptions specified in the Lift Thickness clause under the Sampling clause.

Payment at the Contract price for the above tender items shall include full compensation for all labour, Equipment, and Materials required to do the work (including the HMA used for temporary ramp downs), the removal of HMA used for temporary ramp downs, and the applicable payment adjustments.

When repairing HMA, all associated work and replace or restore all associated damage and removals shall be carried out at no additional cost to the Owner.

When the Contract Administrator instructs to cease paving due to continued medium or severe segregation regardless of cause, shall be at no additional cost to the Owner.

The preparation and correction of existing surfaces and pavement beneath surface courses carried out in order to meet the requirements of the Contract Documents, including milling, padding, and diamond grinding, shall be at no additional cost to the Owner.

#### **313.10.01.02 Payment Adjustment for Mix Properties and Compaction**

For all mixes, when repair is not required or repair is not chosen for a lot, the payment adjustment for that lot due to mix properties and compaction requirements shall be:

$$PA_{MC} = \text{lot quantity} \times \text{price} \times [PF_{MC} - 1.000] \quad (\text{Formula 2})$$

Where:

$PA_{MC}$  = payment adjustment for mix properties and compaction  
 lot quantity = the quantity of the mix in the lot. For SMA 19.0, SMA 12.5, SMA 9.5, Superpave 12.5FC 1, and Superpave 12.5FC 2 tender items measured by tonnage, the lot quantity is the quantity of the mix in the lot multiplied by the applicable mass multiplier factor (MF) in the Payment Adjustment for Aggregate Density clause.  
 price = the Contract price of the hot mix tender item  
 $PF_{MC}$  = payment factor for mix properties and compaction

For all mixes, when the  $PF_{MC}$  is:

- a) Less than 1.000, there shall be a reduction in payment, and
- b) Equal to 1.000 there shall be no adjustment.

#### **313.10.01.02.01 Calculations**

##### **313.10.01.02.01.01 General**

The  $PF_{MC}$  shall be based on the individual payment factors obtained from Table 6, based on PWL, determined for gradation, AC content, voids, and compaction using LS-101, Table 5, and the formulae in the Payment Factor for Gradation clause, the Payment Factor for Combined Gradation and Asphalt Cement Content clause, the Payment Factor for Voids clause, the Payment Factor for Combined Mix Properties clause, and the Payment Factor for Combined Mix Properties and Compaction clause. Rounding-off procedures for all calculations shall follow LS-100.

When there is no sampling or testing specified in the Contract Documents for an attribute or when the requirement for sampling or testing for an attribute is waived by the Owner, the payment factor for that attribute shall be equal to the payment factor it is added to in Formulae 5, 10, 11 or 12.

#### **313.10.01.02.01.02 Payment Factor for Gradation**

The payment factor for gradation shall be calculated using the following formulae:

For Superpave 37.5, Superpave 25.0, Superpave 19.0, Superpave 12.5, Superpave 12.5FC 1, Superpave 12.5FC 2, SMA 19.0, and SMA12.5:

$$PF_G = (PF_{DLS} + PF_{4.75} + PF_{75}) / 3 \quad (\text{Formula 3})$$

For Superpave 9.5, Superpave 4.75, and SMA 9.5:

$$PF_G = (PF_{4.75} + PF_{75}) / 2 \quad (\text{Formula 4})$$

Where:

- $PF_G$  = payment factor for gradation
- $PF_{DLS}$  = payment factor for designated large sieve
- $PF_{4.75}$  = payment factor for the 4.75 mm sieve
- $PF_{75}$  = payment factor for the 75  $\mu$ m sieve

#### **313.10.01.02.01.03 Payment Factor for Combined Gradation and Asphalt Cement Content**

The payment factor for combined gradation and AC content shall be calculated using the following formula:

$$PF_{GAC} = (PF_G + PF_{AC}) / 2 \quad (\text{Formula 5})$$

Where:

- $PF_{AC}$  = payment factor for AC content
- $PF_{GAC}$  = payment factor for combined gradation and AC content

#### **313.10.01.02.01.04 Payment Factor for Voids**

For Superpave mixes, if the lot mean VMA is not more than 0.50 per cent below the minimum VMA as specified in the Contract Documents for mix design purposes, the payment factor for VMA is 1.000. For lot mean VMA results more than 0.50 per cent lower than the minimum specified for mix design purposes, a payment factor for the subject lot shall be calculated in accordance with the following:

$$\text{If } (VMA_{min} - VMA_{mean}) \geq 2.5, \text{ then } PF_{VMA} = 0.0 \quad (\text{Formula 6})$$

$$\text{If } (VMA_{min} - VMA_{mean}) < 2.5 \text{ then, } PF_{VMA} = 0.8000 - 0.4 \times (VMA_{min} - 0.5 - VMA_{mean}) \quad (\text{Formula 7})$$

Where:

- $PF_{VMA}$  = payment factor for VMA
- $VMA_{mean}$  = lot mean VMA
- $VMA_{min}$  = minimum VMA specified for mix design

For Superpave mixes, the payment factor for VMA shall be compared to the payment factor for air voids and the lesser of the two is the payment factor for voids ( $PF_{VOIDS}$ ).

For SMA mixes, if the lot mean VMA is not more than 1.00 per cent below the minimum VMA as specified in the Contract Documents for mix design purposes, the payment factor for VMA is 1.000. For lot mean VMA results more than 1.00 per cent lower than the minimum specified for mix design purposes, a payment factor for the subject lot shall be calculated in accordance with the following:

If  $(VMA_{min} - VMA_{mean}) \geq 3.0$ , then  $PF_{VMA} = 0.0$  (Formula 8)

If  $(VMA_{min} - VMA_{mean}) < 3.0$  then,  $PF_{VMA} = 0.8000 - 0.4 \times (VMA_{min} - 1.0 - VMA_{mean})$  (Formula 9)

Where:

$PF_{VMA}$  = payment factor for VMA

$VMA_{mean}$  = lot mean VMA

$VMA_{min}$  = minimum VMA specified for mix design

For SMA mixes, the payment factor for VMA shall be compared to the payment factor for air voids and the lesser of the two is the payment factor for voids ( $PF_{VOIDS}$ ).

#### **313.10.01.02.01.05 Payment Factor for Combined Mix Properties**

The payment factor for combined mix properties shall be calculated using the following formula:

$$PF_M = (PF_{GAC} + PF_{VOIDS}) / 2 \quad (\text{Formula 10})$$

Where:

$PF_M$  = payment factor for combined mix properties

#### **313.10.01.02.01.06 Payment Factor for Combined Mix Properties and Compaction**

The payment factor for combined mix properties and compaction shall be calculated using Formula 11.

$$PF_{MC} = (PF_C + PF_M) / 2 \quad (\text{Formula 11})$$

Where:

$PF_C$  = payment factor for compaction

The  $PF_{MC}$  shall be rounded and reported to four decimal places.

When the Contract Administrator decides that the unrepaired area of an original lot that has been partially repaired shall not be resampled, the  $PF_{MC}$  for the unrepaired area shall be 1.000.

#### **313.10.01.02.01.07 Small Quantity Lots**

For small quantity lots, each subplot shall be assigned a  $PF_{MC}$  of 1.000 if the subplot is not rejectable. If the subplot is determined to be rejectable, it shall be administered as described in the Repairs for Mix Properties and Compaction clause. When the Owner has determined that a rejectable subplot may remain in the work without repair, the lot shall be subjected to a payment adjustment reflecting the extent of the non-conformance as determined by the Owner.

#### **313.10.01.03 Payment Adjustment for Surface Smoothness**

Payment adjustment for surface smoothness shall be as specified in the Contract Documents.

#### **313.10.01.04 Payment Adjustment for Segregated HMA**

For all surface courses, where payment reduction for segregation is allowed in lieu of repairs, the payment reduction shall be calculated as follows:

- a) \$2,000 once for each applicable surface course tender item,
- b) An additional payment reduction of \$2.50/m for mid-lane segregation, and

- c) An additional payment reduction of \$5.00/m<sup>2</sup> for other segregation. The area of repair shall be computed by multiplying the full lane width by the length of the repair and rounded to the next whole square metre.

### **313.10.01.05 Payment Adjustment for Aggregate Density**

For Superpave 12.5FC 1, Superpave 12.5FC 2, SMA 19.0, SMA 12.5, and SMA 9.5 tender items measured in tonnes, the tender quantity is based on reference densities according to Table 10. A payment adjustment for aggregate density for each lot for these tender items shall be calculated by the following formulae:

$$MF = D_R / (BRD_{mix}) \quad \text{(Formula 12)}$$

$$PA_{AD} = M_{mix} \times \text{Contract Price} \times [MF - 1.000] \quad \text{(Formula 13)}$$

Where:

|                |   |                                                                                                                                                                                                                                                                  |
|----------------|---|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $D_R$          | = | the reference bulk relative density of the mix in t/m <sup>3</sup> , as specified in Table 10                                                                                                                                                                    |
| $BRD_{mix}$    | = | the lot average bulk relative density in t/m <sup>3</sup> , calculated from values obtained in the testing of bulk samples obtained during production. The values shall be the same as those used in calculating the final air voids payment factor for the lot. |
| $PA_{AD}$      | = | payment adjustment for aggregate density                                                                                                                                                                                                                         |
| $M_{mix}$      | = | the weighed mass of the mix in the lot incorporated into the work                                                                                                                                                                                                |
| $MF$           | = | the mass multiplier factor calculated to three decimal places                                                                                                                                                                                                    |
| Contract Price | = | the Contract price of the tender item for the mix                                                                                                                                                                                                                |

For all mixes, when the mass multiplier factor is:

- a) Less than 1.000 there shall be a reduction in payment,
- b) Equal to 1.000 there shall be no adjustment, and
- c) Greater than 1.000 there shall be an increase in payment for the lot.

There shall be no payment adjustment for aggregate density for HMA tender items measured by square metres.

### **313.10.01.06 Payment Adjustment for Asphalt Cement Content and Changes in the Price Index**

#### **313.10.01.06.01 Hot Mix Asphalt Quantity Calculation**

The quantity of HMA for use in the calculations ( $T_{mix}$ ) shall be the tonnage of HMA accepted into the work.

When the unit of measure is square metres,  $T_{mix}$  shall be determined using the theoretical tonnage. The theoretical tonnage shall be calculated for each lot by the Contract Administrator as follows and rounded to one decimal according to LS-100:

$$T_{mix} = [0.975 \times BRD_{mix} \times (T_D / 1000) \times A_{mix}] \quad \text{(Formula 14)}$$

Where:

|             |   |                                                                                                                                                                                                                                                                  |
|-------------|---|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $BRD_{mix}$ | = | the lot average bulk relative density in t/m <sup>3</sup> , calculated from values obtained in the testing of bulk samples obtained during production. The values shall be the same as those used in calculating the final air voids payment factor for the lot. |
| $T_D$       | = | the design thickness, in millimetres, of the HMA                                                                                                                                                                                                                 |
| $A_{mix}$   | = | area of hot mix placed in square metres in the lot                                                                                                                                                                                                               |

### **313.10.01.06.02 Payment Adjustment for Asphalt Cement Content**

The payment adjustment for AC content for each lot shall be calculated using the following formula:

$$PA_{AC} = T_{mix} \times [Price_{AC} \times (AC_{ERS} - AC_{BID})/100] \quad (\text{Formula 15})$$

Where:

- $PA_{AC}$  = payment adjustment for asphalt cement content
- $T_{mix}$  = the quantity of the HMA accepted into the lot according to the Hot Mix Asphalt Quantity Calculation clause
- $Price_{AC}$  = the purchase price per tonne of the AC used in the mix according to the invoice submitted as per the Submission Requirements subsection
- $AC_{ERS}$  = the average percentage by mass of AC in the lot
- $AC_{BID}$  = the percentage by mass of AC specified for bidding purposes elsewhere in the Contract Documents. For SMA mixes select a minimum AC Content from Table 5 of OPSS 1151 based on combined aggregate bulk relative density from first set of QA samples

For progress payment purposes, payment adjustments are made on the monthly progress payment certificate for the months in which hot mix paving occurs.

### **313.10.01.06.03 Payment Adjustment for Changes in the Asphalt Cement Price Index**

A payment adjustment is applied based on changes to the Ministry's PGAC price index unless the Contract Administrator is notified in writing of the choice to opt out within five Business Days of receiving permission to start work. Once opted out of payment adjustments based on the price index, opt back in shall not be permitted. The price index is published monthly in the Contract Bulletin. The price index is used to calculate the amount of the payment adjustment per tonne of new AC accepted into the Work.

The price index is based on the price, excluding taxes, FOB the depots in the Toronto area, of AC grade PG 58-28 or equivalent. One index is used to establish and calculate the payment adjustment for all grades.

A payment adjustment per tonne of new AC is established for each month in which paving occurs when the price index for the month differs by more than 5% from the price index for the month prior to Tender Opening. When the price index differential is less than 5%, there is no payment adjustment established for that month. Payment adjustments due to changes in the price index are independent of any other payment adjustments made to the hot mix tender items.

The payment adjustment for the month is calculated from the formulae in Table 11.

The payment adjustment per tonne applies to the quantity of new AC in the HMA accepted into the Work during the month for which it is established. The quantity of new AC includes all grades of AC supplied with and without polymer modifiers.

For each month in which a payment adjustment has been established, the quantity is calculated using the HMA quantity accepted into the Work and its corresponding AC content as required by the JMF except for mixes which contain reclaimed asphalt pavement.

For mixes which contain reclaimed asphalt pavement the percentage of new AC is determined from the difference between the AC content required by the JMF and the AC content of the reclaimed asphalt pavement incorporated into the HMA, as calculated by the Contract Administrator.

For mixes containing an AST-AC, the percentage of AST-AC is deducted from the percentage of new AC. No other deductions are made for any other additives.

For progress payment purposes, payment adjustments are made on the monthly progress payment certificate for the months in which HMA paving occurs.

**313.10.01.07****Payment Adjustment for Lift Thickness**

The payment adjustment for lift thickness shall apply to all placed and compacted HMA measured by square metre tender items using the horizontal area of the surface course in the lot. When the thickness payment adjustment is determined using a  $T_L$  calculated using a combination of tender items, the thickness payment adjustment shall apply to each binder course tender item included in  $T_L$ . The thickness payment adjustment shall be a reduction in payment. The formulae provided in Table 9 shall be used to calculate the thickness payment adjustment for each tender item. The lot payment adjustment shall be the sum of the payment adjustments calculated for each tender item.

When a rejectable subplot remains in the work without repair, the rejectable lifts in the subplot shall be subject to a payment reduction. The thickness payment adjustment for each rejectable lift shall be:

$$PA_T = 0.5 \times (\text{subplot quantity} \times \text{Contract price}) \quad (\text{Formula 16})$$

Where:

$PA_T$  = subplot payment adjustment for each rejectable lift  
subplot quantity = the area of the subplot  
Contract price = the Contract price of the tender item for the lift

**313.10.02****Anti-Stripping Treatments**

When aggregates have been processed from commercial sources for use in hot mix surface course paving, payment at the Contract price for the applicable HMA tender item shall be full compensation for all labour, Equipment, and Materials required to test, supply, and incorporate, the AST.

When aggregates have been processed from MTO/Crown, Wayside, and/or Letter of Approval quarries for use in hot mix surface course paving and the use of an AST was required, payment at the Contract price for the applicable HMA tender item shall be full compensation for all labour, Equipment, and Materials required to test, supply, and incorporate the AST. When hydrated lime is used as the AST, payment includes full compensation for the amount up to 1.0% by mass of total dry aggregate. When an alternate AST-AGG is used as the AST, payment includes full compensation for the amount up to the listed minimum dosage from the DSM listing for Anti-Stripping Treatments by mass of aggregate. When an AST-AC is used as the AST, payment includes full compensation for the amount up to the listed minimum dosage from the DSM listing for Anti-Stripping Treatments by mass of AC. Payment for additional AST above the listed minimum dosages shall be administered as a Change in the Work.

**313.10.03****Hot Mix Asphalt Miscellaneous**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Materials to do the work except that the HMA Material shall be paid for under the appropriate HMA tender item.

**313.10.04****Tack Coat**

Where there is no separate tender item for tack coat, payment at the Contract price for the applicable HMA tender item to be placed on the tack coat shall be full compensation for all labour, Equipment, and Materials for the tack coating.

**313.10.05****Repair**

No payment shall be made for the:

- a) Quantity of HMA that is removed and replaced, overlaid, or otherwise repaired; or

- b) For additional shouldering, traffic control, and other work such as zone painting or bridge deck waterproofing.

When:

- a) In lieu of a reduction in payment, repairs to the lot, subplot, or visually defective HMA are completed; or
- b) The Contract Administrator has determined that a rejectable lot or subplot requires repair;

for all additional testing resulting from a repair to a lot a charge shall be applied at the rates established by the Owner for the year in which the testing was carried out.

No additional payment shall be made for the cost of tolerance measurements of the repaired areas that are required by the Contract Administrator.

### **313.10.06 Referee Testing and Segregation Challenge**

#### **313.10.06.01 Mix Properties and Compaction**

If the referee test results show that the referee payment factor for compaction or mix properties is higher than the payment factor for compaction or mix properties based on the original QA test results by more than 0.025 and the referee results show that the lot is not rejectable, the Owner shall bear the cost of the referee testing for that attribute.

If the referee test results show that the lot is rejectable or the referee test results show that the referee payment factor for compaction or mix properties is not higher than the payment factor for compaction or mix properties based on the original QA test results by more than 0.025, the Contractor shall bear the cost of the referee testing for that attribute.

For density testing of aggregates, if referee testing is invoked, the cost of referee testing is assigned as follows:

- a) If the combined aggregate density as determined by the referee laboratory is within 0.010 of the result determined by the QA laboratory, the referee testing shall be at no additional cost to the Owner.
- b) If the referee result is between 0.011 and 0.020 of the QA result, the cost of referee testing shall be shared equally between the Contractor and Owner.
- c) If the difference in results is equal to or in excess of 0.020, the cost of referee testing shall be borne by the Owner.

When there is an outlier in the referee test results, the Owner shall charge 50% of the total cost for referee testing of all sublots in the original lot.

The cost of the referee testing shall be based on the referee testing rates as specified elsewhere in the Contract Documents.

#### **313.10.06.02 Lift Thickness**

If the referee test result is at least 3 mm greater than the original QA test result, the Owner shall bear the cost of the thickness measurement referee testing. Otherwise, the Contractor shall bear the cost of the thickness measurement referee testing.

**313.10.06.03****Segregation Challenge**

When a challenge is successful as described in the Challenging Severity of Segregation clause, the Owner shall pay for the cost of the traffic control, if the traffic control was not necessary for any other reason. The Owner shall not be responsible for any other costs associated with the second visual assessment including the cost of delays.

When a challenge is not successful as described in the Challenging Severity of Segregation clause, all costs associated with the second visual assessment, including the cost of traffic control and delays, shall be at no additional cost to the Owner.

**TABLE 1**  
**Maximum Field Adjustments for JMF**

| <b>JMF Properties</b>                                                                                                                                                                                                                  | <b>Maximum Field Adjustment<br/>% (Notes 1 and 2)</b> |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
| AC content (all mixes except SMA mixes)                                                                                                                                                                                                | ± 0.2                                                 |
| AC content (SMA mixes only)                                                                                                                                                                                                            | ± 0.4                                                 |

| <b>Notes:</b><br>1. Each material sample receptacle shall have a maximum mass of 30 kg. For ease of handling, especially when the larger sample size is required, splitting of material at the paving site is permitted such that a sample is contained in a maximum of two receptacles whose total mass does not exceed the maximum specified above. Once delivered to testing laboratories, combining of the material from the two receptacles is only mandatory if a single receptacle contains insufficient material to carry out the full suite of tests required.<br><br>2. The larger sample size shall be applicable when samples are designated for testing to the maximum number of gyrations. The frequency of the larger samples shall be one per lot, as designated by the Contract Administrator. |                                                                                            |                                                                                                                                                                          |

| Notes:<br>1. For all gyratory-compacted specimens and cores of SMA mixes and Superpave mixes, if the per cent water absorbed by the specimen is found to exceed 2% by volume, as described in AASHTO T 166, then the bulk relative density shall be determined using either LS-306 or ASTM D 6752<br><br>2. Calculate to two decimal places for each subplot using the $BRD_m$ for the subplot, and the $G_{sb}$ of the most recent QA samples, as specified in the Contract Documents, to provide a lot mean VMA to two decimal places.<br><br>3. The rounding-off procedure, for all values, shall be according to LS-100. |                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                     |

**314.01 SCOPE**

This specification covers the requirements for the construction of Subbase, Base, roadway surface, Shoulder, and edge ramping for bituminous pavements, selected subgrade and stockpiling at specified sites.

**314.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

### **314.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

### **314.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **314.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Selected Subgrade** means a granular material meeting the requirements of Select Subgrade Material (SSM), as specified in OPSS 1010, which is used to replace unsuitable native soils or raise the existing grade or both, in order to meet the final subgrade grading requirements, specified in the Contract Documents.

**Tolerance** means a construction working tolerance only that is considered to be:

a) Minus when it is:

- i. narrower than the Contract standard when pertaining to horizontal dimensions as measured from centreline, or
- ii. lower in elevation than the Contract standard when pertaining to vertical dimensions.

b) Plus when it is:

- i. wider than the Contract standard when pertaining to horizontal dimensions as measured from centreline, or
- ii. higher in elevation than the Contract standard when pertaining to vertical dimensions.

## **314.05 MATERIALS**

### **314.05.01 Aggregates**

Aggregates used for Base, Subbase and selected subgrade applications shall be according to OPSS 1010.

### **314.05.02 Water**

Water shall be free of any contaminants that could adversely affect the environment or the placement and compaction of materials for Base, Subbase and selected subgrade applications.

## **314.06 EQUIPMENT**

### **314.06.01 Water**

Equipment used for applying water to granular materials in order to meet compaction requirements for Base, Subbase and selected subgrade applications shall be equipped with variable flow control to uniformly and completely wet the material without causing the material to be eroded away. The equipment operator shall also have the capability to monitor and change the flow while the equipment is moving.

## **314.07 CONSTRUCTION**

### **314.07.01 Subbase, Base, Surface, and Selected Subgrade**

All materials shall be kept free from clay and other types of deleterious material. Construction operations shall not disturb underlying work.

All materials shall be placed in uniform lifts without segregation.

Except as provided under the Modified Layer Compaction Method clause:

- a) Granular B, Type II shall be placed in accordance with the compaction methods specified in the Granular B, Type II clause such that the thickness of the compacted layer is not greater than 150 mm.
- b) All other materials shall be placed such that the thickness of the compacted layer is not greater than 150 mm.

In all cases, each lift shall be bladed to a smooth surface according to the required cross-section and maintained until placement of a subsequent lift, when applicable.

Prior to closing down operations for each Day, the Subbase material shall be bladed and compacted and, if necessary, covered with sufficient Base material to carry traffic.

The Base shall be maintained to the tolerances in grade and cross-section and to the specified density until Contract Completion or, if the Contract includes paving, until the Base surface is paved.

#### **314.07.02 Winter Grading**

Any areas where materials used for Subbase, Base, selected subgrade or other fill applications are being placed shall be free of ice and snow. Frozen material shall not be incorporated into the Work. Materials used for Subbase, Base, selected subgrade or other fill applications shall not be placed over frozen ground. However, one lift of material may be placed over frozen ground, as long as the final grading and compaction of that lift is done after the underlying material has thawed.

#### **314.07.03 Edge Ramping of Bituminous Pavement**

A ramp of the specified material shall be built along the outside edges of each bituminous pavement construction course. Such ramps shall be at a height level with the pavement course and fall away from its edge at a slope not steeper than 4H:1V. Care shall be taken to prevent any ramping material from being spilled or pushed onto the pavement. Any material that is spilled shall be removed immediately without damage to the pavement and the surface thoroughly cleaned with the use of a power broom or other suitable means.

Prior to paving any section, only sufficient material to construct the ramps shall be placed on the Shoulders. No other Shoulder material shall be placed until the conditions, as detailed in the Shoulders subsection, have been attained.

Edge ramps shall be completed prior to opening adjacent pavement to traffic.

#### **314.07.04 Shoulders**

Material used for shouldering shall be placed and compacted at locations and to the line, grade, and cross-section specified in the Contract Documents.

Prior to commencing Shoulder construction, all debris and deleterious material shall be removed from the Shoulder area.

Shouldering operations shall commence as soon as, but not before, the following pavement conditions are met:

##### **a) Bituminous Pavements**

Placement of material for shouldering operations shall not commence along any section of pavement, until at least 6 hours have elapsed from the time of completion of the final bituminous pavement course in that section. In addition, for pavement sections that are already open to traffic, all shouldering operations shall be completed within 24 hours of their commencement. In all cases where a pavement section is not yet open to traffic, the shouldering shall be completed prior to opening that pavement section to traffic.

b) Concrete Pavement and Concrete Base

Shouldering operations shall commence according to OPSS 350. Shouldering shall be completed prior to opening the concrete base or concrete pavement to traffic.

All Shoulder construction material shall be conveyed from the transport vehicle onto the Shoulder area. End dumping of Shoulder construction material directly on to the adjacent pavement surface or directly on to the Shoulder shall not be permitted. The material shall be uniformly distributed within the specified Shoulder limits without segregation. Grading and shaping operations shall confine all material to within the specified Shoulder limits without overspill.

Any Shoulder construction material deposited, dragged, or inadvertently placed on the pavement surface shall be removed immediately and the pavement surface shall be thoroughly cleaned with the use of a power broom or other suitable means.

**314.07.05                      Compaction**

**314.07.05.01                  General**

Each lift of material shall be compacted as specified below prior to the placement of the next lift.

The rate of placing material shall be controlled by the adequacy of the compaction obtained.

**314.07.05.02                  Compaction Requirements**

**314.07.05.02.01              Granular B, Type II**

Material shall not be dumped into position, but shall be deposited on and pushed over the end of the lift being constructed by means of bulldozers or other approved equipment.

The placement of the first lift of material over wet or weak subgrade shall be monitored and the placement and compaction procedure modified as required, with the approval of the Contract Administrator, to minimize subgrade disturbance. Localized, unusually wet or weak subgrade areas shall be identified to the Contract Administrator for possible treatment.

In restricted zones, as specified in OPSS 501, Granular B, Type II shall be compacted using hand-operated vibratory equipment with a minimum operating mass of 400 kg and a maximum power output between 5.0 and 9.9 kW. Where confined areas are less than the minimum width and where such equipment can be used safely, then smaller vibratory hand-operated tampers shall be used. One hundred percent compaction coverage with a minimum of four passes shall be provided in all cases.

In non-restricted zones, Granular B, Type II shall be compacted using single drum, vibratory, smooth steel drum rollers, with a minimum operating mass of 5,000 kilograms and minimum operating dynamic force of 75 kN. One hundred percent roller pass coverage with a minimum number of four passes shall be provided. Each roller pass shall overlap the coverage of the preceding pass by a minimum of 0.5 m.

**314.07.05.02.02              All Other Granular Materials**

The compaction requirements shall be according to OPSS 501.

**314.07.05.03****Modified Layer Compaction Method**

Material may be placed in layers thicker than permitted under the Subbase, Base, Surface, and selected subgrade subsection, subject to the following provisions:

- a) All materials, with the exception of Granular B, Type II shall be placed in uniform layers such that each layer shall have a depth of not more than 300 mm after compaction.
- b) Granular B, Type II shall be placed in uniform layers with a compacted depth not to exceed the values shown in Table 1 for various sizes of single drum, vibratory, smooth wheel drum rollers. Both the minimum operating mass and the minimum operating dynamic force requirements shown in Table 1 shall be met for the roller used. One hundred percent roller pass coverage with a minimum number of four passes shall be provided. Each roller pass shall overlap the coverage of the preceding pass by a minimum of 0.5 m.
- c) Prior to placing material in layers as described in a) or b) above depending on the type of granular material used, the ability of the proposed method to achieve satisfactory compaction shall be demonstrated to the satisfaction of the Contract Administrator by means of a two-lane trial area. The trial area location shall be approved by the Contract Administrator. At least 48 hours prior to any work commencing on the trial area, full details of the proposed placing and compacting system or systems, including the rate of placing, depth of layer, number and type of compaction units, and number of passes shall be submitted to the Contract Administrator. The areas designated to evaluate each system shall be of sufficient length to be representative of the proposed method and shall normally be approximately 150 m in length. Approval will follow within one Business Day after satisfactory completion of the compaction trial area.
- d) When the Contract Administrator, approves a system of placing and compacting, the system shall be used for the remainder of the work to which it is applicable, except that:
  - i. Should it be necessary at any time to change the system or any part of it, including the source of material or the rate of placing the material, approval to change the system shall be obtained from the Contract Administrator, who may require a further trial area.
  - ii. If, at any time, tests show that a previously-approved system is no longer producing the required degree of compaction, changes shall be made as necessary to satisfy the requirements of this specification.

**314.07.06****Tolerances**

The surface of the uppermost layer of granular material and each granular course shall be bladed, shaped, and compacted to produce the grade and cross-section specified in the Contract Documents, within the tolerances shown in Table 2.

In the event of a conflict between meeting horizontal grading tolerances and meeting vertical grading tolerances, the vertical grading tolerances shall take precedence.

**314.07.07****Stockpiling of Granular Material**

Sites for stockpile construction, specified in the Contract Documents, shall be cleared and grubbed, regardless of stockpile height, according to OPSS 201. Organic soil underlying the stockpile location shall be removed and the site cleaned up prior to stockpile construction. Stockpiles shall be constructed, including the supply and placement of a pad upon which the materials are to be stockpiled, according to OPSS 1001.

### **314.07.08                      Grade Checks**

The Contract Administrator shall be notified within 12 hours when each Subbase or Base course has been completed, including Shoulders, and prior to the next course being placed.

The Contractor shall be responsible for carrying out all grade checks to ensure that horizontal and vertical grading tolerances are met.

Grade checks shall be carried out on all finished granular surfaces. Grade checks of granular grading surfaces shall be based on horizontal and vertical grading tolerances, as specified in the Tolerances subsection. The grade shall be certified at the stations and offsets shown in the grading templates, or when grading templates are not available, at the frequency requirements shown for the layout specified elsewhere in the Contract Documents.

### **314.07.09                      Submission of Grade Checks**

All grade checks concerning horizontal and vertical grading tolerances, including all non-compliances, shall be submitted to the Contract Administrator within 2 Business Days following completion of the grade.

When grading templates are available, the Contractor shall sign and certify on the grading template that the components of the work indicated on that template have been correctly constructed to the specified line and grade tolerances. If a template is not available, then the Contractor shall complete, sign, and submit MTO form PH-CC-820 to the Contract Administrator.

### **314.07.10                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **314.08                              QUALITY ASSURANCE**

### **314.08.01                      General**

The Owner may conduct random QA grade checks to verify that the grade and cross-section are within the specified tolerances.

### **314.08.02                      Acceptance**

If the Contract Administrator chooses not to take QA grade checks or if the QA grade checks conform to those determined by the Contractor, the work shall then be accepted.

However, if any discrepancies between the QA and the Contractor's grade checks are found, then, at the discretion of the Owner, additional QA grade checks may be carried out in any other location.

If the finished grade or cross-section or both are not within the tolerances specified in the Tolerances subsection, then:

- a) The Contract Administrator shall notify the Contractor and advise where the tolerances have not been met, including overbuilding of the width of a granular course.
- b) The Contractor shall be charged for each station where the tolerances have not been met, at the rate specified in the Basis of Payment section.
- c) The Contractor shall bring the granular surface to within the specified tolerances for grade, at no additional cost to the Owner.

**314.09 MEASUREMENT FOR PAYMENT**

**314.09.01 Actual Measurement**

**314.09.01.01 Granular A, B Type I, B Type II, B Type III, M and O  
Granular A, B Type I, B Type II, B Type III, M, and O Stockpiled  
Granular A, B Type I, B Type II, B Type III, M, and O from Stockpile  
Select Subgrade Material, Compacted**

**314.09.01.01.01 Tonne**

When payment is by the tonne:

- a) When the Contractor supplies Granular A and M composed of air-cooled iron blast-furnace slag or nickel slag, the payment quantities shall be determined by applying the following factors:
  - i. The total measured mass of air-cooled iron blast-furnace slag incorporated into the work shall be multiplied by a factor of 1.116.
  - ii. The total measured mass of nickel slag incorporated into the work shall be multiplied by a factor of 0.85.
- b) When Granular B is composed of slag, the payment quantities shall be determined by comparing the density of the material to the average density of granular material as set by the Owner for that specific area and applying the conversion factors that have been determined to the weighed tonnes.
- c) When granular material is composed of slag, it is necessary to determine the amount of overrun or underrun. Such overrun and underrun shall be the difference between the tender quantity and the payment quantity as determined by applying the foregoing factors to the weighed tonnes.

**314.09.01.01.02 Cubic Metre**

When payment is by cubic metre, one of the following methods shall be used as determined by the Contract Administrator:

a) End Area Method

i. At Source

The volume of material shall be measured at the source in its original location and computed in cubic metres by the method of average end areas.

Cross-sections shall be taken after the source has been cleared, grubbed, and stripped of all unsuitable surface material.

The volume of boulders removed from borrow pits that cannot be accommodated in embankments or any other areas acceptable to the Owner, shall be deducted.

ii. In Place

When the measurement for payment of material in its original location is impractical, the measurement for payment shall be made of material measured in place with no allowance for shrinkage and computed in cubic metres by the method of average end areas.

b) Truck Box Method

The truck box method shall only be used when the Contract Administrator deems that the quantities are too small or the end area method is impractical for other reasons.

In this case, measurement for payment shall be based on the total volume in cubic metres of loose granular material, calculated by the Contract Administrator, from estimated percentages of the pre-determined capacity of each truck box determined from measurements of its dimensions.

Each truck that the Contractor intends to use shall be uniquely and readily identifiable to the satisfaction of the Contract Administrator.

**314.09.01.01.03            Square Metre**

When payment is by square metre, the area shall be based on that shown in the Contract Documents.

**314.09.02                    Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**314.10                        BASIS OF PAYMENT**

- 314.10.01                    Granular A - Item**  
**Granular A, Stockpiled - Item**  
**Granular A, from Stockpile - Item**
- Granular B Type I - Item**  
**Granular B Type I, Stockpiled - Item**  
**Granular B Type I, from Stockpile - Item**
- Granular B Type II - Item**  
**Granular B Type II, Stockpiled - Item**  
**Granular B Type II, from Stockpile - Item**
- Granular B Type III - Item**  
**Granular B Type III, Stockpiled - Item**  
**Granular B Type III, from Stockpile - Item**
- Granular M - Item**  
**Granular M, Stockpiled - Item**  
**Granular M, from Stockpile - Item**
- Granular O - Item**  
**Granular O, Stockpiled - Item**  
**Granular O, from Stockpile - Item**
- Select Subgrade Material, Compacted - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

As specified in the Acceptance subsection, \$250.00 shall be deducted from payment for each station where the QA grade check of the finished grade is found to be outside of the specification limit.

Any additional grading carried out to correct grades that are not within the tolerances specified in the Tolerances subsection shall be carried out at no additional cost to the Owner.

Where a finished granular course exceeds the horizontal tolerances specified in the Tolerances subsection and the material outside that tolerance has been left in place, the Owner shall deduct from payment the theoretical quantity of material placed outside of that tolerance, based on a conversion factor of 2.0 t/m<sup>3</sup>, regardless of the type of granular material used.

**TABLE 1**  
**Modified Layer Compaction Thickness for Granular B, Type II**  
**Single Drum, Vibratory, Smooth Wheel Drum Roller**

| Minimum Operating Mass<br>kg | Minimum Operating<br>Dynamic Force<br>kN | Maximum Layer Depth<br>After Compaction<br>mm |
|------------------------------|------------------------------------------|-----------------------------------------------|
| 5,000                        | 75                                       | 300                                           |
| 8,000                        | 150                                      | 450                                           |

| 15,000                       | 350                                      | 750                                           |

**TABLE 2**  
**Allowable Tolerances for Finished Granular Surfaces**

| Tolerances From Specified Grade and Cross - Section                                                                                                      | Finished Granular Courses mm | Finished Granular Surfaces Immediately Beneath Bituminous Courses, Sidewalks, and Curb and Gutter mm |              | Finished Granular Surfaces Immediately Beneath Concrete Courses, Sidewalks, and Curb and Gutter mm |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|------------------------------------------------------------------------------------------------------|--------------|----------------------------------------------------------------------------------------------------|
|                                                                                                                                                          |                              | When the Finished Grade is Controlled by Fixed Components Such as Existing Pavements and Curbs       | All Others   |                                                                                                    |
| Vertical                                                                                                                                                 | + 30<br>- 30                 | + 10<br>- 10                                                                                         | + 30<br>- 30 | + 10<br>- 10                                                                                       |
| Horizontal                                                                                                                                               | + 30<br>- 0                  | + 10<br>- 0                                                                                          | + 30<br>- 0  | + 10<br>- 0                                                                                        |
| Surface Deviation (Note 1)                                                                                                                               | 15                           | 10                                                                                                   |              | 10                                                                                                 |
| Notes:                                                                                                                                                   |                              |                                                                                                      |              |                                                                                                    |
| 1. The maximum gap between a granular surface and the underside of a 3 m rigid metal straightedge, placed anywhere and in any direction on that surface. |                              |                                                                                                      |              |                                                                                                    |

**Appendix 314-A, November 2015**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

## **Ontario Provincial Standard Specifications, Material**

OPSS 1010      Aggregates - Base, Subbase, Select Subgrade, and Backfill Material  
OPSS 1605      Extruded Expanded Polystyrene Pavement Insulation

### **316.05                      MATERIALS**

#### **316.05.01                      Extruded Expanded Polystyrene**

Extruded expanded polystyrene insulation shall be according to OPSS 1605 and supplied in sheets 600 x 2400 mm.

Grade and compressive strength of the extruded expanded polystyrene insulation shall be as specified in the Contract Documents.

#### **316.05.02                      Tack Coat**

Tack coat shall be according to OPSS 308.

#### **316.05.03                      Granular**

Granular base and subbase shall be according to OPSS 1010.

When Granular B is used as backfill, 100% of the material shall pass the 75 mm sieve.

### **316.07                      CONSTRUCTION**

#### **316.07.01                      General**

The site shall be prepared and extruded expanded polystyrene insulation placed and covered with compacted granular material.

#### **316.07.02                      Site Preparation**

##### **316.07.02.01                      Excavation**

The excavation shall be carried out to the dimensions specified in the Contract Documents. The tolerance of the earth grade on which the extruded expanded polystyrene is to be placed shall be according to OPSS 206 and the surface shall not deviate by more than 10 mm at any place on a 3 m straight edge.

All protruding material such as cobbles, boulders, and roots exceeding 50 mm in any dimension shall be removed from the surface.

##### **316.07.02.02                      Pavement Surface**

The pavement surface shall be cleaned of all earth, granular, and any other debris before tack coat is placed.

### **316.07.03                    Placing Extruded Expanded Polystyrene**

#### **316.07.03.01                General**

Extruded expanded polystyrene sheet treatment shall be placed and secured. The sheets shall be placed lengthwise and parallel to the centreline of the roadway to obtain butt joints and staggered transverse joints. The area to be treated and the insulation thickness shall be as specified in the Contract Documents.

#### **316.07.03.02                Securing**

Each sheet of extruded expanded polystyrene may be secured by placing sufficient granular material to ensure that no movement takes place during subsequent operations.

Alternatively, hardwood skewers 10 mm in diameter and 150 mm in length shall be used to secure the extruded expanded polystyrene to the prepared surfaces.

When extruded expanded polystyrene is placed directly on a pavement surface, tack coat shall be applied according to OPSS 308 to the existing pavement surfaces to provide a secure bond between the extruded expanded polystyrene and the pavement surface. The tack coat shall be applied at a rate of 0.35 kg/m<sup>2</sup>. The extruded expanded polystyrene shall be placed while the tack coat is still tacky.

#### **316.07.04                    Granular Material**

Granular base or subbase material shall be placed according to OPSS 314; except, the initial lift of granular material for protection of extruded expanded polystyrene from construction traffic shall be the depth specified in the Contract Documents placed in one lift by end dumping and spreading.

Vehicular traffic shall not be permitted on the extruded expanded polystyrene sections until the full depth of the entire granular base and subbase courses have been placed and compacted according to OPSS 501.

#### **316.07.05                    Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **316.09                        MEASUREMENT FOR PAYMENT**

#### **316.09.01                    Actual Measurement**

##### **316.09.01.01               Extruded Expanded Polystyrene Treatment**

Measurement of extruded expanded polystyrene shall be by area in square metres.

##### **316.09.02                    Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **316.10                        BASIS OF PAYMENT**

#### **316.10.01                    Extruded Expanded Polystyrene Treatment - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**316.10.02                      Excavation**

Payment for earth and rock excavation shall be according to OPSS 206.

**316.10.03                      Granular Base and Subbase**

Payment for granular base and subbase material placed over the polystyrene shall be according to OPSS 314.

**316.10.04                      Tack Coat**

Payment for tack coat shall be according to OPSS 308.

## CONSTRUCTION SPECIFICATION FOR TEMPORARY HOT MIX PAVEMENT

#### 317.01 SCOPE

This specification covers the requirements for construction of temporary hot mix asphalt.

#### 317.02 REFERENCES

This Special Provision refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Construction**

OPSS 313 Hot Mix Asphalt - End Result

#### 317.03 DEFINITIONS

For this Special Provision, the definitions in OPSS 313 and the following definition apply:

**Temporary Hot Mix Pavement** means hot mix that is not intended to form part of the permanent work.

## **317.05 MATERIALS**

### **317.05.01 Hot Mix Asphalt**

Temporary hot mix pavement mix shall be suitable for its intended use.

### **317.05.02 Release Agents**

Release agents shall be according to the Release Agents clause as specified in OPSS 313.

## **317.07 CONSTRUCTION**

### **317.07.01 Preparation of Foundation and Existing Pavement**

Preparation of foundation and existing pavement shall be according to the Preparation of Foundation and Existing Pavement clause as specified in OPSS 313.

### **317.07.02 Placing Hot Mix Asphalt**

#### **317.07.02.01 Paving**

Levelling, binder and surface courses shall be laid to the specified depths by means of mechanical self-propelled pavers and uniformly compacted with rollers. A shoulder spreader may be used if the lane widening is equal to or less than 1.5 m in width and adjacent to an existing lane.

Excess HMA shall not be cast onto the surface of the freshly laid mat. After final compaction of each course the surface shall be smooth and true to the established crown and grade, uniform in texture and shall be free of any defects including, but not limited to, segregation, fat spots, oil spills, chatter, and roller marks.

All through lane paving courses shall be completed prior to the placement of adjacent sideroads, speed change lanes, and other paved areas.

The temporary HMA shall be placed and compacted to the total thickness specified in the Contract Documents.

At the end of each completed portion of the lanes and prior to opening them to traffic, the ends of completed sections of HMA course shall be temporarily ramped down to the existing pavement according to the Temporary Ramp Downs clause.

If paving is being carried out under lane closures, paving shall be completed to the same station for the full pavement width, including paved shoulders, prior to the roadway being reopened to traffic except as noted in the Partial Paving of Full Pavement Width clause.

#### **317.07.02.02 Partial Paving of Full Pavement Width**

Partial paving of the full pavement width is not permitted when one or more of the following conditions exist:

- a) When the ramping height would be greater than 50 mm, or
- b) The pavement slope would cause water to accumulate at the edge of the ramping and extend onto an adjacent lane or shoulder that will be open to traffic.

When partial paving of the full pavement width is permitted, temporary longitudinal and transverse ramp downs shall be placed regardless of the difference in height elevations between adjacent pavement surfaces.

### **317.07.02.03 Temporary Ramp Downs**

Temporary ramp downs shall be according to the Temporary Ramp Downs clause as specified in OPSS 313.

### **317.07.03 Winter Carry-over of Temporary Hot Mix Pavement**

If temporary hot mix pavement is specified to be removed prior to seasonal shutdown but due to delays cannot be removed:

- a) The Contract Administrator shall be notified at least 20 Business Days prior to the seasonal shutdown, and;
- b) The responsibility for preparing the temporary hot mix pavement for, and making repairs during, the shutdown period will depend upon the reasons for the carry-over to the next construction season.

Preparation requirements for the shutdown period will be subject to prior approval by the Owner and may include, but are not limited to, drainage improvements, erosion control measures, resurfacing with a lift of HMA, placing shoulder materials, temporary pavement markings, and traffic control.

### **317.07.04 Quality Control**

#### **317.07.04.01 General**

The QC procedures shall be conducted to ensure HMA meets the requirements of the selected HMA type for the intended purpose.

#### **317.07.04.02 Repairs**

All defects in the materials and workmanship of the temporary hot mix pavement shall be repaired to ensure a safe and smooth riding surface. Repairs shall be made with the same HMA type as the original work unless the Owner accepts a proposal to do otherwise. The Contractor shall not be responsible for repairing defects caused by granular base, sub-base or sub-grade problems provided these have been constructed according to the Contract Documents.

Timing for repairing defects shall be according to Table 1.

In emergency situations, or if the Contractor has not started repairs within 24 hours of receiving written notification the Owner may, without obligation to do so, make such repairs. The Owner will keep records of lane closure times and repair costs. The Contractor shall not conduct any operations in the same area during the Owner's repair operation.

### **317.07.05 Management of Excess Materials**

Management of excess material shall be according to the Contract Documents.

## **317.09 MEASUREMENT FOR PAYMENT**

### **317.09.01 Actual Measurement**

#### **317.09.01.01 Temporary Hot Mix Pavement**

##### **317.09.01.01.01 By Mass**

Measurement of temporary hot mix pavement shall be by mass in tonnes.

The quantities of HMA used for temporary ramping shall not be measured for payment. The removal of HMA used for temporary ramping shall not be measured for payment.

**317.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement is based on the units shown in the clauses under Actual Measurement.

**317.10 BASIS OF PAYMENT**

**317.10.01 Temporary Hot Mix Pavement – Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment and Materials to do the work.

**317.10.02 Repair Delay Charges**

The Contractor will be assessed \$30 per hour for each hour, or part thereof, that expires between:

- a) 24 hours after the time that the Contractor is given written notification by the Contract Administrator that a deficiency has been observed in the temporary hot mix pavement and the time that the repair begins, and
- b) each time that uncompleted repair work stops and the time that it resumes.

**317.10.03 Removal of Temporary Hot Mix Pavement**

Payment for removal of the temporary hot mix pavement, excluding defective temporary hot mix pavement, shall be made under the applicable tender item for HMA pavement removal.

**TABLE 1**  
**Repair Criteria and Maximum Repair Period for Defects in Temporary HMA Pavement Surface**

| Defect                     | Repair Criteria                                                                                                                                                         | Freeway | Non-Freeway |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|
| Potholes                   | Any pothole that is deeper than 50 mm and greater than 0.04 m <sup>2</sup> (e.g., 20 cm X 20 cm or 10 cm X 40 cm) on asphalt pavement shall be repaired upon detection. | 3 Days  | 7 Days      |
|                            | Any pothole exceeding 20 mm in depth on a bridge surface shall be repaired upon detection.                                                                              | 3 Days  | 3 Days      |
| Pavement Edge Surface Loss | Paved surface edge surface loss which extends more than 100 mm inward from the outer edge shall be repaired upon detection.                                             | 7 Days  | 7 Days      |
| Water Ponding              | Water Ponding on paved surfaces resulting from high gravel shoulders repaired upon detection.                                                                           | 7 Days  | 14 Days     |
| Distortion                 | Distortions such as rippling, shoving, rutting, bumps, and dips are marked with warning signage upon detection.                                                         | 1 Day   | 1 Day       |
| Cracking                   | Cracks in asphalt pavement surfaces wider than 25 mm shall be repaired upon detection.                                                                                  | 14 Days | 14 Days     |
| Sink Holes                 | Sink Holes shall be repaired upon detection.                                                                                                                            | 1 Day   | 1 Day       |
| Hazards                    | Deficiencies or defects that pose an imminent hazard shall be addressed upon detection.                                                                                 | 2 hours | 2 hours     |

## **ASTM International**

C174 / C174M - 17 Standard Test Method for Measuring Thickness of Concrete Elements Using Drilled Concrete Cores

### **320.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 313 and OPSS 350 and the following definitions apply:

**Delineator** means the material used to delineate boundary between Portland cement treated open graded drainage layer and the overlying concrete slab to facilitate measurement of the slab thickness.

**Design Lift Thickness** means the thickness in millimetres of the OGDL lift as specified in the Contract Documents.

**Drainage System** means the OGDL, subdrains, and the lateral outlets.

**Duplicate Samples** means two samples taken at the same time and location - one to be used for quality assurance testing and the other for referee testing.

**Mixture or Mix** means open graded drainage layer material treated with either asphalt cement or Portland cement.

**Open Graded Drainage Layer (OGDL)** means a rapid draining layer located within the pavement structure that is covered either by concrete pavement, concrete base, or hot mix asphalt pavement and overlies the granular base course. The OGDL can be either Portland cement treated or asphalt cement treated.

**Porosity of OGDL** means the ratio of the volume of voids to total volume of OGDL as measured by LS-627.

### **320.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **320.04.01 Submission Requirements**

The following information shall be submitted to the Contract Administrator at least three Days prior to placement of the OGDL:

- a) Source(s) for the OGDL aggregate material.
- b) Volumetric proportions for the OGDL mixture.
- c) The type of plant to be used for OGDL mixture production and the plant location.

## **320.05 MATERIALS**

### **320.05.01 General**

Proportioning and mixing of OGDL materials shall produce a uniform homogenous mixture in which all particles of the aggregates are thoroughly and uniformly coated.

The porosity of the placed OGDL lift shall be 0.25 to 0.40, determined according to LS-627.

### **320.05.02 Aggregates**

Aggregates for OGDL shall consist of 100% crushed particles produced by crushing bedrock material. Reclaimed materials or crushed reclaimed materials shall not be permitted.

The aggregates shall meet all of the requirements for gradation and physical properties shown in Tables 1 and 2.

### **320.05.03 Asphalt Cement Treated OGDL**

Asphalt cement shall be according to the requirements for performance graded asphalt cement specified in the Contract Documents. The percentage by mass of asphalt cement in the mixture shall be  $1.8 \pm 0.2\%$ .

### **320.05.04 Portland Cement Treated OGDL**

Cementing materials and water used in production of OGDL shall be according to OPSS 1350.

The mix shall contain  $120 \pm 10 \text{ kg/m}^3$  of Type GU Portland cement or Portland limestone cement (PLC) Type GUL. A portion of Portland or Portland limestone cement may be replaced by supplementary cementing materials as specified in OPSS 1350.

### **320.05.05 Delineator**

The delineator shall consist of SS-1 emulsified asphalt according to OPSS 1103 diluted with an equal volume of water.

## **320.06 EQUIPMENT**

### **320.06.01 Production Equipment**

Portland cement treated OGDL mix shall be produced, mixed and delivered from a batching plant according to OPSS 1350.

### **320.06.02 Paving Equipment**

Paving equipment shall not cause segregation of the material and shall place a uniform, homogeneous OGDL across the lane to the required grade and design lift thickness specified in the Contract Documents.

Paving equipment shall be self-propelled and capable of laying a consistent satisfactory mat that is true to the crossfall, profile, cross-section, and alignment specified in the Contract Documents.

### **320.06.03 Straight Edge**

The straight edge shall be 3 m in length, metal, and have a level recessed in its upper edge parallel to the lower edge.

## **320.07 CONSTRUCTION**

### **320.07.01 Operational Constraints**

OGDL mixture shall not be placed in the rain and the ambient temperature at the time of mixture placement shall be above 2°C. Precautions shall be taken to protect placed plastic Portland cement treated OGD L from rain.

Traffic shall not be permitted on the OGD L with the exception of sampling equipment, equipment for the application of delineator, and the paving train during the placement of the overlying pavement.

Contamination of the OGD L by mud or other contaminants shall not be permitted.

All OGD L shall be covered with the overlying pavement within 30 Days following placement.

The subdrains and lateral outlets of the drainage system shall be operational prior to the placement of the OGD L.

### **320.07.02 Longitudinal and Transverse Joints**

All joints shall be made to obtain a complete bond between the two OGD L edges and a smooth riding surface. Longitudinal and transverse joints shall be butt joints. The existing or previously placed OGD L edge shall be a straight clean vertical surface for the full depth of the OGD L. Where ramping or damage has occurred, trimming shall be required.

All dirt or other foreign material and all loose material shall be removed from all vertical surfaces. When matching a compacted joint, the depth of the uncompacted mat shall be set to allow for compaction.

### **320.07.03 Rolling**

Rollers for compaction shall not be in vibration mode. Aggregate pick-up by the rollers shall be avoided. When water is used on the roller drums to prevent aggregate pick-up, free water shall not be allowed to fall onto the Portland cement treated OGD L surface.

### **320.07.04 Surface Tolerances**

The surface shall be shaped and compacted so the finished surface does not deviate more than 10 mm from the grade and cross-section specified in the Contract Documents.

The surface tolerance shall be such that when tested with a 3 m straight edge placed in any direction on the surface except across the crown, there shall not be a gap greater than 5 mm between the bottom of the straight edge and the surface of the OGD L. Correction of the finished surface by grading or milling, or both, shall not be permitted.

### **320.07.05 Delineation**

A delineator shall be placed on the Portland cement treated OGD L prior to placement of the overlying concrete pavement or concrete base.

The delineator shall be applied using self-propelled or towed pressure distributors capable of applying the product in a continuous and uniform manner over all of the OGD L to be overlaid.

### **320.07.06 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **320.08 QUALITY ASSURANCE**

### **320.08.01 General**

A laboratory designated by the Owner shall carry out acceptance testing.

The Owner shall be responsible for all costs associated with testing for Quality Assurance (QA) purposes, unless otherwise specified in this specification.

All test results shall be forwarded to the Contractor as they become available.

### **320.08.02 Sampling**

The Contract Administrator shall be allowed access to all sampling locations and reserves the right to request a sample at any time.

All samples shall be placed in clean sample bags, then sealed and labelled, as specified in the Contract Documents.

All samples shall be accompanied by MTO Form PH-D-10.

#### **320.08.02.01 Sampling of Aggregate for Gradation and Physical Properties**

All aggregates samples shall be duplicate samples.

At least one duplicate 25 kg sample of aggregate from every lot of 50,000 m<sup>2</sup> or part thereof of OGDL being produced shall be obtained.

Additional samples shall also be taken whenever the aggregate changes to a new source or a new bench in a quarry. In this case, the existing lot shall be terminated and a new lot commenced.

Unless otherwise specified, all samples of aggregate shall be taken at the plant producing OGDL from individual stockpiles with a minimum quantity of 500 tonnes of aggregate, or at least 10% of the total quantity of aggregate requirement for the OGDL mix, unless otherwise directed by the Contract Administrator.

Sampling from stockpiles shall be according to LS-625. Each sample shall be treated as discrete sample and not combined or blended with any other sample.

#### **320.08.02.02 Sampling of OGDL for Thickness and Porosity**

The Contract Administrator shall establish the lot size as well as the number of sublots for thickness and porosity sampling, after discussions with the Contractor and prior to placement of the OGDL.

Lot size is generally 40,000 m<sup>2</sup> with the subplot size of 4,000 m<sup>2</sup>. In all cases, a maximum allowable subplot numbers is 10 sublots per lot.

Within five Business Days of placement and prior to the placement of the overlying pavement layer, one intact 150 mm nominal diameter core shall be taken of the full depth of the OGDL for each subplot at a random location selected by the Contract Administrator.

Metal or cardboard containers that protect the integrity and shape of cores during transportation and until testing shall be used. When cores are taken the cores shall be intact and undamaged. If an intact and undamaged core cannot be obtained, then the sample shall be taken by saw cutting an intact sample with minimum dimensions of 140 by 140 mm square and maximum dimensions of 145 by 145 mm square. The sample shall be delivered intact and undamaged.

Immediately after sampling, each sample hole shall be filled with OGDL aggregate, treated with asphalt cement or Portland cement, up to the top of the surrounding OGDL.

### **320.08.03                      Testing**

#### **320.08.03.01                      Gradation and Physical Properties**

Aggregates shall be tested according to Tables 1 and 2.

Aggregate shall be tested according to LS-614, unless written notification to the Contract Administrator to test according to LS-606 is received prior to sampling of the applicable materials for QA purposes. Unless the Contract Administrator has received such a request to replace LS-614 with LS-606, conformance to LS-614 shall be required.

When notification to replace LS-614 is received after QA testing using LS-614 has been initiated, the Owner shall charge \$750.00 for each test initiated, which includes the cost of the testing using LS-614, administrative charges, and additional sampling, if required.

#### **320.08.03.02                      Thickness**

One sample from each subplot shall be tested to determine the thickness of the OGDL according to ASTM C174. The test result for each subplot shall be used to compute the lot mean thickness calculated to one decimal place according to LS-100.

#### **320.08.03.03                      Porosity**

The same sample used for the thickness determination from each subplot shall be tested to determine the porosity of the OGDL according to LS-627. The test result for each subplot shall be used to compute the lot mean porosity calculated to two decimal places according to LS-100.

### **320.08.04                      Acceptance**

Acceptance of OGDL shall be based on the gradation and physical properties of the aggregates used as well as the thickness, porosity, surface appearance and surface tolerance of the OGDL after placement.

#### **320.08.04.01                      Acceptance of Gradation and Physical Properties**

The aggregates within a lot of OGDL shall be deemed to be acceptable, if the test results for the aggregate sample representing that lot meet all of the acceptance limit requirements specified in Tables 1 and 2.

If one or more test results for an aggregate sample representing a lot of OGDL do not meet all of those acceptance limit requirements, then the OGDL aggregates shall be removed from the Work and replaced according to the Repairing and Re-Decisioning subsection, or a price reduction applied at the discretion of the Contract Administrator. A price reduction may only be applied for each m<sup>2</sup> of OGDL left in the Work as long as the aggregate sample representing that lot are all within the price reduction range(s) specified in Tables 1 and 2.

If the QA test results of an aggregate sample representing a lot of OGDL for gradation and physical properties do not meet all the specified requirements and are not price adjusted, then all of the aggregates within that lot shall be rejected and any OGDL that includes those aggregates shall be removed from the Work and replaced at no additional cost to the Owner.

#### **320.08.04.02                      Acceptance of Surface Appearance**

The surface appearance of the OGDL shall be assessed by the Contract Administrator based on visual surveys. The finished OGDL surface shall have a uniformly open texture and be free of loose aggregate. The OGDL shall be rejected if:

- a) A single appearance of irregularity exceeds 5 m<sup>2</sup>.
- b) The combined area of multiple irregularities exceeds 10 m<sup>2</sup> over a 100 m<sup>2</sup> section.

c) Any OGDL identified by the Contract Administrator as being contaminated.

OGDL that is rejected for its appearance shall be repaired. OGDL that is repaired shall be re-decided according to the Repairing and Re-Deciding subsection.

#### **320.08.04.03 Acceptance of Surface Tolerance**

All areas not meeting the surface tolerance requirements as specified in the Surface Tolerances subsection shall be rejected, repaired and re-decided according to the Repairing and Re-Deciding subsection.

#### **320.08.04.04 Acceptance of Thickness**

Thickness acceptance shall be based on the mean of the lot, provided that no single subplot is deemed rejectable. A subplot shall be rejected, if the subplot thickness is less than 0.60 of the design lift thickness. Rejected sublots shall not be included in the lot mean thickness calculation.

If the lot mean thickness is greater than or equal to the design lift thickness, the item shall be accepted without any price reduction for thickness.

If the lot mean thickness is less than the design lift thickness, but greater than or equal to 0.75 of the design lift thickness, the lot shall be subject to a price reduction calculated using the pay factors given in Table 3.

The lot shall be rejected, if the lot mean thickness is less than 0.75 of the design lift thickness.

If repair to the lot is chosen in lieu of a price reduction or if a rejected lot requires repair, the lot shall be repaired and decided according to the Repairing and Re-Deciding subsection.

#### **320.08.04.05 Acceptance of Porosity**

Acceptance for the porosity of OGDL shall be based on the lot mean for the porosity of OGDL, and the porosity of individual sublots.

A subplot shall be rejected if the porosity of OGDL is less than 0.20 or greater than 0.50. Rejected sublots shall not be included in the lot mean porosity calculation and shall be repaired according to the Repairing and Re-Deciding subsection.

The lot shall be accepted if the lot mean porosity of OGDL is greater than or equal to 0.25, and less than or equal to 0.40, and with less than 30% of sublots with porosity outside the range of 0.25 to 0.40.

If the lot mean porosity of OGDL is greater than or equal to 0.25, and less than or equal to 0.40, and with more than 30% of sublots with porosity outside the range of 0.25 to 0.40, those sublots outside the range shall require repair until more than 30% of sublots are within the range of 0.25 to 0.40 for the porosity.

If the lot mean porosity of OGDL is greater than or equal to 0.20 and less than 0.25, or greater than 0.40 and less than or equal to 0.50, the lot shall be subjected to a price reduction calculated using the pay factors in Table 4. If repair to the sublots is chosen in lieu of a payment adjustment, the sublots shall be repaired and re-decided according to the Repairing and Re-Deciding subsection.

If the lot mean porosity of OGDL is less than 0.20 or greater than 0.50, the lot shall be rejected, repaired and re-decided according to the Repairing and Re-Deciding subsection.

#### **320.08.04.06 Referee Testing for Gradation and Physical Properties**

Referee testing may be invoked for one or more attributes by submitting a written request to the Contract Administrator, within five Business Days following notification that a sample representing a lot of OGDL does not meet the requirements of this specification.

Referee testing shall be carried out, as specified herein and as specified in the Contract Documents.

The retained duplicate QA aggregates samples shall be used for referee testing.

All referee test results for a lot shall replace the respective QA tests for acceptance of the applicable lot and shall be binding on both the Owner and the Contractor.

If a lot is not accepted at full payment based on the referee test results, the cost of the referee testing of that lot, including the cost of transporting the samples to the referee laboratory, at the rates as specified in the Contract Documents shall be at no additional cost to the Owner. In all other cases, the Owner shall bear the cost of the referee testing and the cost of transporting the samples of that lot.

#### **320.08.04.07                      Re-test for Thickness and Porosity**

Re-testing for thickness or porosity or both may be invoked by submitting a written request to the Contract Administrator, within five Business Days following notification that any QA samples representing a lot or subplot of OGDL fails to meet the requirements of this specification.

The re-test shall be carried out on the same QA sample, as specified herein and as specified in the Contract Documents. Witnessing of the re-test of the same QA samples for thickness or porosity or both is permitted.

All re-test results for a lot or subplot shall replace the respective QA tests for acceptance of the applicable lot or subplot and shall be binding on both the Owner and the Contractor.

If a lot is not accepted at full payment based on the re-test results, the cost of the re-testing of that lot shall be at no additional cost to the Owner. In all other cases, the Owner shall bear the cost of the re-testing.

#### **320.08.05                      Repairing and Re-Decisioning**

##### **320.08.05.01                      General**

All repairs including removals and replacements to OGDL shall be full lane or shoulder width and a sufficient length for the repair to be carried out employing the same equipment used during initial placement of the OGDL with the exception of repairs for surface deficiencies in surface tolerance. OGDL used for repairs shall meet the requirements of this specification.

All repairs shall be carried out at no additional cost to the Owner.

##### **320.08.05.02                      Gradation and Physical Properties**

Any OGDL that includes rejected aggregates, as specified in the Acceptance of Gradation and Physical Properties clause, shall be removed and replaced.

##### **320.08.05.03                      Surface Appearance**

Rejected OGDL due to surface irregularities or contamination shall be removed and replaced.

##### **320.08.05.04                      Surface Tolerance**

Where the finish grade of OGDL is below the design grade, the final grade of the pavement shall be corrected with an additional thickness of overlying surface material. Patching on the surface of OGDL shall not be permitted. If the finish grade of OGDL is above the design grade, the overlying surface material shall follow the design thickness. Milling on the surface of OGDL shall not be permitted.

##### **320.08.05.05                      Thickness and Porosity**

For each subplot or lot that is rejected due to thickness or porosity or both, or chosen for repair, the entire subplot of OGDL shall be removed and replaced.

When repairs are made to rejected sublots or lot or those sublots that are chosen for repair due to non-conformance, the original lot and replaced sublots shall be re-evaluated and re-decided for acceptance.

The original lot shall be divided into two reconfigured lots in the following way: All non-replaced sublots shall be grouped as one lot; The remaining sublots (i.e., replaced sublots) shall be grouped as another lot. Lot mean thickness and lot mean porosity shall be re-calculated for both reconfigured lots and shall be re-decided for either in payment at the full Contract price, subjected to a payment reduction, or deemed rejectable.

## **320.09 MEASUREMENT FOR PAYMENT**

### **320.09.01 Actual Measurement**

#### **320.09.01.01 Open Graded Drainage Layer**

Measurement of OGD L shall be by area in square metres.

### **320.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

## **320.10 BASIS OF PAYMENT**

### **320.10.01 Open Graded Drainage Layer - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work, except as otherwise specified herein.

When test results show that either the thickness payment factor or porosity of OGD L payment factor for the lot is less than 1.000, the payment reduction for the lot shall be as follows.

$$(2.000 - PF_T - PF_P) \times \text{item price} \times \text{lot quantity}$$

Where:  $PF_T$  and  $PF_P$  are calculated according to Table 3 and 4, respectively.

In addition, any OGD L that contains aggregates that do not meet any of the requirements for gradation or physical properties as specified in the Acceptance of Gradation and Physical Properties clause shall be subject to a 10% payment reduction.

For purposes of payment reduction, the term item price means the Contract price of the Open Graded Drainage Layer item.

**TABLE 1**  
**Gradation Requirements (LS-602)**

| <b>Percentage Passing By Mass of Aggregate (Note 1)</b>                        |                         |                                 |
|--------------------------------------------------------------------------------|-------------------------|---------------------------------|
| <b>Sieve Designation</b>                                                       | <b>Acceptance Limit</b> | <b>Price Reduction Range(s)</b> |
| 37.5 mm                                                                        | 100                     | 90.1 – 100                      |
| 26.5 mm                                                                        | 95.0 – 100              | 85.5 – 94.9                     |
| 19.0 mm                                                                        | 90.0 – 100              | 81.1 – 89.9                     |
| 16.0 mm                                                                        | 65.0 – 100              | 58.5 – 64.9                     |
| 13.2 mm                                                                        | 40.0 – 86.0             | 36.1 – 39.9 or 86.1 – 94.6      |
| 9.5 mm                                                                         | 20.0 – 55.0             | 18.1 – 19.9 or 55.1 – 60.5      |
| 4.75 mm                                                                        | 0 – 10.0                | 10.1 – 12.0                     |
| 2.36 mm                                                                        | 0 – 5.0                 | 5.1 – 6.0                       |
| 75 µm                                                                          | 0 – 2.0                 | 2.1 – 2.4                       |
| Notes:<br>1. All results are rounded to one decimal place according to LS-100. |                         |                                 |

**TABLE 2**  
**Physical Property Requirements**

| <b>MTO Test Number</b>                    | <b>Laboratory Test</b>                                | <b>Acceptance Limit</b> | <b>Price Reduction Range</b> |

| LS-618                                    | Micro-Deval Abrasion, % maximum loss                  | 21.0                    | 21.1 - 23.1                  |
| LS-630                                    | Amount of Contamination, % maximum                    | 1.0<br>(Note 2)         | ≤1.1<br>(Note 2)             |
| LS-631                                    | Plastic Fines                                         | NP (Non-Plastic)        | NP (Non-Plastic)             |
| <b>Alternative Requirement for LS-614</b> |                                                       |                         |                              |
| LS-606                                    | Magnesium Sulphate Soundness, % maximum loss (Note 1) | 15.0                    | 15.1 - 18.8                  |

Notes:

- The Owner shall waive the requirements for LS-614, Unconfined Freeze-Thaw, provided the Contractor has submitted a written request that the aggregate meet the alternative requirements for LS-606, Magnesium Sulphate Soundness.
- Combined amount of wood, clay brick and/or gypsum and/or gypsum wall board or plaster, etc. shall not exceed the maximum percentages by mass shown above.
- All results are rounded to one decimal place according to LS-100.

**TABLE 3**  
**Thickness Payment Factors**

| Acceptance Criteria         | Classification    | Payment Factor, $PF_T$ |
|-----------------------------|-------------------|------------------------|
| $T_C \geq T_D$              | Acceptable        | 1.000                  |
| $0.9T_D \leq T_C < 1.0T_D$  | Payment Reduction | $T_C/T_D$              |
| $0.75T_D \leq T_C < 0.9T_D$ | Payment Reduction | $(T_C/T_D)^{1.5}$      |

Where:

$T_D$  is the OGDL design lift thickness specified in the Contract Documents in millimetres.

$T_C$  is the mean thickness of OGDL of the lot in millimetres calculated to one decimal place according to LS-100.

$PF_T$  is the payment factor for thickness of the OGDL of the lot calculated to three decimal places according to LS-100.

**TABLE 4**  
**Porosity of OGDL Payment Factors**

| Acceptance Criteria                                                                                               | Classification    | Payment Factor, $PF_P$ |
|-------------------------------------------------------------------------------------------------------------------|-------------------|------------------------|
| $0.25 \leq n_c \leq 0.40$<br>with <b>less</b> than 30% of sublots with porosity outside the range of 0.25 to 0.40 | Acceptable        | 1.000                  |
| $0.20 \leq n_c < 0.25$                                                                                            | Payment Reduction | $1 - 4(0.25 - n_c)$    |
| $0.40 < n_c \leq 0.50$                                                                                            | Payment Reduction | $1 - 2(n_c - 0.4)$     |

Where:

$PF_P$  is the payment factor for porosity of OGDL of the lot calculated to three decimal places according to LS-100.

$n_c$  is the mean porosity of OGDL of the lot calculated to two decimal places according to LS-100.

|--------------|-------------------|
| <b>330-A</b> | <b>Commentary</b> |
|--------------|-------------------|

**330.01 SCOPE**

This specification covers the requirements for in-place full depth reclamation of bituminous pavement and mixing with a portion of the underlying granular, and shaping and compacting the processed materials as granular base.

**330.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

### **330.01.02                      Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

### **330.02                              REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

#### **Ontario Provincial Standard Specifications, Construction**

|          |                                    |
|----------|------------------------------------|
| OPSS 301 | Restoring Unpaved Roadway Surfaces |
| OPSS 501 | Compacting                         |

#### **Ontario Ministry of Transportation Publications**

|                                |                                                                         |
|--------------------------------|-------------------------------------------------------------------------|
| MTO Laboratory Testing Manual: |                                                                         |
| LS-621                         | Determination of Amount of Asphalt-Coated Particles in Coarse Aggregate |

### **330.07                              CONSTRUCTION**

#### **330.07.01                      General**

The work of in-place full depth reclamation shall consist of pulverizing the existing bituminous pavement, mixing the processed material with the underlying granular material, and shaping and compacting the blended material and the existing shoulders.

#### **330.07.02                      Operational Constraints**

The in-place full depth reclamation including pulverizing, mixing, shaping, and compacting to final grade shall be completed across the full pavement width prior to closing down operations each day.

The existing shoulders shall also be shaped and compacted to grade prior to closing down operations each day.

### **330.07.03                      Reclamation of Bituminous Pavement and Underlying Granular**

The bituminous pavement and underlying granular shall be reclaimed to the depths specified in the Contract Documents. The tolerance for the average depth of processing shall be  $\pm 15$  mm from the depth specified.

The processed depth shall be such that the blended material shall contain a maximum of 50% by mass of asphalt coated aggregate in the final blend as determined by LS-621.

The operation of full depth reclamation shall ensure that 100% of the mixed material passes the 26.5 mm sieve and not more than 75% passes the 4.75 mm sieve.

### **330.07.04                      Surface Shaping and Compacting**

The graded surface of the processed material, including existing shoulder, shall be according to the requirements of OPSS 301. The material shall be compacted as specified in OPSS 501. Scarifying and fine grading to the specified lines and grades shall be carried out immediately prior to paving.

Surfaces of processed material that have been exposed to traffic and are to receive granular base material to depths of up to 100 mm as required in the Contract shall be scarified immediately prior to placement of the base course material.

### **330.07.05                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **330.08                              QUALITY ASSURANCE**

### **330.08.01                      Samples for Testing**

Samples for testing may be taken by the Contract Administrator to ensure that the mix is according to LS-621.

## **330.09                              MEASUREMENT FOR PAYMENT**

### **330.09.01                      Actual Measurement**

#### **330.09.01.01                      In-Place Full Depth Reclamation of Bituminous Pavement and Underlying Granular**

Measurement of in-place full depth reclamation of bituminous pavement and underlying granular shall be by horizontal area processed in square metres.

### **330.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**330.10****BASIS OF PAYMENT****330.10.01****In-Place Full Depth Reclamation of Bituminous Pavement and Underlying Granular - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Payment for granular base shall be made under the appropriate roadway granular item.

For the purposes of the Changes in the Work clause of the MTO General Conditions of Contract, the depths of pavement to be processed shown in the Contract Documents shall be deemed to be incorrect only when the average depth of all processing differs by more than 15 mm from the equivalent average depth derived from measurements taken by the Contract Administrator during the processing operation.

**Appendix 330-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

|--------------|-------------------|
| <b>331-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **331.01 SCOPE**

This specification covers the requirements for in-place full-depth reclamation of the existing hot mix asphalt (HMA) pavement and underlying granular base; shaping and compacting the unstabilized material; if required, adding and blending corrective aggregates or active filler or both; adding and mixing expanded asphalt; and shaping and compacting the expanded asphalt mix.

#### **331.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

### **331.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

**American Association of State Highway and Transportation Officials (AASHTO)**

T40-02            Sampling Bituminous Materials

**Wirtgen GmbH Publication**

Wirtgen Cold Recycling Technology manual, 1st edition, 2012

**331.03                            DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Active Filler** means substances that chemically alter the mix properties.

**Corrective Aggregate** means virgin aggregate or reclaimed asphalt pavement (RAP) or both added to the reclaimed materials to meet the expanded asphalt mix requirements.

**Expanded Asphalt** means heated asphalt cement expanded from its normal volume by the addition of water.

**Expanded Asphalt Mix (EAM)** means the mixture of reclaimed materials; corrective aggregate or active filler or both, if required; and expanded asphalt.

**Expanded Asphalt Mix (EAM) Mat** means a pavement course which comprises Expanded Asphalt Mix.

**Hot Mix Asphalt (HMA)** means as defined in OPSS 313

**Performance Graded Asphalt Cement (PGAC)** means as defined in OPSS 313.

**Quality Assurance (QA)** means as defined in OPSS 313.

**Reclaimed Asphalt Pavement (RAP)** means as defined in OPSS 313.

**Reclaimed Material** means the mixture of reclaimed existing asphalt pavement and granular base.

**Unstabilized Material** means the mixture of reclaimed existing asphalt pavement and granular base; and corrective aggregate or active filler or both, if required.

**331.04                            DESIGN AND SUBMISSION REQUIREMENTS**

**331.04.01                      Design Requirements**

For mix design purposes, prior to commencing the work the Contractor shall obtain samples representative of the material that is produced during in-place full-depth reclamation. These samples shall be used to establish the design rate of expanded asphalt as a per cent by mass of the unstabilized material and to establish the necessity for corrective aggregate and/or active filler. The dry tensile strength shall be a minimum of 225 kPa and the wet tensile strength shall be a minimum of 100 kPa.

For bidding purpose only, the design rate of the expanded asphalt shall be as specified in the Contract Documents.

The mix design shall be carried out according to the Wirtgen Cold Recycling Technology manual using briquettes produced according to LS-297. The mix design shall be completed by a laboratory with Canadian Council of Independent Laboratories (CCIL) Type A certification or equivalent equipped to carry out expanded asphalt mix designs. When the existing pavement significantly changes composition, a separate mix design shall be completed.

Each mix design shall include the following:

- a) Information on the grade, manufacturer, and supplier of the PGAC.
- b) The percent by mass of expanded asphalt in the mix, referred to as the design rate, and all calculations performed to determine the design rate of expanded asphalt.
- c) The recommended PGAC temperature for foaming, the half-life, the expansion ratio and the percent of water added for foaming.
- d) The optimum moisture content and the mix design bulk relative density.
- e) The dry tensile strength, the wet tensile strength, and the tensile strength ratio.
- f) The amount of water to be added to the mix.
- g) Maximum field rate adjustment allowed to the design rate without adverse effects to mix properties.
- h) Recovered penetration for the binder of the existing pavement according to LS-200.
- i) Type, source, gradation and quantity of corrective aggregate, if required.
- j) Type, source and quantity of active filler, if required.

### **331.04.02 Submission Requirements**

A copy of the mix design shall be submitted to the Contract Administrator a minimum of 7 Business Days prior to the start of EAM operations. Within 4 Business Days after receiving the mix design, the Contract Administrator shall provide written confirmation of receipt of the submitted mix design documents or of any non-conformance to the contract requirements.

Confirmation of receipt of the mix design documents does not constitute any guarantee that the mix can be produced or constructed or both to Contract requirements, and does not relieve the Contractor of the responsibility for ensuring the specified quality of Materials and workmanship.

A new mix design shall be submitted when the expanded asphalt design rate is adjusted by 0.3% or greater. Separate or new mix designs shall be submitted if the composition or layer thicknesses of the existing pavement changes significantly. Where more than one mix design is required, the area for which each mix design is to be used shall be clearly identified.

## **331.05 MATERIALS**

### **331.05.01 Performance Graded Asphalt Cement**

PGAC shall be according to OPSS 1101. The Additional Testing Requirements and Acceptance Criteria for PG Grades table shall not apply. PGAC shall be selected with performance properties meeting the design maximum pavement temperature of 52 °C and the minimum pavement temperature of -28 °C at a minimum, and the selected PGAC shall have suitable expansion characteristics.

### **331.05.02                      Corrective Aggregates**

If required by the mix design, corrective aggregate shall be incorporated into the reclaimed material at the application rate determined in the mix design. Corrective aggregate shall meet the physical property requirements of OPSS 1010 for Granular A.

### **331.05.03                      Active Filler**

If required by the mix design, active filler shall be incorporated into the reclaimed material at the application rate determined in the mix design.

When used as active filler, Portland cement shall be according to OPSS 1301. Not more than 1% by mass of Portland cement shall be added to the mix.

### **331.05.04                      Water**

Water shall be clean and free from oil, acid, alkali, organic matter or other deleterious substances.

### **331.05.05                      Expanded Asphalt Mix**

The EAM shall be 100% passing the 37.5 mm sieve, and 95% to 100% passing the 26.5 mm sieve, and shall be measured based on air dried gradation according to coarse sieving operation of LS-602.

## **331.06                              EQUIPMENT**

### **331.06.01                      Full-Depth Reclamation and Stabilization Equipment**

The reclaimer-stabilizer shall be capable of reclaiming the existing asphalt pavement and underlying granular base to the depths specified in the Contract Documents, incorporating corrective aggregate or active filler or both into the mix, adding expanded asphalt in a controlled manner, and producing a uniform mix.

The reclaimer-stabilizer shall be fitted with an automatic sensor system to accurately maintain a preset depth of cut within a tolerance of 10 mm and shall have a minimum 2.0 m wide cutting drum.

The reclaimer-stabilizer shall have an asphalt cement expansion system capable of producing optimum expansion and an injection system capable of injecting and blending expanded asphalt uniformly throughout the unstabilized material. In order to mix the unstabilized material with the expanded asphalt, the reclaimer-stabilizer shall include the following features:

- a) A system to control and regulate the application of expanded asphalt in relation to travel speed and mass of material within a tolerance of  $\pm 3.0\%$  by volume of asphalt cement.
- b) A system to monitor and control all aspects of the mixing process, including percent expanded asphalt, rate of application, and percent water for optimum compaction.
- c) A system of nozzles that provides uniform application of the expanded asphalt across the full width of treatment. The application system shall be adjustable for varying widths of treatment.

The aggregate delivery vehicle shall have a system for controlled application of the corrective aggregate.

### **331.06.02                      Placing Equipment**

A mechanical paver capable of spreading the mix evenly in front of the screed in one continuous pass to the specified cross-fall and grade shall be used to place the EAM. The paver shall be equipped with distributing augers for the full width to be paved. The paver shall have a vibratory screed capable of vibrating the full width of mix placed.

### **331.06.03                      Pilot Vehicle**

The pilot vehicle used to control traffic shall be according to OTM, Book 7.

## **331.07                              CONSTRUCTION**

### **331.07.01                      Operational Constraints**

In-place full depth reclamation including mixing, shaping and compacting to final grade shall be completed across the full pavement width prior to closing down operations each day.

The existing shoulders shall be shaped and compacted to match the adjacent lane prior to closing down operations each day.

Expanded asphalt stabilization shall not proceed during periods of rain or when the surface is in a saturated condition.

Traffic, including construction traffic, shall be kept off the freshly placed EAM until such time as it is able to carry traffic without damage. The Contractor shall be responsible for repair of damaged EAM.

The HMA course(s) shall not be placed on the EAM until the following requirements have been met:

- a) The EAM has been allowed to cure for a minimum of 3 Days.
- b) It has been demonstrated that the EAM meets all the requirements of this specification.
- c) All defective areas in the EAM have been repaired to the satisfaction of the Contract Administrator.

### **331.07.02                      In-Place Full-Depth Reclamation**

The existing asphalt pavement and underlying granular base shall be reclaimed to the depths and widths specified in the Contract Documents.

The graded surface of the reclaimed material, including existing shoulders shall be according to the surface tolerance requirements of OPSS 301. Reclaimed material exceeding 50 mm in size shall be removed from the work. The material shall be compacted according to OPSS 501.

### **331.07.03                      Expanded Asphalt Trial Section**

Prior to carrying out expanded asphalt stabilization, the Contractor shall demonstrate to the Contract Administrator the ability to successfully carry out expanded asphalt stabilization according to this specification by placing a trial section within the Contract limits.

In lieu of a trial section, the Contract Administrator may accept evidence that the Contractor has demonstrated the ability to successfully mix, handle, place, and compact EAM with the same equipment, placing crew, and methodology to meet the Contract requirements for placing EAM on another Contract within the last 12 months.

The trial section shall be a minimum of 3,500 m<sup>2</sup> or the equivalent of one tanker load of asphalt cement. The Contractor shall propose the location of the trial section to the Contract Administrator for approval. A minimum of 48 hours notice shall be given to the Contract Administrator prior to placing the trial section.

The Contract Administrator shall allow the Contractor to continue the expanded asphalt stabilization work based on an acceptable visual assessment of the trial section according to the requirements of the Grading and Compacting the Expanded Asphalt Mix subsection. When EAM is rejected by visual assessment, the Contractor shall repeat additional trial sections until the EAM meets the requirements of the Surface Appearance subsection.

The Contractor shall be responsible for the repair, removal, or replacement of an unacceptable trial section according to the Repairing and Re-Evaluating subsection.

#### **331.07.04                      Expanded Asphalt Stabilization**

Expanded asphalt stabilization shall be to the depth and limits detailed in the Contract Documents. The overlap between successive passes of the reclaimer-stabilizer shall be a minimum of 100 mm and a maximum of 150 mm.

If required, corrective aggregate or active filler or both shall be added to the roadway prior to stabilizing.

In areas that are inaccessible to the reclaimer-stabilizer equipment, existing asphalt pavement shall be removed and replaced with a minimum 100 mm of binder course hot mix placed flush with the adjacent EAM surface.

#### **331.07.05                      Compacting the Expanded Asphalt Mix**

The surface of the EAM shall be uniform in texture and free of surface defects.

Granular material shall be compacted according to OPSS 501.

The compacted surface of the EAM shall be according to the surface tolerances as specified in this specification.

#### **331.07.06                      Traffic Control with Moving Vehicles**

Traffic shall be controlled with moving vehicles according to OTM, Book 7.

The moving vehicles shall guide one-way traffic through or around construction. The maximum speed of the moving vehicles shall be 30 km/h. Traffic control with moving vehicles shall be maintained until such time as the expanded asphalt stabilization is able to carry traffic without damage.

### **331.08                              QUALITY ASSURANCE**

#### **331.08.01                      General**

Acceptance of the EAM shall be based on the following criteria:

- a) Surface Appearance
- b) Asphalt Cement Content
- c) Tensile Strength of EAM
- d) Thickness

- e) Surface Tolerance
- f) Compaction
- g) EAM Gradation
- h) Corrective Aggregates, if required.

Work that does not meet the acceptance criteria shall be repaired according to the Repairing and Re-Evaluating subsection.

### **331.08.02                      Sampling**

#### **331.08.02.01                      Lot Size**

A lot size shall be a maximum of 50,000 m<sup>2</sup> of expanded asphalt stabilization divided into 10 sublots of equal size. The lot size may be adjusted at the discretion of the Contract Administrator and after discussion with the Contractor, prior to starting the work and when changes occur in the mix design or in the sequence of expanded asphalt stabilization. The maximum subplot size shall be 5,000 m<sup>2</sup>. The minimum number of sublots in a lot shall be three.

#### **331.08.02.02                      Performance Graded Asphalt Cement**

Samples of PGAC to be used in the mix shall be taken from the storage tank at the terminal according to the Tank Tap Method specified in AASHTO T40-02 and the terminal's health and safety plan in the presence of the Contract Administration at a frequency of three sets of samples per Contract for PGAC providing to three different lots. Each set of samples shall be a minimum of 2 full one-litre portions. The Contractor's health and safety plan and procedure for sampling shall be reviewed at the pre-pave meeting.

Sample containers supplied by the Contractor shall be triple tight steel containers or suitable containers that can be sealed to prevent leakage or contamination.

#### **331.08.02.03                      Corrective Aggregate**

Where the quantity of corrective aggregate is greater than 5,000 tonnes, two 25 kg samples shall be taken in the presence of the Contract Administrator for each 25,000 tonnes of material produced, and whenever material is produced from a new source or new bench in a quarry, or whenever a significant change in production of materials occurs.

QA samples shall be taken in accordance with procedures given in LS-625 and at the time and location determined by the Contract Administrator.

#### **331.08.02.05                      Expanded Asphalt Mix**

For the purpose of accepting the asphalt cement content, samples of unstabilized material and EAM shall be taken at a minimum frequency of one set of samples per subplot. To obtain a set of samples, one 15 kg sample of unstabilized material shall be obtained immediately following in-place full depth reclamation and, from the same approximate location, a second 15 kg sample of EAM immediately following stabilization. The maximum sampling depth shall be 100 mm. The second sample may be obtained after placement and prior to compaction.

For the purpose of determining the EAM gradation, another 30 kg sample of EAM shall be taken from each of three randomly selected sublots for every lot.

The samples shall be packaged in non-absorptive materials to protect sample integrity and sealed in waterproof containers. The samples shall be transported in a manner that avoids stacking and extreme temperatures.

### **331.08.03                      Acceptance Criteria**

#### **331.08.03.01                      Surface Appearance**

Surface appearance shall be assessed by the Contract Administrator based on SP-027 manual after the EAM mat has been opened to traffic. The finished EAM surface shall have a uniformly smooth texture and be free from surface defects of ravelling, deformation, flushing, and rutting prior to placement of the HMA overlay.

#### **331.08.03.02                      Asphalt Cement Content**

For each subplot, the sample of unstabilized material taken immediately following in-place full depth reclamation and the sample of EAM taken immediately after stabilization, shall be tested for total asphalt cement content according to LS-282. The total asphalt cement content of the EAM includes existing aged asphalt cement and new asphalt cement. The per cent by mass of new asphalt cement added to the unstabilized material shall be determined from the two samples at each location by subtracting the total asphalt cement content of the unstabilized material from the total asphalt cement content of the EAM.

The average new asphalt cement content of a lot shall not be less than 0.4% or more than 0.6% of the established mix design.

#### **331.08.03.03                      Tensile Strength**

Samples of EAM shall also be tested for dry tensile strength and wet tensile strength according to LS-297.

Dry tensile strength requirements for the lot are met when the following are satisfied:

- a) The mean dry tensile strength of the lot is equal to or greater than 225 kPa; and
- b) No individual subplot dry tensile strength is less than 200 kPa.

Wet tensile strength requirements for the lot are met when the following are satisfied:

- a) The mean wet tensile strength of the lot is equal to or greater than 100 kPa; and
- b) No individual subplot wet tensile strength is less than 75 kPa.

EAM that does not meet the above dry tensile strength and wet tensile strength requirements shall be deemed rejectable.

#### **331.08.03.04                      Thickness**

Thickness of the EAM shall be measured by the Contract Administrator at a minimum frequency of one thickness measurement per subplot. Measurements shall be taken by excavating along the edge of the stabilized pass with a shovel and measuring the depth of stabilization from the bottom of the EAM to the surface of the adjacent unstabilized material. Thickness requirements for the lot are met when the following are satisfied:

- a) At least 90% of all thickness measurements are equal to or greater than the specified thickness minus 20 mm, and

- b) No individual thickness measurement for the lot is less than the specified thickness minus 30 mm.

#### **331.08.03.05                      Surface Tolerance**

The surface tolerance of any EAM surface shall be such that when tested with a 3 m straight edge placed anywhere on the EAM surface, including the edge of the EAM, in any direction on the surface, there shall not be a gap between the bottom of the straight edge and the surface of the EAM greater than 10 mm according to OPSS 301.

#### **331.08.03.06                      Compaction**

Compaction measurements shall be taken by the Contract Administrator according to OPSS 501 for granular materials and at a minimum frequency of one QA measurement per subplot. Compaction requirements of the EAM placed for the lot are met when the following are satisfied:

- a) The lot average of all compaction measurements is greater than or equal to 97% of the target density; and
- b) No individual compaction measurement for the subplot is less than 95% of the target density.

#### **331.08.03.07                      Expanded Asphalt Mix Gradation**

If the EAM does not meet the gradation requirements, the Contractor shall submit an action plan of mediation to the Contract Administrator for approval within 2 Business Days after the delivery of the QA testing results.

#### **331.08.03.08                      Corrective Aggregate**

QA testing shall be carried out to ensure that corrective aggregate to be used in the work is according to the physical property requirements of Granular A according to OPSS 1010.

#### **331.08.04                          Repairing and Re-Evaluating**

##### **331.08.04.01                      General**

With the exception of repairs for surface tolerance, the minimum width of repair shall be the full lane width.

For repairs due to the surface appearance defects, the minimum repair length shall be sufficient for the repair to be carried out by the reclaimer-stabilizer equipment. For other repairs based on the lot and subplot acceptance, the minimum length shall be according to the Repairing and Re-Evaluating clause of OPSS 313. All repairs shall be made using the same equipment as was used during initial production and placement.

All repairs will be re-evaluated and retested according to Acceptance Criteria subsection.

##### **331.08.04.02                      Surface Appearance**

Unacceptable EAM due to the surface appearance defects, including any area damaged or contaminated by traffic, by water added by Contractors during compaction, or by nature, shall be reprocessed by the reclaimer-stabilizer. If required, additional expanded asphalt shall be added during reprocessing.

Alternatively, the Contractor shall remove and replace damaged or otherwise unacceptable EAM with the same hot mix type to be used in the overlying hot mix lift to a minimum depth of 50 mm according to OPSS 313.

### **331.08.04.03                      Asphalt Cement Content**

For sublots with insufficient asphalt cement content, the EAM mat shall be reprocessed by the reclaimer-stabilizer with addition of asphalt cement during reprocessing. For sublots with excessive asphalt cement content, the EAM mat shall be reprocessed by the reclaimer-stabilizer with addition of corrective aggregates during reprocessing. The unacceptable sublots are repaired until the corresponding lot mean is within the acceptance tolerance.

### **331.08.04.04                      Tensile Strength**

The rejectable sublots shall be reprocessed by the reclaimer-stabilizer, if required, with addition of asphalt cement during reprocessing until the corresponding lot mean is above the acceptance criterion. Alternatively, the EAM mat shall be removed to a minimum depth of 50 mm and replaced by an appropriate HMA approved by the Contract Administrator.

### **331.08.04.05                      Thickness**

For sublots with insufficient thickness, the Contractor shall determine the limits of the unacceptance EAM based on additional measurement. The pavement segments with insufficient thickness shall be overlaid with binder course or surface course with additional thickness so as to compensate for the insufficient thickness as found in EAM layer.

### **331.08.04.06                      Surface Tolerance**

To meet the specified surface tolerance, all deficient areas shall be re-profiled by milling or padded with the same hot mix type to be used in the overlying hot mix lift.

### **331.08.04.07                      Compaction**

Mixes that cannot be compacted to the specified density shall be removed to a minimum depth of 50 mm and replaced by HMA approved by the Contract Administrator.

## **331.09                                      MEASUREMENT FOR PAYMENT**

### **331.09.01                              Actual Measurement**

#### **331.09.01.01                      Full-Depth Reclamation with Expanded Asphalt Stabilization**

Measurement of full-depth reclamation with expanded asphalt stabilization shall be by horizontal area in square metres.

### **331.09.02                              Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **331.10                                      BASIS OF PAYMENT**

### **331.10.01                              Full-Depth Reclamation with Expanded Asphalt Stabilization - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

The addition of corrective aggregate, active filler or other additives, including any expanded asphalt that is required due to the additives, shall be at no extra cost to the Owner.

HMA required to replace unacceptable EAM shall be at no extra cost to the Owner.

PGAC shall be included in the Full-Depth Reclamation with Expanded Asphalt Stabilization item.

Repair of unacceptable EAM shall be carried out at no extra cost to the Owner.

The additional expanded asphalt, if required, added during reprocessing of unacceptable EAM shall be carried out at no extra cost to the Owner.

Repair of areas of EAM damaged by traffic shall be completed at no extra cost to the Owner.

Repair, removal, or replacement of an unacceptable trial section shall be completed at no extra cost to the Owner.

**332.01 SCOPE**

This specification covers the requirements for the preparation of the existing pavement surface; heating and hot milling the existing hot mix asphalt (HMA); adding and mixing in one or more of rejuvenating agent and beneficiating HMA; and redistribution and compaction of the hot in-place recycled (HIR) mix in a single operation.

## 332.03 DEFINITIONS

For the purpose of this specification, the definitions in OPSS 313, OPSS 1151, and the following definitions apply:

**Attribute** means one of the following properties: designated large sieve (DLS), 4.75 mm sieve, 75 µm sieve, AC content, air voids, lift thickness, compaction, or recovered asphalt cement (RAC) performance grade.

**Beneficiating HMA** means a HMA designed such that the final HIR mix shall be according to the Contract Documents.

**Design Lift Thickness ( $T_D$ )** means the thickness in millimetres of the HIR mix as specified in the Contract Documents.

**Field Adjustment to the Job Mix Formula (JMF)** means a change in the target gradation, rejuvenating agent content, beneficiating HMA content, or any combination, of a HIR mix without a redesign of the HIR mix, resulting in an adjusted JMF.

**Hot In-place Recycled (HIR) Mix** means the mixture of hot milled material containing one or more of the following components: rejuvenating agent and beneficiating HMA.

**Hot Milled Material** means the material produced during the heating and hot milling of the existing HMA.

**Hot Milling** means the process of applying adequate heat to the pavement to sufficiently soften the pavement, followed by the use of milling heads to uniformly remove the heated material to the depth specified in the mix design submission with minimal fracturing of the existing aggregates.

**Job Mix Formula (JMF)** means the percentage passing on each designated sieve of the total mass of aggregate, the amount of rejuvenating agent, and the amount of asphalt cement as a percent by mass of the HIR mix that are based on specified mix design procedures.

**Joint** means a vertical contact between a HIR mix and any pavement or any rigid object that exists at the time the HIR mix is laid.

**Lift Thickness** means the thickness in millimetres, measured according to LS-294, of the placed and compacted HIR mix.

**Loose Mix** means a representative sample of uncompacted HIR mix for testing mix properties or the RAC performance grade.

**Mix Design** means the design of the proportions of new and existing aggregates; new and existing AC; rejuvenating agent; and additives; when uniformly mixed, that results in an acceptable HIR mix.

**Mix Properties** means the AC content, gradation, and air voids.

**Recovered Asphalt Cement (RAC)** means the AC extracted and recovered from the HIR mix according to LS-284, using re-agent grade trichloroethylene, or other solvent acceptable to the Owner.

**Rejuvenating Agent** means a product that when added to the hot milled material; the RAC from the HIR mix meets the requirements of the Contract Documents.

**Screed** means the unit of the placement unit of the recycling train that strikes off and imparts initial compaction to the HIR mix.

## **332.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **332.04.01 Design Requirements**

The HIR mix design shall be according to OPSS 1151 and as specified in the Contract Documents.

### **332.04.02 Submission Requirements**

A copy of the technical data sheet and safety data sheet of the release agent(s) shall be submitted to the Contract Administrator.

The submission of additional information for HIR mixes shall be according to OPSS 1151 and as specified in the Contract Documents.

## **332.05 MATERIALS**

### **332.05.01 Hot In-place Recycled Mix**

The HIR mix produced shall be according to the mix design and meet the requirements of Table 1. Asphalt cement, anti-stripping treatments, release agents, rejuvenating agents, and other additives shall be compatible with the other components of the HIR mix.

#### **332.05.01.01 Recovered Asphalt Cement**

The RAC recovered from the HIR mix produced shall be according to OPSS 1101 and as specified in the Contract Documents.

### **332.05.01.02                    Beneficiating Hot Mix Asphalt**

The aggregates used in the beneficiating HMA shall be according to OPSS 1003 for the HMA mix type the HIR mix is required to meet as specified in the Contract Documents. Asphalt cement, anti-stripping treatments, release agents, and other additives shall be compatible with the other components of the beneficiating HMA.

The PGAC used in the beneficiating HMA shall be according to OPSS 1101 and as specified in the Contract Documents for the performance grade specified for the HIR mix in the Contract Documents.

RAP, RST, or both shall not be used in the composition of the beneficiating HMA.

### **332.05.01.03                    Rejuvenating Agents**

The rejuvenating agent incorporated into the HIR mix shall not contain any wax components.

### **332.05.02                        Release Agents**

No release agents shall be used that may adversely affect the quality or performance of the HIR mix. Release agents shall be used according to the proprietary requirements.

Petroleum based release agents, excess water, or excess release agents shall not be used.

## **332.06                            EQUIPMENT**

### **332.06.01                        Heating Unit**

Heating units shall apply heat in a uniform manner to the surface of the existing pavement to be hot milled. Open flame heating of the existing HMA pavement shall not be permitted.

Heaters shall be spaced and operated such that:

- a) Sufficient heat penetration of the pavement shall be achieved, with heat penetration into the underlying pavement beneath the hot milling depth specified in the mix design submission,
- b) The desired HIR mix temperatures are achieved, and
- c) The existing HMA surface is not burnt or scorched.

### **332.06.02                        Recycling Train**

The recycling train shall be self-contained mechanical units specifically designed for HIR of HMA pavements. The recycling train shall have the capability to process the existing pavement to a depth of at least 50 mm.

Heaters used as part of the recycling train shall be according to the Heating Unit subsection.

The recycling train shall include hot milling, blending, and placement units.

### **332.06.02.01                    Hot Milling Unit**

The hot milling unit shall be capable of uniformly milling the preheated HMA to the hot milling depth specified in the mix design submission.

### **332.06.02.02                    Blending Unit**

The blending unit shall be capable of thoroughly mixing the hot milled material, rejuvenating agent, and beneficiating HMA.

### **332.06.03                        Diamond Grinding**

A diamond grinder shall be power-driven, self-propelled, and designed for grinding HIR mix or HMA. It shall be equipped with a grinding head with at least 50 diamond blades per 300 mm of shaft. The grinding head shall be at least 1.2 m wide. The grinder shall be equipped with the capability to adjust the depth, slope, and crossfall to remove HIR mix or HMA to the required profile and shall also include a slurry pick-up system.

## **332.07                                CONSTRUCTION**

### **332.07.01                        Quality Control**

The QC procedures shall be conducted to ensure the HIR mix meets the requirements of the Contract Documents. Interpretation of QC inspections, test results, and measurements and the determination of any action to be taken shall be carried out to ensure that the work is according to the requirements of the Contract Documents.

A single sample for QC purposes may be obtained at the same time and location as QA acceptance samples. No additional loose mix samples shall be taken from the placed HIR mix.

Up to three additional cores may be taken in each surface lot for QC purposes. Cores shall not be spaced closer than one metre from any other core. If further additional samples are required, a written request shall be made to the Contract Administrator and samples shall only be taken upon written approval of the Contract Administrator. All sample locations shall be restored as specified in the Contract Documents.

### **332.07.02                        Preparation of Existing Pavement**

Prior to the HIR operation:

- a) Existing HMA surfaces shall be clean and free of all loose, broken, and foreign materials.
- b) Milled existing HMA surfaces shall be clean and free of all loose, broken, and foreign materials and shall be swept with a power broom.
- c) The Contractor shall be responsible for preparing the existing HMA surface by removing all materials such as cold mix patching material, crack sealant, and spray patch material, as the deemed necessary for the HIR mix to meet the requirements of the Contract Documents.

Existing surfaces to be HIR may be corrected by additional cold milling, hot milling, addition of beneficiating HMA or a combination in order to place and compact the HIR mix to the design thickness specified in the Contract Documents.

Removal of the existing pavement by the hot milling unit shall be performed in such a manner as to leave adjacent pavement and structures remaining in place undisturbed and undamaged. All damaged or disturbed portions shall be corrected expeditiously and repaired to the satisfaction of the Contract Administrator. Broken edges of portions to be left in place that are visible after construction shall be squared and neatly trimmed.

### **332.07.03                        Transportation of Beneficiating Hot Mix Asphalt**

Truck boxes used to transport beneficiating HMA shall be clean and, if required, lightly coated with a uniform application of a release agent. Truck boxes shall be drained after each application and before loading.

#### **332.07.04 Placing Hot In-place Recycled Mix**

##### **332.07.04.01 Operational Constraints**

The HIR mix shall not be placed unless the ambient air temperature is at least 7 °C.

The HIR process shall be carried out when the roadway is clean and free of standing water. The HIR process shall not proceed in the rain.

The supply of any materials to the recycling train shall be accomplished with no traffic on the uncompacted mat. Public traffic shall not be permitted on freshly laid HIR mix until the temperature of the mat is 50 °C or less.

A lot shall be closed before paving begins on a different lot using the same tender item, the same mix design, or both, unless otherwise allowed by the Contract Administrator.

##### **332.07.04.02 Paving**

The heating units and recycling train shall heat and hot mill the HMA pavement across the complete lane width and partial width shoulder, if applicable, to the hot milling depth specified in the mix design submission.

The underlying pavement, immediately in front of the placement unit, shall be heated to a temperature of 60 to 80 °C.

When inspection and testing indicate that the required average depth of heating and hot milling is not being met, the process shall be immediately corrected.

Rejuvenating agent and/or beneficiating HMA shall be added to and mixed with all the hot milled material from the road, in a blending unit, and in the amount specified in the mix design. The HIR mix shall be homogeneous after mixing.

The final placement of the HIR mix by the recycling train shall be uniformly distributed to the specified profile and crossfall. The HIR mix shall be compacted to the design lift thickness specified in the Contract Documents and meet all acceptance criteria specified in the Contract Documents.

Each successive pass of the recycling train shall reprocess the edge of the previously HIR adjacent surface. Heating units shall overlap the previously HIR adjacent surface by a minimum of 100 mm such that it is heated to a temperature of 80 to 100 °C immediately prior to placement of the HIR mix. The hot milling units shall reprocess the edge of the previously HIR adjacent surface by a minimum of 50 mm.

The HIR mix shall be a minimum temperature of 110 °C, immediately behind the screed, to meet the compaction requirements specified in the Contract Documents.

Prior to roller compaction, obvious defects in the HIR mix placed shall be corrected. Irregularities in the alignment and grade along the outside edges shall be corrected. Excess HIR mix shall not be cast onto the surface of the freshly laid mat. After final compaction the surface shall be smooth and true to the established crown and grade, uniform in texture, and shall be free of any defects including, but not limited to, cracks, segregation, fat spots, oil spills, chatter, and roller marks.

All through lane HIR mix shall be completed prior to the placement of adjacent sideroads.

Areas that are not accessible to the heating and hot milling equipment shall have the HMA removed to the depth required to meet the design lift thickness requirements specified in the Contract Documents. These areas shall be tack coated according to OPSS 308, paved according to OPSS 313, and the HMA mix type and the HIR mix shall be as specified in the Contract Documents. The surface of each layer placed and compacted shall be level with the adjacent pavement. The paving of such areas shall be completed prior to the placing of any subsequent course on the HIR mix, if applicable, and as a separate operation from any other paving.

If actions fail to prevent continued medium or severe segregation regardless of cause, the Contract Administrator may instruct to cease HIR operations until the problem has been corrected.

### **332.07.05 Longitudinal and Transverse Joints**

All joints shall be made to obtain a complete bond between the two pavement edges and a smooth riding surface. The existing or previously placed pavement edge shall be a straight clean vertical surface for the full depth of the course. Where ramping or damage has occurred, trimming shall be required. All dirt or other foreign material and all loose material shall be removed from all vertical surfaces.

Longitudinal and transverse joints between the new HIR pavement and the existing pavement shall be butt joints as specified in the Contract Documents. All longitudinal joints at intersecting roads shall be butt joints. Heating beds on the heating units shall heat and soften material beyond the hot milling width by a minimum of 100 mm to achieve proper thermal bonding between the existing asphalt pavement and the HIR mix along the longitudinal joints. The longitudinal joints shall be parallel to the lane and visually uniform longitudinally and offset 50 mm from the edge of the demarcation between the lanes as specified in the Contract Documents.

When matching a compacted joint, the depth of the uncompacted mat shall be set to allow for compaction.

### **332.07.06 Compaction**

Compaction of the HIR mix shall be conducted using appropriate methods and equipment to provide a uniformly compacted mat as specified in the Contract Documents.

At all places not accessible to rollers, the HIR mix shall be compacted by mechanical self-powered gas-, electric-, or air-powered equipment.

### **332.07.07 Field Adjustments to the Job Mix Formula**

The JMF may be adjusted to more closely reflect the HIR mix being produced unless a new mix design is required according to OPSS 1151 and as specified in the Contract Documents. The adjusted JMF shall be submitted in writing to the Contract Administrator within one Business Day of the field adjustment to the JMF.

### **332.07.08 Sampling**

#### **332.07.08.01 Mix Properties and Recovered Asphalt Cement Performance Grade**

Samples shall be appropriately labelled with the Contract number, highway number, Region, lot number, subplot number, mix type, station, and date and time of sampling.

Each random sample location from which the sample is to be taken shall be as designated by the Contract Administrator. A set of two samples shall be taken according to Table 2. One of these samples shall be for QA testing and the other shall be for referee testing. Samples for QA and referee testing shall be obtained concurrently at the paver once the rejuvenating agent, or beneficiating HMA, or both have been added.

When the mass of the sample does not meet the requirements of Table 2, the sample shall be discarded and a new one taken immediately.

#### **332.07.08.02 Compaction**

Upon completion of each subplot, the Contract Administrator shall submit in writing, notification of each random sample location. Pavement core samples shall be obtained in duplicate from each subplot no later than the next Business Day after the completion of the subplot. Each core shall meet the following requirements:

- a) Have a minimum nominal diameter of 150 mm and a maximum nominal diameter of 200 mm, and

b) Consist of the full layer being sampled and at least one underlying layer, if one is present.

Cores shall not be taken within 250 mm of a longitudinal or transverse joint or the edge of pavement.

Each set of samples shall be taken from the same lane, same transverse offset, and at a spacing of 1.0 m  $\pm$  0.1 m between each individual core edge.

Cores shall not be damaged during coring operations or in transit. If a core is damaged, a replacement core shall be extracted at a location adjacent to the original core.

Core samples shall also include design lift thickness on the label. The lot and subplot numbers shall be clearly marked with a permanent marker on all compaction cores.

HIR mix and compaction requirements for filling the sample holes shall be the same as the adjacent undisturbed pavement. Sample holes shall be cleaned, dried, and filled and then compacted using a mechanical self-powered gas-, electric-, or air-powered compactor immediately after sampling.

A one-litre sample of the release agent(s) shall be delivered to the Contract Administrator upon request.

### **332.07.08.03                      Lift Thickness**

Single cores consisting of the HIR mix placed shall be used to evaluate the lift thickness of the HIR tender item placed at each sample location. Sample locations shall be determined based on the surface area of the HIR mix placed as specified in the Contract Documents.

All areas of HIR paving as specified in the Contract Documents, including paved shoulders, shall be sampled for lift thickness.

Upon completion of each subplot, the Contract Administrator shall submit in writing notification of the location to be used for sampling. One pavement core sample shall be obtained from each subplot no later than the next Working Day after completion of the subplot. This one core shall be used for both QA and referee testing.

Each core shall have a nominal diameter of 50 mm, shall consist of the HIR mix placed in the subplot, and at least one underlying HMA layer if one exists. Each core shall have its vertical side cored perpendicular to the upper surface of the core. Each sample shall be placed in a suitable container to protect the sample integrity during transport and until testing. The subplot number shall be clearly marked with a permanent marker on each core.

No replacement thickness cores shall be obtained for QA or referee testing. When a core thickness is reported as "indeterminate", a new 150 mm core shall be taken centred over the subplot's previously taken 50 mm core.

Holes resulting from the removal of thickness core samples shall be cleaned, dried, and filled with a material acceptable to the Contract Administrator immediately after sampling.

### **332.07.09                      Performance Graded Asphalt Cement**

If beneficiating HMA is used, samples of the PGAC added to the beneficiating HMA shall be taken according to OPSS 1101 and as specified in the Contract Documents.

### **332.07.10                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **332.08 QUALITY ASSURANCE**

### **332.08.01 Acceptance Criteria**

The Owner shall conduct tests, carry out calculations, and provide values according to Table 3. The Contractor shall be provided with results from the completed tests. Payment factors and payment adjustments for each lot shall be determined by the Contract Administrator based on the QA test results as specified in the Contract Documents. Unless referee testing is invoked, in which case referee results shall be used.

Acceptance of HIR mix shall be based on the following criteria:

- a) Air Voids and Compaction
- b) Gradation and AC Content
- c) RAC Performance Grade
- d) Surface Tolerance
- e) Surface Appearance
- f) Surface Smoothness
- g) Lift Thickness
- h) Geometrics and Longitudinal Joint Location
- i) PGAC Physical Requirements

#### **332.08.01.01 Air Voids and Compaction**

##### **332.08.01.01.01 Lot Size**

Before the HIR operation starts, a discussion with the Contract Administrator shall happen regarding their determination of the size and location of the lots and sublots. Guidelines for the breakdown of the tender item quantity into lots are as listed in Table 4. Generally, lot size is 40,000 m<sup>2</sup> with sublots of 4,000 m<sup>2</sup>; however, subplot sizes shall be adjusted to ensure a minimum of three sublots per lot.

When the tender item quantity is less than 4,000 m<sup>2</sup>, the lot shall be divided into at least three sublots as determined by the Contract Administrator, unless such division is deemed impractical by mutual agreement.

When only one or two sublots are completed at the end of placement of the tender item due to a change in the JMF or when a delay of more than 20 Business Days occurs in placing the complete lot, the test results obtained shall be considered as part of the previous lot and the previous lot shall then have 11 or 12 sublots. When only three to nine sublots are completed due to the above circumstances, then the three to nine sublots shall be considered as a lot.

When a delay of more than 20 Business Days occurs in placing the complete lot and this lot shall be completed during the same calendar year, a request in writing prior to the end of the 20 Business Days, may be submitted to the Contract Administrator that the lot be continued upon the resumption of placement of that tender item. If the request is not made or is not accepted by the Contract Administrator, the lot shall be terminated and evaluated for acceptance.

#### **332.08.01.01.02 Basis of Acceptance**

Acceptance for HIR mix for air voids and compaction is based on the lot PWL for each attribute. PWL shall be determined using lot test results, LS-101, and lower and upper limits as specified in Table 1. The PWL of the lot for each criterion shall be used to determine the payment adjustment factor from Table 5. If the PWL is less than 50% for air voids or compaction, the lot is rejectable and shall be subject to repair or payment adjustment.

The Contract Administrator shall determine if a rejectable lot may remain in the work without repairs. When the Contract Administrator has determined that a rejectable lot may remain in the work without repair, the lot shall be subjected to a payment adjustment. If repair of the lot is chosen in lieu of a payment adjustment or if the Contract Administrator determines that a rejectable lot requires repair, the lot shall be repaired and re-evaluated as detailed in the Repairs subsection.

#### **332.08.01.02 Gradation and Asphalt Cement Content**

##### **332.08.01.02.01 Lot Size**

The lots and sublots for gradation and AC content shall be according to the Lot Size clause under the Air Voids and Compaction clause of the Acceptance Criteria subsection.

##### **332.08.01.02.02 Basis of Acceptance**

Acceptance for HIR mix for gradation and AC content shall be determined using the lot mean, LS-282 or LS-292, the specification limits specified in Table 1, and subplot acceptability.

Sublot test results shall be acceptable if they meet the specification limits specified in Table 1. If a subplot test result for any payment adjustment sieve or AC content does not meet the specification limits specified in Table 1, the subplot shall be deemed rejectable and shall be repaired as detailed in the Repairs subsection. When a lot contains any subplot that is deemed rejectable, the lot is rejectable until the subplot has been repaired and re-evaluated as acceptable. The repaired subplot shall be re-evaluated using the test results for the repaired subplot and used in determining payment and acceptance of the lot. When the Contract Administrator allows a rejectable subplot to remain in place without repair, the subplot test result for the rejectable subplot shall be treated as a lot with one subplot and the remaining sublots shall form a separate lot.

The Contract Administrator shall calculate the gradation payment adjustment and AC content payment adjustment for the lot once all subplot test results for the lot have been completed. The Contract Administrator shall calculate the lot mean to one decimal point and the lot gradation and the lot AC content payment adjustments based on all the subplot test results in the lot according to LS-100. If the lot mean does not meet the specification limits specified in Table 1, the lot is rejectable.

#### **332.08.01.03 Recovered Asphalt Cement Performance Grade**

##### **332.08.01.03.01 Basis of Acceptance**

Acceptance of the RAC performance grade in the HIR mix shall be according to OPSS 1101 and as specified in the Contract Documents.

Disposition of HIR mix with borderline or rejectable lots shall be according to OPSS 1101 and as specified in the Contract Documents.

##### **332.08.01.04 Surface Tolerance**

Surface tolerance shall be according to OPSS 313. Surface tolerance related repairs shall be carried out according to the Repairs subsection.

### **332.08.01.05 Surface Appearance**

The HMA deemed by visual appearance to have flushing, bleeding, segregation, fat spot, surface damage, cracking, chatter, or surface contamination but not limited to these, shall be considered deficient material or work. Traffic control shall be provided for all surface appearance assessments. Deficient material, mixture, and work shall be removed and replaced or repaired or assessed a payment reduction.

#### **332.08.01.05.01 Segregation**

The HIR mix exhibiting medium or severe mid-lane segregation shall be assessed a payment reduction or shall be repaired at the discretion of the Contract Administrator.

The HIR mix exhibiting other segregation shall be addressed in accordance with the following:

- a) Slightly segregated HIR mix shall be accepted into the work with no payment reduction.
- b) Medium segregated HIR mix shall be assessed a payment reduction or repaired at the discretion of the Contract Administrator.
- c) Severely segregated HIR mix shall be repaired by removal and replacement according to the Repairs subsection.

Bullnoses and tapers that were not machine-laid and any areas of handwork shall not be assessed based on segregation but because of other workmanship-related problems.

### **332.08.01.06 Surface Smoothness**

The acceptability of surface smoothness shall be as specified in the Contract Documents.

### **332.08.01.07 Lift Thickness**

#### **332.08.01.07.01 Lot Size**

The Contract Administrator shall determine the size and location of the lots and sublots before the HIR process starts. There shall be one lot consisting of all HIR tender items when the entire Contract has the same  $T_D$ . When more than one  $T_D$  is specified for the HIR tender item, there shall generally be a separate lot for each  $T_D$  specified in the Contract Documents for the HIR tender item. Each lot shall be divided into sublots, which shall normally be 2,000 m<sup>2</sup> in size. A minimum of three sublots are required for each lot.

#### **332.08.01.07.02 Basis of Acceptance**

Acceptance of HIR mix for lift thickness is based on subplot lift thickness measurements and lot mean lift thickness of the tender item. The Contract Administrator shall calculate the thickness payment adjustment for the lot once all measurements for the lot have been completed.

Sublot lift thickness shall be acceptable if they are equal to or greater than the minimum subplot lift thickness specified in Table 6 for the tender item's  $T_D$ . The subplot shall be deemed rejectable and shall be repaired if the lift thickness measurement is less than the minimum subplot lift thickness specified in Table 6. The repaired subplot shall be re-evaluated using the lift thickness measurement for the repaired subplot and used in determining payment of the lot.

The Contract Administrator shall calculate the lot mean lift thickness for each tender item to one decimal point and the lot payment adjustment for lift thickness based on all the subplot lift thickness measurements in the lot according to LS-100 and the Payment Adjustment for Lift Thickness clause. If the lot mean is less than 85% of the  $T_D$ , the lot is rejectable.

When a lift thickness lot contains any subplot that is deemed rejectable, the lot shall be rejectable until the subplot has been repaired and re-evaluated as acceptable. When the Contract Administrator allows a rejectable subplot to remain in place without repair, the subplot shall be subjected to a payment reduction according to the Payment Adjustment for Lift Thickness clause. A subplot lift thickness measurement for a rejected subplot that receives a payment reduction shall not be used to assess the lot mean for the tender item.

The Owner shall determine if a rejectable lot may remain in the work without repairs. When the Owner has determined that a rejectable lot may remain in the work without repair, the lot shall be subject to a payment reduction as determined by the Owner.

### **332.08.01.08                      Geometrics and Longitudinal Joint Location**

#### **332.08.01.08.01              Basis of Acceptance**

After final compaction, the HIR mix shall be smooth and true to the design profile and cross-section and constructed to the design width.

The Contract Administrator shall conduct spot checks of the width of the HIR mix to determine if the complete lane and shoulder widths, as specified in the Contract Documents, have been HIR processed, placed, and compacted for acceptance.

The width of HIR mix shall be accepted provided:

- a) The outside edges of the lanes and the paved shoulders are parallel to the lane and visually uniform longitudinally,
- b) The width across all the adjacent HIR lanes and shoulders, when specified, from the outside edge to outside edge is not less than the sum of the specified widths, and
- c) The width of retrofitted partially paved shoulder is not less than the specified width, when specified in the Contract Documents.

If the width is not acceptable at any location, the Contract Administrator shall provide notification in writing that the pavement is rejectable. A written proposal for corrective action shall be submitted to the Contract Administrator within three Business Days of receiving the notification.

Longitudinal joints not meeting the Contract requirements shall be removed and replaced or assessed a payment reduction.

### **332.08.01.09                      Performance Grade Asphalt Cement Physical Requirements**

The Contract Administrator shall determine the acceptability of the PGAC incorporated into the benefiting HMA according to OPSS 1101 and as specified in the Contract Documents.

#### **332.08.01.10                      Optional Trial**

When the HIR tender item quantity is 40,000 m<sup>2</sup> or more, an optional trial of one lot, not exceeding 4,000 m<sup>2</sup>, with one subplot shall be permitted. If this optional trial is chosen, the Contract Administrator shall be advised in writing prior to placing the trial lot. The optional trial shall not be placed in a critical location. The optional trial will be treated as a small quantity lot for basis of acceptance and payment.

#### **332.08.01.11 Small Quantity Lots**

Small quantity lots shall not be subject to payment adjustment unless the HIR mix is rejectable. Acceptance for these lots shall be on a subplot-by-subplot basis. The subplot shall be considered acceptable if the HIR mix complies with the limits specified in Table 1. HIR mix that does not comply with Table 1 shall be considered rejectable.

#### **332.08.02 Referee Testing**

##### **332.08.02.01 General**

A single request for referee testing for a given lot can only be invoked within five Business Days after the QA test results for that lot have been received and where applicable, the Contract Administrator's calculated QA payment factors and payment adjustments for that lot have been received.

Referee testing may only be invoked if all referee samples have been received in a condition suitable for testing.

##### **332.08.02.02 Mix Properties and Compaction**

Referee testing may only be requested for the entire lot, or a maximum of two sublots from that lot. For all sublots in the referee request, referee testing shall fall into one of three categories:

- a) Mix properties only,
- b) Compaction only, or
- c) Mix properties and compaction.

The referee laboratory shall use the same test method as the QA laboratory except when the QA laboratory chooses LS-292, the referee laboratory shall use that method provided the calibration requirements are met. If they are not met, the referee laboratory shall use LS-282.

When referee testing of mix properties is invoked, the referee laboratory shall conduct all necessary testing, except for the combined aggregate density, which will be supplied by the Contract Administrator.

When referee testing for compaction is invoked, the referee laboratory shall determine the MRD of the referee loose mix sample for the subplot, and this value shall be used in the calculation of compaction for the referee core.

The results generated by the referee laboratory shall be used to re-evaluate the lot to determine the payment factors for the acceptance of the disputed properties for the disputed lots of HIR mix. The referee test results are binding on both the Owner and the Contractor.

##### **332.08.02.03 Recovered Asphalt Cement Performance Grade**

Referee testing for RAC performance grade shall be according to OPSS 1101 and as specified in the Contract Documents.

##### **332.08.02.04 Challenging Severity of Segregation**

A challenge, in writing, of the severity of any segregated area assessed as either medium or severe, may be submitted within five Business Days of receiving the Owner's first visual assessment. The written challenge shall list the dimensions and assessment of the severity of each disputed segregated area.

For Contracts with up to 240,000 m<sup>2</sup> of HIR mix, a maximum of two separate written challenges for each tender item shall be permitted. For Contracts with more than 240,000 m<sup>2</sup> of HIR mix, a maximum of four separate written challenges for each tender item shall be permitted. Each written challenge may involve more than one disputed segregated area.

The Owner or a representative of the Owner, who did not carry out the original assessment and who is not the Contract Administrator shall make a second visual assessment of the disputed areas. All necessary surface preparations and traffic control shall be provided so that this second visual assessment shall be carried out within five Business Days after the Contract Administrator has received the written challenge. The results of that second visual assessment shall be binding on both the Owner and Contractor.

A further challenge may be made to the Owner's second visual assessment of the segregation severity. Such a challenge shall be made in writing within five Business Days of receiving the Owner's second visual assessment. Such a challenge shall be resolved by the Owner or a representative of the Owner determining the macrotexture ratio, according to LS-317. All necessary surface preparations and traffic control shall be provided during the field measurements for macrotexture ratio. Table 7 shall be used with the macrotexture ratio to determine the degree of severity and the disposition of the disputed area of segregation. The macrotexture ratio results shall be binding on both the Owner and the Contractor.

#### **332.08.02.05                      Lift Thickness**

An individual lift thickness measurement may be challenged by requesting referee testing in writing to the Contract Administrator within five Business Days after receiving the subplot thickness measurement. An opportunity shall be permitted to view the re-measurement of the QA designated pavement core for that subplot at an alternative Owner designated laboratory together with the Owner's representative. The re-measured lift thickness measurement shall be considered binding and shall replace the original lift thickness measurement for assessment of the subplot.

#### **332.08.02.06                      Outlier in Referee Results**

Where an entire lot of three or more sublots has been referee tested, an individual value for any attribute of a subplot's test result, excluding lift thickness may be questioned. The request shall be made within three Business Days after receiving all the test results for the lot, and only when the payment factor for the attribute with an outlier is less than 1.0 or a payment adjustment applies. The validity of the questioned attribute shall be ascertained in accordance with ASTM E178 using a T test at a 10% significance level.

If the T test procedure shows that the questioned value of the attribute is not an outlier, then the test result shall be used in the calculations. If the T test procedure shows that the questioned value of the attribute is an outlier, then the test result for the subplot shall be checked for mathematical errors. If there are no mathematical errors, the subplot with the outlier is treated as a lot with one subplot and the remaining sublots shall form a separate lot with no further consideration for outliers.

If only two sublots remain, the two sublots shall be treated as two separate lots each with one subplot.

#### **332.08.03                              Repairs**

##### **332.08.03.01                      General**

All repairs shall be performed at no additional cost to the Owner. No repairs are permitted prior to completion of a lot.

The materials and the construction of repairs shall meet the acceptance criteria and other requirements specified in the Contract Documents.

Repairs shall be full lane or full shoulder width except where localized repairs are allowed as specified in the Contract Documents. The limits and type of repairs shall be subject to the approval of the Contract Administrator and shall be approved prior to the repairs being carried out.

All transverse joints in repairs shall butt up to a full depth vertical surface. Repairs shall consist of the removal and replacement of the full thickness of the HIR mix or the placement of an overlay when permitted by the Contract Administrator. A paver or recycling train shall be used in carrying out the repair.

Repairs of an urgent nature, including moderate to very severe aggregate loss, moderate to very severe flushing, and wheel track rutting 16 mm in depth or greater shall be repaired within seven Days, unless extended by mutual agreement. Except for urgent repairs, repairs shall be completed within 60 Days or prior to seasonal shutdown each year, whichever is the lesser, unless extended by mutual agreement.

### **332.08.03.02                      Repairs for Mix Properties, Compaction, and Recovered Asphalt Cement Performance Grade**

For a lot that is not rejected, repairs may be chosen in lieu of accepting a payment adjustment if for air voids and compaction the total payment factor for the lot is less than 0.940. When the Contract Administrator requires a rejectable lot to be repaired or repairs are chosen in lieu of accepting a payment adjustment, areas of HIR mix in a lot that are to be repaired shall be determined subject to the minimum lengths and widths specified in the Contract Documents. Each repair area shall include at least one of the loose mix or compaction core sample locations or both representing that subplot.

The minimum length of a single repair to one lane shall be 250 m. The minimum length of a single repair that extends over more than one lane shall be 250 lane-metres and no portion of the single repair in a lane shall be less than 125 m in length.

The minimum limits of each repair shall be at least 125 lane-metres from the location of the loose mix or compaction core or both that represents the subplot; otherwise, a repair limit shall coincide with one end of the subplot when the sample location is less than 125 lane-metres from it. If the proposed limit of a single repair falls within the proposed limit of another single repair, the overlap shall count towards the 250 lane-metre minimum for both repairs. Repair areas within a single lane shall be separated by at least 100 m. If the delineation of repair areas results in patches less than 100 metres apart, these repair areas shall be re-established to form a continuous repair.

A list and sketch identifying the proposed locations of the repairs shall be submitted to the Contract Administrator for review at least five Business Days prior to the intended start of the repair work. Each subplot and single repair shall be uniquely labelled. Overlapping repair areas and discontinuous portions of a single repair shall be labelled so that they are readily identified with their single repair.

Prior to the repair, slab samples or cores shall be taken for testing of mix properties, RAC performance grade, or compaction, or all in the unrepaired area within 1 m of the limits of each end of the repair area. Additional samples or cores shall not be permitted to be taken beyond these locations until after QA, or referee testing demonstrates that the remaining Material in the subplot proposed for repair is deemed to be rejectable. If the proposed repair limit coincides with the beginning of a subplot that is being left unrepaired, samples are not required at this location. Sufficient Material shall be obtained for testing by the Owner's QA laboratory, and for possible referee testing.

Testing shall demonstrate that the remaining Material in the subplot proposed for repair is not rejectable. To determine if the HIR mix is rejectable, the mix properties, RAC performance grade, and compaction shall comply with the basis of acceptance of lots with one or two sublots. If the Material is deemed to be rejectable, the proposed limit of the repair shall be extended by a minimum of 25 m and the sampling and testing repeated. The repair area selected shall incorporate the location used for obtaining samples that shall be used to confirm that the remaining HIR mix is not rejectable. If the repair proposal results in the removal of at least half the subplot quantity, the Contract Administrator may waive testing demonstrating the suitability of the remainder of that subplot.

The unrepaired sublots combined with the unrepaired areas of any repaired sublots shall comprise one lot and shall be assessed based on the loose mix and core samples representing the unrepaired sublots. When a repaired subplot consists of two or more separate unrepaired areas, the Contract Administrator shall decide whether to combine these unrepaired areas as one subplot or to consider each unrepaired area as a separate subplot. If there are only one or two sublots in a lot that are not repaired, the Contract Administrator shall include those sublots as part of the previous or next lot.

The HIR or HMA mix used for the repair shall comprise a separate lot or, prior to beginning any repair, the Contract Administrator in conjunction with the Contractor may decide to include it as part of the current lot being produced. The repaired area shall be tested and assessed for all acceptance criteria specified in the Acceptance Criteria subsection and re-evaluated for acceptance.

The two reconfigured lots shall be accepted at the full Contract price, subjected to a payment adjustment or rejected according to the Payment Adjustment for Air Voids and Compaction clause, Payment Adjustment for Gradation clause, Payment Adjustment for Asphalt Cement Content clause, and Payment Adjustment for Recovered Asphalt Cement Performance Grade clause.

### **332.08.03.03 Repairs for Surface Tolerance**

All areas not meeting the surface tolerance requirements shall be repaired by diamond grinding to a maximum of 5 mm or removed and replaced. Slurry produced from diamond grinding shall be removed from the site and managed as specified in the Contract Documents. The repaired areas shall be re-evaluated for surface tolerance acceptance by means of a 3 m straight edge as specified in the Surface Tolerance clause.

### **332.08.03.04 Repairs for Lift Thickness**

Any repairs solely to correct for excess lift thickness shall not be permitted. The minimum length of a repair is the entire length of the subplot being repaired.

Acceptance for lift thickness of the repaired subplot shall be based on the individual subplot lift thickness measurement and the lot thickness payment adjustment shall be calculated based on the re-evaluated subplot measurement.

## **332.09 MEASUREMENT FOR PAYMENT**

### **332.09.01 Actual Measurement**

#### **332.09.01.01 Hot In-place Recycled Mix**

Measurement of HIR mix shall be by the horizontal area in square metres in place.

#### **332.09.01.02 Tonne to Square Metre Conversion**

When the Contract Documents refer to a quantity of material for HIR mix in tonnes and the Contract Documents do not already modify the quantity to relate to square metres, the Contract Administrator shall determine the theoretical quantity in square metres ( $Q_A$ ) that shall replace the non-payment tonnage quantity ( $Q_i$ ) references as follows:

$$Q_A = Q_t / [0.975 \times BRD_{MD} \times (T_D/1000)] \quad \text{(Formula 1)}$$

Where:

$BRD_{MD}$  = the bulk relative density in  $t/m^3$ , provided in the HIR mix design submitted for HIR mix, the  $Q_A$  is calculated for

$T_D$  = the design thickness, in millimetres, of the HIR mix

$Q_t$  = non-payment tonnage quantity referred to elsewhere in the Contract Document for the HIR mix under the measurement by square metre tender item

### **332.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement is based on the units shown in the clauses under Actual Measurement. The Plan Quantity shall not be adjusted due to any of the exceptions specified in the Lift Thickness clause under the Sampling subsection.

## **332.10 BASIS OF PAYMENT**

### **332.10.01 Hot In-place Recycled Mix - Item**

Payment at the Contract price for the above tender item shall include full compensation for all labour, Equipment, and Materials required to do the work, including rejuvenating agent and beneficiating HMA quantities if used, and the applicable payment adjustments.

No additional payment shall be made for the work, labour, Equipment, and Materials required to remove the existing pavement and place HMA in areas not accessible to the heating and hot milling equipment.

The preparation and correction of existing HMA surfaces carried out in order to meet the requirements of the Contract Documents, including removal of materials such as cold mix patching material, crack sealant, and spray patch material; cold milling, hot milling, and the addition of beneficiating HMA; shall be at no additional cost to the Owner.

No additional payment shall be made under this item for HMA required to retrofit partially paved shoulders or for pavement widening.

When repairing HIR mix, all associated work and replacing or restoring all associated damage and removals shall be carried out at no additional cost to the Owner.

When the Contract Administrator instructs to cease HIR operations due to continued medium or severe segregation regardless of cause, there shall be no additional cost to the Owner.

#### **332.10.01.01 Payment Adjustment for Air Voids and Compaction**

When repair is not required or repair is not chosen for a lot, the payment adjustment for that lot due to air voids and compaction requirements shall be:

$$PA_{AVC} = \text{lot quantity} \times \text{Contract price} \times [PF_{AVC} - 1.0000] \quad \text{(Formula 2)}$$

Where:

$PA_{AVC}$  = payment adjustment for air voids and compaction

lot quantity = the horizontal area of HIR mix in the lot in  $m^2$

Contract price = for the purposes of payment adjustment due to air voids and compaction, means the Contract price of the HIR tender item

$PF_{AVC}$  = payment factor for combined air voids and compaction as determined according to the Calculations clause

When the  $PF_{AVC}$  is:

- a) Less than 1.0000, there shall be a reduction in payment, and
- b) Equal to 1.0000 there shall be no adjustment.

### **332.10.01.01.01      Calculations**

#### **332.10.01.01.01.01      General**

The  $PF_{AVC}$  shall be based on the individual payment factors obtained from Table 5, based on PWL, determined for air voids and compaction using LS-101, Table 1, and the formulae in the Payment Factor for Combined Air Voids and Compaction clause. Rounding-off procedures for all calculations shall follow LS-100.

When there is no sampling or testing specified in the Contract Documents for an attribute or when the requirement for sampling or testing for an attribute is waived by the Owner, the payment factor for that attribute shall be equal to either:

- a) The payment factor it is added to in Formula 3, if that payment factor is less than 1.0000; or,
- b) 1.0000, if the payment factor it is added to in Formula 3, is equal to 1.0000.

#### **332.10.01.01.01.02      Payment Factor for Combined Air Voids and Compaction**

The payment factor for combined air voids and compaction ( $PF_{AVC}$ ) shall be calculated using the following formulae:

$$PF_{AVC} = (PF_C + PF_{AV}) / 2 \quad \text{(Formula 3)}$$

Where:

$PF_C$  = payment factor for compaction from Table 5

$PF_{AV}$  = payment factor for air voids from Table 5

The  $PF_{AVC}$  shall be rounded and reported to four decimal places.

When the Contract Administrator decides that the unrepaired area of an original lot that has been partially repaired shall not be resampled, the  $PF_{AVC}$  for the unrepaired area shall be 1.0000.

#### **332.10.01.01.01.03      Small Quantity Lots**

For small quantity lots, each subplot shall be assigned a  $PF_{AVC}$  of 1.0000 if the subplot is not rejectable. If the subplot is determined to be rejectable, it shall be administered as described in the Repairs subsection. When the Owner has determined that a rejectable subplot may remain in the work without repair, the lot shall be subject to a payment reduction reflecting the extent of the non-conformance as determined by the Owner.

### **332.10.01.02      Payment Adjustment for Gradation**

When repair is not required or repair is not chosen for a lot, the payment adjustment for that lot due to gradation requirements shall be a reduction in payment. The payment adjustment for gradation shall be calculated using the following formula:

$$PA_G = \text{lot quantity} \times \text{Contract price} \times [PF_{DLS} + PF_{4.75} + PF_{75}] \quad \text{(Formula 4)}$$

If DLS gradation is rejectable then  $PF_{DLS} = 0.04$

If DLS gradation is acceptable then  $PF_{DLS} = 0$

If the 4.75 mm sieve gradation is rejectable then  $PF_{4.75} = 0.04$

If the 4.75 mm sieve gradation is acceptable then  $PF_{4.75} = 0$

If the 75  $\mu$ m sieve gradation is rejectable then  $PF_{75} = 0.04$

If the 75  $\mu$ m sieve gradation is acceptable then  $PF_{75} = 0$

Where:

$PA_G$  = payment adjustment for gradation

$PF_{DLS}$  = payment factor for the DLS gradation

$PF_{4.75}$  = payment factor for the 4.75 mm sieve gradation

$PF_{75}$  = payment factor for the 75  $\mu$ m sieve gradation

lot quantity = shall be the horizontal area of HIR mix in the lot in  $m^2$

Contract price = for the purposes of payment adjustment due to gradation, means the Contract price of the HIR tender item

### **332.10.01.03 Payment Adjustment for Asphalt Cement Content and Changes in the Asphalt Cement Price Index**

#### **332.10.01.03.01 Hot In-place Recycled Mix Quantity Calculation**

The quantity of HIR mix for use in the calculations ( $T_{HIR}$ ) shall be the theoretical tonnage of HIR mix accepted into the work.

The theoretical tonnage shall be calculated by the Contract Administrator as follows and rounded to one decimal according to LS-100:

$$T_{HIR} = [0.975 \times BRD_{HIR} \times (T_D/1000) \times \text{lot quantity}] \quad (\text{Formula 5})$$

Where:

$T_{HIR}$  = the theoretical tonnage of HIR mix in the lot

$BRD_{HIR}$  = the lot average bulk relative density in  $t/m^3$ , calculated from values obtained in the testing of bulk samples obtained during production of the first complete lot of at least three sublots of HIR mix placed in the work. The values shall be the same as those used in calculating the final air voids payment factor for the lot.

$T_D$  = the design thickness, in millimetres, of the HIR mix

lot quantity = shall be the horizontal area of HIR mix in the lot in  $m^2$

#### **332.10.01.03.02 Payment Adjustment for Asphalt Cement Content**

The payment adjustment for AC content shall apply to all placed and compacted HIR mix using the theoretical tonnage as calculated in the Hot In-place Recycled Mix Quantity Calculation clause.

A payment adjustment shall be applied based on the Ministry's PGAC price index. The price index is published monthly in the Contract Bulletin.

The price index shall be based on the price, excluding taxes, FOB the depots in the Toronto area, of AC grade PG 58-28 or equivalent. One index shall be used to establish and calculate the payment adjustment for all grades.

The payment adjustment for AC content for each lot shall be calculated using the following formulae:

When  $AC_{HIR} < AC_{SPEC} - 0.1\%$ :

The payment adjustment for AC content shall be a reduction in payment for the lot.

$$PA_{AC} = T_{HIR} \times I_{TO} \times \{[AC_{HIR} - (AC_{SPEC} - 0.1)]/100\} \quad (\text{Formula 6})$$

When  $AC_{HIR} \geq AC_{SPEC}$  and  $\leq AC_{SPEC} + 0.5\%$ :

The payment adjustment for AC content shall be an increase in payment for the lot.

$$PA_{AC} = T_{HIR} \times I_{TO} \times \{[AC_{HIR} - AC_{SPEC}]/100\} \quad (\text{Formula 7})$$

When  $AC_{HIR} > AC_{SPEC} + 0.5\%$ :

The payment adjustment for AC content shall be a reduction in payment for the lot.

$$PA_{AC} = T_{HIR} \times I_{TO} \times \{[(AC_{SPEC} + 0.5) - AC_{HIR}]/100\} \quad (\text{Formula 8})$$

Where:

$AC_{HIR}$  = the lot mean percentage by mass of AC in the HIR mix

$AC_{SPEC}$  = the percentage by mass of AC specified for the work as specified elsewhere in the Contract Documents

$PA_{AC}$  = payment adjustment for AC content

$T_{HIR}$  = the theoretical tonnage of HIR mix in the lot as calculated in Formula 5

$I_{TO}$  = PGAC price index for the month prior to Tender Opening

### **332.10.01.03.03 Payment Adjustment for Changes in the Asphalt Cement Price Index**

When beneficiating HMA is used, a payment adjustment shall be applied based on changes to the Ministry's PGAC price index unless the Contract Administrator is notified in writing of the choice to opt out within five Business Days of receiving permission to start work. Once opted out of payment adjustments based on the price index, opt back in shall not be permitted. The price index is published monthly in the Contract Bulletin. The price index is used to calculate the amount of the payment adjustment per tonne of new AC accepted into the Work.

The price index is based on the price, excluding taxes, FOB the depots in the Toronto area, of AC grade PG 58-28 or equivalent. One index is used to establish and calculate the payment adjustment for all grades.

A payment adjustment per tonne of new AC is established for each month in which paving occurs when the price index for the month differs by more than 5% from the price index for the month prior to Tender Opening. When the price index differential is less than 5%, there is no payment adjustment established for that month. Payment adjustments due to changes in the price index are independent of any other payment adjustments made to the HIR tender items.

The payment adjustment for the month is calculated from the following formulae:

When  $I_P > 1.05 I_{TO}$ :

The payment adjustment for changes in the PGAC Price Index shall be an increase in payment for the lot.

$$PA_{PI} = (I_P - 1.05 I_{TO}) \times T_{AC} \quad (\text{Formula 9})$$

When  $I_P < 0.95 I_{TO}$ :

The payment adjustment for changes in the PGAC Price Index shall be a reduction in payment for the lot.

$$PA_{PI} = (0.95 I_{TO} - I_P) \times T_{AC} \quad (\text{Formula 10})$$

Where:

$PA_{PI}$  = payment adjustment for new AC due to changes in the PGAC price index, in dollars

$I_P$  = PGAC price index for the month in which paving occurs

$I_{TO}$  = PGAC price index for the month prior to Tender Opening

$T_{AC}$  = quantity of new AC in the HIR mix, in tonnes calculated as follows:

$$T_{AC} = [AC_{ben} / 100] \times [\%ben / 100] \times T_{HIR\_mnth} \quad (\text{Formula 11})$$

Where:

$AC_{ben}$  = the percentage of new AC in the beneficiating HMA as required by the JMF

$\%ben$  = the percentage of beneficiating HMA in the HIR mix as required by the JMF

$T_{HIR\_mnth}$  = the tonnage of HIR mix, as calculated in the Hot In-place Recycled Mix Quantity Calculation clause, accepted into the work during the month for which the payment adjustment was calculated.

The payment adjustment per tonne applies to the quantity of new AC in the beneficiating HMA accepted into the Work during the month for which it is established. The quantity of new AC includes all grades of AC supplied with and without polymer modifiers.

For each month in which a payment adjustment has been established, the quantity is calculated using the percentage of beneficiating HMA in the HIR mix accepted into the Work and the corresponding AC content of the beneficiating HMA as required by the JMF.

For beneficiating HMA mixes containing an AST-AC, the percentage of AST-AC is deducted from the percentage of new AC in the beneficiating HMA. No other deductions are made for any other additives.

### **332.10.01.04 Payment Adjustment for Segregated Hot In-place Recycled Mix**

Where a payment reduction for segregation is allowed in lieu of repairs, the payment reduction shall be calculated as follows:

- a) \$2,000 once for each tender item;
- b) An additional payment reduction of \$2.50/m for mid-lane segregation; and
- c) An additional payment reduction of \$5.00/m<sup>2</sup> for other segregation. The area of each repair shall be computed by multiplying the full lane width by the length of the repair and rounded to the next whole square metre.

### **332.10.01.05 Payment Adjustment for Surface Smoothness**

Payment adjustment for surface smoothness shall be as specified in the Contract Documents.

### **332.10.01.06 Payment Adjustment for Lift Thickness**

The payment adjustment for lift thickness shall apply to all placed and compacted HIR mix using the horizontal area of the HIR mix in the lot. The payment adjustment for lift thickness shall be a reduction in payment. The payment adjustment for lift thickness shall be calculated using the following formula:

$$PA_T = \text{lot quantity} \times \text{Contract price} \times \{[1.000 - (T_L / T_D)] \times 2.0\} \quad (\text{Formula 12})$$

Where:

$PA_T$  = payment adjustment for lift thickness

$T_L$  = lot mean, if lot mean is less than or equal to  $T_D$  (see definition)

or

$T_L$  =  $T_D$ , if lot mean is greater than  $T_D$

lot quantity = the horizontal area of the HIR mix in the lot in m<sup>2</sup>

Contract price = the Contract price of the HIR tender item

When a rejectable subplot remains in the work without repair, the subplot shall be subject to a payment reduction. The payment adjustment for each rejectable subplot lift thickness shall be:

$PA_{\text{SUBLOT}} = \text{sublot quantity} \times \text{Contract price} \times 0.5$

(Formula 13)

Where:

$PA_{\text{SUBLOT}}$  = subplot payment adjustment for lift thickness

subplot quantity = the horizontal area of HIR mix in the subplot in m<sup>2</sup>

Contract price = the Contract price of the HIR tender item

### **332.10.02 Referee Testing and Segregation Challenge**

#### **332.10.02.01 Air Voids and Compaction**

If the referee test results show that the referee payment factor for air voids or compaction is higher than the payment factor for air voids or compaction based on the original QA test results by more than 0.025 and the referee results show that the lot is not rejectable, the Owner shall bear the cost of the referee testing for that attribute.

If the referee test results show that the lot is rejectable, or the referee test results show that the referee payment factor for air voids or compaction is not higher than the payment factor for air voids, or compaction based on the original QA test results is more than 0.025, the Owner shall charge the cost of the referee testing.

When there is an outlier in the referee test results, the Owner shall charge 50% of the total cost for referee testing of all sublots in the original lot.

The cost of the referee testing shall be based on the referee testing rates as specified in the Contract Documents.

#### **332.10.02.02 Gradation and Asphalt Cement Content**

The cost of the referee testing shall be charged, unless the testing confirms total conformance of the attribute to the Contract Documents, in which case the costs shall be borne by the Owner.

#### **332.10.02.03 Segregation Challenge**

When a challenge is successful, as described in the Challenging Severity of Segregation clause, the Owner shall pay for the cost of the traffic control, if the traffic control was not necessary for any other reason. The Owner shall not be responsible for any other costs associated with the assessment, including the cost of delays.

When a challenge is not successful, as described in the Challenging Severity of Segregation clause, all costs associated with the assessment, including the cost of traffic control and delays shall be at no additional cost to the Owner.

#### **332.10.02.04 Lift Thickness**

If the referee test result is 3.0 mm or more greater than the original QA test result, the Owner shall bear the cost of the thickness measurement referee testing. Otherwise, the Contractor shall be charged the cost of the thickness measurement referee testing.

### **332.10.03 Repairs**

No payment shall be made for the:

- a) Quantity of HIR mix that is removed and replaced, overlaid, or otherwise repaired; or
- b) For additional shouldering, traffic control, and other work such as zone painting or bridge deck waterproofing.

When:

- a) In lieu of a reduction in payment, repairs to the lot, subplot, or visually defective HIR mix are completed; or
- b) The Contract Administrator has determined that a rejectable lot or subplot requires repair.

No payment shall be made to repair areas of HIR mix damaged by traffic.

For all additional testing resulting from a repair to a lot a charge shall be applied at the rates established by the Owner for the year in which the testing was carried out.

No additional payment shall be made for the cost of tolerance measurements of the repaired areas that are required by the Contract Administrator.

**TABLE 1**  
**Specification Limits for Hot In-place Recycled Mix Acceptance Attributes**

| Properties and Attributes                                                              | Mix Type HIR Mix is Required to Meet   | Lower Limit (LL)<br>%                | Upper Limit (UL)<br>%                |
|----------------------------------------------------------------------------------------|----------------------------------------|--------------------------------------|--------------------------------------|
| AC Content                                                                             | All HMA types                          | AC <sub>SPEC</sub> - 0.4<br>(Note 1) | AC <sub>SPEC</sub> + 0.5<br>(Note 1) |
| Designated Large Sieve (DLS)                                                           | Superpave 12.5, 12.5FC 1, and 12.5FC 2 | 40                                   | 95                                   |
| 4.75 mm Sieve                                                                          | Superpave 12.5, 12.5FC 1, and 12.5FC 2 | 40                                   | 65                                   |
| 75 µm Sieve                                                                            | Superpave 12.5, 12.5FC 1, and 12.5FC 2 | 2                                    | 13                                   |
| Air Voids                                                                              | All HMA types                          | 2.0                                  | 5.5                                  |
| Pavement Compaction                                                                    | Superpave 12.5 and 12.5FC 1            | 92.0                                 | 97.0                                 |
|                                                                                        | Superpave 12.5FC 2                     | 92.0                                 | 98.0                                 |

| Notes:<br>1. Each material sample receptacle shall have a maximum mass of 30 kg. For ease of handling, especially when the larger sample size is required, splitting of material at the paving site is permitted such that a sample is contained in a maximum of two receptacles whose total mass does not exceed the maximum specified above. Once delivered to testing laboratories, combining of the material from the two receptacles is only mandatory if a single receptacle contains insufficient material to carry out the full suite of tests required.<br>2. Loose mix samples shall be representative of the final HIR mix and shall be taken at the paver after the rejuvenating agent or beneficiating HMA or both have been added.<br>3. The larger sample size shall be applicable when samples are designated for testing to the maximum number of gyrations. The frequency of the larger samples shall be one per lot, as designated by the Contract Administrator. |                                      |                         |                         |

|--------------|-------------------|
| <b>333-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **333.01 SCOPE**

This specification covers the requirements for cold in-place recycling of existing hot mix asphalt (HMA) pavement, sizing, adding active filler if required, adding and mixing emulsified asphalt, and spreading and compacting the cold in-place recycled (CIR) mix.

#### **333.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

### **333.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

### **333.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications.

D6752/D 6752M-11      Standard Test Method for Bulk Specific Gravity and Density of Compacted Bituminous Mixtures Using Automatic Vacuum Sealing Method

### **333.03                      DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Active Filler** means substances added to the reclaimed existing asphalt pavement that chemically alter the mix properties.

**Cold In-Place Recycled (CIR) Mix** means the in-place mixture of existing reclaimed HMA pavement, emulsified asphalt, and water.

**Hot Mix Asphalt (HMA)** means as defined in OPSS 313

**Quality Assurance (QA)** means as defined in OPSS 313.

**Reclaimed Asphalt Pavement (RAP)** means as defined in OPSS 313.

**Target Density** means the average bulk relative density for the lot established according to LS-300 by the QA testing laboratory, and used to determine the per cent compaction.

### **333.04                      DESIGN AND SUBMISSION REQUIREMENTS**

#### **333.04.01                  Design Requirements**

For mix design purposes, prior to commencing the work, the Contractor shall obtain samples representative of the material that is produced during the milling operation. These samples shall be used to establish the design rate of emulsified asphalt as a percent by mass of the RAP. The design rate of the emulsified asphalt shall be a minimum of 1.2%.

The mix design shall be completed by a laboratory with Canadian Council of Independent Laboratories (CCIL) Type A certification or equivalent equipped to carry out CIR mix design. Where the existing pavement significantly changes composition, a separate mix design shall be completed.

Each mix design shall include the following:

- a) Information on the type, manufacturer, and supplier of the emulsified asphalt.
- b) The percent by mass of emulsified asphalt in the CIR, referred to as the design rate, and all calculations performed to determine the design rate of emulsified asphalt.
- c) The optimum moisture content and the mix design bulk relative density.
- d) The amount of water to be added to the mix.
- e) Maximum field rate adjustment allowed to the design rate without adverse effects to the mix properties.
- f) Recovered penetration for the binder of the existing pavement according to LS 200.

g) Type, source and quantity of active filler, if required.

#### **333.04.02 Submission Requirements**

A copy of the mix design shall be submitted to the Contract Administrator a minimum of 7 Business Days prior to the start of CIR operations. Within 4 Business Days after receiving the mix design, the Contract Administrator shall provide written confirmation of receipt of the submitted mix design documents or of any non-conformance to the contract requirements.

Confirmation of receipt of the mix design documents does not constitute any guarantee that the mix can be produced or constructed or both to Contract requirements, and does not relieve the Contractor of the responsibility for ensuring the specified quality of Materials and workmanship.

A new mix design shall be submitted when the emulsified asphalt design rate is adjusted by greater than 0.20%. Separate or new mix designs shall be submitted if the composition or layer thicknesses of the existing pavement changes significantly. Where more than one mix design is required, the area for which each mix design is to be used shall be clearly identified.

#### **333.05 MATERIALS**

##### **333.05.01 Reclaimed Asphalt Pavement**

RAP material shall be 100% passing the 37.5 mm sieve, and 95% to 100% passing the 26.5 mm sieve after processing, and shall be measured based on air dried gradation according to the coarse sieving operation of LS-602.

##### **333.05.02 Emulsified Asphalt**

Emulsified asphalt shall be polymer modified mixing grade according to OPSS 1103 and be compatible with the process and materials used.

##### **333.05.03 Water**

Water shall be clean and free from oil, acid, alkali, organic matter, or other deleterious substances.

##### **333.05.04 Active Filler**

When active filler is required, it shall be incorporated into the existing reclaimed asphalt pavement at the application rate specified in the mix design.

When used as active filler, Portland cement shall be according to OPSS 1301. Not more than 1% by mass of Portland cement shall be added to the mix.

#### **333.06 EQUIPMENT**

##### **333.06.01 Recycling Train**

The recycling train shall include the following:

- a) A self-propelled cold milling unit with a cutting drum capable of reclaiming a full lane width of asphalt pavement to the depth specified in the Contract Documents in one pass.
- b) A screening and sizing unit capable of processing the RAP.

- c) An aggregate feed system that measures and regulates the mass of RAP being added into the mixing unit prior to the addition of the emulsified asphalt. The scale shall be calibrated to the manufacturer's tolerance prior to the start of the work and when requested by the Contract Administrator.
- d) An emulsified asphalt control system equipped with a flow meter calibrated in litres per tonne and a total delivery meter calibrated in litres to continuously maintain the required amount of emulsified asphalt added to within 0.2% by mass of the reclaimed material feed.
- e) A means of monitoring and controlling the addition of water.
- f) A mixing unit capable of producing a uniform and thoroughly blended CIR mix.

#### **333.06.02                      Placing Equipment**

A mechanical paver capable of spreading the mix evenly in front of the screed in one continuous pass to the specified crossfall and grade shall be used to place the CIR mix. The paver shall be equipped with distributing augers for the full width to be paved. The paver shall have a vibratory screed capable of vibrating the full width of mix placed.

#### **333.06.03                      Compaction Equipment**

Compaction equipment shall be selected to achieve the required compaction.

#### **333.06.04                      Drying Unit**

A drying unit specifically designed to provide radiant heat to the CIR mat may be used. Open flame heating shall not be used. The entire heater assembly shall be capable of readily adjusting the intensity of heat on the pavement surface.

#### **333.06.05                      Straight Edge**

The straight edge shall be 3 m in length, metal, and have a level recessed in its upper edge parallel to the lower edge.

#### **333.06.06                      Pilot Vehicle**

Pilot vehicles used to control traffic shall be according to OTM, Book 7.

### **333.07                              CONSTRUCTION**

#### **333.07.01                      General**

HMA pavement in areas inaccessible to the reclaiming equipment shall be removed and replaced with acceptable binder course HMA. The HMA shall be placed to the CIR depth specified in the Contract Documents in compacted lift thicknesses between 40 and 75 mm in depth.

The overlap between successive passes of the recycling train shall be a minimum 100 mm.

#### **333.07.02                      Operational Constraints**

The work shall not be carried out when the ambient temperature is less than 10 °C or when the overnight low is forecast to be less than 2 °C. Cold in-place recycled mix shall not be placed after September 1st without the written approval from the Contract Administrator. The work shall be carried out when the roadway is clean and free of standing water. The work shall not proceed during periods of rain or when the surface is in a saturated condition.

All traffic, including construction traffic, shall be kept off the freshly placed CIR mat until it is able to carry traffic without damage. Any damage to the CIR mat shall be repaired.

The wearing surface shall not be placed on the CIR mat until the following requirements have been met:

- a) The CIR mat has been opened to traffic and allowed to cure for a minimum of 14 Days.
- b) The specified moisture content has been achieved according to the Acceptance Criteria section.
- c) The specified density has been achieved according to the Compaction subsection.
- d) All defective areas in the CIR mat have been repaired to the satisfaction of the Contract Administrator.

The wearing surface shall be placed within 30 Days of placing the CIR mat. The 30 Day requirement may be waived by the Contract Administrator if the CIR mix does not meet the requirements of this specification and is subject to repair.

### **333.07.03 Cold In-Place Recycling Trial Section**

Prior to carrying out CIR, the ability to successfully carry out CIR according to this specification shall be demonstrated to the Contract Administrator by placing a trial section within the Contract limits.

In lieu of a trial section, the Contract Administrator may accept evidence that the ability to successfully mix, handle, place, and compact CIR with the same equipment, placing crew, and methodology to meet the Contract requirements for placing CIR has been demonstrated on any Contract within the last 12 months.

The trial section shall be one lane width and 500 m in length. The location of the trial section shall be proposed to the Contract Administrator for approval. A minimum of 48 hours notice shall be given to the Contract Administrator prior to placing the trial section.

The Contract Administrator shall allow the CIR work to continue based on an acceptable visual assessment of the trial according to the requirements of the Surface Appearance subsection. When the CIR is rejected by visual assessment, the trial section shall be repaired or removed and replaced until the CIR meets the requirements of the Surface Appearance subsection.

### **333.07.04 Surface Preparation**

When specified in the Contract Documents, milling prior to CIR work shall be carried out to achieve the specified crossfall and grade.

All deleterious and loose milled material shall be removed from the milled surfaces, and longitudinal and transverse joints after reclaiming operations are completed and before placing CIR mix.

Existing crack sealant shall be removed and disposed of prior to CIR reclaiming operations.

### **333.07.05 Mixing**

The emulsified asphalt shall be added at the design rate. The rate of addition of emulsified asphalt shall be field adjusted as required to within 0.20% of the design rate and mixed to produce a uniformly coated CIR mix that can be compacted to the specified density. The emulsified asphalt added shall not be less than 1.2%.

Water may be added in a controlled manner to facilitate uniform mixing.

### **333.07.06                      Compaction**

The CIR mix shall be compacted according to the requirements of the Acceptance Criteria for Compaction subsection.

### **333.07.07                      Surface Appearance**

The compacted CIR mat shall be smooth and constructed to the crossfall and grade specified in the Contract Documents. The surface of the CIR mat shall be of uniform texture and free of segregation, raveling, rutting, longitudinal streaks, flushing, fat spots, oil spills, roller marks, and other defects.

### **333.07.08                      Drying**

Prior to the placement of the wearing surface, the Contractor may elect to use a drying unit. Overheating or burning of the CIR shall not be allowed.

### **333.07.09                      Traffic Control with Moving Vehicles**

Traffic shall be controlled with moving vehicles according to OTM, Book 7.

The moving vehicles shall guide one-way traffic through or around construction. The maximum speed of the moving vehicles shall be 30 km/h. Traffic control with moving vehicles shall be maintained until such time as the CIR mat is able to carry traffic without damage.

### **333.07.10                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **333.08                              QUALITY ASSURANCE**

### **333.08.01                      General**

Acceptance of the CIR mix shall be based on the following criteria:

- a) Surface Appearance
- b) Surface Tolerance
- c) Moisture Content
- d) Compaction
- e) RAP Gradation

Work that does not meet the acceptance criteria shall be repaired according to the Repairing and Re-Evaluating subsection.

### **333.08.02                      Sampling**

#### **333.08.02.01                  Lot Size**

The Contract Administrator shall determine the size and location of the lots and sublots after discussion with the Contractor and before CIR production starts. A lot shall typically represent 25,000 m<sup>2</sup> with 5 equal sublots of 5,000 m<sup>2</sup> in size.

### **333.08.02.02 Cold In-Place Recycling Material**

Samples of CIR material shall be packaged in non-absorptive materials to protect sample integrity and sealed in waterproof containers. Samples shall be transported in a manner that avoids stacking and extreme temperatures.

#### **333.08.02.02.01 Slabs**

At least 4 Business Days prior to the planned overlay of the CIR mat, 2 slab samples of the CIR material shall be obtained from each subplot. The two slab samples shall be located side-by-side and taken at random locations as directed by the Contract Administrator. Each slab sample shall be dry cut 150 mm x 150 mm and removed intact from the CIR mat.

One slab sample shall be used to test for bulk relative density and the other slab sample shall be used to test for moisture content. The result of the moisture content will be used for both the moisture acceptance, and moisture adjustment for compaction calculation according to LS-306.

Additional slab samples for QA acceptance tests shall only be taken after the Contractor has carried out remedial work to improve moisture content and/or compaction in the rejected subplot. The Contractor shall be charged the cost of additional tests.

#### **333.08.02.02.02 Loose Mix Samples**

For the purpose of determining the RAP gradation, 30 kg of loose CIR mix samples shall be taken from each of two randomly selected sublots for every lot.

### **333.08.02.03 Reclaimed Material**

At the start of production of each new lot or whenever the existing pavement material significantly changes composition, one 15 kg sample of material reclaimed from the roadway shall be obtained prior to adding emulsion for the purpose of determining the target density for compaction. Samples shall be taken at random locations as directed by the Contract Administrator.

#### **333.08.02.04 Emulsified Asphalt**

Samples of emulsified asphalt used in the mix shall be taken at the job site from the tankers according to the Contractor's health and safety plan at a frequency of three sets of samples per Contract randomly taken from three different lots. Each sample shall be taken either from a sampling spigot on the transfer line, if available, or from the end of the transfer line after a minimum of 4,000 kg has been drawn from the tanker. Each set of samples shall be a minimum of 2 full four-litre containers. The Contractor's health and safety plan and procedure for sampling shall be reviewed at the pre-pave meeting.

The sample containers supplied by the Contractor shall be new triple tight epoxy lined pails or suitable leak-proof plastic containers. The sample labels shall be obtained from the Contract Administrator.

### **333.08.03 Acceptance Criteria**

#### **333.08.03.01 Surface Appearance**

Surface appearance shall be assessed by the Contract Administrator based on visual surveys after the CIR mat has been opened to traffic. The finished CIR surface shall have a uniformly smooth texture and shall meet the surface appearance requirements of ravelling, segregation and rutting as specified in Table 1 prior to placement of HMA overlay.

### **333.08.03.02 Surface Tolerance**

The surface tolerance of any CIR surface shall be such that when tested with a 3 m straight edge placed anywhere on the CIR surface, except across the crown, and in any direction on the surface, there shall not be a gap between the bottom of the straight edge and the surface of the CIR greater than 6 mm.

### **333.08.03.03 Moisture Content**

The QA laboratory shall test one sample from each subplot to determine the moisture content of CIR mix according to LS-291, and the test result of the moisture content shall be rounded to one decimal place according to LS-100. The test result for each subplot shall be used to compute the lot mean for moisture content of CIR mix.

The moisture content of CIR mix acceptance shall be based on the mean moisture content of the lot and the moisture content of the individual sublots. The lot is acceptable if the lot mean moisture content is equal to or less than 2% with no individual subplot's moisture content greater than 3%. The lot is rejectable if the lot mean moisture content of CIR mix is greater than 3%. Any subplot with its moisture content greater than 3% shall be deemed rejectable.

If the lot mean moisture content of CIR mix is less than 3% and greater than 2%, the Contractor may elect to accept a payment reduction or repair for the lot. The payment reduction shall be calculated according to Table 2. If the Contractor elects to repair the lot in lieu of a payment reduction, the lot shall be repaired according to the Repairing and Re-Evaluating subsection.

### **333.08.03.04 Compaction**

The compaction of the CIR mix shall be calculated for each subplot from the bulk relative density determined from slab samples according to LS-306 or ASTM D-6752, and the target density for the lot as follows:

$$\text{Compaction} = (\text{bulk relative density of slab sample} / \text{target density}) \times 100\%$$

where the target density to be used for acceptance purposes shall be calculated for each lot from material reclaimed from the roadway prior to adding emulsion. The target density shall be established according to LS-300.

Each lot of CIR mix shall be compacted to a minimum mean of 96.0% of the target density established for the mix, with no individual subplot's bulk relative density result falling below 95.0% of the target density. CIR that is not compacted to the required density shall be deemed rejectable.

### **333.08.03.05 Reclaimed Asphalt Pavement Gradation**

If the RAP does not meet the gradation requirements, the Contractor shall submit an action plan of remediation to the Contract Administrator for approval within 2 Business Days after the delivery of the QA testing results.

### **333.08.04 Repairing and Re-Evaluating**

CIR mix that is rejectable based on the Acceptance Criteria subsection shall be repaired according to the requirements specified in Table 1.

Repairs shall be for the full lane width. For repairs due to surface appearance defects, the minimum repair length shall be sufficient for the repair to be carried out by the recycling train, or by the paving equipment, whichever is applicable. For other repairs based on the lot and subplot acceptance, the minimum length shall be according to the Repairing and Re-Evaluating clause of OPSS 313 and to the depth specified in Table 1.

The HMA required to repair unacceptable CIR shall be placed in compacted lift thicknesses between 40 and 75 mm. The HMA mix type and design used for repairs shall be approved by the Contract Administrator and shall meet the acceptance requirements for the HMA specified elsewhere in the Contract Documents.

All repairs will be re-evaluated and retested according to the Acceptance Criteria subsection.

When repairs are made to rejectable sublots or those sublots that the Contractor elects to repair due to the non-conformance of the moisture content requirements, the lot shall be re-evaluated and re-decisioned for payment reduction. The original lot shall be divided into two reconfigured lots in the following way: All acceptable sublots (with moisture content equal to or less than 2%) shall be grouped as one lot and shall receive the full Contract price. The remaining sublots shall be grouped as another lot and shall use the retest results of the repaired sublots to calculate the mean lot moisture content, and shall be accepted either at the full Contract price, or subjected to a payment reduction, or deemed rejectable.

### **333.09 MEASUREMENT FOR PAYMENT**

#### **333.09.01 Actual Measurement**

##### **333.09.01.01 Cold In-Place Recycled Mix**

Measurement of CIR mix placed shall be by area in square metres.

#### **333.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **333.10 BASIS OF PAYMENT**

#### **333.10.01 Cold In-Place Recycled Mix - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

The addition of active filler or other additives to the mix, including any emulsion that is required due to the additives, shall be at no extra cost to the Owner.

HMA required to replace unacceptable CIR material shall be at no extra cost to the Owner.

Emulsified asphalt shall be included in the Cold In-Place Recycled Mix item.

Repair of an unacceptable CIR mat shall be carried out at no extra cost to the Owner.

HMA placed in areas inaccessible to the reclaiming equipment shall be included in the Cold In-Place Recycled Mix item.

Repair of areas of CIR damaged by traffic shall be completed at no extra cost to the Owner.

Repair, removal, or replacement of an unacceptable trial section shall be completed at no extra cost to the Owner.

**333.10.02****Payment Reduction for Moisture Content**

When test results show that the moisture content payment factor for the lot is less than 1.000 and the Contractor is not required to or does not elect to repair the lot, the payment reduction for the lot shall be as follows:

$(1.000 - \text{Payment Factor}) \times \text{item price} \times \text{lot quantity}$

For purposes of payment reduction, the term item price means the Contract price of the applicable tender item.

For purposes of re-decision after repairs, the lot quantity is the area of the reconfigured lot.

**TABLE 1**  
**Acceptance Criteria and Repair Requirements for CIR Mix**

| Acceptance Criteria                                                                                                                                                                                                                           | Defect Type                                                                                               | Severity / Criteria                                                           | Acceptable / Rejectable | Repair Requirements                                                                                                                                                                                                                                                                                           |

|--------------|-------------------|
| <b>335-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **335.01 SCOPE**

This specification covers the requirements for cold in-place recycling of existing hot mix asphalt (HMA) pavement, sizing, adding active filler if required, adding and mixing expanded asphalt, and spreading and compacting the cold in-place recycled expanded asphalt mix (CIREAM).

#### **335.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

### **335.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

### **335.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications.

### **335.03                      DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Active Filler** means substances added to the reclaimed existing asphalt pavement that chemically alter the mix properties.

**Cold In-Place Recycled Expanded Asphalt Mix (CIREAM)** means the in-place mixture of existing reclaimed asphalt pavement (RAP), active filler, and expanded asphalt.

**Cold In-Place Recycled Expanded Asphalt Mix (CIREAM) Mat** means a pavement course which comprises Cold In-Place Recycled Expanded Asphalt Mix

**Expanded Asphalt** means heated asphalt cement expanded from its normal volume by the addition of water.

**Hot Mix Asphalt (HMA)** means as defined in OPSS 313.

**Performance Graded Asphalt Cement (PGAC)** means as defined in OPSS 313.

**Quality Assurance (QA)** means as defined in OPSS 313.

**Reclaimed Asphalt Pavement (RAP)** means as defined in OPSS 313.

**Target Density** means the average bulk relative density for each subplot established according to LS-297, and used to determine the per cent compaction.

### **335.04                      DESIGN AND SUBMISSION REQUIREMENTS**

#### **335.04.01                      Design Requirements**

For mix design purposes, prior to commencing the work, the Contractor shall obtain samples that are representative of the material that is produced during the milling operation. These samples shall be used to establish the design rate of expanded asphalt as a percent by mass of the RAP. The mix design shall meet the following requirements:

- a) The design rate of the expanded asphalt shall be a minimum of 1.0%.
- b) The dry tensile strength shall be a minimum of 225 kPa and the wet tensile strength shall be a minimum of 100 kPa.

The mix design shall be carried out according to the Wirtgen Cold Recycling Technology manual using briquettes produced according to LS-297. Mix design shall be completed by a laboratory with Canadian Council of Independent Laboratories (CCIL) Type A certification or equivalent equipped to carry out expanded asphalt mix designs. When the existing pavement significantly changes composition, a separate mix design shall be completed.

Each mix design shall include the following:

- a) Information on the grade, manufacturer, and supplier of the PGAC.
- b) The percent by mass of expanded asphalt in the CIREAM, referred to as the design rate, and all calculations performed to determine the design rate of expanded asphalt.
- c) The recommended PGAC temperature for foaming, the half-life, the expansion ratio and the percent of water added for foaming.
- d) The optimum moisture content and the mix design bulk relative density.
- e) The dry tensile strength, the wet tensile strength, and the tensile strength ratio.
- f) The amount of water to be added to the mix.
- g) Maximum field rate adjustment allowed to the design rate without adverse effects to the mix properties.
- h) Recovered penetration for the binder of the existing pavement according to LS-200.
- i) Type, source and quantity of active filler, if required.

#### **335.04.02 Submission Requirements**

A copy of the mix design shall be submitted to the Contract Administrator a minimum of 7 Business Days prior to the start of CIREAM operations. Within 4 Business Days commencing after the day of delivery of all required documents for the mix design, the Contract Administrator shall provide written confirmation of receipt of the submitted mix design documents or of any non-conformance to the contract requirements.

Confirmation of receipt of the mix design documents does not constitute any guarantee that the mix can be produced or constructed or both to Contract requirements, and does not relieve the Contractor of the responsibility for ensuring the specified quality of Materials and workmanship.

A new mix design shall be submitted when the expanded asphalt design rate is adjusted by greater than 0.20%. Separate or new mix designs shall be submitted if the composition or layer thicknesses of the existing pavement changes significantly. Where more than one mix design is required, the area for which each mix design is to be used shall be clearly identified.

#### **335.05 MATERIALS**

##### **335.05.01 Reclaimed Asphalt Pavement**

RAP material shall be 100% passing the 37.5 mm sieve, and 95% to 100% passing the 26.5 mm sieve after processing, and shall be measured based on air dried gradation according to the coarse sieving operation of LS-602.

### **335.05.02 Performance Graded Asphalt Cement**

PGAC shall be according to OPSS 1101. The table of Additional Testing Requirements and Acceptance Criteria for PGAC Grades shall not apply. PGAC shall be selected with performance properties meeting the design maximum pavement temperature of 52 °C and the minimum pavement temperature of -28 °C at a minimum, and the selected PGAC shall have suitable expansion characteristics.

### **335.05.03 Water**

Water shall be clean and free from oil, acid, alkali, organic matter, or other deleterious substances.

### **335.05.04 Active Filler**

If required by the mix design, active filler shall be incorporated into the reclaimed existing asphalt pavement at the application rate determined in the mix design.

When used as active filler, Portland cement shall be according to OPSS 1301. Not more than 1% by mass of Portland cement shall be added to the mix.

## **335.06 EQUIPMENT**

### **335.06.01 Recycling Train**

The recycling train shall include the following:

- a) A self-propelled cold milling unit with a cutting drum capable of reclaiming a full lane width of asphalt pavement to the depth specified in the Contract Documents in one pass.
- b) A screening and sizing unit capable of processing the RAP.
- c) An aggregate feed system that measures and regulates the mass of RAP being added into the mixing unit prior to the addition of the expanded asphalt. The scale shall be calibrated to the manufacturer's tolerance prior to the start of the work and when requested by the Contract Administrator.
- d) An asphalt cement expansion system capable of producing optimum expansion and an injection system capable of injecting and blending expanded asphalt uniformly throughout the reclaimed material.
- e) A system to control and regulate the application of expanded asphalt in relation to the mass of RAP being processed within a tolerance of  $\pm 3.0\%$  by volume of asphalt cement.
- f) A mixing unit capable of producing a uniform and thoroughly blended CIREAM.

### **335.06.02 Placing Equipment**

A mechanical paver capable of spreading the mix evenly in front of the screed in one continuous pass to the specified crossfall and grade shall be used to place the CIREAM. The paver shall be equipped with distributing augers for the full width to be paved. The paver shall have a vibratory screed capable of vibrating the full width of mix placed.

### **335.06.03 Compaction Equipment**

Compaction equipment shall be selected to achieve the required compaction.

#### **335.06.04                      Straight Edge**

The straight edge shall be 3 m in length, metal, and have a level recessed in its upper edge parallel to the lower edge.

#### **335.06.05                      Pilot Vehicle**

Pilot vehicles used to control traffic shall be according to OTM, Book 7.

### **335.07                              CONSTRUCTION**

#### **335.07.01                      General**

HMA pavement in areas inaccessible to the reclaiming equipment shall be removed and replaced with acceptable binder course HMA. The HMA shall be placed to the CIREAM depth specified in the Contract Documents in compacted lift thicknesses between 40 and 75 mm in depth.

The overlap between successive passes of the recycling train shall be a minimum 100 mm.

#### **335.07.03                      Operational Constraints**

Cold in-place recycled expanded asphalt mix (CIREAM) shall not be placed after September 1st without the written approval from the Contract Administrator.

The work shall be carried out when the roadway is clean and free of standing water. Cold in-place recycled expanded asphalt mix shall not proceed during periods of rain or when the surface is in a saturated condition.

All traffic, including construction traffic, shall be kept off the freshly placed CIREAM mat until it is able to carry traffic without damage. Any damage to the CIREAM mat shall be repaired.

The wearing surface shall not be placed on the CIREAM mat until the following requirements have been met:

- a) The CIREAM mat has been opened to traffic and allowed to cure for a minimum of 3 Days.
- b) The specified tensile strength has been achieved according to the Quality Assurance section.
- c) The specified density has been achieved according to the Compaction subsection.
- d) All defective areas in the CIREAM mat have been repaired to the satisfaction of the Contract Administrator.

The wearing surface shall be placed within 30 Days of placing the CIREAM mat. The 30 Day requirement may be waived by the Contract Administrator if the CIREAM does not meet the requirements of this specification and is subject to repair.

#### **335.07.03                      Cold In-Place Recycling Expanded Asphalt Trial Section**

Prior to carrying out CIREAM, the ability to successfully carry out CIREAM according to this specification shall be demonstrated to the Contract Administrator by placing a trial section within the Contract limits.

In lieu of a trial section, the Contract Administrator may accept evidence that the ability to successfully mix, handle, place, and compact CIREAM with the same equipment, placing crew, and methodology to

meet the Contract requirements for placing CIREAM has been demonstrated on any Contract within the last 12 months.

The trial section shall be one lane width and 500 m in length. The location of the trial section shall be proposed to the Contract Administrator for approval. A minimum of 48 hours notice shall be given to the Contract Administrator prior to placing the trial section.

The Contract Administrator shall allow the CIREAM work to continue based on an acceptable visual assessment of the trial according to the requirements of the Surface Appearance subsection. When the CIREAM is rejected by visual assessment, the trial sections shall be repaired or removed and replaced until the CIREAM meets the requirements of the Surface Appearance subsection.

#### **335.07.04                      Surface Preparation**

When specified in the Contract Documents, milling prior to CIREAM work shall be carried out to achieve the specified crossfall and grade.

All deleterious and loose milled material shall be removed from the milled surfaces, and longitudinal and transverse joints after reclaiming operations are completed and before placing CIREAM.

All existing crack sealant shall be removed and disposed of prior to CIREAM reclaiming operations.

#### **335.07.05                      Mixing**

The expanded asphalt shall be added at the design rate. The rate of addition of expanded asphalt shall be field adjusted as required to within 0.20% of the design rate and mixed to produce a uniformly coated CIREAM that can be compacted to the specified density. The expanded asphalt added shall not be less than 1.0%.

#### **335.07.06                      Compaction**

The CIREAM shall be compacted according to the requirements of the Acceptance Criteria for Compaction subsection.

#### **335.07.07                      Surface Appearance**

The compacted CIREAM mat shall be smooth and constructed to the crossfall and grade specified in the Contract Documents. The surface of the CIREAM mat shall be of uniform texture and free of segregation, raveling, rutting, longitudinal streaks, flushing, fat spots, oil spills, roller marks, and other defects.

#### **335.07.08                      Traffic Control with Moving Vehicles**

Traffic shall be controlled with moving vehicles according to OTM, Book 7.

The moving vehicles shall guide one-way traffic through or around construction. The maximum speed of the moving vehicles shall be 30 km/h. Traffic control with moving vehicles shall be maintained until such time as the CIREAM mat is able to carry traffic without damage.

#### **335.07.09                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **335.08 QUALITY ASSURANCE**

### **335.08.01 General**

Acceptance of the CIREAM shall be based on the following criteria:

- a) Surface Appearance
- b) Surface Tolerance
- c) Compaction
- d) Tensile Strength
- e) RAP Gradation

Work that does not meet the acceptance criteria shall be repaired according to the Repairing and Re-Evaluating subsection.

### **335.08.02 Sampling**

#### **335.08.02.01 Lot Size**

The Contract Administrator shall determine the size and location of the lots and sublots after discussion with the Contractor and before CIREAM production starts. A lot shall typically represent 25,000 m<sup>2</sup> with 5 equal sublots of 5,000 m<sup>2</sup> in size.

#### **335.08.02.02 Cold In-Place Recycled Expanded Asphalt Mix Samples**

Samples of CIREAM material shall be packaged in non-absorptive materials to protect sample integrity and sealed in waterproof containers. Samples shall be transported in a manner that avoids stacking and extreme temperatures.

##### **335.08.02.02.01 Loose Samples**

After placement and prior to compaction, the Contractor shall obtain one 15 kg sample of the CIREAM from each subplot, taken at random locations as directed by the Contract Administrator. The samples to be tested for acceptance of CIREAM shall be used to test for dry tensile strength and wet tensile strength according to LS-297.

For the purpose of determining the RAP gradation, another 30 kg sample of CIREAM samples shall be taken from each of two randomly selected sublots for every lot.

##### **335.08.02.02.02 Slabs**

Prior to the planned overlay of the CIREAM mat, two slab samples of the CIREAM material shall be obtained from each subplot. The two slab samples shall be located side-by-side and taken at random locations as directed by the Contract Administrator. Each slab samples shall be dry cut 150 x 150 mm and removed intact from the CIREAM mat.

One slab sample shall be used to test for bulk relative density and the other slab sample shall be used to test for moisture content for the purpose of moisture adjustment according to LS-306.

Additional slab samples for QA acceptance tests shall only be taken after the Contractor has carried out remedial work to improve compaction in the rejected subplot. The Contractor shall be charged the cost of additional tests.

### **335.08.02.03 Performance Graded Asphalt Cement**

Samples of PGAC to be used in the mix shall be taken from the storage tank at the terminal according to the Tank Tap Method specified in AASHTO T40-02 and the terminal's health and safety plan in the presence of the Contract Administrator at a frequency of three sets of samples per Contract for PGAC providing to three different lots. Each set of samples shall be a minimum of 2 full one-litre portions. The Contractor's health and safety plan and procedure for sampling shall be reviewed at the pre-pave meeting.

Samples of PGAC used in the mix shall be obtained, properly labelled and identified, and delivered to the designated QA testing laboratory as specified in the Contract Documents.

### **335.08.03 Acceptance Criteria**

#### **335.08.03.01 Surface Appearance**

Surface appearance shall be assessed by the Contract Administrator based on visual surveys after the CIREAM mat has been opened to traffic. The finished CIREAM surface shall have a uniformly smooth texture and shall meet the surface appearance requirements of ravelling, segregation and rutting as specified in Table 1 prior to placement of HMA overlay.

#### **335.08.03.02 Surface Tolerance**

The surface tolerance of any CIREAM surface shall be such that when tested with a 3 m straight edge placed anywhere on the CIREAM surface, except across the crown, and in any direction on the surface, there shall not be a gap between the bottom of the straight edge and the surface of the CIREAM greater than 6 mm.

#### **335.08.03.03 Compaction**

The compaction of the CIREAM mix shall be calculated for each subplot from the bulk relative density determined from slab samples according to LS-306 or ASTM D-6752 and the target density as follows:

Compaction = (bulk relative density of the slab sample / target density) x 100%

where the target density to be used for acceptance purposes shall be calculated for each subplot by averaging the densities of the six (6) compacted specimens produced for indirect tensile strength testing according to LS-297.

Each lot of CIREAM shall be compacted to a minimum mean of 96.0% of the target density established for the mix, with no individual subplot bulk relative density result falling below 95.0% of the target density. CIREAM that is not compacted to the required density shall be deemed rejectable.

#### **335.08.03.04 Tensile Strength of Cold In-Place Recycled Expanded Asphalt Mix**

Acceptance of the CIREAM shall be based on dry tensile strength and wet tensile strength.

Samples of CIREAM shall be tested for acceptance purposes according to LS-297.

Dry tensile strength requirements for the lot are met when:

- a) The mean dry tensile strength of the lot is equal to or greater than 225 kPa; and
- b) No individual subplot dry tensile strength is less than 200 kPa.

Wet tensile strength requirements for the lot are met when:

- a) The mean wet tensile strength of the lot is equal to or greater than 100 kPa; and
- b) No individual subplot wet tensile strength is less than 75 kPa.

CIREAM that does not meet the above dry tensile strength and wet tensile strength requirements shall be deemed rejectable.

#### **335.08.03.05 Reclaimed Asphalt Pavement Gradation**

If the RAP does not meet the gradation requirements, the Contractor shall submit an action plan of remediation to the Contract Administrator for approval within 2 Business Days after the delivery of the QA testing results.

#### **335.08.04 Repairing and Re-Evaluating**

CIREAM that is rejectable based on the Acceptance Criteria subsection shall be repaired according to the requirements specified in Table 1.

Repairs shall be for the full lane width. For repairs due to the surface appearance defects, the minimum repair length shall be sufficient for the repair to be carried out by the recycling train, or by the paving equipment, whichever is applicable. For other repairs based on the lot and subplot acceptance, the minimum length shall follow the Repairing and Re-Evaluating clause of OPSS 313 and to the depth specified in Table 1.

The HMA required to repair unacceptable CIREAM shall be placed in compacted lift thicknesses between 40 and 75 mm. The HMA mix type and design used for repairs shall be approved by the Contract Administrator and shall meet the acceptance requirements for the HMA specified elsewhere in the Contract Documents.

All repairs will be re-evaluated and retested according to the Acceptance Criteria subsection.

### **335.09 MEASUREMENT FOR PAYMENT**

#### **335.09.01 Actual Measurement**

##### **335.09.01.01 Cold In-Place Recycled Expanded Asphalt Mix**

Measurement of CIREAM placed shall be by area in square metres.

#### **335.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **335.10 BASIS OF PAYMENT**

#### **335.10.01 Cold In-Place Recycled Expanded Asphalt Mix - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

The addition of active filler or other additives to the mix, including any expanded asphalt that is required due to the additives, shall be at no extra cost to the Owner.

HMA required to replace unacceptable CIREAM material shall be at no extra cost to the Owner.

PGAC shall be included in the CIREAM item.

Repair of an unacceptable CIREAM mat shall be carried out at no extra cost to the Owner.

HMA placed in areas inaccessible to the reclaiming equipment shall be included in the CIREAM item.

Repair of areas of CIREAM damaged by traffic shall be completed at no extra cost to the Owner.

Repair, removal, or replacement of an unacceptable trial section shall be completed at no extra cost to the Owner.

**TABLE 1**  
**Acceptance Criteria and Repair Requirements for CIREAM**

| Acceptance Criteria                                                                                                                                                                                                                           | Defect Type                                                                                                                                            | Severity / Criteria                                                                                                                                                                                 | Acceptable / Rejectable | Repair Requirements                                                                                                                                                                                                                                                                              |

|                                                                                                                                                                                                                                               |                                                                                                                                                        | Moderate to Severe                                                                                                                                                                                  | Rejectable              | Mill 50 mm and replace with an acceptable binder course HMA (Note 2).                                                                                                                                                                                                                            |
|                                                                                                                                                                                                                                               |                                                                                                                                                        | Very Severe                                                                                                                                                                                         | Rejectable              | Remove CIREAM to full depth and replace with an acceptable binder course HMA (Note 2).                                                                                                                                                                                                           |
|                                                                                                                                                                                                                                               | Segregation (Note 1)                                                                                                                                   | Slight to Medium                                                                                                                                                                                    | Acceptable              | No action required.                                                                                                                                                                                                                                                                              |
|                                                                                                                                                                                                                                               |                                                                                                                                                        | Severe                                                                                                                                                                                              | Rejectable              | Mill 50 mm and replace with an acceptable binder course HMA (Note 2).                                                                                                                                                                                                                            |
|                                                                                                                                                                                                                                               | Rutting (Note 1)                                                                                                                                       | Very Slight to Slight                                                                                                                                                                               | Acceptable              | No action required.                                                                                                                                                                                                                                                                              |
|                                                                                                                                                                                                                                               |                                                                                                                                                        | Moderate to Severe                                                                                                                                                                                  | Rejectable              | Mill 50 mm and replace with an acceptable binder course HMA (Note 2).                                                                                                                                                                                                                            |
|                                                                                                                                                                                                                                               |                                                                                                                                                        | Very Severe                                                                                                                                                                                         | Rejectable              | Remove CIREAM to full depth and replace with an acceptable binder course HMA (Note 2).                                                                                                                                                                                                           |
| Surface Tolerance                                                                                                                                                                                                                             | Non-conformance for surface tolerance as per the Surface Tolerance subsection of the Acceptance Criteria.                                              | > 6 mm based on 3 m straightedge measurement                                                                                                                                                        | Rejectable              | All deficient areas shall be re-profiled by milling or padded with the same hot mix type to be used in the overlying hot mix lift.                                                                                                                                                               |
| Compaction                                                                                                                                                                                                                                    | Non-conformance for Compaction as per the Compaction subsection of the Acceptance Criteria.                                                            | < 96% for Compaction of Lot's Mean; and<br>< 95% for Compaction of Individual Sublot                                                                                                                | Rejectable              | For rejected sublots, or sublots within the corresponding rejected lot:<br>1) Recompact the CIREAM mat, if required, with reheating process, or<br>2) Reprocess with a recycling train (Note 2), or<br>3) Remove CIREAM material to full depth and replace with an acceptable binder course HMA. |
| Tensile Strength                                                                                                                                                                                                                              | Non-conformance for Tensile Strength as per the Tensile Strength of Cold In-place Recycled Expanded Asphalt Mix subsection of the Acceptance Criteria. | For Dry Tensile Strength:<br>< 225 KPa for Lot's Mean; and<br>< 200 KPa for Individual Sublot.<br><br>For Wet Tensile Strength:<br>< 100 KPa for Lot's Mean; and<br>< 75 KPa for Individual Sublot. | Rejectable              | Remove CIREAM to full depth in the lot or sublot represented by the test and replace with an acceptable binder course HMA (Note 2).                                                                                                                                                              |
| Notes:<br>1) Defect and severity definitions according to SP-027.<br>2) Reprocessing with a recycling train may be considered as a repair method, upon submission of a proposal by the Contractor and approved by the Contract Administrator. |                                                                                                                                                        |                                                                                                                                                                                                     |                         |                                                                                                                                                                                                                                                                                                  |

**Appendix 335-A, November 2015**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

## 336.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Appurtenances** mean maintenance holes, catch basins, valve chambers, and water valve covers and similar Utility access covers located within the paved portion of the roadway.

**Double Application** means a scratch coat placed on the existing pavement to form a uniform surface followed by a surface coat in a consistent thickness.

**Micro-Surfacing** means the application of a pavement surface composed of polymer-modified asphalt emulsion, high quality aggregate, mineral filler, and water.

**Rut Filling** means a layer of micro-surfacing placed on the existing pavement using a rut-filling box on the longitudinal wheel path rut.

**Scratch Coat** means a levelling layer of micro-surfacing mixture placed on the existing pavement prior to placing a surface coat.

**Siliceous Aggregate** means rock aggregate containing or composed of silica (SiO<sub>2</sub>) or minerals with silica in the crystal structure as silicate (SiO<sub>4</sub>).

**Single Application** means a single layer of micro-surfacing mixture placed on the existing pavement as a surface coat in a consistent thickness.

**Surface Coat** means a top layer of micro-surfacing mixture laid on a scratch coat or directly on the existing pavement.

## **336.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **336.04.01 Design Requirements**

#### **336.04.01.01 Mix Design**

A laboratory equipped and staffed to carry out mix designs for micro-surfacing shall designate the mix proportions and prepare the job mix formula.

The compatibility of the aggregate and the polymer modified emulsified asphalt shall be confirmed by the laboratory designing the mix.

All component materials used in the mix design shall be representative of the material to be used on the Contract.

The mix design proportions shall be within the following limits.

|                   |                                       |
|-------------------|---------------------------------------|
| Residual Asphalt: | 6.0 to 11.5% by dry mass of aggregate |
| Mineral Filler:   | 0 to 3.0% by dry mass of aggregate    |

The micro-surfacing mixture shall be designed to carry traffic within one hour of placement.

### **336.04.02 Submission Requirements**

#### **336.04.02.01 Mix Design**

Two weeks prior to the start of micro-surfacing, the mix design shall be submitted in writing to the Contract Administrator together with the results of the tests listed in Table 1.

Material for micro-surfacing shall only be placed after the Contract Administrator has issued confirmation in writing. The Contract Administrator shall review and issue the written confirmation within 5 Business Days that the mix design has been submitted and meets the specified requirements.

#### **336.04.02.02 Submission of Test Data**

The Contractor shall provide Quality Control (QC) test results of all aggregates and filler used in the Work from a laboratory meeting the requirements of the Laboratory Requirements clause. Test results showing complete conformance with the physical property requirements of this specification shall be provided to the Contract Administrator at the time of submission of the mix design.

QC test results shall be submitted using MTO forms as applicable.

Only aggregate sample test data obtained from stockpiled material to be used in the Work and tested within the past 14 months shall be submitted.

#### **336.04.02.03 Laboratory Requirements**

An acceptable laboratory conducting tests for physical properties or consensus properties shall be one that holds a certificate from the Canadian Council of Independent Laboratories (CCIL) as Type D for the applicable test methods and also participates in the annual MTO Proficiency Sample Testing Program.

An acceptable laboratory conducting tests for LS-601 and LS-602 shall be one that holds a valid certificate from CCIL as Type C. Testing for LS-601 and LS-602 shall be conducted by qualified laboratory staff who hold a valid certificate from CCIL in aggregate testing. Testing for LS-609 shall be conducted by a person holding a valid certificate from CCIL showing them qualified in petrographic examination.

Equivalent alternate laboratory and technician certifications or laboratory proficiency sample testing programs may be used to demonstrate similar requirements, provided they are acceptable to the Owner.

## **336.05 MATERIALS**

### **336.05.01 Polymer Modified Emulsified Asphalt**

The emulsified asphalt shall be CQS-1HP according to OPSS 1103.

The polymer modifier shall be a minimum of 3% polymer solids by mass of asphalt cement residue in the emulsion.

The emulsion shall be homogeneous after mixing. To facilitate sampling and testing, the emulsion shall be stable for 14 Days after delivery to the job site. The polymer material shall be milled or blended into the asphalt cement or blended into the emulsifier solution prior to the emulsification process. The addition of polymers or other additives after the manufacture of the polymer modified emulsified asphalt is not permitted.

### **336.05.02 Aggregates**

Aggregates shall be according to OPSS 1001.

Aggregates shall meet the coarse and fine aggregate requirements of Table 2.

Aggregates shall meet the gradation requirements of Table 3.

### **336.05.03 Mineral Filler**

Mineral filler shall be Portland cement Type GU according to OPSS 1301.

### **336.05.04 Water**

The water shall be free from oil, acid, alkali, organic matter, or other deleterious substances.

### **336.05.05 Mix Additives**

Additives shall be compatible with the other components of the micro-surfacing mix.

### **336.05.06 Tack Coat**

Tack coat shall be the same polymer modified emulsified asphalt used in the micro-surfacing mix and diluted to 1 part emulsion to 3 parts water by volume.

## **336.06 EQUIPMENT**

### **336.06.01 Mixing Equipment**

The mixing equipment shall be specifically designed and manufactured to mix and place micro-surfacing mixture. The mixture shall be mixed by an automatic sequenced, self-propelled, continuous flow micro-surfacing mixing machine. The mixing machine shall be capable of accurately delivering and proportioning the aggregate, emulsified asphalt, mineral filler, additives, and water to a revolving multi-blade double shaft mixer and discharging the mixed product in a continuous flow. The mixing equipment shall have sufficient storage capacity for aggregate, emulsified asphalt, mineral filler, additives, and water to maintain an adequate supply to meet mix design proportions.

### **336.06.02                      Proportioning Devices**

Individual volume or weight controls for proportioning aggregate, mineral filler, emulsified asphalt, additives, and water to be added to the mix shall be provided and properly marked.

### **336.06.03                      Spreading Equipment**

The mix shall be spread uniformly by means of a conventional augured surfacing spreader box attached to the mixing machine and equipped with paddles to agitate and spread the mix evenly throughout the box. A front seal shall be provided to ensure no loss of the mix at the pavement contact point. The rear seal shall act as final strike-off and shall be adjustable. The spreader box and rear strike off shall be designed to ensure that a uniform consistency is achieved to produce a free flow of material to the rear strike-off. The spreader box shall be equipped with a suitable means to adjust the box to compensate for variations in the pavement geometry. Rut filling spreader boxes shall be specifically designed for rut filling applications.

The spreading equipment shall be capable of being re-supplied with the micro-surfacing mixture within the working lane to continuously place micro-surfacing for a minimum 2-lane-km distance. The machine shall be equipped to allow the operator to have full control of the forward and reverse speeds during application of the micro-surfacing mixture.

### **336.06.04                      Pilot Vehicle**

The pilot vehicle shall be according to the requirements of the OTM, Book 7.

## **336.07                              CONSTRUCTION**

### **336.07.01                      Operational Constraints**

Micro-surfacing mixture shall be placed only when the atmospheric temperature is at least 10 °C and rising and the weather is free of fog or rain and there is no forecast of temperatures below 0 °C within 24 hours from the time of application. The mix proportions shall be adjusted when weather conditions prolong opening to traffic beyond one hour.

Micro-surfacing shall commence no earlier than May 15 and shall be completed no later than September 30.

Traffic, including construction traffic, shall be kept off the freshly placed mixture.

The centreline shall be delineated with short term pavement markings at the end of each Day of micro-surfacing. Short term pavement markings shall be according to OPSS 710.

### **336.07.02                      Trial Area**

A trial area 100 m in length and one lane wide shall be placed at the commencement of the micro-surfacing operation to demonstrate the ability to produce a surface in conformance with that meets the requirements of this specification. Within 1 hour of placement, the Contract Administrator shall inspect the Work for acceptance. The trial areas shall be repeated until the micro-surfacing meets the requirements of this specification. The location of the trial area shall be approved by the Contract Administrator.

### **336.07.03                      Surface Preparation**

The area to be surfaced shall be thoroughly cleaned using a rotary power broom to remove all sand, dirt, and other debris. Areas inaccessible to a rotary power broom shall be manually cleaned.

Existing crack sealing material shall be removed.

Existing durable pavement markings shall be removed.

Unless specified in the Contract Documents, all pavement surfaces to be micro-surfaced shall be tack coated. Where tack coating is not required, water shall be applied to the pavement surface immediately ahead of the spreader to dampen the pavement surface without allowing any free-standing or free-flowing water.

Surfaces to be tack coated shall be free of standing water and contamination, such as mud, loose aggregate, and debris. Tack coat shall be applied at a rate of 0.25 to 0.40 kg/m<sup>2</sup> as determined by the Contractor based on the condition of the existing pavement surface. Tack coating shall be allowed to cure sufficiently before micro-surfacing.

All roadway appurtenances within the area of micro-surfacing shall be properly covered and protected immediately prior to micro-surfacing.

#### **336.07.04 Mix Application**

Micro-surfacing mixture shall be placed as a scratch and surface coat (double application) or a surface coat only (single application), as specified in the Contract Documents.

Additives may be added to the micro-surfacing mix during construction to provide control of the quick-set properties and to increase adhesion.

A sufficient amount of mixture shall be carried in all parts of the spreader box at all times so that complete coverage is obtained. Water used to spray the spreader box to facilitate spreading shall not harm the mix. Lumping, balling, or unmixed aggregate shall not be permitted in the finished surface. Any oversized aggregate or foreign materials shall be screened from the aggregate prior to delivery to the mixing equipment.

The application rates for a single layer of micro-surfacing mix shall meet the requirements of Table 4.

Ruts of 13 mm or greater in depth shall be filled with micro-surfacing mixture using a rut-filling spreader box prior to micro-surfacing. Ruts greater than 25 mm in depth shall be filled with micro-surfacing mixture applied with two passes of the rut filling spreader box. All rut-filling material shall cure under traffic for at least a 24-hour period before additional material is applied. The minimum width of a rut filling micro-surfacing application shall be 1.5 metres.

When specified in the Contract Documents, micro-surfacing mixture shall be applied as a scratch coat to fill ruts less than 13 mm in depth, cracks and shallow potholes to leave a uniform surface.

##### **336.07.04.01 Handwork**

In restricted areas where hand spreading is necessary, adjustments to the mix formula may be made to retard the setting time. The mixture shall be placed along one edge of the surface to be covered and spread uniformly with squeegees or other suitable Hand Tools.

##### **336.07.04.02 Appearance**

After micro-surfacing, the surface shall have a uniform texture free from excessive scratch marks, tears, indentations, or other surface irregularities. Tear marks or other surface irregularities in any 12 m<sup>2</sup> area per lane are considered excessive if there are:

- a) four or more marks  $\geq$  12 mm wide and  $\geq$  100 mm long.
- b) any marks  $\geq$  25 mm wide and  $\geq$  25 mm long.

There shall be no transverse ripples or longitudinal streaks of 6 mm or greater in depth when measured by placing a 3 m straight edge in any direction over the finished surface.

The edges of the micro-surfaced surface shall be finished uniformly, with a neat appearance along the roadway centreline, lane lines, shoulder, pavement edge, and curb lines.

#### **336.07.04.03                      Documentation**

A summary of the quantity and application rate of micro-surface material placed and a list of the quantities used for each of the mix components (i.e., aggregate, emulsified asphalt, water, mineral filler, and additive) shall be submitted daily to the Contract Administrator.

A summary of the station-to-station limits, quantity, and application rate of the tack coat shall be submitted daily to the Contract Administrator.

#### **336.07.04.04                      Joints**

The longitudinal and transverse joints shall be neat and uniform in appearance, with no excessive build-up. Longitudinal joints shall be placed on lane lines.

The longitudinal joints in the scratch coat shall be constructed as a butt joint.

The longitudinal joint in the surface course shall have an overlap of 50 to 100 mm.

#### **336.07.05                              Clean Up**

All areas not to be micro-surfaced, such as shoulders, ditches, and gutters, shall have the micro-surfacing mixture removed on a daily basis.

Appurtenances shall be free of micro-surfacing mixture and left in an operable condition.

#### **336.07.06                              Traffic Convoy**

Traffic shall be convoyed according to the OTM, Book 7.

The pilot vehicle shall guide one-way traffic through or around construction. The maximum speed of the convoy shall be 30 km/h. Convoying shall be maintained until such time as the micro-surfacing mixture is able to carry traffic without damage.

#### **336.07.07                              Repairs**

All repairs to address appearance deficiencies described in the Appearance clause shall consist of an additional application of micro-surfacing mixture for the full lane width over the length of deficiency.

The length of repair shall be sufficient to eliminate all appearance deficiencies. If the distance between repair areas is less than 3 m, then the adjacent repairs shall be treated as one repair.

#### **336.07.08                              Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

## **336.08 QUALITY ASSURANCE**

### **336.08.01 Sampling and Testing**

Sampling shall be conducted by the Contractor according to LS-625. Quality assurance (QA) samples shall be taken from stockpiles of aggregate to be used in the Work. Sampling locations shall be determined by the Contract Administrator.

Duplicate samples shall be obtained and sealed by the Contractor in the presence of the Contract Administrator. One of the duplicate samples shall be randomly selected for testing by the QA laboratory and the remaining sealed sample shall be retained by the QA laboratory for possible referee testing. In the event that the Contractor is unavailable to take the sample, no further material shall be placed in the Work until the QA sample has been taken. Samples shall be of sufficient mass of the material to conduct the necessary gradation and physical property tests.

All QA samples shall be delivered by the Contract Administrator, within 24 hours of sampling.

Notwithstanding the requirements for QA sampling as indicated in this specification, the Owner reserves the right to obtain a QA sample at any time without notice.

#### **336.08.01.01 Acceptance of Aggregate**

If the QA test results of the aggregate sample do not meet all the requirements in this specification, the material shall be considered rejectable and shall not be used in the Work.

#### **336.08.01.02 Referee Testing of Aggregate**

The Contractor may invoke referee testing by submitting a written request to the Contract Administrator, within 5 Business Days following notification that a sample does not meet the requirements of this specification.

The retained QA aggregates sample shall be used for referee testing.

In the event the referee testing result shows the sample does not meet the requirement of this specification, the Contractor shall be responsible for the cost of the referee testing, including the cost of transporting the samples to the referee laboratory.

### **336.08.02 Warranty Requirements**

#### **336.08.02.01 Warranty Period**

The warranty period shall be 24 months from the date of Contract Completion.

#### **336.08.02.02 Distress Survey**

A distress survey will be completed by the Owner one year from the date of Contract Completion according to the severity and density definitions provided in SP-024. A second distress survey will be completed a minimum of 45 Days prior to the end of the warranty period. The results of both surveys shall be sent to the Contractor.

If the Owner determines that any distresses found pose a hazard to the travelling public at any time during the warranty period, the Contractor shall be required to make the repairs according to this specification within 2 weeks of being notified to the approval of the Owner.

### **336.08.02.03                      Performance Requirements**

At the end of the warranty period, the surface shall be free from any aggregate loss or ravelling that is slight to very severe and from flushing that is moderate to very severe. The density of flushing that is very slight to slight shall not be greater than intermittent.

If the surface does not meet the performance requirements, the applicable repairs or replacement methods specified in Table 5, shall be completed within 30 days. Acceptance of the areas being repaired or replaced shall be at the sole discretion of the Contract Administrator.

The length of repair shall be sufficient to eliminate all surficial defects as described. If the distance between repair areas is less than 3 m, then the adjacent repairs shall be treated as one repair.

### **336.09                                      MEASUREMENT FOR PAYMENT**

#### **336.09.01                                  Actual Measurement**

##### **336.09.01.01                              Micro-Surfacing Type II Micro-Surfacing Type III Modified Micro-Surfacing Type III**

Measurement of the micro-surfacing mixture placed shall be by area in square metres.

#### **336.09.02                                  Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **336.10                                      BASIS OF PAYMENT**

#### **336.10.01                                  Micro-Surfacing Type II - Item Micro-Surfacing Type III Modified - Item Micro-Surfacing Type III - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

#### **336.10.02                                  Trial Area**

The accepted trial area shall be paid for at the Contract unit price for micro-surfacing. All costs associated with repairing and replacing unacceptable trial areas shall be at no additional cost to the Owner.

**TABLE 2**  
**Micro-Surfacing Coarse and Fine Aggregates Requirements**

| Micro-Surfacing Type | Application (Note 1) | Physical Requirements<br>as Specified in OPSS 1003 |
|----------------------|----------------------|----------------------------------------------------|
| II                   | Low Traffic Volume   | Superpave 12.5 (Note 2)                            |
| II                   | High Traffic Volume  | Superpave 12.5 FC2                                 |
| III Modified         | High Traffic Volume  | Superpave 12.5 FC2                                 |
| III                  | High Traffic Volume  | Superpave 12.5 FC2                                 |

Notes:

- 1) Low Traffic Volume: AADT < 2,500 per lane  
High Traffic Volume: AADT ≥ 2,500 per lane
- 2) Aggregates meeting the physical requirements of Superpave 12.5 aggregates shall be produced from quarried bedrock consisting of 100% siliceous aggregate determined in accordance with LS-609.

**TABLE 3**

### **337.01 SCOPE**

This specification covers the requirements for slurry seal and includes all surface preparation, material application, handwork, joints, protection while curing, clean up, and provision for a trial area.

### **337.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

| TB 139-90   | Test Method to Classify Emulsified Asphalt/Aggregate Mixture Systems by Modified Cohesion Tester Measurement of Set and Cure Characteristics |

### **337.03                      DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Appurtenances** mean maintenance holes, catch basins, valve chambers, and water valve covers and similar Utility access covers located within the paved portion of the roadway.

**Slurry Seal** means a homogeneous mixture of emulsified asphalt, fine aggregates, water, mineral filler, and, if required, additive. This mixture is applied in a cold fluid state on a prepared bituminous surface.

### **337.04                      DESIGN AND SUBMISSION REQUIREMENTS**

#### **337.04.01                  Design Requirements**

A laboratory that is equipped and staffed to carry out slurry seal mix designs with, as a minimum, a current CCIL Type C Certification or an equivalent laboratory shall designate the mix proportions and prepare the job mix formula.

The compatibility of the aggregate and the emulsified asphalt shall be confirmed by the laboratory designing the mix.

All component materials used in the mix design shall be representative of the material to be used on the Contract.

Slurry seal shall only be placed after the Contract Administrator has issued confirmation in writing that the mix design has been reviewed and meets the specified requirements.

The mix design proportions shall be within the following limits:

Residual Asphalt:

|                        |                                       |
|------------------------|---------------------------------------|
| Slurry Seal - Type I   | 10 to 16% by dry mass of aggregate    |
| Slurry Seal - Type II  | 7.5 to 13.5% by dry mass of aggregate |
| Slurry Seal - Type III | 6.5 to 12% by dry mass of aggregate   |

Mineral Filler:

0.5 to 2.0% by dry mass of aggregate

The slurry seal material shall be designed to carry traffic within 4 hours of placement unless specified in the Contract Documents.

### **337.04.02 Submission Requirements**

#### **337.04.02.01 Mix Design**

Two weeks prior to the start of the slurry seal operation, the mix design shall be submitted in writing to the Contract Administrator together with the results of the tests listed in Table 1.

### **337.05 MATERIALS**

#### **337.05.01 Emulsified Asphalt**

The emulsified asphalt shall be specially designed for slurry seal work and shall meet the requirements of OPSS 1103.

#### **337.05.02 Aggregates**

The aggregates shall be according to Table 2 and OPSS 1001. The aggregate shall meet the physical requirements of Superpave 12.5 mix for the traffic category specified in the Contract Documents according to OPSS 1003, except that the maximum absorption for coarse aggregate shall not be more than 1.75%.

#### **337.05.03 Mineral Filler**

Mineral filler shall be Portland cement, Type GU, according to OPSS 1301.

#### **337.05.04 Water**

The water shall be free of harmful salts and contaminants.

#### **337.05.05 Mix Additives**

Additives may be added to the slurry seal mix during construction to provide control of the quick-set properties and to increase adhesion. Additives shall be compatible with the other components of the slurry seal mix.

#### **337.05.06 Tack Coat**

Tack coat shall be the same emulsified asphalt used in the mix and diluted to 1 part emulsion to 3 parts water by volume.

## **337.06 EQUIPMENT**

### **337.06.01 Rotary Power Brooms**

Rotary power brooms shall be capable of cleaning gravel, sand, dirt and other debris from the roadway surfaces.

### **337.06.02 Mixing and Spreading Equipment**

Mixing equipment shall be specifically designed and manufactured to mix slurry seal material.

Spreading equipment shall be designed to apply a fine mist of water on the road surface immediately prior to placement of slurry seal.

The spreading equipment shall also have a spreader box and rear strike-off and be designed and operated to ensure that a uniform consistency is achieved and to produce a free flow of material to the rear strike-off. The spreader box shall be equipped with a suitable means to adjust the box to compensate for variations in the pavement geometry. The spreader box shall be capable of spreading slurry in one pass at varying widths up to 4.3 m.

### **337.06.03 Proportioning Devices**

Individual volume or weight controls for proportioning aggregate, mineral filler, emulsified asphalt, additives, and water to be added to the mix shall be provided and properly marked.

### **337.06.04 Pilot Vehicle**

Pilot vehicles used to control traffic shall be according to OTM, Book 7.

## **337.07 CONSTRUCTION**

### **337.07.01 Operational Constraints**

Slurry seal shall be placed only when the atmospheric temperature is at least 10 °C and rising and the weather is free of fog or rain and there is no forecast of temperatures below 0 °C within 24 hours from the time of application.

Slurry seal shall commence no earlier than May 15 and shall be completed no later than September 30.

Traffic, including construction traffic, shall be kept off the freshly placed mixture to prevent damage to the surface.

### **337.07.02 Trial Area**

A trial area 100 m in length and one lane wide shall be placed at the commencement of the slurry seal operation, to demonstrate the ability to produce slurry seal according to this specification. Within 4 hours of placement, the Contract Administrator shall inspect the slurry seal for conformance. The trial area shall be repeated until the slurry sealing meets the requirements of this specification. The location of the trial area shall be approved by the Contract Administrator.

### **337.07.03 Surface Preparation**

The surface upon which slurry seal is placed shall be clean and dry at the time of application. The area to be surfaced shall be thoroughly cleaned using a rotary power broom. Areas inaccessible to the rotary power broom shall be cleaned manually.

Existing durable pavement markings shall be removed except at those locations specified in the Contract Documents.

When specified in the Contract Documents, all existing pavement surfaces to receive slurry seal shall be tack coated. Surfaces to be tack coated shall be free of standing water and contamination, such as mud, loose aggregate, and debris. Tack coat shall be applied at a rate of 0.25 to 0.40 kg/m<sup>2</sup> as determined by the Contractor based on the condition of the existing pavement surface. Tack coating shall be allowed to cure sufficiently before application of slurry seal.

All roadway appurtenances within the area to receive slurry seal shall be properly covered and protected immediately prior to the placement of the slurry seal.

### **337.07.04 Mixture Application**

Slurry seal shall be placed according to the application rates specified in Table 3.

### **337.07.05 Handwork**

Areas which cannot be reached with the slurry seal spreading equipment shall be surfaced using hand squeegees to provide complete and uniform slurry seal coverage. The area to be hand worked shall be lightly dampened prior to slurry seal placement and the slurry seal applied concurrent with adjacent machine applied slurry seal.

### **337.07.06 Appearance**

Following placement, the slurry seal shall have a uniform texture and consistent appearance, and be free from excessive scratch marks, tears, indentations, or other surface irregularities. Tear marks in any 12 m<sup>2</sup> area per lane are considered excessive if there are:

- a) Four or more marks  $\geq 12$  mm wide and  $\geq 100$  mm long
- b) Any marks  $\geq 25$  mm wide and  $\geq 25$  mm long

There shall be no longitudinal ripples, raking, wash-boarding, chatter, or other irregularities that affect the ride quality.

The edges of the slurry seal shall be finished uniformly, with a neat appearance along the roadway centreline, lane lines, shoulder, pavement edge, and curb lines.

### **337.07.07 Documentation**

A summary of the quantity and application rate of slurry seal placed and a list of the quantities used for each of the slurry seal components (i.e., aggregate, emulsified asphalt, mineral filler, and additive) shall be submitted daily to the Contract Administrator.

### **337.07.08 Joints**

The longitudinal and transverse joints shall be neat and uniform in appearance with no excessive build-up. Longitudinal joints shall be placed on lane lines.

The longitudinal joint in the surface course shall have an overlap of 50 to 100 mm.

#### **337.07.09                      Clean Up**

All areas not to be slurry sealed, such as shoulders, ditches, and gutters, shall have the slurry seal material removed on a daily basis. Appurtenances shall be free of slurry seal and left in operable condition.

#### **337.07.10                      Repairs**

Damaged slurry sealed surfaces shall be repaired by the Contractor.

Repairs to address appearance deficiencies described in the Appearance subsection shall consist of an additional application of slurry seal for the full lane width over the length of deficiency.

The length of repair shall be sufficient to eliminate all appearance deficiencies. If the distance between repair areas is less than 3 m, these repair areas shall be treated as one continuous repair.

#### **337.07.11                      Traffic Control with Moving Vehicles**

When specified in the Contract Documents, traffic shall be controlled with moving vehicles according to OTM, Book 7.

The moving vehicles shall guide one-way traffic through or around construction. The maximum speed of the moving vehicles shall be 30 km/h. Traffic control with moving vehicles shall be maintained until such time as the slurry seal is able to carry traffic without damage.

#### **337.07.12                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **337.08                              QUALITY ASSURANCE**

#### **337.08.01                      Sampling**

The aggregate shall be stockpiled 2 weeks prior to construction for sampling and testing. Samples for gradation testing shall be taken from the stockpile as determined by the Contract Administrator.

### **337.09                              MEASUREMENT FOR PAYMENT**

#### **337.09.01                      Actual Measurement**

##### **337.09.01.01                  Slurry Seal - Type I Slurry Seal - Type II Slurry Seal - Type III**

Measurement of the slurry seal placed shall be by area in square metres with no deductions for appurtenances.

##### **337.09.01.02                  Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**337.10****BASIS OF PAYMENT****337.10.01**

**Slurry Seal - Type I - Item**  
**Slurry Seal - Type II - Item**  
**Slurry Seal - Type III - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Repair, removal, disposal, and replacement of any damaged or defective slurry seal shall be at no additional cost to the Owner.

The accepted trial area shall be paid for at the tender unit price for slurry seal. All costs associated with unacceptable trial areas shall be borne by the Contractor at no additional cost to the Owner.

#### **341.01 SCOPE**

This specification covers the requirements of sealing cracks and joints with hot-poured rubberized asphalt joint/crack sealant compound in asphalt pavement.

#### **341.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Material**

OPSS 1212 Hot-Poured Rubberized Asphalt Joint/Crack Sealant Compound

##### **Ontario Ministry of Transportation Publications**

SP-024 Manual for Condition Rating of Flexible Pavements – Distress Manifestations

### 341.03

### DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Overband** means a routed groove or unrouted crack, which is sealed in such a way that the surface of the sealant is approximately 2 to 3 mm above the adjacent asphalt pavement surface at the centerline of the routed groove or unrouted crack and is feathered out to 0 mm, approximately 20 to 30 mm on either side of the routed groove or the edge of the unrouted crack.

**Pavement Edge** means where the outside edge of the asphalt pavement surface meets the gravel shoulder or concrete barrier.

**Routing/Routed** means cutting grooves in an asphalt pavement using either a router equipped with carbide cutting wheels or a random crack saw equipped with a series of diamond blades.

**Skew Cracks** means non-transverse cracks that exist within the lane and may cross pavement edge.

### 341.04

### DESIGN AND SUBMISSION REQUIREMENTS

#### 341.04.01

#### Submission Requirements

The following shall be submitted to the Contract Administrator at least 5 Business Days prior to the placement of sealant compound:

- a) The following sealant compound information obtained from the manufacturer for every batch/lot of sealant compound which is likely to be used on the Contract:
  - i) The batch number/lot or designation;
  - ii) The size of the batch/lot;
  - iii) Application recommendations;
  - iv) Recommended heating time and temperature;
  - v) Allowable storage time and temperature after initial heating;
  - vi) Allowable reheating criteria;
  - vii) Recommendations for continuous overnight heating, if the manufacturer allows such heating;
  - viii) Application temperature range.
- b) One copy of at least one set of test results that have been conducted for each batch of hot-poured rubberized asphalt joint/crack sealant compound used on the Contract. The testing shall be carried out according to OPSS 1212 by a certified Canadian Council of Independent Laboratories (CCIL) laboratory that is independent of both the manufacturer and the Contractor.

### 341.05

### MATERIALS

#### 341.05.01

#### Sealant Compound

The sealant compound shall be a hot poured rubberized asphalt sealant compound according to OPSS 1212.

#### 341.05.02

#### Limestone Screenings

Limestone screenings used for dusting sealant shall have 100 percent passing the 1.18 mm sieve and not greater than 25 percent passing the 0.075 sieve. Other blotting materials may be used with written approval from the Contract Administrator.

## **341.06 EQUIPMENT**

### **341.06.01 Routers and Random Crack Saws**

All equipment used for routing shall consist of well-maintained mechanical routers or random crack saws capable of continually creating well-defined right-angled grooves with centrelines which are approximately coincident with the centerlines of their associated cracks to the tolerances stated within this specification. Such capability shall be successfully demonstrated to the Contract Administrator's satisfaction prior to its use.

### **341.06.02 Heating Kettle**

The heating kettle for the sealant compound shall be a double boiler oil transfer type with built in agitator and equipped with calibrated thermometers to measure the temperature of both the heat transfer oil and the sealant compound. The heating kettle shall be equipped with a spigot.

The heating kettle shall have automatic thermometric controls used to prevent the overheating of the sealant compound.

### **341.06.03 Hot-Compressed Air Lance**

The hot-compressed air lance shall have an air discharge temperature of approximately 500° C and an air exit velocity of at least 1000 metres per second.

### **341.06.04 Air Compressor**

The air compressor used to supply the hot-compressed air lance shall be equipped with oil and moisture filters and providing a minimum pressure of 700 kPa at a minimum air volume of 4.25 cubic metres per minute (150 cubic feet per minute).

## **341.07 CONSTRUCTION**

### **341.07.01 General**

Routing and/or sealing shall not be carried out when the pavement is damp or wet, when water is migrating up into the routs or when the pavement surface temperature is greater than 50° C.

The conditions under which cracks shall be routed and sealed or sealed without routing, are specified elsewhere in the Contract Documents and based on the average widths of the cracks at the time that the work is done.

### **341.07.02 Crack Routing**

Under no circumstances shall more cracks be routed during the day than can be sealed prior to shutting down operations each Day.

In addition, the routing operation shall not be so far ahead of the cleaning operation that dirt and debris left on the road is creating clouds of dust which is obscuring driver vision in adjacent traffic.

Cracks shall not be routed in locations where the centerlines of two or more parallel or sub-parallel cracks are within 75 mm of one another or the cracks are associated with alligator or map cracking as described in SP-024.

All transverse and skewed cracks shall be routed to within 25 mm of the pavement edge.

The corners of all routed grooves shall be right-angled with no more than 10° of deviation from one corner to the other and with its centreline no more than 4 mm from the centreline of its associated crack.

Any portion of a crack that meanders outside of the cross section of a routed groove shall be considered unacceptable for payment purposes.

When it cannot be demonstrated to the satisfaction of the Contract Administrator that the specified dimensions and shape of the routed groove can be maintained, then the equipment being used shall be adjusted and/or replaced so that the shape and dimensions of the routed groove meet all specified tolerances. All carbide cutters in the router's cutting head shall be replaced at the completion of 2500 linear metres of routing. The Contract Administrator shall be notified prior to the correction of all equipment used for routing.

Two or more cracks shall not be joined up by routing through pavement that is not cracked and under no circumstances shall grooves be cut in areas where a crack does not exist.

### **341.07.03 Sealant Preparation**

The sealant compound shall be slowly melted with constant agitation until it is in a lump-free, free-flowing state, within the application temperature range recommended by the manufacturer for application.

Temperature gauges for both the heating oil and sealant compound on the kettle melter shall be properly calibrated at all times.

The Contract Administrator shall be informed at least 24 hours prior to the charging of the kettle with sealant compound. The initial charge of sealant shall be placed in an empty kettle at the work site in the presence of the Contract Administrator.

### **341.07.04 Cleaning and Drying Routed Grooves and Cracks and Removal of Debris**

Immediately prior to placing the sealant compound, all routed grooves, all unrouted cracks and the surface of the asphalt 50 mm on either side of the grooves and unrouted cracks where an overband is to be constructed, shall be cleaned and dried using a hot compressed air lance. The use of a hot compressed air lance shall not result in the charring or burning of the asphalt surface.

Hot compressed air shall be applied to ensure that all moisture and loose debris have been removed and fractured aggregate surfaces have been scaled from all routed grooves or unrouted cracks.

Before applying sealant compound, all loose debris from the routing and cleaning operation shall be completely removed from the adjacent asphalt roadway.

### **341.07.05 Placing Sealant Compound**

#### **341.07.05.01 General**

After each routed or unrouted crack has been cleaned and dried, hot-poured rubberized asphalt sealant compound shall be uniformly placed without the formation of entrapped air, using either a manual pouring cone filled from a spigot located on the heating kettle itself or by using a hose and wand fitted with the proper sized shoe which allows the sealant compound to be pumped directly from the heating kettle into the routed or unrouted crack. Sealant compound shall only be placed if the pavement temperature at the surface is less than or equal to 50° C.

#### **341.07.05.02 On Surfaces to Receive an Asphalt Overlay**

For pavements which are being covered with an asphalt overlay all routed and unrouted cracks shall be immediately filled after cleaning and drying with sealant compound as specified in the Contract Documents.

For all existing pavements that are not being covered with an asphalt overlay, all routed and unrouted transverse or skewed cracks as well as any unrouted longitudinal cracks within 150 mm of the pavement edge shall be immediately filled with sealant compound after cleaning and drying so that upon complete cooling, the sealant compound forms a well-defined overband as specified in the Contract Documents.

All routed longitudinal cracks shall be immediately filled with sealant compound after cleaning and drying so that upon complete cooling, the sealant compound is at or slightly above the adjacent asphalt pavement surface, as specified in the Contract Documents.

Where an overband is being constructed, a rubber or plastic squeegee with its bottom edge trimmed slightly larger than the specified dimensions of the overband shall be used to strike off the sealant compound after it is poured into the routed or unrouted transverse or skewed crack.

For routed or unrouted transverse or skewed cracks, the sealant compound shall be struck off by starting from the end of the routed groove or unrouted crack closest to the pavement edge and working towards the center of the road.

Upon complete cooling of the sealant to the ambient temperature, the minimum elevation of the sealant compound shall, in all cases, shall be at or above the adjacent asphalt pavement surface as specified in the Contract Documents. If, during the application the sealant compound is contracting such that this requirement is not likely to be met, then sealant compound shall be applied as many times as is necessary to meet this requirement, before being dusted.

Before leaving the site at the end of each day, the heating kettle shall be completely drained of any remaining sealant compound. However, if a situation arises and the work has to stop before the sealant has been completely used, then the Contract Administrator may require that all remaining sealant be drained from the kettle. In this case, the Contract Administrator shall be informed when the kettle is being drained to allow the Contract Administrator sufficient opportunity to witness it.

Under no circumstances shall the sealant compound be heated continuously overnight without providing the Contract Administrator with a written declaration from the manufacturer clearly stating under what conditions this can be safely done without causing degradation of the sealant. If this written declaration has not been provided to the Contract Administrator and the heating kettle is not completely empty at the beginning of any Day, then the Contract Administrator may require that the heating kettle be completely drained and the wasted sealant compound be replaced before continuing work on the Contract.

At least once each hour, the temperature of the sealant compound shall be measured in the presence of the Contract Administrator using a calibrated thermometer and recorded along with the date and time of the measurement. The temperature record shall be made available to the Contract Administrator upon request.

If, at any time the Contract Administrator finds that the temperature of the sealant compound is not within the manufacturer's recommended range, then, at the discretion of the Contract Administrator, sealant compound that was placed in the roadway since the last acceptable temperature that was verified by the Contract Administrator shall either be removed, repaired or, in lieu of repairs, the affected sealed cracks shall receive a payment adjustment as specified in the Basis of Payment section. If the sealant has been overheated, then any sealant compound remaining in the heating kettle shall be rejected, and drained out and replaced with acceptable material. All rejected sealant compound shall be removed from the Working Area.

Sealant compound damaged by construction operation and any damage caused by the lane being opened to traffic before the sealant has sufficiently cooled, shall be removed and replaced.

**341.07.06 Sealant Dusting For Cracks/Routs Treated in Pavements Not Being Covered by an Asphalt Overlay**

Where traffic is to be maintained during crack sealing, the surface of the sealant shall be dusted with limestone screenings prior to allowing any traffic, including construction vehicles, on the sealed cracks. Portland cement shall not be used.

At all locations, the sealant compound shall be dusted only after it has cooled so that the final elevation of the sealant compound is at or slightly above the pavement surface as specified in the Contract Documents and, a skin has formed on the sealant which is tacky enough to allow the dust to stick to it.

**341.07.07 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

**341.08 QUALITY ASSURANCE**

**341.08.01 Sampling and Testing Sealant Compound**

**341.08.01.01 Unheated (as Delivered) Sealant Compound**

When requested by the Contract Administrator, the Contractor shall provide samples of batches of sealant compound used on the Contract. Each sample shall be approximately 4 litres in volume. All samples of unheated sealant compound shall be placed in security bags, sealed with security seals in the presence of the Contract Administrator, and delivered in a suitable box, clearly marked with the sampling identification information, as specified elsewhere in the Contract Documents, along with the following additional information:

- a) The designated trade name and designation # of the compound;
- b) The manufacturer;
- c) The manufacturer's batch number; and
- d) The size of the applicable batch.

Samples shall be delivered to the following address:

Bituminous Section  
Ontario Ministry of Transportation  
Room 15,  
145 Sir William Hearst Avenue  
Downsview, Ontario M3M 0B6

**341.08.01.02 Samples during Sealant Placement**

The Contractor at the direction of and in the presence of the Contract Administrator shall take samples of hot-poured rubberized asphalt joint/crack sealant compound directly from the heating kettle, while the sealant compound is being placed,. A minimum of either three samples at points when approximately 1/4, 1/2, and 3/4 of the tender quantity number of linear metres has been placed or a minimum of one sample for each 25,000 linear metres placed, whichever is greater, shall be taken. Additional samples shall be taken when requested by the Contract Administrator.

Each sample shall be placed in a triple-tight single metal container (e.g. paint can) with a wire handle and with a minimum volume of 4 litres. The side and top of each metal container shall be clearly marked with the following information:

- a) Contract number;
- b) Designated trade name and designation # of the compound;
- c) Manufacturer;
- d) Manufacturer's batch number; and
- e) The point in the Contract at which the sample was taken, e.g., the percentage of the work completed.

An accompanying tag shall also be firmly affixed to the wire handle of the metal container showing all of the sampling identification information listed above, all other sampling information specified elsewhere in the Contract Documents as well as the following additional information:

- a) The station and offset in the roadway where the sample was taken;
- b) The temperature of the sealant compound when the sample was taken; and the
- c) Weather conditions (ambient temperature and precipitation).

The samples shall be delivered to the following address:

Bituminous Section  
 Ontario Ministry of Transportation  
 Room 15,  
 145 Sir William Hearst Avenue  
 Downsview, Ontario, M3M 0B6

#### **341.08.02                      Deficiencies and Repairs during Construction**

If any of the deficiencies listed under various categories in Table 1 are found during construction, then, at the discretion of the Contract Administrator, the sealed crack or routed groove shall be repaired by the Contractor as specified or, in lieu of repairs, a payment adjustment shall be applied as specified in the Basis of Payment section.

A repair proposal shall be submitted to the Contract Administrator for all repairs. Repairs shall not commence until approval of the proposal has been received from the Contract Administrator.

Any materials, equipment or procedures used in the repair or replacement of routing and sealing shall be the same as those specified for the original work.

#### **341.09                              MEASUREMENT FOR PAYMENT**

##### **341.09.01                      Actual Measurement**

Where a crack is being routed and sealed, measurement for payment shall be in linear metres along the sealed crack, but excluding any portions of the sealed crack where the crack migrates away from the routed groove.

Where a crack is being sealed without routing, measurement for payment shall be in linear metres along the sealed crack.

Separate measurements shall be made for:

- a) Cracks that are routed and sealed with no deficiencies (i.e. L1);

- b) Cracks that are routed and sealed that are deficient, as specified in Table 1, but are left unrepaired (i.e. L2);
- c) Cracks that are sealed without routing and with no deficiencies (i.e. L3); and
- d) Cracks that are sealed without routing that are deficient, as specified in Table 1, but are left unrepaired (i.e. L4).

#### **341.09.02 Plan Quantity**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **341.10 BASIS OF PAYMENT**

The removal, disposal, and/or replacement of any sealant, according to the Contract Documents, shall be at no additional cost to the Owner.

#### **341.10.01 Routing and Sealing Cracks in Asphalt Pavement – Item**

Payment at the Contract price for routing and sealing cracks shall be full compensation for all labour, Equipment and Material required to do the work. No additional payment shall be made for overruns in sealant compound quantity.

##### **341.10.01.01 Payment Adjustment**

When the Contract Administrator allows a payment adjustment in lieu of repairs for a routed and sealed crack which exhibits one or more of the deficiencies listed in Table 1, then a payment reduction of 50% of the Contract price shall be applied for each linear metre exhibiting such deficiencies.

Payment for routed and sealed cracks shall be made in accordance with the following equation:

$$(1) \quad \text{Payment} = \text{Contract Price} \times (L1 + 0.5 \times L2)$$

Where: Contract Price = the Contract price for this tender item

L1 = the total length in linear metres of the measured cracks that are routed and sealed with no deficiencies;

L2 = the total length in linear metres of measured cracks that are routed and sealed but are deficient, as specified in Table 1 and are left unrepaired.

#### **341.10.02 Sealing Cracks in Asphalt Pavement– Item**

Payment at the Contract price for sealing cracks without routing shall be full compensation for all labour, Equipment and Material required to do the work. No additional payment shall be made for overruns in sealant compound quantity.

##### **341.10.02.01 Payment Adjustment**

When the Contract Administrator allows a payment adjustment in lieu of repairs for a crack that is sealed without routing and exhibits one or more of the deficiencies listed in Table 1, then a payment reduction of 50% of the Contract price shall be applied for each linear metre exhibiting such deficiencies.

Payment for cracks that are sealed without routing shall be made in accordance with the following equation:

(2)  $\text{Payment} = \text{Contract Price} \times (\text{L3} + 0.5 \times \text{L4})$

Where: Contract Price = the Contract price for this tender item

L3 = the total length in linear metres of the measured cracks that are sealed without routing and have no deficiencies;

L4 = the total length in linear metres of measured cracks that are sealed without routing but are deficient, as specified in Table 1 and are left unrepaired.

**Table 1**  
**Deficiencies and Repairs during Construction**

| Categories                                                        | Deficiencies                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Repairs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|---------------|-------------------|
| <b>342 -A</b> | <b>Commentary</b> |
|---------------|-------------------|

### **342.01 SCOPE**

This specification covers the requirements for the installation of centreline rumble strips (CRS) into the surface course of asphalt pavement, and the grinding of shoulder rumble strips (SRS) into the surface course of fully or partially paved asphalt shoulders.

#### **342.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **342.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **342.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications and publications:

### **Ontario Provincial Standard Specifications, Construction**

|          |                              |
|----------|------------------------------|
| OPSS 313 | Hot Mix Asphalt – End Result |
| OPSS 510 | Removal                      |
| OPSS 710 | Pavement Marking             |

## **342.06 EQUIPMENT**

The construction equipment shall employ a rotary type cutting head capable of installing rumble strips with a smooth surface to the lines and dimensions as specified in the Contract Documents.

## **342.07 CONSTRUCTION**

### **342.07.01 General**

Centreline rumble strips (CRS) shall be installed at the centreline of the highway as specified in the Contract Documents.

Shoulder rumble strips (SRS) shall be installed at the partially paved asphalt shoulder or fully paved asphalt shoulder as specified in the Contract Documents.

The pavement surface shall be cleaned and all debris shall be disposed of as specified elsewhere in the Contract Documents.

#### **342.07.02                      Placement**

Centreline rumble strips and SRS shall not be placed within 200 mm of routed and filled transverse joints.

Centreline rumble strips shall be installed prior to the final pavement markings being placed.

Shoulder rumble strips shall be installed after the final pavement markings have been placed. Any damage to the final pavement markings shall be repaired according to OPSS 710.

Where SRS are installed in conjunction with a bicycle buffer zone, the SRS shall be installed prior to the placement of the outer pavement marking edge line.

#### **342.07.03                      Tolerances**

Tolerances for the width and depth of each rumble strip groove shall be as specified in the Contract Documents. If any one of these tolerances is exceeded in more than two grooves within a one metre length section, the section shall be rejected.

Rejected sections shall be repaired or assessed a payment reduction as directed by the Contract Administrator.

Rejected sections shall be repaired by partial depth asphalt removal according to OPSS 510, replacement of the hot mix asphalt according to OPSS 313, the reinstallation of rumble strips according to this specification, and reinstatement of damaged pavement markings according to OPSS 710. The depth of the partial depth removal shall be 50 mm and the width shall be 500 mm centred over the rumble strip. However, when this will result in a narrow remaining width of asphalt pavement on either side that is less than 300 mm, the removal width shall be extended to include the narrow width of asphalt pavement.

### **342.09                              MEASUREMENT FOR PAYMENT**

#### **342.09.01                      Actual Measurement**

##### **342.09.01.01                  Shoulder Rumble Strips - Asphalt Centreline Rumble Strips – Asphalt Shoulder Rumble Strips for Bicycle Buffer Zone - Asphalt**

Measurement of rumble strips shall be by horizontal length in metres in which the CRS or SRS have been placed.

#### **342.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**342.10 BASIS OF PAYMENT**

**342.10.01 Shoulder Rumble Strips - Asphalt – Item  
Centreline Rumble Strips- Asphalt - Item  
Shoulder Rumble Strips for Bicycle Buffer Zone – Asphalt - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract contains separate items for work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

**Appendix 342-A, November 2015**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

Environmental Protection Act, R.S.O 1990, E.19

## 350.03 DEFINITIONS

For the purpose of this specification, the following definitions shall apply:

**Concrete Base** means a rigid pavement structure, which is overlaid with asphaltic concrete, and includes concrete shoulders when present.

**Concrete Pavement** means a rigid pavement structure with an exposed concrete surface, and includes concrete shoulders when present.

**Cold Weather** means those conditions when the ambient air temperature is at or below 5 °C. It is also considered to exist when the ambient air temperature is at or is likely to fall below 5 °C within 96 hours after completion of concrete placement. Temperature refers to shade temperature.

**Effluent** means liquid waste that is a direct result of concrete grinding, grooving and sawcutting. Effluent includes any stormwater, or surface drainage that becomes mixed with this material.

**Environmental Compliance Approval (ECA)** means as interpreted by Section 2.1 of the Ontario Environmental Protection Act.

**Grout Retention Disk** means a plastic disk that provides a barrier that prevents dowel adhesive from escaping from a dowel hole or tie bar hole before it has hardened.

**Horizontal Alignment** means the deviation of the dowel bar from true parallel alignment from the edge of the concrete pavement or concrete base, measured over the entire length of the dowel bar.

**Horizontal Side Shift** means the location of the dowel bar relative to the planned location from the concrete pavement or concrete base edge, nearest longitudinal joint, or nearest parallel dowel bar.

**Hot Weather** means those conditions when the ambient air temperature is at or above 28 °C. It is also considered to exist when the ambient air temperature is at or is likely to rise above 28 °C within 24 hours after concrete placement. Temperature refers to shade temperature.

**International Roughness Index (IRI)** means a specific mathematical transform of a true profile in which a low pass filter (usually consisting of a moving average with a 250 mm base length) followed by a “Quarter Car Filter” are applied to the true profile then the absolute values of the vertical vibration of the “Quarter Car Filter” are accumulated and divided by the subplot length. It is expressed in units of m/km.

**Load Transfer Device** means a metal support, or dowel basket, that holds a dowel in place ahead of paving operations.

**Longitudinal Side Shift** means the longitudinal translation of the dowel bar relative to its planned location perpendicular to the concrete pavement or concrete base edge.

**MPI Device** means a magnetic pulse induction (MPI) equipment meeting the requirements of ASTM E3013 and specifically developed for measuring dowel bar position and alignment in concrete pavements and concrete bases.

**Mean Roughness Index (MRI)** means the number calculated by averaging the IRI values from the two-wheel path profiles.

**Panel** means a section of concrete pavement or concrete base bounded by the nearest longitudinal and transverse joints.

**Percent Within Limits (PWL)** means an estimate of the percentage of the lot population that is within the specified limits, determined by using the mean and standard deviation of the lot according to LS-101.

**Vertical Alignment** means the deviation of the dowel bar from true parallel alignment from the surface of the concrete pavement or concrete base, measured over the entire length of the dowel bar.

## **350.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **350.04.01 Design Requirements**

#### **350.04.01.01 Concrete Mix Designs**

The concrete mix shall be designed to provide adequate strength and durability for the intended use and to meet the requirements specified in the Contract Documents.

### **350.04.02 Submission Requirements**

#### **350.04.02.01 Concrete Mix Design**

Concrete mix design(s) submissions shall be according to OPSS 1350.

#### **350.04.02.02 Curing Compound**

Curing compound submissions shall be according to OPSS 904.

### **350.04.02.03            Temperature Control Plans**

#### **350.04.02.03.01        Cold Weather**

A temperature control plan shall be submitted according to the Temperature Control Plans clause of OPSS 904 for concrete paving operations that require curing during cold weather.

#### **350.04.02.03.02        Hot Weather**

For concrete paving operations subject to hot weather, a description of the methods to be used to control the temperatures of the concrete and underlying base shall be submitted to the Contract Administrator 7 Days prior to placement.

#### **350.04.02.04            Temperature Records**

For concrete paving operations that require curing during cold weather, temperature records shall be submitted according to the Submission of Temperature Records clause of OPSS 904.

#### **350.04.02.05            Effluent Management**

A written agreement from the operator of the receiving site or property owner selected to accept the effluent, shall be submitted to the Contract Administrator a minimum of 14 Days prior to commencement of the effluent producing work.

At the completion of the work, a copy of a release signed by the same receiving site operator or property owner shall be submitted to the Contract Administrator.

A copy of the Contractor's ECA for a waste management system shall be submitted to the Contract Administrator prior to the commencement of any work that will generate effluent.

### **350.05                    MATERIALS**

#### **350.05.01                Bond Breaker**

Bond breaker shall be RC-250, Tectyl 506, or an alternative type of material acceptable to the Owner.

Dowel bars and load transfer devices shall be shop coated with bond breaker, except for dowels which are installed into existing concrete.

#### **350.05.02                Burlap**

Burlap shall be according to OPSS 1306.

#### **350.05.03                Concrete**

Concrete and concrete materials shall be according to OPSS 1350 with the exception that the maximum allowable proportion by mass of the total cementing material for slag shall be 30%.

The minimum specified 28-Day compressive strength shall be 35 MPa.

#### **350.05.04                Curing Compound**

Curing compound shall be according to OPSS 1315.

#### **350.05.05                Epoxy Adhesives**

Epoxy resins dowel adhesives used for dowel and tie bars shall be from the MTO DSM approved for horizontal applications and mixed in the nozzle (cartridge). Cementitious grouts shall not be permitted for this application.

#### **350.05.06                      Expansion Joint Filler**

Expansion joint filler shall be according to OPSS 1308.

#### **350.05.07                      Forms**

Forms shall be according to OPSS 919.

#### **350.05.08                      Moisture Vapour Barrier**

The moisture vapour barrier shall be a white opaque polyethylene film according to ASTM C171 and at least 100 µm thick.

#### **350.05.09                      Proprietary Patching Materials**

Proprietary patching materials shall be from the Owner's list of acceptable concrete patching materials. The list of proprietary patching materials may be obtained from the Contract Administrator.

#### **350.05.10                      Tie Bars, Dowel Bars and Load Transfer Devices**

Tie bars and dowel bars shall be according to OPSS 1440. Tie bars and dowel bars shall be epoxy coated according to OPSS 1442. Load transfer devices shall be according to OPSS 1441.

#### **350.05.11                      Water**

Water used for curing and pre-soaking of burlap shall be according to OPSS 1302.

### **350.06                          EQUIPMENT**

#### **350.06.01                      Air Compressor**

The compressor for air blasting shall have a minimum capacity of 3.5 m<sup>3</sup>/min. The compressed air shall be free from oil and other contaminants.

#### **350.06.02                      Batching Plant and Delivery Equipment**

The batching plant shall be according to the Batching Plant subsection of OPSS 1350. Delivery equipment shall be according to the Delivery Equipment subsection of OPSS 1350.

#### **350.06.03                      Diamond Grinder**

When a diamond grinder is used, it shall be power-driven, self-propelled equipment specifically designed to grind and texture concrete surfaces. It shall be equipped with a grinding head with at least 50 diamond blades per 300 mm of shaft. The grinding head shall be at least 0.9 m wide. The grinder shall have the capability to adjust the depth, slope, and cross-fall to ensure that concrete is removed to the desired dimensions and uniformly feathered and textured across the width and length of the repair area.

#### **350.06.04                      Effluent Collection Systems**

The diamond grinding and grooving machines shall be equipped with a vacuum system that is capable of removing all standing effluent, leaving the roadway in a clean, near dry condition after each pass. Effluent shall not be permitted to encroach into open lanes, enter into closed drainage systems or surrounding areas.

#### **350.06.05                      Gang Drill**

The gang drill shall consist of not less than three independently powered pneumatic drills. Drilling shall not damage adjacent concrete.

### **350.06.06 Grooving Machines**

Grooving machines shall have circular diamond-tipped blades, mounted on a multi-blade arbor, and shall be self-propelled and specifically designed to groove concrete pavement. The grooving machine shall have a depth control device capable of detecting variations in the concrete pavement surface and automatically adjust the cutting head height to maintain the specified groove depth. The grooving machine shall have alignment control devices.

At the beginning of each work shift, all grooving machines shall be equipped with a full complement of grooving blades capable of cutting grooves of the specified width, depth, and spacing.

### **350.06.07 Hand Finishing Equipment**

Floats used to finish concrete shall be made of magnesium.

### **350.06.08 Sawcutting Equipment**

The sawcutting equipment shall be self-propelled, guided, and capable of sawcutting the joints to the dimensions specified in the Contract Documents. The sawcutting equipment shall be capable of cutting the joints without causing spalling or damage to the adjacent concrete.

The sawcutting equipment for longitudinal joints shall have guided wheels, which run along each longitudinal vertical face of the concrete pavement or concrete base.

The saw shall be equipped with a diamond blade.

### **350.06.09 Slip-Form Paving Equipment with Automatic Dowel Bar Inserter (DBI)**

When a DBI is used, the equipment shall be capable of:

- a) Controlling insertion of the dowel bars and tie bars to achieve the required depth, alignment and spacing;
- b) Automatically marking the centre of the dowel bars for the joint cutting operation, by applying a mark adjacent to the concrete on both sides of the slip-form paver using spray paint or other permanent and visible marking; and
- c) Consolidating the concrete around the automatically-inserted dowel bars and tie bars.

### **350.06.10 Straight Edge**

Straight edges shall be commercially made of metal and 3 m long.

### **350.06.11 Thermocouples and Dataloggers**

Thermocouples and associated instrumentation shall:

- a) Have a combined accuracy of  $\pm 1.5$  °C;
- b) Record temperatures at hourly intervals or less; and
- c) Display the temperature.

## **350.07 CONSTRUCTION**

### **350.07.01 General**

The concrete pavement and concrete base shall be protected from damage. Traffic, other than foot traffic and rubber-tired sawing equipment, shall not be permitted on the concrete until it has attained a compressive strength of 20 MPa.

Shouldering operations and construction of adjacent lanes may commence once the concrete has attained a compressive strength of 20 MPa. Shoulders shall be as specified in the Contract Documents.

### **350.07.02 Production of Concrete**

Production of concrete shall be according to the General, Temperature Control, Mixing Time and Mixing Rate, and Delivery subsections of OPSS 1350.

### **350.07.03 Placing of Concrete**

#### **350.07.03.01 General**

Immediately ahead of the concrete placing operation, the underlying material shall be wetted by means of a uniform spray of water sufficient to wet the underlying material thoroughly without leaving standing water.

The method of transporting, placing, and consolidating the concrete shall be such as to prevent segregation.

Concrete shall be placed within 1.5 m of its final position. Concrete shall not be dropped from more than 1.5 m above the underlying material. Concrete shall not be placed more than 10 m ahead of the concrete paving equipment.

Concrete shall be placed at a steady rate, such that a monolithic concrete is obtained without the formation of cold joints.

When there is an interruption in placing concrete greater than 20 minutes, the surface of the concrete where curing has not been applied, and concrete placed ahead of the concrete paving equipment shall be covered with wet burlap. The Contract Administrator shall be notified immediately of any interruption resulting in a cold joint. A proposal for remedial action shall be submitted to the Contract Administrator for approval.

Any excess concrete beyond the concrete pavement or concrete base edge shall be removed immediately.

#### **350.07.03.02 Concrete Placing Restrictions**

No concrete shall be placed until all curing material, including cold weather protection material when required, has been delivered to the site.

Concrete shall only be placed when the ambient air temperature is 1 °C and rising, and is less than 32 °C.

All surfaces against which concrete is to be placed shall be free of:

- a) Standing water;
- b) Ice and snow; and
- c) Debris.

Concrete shall not be placed against any material which is at a temperature above 35 °C, nor against any material whose temperature is below 5 °C.

Concrete shall not be placed on or against frozen ground. De-icing chemicals shall not be used.

Fresh concrete shall be protected from contact with rain or snow and concrete shall not be placed during rain or snowfall.

#### **350.07.04 Consolidation**

For slip-form pavers, the concrete shall be consolidated by vibrators of sufficient number, spacing and frequency to provide uniform consolidation to the entire concrete pavement or concrete base width and depth. The vibrators shall not operate while the paver is stopped.

Concrete shall be thoroughly consolidated against and along the face of all forms and into the face of previously placed concrete. The vibrators shall not come in contact with the base, subbase, underlying material, forms, tie bars, dowel bars or load transfer devices.

For fixed-form placement, hand-held vibrators shall be used to supplement consolidation adjacent to and along the full length of the form. They shall also be inserted at regularly spaced intervals along both sides of load transfer devices, when used.

#### **350.07.05 Finishing**

When a slip-form paver is used, hand finishing is not required but is permitted to address localized areas of open texturing, undulations, projections, or ridges.

No water or other materials shall be applied to the concrete surface or the finishing tools to aid in the finishing.

When fixed forms are being used, or where concrete is being placed against an existing concrete pavement or concrete base, the edge of the concrete surface shall be finished with an edging tool having a radius of not more than 6 mm before surface texturing.

#### **350.07.06 Initial Texturing of Concrete Pavement or Concrete Base Surface**

The plastic surface of the concrete shall receive an initial texturing immediately after finishing and before the application of curing on the concrete. The initial texturing shall be performed by dragging burlap longitudinally to produce a uniform textured surface. The burlap shall be kept in a clean condition and free from tears and encrusted mortar. It shall be kept damp but shall not add excessive water to the concrete surface.

#### **350.07.07 Curing**

For slip-form placement, curing shall be applied immediately after initial texturing of the concrete surface, and within 15 minutes of concrete being formed by the paver. For fixed-form placement, curing shall be applied immediately after initial texturing of the concrete surface.

The curing period shall be a minimum of 7 Days for concrete cured with curing compound and for concrete subject to cold weather. For all other concrete, the curing period shall be a minimum of 4 Days.

Concrete pavement and concrete base shall be cured using one of the following methods, according to the applicable clauses of OPSS 904:

- a) Curing with Curing Compound clause; or
- b) Curing with Burlap and Water clause.

Formed surfaces shall require no additional curing where the formwork is left in place for the minimum specified curing period. If formwork is removed during the curing period, formed surfaces shall be cured using one of the methods listed above.

When curing compound is used, it shall not be applied to joint faces against which joint sealing compound will be placed or, to concrete surfaces to which concrete or mortar is to be bonded.

Curing compound used on the surface of a concrete base shall be removed completely prior to the application of tack coat and overlaying with asphalt pavement. The method of removal shall be by abrasive blast cleaning according to OPSS 929, and it shall not result in any damage to the concrete surface. The removal process shall meet all environmental constraints specified in the Contract Documents.

### **350.07.08 Cold Weather Protection**

#### **350.07.08.01 General**

During cold weather, the temperature of the concrete shall be monitored and controlled for a minimum period of 7 Days to ensure that the concrete temperature does not fall below 15 °C for the first 3 Days of curing and then 10 °C for the following 4 Days. The monitoring shall commence at the start of the concrete placing operation.

The cold weather protection system shall be designed for the worst conditions that can be reasonably anticipated from local weather records, forecasts, site conditions, and past experience for the time period during which the protection is required. For cold weather conditions, concrete shall be protected according to the Concrete Subject to Cold Weather clause in OPSS 904. The conditions shall be monitored, and the protection system shall be modified as required.

Cold weather protection may be removed for sawcutting of joints; however, when removed no concrete shall be left unprotected for more than 1 hour and no more than 25 linear metres of concrete shall be exposed at any one time.

#### **350.07.08.02 Monitoring and Control of Temperature**

During cold weather, records of monitoring and control of the concrete and ambient air temperature shall be submitted to the Contract Administrator.

For each Day's placement of concrete, thermocouples or sensors shall be embedded within 5 mm of the concrete surface in a minimum of four locations distributed throughout the placed concrete, as directed by the Contract Administrator. At least one additional thermocouple or sensor shall be installed to measure ambient air temperature above the surface of the concrete and outside of the specified cold weather protection.

The recording of concrete temperatures shall begin at the start of concrete placement. The temperature shall be recorded automatically at intervals no greater than 15 minutes. The thermocouples and instrumentation shall be left in place and temperatures recorded until the end of the temperature monitoring period.

Concrete and ambient air temperature readings shall be monitored and verified on site every 6 hours or more frequently as required for the first 3 Days, and every 12 hours or more frequently as required for the remainder of the temperature monitoring period. All necessary action shall be taken to maintain the temperature within the specified limits.

The Contract Administrator shall be provided physical and digital access to verify temperature readings.

#### **350.07.08.03 Submission of Temperature Records**

At the end of each Day during the temperature monitoring period, datalogger temperature records for all of the thermocouples and sensors and a record of any actions taken to maintain control of temperature shall be submitted to the Contract Administrator. At the end of the temperature monitoring period, the complete temperature records for all of the thermocouples and sensors, including graphical plots of temperature versus time, shall be submitted to the Contract Administrator.

## **350.07.09 Joints**

### **350.07.09.01 General**

Joints shall be of the type and at the locations specified in the Contract Documents.

Transverse joints in new concrete pavement shall be at the same locations and continuous with transverse joints in the existing adjacent concrete pavement.

### **350.07.09.02 Longitudinal and Transverse Joints**

For concrete pavement and concrete base, there shall be no reservoir cut and a backer rod shall not be used.

For concrete pavement, the dimensions of the longitudinal and transverse joints shall be as specified in the Contract Documents for full depth joint filling without reservoir cut.

For concrete base, the dimension of the joint shall be as specified in the Contract Documents.

### **350.07.09.03 Construction Joints**

Transverse construction joints shall be made at the end of each Day's production or when an interruption greater than 20 minutes occurs in the concrete paving operation. Construction joints shall be located at a transverse contraction joint or expansion joint location.

### **350.07.09.04 Tie Bars and Dowel Bars**

#### **350.07.09.04.01 General**

Prior to placement of concrete or the installation of tie bars or dowel bars, bars which are loose, broken, cracked or otherwise damaged shall be removed and replaced.

#### **350.07.09.04.02 Protection of Tie Bars and Dowel Bars**

Unprotected on-site storage shall not exceed 30 Days and total on-site storage time shall not exceed 120 Days. When protection is required, bars shall be covered with opaque polyethylene sheeting. For stacked bundles, the protective covering shall be draped over the sides of the bundles and around the perimeter of the stack. The covering shall be secured, with provisions for air circulation around the bars to prevent condensation under the protective covering.

The bars shall be stored clear of the ground on timbers or other suitable protective cribbing spaced to prevent sags in the bundles. Stacks of bundles of straight bars shall have blocking to prevent contact between the layers of bundles.

#### **350.07.09.04.03 Repair of Tie Bars and Dowel Bars**

Bars with coating damage less than 1% of the surface area of the bar shall be repaired. Bars with coating damage greater than 1% of the surface area of the bar shall not be used.

Repairs to damaged epoxy coating shall be according to OPSS 1442. Repairs shall not be performed when the temperature of the bar or the ambient air is 5 °C or less, or when moisture is present on the bar. All repairs to the coating of bars shall be completed at least 24 hours before permission to place concrete is given. Repairs should be performed immediately after the damage occurs and shall be done before rusting begins. If any rust is present, it shall be completely removed before the patching material is applied. Repaired dowel bars shall be coated with a bond-breaker.

#### **350.07.09.04.04 Installation of Tie Bars in Plastic Concrete**

Tie bars at longitudinal joints shall be installed as specified in the Contract Documents. Tie bars may be installed in the plastic concrete using an inserter or by means of tie bar baskets. Tie bars shall not be manually inserted into the plastic concrete.

Tie bars shall be installed within a tolerance of  $\pm 15$  mm from the specified depth. Tie bars shall not be placed within 600 mm of a transverse joint.

Tie bars shall be installed in the plastic concrete so that voids are not created around the bar.

#### **350.07.09.04.05 Installation of Dowel Bars in Plastic Concrete**

Dowel bars at transverse joints shall be installed as specified in the Contract Documents. Dowel bars may be installed in the plastic concrete using a DBI or by means of load transfer devices. Dowel bars shall not be manually inserted into the plastic concrete.

When load transfer devices are used, they shall be placed a minimum of 100 m in advance of the concrete placing operation. Load transfer devices shall be prevented from moving, by the use of stakes placed on both sides of the load transfer device. A minimum of three stakes shall be uniformly spaced on each side of the load transfer device for each lane, to prevent movement during the concrete paving operation. The spacer wire shall be cut in two places and the mid-section removed after staking the load transfer device in position. The section of spacer wire removed shall be a minimum of 300 mm in length.

Dowel bars shall be placed parallel to the longitudinal axis (horizontal alignment) and horizontal plane (vertical alignment) of the concrete pavement or concrete base within a tolerance of  $\pm 15$  mm along the length of the dowel bar.

The location of the centre of the dowel bars shall be precisely marked to permit joint forming or cutting operations directly over the centre of the dowel bars. Transverse joints shall be sawcut within a tolerance of  $\pm 50$  mm from the center of the dowel bars (longitudinal side shift).

Dowel bars shall be placed mid-depth of the concrete pavement or concrete base within the following tolerances:

- a) For a specified concrete pavement or concrete base thickness of  $< 215$  mm:
  - i. lower limit = - 6 mm,
  - ii. upper limit = + 6 mm.
- b) For a specified concrete pavement or concrete base thickness from 215 to 229 mm:
  - i. lower limit = - 12 mm,
  - ii. upper limit = + 15 mm.
- c) For a specified concrete pavement or concrete base thickness of 230 mm or greater:
  - i. lower limit = - 15 mm,
  - ii. upper limit = + 25 mm.

#### **350.07.09.04.06 Installation of Tie Bars and Dowel Bars in Hardened Concrete**

When tie bars and dowel bars are installed in hardened concrete, they shall be at the locations and within the tolerances specified in the Installation of Tie Bars in Plastic Concrete and Installation of Dowel Bars in Plastic Concrete clauses as applicable.

Tie bars and dowel bars shall be installed in hardened concrete by drilling holes into the existing concrete using a gang drill. For concrete that is less than 7 Days of age, prior to drilling, cylinders according to the Testing for Early Strength subsection of OPSS 904 shall be prepared to demonstrate that the concrete has reached a

minimum compressive strength of 20 MPa. The diameter of the drill hole shall be no more than 5 mm larger than the diameter of the dowel or tie bar. Prior to installing the dowel bar or tie bar, the inside surface of each drill hole shall be wire brushed and then cleaned using compressed air. The dowel or tie bar shall be secured into the existing concrete with an epoxy adhesive. The epoxy adhesive shall be injected into the back of the cleaned drill hole and the dowel or tie bar, with grout retention disks attached, shall be inserted to completely encase the bars with epoxy adhesive for the full depth of the hole.

To replace damaged tie bars, a hole offset 75 mm horizontally from the rejected bar shall be drilled and a replacement bar shall be installed. Damaged tie bars shall be cut flush with the concrete surface.

For dowel bars only (not tie bars), the free end of the dowel bars and the exposed vertical concrete face along the transverse joint shall be coated with bond breaker immediately prior to placing concrete.

Holes that have been started but not completed shall be cleaned and filled with a proprietary patching material.

#### **350.07.09.05                      Sawcutting, Cleaning and Sealing of Joints in Concrete Pavement**

Concrete pavement joints shall be sealed. Sealing of joints may be done prior to, or after final texturing of the concrete pavement. Sawcutting, cleaning, and sealing of joints for concrete pavement shall be according to OPSS 369, with the addition that samples of hot poured rubberized joint sealing compound shall be required for quality assurance testing by the Owner.

A 4-litre sample shall be taken from the heating and mixing kettle at the beginning, middle and the end of the process of joint sealing compound installation for each calendar year and shall be provided to the Contract Administrator for testing by the Owner. Upon request, a more frequent sampling of the joint sealing compound shall be carried out for quality assurance testing by the Owner.

Joints shall be sealed prior to opening to traffic. Joints that will be open to traffic may be sealed temporarily, subject to approval by the Owner. A proposal to temporarily seal joints shall be submitted to the Contract Administrator, for acceptance.

#### **350.07.09.06                      Sawcutting and Cleaning of Joints in Concrete Base**

Concrete base joints shall not be sealed. Sawcutting and cleaning of joints for concrete base shall be according to OPSS 369.

#### **350.07.10                      Optional Diamond Grinding to Improve Surface Tolerance and Smoothness**

Diamond grinding, to improve concrete pavement surface tolerance and smoothness prior to Owner acceptance testing, may be completed at the Contractor's option. The optional diamond grinding shall be completed prior to final texturing of the concrete pavement.

When this option is selected, a written proposal, according to the Repairs subsection, shall be submitted to the Contract Administrator at least 5 Business Days prior to commencing the diamond grinding. The proposal shall list the diamond grinding locations by subplot(s), station limits, and include the length of each location. Where the distance between individual locations within the same lane is less than 100 m, these locations shall be specifically identified in the proposal along with the length between the two locations.

The optional diamond grinding shall not commence until written permission to proceed has been received from the Contract Administrator.

The optional diamond grinding shall be deemed to be a repair.

## **350.07.11 Final Texturing of Concrete Pavement Surface**

### **350.07.11.01 Trial Section**

The ability to texture the concrete pavement surface according to the requirements of this specification by grooving shall be demonstrated by means of a 500 m single lane trial section. The location of the trial section shall be selected by the Contract Administrator.

The Contract Administrator shall give permission to proceed with the final texturing on the Contract when it has been demonstrated to the satisfaction of the Contract Administrator that the trial section meets the requirements of this specification.

The Contract Administrator may require additional trial section(s) to be constructed, at no additional cost to the Owner, using alternate means as required, until it has been demonstrated that the requirements of this specification have been met.

### **350.07.11.02 Final Texturing of Concrete Pavement**

Concrete pavements shall receive a final texturing by grooving. Concrete base shall not receive a final texturing. Final texturing shall be done after the curing period and, if applicable, the cold weather protection period, is complete. The concrete pavement surface shall be grooved with a grooving machine longitudinally. Longitudinally grooved areas shall be straight and run parallel to the longitudinal axis of the concrete pavement, begin and end at lines radial to the concrete pavement center line and shall be centered within the lane width, or as specified in the Contract Documents.

The concrete pavement shall be grooved to the full width of the lane under construction with no grooves cut within 150 mm and no closer than 50 mm of longitudinal joints.

Grooves shall be:

- a) Cut 2.5 mm in width, with a tolerance of plus 1.5 mm.
- b) Cut between 3.0 and 6.0 mm in depth, except over inductive loop detectors where they shall be cut between 1.5 and 3.0 mm in depth.
- c) Spaced 19 mm centre-to-centre with a tolerance of plus or minus 2.5 mm.

Grooving that results in ravelling, aggregate fractures, spalls, or disturbance to the transverse or longitudinal joints, shall not be permitted and shall be controlled or corrected immediately as the work progresses.

If a single grooving blade on any individual grooving machine becomes incapable of cutting a groove within the specified tolerances, work shall be permitted to continue for the remainder of the work shift and the groove shall not be required to be recut. Should two or more grooving blades on any individual grooving machine become incapable of cutting grooves within the specified tolerances, operations shall cease with this machine until repairs to the equipment are completed.

The Contract Administrator shall immediately be notified in writing if any of the defects or conditions listed in the Acceptance of Concrete Surface Texturing subsection are present in the work and shall include the extent of the defects and an explanation of the cause. A proposal for the remedial work for the above defects and conditions shall be submitted to the Contract Administrator for review. Repairs shall not proceed until approval of the proposal has been received from the Contract Administrator. Repairs shall be at no additional cost to the Owner.

### **350.07.12 Surface Tolerance**

The surface of the concrete shall be such that when tested with a 3 m long straight edge placed in any location and direction, including the edge of concrete pavement or concrete base and joints, except across the crown or drainage gutters, there shall not be a gap greater than 3 mm between the bottom of the straight edge and the surface of the concrete pavement.

For concrete base, the tolerance relative to a 3 m straight edge shall be maximum 6 mm.

The surface of the concrete shall join flush with adjacent concrete pavement or concrete base.

Diamond grinding, according to the Repairs clause, shall be carried out to ensure the concrete surface meets these requirements.

### **350.07.13                      Material Sampling and Testing**

#### **350.07.13.01                      Sampling of Water, Admixtures, Limestone Filler and Cementing Materials**

Sampling of water, admixtures, limestone filler and cementing materials shall be according to Sampling of Water, Admixtures, Limestone Filler and Cementing Materials clause in OPSS 1350.

#### **350.07.13.02                      Sampling and Testing of Plastic Concrete**

Sampling, testing, acceptance, adjustments, visual acceptance, and submission of results for plastic concrete shall be according to the following clauses in OPSS 1350 with the exception that after satisfactory control has been established, testing shall be carried out on one load of concrete in every five loads:

- a) Testing of Plastic Concrete;
- b) Frequency of Testing Slump, Air Content and Temperature;
- c) Acceptance and Field Adjustment of Plastic Concrete;
- d) Visual Acceptance of Plastic Concrete;
- e) Within-Batch Uniformity of Plastic Concrete;
- f) Submission of Plastic Concrete Test Results.

#### **350.07.13.03                      Sampling for Acceptance Testing of Thickness, 28-Day Compressive Strength, Air Void System Parameters, Rapid Chloride Permeability and Acceptance of Joint Sealing**

##### **350.07.13.03.01                      General**

Core samples shall be removed from the concrete pavement or concrete base at locations identified by the Contract Administrator for acceptance testing of thickness, 28-Day compressive strength, air void system parameters and rapid chloride permeability.

The lot and subplot size and number of cores per subplot shall be according to the Quality Assurance section.

After sealing operations are complete, the Contract Administrator may require that additional cores, up to two cores per subplot, be taken at joint locations to evaluate the acceptability of the joint cleaning and sealing. If the samples show that the joint cleaning and sealing is not according to this specification, additional cores may be required at no addition cost to the Owner.

##### **350.07.13.03.02                      Coring**

Core samples shall be obtained for acceptance testing. Coring shall be carried out according to CSA A23.2-14C. The cores shall be 100 mm in diameter and shall be drilled through the full depth of concrete pavement or concrete base, perpendicular to the surface of the concrete. No core shall be taken within 500 mm of any joint or edge of slab.

Removal of five cores per subplot for testing of 28-Day compressive strength, air void system and rapid chloride permeability shall be carried out when the concrete is 7 to 10 Days of age. The Contract Administrator shall randomly select a location for coring within the subplot and three cores for acceptance testing of 28-Day

compressive strength shall be removed from a single panel of concrete pavement or concrete base. Cores for testing of air void system parameters and rapid chloride permeability shall be taken from a panel of concrete pavement or concrete base adjacent to the panel from which the cores for compressive strength testing were taken.

Core samples for measurement of thickness shall be taken after completion of any repairs and of final texturing. A single core shall be removed from each subplot for thickness measurement at a location randomly selected by the Contract Administrator.

Each core shall be marked legibly with durable ink immediately after removal with the following:

- a) The Contract number;
- b) Component type (concrete pavement or concrete base);
- c) Lot number;
- d) Sublot number;
- e) Exact location of each individual core;
- f) Date of concrete placement (i.e., yyyy-mm-dd);
- g) Date of extraction.

Each core shall be placed in a plastic bag and sealed to prevent loss of moisture, before they are placed in a security bag in the presence of the Contract Administrator. The cores, a transmittal form, and the MTO form PH-CC-433-A, Concrete Mix Design Form A of the concrete mix design for the concrete pavement or concrete base shall all be submitted to the Contract Administrator.

Core holes shall be filled according to OPSS 1350.

#### **350.07.14                      Preparation for Measurement of Position and Alignment of Dowel Bars**

##### **350.07.14.01                  Joint Cut-Out Procedure**

Joint cut-outs shall be carried out by the Contractor for evaluation of dowel bar position and alignment by the Contract Administrator. The joint cut-out measurement shall be according to the Quality Assurance section. The Contract Administrator shall select the transverse joint to be evaluated.

At the selected joint, the concrete shall be removed by chipping hammer to a depth exposing the full length of all the dowel bars across the entire joint. The concrete shall be removed without disturbing the dowel bars.

After the selected joint has been measured and evaluated by the Contract Administrator, the joint shall be removed and replaced with a full depth concrete repair, 2 m in length, according to OPSS 366.

##### **350.07.14.02                  Preparation for Measurement of Position and Alignment of Dowel Bars**

The Contract Administrator shall be notified in writing when the concrete pavement or concrete base is ready for measurement by the Owner. Lot size, measurement and acceptance of position and alignment of dowel bars using the MPI device shall be according to the Quality Assurance section.

Provisions shall be made for access to the site for acceptance testing of position and alignment of dowel bars.

The area to be measured shall be free of loose stone, debris, and obstructions.

After the measurements by the MPI device are completed, all areas to be repaired shall be marked on the concrete surface at the direction of the Contract Administrator and prior to the commencement of any corrective work.

**350.07.15****Preparation for Surface Smoothness Measurement**

The Contract Administrator shall be notified in writing when the concrete pavement or concrete base is ready for surface smoothness acceptance testing. Surface smoothness acceptance testing shall be carried out after final texturing has been completed.

Provisions shall be made for access to the site for surface smoothness acceptance testing.

The surface to be tested shall be clear of any loose stone, debris, and obstructions which could affect the measurement. The subplot number and station shall be clearly marked at the beginning of each subplot in a way that remains visible to the smoothness measuring operator until the final measurements are completed and accepted.

When reflectors are used for quality assurance or referee measurements, reflectors shall be obtained from the profiler operator and placed on the left/right shoulder or the highway median at the beginning and end of each profile run as required by the profiler operator. After smoothness measurements are completed each Day, the reflectors shall be removed and returned to the profiler operator.

When global position system-distance measuring instrument (GPS-DMI) technology is used for quality assurance or referee measurements, the profiler operator shall collect static GPS coordinates while stopped on the shoulder. Traffic protection for the collection of static GPS coordinates shall be provided.

After the measurements are analyzed, all areas to be repaired due to rejectable sublots or incidents of localized roughness or both, shall be marked on the concrete surface at the direction of the Contract Administrator and prior to the commencement of any corrective work.

**350.07.16****Repairs****350.07.16.01****Surface Tolerance and Surface Smoothness Deficiencies**

A repair proposal shall be submitted to the Contract Administrator at least 5 Business Days prior to carrying out any surface tolerance or surface smoothness related repairs. The proposal shall contain the following:

- a) Sublot;
- b) Repair locations including the appropriate stations;
- c) Length of each repair area;
- d) Distance between the ends of the repair areas on the same lane that are within 100 m of each other;
- e) Detailed description of deficiency.

Repairs shall not begin until written permission to proceed has been received from the Contract Administrator.

Diamond grinding shall be the only method of repair acceptable for correction of surface tolerance and surface smoothness deficiencies including incidents of localized roughness.

Repairs by diamond grinding shall be completed prior to opening the concrete pavement or concrete base to traffic. Diamond grinding shall be performed parallel to the lane with each pass overlapping the previous one by up to 25 mm. There shall not be more than 3 mm of elevation difference between adjacent lanes and the concrete pavement or concrete base cross slope shall be maintained throughout the repaired area. After repair, the concrete pavement or concrete base shall be of a uniform texture.

The maximum depth of removal of concrete by diamond grinding shall not exceed 10 mm. The minimum width of all repairs shall be the width of the lane being repaired.

Repaired areas that do not meet the texturing requirements of this specification shall be re-textured according to the requirements of this specification.

## **350.07.16.02 Crack Repairs**

If any cracks are found in the concrete pavement or concrete base, a proposal for remedial work shall be submitted to the Contract Administrator for review. Crack repairs shall not proceed until approval of the proposal has been received from the Contract Administrator.

## **350.07.17 Management of Effluent**

### **350.07.17.01 General**

Effluent shall be captured and managed as specified in the Contract Documents.

The requirements of this specification do not relieve the Contractor of obligations imposed by the Contractor's ECA for a waste management system.

All approvals, releases, and agreements, and conditions that are required for the management of effluent shall be obtained prior to the commencement of the effluent producing work.

Effluent shall be transported to one of the following receiving sites:

- a) A waste disposal site with an ECA for a waste disposal site valid for liquid industrial waste class 146 (L);
- b) A waste processing facility with an ECA for a waste disposal site (processing) valid for liquid industrial waste class 146 (L).

For each shipment of effluent from the construction area to any certified receiving site:

- a) The carrier shall have an ECA for a waste management system valid for liquid industrial waste class 146 (L), and shall comply with the Environmental Compliance Approval clause;
- b) The Contractor shall present, on behalf of the carrier, a Regulation 347 Form 1 manifest for "Part A" to be completed by the Contract Administrator; and
- c) The Contract Administrator shall be notified a minimum of 2 weeks prior to the first shipment and a minimum of 24 hours prior to each subsequent shipment requiring the manifest.

Responsibilities of certified carriers shall include, but not be limited to, the following:

- a) Transportation of waste materials produced by the work according to the ECA; and
- b) Waste materials including, but not restricted to, manifesting of liquid industrial waste.

### **350.07.17.02 Environmental Compliance Approval**

The Contractor's ECA for a waste management system and the receiver's ECA for a waste disposal site shall be valid for all of the following:

- a) The entire period of the work;
- b) The entire area within the limits of the work and the entire haul route;
- c) The equipment to be utilized; and
- d) Waste classification 146 (L).

## **350.07.18 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **350.08 QUALITY ASSURANCE**

### **350.08.01 Acceptance of Concrete Pavement and Concrete Base**

Concrete pavement and concrete base shall be acceptable if the requirements of this specification are met, including:

- a) Thickness;
- b) 28-Day compressive strength;
- c) Air void system in hardened concrete;
- d) Rapid chloride permeability;
- e) Position and alignment of dowel bars;
- f) Position of tie bars;
- g) Texturing;
- h) Curing;
- i) Control of temperature;
- j) Surface smoothness;
- k) Surface tolerance; and
- l) There are no visible defects detected by inspection according to the Field Inspection subsection.

Unacceptable lots and sublots shall be rejected. Concrete from rejected lots and sublots shall be removed and replaced.

The area to be removed shall be bounded by the nearest adjacent transverse joints, longitudinal joint and outside edge of concrete pavement or concrete base, so that there shall be no additional joints.

Concrete pavement or concrete base that has been replaced shall be evaluated for acceptance on the same basis as the original lots and sublots.

### **350.08.02 Field Inspection**

The Contract Administrator shall inspect the work during production and shall reject all or a portion of the work based on the presence of one or more of the following defects:

- a) Insufficient depth of sawcut of joints;
- b) Ravelling or damaging the concrete surface adjacent to the sawcut joints;
- c) Joints that have not been cleaned and prepared according to this specification, prior to sealing;
- d) Joints that have not been sealed according to this specification;
- e) Cracks;
- f) Voids or honeycombing;
- g) Tie bars and dowel bars not meeting the specified lengths or diameters;

- h) Loose tie bars;
- i) Cut or otherwise damaged tie bars or dowel bars;
- j) Excessive bleeding or segregation of the concrete;
- k) Presence of effluent that has not been removed according to this specification.

After sealing operations are complete, the Contract Administrator shall inspect any cores taken at joint locations to evaluate the acceptability of the joint cleaning and sealing. The Contract Administrator shall reject all or a portion of the work if the samples show that the joint cleaning and sealing is not according to this specification.

### **350.08.03                      Acceptance of 28-Day Compressive Strength, Air Void System Parameters, Rapid Chloride Permeability and Thickness**

#### **350.08.03.01                      General**

Acceptance of 28-Day compressive strength, air void system parameters, rapid chloride permeability and thickness shall be based on testing of cores removed from the hardened concrete. Acceptance of 28-Day compressive strength and thickness shall be on a lot basis. Acceptance of air void system parameters and rapid chloride permeability shall be on a subplot basis.

#### **350.08.03.02                      Lot Size**

A lot shall consist of the total quantity of concrete pavement or concrete base of the same specified thickness and specified 28-Day compressive strength. For lots less than or equal to 50,000 m<sup>2</sup>, each lot shall be divided into sublots of approximately 1,000 m<sup>2</sup>. A minimum of three sublots are required for each lot. For lots greater than 50,000 m<sup>2</sup>, the lot shall be divided into sublots of approximately 2,000 m<sup>2</sup>.

A total of six cores shall be removed from each subplot:

- a) Three cores from each subplot for determination of the 28-Day compressive strength;
- b) One core for determination of air void system parameters;
- c) One core for determination of rapid chloride permeability;
- d) One core for determination of thickness.

#### **350.08.03.03                      Acceptance Testing**

##### **350.08.03.03.01                      28-Day Compressive Strength Testing**

Testing of 28-Day compressive strength shall be according to LS-410, with the exception that determination of concrete pavement thickness is not required. The 28-Day compressive strength of a subplot shall be the average of the set of three cores for the subplot, rounded to one decimal place.

##### **350.08.03.03.02                      Air Void System in Hardened Concrete**

One half of one core representing the subplot shall be tested for air void system parameters to determine the acceptability of concrete. The core shall be tested according to LS-432. The other half of the core shall be retained by the Owner for audit purposes.

##### **350.08.03.03.03                      Rapid Chloride Permeability**

The core taken for rapid chloride permeability shall be tested according to LS-433. Acceptance testing shall be carried out at 28 to 32 Days. Two 50 mm long samples shall be cut from the core representing the subplot for rapid chloride permeability and tested to determine the acceptability of the concrete within the subplot.

#### **350.08.03.03.04      Thickness Testing**

The concrete pavement or concrete base thickness for each subplot shall be determined based on the length of the core removed from each subplot for thickness testing, when measured according to LS-450.

#### **350.08.03.04      Basis of Acceptance**

##### **350.08.03.04.01      28-Day Compressive Strength**

Acceptance of concrete pavement or concrete base 28-Day compressive strength for each lot shall be based on the mean and standard deviation of the measurements for compressive strength of all sublots contained in the lot.

The Contract Administrator shall calculate the mean and standard deviation of the results and calculate the percent within limits (PWL) according to LS-101. For calculation of PWL, the lower limit for 28-Day compressive strength is the specified minimum 28-Day compressive strength.

If the lot PWL is greater than or equal to 90%, the lot is acceptable. If the lot PWL is greater than 95%, the lot shall be accepted with a bonus. If the lot PWL is less than 90% and greater than or equal to 50%, the lot is accepted with a payment adjustment according to the Basis of Payment section. If the lot PWL is less than 50%, the lot shall be rejected.

Notwithstanding the overall PWL, if the compressive strength of a subplot is less than 60% of the specified compressive strength, the subplot shall be rejected.

##### **350.08.03.04.02      Air Void System in Hardened Concrete**

For a subplot to be considered acceptable, the core representing the subplot shall have an air content of 3.0% or more and a spacing factor of 0.230 mm or less. Acceptable sublots shall be subject to full payment or a bonus payment. Calculation of the bonus shall be according to the Basis of Payment section.

Sublots with an air content of less than 3.0% or a spacing factor greater than 0.230 mm and but less than or equal to 0.260 mm shall be considered unacceptable but, at the discretion of the Owner, may be permitted to remain in the Work with a payment adjustment. The payment adjustment shall be calculated based on individual sublots and applied according to the Basis of Payment section.

Sublots with a spacing factor greater than 0.260 mm shall be rejected.

##### **350.08.03.04.03      Rapid Chloride Permeability**

Sublots with rapid chloride permeability less than or equal to 2500 coulombs shall be considered acceptable. Sublots with a rapid chloride permeability result greater than 2500 coulombs and less than or equal to 3500 coulombs shall be considered unacceptable but, at the discretion of the Owner, may be permitted to remain in the Work with a payment adjustment. The payment adjustment shall be calculated based on individual sublots and applied according to the Basis of Payment section.

Sublots with rapid chloride permeability results exceeding 3500 coulombs shall be rejected.

##### **350.08.03.04.04      Thickness**

Acceptance of concrete pavement or concrete base thickness for each lot shall be based on the mean and standard deviation of the measurements for thickness of all sublots contained in the lot.

The Contract Administrator shall calculate the mean and standard deviation of the results and calculate the PWL according to LS-101. For calculation of PWL, the lower limit for thickness is the specified thickness minus 5 mm.

If the lot PWL is greater than or equal to 90%, the lot is acceptable. If the lot PWL is greater than 95%, the lot shall be accepted with a bonus. If the lot PWL is less than 90% and greater than or equal to 50%, the lot is

accepted with a payment adjustment according to the Basis of Payment section. If the lot PWL is less than 50%, the lot shall be rejected.

Notwithstanding the overall PWL, if the thickness of a subplot is less than 60% of the specified concrete pavement or concrete base thickness, the subplot shall be rejected.

### **350.08.03.05 Referee Testing**

#### **350.08.03.05.01 General**

Referee testing for a subplot may only be invoked by the Contractor within 3 Business Days of receiving the test results for that subplot.

Referee testing shall be carried out according to the Acceptance Testing clause.

The referee laboratory shall be designated by the Owner based on the applicable roster. Referee test results shall be forwarded to the Contractor as they become available.

#### **350.08.03.05.02 28-Day Compressive Strength**

Referee testing of 28-Day compressive strength for a subplot shall be carried out on a new set of three cores removed within 24 hours of invoking the referee testing. Cores for referee testing for each disputed subplot shall be taken in the presence of the Contract Administrator at a location no more than 1 m from the location that each of the disputed acceptance cores were removed. The core size and core extraction shall be according to the Coring clause.

If the difference between the referee test result and the acceptance test result is less than or equal to the confirmation value, then the acceptance test result is confirmed and the acceptance test result shall be used in the determination of acceptance and payment for the concrete. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed and the acceptance test result shall be disregarded and not used in the determination of acceptance and payment.

The confirmation value for confirming the acceptance test result shall be the greater of 10% of the specified strength or 10% of the strength of the acceptance cores, expressed to one decimal place.

When the referee result confirms the acceptance test result, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost. When acceptance results are eliminated from the analysis as a result of the referee process, the concrete shall be assessed based on the available strength results for the lot.

#### **350.08.03.05.03 Air Void System in Hardened Concrete**

Referee testing for air voids shall be carried out on the same half of the core sample that was tested for acceptance. When the referee testing is invoked, the sample representing the subplot shall be referee tested and the acceptance test results discarded. The subplot referee test results shall replace the acceptance test result in the acceptance requirements of this specification.

When the referee results indicate that the refereed subplot is acceptable, the Owner shall bear the cost. When the referee results indicate that the refereed subplot is not acceptable, the Contractor shall be charged the cost of the air void system referee testing.

#### **350.08.03.05.04 Rapid Chloride Permeability**

Referee testing of rapid chloride permeability of a subplot shall be done on a new core removed within 24 hours of invoking the referee testing. Cores for referee testing for each disputed subplot shall be taken in the presence of the Contract Administrator at a location no more than 1 m from the location from which the disputed acceptance core was removed. The core size, core extraction, and filling shall be according to the Coring clause.

When the referee result is greater than the acceptance test result or no more than 500 coulombs below the acceptance test result, the acceptance test result is then confirmed and shall remain valid. When the referee test result for the subplot is more than 500 coulombs below the acceptance test result, the acceptance test result is then not confirmed and the referee test result shall replace the acceptance test result in the acceptance requirements of this specification.

When the referee result confirms the acceptance test result, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

#### **350.08.03.05.05            Thickness**

Referee testing of thickness for a subplot shall be done on the same core that was used for acceptance testing of thickness.

If the difference between the referee test result and the acceptance test result is less than or equal to the confirmation value, then the acceptance test result is confirmed and the acceptance test result shall be used in the determination of acceptance and payment for the concrete. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed and the acceptance test result shall be disregarded and not used in the determination of acceptance and payment.

The confirmation value for confirming the acceptance test result shall be 5.0 mm.

When the referee result confirms the acceptance test result, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

When acceptance results are eliminated from the analysis as a result of the referee process, the concrete shall be assessed based on the available thickness results for the lot.

#### **350.08.04                    Acceptance of Position and Alignment of Dowel Bars**

##### **350.08.04.01            General**

All testing shall be carried out by the Owner. Test results shall be forwarded to the Contractor as they become available.

Acceptance testing of position and alignment of dowel bars shall be carried out upon completion of construction of the concrete pavement or concrete base or as portions of the work are completed.

The Contract Administrator shall arrange for acceptance testing after:

- a) Written notification that the concrete pavement or concrete base is ready for acceptance testing is received; and
- b) The Contract Administrator is satisfied that the concrete pavement or concrete base is free of loose stone, debris, and obstructions.

The Contract Administrator shall provide 48 hours notice of when the dowel bar position and alignment measurements shall begin. When weather conditions are unsuitable for testing according to the equipment manufacturer's recommendations, testing shall be suspended and shall resume only when conditions are acceptable for testing.

##### **350.08.04.02            Lot Size**

The total quantity of concrete pavement or concrete base on the Contract shall be divided into lots, with each lot containing all the transverse joints with dowel bars placed by the same method (load transfer devices or automatic dowel bar inserter). Each transverse joint shall represent a subplot.

#### **350.08.04.03 Measurement and Acceptance**

One joint for every 10 sublots or a minimum of 10 joints shall be randomly selected by the Contract Administrator and dowel position and alignment shall be measured for that joint.

Measurement of dowel position and alignment using MPI device shall be according to ASTM E3013.

Verification of the MPI device result by means of a joint cut-out, shall be done on a joint from the first subplot for each method of placement (load transfer devices or automatic dowel bar inserter) and shall be carried out once per year for multi-year Contracts. The procedure for joint cut-outs shall be according to the Joint Cut-Out Procedure clause. The Contract Administrator shall inspect the joint and measure and record the depth, horizontal and longitudinal side shift, vertical and horizontal alignment of all the dowel bars and compare to the measurements obtained using the MPI device to verify accuracy.

Acceptance of the dowel bar position and alignment for the lot shall be based on the mean and standard deviation of the lot MPI device measurements for vertical alignment, horizontal alignment, longitudinal side shift and depth. The dowel bar closest to the longitudinal joint shall be removed from the analysis due to possible interference of the tie bar. All MPI device measurements for vertical alignment, horizontal alignment and longitudinal side shift shall be converted to positive values prior to calculating the mean and standard deviation. The Contract Administrator shall calculate the PWL for each criterion according to LS-101. For calculation of PWL, the upper limit and lower limits for each attribute are as specified in Table 1.

If the lot PWL is greater than or equal to 90%, the lot is acceptable for the criteria. If the lot PWL is less than 90% and greater than or equal to 50%, the lot is accepted for the criteria with a payment adjustment defined in the Basis of Payment section. If the lot PWL is less than 50%, the lot shall be rejected.

In addition, any subplot which contains an individual dowel bar which exceeds any of the criteria identified in Table 2 for vertical alignment, horizontal alignment, horizontal side shift, longitudinal side shift and depth, is rejectable and shall be removed and replaced. The Owner shall scan joints on either side of the unacceptable subplot, until five consecutive joints on each side are found with no rejectable bars. Any joints with rejectable bars shall be removed and replaced, according to OPSS 366. The area of concrete to be removed shall be according to the Acceptance of Concrete Pavement and Concrete Base subsection.

#### **350.08.04.04 Referee Testing**

##### **350.08.04.04.01 General**

For each measurement taken by the Owner, a written request for referee testing, no more than 3 Business Days after receiving the test results may be made. Each request shall identify the subplot(s) for referee testing.

Referee testing of dowel position and alignment shall be done using the MPI device according to ASTM E3013.

Referee testing shall be done by the Owner. Up to two representatives can witness the referee testing. Referee test results shall be forwarded to the Contractor as they become available.

##### **350.08.04.04.02 Referee Testing Cost**

When the referee result for a subplot confirms the acceptance test result, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

#### **350.08.05 Acceptance of Concrete Surface Texturing**

The Contract Administrator shall select, inspect, and measure grooving areas for acceptance. The Contract Administrator shall reject all or a portion of the work based on the presence of one or more of the defects identified below that fall within either one of the conditions in Table 3:

- a) Width of grooves less than 2.5 mm or greater than 4.0 mm;

- b) Depth of grooves less than 3 mm or greater than 6 mm, except over inductive loop detectors where the depth shall be between 1.5 and 3.0 mm; and
- c) Distances between centres of grooves less than or greater than 19 mm  $\pm$  2.5 mm.

### **350.08.06 Acceptance of Surface Smoothness**

#### **350.08.06.01 General**

Lot acceptance for surface smoothness of concrete pavement or concrete base shall be based on measurements of MRI and incident(s) of localized roughness. All acceptance testing of surface smoothness shall be performed by the Owner. Test results shall be forwarded to the Contractor as they become available.

Requirements for smoothness apply regardless of whether the concrete pavement or concrete base is constructed adjacent to existing concrete pavement or concrete base, respectively, except as provided for in the Acceptance of Surface Smoothness, Lot Size clause, bullet d).

Acceptance testing of surface smoothness shall be done upon completion of construction of the concrete pavement or concrete base, or as portions of the work are completed.

The Contract Administrator shall arrange for acceptance testing after:

- a) Final texturing has been completed;
- b) Written notification that the concrete pavement or concrete base is ready for acceptance testing is received; and
- c) The Contract Administrator is satisfied that the concrete pavement or concrete base is free of loose stone, debris, and obstructions.

The Contract Administrator shall provide 48 hours notice of when the surface smoothness measurements will begin. When the weather conditions are unsuitable for testing, according to the equipment manufacturer's recommendations, the testing shall be suspended and resumed only when the conditions are acceptable.

#### **350.08.06.02 Lot Size**

A lot shall consist of the total quantity of concrete pavement or concrete base. Each lot shall be divided into approximately 100 m single lane sublots. When the last subplot is less than 50 m in length, it shall be added to the previous subplot.

The Owner shall measure all through lane concrete surfaces with the following exceptions:

- a) Where the posted speed is 60 km/hour or less;
- b) Lanes less than 400 m in length;
- c) Shoulders;
- d) Within the first or last 10 m length of the new concrete pavement or concrete base section where the new concrete pavement or concrete base abuts against an existing asphalt or concrete pavement where the Contractor is not responsible for the adjoining surface;
- e) Bridge decks and within 10 m of bridge deck expansion joints or approach slabs.

**350.08.06.03****Measurement and Acceptance of Surface Smoothness**

Smoothness measurement of the surface of the concrete pavement or concrete base, and incidents of localized roughness shall be measured according to LS-296, using an inertial profiler. The inertial profiler shall do three runs of any pavement section. The surface smoothness of each subplot shall be determined by calculating the MRI.

For concrete pavement, a subplot's smoothness shall be acceptable if the average MRI is less than or equal to 1.000 m/km. If the subplot's MRI is greater than 1.000 m/km but less than or equal to 1.250 m/km, the subplot is accepted with a payment adjustment according to the Basis of Payment section or may be repaired by diamond grinding. If the subplot's MRI is greater than 1.250 m/km, the subplot is unacceptable and shall be repaired by diamond grinding or removed and replaced.

For concrete base, a subplot's smoothness shall be acceptable if the average MRI is less than or equal to 1.200 m/km. If the subplot's MRI is greater than 1.200 m/km but less than or equal to 1.500 m/km, the subplot is accepted with a payment adjustment according to the Basis of Payment section or may be repaired by diamond grinding. If the subplot's MRI is greater than 1.500 m/km, the subplot is unacceptable and shall be repaired by diamond grinding or removed and replaced.

In addition, for concrete pavement or concrete base, incidents of localized roughness of less than 2.400 m/km are acceptable. Incidents of localized roughness between 2.400 m/km and 3.499 m/km are accepted with a payment adjustment or may be repaired by diamond grinding. Incidents of localized roughness greater than or equal to 3.500 m/km are unacceptable and shall be repaired by diamond grinding or removed and replaced.

**350.08.06.04****Referee Testing****350.08.06.04.01****General**

Referee testing for a subplot may only be invoked within 5 Business Days of receiving the test results for that subplot with a written request to the Contract Administrator.

The referee inertial profiler shall be designated by the Owner based on the applicable roster. Referee test results shall be forwarded to the Contractor as they become available.

All sublots that are requested for referee testing shall be re-measured, according to LS-296 within 21 Business Days of the Contract Administrator receiving the written request for referee testing. The disposition of all of the re-measured sublots and all incident(s) of localized roughness that are located within those sublots shall be based on the referee measurements and the results shall be binding on both the Contractor and the Owner.

**350.08.06.04.02****Referee Testing Cost**

If referee testing is invoked and the MRI for the sublots tested in that request is either higher or less than 10% lower than the MRI determined from the original MRI measurements taken by the quality assurance inertial profiler for those sublots, then the Contractor shall be charged the cost of the referee testing, otherwise, the Owner shall bear the cost.

**350.08.07****Acceptance of Repairs****350.08.07.01****General**

At the discretion of the Contract Administrator, where defects or deficiencies have been repaired by either standard methods or by Contractor proposal, the Contract Administrator shall:

- a) Conduct a visual inspection or other measures;
- b) Request additional coring when required; or
- c) Conduct any other testing deemed necessary to assess the effectiveness of the repairs.

All repaired or replaced areas shall be measured by the Owner to ensure they meet the requirements of this specification.

**350.08.07.02                      Acceptance of Repair of Surface Tolerance and Surface Smoothness Deficiencies**

The Contractor shall inform the Contract Administrator, in writing, when the repaired sublots are ready for acceptance re-measurement by the Owner. Sublots repaired by diamond grinding to correct deficiencies or as chosen by the Contractor, or areas that have been removed and replaced, shall be re-measured for surface smoothness.

A repaired subplot shall be evaluated for acceptance according to the Acceptance of Surface Smoothness clause and Acceptance of Concrete Surface Texturing subsection.

Grooving in areas that have been diamond ground after final texturing shall be re-evaluated for acceptance according to the Acceptance of Concrete Surface Texturing subsection.

The Contractor shall be responsible for the cost of re-measurement of repaired sublots.

**350.08.08                      Scaling Warranty**

**350.08.08.01                      General**

The Contractor shall warrant that throughout and at the end of the warranty period, there shall be no medium or severe scaling of the concrete pavement surface and light scaling shall not exceed 20% of the concrete pavement surface. Visual inspection and assessment of severity of scaling shall be according to Figures 1-6. Panels with medium or severe scaling shall be removed and replaced. For panels with light scaling greater than 20%, a repair proposal shall be submitted to the Owner for approval.

**350.08.08.02                      Warranty Period**

The warranty period shall begin on the date of the Certificate of Substantial Performance and shall continue for 3 years.

**350.08.08.03                      Distress Survey**

The Owner may carry out a survey at any time during the warranty period. Severity and extent of surface scaling shall be evaluated according to the requirements of this specification.

Survey results shall be sent to the Contractor at least 60 Days prior to the end of the warranty.

**350.09                      MEASUREMENT FOR PAYMENT**

**350.09.01                      Actual Measurement**

**350.09.01.01                      Concrete Pavement  
Concrete Base**

Measurement of concrete pavement or concrete base shall be the surface area placed in square metres.

**350.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

## **350.10 BASIS OF PAYMENT**

### **350.10.01 Concrete Pavement - Item**

#### **Concrete Base - Item**

##### **350.10.01.01 General**

Payment at the Contract price for the above tender item(s) shall be full compensation for all labour, equipment and material required to do the work subject to payment adjustments.

Payment shall not be made for diamond grinding, other repairs and areas removed and replaced as detailed in this specification.

### **350.10.01.02 Combined Payment Factor for 28-Day Compressive Strength, Air Void System Parameters, Rapid Chloride Permeability and Thickness**

#### **350.10.01.02.01 General**

The total combined payment factor ( $PF_{TC}$ ) for 28-Day compressive strength, air void system parameters, rapid chloride permeability and thickness shall be calculated using the following formula:

$$PF_{TC} = (PF_{strength} + PF_{AVS} + PF_{RCP} + PF_{thickness}) - 3$$

Where:

|                  |   |                                                |
|------------------|---|------------------------------------------------|
| $PF_{strength}$  | = | Payment factor for 28-Day compressive strength |
| $PF_{AVS}$       | = | Payment factor for air void system parameters  |
| $PF_{RCP}$       | = | Payment factor for rapid chloride permeability |
| $PF_{thickness}$ | = | Payment factor for thickness                   |

The sum of  $PF_{strength}$ ,  $PF_{AVS}$ ,  $PF_{RCP}$ , and  $PF_{thickness}$ , shall be as calculated, but shall not be less than 3.8.

The combined payment factor 28-Day compressive strength, air void system parameters, rapid chloride permeability and thickness shall be rounded to three decimal places, according to LS-100.

#### **350.10.01.02.02 Payment Factors for Thickness and 28-Day Compressive Strength**

The payment factors for thickness ( $PF_{thickness}$ ) and 28-Day compressive strength ( $PF_{strength}$ ) shall be determined according to Table 4.

#### **350.10.01.02.03 Payment Factor for Air Void System Parameters**

The payment factor for air void system parameters ( $PF_{AVS}$ ) for the entire lot shall be the average of the individual payment factors for all measured sublots within the lot.

The individual payment factors for each acceptable subplot and each unacceptable subplot that the Owner has permitted to remain in the Work shall be determined by the Contract Administrator according to Table 5. For the purpose of calculating the individual payment factors for each subplot, the Contract Administrator shall round-off spacing factor test data to two decimal places and air content test data to one decimal place according to LS-100.

#### **350.10.01.02.04 Payment Factor for Rapid Chloride Permeability**

The payment factor for rapid chloride permeability ( $PF_{RCP}$ ) for the entire lot shall be the average of the individual payment factors for all measured sublots within the lot. The Contract Administrator shall round the payment factors for each subplot and lot to two decimal places according to LS-100.

The individual payment factor for each acceptable subplot shall be 1.00.

The individual payment factor for each unacceptable subplot that the Owner has permitted to remain in the Work shall be determined by the Contract Administrator as follows:

$$\text{Sublot Payment Factor} = 1.00 - \frac{C - 2500}{2000}$$

Where:

C = Rapid chloride permeability of the subplot (coulombs)

### **350.10.01.03 Payment Factor and Payment Adjustments for Surface Smoothness**

#### **350.10.01.03.01 Mean Roughness Index**

A subplot's payment factor for smoothness shall be based on the initial quality assurance measurements unless that subplot has been repaired by diamond grinding or the initial quality assurance MRI has been substituted as a result of referee testing. Where a subplot has been repaired by diamond grinding, the subsequent measurements taken after the repair shall be used in the calculation for the payment adjustment to that subplot. No subplot that has been repaired by diamond grinding for any reason shall receive a payment factor greater than 1.000. The Contractor's optional diamond grinding according to the Optional Diamond Grinding to Improve Surface Tolerance and Smoothness subsection shall be deemed to be a repair and shall not receive a payment factor greater than 1.000.

For concrete pavement, any subplot with an initial MRI measurement for the three runs that is greater than 1.000 m/km but less than or equal to 1.250 m/km, the Contractor may either accept the inclusion of its payment factor in the calculation for the lot or choose to repair at least a portion of the subplot by diamond grinding.

For concrete pavement, the individual payment factors for each subplot shall be determined by the Contract Administrator by substituting the MRI's into the applicable formulae shown in Table 6 and rounding to three decimal places, according to LS-100.

For concrete pavement, the payment factor for the entire lot ( $PF_{\text{smoothness}}$ ) shall be the lesser of the following:

- a) The average of the individual payment factors for all measured sublots of concrete pavement within the lot, rounded to three decimal places, according to LS-100; or
- b) 1.020.

For concrete base, any subplot with an initial MRI measurement for the three runs that is greater than 1.200 m/km but less than or equal to 1.500 m/km, the Contractor may either accept the inclusion of its payment factor in the calculation for the lot or choose to repair at least a portion of the subplot by diamond grinding.

For concrete base, the individual payment factors for each subplot shall be determined by the Contract Administrator by substituting the MRI's into the applicable formulae shown in Table 7 and rounding to three decimal places, according to LS-100.

For concrete base, the payment factor for the entire lot ( $PF_{\text{smoothness}}$ ) shall be the lesser of the following:

- a) The average of the individual payment factors for all measured sublots of concrete base within the lot, rounded to three decimal places, according to LS-100, or
- b) 1.000.

#### **350.10.01.03.02 Incident(s) of Localized Roughness**

The Contractor shall either be given payment adjustments or be required to repair all incidents of localized roughness according to Table 8. Where two or more incidents of localized roughness are found to be within 2 m of one another and they are left unrepaired, the localized roughness at those locations shall be treated as a single incident of localized roughness. The MRI of that single incident of localized roughness shall be the MRI

for all the individual incidents of localized roughness within that 2 m for assessment of payment adjustment.

The surface smoothness payment adjustment for any subplot which includes any unrepaired incidents of localized roughness shall be unaffected by any payment adjustment given for such incidents of localized roughness.

#### **350.10.01.04 Payment Factor for Position and Alignment of Dowel Bars**

The payment factor for position and alignment of dowel bars shall be calculated using the following formula:

$$PF_{dowel\ bars} = PF_{horizontal} + PF_{vertical} + PF_{sideshift} + PF_{depth} - 3$$

Where:

- PF<sub>horizontal</sub> = Payment factor for horizontal alignment
- PF<sub>vertical</sub> = Payment factor for vertical alignment
- PF<sub>sideshift</sub> = Payment factor for longitudinal side shift
- PF<sub>depth</sub> = Payment factor for depth

The payment factors of the dowel bars for horizontal and vertical alignment, longitudinal side shift and depth shall each be calculated using the equations in Table 9, rounded to three decimal places, according to LS-100.

#### **350.10.01.05 Payment Adjustment**

The payment factors (PF<sub>TC</sub>, PF<sub>smoothness</sub>, and PF<sub>dowel bars</sub>) shall be used to calculate the overall payment adjustment(s) for thickness, strength, AVS, RCP, surface smoothness, and position and alignment of dowel bars. If applicable, the overall maximum bonus shall be as calculated below except it shall not exceed 5.00% for concrete pavement and 3.00% for concrete base.

The payment adjustment shall be calculated by the Contract Administrator using the following formula:

$$Payment\ Adjustment = Lot\ Size \times T \times \left( (PF_{TC} + PF_{smoothness} + PF_{dowel\ bars}) - 2 \right) - 1$$

Where:

- Lot Size = Total quantity of concrete pavement or concrete base having the same specified thickness, the same specified 28-Day compressive strength, and having dowel bars placed by the same method, in m<sup>2</sup>.
- T = Tender Unit Price in \$/m<sup>2</sup>
- PF<sub>smoothness</sub> = the payment factor for smoothness for the lot

The sum of PF<sub>TC</sub>, PF<sub>smoothness</sub>, and PF<sub>dowel bars</sub> shall be as calculated, but not less than 2.2.

When the total quantity of concrete pavement or concrete base for the Contract is covered by one lot, a single payment adjustment shall be calculated according to the formula above.

When the total quantity of concrete pavement or concrete base for the Contract is divided into more than one lot due to different specified thickness, specified 28-Day compressive strength, or dowel bar placement method, the Contract Administrator shall calculate multiple payment adjustments.

Table 10 illustrates how lot size is determined for each payment adjustment and which payment factors are input into the calculation.

**TABLE 1**  
**Limits for Position and Alignment of Dowel Bars**

| Attribute                                                                     | Lower Limit (mm) | Upper Limit (mm) |
|-------------------------------------------------------------------------------|------------------|------------------|
| Horizontal alignment (mm)                                                     | Not Applicable   | 15               |
| Vertical alignment (mm)                                                       | Not Applicable   | 15               |
| Longitudinal Side Shift (mm)                                                  | Not Applicable   | 50               |
| Depth Tolerance (for specified concrete pavement or concrete base thickness): |                  |                  |
| < 215 mm                                                                      | Mid-depth - 6    | Mid-depth + 6    |
| 215 to 229 mm                                                                 | Mid-depth - 12   | Mid-depth + 15   |
| ≥ 230 mm                                                                      | Mid-depth - 15   | Mid-depth + 25   |

**TABLE 2**  
**Rejection Criteria for Position and Alignment of Dowel Bars**

| Attribute                                                           | Lower Limit (mm) | Upper Limit (mm) |
|---------------------------------------------------------------------|------------------|------------------|
| Horizontal alignment (mm)                                           | -38              | 38               |
| Vertical alignment (mm)                                             | -38              | 38               |
| Horizontal or Longitudinal Side Shift (mm)                          | -75              | 75               |
| Depth (for specified concrete pavement or concrete base thickness): |                  |                  |
| < 215 mm                                                            | Mid-depth - 10   | Mid-depth + 10   |
| 215 to 229 mm                                                       | Mid-depth - 18   | Mid-depth + 23   |
| 230 to 259 mm                                                       | Mid-depth - 25   | Mid-depth + 35   |
| ≥ 260 mm                                                            | Mid-depth - 25   | Mid-depth + 40   |

### 351.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Cold Weather** means those conditions when the ambient air temperature is at or below 5 °C. It is also considered to exist when the ambient air temperature is at or is likely to fall below 5 °C within 96 hours after completion of concrete placement. Temperature refers to shade temperature.

**Sidewalk Bay** means the area between two transverse joints, regardless of the type of joint.

### 351.04 DESIGN AND SUBMISSION REQUIREMENTS

#### 351.04.01 Design Requirements

##### 351.04.01.01 Concrete Mix Designs

The concrete mix used for the sidewalk shall be designed to provide adequate strength and durability and to meet the requirements specified in the Contract Documents.

#### 351.04.02 Submission Requirements

##### 351.04.02.01 Concrete Mix Designs

Concrete mix design(s) submissions shall be according to OPSS 1350.

##### 351.04.02.02 Tactile Walking Surface Indicator Plates

At least 1 week prior to the installation of the tactile walking surface indicator (TWSI) plates, a copy of the Working Drawings shall be submitted to the Contract Administrator.

In addition, the following shall be submitted with the Working Drawings:

- a) The manufacturer's installation instructions.

- b) When requested by the Contract Administrator, a certificate from the manufacturer for the tactile walking surface indicator plates that confirms the product was manufactured and met the test requirements according to the Contract Documents. The certificate shall include test results from an independent testing laboratory currently accredited by the Standards Council of Canada.

## **351.05 MATERIALS**

### **351.05.01 Concrete**

Concrete and concrete materials shall be according to OPSS 1350 with the following addition:

- a) The minimum specified 28-Day compressive strength shall be 30 MPa, or as specified in the Contract Documents.

### **351.05.02 Expansion Joint Material**

Expansion joint filler material shall be asphalt impregnated fibreboard having a minimum of 12 mm thickness and shall be according to OPSS 1308, Type A.

### **351.05.03 Granular Base**

Granular base shall be according to OPSS 1010.

### **351.05.04 Subgrade Moisture Vapour Barrier**

Subgrade moisture vapour barrier shall be according to ASTM C171.

### **351.05.05 Tactile Walking Surface Indicator Plates**

The TWSI plates shall be:

- a) As specified in the Contract Documents.
- b) Cast iron, Gray in colour.
- c) New.
- d) According to ASTM A48, Class 30 or 35B.
- e) Bare and not coated with paint or other coating substances.
- f) Sound, free from pouring faults, cracks, blowholes, and other defects.

The top of the truncated domes and the field between the truncated domes shall have a wet and dry static coefficient of friction of 0.8 according to ASTM C1028.

The initials or trademark of the manufacturer, year of manufacture, and country of manufacture shall be distinctly cast and legible in raised letters on the top side of each plate.

## **351.06 EQUIPMENT**

### **351.06.01 Formwork**

Formwork shall be according to OPSS 919.

## **351.06.02 Hand Finishing Equipment and Joint Tools**

Floats and joint tools shall be made of magnesium. Magnesium bull floats shall be commercially made.

## **351.06.03 Slip Forming**

The equipment used for slip forming shall have automatic horizontal and vertical alignment controls, and shall be used in conjunction with a minimum of one stringline.

## **351.06.04 Straight Edges**

Straight edges shall be according to OPSS 904.

## **351.07 CONSTRUCTION**

### **351.07.01 General**

Concrete sidewalk shall be constructed at the locations and to the dimensions specified in the Contract Documents.

### **351.07.02 Excavation and Embankment Construction**

Excavation and embankment construction shall be according to OPSS 206.

### **351.07.03 Subgrade**

When the subgrade is prepared for granular base, the finished subgrade surface shall be within a 15 mm deviation measured at any point on a 3 m long straight edge.

When the subgrade is prepared for sidewalk, the finished subgrade surface shall be within a 12 mm deviation from the specified grade and cross-section, with the surface being within a 10 mm deviation measured at any point on a 3 m long straight edge.

### **351.07.04 Granular Base**

Placement of granular base material shall be according to OPSS 314.

When a granular base is prepared for sidewalk, the finished granular surface shall be within a 12 mm deviation from the specified grade and cross-section, with the surface being within a 10 mm deviation measured at any point on a 3 m long straight edge.

### **351.07.05 Compaction**

Compaction of subgrade and granular base shall be according to OPSS 501.

### **351.07.06 Preparation Work**

Prior to placing concrete on:

- a) subgrade, the subgrade shall be wetted down, except where clays occur.
- b) granular base, the granular immediately ahead of the concrete placing operation shall be wetted down thoroughly.

The wetting down shall be carried out without leaving standing water.

Alternatively, a subgrade moisture vapour barrier may be placed to completely cover the subgrade under the sidewalk. Adjacent strips shall be lapped 100 mm minimum and ends shall be lapped 300 mm minimum.

### **351.07.07 Form Setting**

Throughout their entire length, forms shall be set true to the lines, grades, and thickness specified in the Contract Documents and in direct contact with the subgrade or granular base.

### **351.07.08 Utility Isolation in Sidewalk**

The required Utility isolations shall be constructed in the concrete sidewalk to the details and locations specified in the Contract Documents.

### **351.07.09 Placing of Concrete**

Placing of concrete shall be according to the Placing of Concrete, General clause and Concrete Placing Restrictions clause of OPSS 904.

Any excess concrete beyond the sidewalk edge shall be removed.

Concrete shall be placed at a steady rate, such that a monolithic concrete is obtained without the formation of cold joints. When there is an interruption in placing concrete greater than 20 minutes, the surface of the concrete where curing has not been applied shall be covered with wet burlap. The Contract Administrator shall be notified immediately of any interruption resulting in a cold joint. A proposal for remedial action shall be submitted to the Contract Administrator for approval.

### **351.07.10 Tactile Walking Surface Indicator Plate Installation**

A set of two TWSI plates shall be set into plastic concrete at each concrete sidewalk ramp as specified in the Contract Documents and according to the plate manufacturer's installation instructions.

Plates shall be cleaned after installation.

### **351.07.11 Consolidation**

Consolidation of concrete shall be according to OPSS 904.

### **351.07.12 Concrete Finishing**

Concrete finishing shall be according to OPSS 904.

The concrete sidewalk shall be given a broomed texture after finishing with a float.

The concrete adjacent to all formwork and joints shall be finished with a tool that produces a 5 mm rounded edge and a smooth, horizontal surface with a maximum width of 50 mm. All tooling shall be uniform and straight and shall be depressed to a maximum of 1 mm below the adjacent surface. Any ridges along the tooled marks shall be removed.

### **351.07.13 Joints**

#### **351.07.13.01 General**

Longitudinal and transverse joints shall be constructed of the type and at the locations specified in the Contract Documents.

#### **351.07.13.02 Dummy Joints**

Dummy joints shall be hand formed using a 5 mm radius dummy joint tool.

### **351.07.13.03                      Contraction Joints**

Contraction joints shall be placed at every third dummy joint and shall be sawcut or formed to a depth that is one quarter the thickness of the sidewalk.

When sawcutting is used, sawcutting shall be carried out as soon as the joint can be sawcut without ravelling the joint or damaging the concrete surface, and prior to any cracks developing.

Sawcut joints shall be cleaned. Cleaning of joints shall remove all sawcut slurry, grinding and grooving effluent, if applicable, and any other debris from the joint. Cleaning of joints shall consist of flushing the joints with water in one direction to remove slurry, effluent, and debris. Additional methods of cleaning the joints may be required and shall be approved by the Contract Administrator.

When the sidewalk width is 2.5 m or greater, a longitudinal contraction joint shall be sawn or formed at a maximum spacing interval of 1.5 m. Longitudinal contraction joints shall be constructed with equal spacing between joints and from joints to the sidewalk edges.

### **351.07.13.04                      Expansion Joints**

Expansion joints shall be constructed to the full depth of the slab.

Expansion joints shall be filled with expansion joint material and shall be clean and dry at the time of construction.

Expansion joints shall be constructed where the sidewalk abuts a rigid object or changes direction.

### **351.07.14                              Identification Stamp**

The concrete sidewalk shall be clearly and legibly marked with an approved stamp at each end of the work, every 20 m and all other places as directed by the Contract Administrator. The stamp shall be centered on the sidewalk bay next to and parallel to transverse joint. The stamp shall identify the Contractor's name and the year of construction.

### **351.07.15                              Curing**

Concrete curing shall be according to OPSS 904.

### **351.07.16                              Concrete Subject to Cold Weather**

For concrete subject to cold weather during the curing period, the protection of concrete shall be according to OPSS 904.

### **351.07.17                              Protection of Sidewalk**

Vehicular traffic shall be restricted from crossing the sidewalk after the concrete has been placed for a minimum period of 3 Days or until the concrete has reached 75% of the specified 28-Day compressive strength.

### **351.07.18                              Surface Tolerance**

Formed and unformed surfaces shall be such that when tested with a 3 m long straight edge placed anywhere in any direction on the surface, there shall be no gap greater than 6 mm between the bottom of the straight edge and the surface of the concrete. When the straight edge is placed across a construction joint, the gap between the straight edge and the surface of the concrete shall not be greater than 3 mm.

### **351.07.19                              Tactile Walking Surface Indicator Plate Tolerances**

Tolerances for the tactile walking surface indicator plates shall be as specified in the Contract Documents. If the TWSI plates are not within the specified tolerances, the plates shall be rejected. Rejected plates shall be removed and replaced as directed by the Contract Administrator.

### **351.07.20 Material Sampling for Thickness**

Core samples shall be obtained for acceptance testing of sidewalk thickness. Cores shall be taken when the concrete is a minimum of 7 Days of age. The Contract Administrator shall randomly select one core from each lot. Coring shall be carried out according to CSA A23.2-14C. The cores shall be 100 mm in diameter and shall be drilled through the full depth of the sidewalk, perpendicular to the concrete surface.

Each core shall be marked legibly with durable ink immediately after removal with the following:

- a) Contract number.
- b) Lot number.
- c) Exact location of each individual core.
- d) Date of concrete placement (ie. yyyy-mm-dd).
- e) Date of extraction.

The cores, a transmittal form, and MTO form PH-CC-433A, Concrete Mix Design Submission Form A shall be submitted to the Contract Administrator. Filling of Core Holes shall be according to OPSS 1350.

One core shall be removed per lot for testing of thickness by the Owner. The core shall be taken at a random location specified by the Contract Administrator. Coring shall be carried out according to CSA A23.2-14C. The core shall be 100 mm in diameter and shall be drilled through the complete depth of concrete sidewalk. The Contract number, lot number and exact location of the core shall be marked legibly on the core with durable ink. The core shall be given to the Contract Administrator along with Form A of the concrete mix design.

### **351.07.21 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

## **351.08 QUALITY ASSURANCE**

### **351.08.01 Acceptance**

The concrete sidewalk shall be acceptable if all requirements of this specification are met, including requirements for:

- a) 28-Day compressive strength.
- b) Air void system parameters.
- c) Thickness.
- d) Surface tolerance.
- e) There are no defects detected by field inspection according to the Field Inspection subsection.

Acceptance for 28-Day compressive strength and air void system parameters shall be according to OPSS 1350.

Unacceptable lots shall be deemed rejectable. Concrete from unacceptable lots shall be removed and replaced at the Contractor's expense.

The replacement concrete sidewalk for lots that have been removed and replaced shall be evaluated for acceptance on the same basis as the original lots.

## **351.08.02                      Field Inspection**

The Contract Administrator shall inspect the work and shall reject all or a portion of the work based on the presence of one or more of the following defects:

- a) Cracks.
- b) Voids, or
- c) Honeycombing.
- d) Surface tolerance not meeting the requirements of this specification.

## **351.08.03                      Acceptance of Thickness**

### **351.08.03.01                  Acceptance Testing**

The lot size for testing of thickness shall be 500 lineal metres of sidewalk. The sidewalk thickness for each lot shall be determined based on the length of the core removed from each lot for thickness testing. Testing of thickness shall be according to LS-450.

Concrete thickness for a lot shall be considered acceptable when the thickness of the core is not more than 8 mm shorter than the specified thickness.

Unacceptable lots shall be removed and replaced.

The Contractor may submit an alternative in writing for the Owner's consideration for unacceptable concrete.

### **351.08.03.02                  Referee Testing**

Referee testing for a lot may only be invoked by the Contractor within 5 Business Days of receiving the test results for that lot.

Referee testing of thickness for a lot shall be done on the same core that was used for acceptance testing of thickness. Referee testing of thickness shall be according to LS-450.

If the difference between the referee test result and the acceptance test result is less than or equal to the confirmation value, then the acceptance test result is confirmed, and the acceptance test results shall be used in the determination of acceptance of the concrete. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed, and the acceptance test result shall be disregarded and not used in the determination of acceptance.

The confirmation value for confirming the acceptance test result shall be 5.0 mm.

When the referee result confirms the acceptance test result, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

## **351.09                              MEASUREMENT FOR PAYMENT**

### **351.09.01                      Actual Measurement**

#### **351.09.01.01                  Concrete Sidewalk**

Measurement of concrete sidewalk shall be by area in square metres.

#### **351.09.01.02                  Tactile Walking Surface Indicators for Concrete Sidewalk Ramps**

For measurement purposes a count shall be made for each set of TWSI plates installed at each concrete sidewalk ramp. A set shall consist of two TWSI plates.

**351.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**351.10 BASIS OF PAYMENT**

**351.10.01 Concrete Sidewalk - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Repair or removal and replacement of an unacceptable sidewalk bay shall be completed at no extra cost to the Owner.

**351.10.02 Tactile Walking Surface Indicators for Concrete Sidewalk Ramps - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**351.10.03 Excavation**

Payment for excavation shall be under the tender item Earth Excavation, Grading or Rock Excavation, Grading according to OPSS 206.

No payment shall be made for appurtenances adjusted by the Utility company.

**351.10.05 Granular Material**

Granular materials required for the work shall be paid for at the Contract price for the appropriate granular tender item.

**CONSTRUCTION SPECIFICATION FOR  
THE INSTALLATION OF INTERLOCKING CONCRETE PAVERS**

**355.01 SCOPE**

This specification covers the requirements for the installation of interlocking concrete pavers for pavements, sidewalks, boulevards, and medians. The work includes the grading, placement of subsurface drainage, subbase, base, bedding sand, joint sand, edge restraints, and interlocking concrete pavers. This specification applies to both manual and mechanical installations.

## CSA Standards

|           |                         |
|-----------|-------------------------|
| A231.2:19 | Precast Concrete Pavers |
|-----------|-------------------------|

### 355.03 DEFINITIONS

For the purpose of this specification the following definitions apply:

**Bedding Sand** means a layer of uncompacted sand that is screeded smooth prior to placement of the concrete pavers.

**Concrete Paver** means a precast concrete paving product.

**Edge Restraint** means a curb, edging, building, or other appurtenance that is intended to confine the bedding sand and concrete pavers so that the concrete pavers do not spread and lose interlock.

**Joint Sand** means a fine, dry sand used to fill the joint space and interlock the concrete pavers.

### 355.04 DESIGN AND SUBMISSION REQUIREMENTS

#### 355.04.01 Submission Requirements

Laboratory test results indicating compliance to material requirements and a full-size sample of each type of concrete paver shall be submitted to the Contract Administrator at least 10 Business Days prior to commencement of paver installation.

### 355.05 MATERIALS

#### 355.05.01 Granular Subbase

The granular subbase material shall be Granular B according to OPSS 1010.

#### 355.05.02 Granular Base

The granular base material shall be Granular A according to OPSS 1010.

#### 355.05.03 Bedding and Joint Sand

Bedding sand shall meet the requirements of concrete sand as specified in OPSS 1002, except that the percent passing the 75 µm sieve shall be less than 1%.

Joint sand shall be dry and meet the gradation requirements of mortar sand according to OPSS 1004 and the physical requirements according to OPSS 1002.

The bedding and joint sand shall be free of organics and deleterious soluble salts or other contaminants.

#### **355.05.04 Concrete Pavers**

Concrete pavers shall be according to CSA-A231.2 Concrete paver size, shape, colour, thickness, and texture shall be as specified in the Contract Documents.

Mechanically installed concrete pavers shall have integral spacer nibs on all vertical faces to control joint spacing.

#### **355.05.05 Edge Restraints**

Edge restraints shall be as specified in the Contract Documents.

#### **355.05.06 Geotextile**

Geotextile shall be non-woven, Class 1, according to OPSS 1860 with an FOS of 60 to 120 µm.

### **355.06 EQUIPMENT**

#### **355.06.01 Compaction**

Concrete pavers shall be set into the bedding sand using a high frequency, low amplitude, mechanical flatplate vibratory compactor having a plate area sufficient to cover a minimum of 12 concrete pavers. The compactor shall transmit an effective force of not less than 22kN per square metre of plate area. The frequency of vibration shall be within the range of 75 to 90Hz.

Pneumatic-tired roller shall have a gross weight of 10 tonnes.

### **355.07 CONSTRUCTION**

#### **355.07.01 Subgrade Preparation**

Preparation of the subgrade shall be according to OPSS 206.

#### **355.07.02 Subbase and Base**

When the interlocking concrete pavers are being placed on:

- a) Granular base, the base and subbase layers shall be constructed according to OPSS 314.
- b) Concrete base, the base layer shall be constructed according to OPSS 350.
- c) Asphalt base, the base layer shall be constructed according to OPSS 313.

Layer depths of subbase and base shall be as specified in the Contract Documents

Both granular subbase and base shall be compacted according to OPSS 501.

#### **355.07.03 Subsurface Drainage**

Subsurface drainage shall be as specified in the Contract Documents. Subdrains shall be constructed according to OPSS 405.

Geotextile shall be installed at all drain locations between the bedding sand and the drain surface extending 100 mm beyond the drain in all directions.

**355.07.04                      Bedding Sand**

**355.07.04.01                  Placement**

The bedding sand shall be placed loose, in a uniform layer with sufficient depth to achieve the final compacted thickness of 20 to 30 mm.

**355.07.04.02                  Screeding**

The bedding sand shall be screeded in a loose condition and protected against compaction prior to placement of the concrete pavers.

**355.07.05                      Edge Restraint**

Edge restraints shall be provided along the perimeter of all concrete paver installations.

**355.07.06                      Laying Pattern**

Concrete pavers shall be installed in the pattern specified in the Contract Documents. Cutting of the concrete pavers, the use of infill concrete, and discontinuities in pattern shall only be allowed along the outer pavement boundaries and adjacent to drains, maintenance holes, edge restraints, and other appurtenances. Where partial concrete pavers are required, they shall be sawcut. No less than one-third of a concrete paver shall be used in pavement subjected to vehicular traffic.

**355.07.07                      Placement**

Concrete pavers shall be placed uniformly to achieve normal joint spacing of 2 to 5 mm between adjacent concrete pavers and such that all joints are aligned.

Concrete pavers shall only be placed on loose moist bedding sand.

**355.07.08                      Compaction**

**355.07.08.01                  Initial Compaction**

After placement, compactive effort shall be applied to the concrete pavers to achieve compaction of the bedding sand and to achieve proper grade. At least three passes of a plate compactor shall be made across the surface of the concrete pavers.

**355.07.08.02                  Joint Sand Compaction**

After initial compaction, dry joint sand shall be uniformly spread over the concrete pavers and swept to fill in the joints. At least two passes of a plate compactor shall be applied to the surface while simultaneously sweeping the sand into the joints. Joints shall be completely filled at the completion of compaction. Excess sand shall then be removed from the pavement surface by sweeping.

**355.07.08.03                  Final Compaction**

On pavements subject to vehicular traffic, final compaction shall be achieved by not less than 10 passes of a pneumatic-tired roller.

**355.07.09                      Surface Tolerance**

The surface of the concrete pavers is to be such that when tested with a 3 m long straightedge placed in any direction on the surface, except across the crown or drainage gutters, the gap between the bottom of the straightedge and the surface of the concrete pavers shall be 10 mm or less.

### **355.07.10 Removal of Unacceptable Concrete Pavers**

All loose concrete pavers and concrete pavers that do not meet the surface tolerance shall be removed and reinstalled.

All pavers broken during the initial compaction shall be removed and replaced prior to the placement of the joint sand and joint sand compaction.

All damaged concrete pavers shall be removed and replaced.

### **355.07.11 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **355.09 MEASUREMENT FOR PAYMENT**

### **355.09.01 Actual Measurement**

#### **355.09.01.01 Interlocking Concrete Pavers**

Measurement shall be made for the area of concrete pavers placed in square metres without deduction for maintenance hole covers, Utility poles, and other appurtenances.

### **355.09.02 Plan Quantity**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **355.10 BASIS OF PAYMENT**

### **355.10.01 Interlocking Concrete Pavers-Item**

Payment at the Contract price for the above item shall be full compensation for all labour, Equipment, and Material to do the work.

Removal and reinstallation of loose concrete pavers or concrete pavers not meeting surface tolerances shall be at no extra cost to the Owner.

Removal and replacement of damaged concrete pavers shall be at no additional cost to the Owner.

### **APPENDICES**

|              |                   |
|--------------|-------------------|
| <b>363-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **363.01 SCOPE**

This specification covers the requirements for repairing rigid pavement with precast concrete slabs using either the Fort Miller Super-Slab<sup>®</sup> Method or the Michigan Method. The work may include both continuous and intermittent slab repairs.

#### **363.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

### **363.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

### **363.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

C 939-02 Flow of Grout for Preplaced-Aggregate Concrete (Flow Cone Method)

### 363.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Bedding Grout** means a thin non-structural grout pumped into the grout distribution system that is cast in the bottom of the Fort Miller Super-Slab® Method to fill voids beneath the slabs to provide uniform support to the slab.

**Cement Treated Base** means granular base material stabilized with Portland cement.

**Continuous Precast Concrete Slab Repair** means the continuous replacement of multiple consecutive slabs of concrete pavement with inter-connecting precast concrete slabs.

**Diamond Grinding** means altering the profile and texture of a concrete pavement surface by using grinding equipment that employs diamond tip blades.

**Intermittent Precast Concrete Pavement Slab Repair** means a 2 to 4.5 m long repair carried out using a single precast slab.

### 363.04 DESIGN AND SUBMISSION REQUIREMENTS

#### 363.04.01 Submission Requirements

##### 363.04.01.01 Precast Concrete Pavement Slab Repair Plan

At least 2 weeks prior to the start of the work, details on the method of the following operations shall be submitted to the Contract Administrator:

- a) Fabrication, transportation, and installation of each precast concrete slab repair method.
- b) Removal of existing concrete (i.e., sawcutting, removal, equipment, and disposal).

- c) Removal of hot mix asphalt repair.
- d) Base preparation.
- e) Precast slab placement.
- f) Grouting (i.e., equipment to be used for mixing and installing).

#### **363.04.01.02                      Precast Concrete Mix Design**

The precast concrete mix design shall be submitted to the Contract Administrator at least 2 weeks prior to the start of the work.

Documentation shall be included with the submission of the mix design that demonstrates the proposed mix design and materials meet the requirements of this specification, including the air void system in the hardened concrete and the minimum specified 28-Day compressive strength.

All supporting test data shall not be more than 12 months old at the time the concrete mix design is submitted to the Contract Administrator.

#### **363.04.01.03                      Flowable Fill Mix Design - Michigan Method**

When flowable fill is used as a levelling material, a concrete mix design for flowable fill shall be submitted to the Contract Administrator at least 2 weeks prior to the start of the work. Trial batch documentation shall also be submitted to the Contract Administrator for review a minimum of 7 Days prior to placement.

#### **363.04.01.04                      Proprietary Concrete Repair Material (PCRM) - Product Details**

At least 7 Days prior to commencement of the work, the name of the PCRM selected for use and the manufacturer's specifications and recommendations for placement shall be submitted to the Contract Administrator. The submission shall also include documentation verifying the suitability of the product for the application and evidence of successful performance in a similar application. The PCRM and supporting information provided shall be acceptable to the Owner.

#### **363.04.01.05                      Chipping Hammer**

At least one week prior to commencement of the work, a copy of the manufacturer's published specifications on the chipping hammers to be used shall be submitted to the Contract Administrator.

### **363.05                                      MATERIALS**

#### **363.05.01                                  Precast Concrete Slabs**

##### **363.05.01.01                              General**

The minimum compressive strength of concrete at 28 Days shall be 30 MPa. Testing of the concrete compressive strength shall be carried out according to CSA A23.2.

The air void parameters of the hardened concrete shall be a minimum air content of 3% and a maximum spacing factor of 0.230 mm.

Concrete shall meet the requirements of the materials section of OPSS 350 and OPSS 1350 with the following exceptions and additions:

- a) Concrete aggregates shall be according to OPSS 1002.
- b) The nominal maximum size of coarse aggregate shall be 19 mm.

#### **363.05.01.02                    Finishing**

Finishing of precast concrete slabs shall be according to OPSS 350.

#### **363.05.01.03                    Texturing of Surface**

Texturing of the precast concrete slab surface shall be according to OPSS 350 except that manual devices may be used to provide the required tined texture.

#### **363.05.01.04                    Dimensions**

Precast concrete slabs shall be full lane width and length of 2 to 4.5 m. Prior to fabrication, the concrete thickness at each repair location shall be determined. Slabs may be cast a maximum of 15 mm thinner than the existing concrete to be repaired to accommodate the bedding material.

#### **363.05.02                        Fine Aggregate for Base Preparation - Fort Miller Super-Slab® Method**

Fine aggregate for base preparation shall be 100% crushed fine aggregate with a plasticity index of 0% according to LS-704 and a maximum micro-Deval abrasion loss of 35 according to LS-619. Fine aggregate means that portion of aggregate material passing the 4.75 mm sieve when tested according to LS-602.

#### **363.05.03                        Flowable Fill - Michigan Method**

Flowable fill shall consist of a mixture of Portland cement, coarse and fine aggregate, fly ash, and water, and may contain air entraining admixture or ground granulated blast furnace slag or both.

Portland cement shall be Type GU cement according to CSA A3000.

Fly ash shall be according to CSA A3000.

Coarse and fine aggregate shall meet the requirements of OPSS 1002 and shall have a maximum aggregate size of 12.5 mm.

The compressive strength of the flowable fill mixture shall not be less than 0.5 MPa or greater than 1.0 MPa at 28 Days.

If an air entraining admixture is used, then the air content of the flowable fill shall not exceed 35% of the flowable fill volume.

#### **363.05.04                        Bedding Grout - Fort Miller Super-Slab® Method**

Bedding grout shall be a mixture of cement, water, and plasticizing admixture. The grout mixture shall have a flow rate of 17 to 22 seconds as measured by ASTM C 939 to ensure fluidity. The compressive strength of the bedding grout shall be a minimum of 2.0 MPa at 12 hours.

**363.05.05 Tie Bars and Dowel Bars**

Tie bars shall be according to OPSS 1440. Dowel bars shall be according to OPSS 1441.

**363.05.06 Expansion Caps for Dowel Bars**

Caps shall be tight-fitting and made of compressible, non-absorptive, closed cell polyethylene that will allow approximately 6 mm movement at the end of the dowel bar.

**363.05.07 Bond Breaker**

Dowel bars shall be coated with RC-250, Tectyl 506, or an approved equivalent.

**363.05.08 Proprietary Concrete Repair Material (PCRM)**

The PCRM selected shall be suitable for the application.

The minimum compressive strength of the PCRM at 28 Days shall be 30 MPa.

The PCRM for use in the dowel grout of the Fort Miller Super-Slab<sup>®</sup> Method shall be capable of being pumped into the inverted dovetail slots.

**363.05.09 Epoxy Adhesives**

Epoxy adhesives shall be from the Owner's approved product list and shall be of the type intended for horizontal dowel application and mixed in the cartridge nozzle.

**363.05.10 Joint Materials**

The joint sealant material shall be according to OPSS 369.

**363.05.11 Water**

Water shall be according to OPSS 1302.

**363.06 EQUIPMENT**

**363.06.01 Screeding Device for Base Preparation**

The screeding device used for fine grading for base preparation shall be laser or otherwise mechanically controlled and shall be capable of fine grading fully compacted fine aggregate or flowable fill to a tolerance of 3 mm.

**363.06.02 Gang Drill**

The gang drill shall consist of not less than three independently powered pneumatic drills.

**363.06.03 Chipping Hammer**

Chipping hammers shall be hand held and have a maximum weight of 9.0 kg prior to any handle modification, where applicable, and a maximum piston stroke of 102 mm. All hammers shall have the manufacturer's name and parts or model number engraved on them by the manufacturer. All information shall be clearly legible. The manufacturer's published specifications shall be the sole basis for determining weight and piston stroke.

#### **363.06.04 Gang Saw**

The gang saw shall have gang-mounted diamond saw blades and shall be capable of cutting at least 3 parallel slots simultaneously at a slot spacing of 300 mm within a tolerance of 3 mm.

#### **363.06.05 Compressor - Air Blasting**

The compressor for air blasting shall have a minimum capacity of 3.5 m<sup>3</sup>/min. The compressed air shall be free from oil and other contaminants.

#### **363.06.06 Consolidating Equipment**

Internal vibrators used to consolidate the PCRM in the dowel bar slots shall have a maximum diameter of 25 mm and shall have a resilient covering that will not damage the epoxy coated reinforcement during use.

#### **363.06.07 Hand Finishing Equipment**

Hand finishing equipment shall be according to OPSS 904.

#### **363.06.08 Straight Edges**

Straight edges shall be according to OPSS 904.

### **363.07 CONSTRUCTION**

#### **363.07.01 General**

Precast concrete pavement slab repairs shall be carried out at the locations identified in the Contract Documents. The work may include both continuous and intermittent slab repairs.

Acceptable methods of intermittent slab repair are the Fort Miller Super-Slab<sup>®</sup> Method and the Michigan Method, as modified by the requirements of this specification.

Acceptable methods of continuous slab repair are the Fort Miller Super-Slab<sup>®</sup> Method as modified by the requirements of this specification, or an alternative continuous precast method with demonstrated and documented good field performance under similar conditions, such as precast, prestressed concrete.

##### **363.07.01.01 Fort Miller Super-Slab<sup>®</sup> Method**

In the Fort Miller Super-Slab<sup>®</sup> Method, the work shall consist of fabricating precast concrete pavement slab repairs (i.e., Super-Slab<sup>®</sup>), sawcutting and removing the existing concrete pavement, repairing and compacting the existing subbase, as necessary, placing and grading fine aggregate base material, inserting and securing dowel bars and tie bars, placing precast slabs, installing PCRM in inverted dovetail slots, installing bedding grout beneath the slabs, and sealing of joints.

##### **363.07.01.02 Michigan Method**

In the Michigan Method, the work shall consist of fabricating precast concrete pavement slab repairs with dowel bars, sawcutting and removing the existing concrete pavement, constructing dowel bar slots, placing of flowable fill levelling material, placing precast slabs, installing PCRM in dowel bar slots, and sealing of joints.

**363.07.01.03****Trial Slab Repair**

Prior to carrying out the precast concrete pavement slab repair, the ability to successfully carry out the slab repair according to this specification shall be demonstrated to the Contract Administrator by placing a trial repair slab within the Contract limits.

In lieu of a trial slab repair, the Contract Administrator may accept evidence demonstrating the ability to successfully conduct the slab repair with the same equipment, placing crew, and methodology to meet the Contract requirements for conducting the slab repair on any Contract within the last 12 months.

The trial slab repair shall be conducted on both the intermittent slab and continuous slab. The location of the trial slab repair shall be proposed to the Contract Administrator for approval. The Contract Administrator shall be given a minimum of 48 hours notice prior to the trial slab repair.

The Contract Administrator shall allow the slab repair work to continue based on an acceptable visual assessment of the trial. When the slab repair is rejected by visual assessment, additional trial slab repairs shall be performed until the slab repair meets the requirements of this specification.

Unacceptable trial repair slabs shall be repaired, removed, or reinstalled, as required.

**363.07.02****Operational Constraints**

Perimeter sawcutting of the removal area shall not be carried out more than 1 week in advance of the expected date of repair.

Bedding grout and dowel grout shall be carried out as soon as possible after the installation of the precast concrete pavement slab.

The temperature of the flowable fill mixture used for the Michigan Method, as manufactured and delivered, shall be at least 10 °C. Placement of flowable fill shall not be allowed if the anticipated air temperature will be 2 °C or less in the 24 hour period following proposed placement.

The PCRM shall not be placed when the air temperature is outside the manufacturer's recommended temperature range or is likely to fall or rise outside the range throughout the duration of the material placing operation. Prior to placing the PCRM, it shall be demonstrated to the Contract Administrator that the existing concrete temperature in the repair area meets the manufacturer's requirements by measuring and recording the substrate temperatures using a contact thermometer or infrared thermometer.

Construction vehicles, equipment, or traffic shall not be permitted to travel on the precast repair until the PCRM has attained a minimum compressive strength of 20 MPa.

Each repair location shall be completed within the time period specified in the Contract Documents. If the repair is not progressing at a rate that will permit the full restoration of traffic within the allowable time period, appropriate measures acceptable to the Contract Administrator shall be undertaken to allow opening of the road to traffic. Full depth precast concrete slab repairs shall replace the above temporary work during the next scheduled closure.

**363.07.03****Removals**

A template shall be used to precisely delineate the limits of the areas to be repaired within a tolerance of 12 mm. Repairs shall be the full width of the lane and full depth of concrete or hot mix asphalt repair.

Concrete removal shall be carried out according to OPSS 510. The outer limits of the removal area shall be sawcut full depth and shall not be overcut by more than 250 mm into the adjacent concrete that is to remain in place. Overcuts shall be filled with a proprietary product acceptable to the Owner.

Concrete removal shall be by lift-out method. Removals shall be carried out without damaging the adjacent concrete pavement or asphalt shoulder or disturbing the underlying base. Heavy breaking equipment such as hoe rams shall not be used in the removal operation. The concrete pavement shall not be broken in place.

If the adjacent concrete is damaged or cracked due to the removal procedure, the damaged concrete shall be repaired according to OPSS 360. Asphalt surfaces damaged during the removal process shall be repaired. A proposal for repairs shall be provided to the Contract Administrator for approval.

### **363.07.04 Base Preparation**

#### **363.07.04.01 General**

Levelling material shall be either a flowable fill for the Michigan Method or fine aggregate for the Fort Miller Super-Slab<sup>®</sup> Method meeting the requirements of this specification.

Micro-grinding of the existing cement treated base is recommended if minor adjustment for the base level is required.

#### **363.07.04.02 Flowable Fill - Michigan Method**

The batching equipment shall have devices designed to measure the specified quantities of each component material and mixing shall be of sufficient duration to ensure uniform consistency of the mixture. Water content shall be maintained so that compressive strengths are achieved and a uniform, flowable mixture is developed that is essentially self-levelling when placed.

#### **363.07.04.03 Fine Aggregate - Fort Miller Super-Slab<sup>®</sup> Method**

Fine aggregate shall be compacted then fine graded using a screeding device capable of grading the fully compacted bedding material to the required tolerance.

### **363.07.05 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 905.

### **363.07.06 Dowel Bar Installation - Michigan Method**

#### **363.07.06.01 Sawcutting Dowel Bar Slots**

Slots shall be created using gang saws. The slots shall be 65 mm wide by 450 mm long and to a maximum depth to allow the dowel bar to be placed at mid-slab depth with 12 mm cover under the bar. The slots shall be parallel to the centreline of the roadway with a maximum tolerance of 3 mm from a parallel line.

Equipment shall not cause damage to the existing pavement. All slurry from the sawcutting operation shall be removed from the slot and pavement. Over-cutting dowel bar slots is not permitted.

#### **363.07.06.02 Concrete Removal in Dowel Bar Slots**

Chipping hammers shall be used to remove concrete within the slots. Concrete shall be removed to ensure the bottom of the slot is level and in such a manner as to prevent damage to the concrete remaining in place. If the concrete removal operation causes damage to the adjacent concrete pavement, corrective action shall be taken immediately.

If during the removal process the adjacent concrete is damaged due to the removal operation, the damaged concrete shall be repaired as a partial depth repair according to OPSS 360.

The chipping hammers shall not be permitted to break through the concrete. In the event of a break through or if a crack develops within a slot, the repair shall be treated as a full depth repair and the entire joint within the lane shall be removed and replaced with a 2 m full depth concrete repair according to OPSS 360.

#### **363.07.06.03 Slot Cleaning**

All concrete surfaces within the slot shall be solid, free from loose or unsound fragments. All concrete surfaces shall be abrasive blast cleaned according to OPSS 929 and all dust and loose material shall be removed from the prepared surface by using compressed air.

#### **363.07.06.04 Placing the PCRM in Dowel Bar Slots - Michigan Method**

All concrete surfaces within the slot shall be in accordance with manufacturer's requirements. Care shall be taken to prevent standing water in the slot. Prior to placing the PCRM, all excess water shall be removed with compressed air.

The treatment of the concrete surfaces within the slot with a bonding agent, if required by the manufacturer, and the mixing, placing, finishing, and curing of the PCRM shall be done according to the manufacturer's recommendations. A metering or measuring device shall be used to establish the correct amount of mixing water. All batches of PCRM shall be consistent.

PCRM shall not be spilled onto the adjacent concrete surface when placing in slots. The PCRM shall be vibrated to consolidate the material into the slot and around the dowel bar.

The PCRM shall be finished flush with the surface of the concrete and all excess material removed immediately. Hand finishing shall be minimized to prevent overworking of the repair. The PCRM shall be cured according to the manufacturer's recommendations.

#### **363.07.07 Dowel Bar and Tie Bar Installation - Fort Miller Super-Slab® Method**

Gang drills shall be used to drill holes in the existing concrete for insertion of dowel bars. The diameter of the drill holes shall be no more than 5 mm larger than the diameter of the dowel bars or tie bars. Drill holes shall be thoroughly cleaned by air blowing from the back of the drill hole outwards. Drilling equipment shall be used in a manner to ensure adjacent pavement is not damaged.

Dowel bars and tie bars shall be secured into the existing concrete with an epoxy adhesive. The epoxy adhesive shall be injected into the back of the cleaned drill hole and the dowel bar or tie bar with grout retention disks attached, and shall be inserted to ensure the bars are completely encased with epoxy adhesive for the full depth of the hole. Tie bars and dowel bars shall be installed as specified in the Contract Documents. Tie bars are only required for continuous repairs.

#### **363.07.08 Slab Installation - Fort Miller Super-Slab® Method**

Slabs shall be guided into position during installation using guide bars inserted in bedding grout port holes to align slabs during setting. The use of pry bars or wedges in joints for alignment purposes shall not be permitted.

The vertical differential between adjacent slabs shall be less than 6 mm. If the vertical differential is greater than 6 mm, the slab shall be removed, the base re-graded, and the slab reset until the differential is less than 6 mm prior moving on to the next slab.

If slabs are to be opened to traffic before they are grouted, incompressible shims shall be placed at approximate ¼ points in both the transverse and longitudinal joints to maintain horizontal alignment of the new precast slabs until they are grouted.

If un-grouted slabs are vertically displaced so that the vertical differential is greater than 6 mm as described above, the slab shall be removed, the base re-graded, and the slab reset prior to grouting, or the surface shall be brought to the required tolerance by grinding as required by this specification.

### **363.07.09                      Placing the Dowel Grout and Bedding Grout - Fort Miller Super-Slab® Method**

Foam grout dams shall be installed at the open ends of the transverse joint to be grouted to prevent dowel grout from escaping during the installation. Dowel grout shall be mixed in strict accordance with the instructions provided by the manufacturer. The volume of water shall be measured accurately for each batch by weighing the batch water or by using calibrated pails that are perforated at a level to ensure the correct amount of water is mixed with each bag of grout. Dowel grout shall be pumped in the back port of each dowel slot until it comes out the second port in the same slot. Foot shall be placed over the second port and pumping shall be continued until the grout flows along the joint to the next slot. The same procedure shall be repeated for the back port of the next slot. The grout level in previously filled ports shall be continually monitored. Grout shall be added, as necessary, to keep the grout level in the ports even with the top of the slab and in the joints above the top of the slots.

Bedding grout shall be placed after the dowel grout has been installed. Bedding grout shall be mixed in strict accordance with the instructions provided by the manufacturer of the viscosity-reducing admixture. Bedding grout shall be pumped in the lowest port of the slab until it comes out the corresponding port at the other end of the slab. While filling the remaining ports in the slab, the grout level shall be continually monitored in previously filled ports and grout added, as required, to keep the grout level in the ports even with the top of the slab. This will maintain a safe and adequate head pressure on the bedding grout until all voids under the slab are filled.

Before the bedding grout fully sets, the top 50 mm of bedding grout in each port shall be removed and replaced with PCRM. The PCRM in all ports shall be finished flush and matching with the surface of the concrete and all excess material removed immediately.

### **363.07.10                      Tolerances**

#### **363.07.10.01                  Dowel Bar and Tie Bar Tolerances**

Dowel bars shall be installed mid-depth of the concrete slab in a plane with the pavement surface and parallel to the centreline of the road. Tie bars shall be installed mid-depth of the concrete slab in a plane with the pavement surface and perpendicular to the longitudinal lane edge sawcut face. The tolerance for the alignment of dowel bars and tie bars shall be  $\pm 15$  mm along the length of the bar in both the vertical and horizontal planes of the pavement and parallel to the direction of traffic.

#### **363.07.10.02                  Surface Tolerances**

The surface of the precast concrete slab repair shall join flush with the existing concrete pavement. Surface tolerance of intermittent repair slabs shall be so that when tested with a 3 m long straight edge placed in the longitudinal direction there shall not be a gap greater than 6 mm between the bottom of the straight edge and the surface of the pavement. Surface tolerance of continuous slabs shall be so that the gap is not greater than 6 mm when the straight edge is placed in any location and direction, including the edge of pavement, except across the crown or drainage gutters.

#### **363.07.11                      Joint Sealing**

All longitudinal and transverse joints shall be sealed according to OPSS 369.

## **363.07.12 Sampling and Testing**

### **363.07.12.01 General**

All samples, including those handled by a commercial carrier shall be accompanied by a sample data sheet and any additional documents as specified elsewhere in the Contract Documents. When not specified or not included on the sample data sheet, samples shall be delivered with a transmittal form identifying the following information:

- a) Contract Number.
- b) Name of Contractor, name of contact person and telephone numbers.
- c) Name of Contract Administrator, and telephone numbers.
- d) Quantity and type of sample. When a sample consists of more than one item, each item shall be individually identified.
- e) Date sampled.
- f) Date shipped.
- g) Sample, lot, and subplot number.
- h) Sample location.

### **363.07.12.02 Compressive Strength of Concrete in Precast Slab**

Concrete test cylinders shall be cast, cured, handled, and delivered for 28-Day compressive strength testing according to OPSS 1350 based on 1 set of 2 cylinders taken for each batch of concrete.

### **363.07.12.03 Compressive Strength of Flowable Fill**

The compressive strength of the flowable fill shall be determined by casting cylinders. Two sets of two standard 150 x 300 mm cylinders to represent a day's placement shall be cast, cured, and delivered. Cylinders for testing the 3-Day and 28-Day compressive strengths shall be stored and cured according to OPSS 1350, then transported to a quality assurance (QA) laboratory designated by the Owner in the Contract Documents. Testing for 28-Day compressive strength shall be conducted according to OPSS 1350, except that specimens shall be air cured in their moulds until they are to be tested.

### **363.07.12.04 Compressive Strength of Proprietary Concrete Repair Materials and Bedding Grout**

Samples of PCRM shall be taken from the mixer in the field for the determination of the early strength and 28-Day compressive strength. The PCRM shall be moulded into cubes according to CAN/CSA A3004-C2.

Cubes shall be prepared on-site from the PCRM to be used to fill the slots. For the 28-Day compressive strength, the PCRM shall be sampled once for every 4 hours of production or a minimum of once per day, whichever is greatest. One set of six cubes shall be made from each sample of PCRM.

Additional cubes for determination of early strength shall be prepared. One set of six cubes shall be made for the final repair area of each closure. These cubes shall be tested to verify that the PCRM in the repair area has attained a compressive strength of 20 MPa. These test results shall be communicated immediately to the Contract Administrator prior to opening to traffic.

The timing of testing and frequency of testing of the early strength cubes shall be determined when the PCRM has attained a minimum compressive strength of 20 MPa.

The specimens shall be stored at a temperature between 15 °C and 25 °C and shall not be moved prior to demoulding. The specimens shall be demoulded and transported to the QA laboratory designated by the Owner within 24 hours  $\pm$  4 hours. The samples shall be transported in a sealed white opaque plastic bag containing at least 250 ml of water and maintained at a temperature between 15 °C and 25 °C.

#### **363.07.12.05                      Falling Weight Deflectometer Testing**

Falling weight deflectometer (FWD) testing shall be carried out on the approach and leave joints of each precast slab to determine the load transfer efficiency across the transverse joints. FWD testing, equipment calibration, and reporting shall be according to MERO-019 using the Load Transfer test with a Detailed Project Level data collection scenario and a JCP Test Plan configuration.

#### **363.07.13                      Repair or Removal of Unacceptable Concrete**

Precast concrete pavement slabs that arrive on the job site cracked, honeycombed, or showing any other visually detectable deficiencies shall be rejected and not used in the work.

Precast concrete pavement slabs that do not meet the surface tolerance requirements shall be removed and replaced, or corrected by diamond grinding.

Concrete pavement adjacent to precast concrete slab repair, damaged or displaced during installation of the precast repair shall be removed and replaced with new concrete as specified.

#### **363.07.14                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **363.08                      QUALITY ASSURANCE**

#### **363.08.01                      Inspection**

Prior to installation and with notification, access shall be provided to the Contract Administrator to inspect the precast concrete pavement slabs to ensure that they are properly textured and crack-free without any honeycombing or other visually detectable deficiencies.

#### **363.08.02                      Acceptance or Rejection**

Prior to opening to traffic, access shall be provided to the Contract Administrator to inspect the precast concrete slab repairs to determine if the completed work contains:

- a) Cracking or spalling.
- b) Ungrouted saw over-cuts from the removal process.
- c) Rocking of precast concrete pavement slab.
- d) Precast concrete pavement slab that does not meet surface tolerance.

Precast concrete pavement slab repairs shall be rejected based on the presence of one or more of the defects identified above or one or more of the following conditions:

- a) FWD testing results indicate a load transfer efficiency of less than 70%.
- b) Compressive strength of the precast slab less than 30 MPa at 28 Days.
- c) Air content of the hardened concrete in the precast slab is less than 3% or spacing factor is greater than 0.230 mm.

A detailed remedial plan shall be submitted to the Contract Administrator for approval to address identified deficiencies.

### **363.09 MEASUREMENT FOR PAYMENT**

#### **363.09.01 Actual Measurement**

##### **363.09.01.01 Precast Concrete Slab Repair**

Measurement of the precast concrete slab repair placed shall be by area in square metres. The total area shall be calculated to the nearest 0.1 m<sup>2</sup>.

#### **363.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

### **363.10 BASIS OF PAYMENT**

#### **363.10.01 Precast Concrete Slab Repair - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Measures taken to permit full restoration of traffic within the allowable time period shall be at no additional cost to the Owner.

Precast concrete pavement slabs that do not meet surface tolerance requirements shall be either removed and replaced or repaired by diamond grinding at no additional cost to the Owner.

Precast concrete pavement slabs rejected by the Contract Administrator shall be removed and replaced with new concrete as specified elsewhere in the Contract Documents at no additional cost to the Owner.

Concrete adjacent to and damaged by the removal process shall be cut back full depth to sound concrete and replaced at no additional cost to the Owner.

Asphalt surfaces damaged during the removal process shall be repaired at no additional cost to the Owner.

Full-depth repairs required as a result of chipping hammers breaking through the concrete or a crack developing as a result of chipping operations shall be carried out at no additional cost to the Owner.

**Appendix 363-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

|---------------|--------------|
| <b>365.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for cross-stitching longitudinal cracks in concrete pavement and concrete base.

**365.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **365.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **365.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

OPSS 369      Sealing or Resealing of Joints and Cracks in Concrete Pavement and Concrete Base

### **Ontario Provincial Standard Specifications, Material**

OPSS 1440      Steel Reinforcement for Concrete  
OPSS 1442      Epoxy Coated Reinforcing Steel Bars for Concrete

### **Ontario Ministry of Transportation Publications**

Designated Sources for Materials (DSM)

## **365.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Cross-Stitching** means tying together concrete pavement or concrete base across a longitudinal crack using deformed tie bars epoxied into holes drilled at an angle across the crack. This prevents horizontal and vertical movement of the concrete crack and migration of the adjacent slabs.

## **365.05 MATERIALS**

### **365.05.01 Tie Bars**

Tie bars shall be deformed tie bars according to OPSS 1440 and as specified in the Contract Documents. Tie bars shall be epoxy coated according to OPSS 1442.

### **365.05.02 Epoxy Adhesive**

Epoxy adhesive shall be of the type specified for horizontal dowel application and mixed in the cartridge. Epoxy adhesive shall be supplied from a source on the ministry DSM.

## **365.06 EQUIPMENT**

### **365.06.01 Drill**

A hydraulic or pneumatic drill shall be used to drill holes in the concrete pavement or concrete base. The drill shall be frame mounted and capable of drilling at a 35 or 45 degree angle to the horizontal. Drilling equipment shall be used in a manner to ensure adjacent concrete is not damaged.

### **365.06.02 Compressor - Air Blasting**

The compressor for air blasting shall have a minimum capacity of 3.5 m<sup>3</sup>/min. The compressed air shall be free from oil and other contaminants.

## **365.07 CONSTRUCTION**

### **365.07.01 Tie Bar Installation**

Tie bars shall be installed as specified in the Contract Documents at locations identified by the Contract Administrator. A minimum of two deformed tie bars shall be cross-stitched through a single longitudinal crack.

Holes for the tie bars shall be drilled at an angle to the horizontal, alternating across opposite sides of the crack to produce a cross-stitching pattern. The diameter of the drill hole shall be no more than 5 mm larger than the diameter of the tie bar. Drill holes shall be located such that the tie bar intersects the longitudinal crack at approximately mid-depth of the concrete slab. Drill holes shall not exit the bottom of the concrete slab and shall be installed within the following tolerances:

- a) Drilling angle:  $\pm 1^\circ$
- b) Drill hole depth:  $\pm 5$  mm
- c) Drill hole diameter:  $\pm 1$  mm
- d) Drill hole offset from longitudinal crack:  $\pm 5$  mm

Prior to tie bar installation, drill holes shall be thoroughly cleaned with compressed air by inserting the compressor nozzle for the full length of the drilled hole.

The tie bars shall be secured into the existing concrete with epoxy adhesive. The epoxy adhesive shall be injected into the cleaned drill hole from the bottom of the hole outward. The tie bars shall be inserted to ensure the bars are completely encased with epoxy adhesive for the full depth of the drill hole. Excess epoxy shall be removed from the surface of the pavement.

**365.07.02                      Sealing of Longitudinal Cracks**

Upon completion of tie bar installation the longitudinal crack shall be sealed according to OPSS 369.

**365.07.03                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**365.08                              QUALITY ASSURANCE**

**365.08.01                      Inspection**

The Contractor shall allow the Contract Administrator to inspect all drill holes prior to placing the tie bars to ensure they meet the requirements of the Contract Documents.

**365.08.02                      Rejection**

Drill holes identified by the Contract Administrator as not meeting the requirements of the Contract Documents shall be filled with epoxy and abandoned.

**365.09                              MEASUREMENT OF PAYMENT**

**365.09.01                      Actual Measurement**

**365.09.01.01                      Cross-Stitching Longitudinal Cracks in Concrete Pavement and Concrete Base**

For measurement purposes, a count shall be made of the number of cross-stitching tie bars installed.

**365.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**365.10                              BASIS OF PAYMENT**

**365.10.01                      Cross-Stitching Longitudinal Cracks in Concrete Pavement and Concrete Base - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Drill holes not within the specified tolerances shall be filled with epoxy and abandoned at no additional cost to the Owner.

**365.10.02                      Sealing of Longitudinal Cracks**

Payment for the sealing of longitudinal cracks shall be according to OPSS 369.

**Appendix 365-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

### **366.01 SCOPE**

This specification covers the requirements for full depth and partial depth repairs of concrete pavement and concrete base using conventional concrete repairs, high early strength concrete repairs, and fast-track concrete repairs (full depth repair only).

### **366.02 REFERENCES**

## 366.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Autogenous Cylinders** means cylinders used for estimating compressive strength of concrete in the repair areas when high early strength or fast-track concrete is used. These cylinders are stored in insulated curing containers in which the elevated curing temperature is obtained from heat of hydration of the cement.

**Cold Weather** means as defined in OPSS 350.

**Conventional Concrete Repair** means a concrete pavement or concrete base repair process excluding high early strength concrete repairs or fast-track concrete repairs.

**Diamond Grinding** means altering the profile and texture of a concrete surface by utilizing grinding equipment that employs diamond tipped blades.

**Fast-track Concrete Repair** means a process in which a section of concrete pavement or concrete base is closed to traffic, concrete is removed and repairs are completed, and the section is re-opened to traffic within a specified time period of 24 hours or less.

**Full Depth Repair** means a repair area in the concrete pavement or concrete base which is the full thickness of the existing concrete pavement or concrete base.

**High Early Strength Concrete Repair** means a process in which a section of concrete pavement or concrete base is closed to traffic, concrete is removed, and concrete repairs are completed and the section re-opened to traffic within 72 hours or within the timeframe specified in the Contract Documents.

**Horizontal Alignment** means as defined in OPSS 350.

**Horizontal Side Shift** means as defined in OPSS 350.

**Hot Weather** means as defined in OPSS 350.

**Longitudinal Side Shift** means as defined in OPSS 350.

**Partial Depth Repair** means a repair area in the concrete pavement or concrete base which has a minimum depth of 50 mm to a maximum depth of one-third the thickness of the existing concrete pavement or concrete base.

**Staged Repair** means a repair area which cannot be repaired in one complete operation due to traffic or construction sequence requirements and must be completed in separate stages.

**Vertical Alignment** means as defined in OPSS 350.

#### **366.04 DESIGN AND SUBMISSION REQUIREMENTS**

##### **366.04.01 Design Requirements**

##### **366.04.01.01 Concrete Mix Design**

The concrete mix shall be designed to provide adequate strength and durability for the intended use and to meet the requirements specified in the Contract Documents.

##### **366.04.02 Submission Requirements**

##### **366.04.02.01 Concrete Mix Design**

The concrete mix design(s) shall be submitted according to OPSS 1350.

Linear shrinkage test results shall be submitted to the Contract Administrator within 40 Days of the mix design submission, for information purposes. Concrete specimens may be obtained from a laboratory batch or sampled in the field. Linear shrinkage testing shall be according to LS-435.

##### **366.04.02.02 Calibration Charts and Autogenous Cylinder Method for High Early Strength and Fast-track Concrete Repairs**

The following information, according to the Autogenous Cylinder Method Calibration Charts for High Early Strength and Fast-track Concrete Repairs subsection, shall be submitted to the Contract Administrator at the time of submission of the concrete mix design for the high early strength and fast-track concrete repairs:

- a) Calibration chart indicating compressive strength versus temperature.
- b) Calibration chart indicating temperature versus time.
- c) Ambient air temperature during development of the calibration charts.

The above data shall be accompanied by a covering letter, signed by an Engineer, identifying the curing method, the test method, and detailing the development of the calibration chart.

For high early strength concrete repairs, calibration charts shall be developed prior to construction of the repairs. For fast-track concrete repairs, calibrations charts shall be developed prior to commencement of the trial area. Calibrations charts shall be developed according to the Autogenous Cylinder Method Calibration Charts for High Early Strength and Fast-track Concrete Repairs subsection. If a trial area is not required, calibration charts shall be developed prior to construction of the fast-track repairs.

All supporting test data shall not be more than 12 months old at the time the concrete mix design is submitted to the Contract Administrator.

If the ambient air temperature at time of placement differs from the ambient air temperature during the development of the calibration charts by more than 10 °C, new calibration charts shall be submitted.

In the event that field performance or conditions are no longer representative of the conditions under which the submitted calibration charts were developed, a new mix design and charts shall be resubmitted prior to proceeding with concrete repairs.

#### **366.04.02.03                    Method of Removal of Existing Concrete**

A description of the method to be used to remove the existing concrete shall be submitted to the Contract Administrator at least 2 weeks prior to the start of the work. The description shall comply with the requirements in the Concrete Removal subsection and include the sawcutting and removal process, equipment, and disposal.

A proposal for repair and/or replacement of disturbed, removed or damaged underlying material including the material, mixing and placement method shall be submitted to the Contract Administrator for review. Repair shall not proceed until the proposal is accepted by the Owner.

#### **366.04.02.04                    Chipping Hammers**

The manufacturer's published specifications on the chipping hammers shall be submitted to the Contract Administrator 1 week prior to the commencement of the partial depth removal operation.

#### **366.04.02.05                    Temperature Control Plans**

##### **366.04.02.05.01                Cold Weather**

Temperature control plans for all concrete repairs except fast-track concrete repair, shall be submitted according to OPSS 904 in the event of cold weather conditions.

##### **366.04.02.05.02                Hot Weather**

For all concrete repairs subject to hot weather conditions, a temperature control plan that describe the methods to be used to control the temperature of the concrete shall be submitted to the Contract Administrator 7 Days prior to placement.

#### **366.04.02.06                    Curing Compound**

Curing compound submissions shall be according to OPSS 904.

#### **366.04.02.07                    Effluent Management**

Effluent management submissions shall be according to OPSS 350.

### **366.05                            MATERIALS**

#### **366.05.01                        Bond Breaker**

Bond breaker shall be RC-250, Tectyl 506, or an alternative type of material acceptable to the Owner.

Dowel bars and load transfer devices shall be shop coated with bond breaker, except for dowels which are installed into existing concrete.

#### **366.05.02                        Bonding Agent**

Bonding agent shall consist of Portland cement and fine aggregate mixed with water to form a stiff mixture. Portland cement shall be according to OPSS 1301. Fine aggregate shall be according to OPSS 1002. The consistency of the mixture shall be such that it can be applied with a stiff brush to the concrete surface in a thin even coating that will not run or puddle.

### **366.05.03                      Burlap**

Burlap shall be according to OPSS 1306.

### **366.05.04                      Concrete**

Materials for concrete shall be according to the Materials section of OPSS 1350 with the following exceptions and additions:

- a) The nominal maximum size of coarse aggregate shall be as specified in Table 1.
- b) The minimum 28-Day concrete compressive strength shall be 35 MPa, unless otherwise specified in the Concrete Documents.
- c) The compressive strength of the concrete in the repair area shall be a minimum of 20 MPa prior to opening to traffic.
- d) For partial depth repairs in areas where the greatest dimension (width or length) of the repair area is less than 300 mm, a proposal to use a proprietary patching material may be submitted to the Contract Administrator for approval.
- e) The requirements for rapid chloride permeability do not apply.
- f) Fast-track concrete repairs shall not be used for partial depth repairs.
- g) For high early strength concrete and fast-track concrete repairs, the maximum temperature of concrete at the time of discharge from the truck shall not exceed 35 °C.
- h) For fast-track concrete repairs, the requirement for greenhouse gas (GHG) reduction does not apply.
- i) For fast-track concrete repairs, the requirement for plastic air content does not apply.
- j) For fast-track concrete repairs, superplasticizer may be used and may be added at the plant or site. Testing of slump prior to addition of superplasticizer is not required.
- k) For fast-track concrete repairs, calcium chloride based accelerator or other accelerators may be used. When used, it shall be measured accurately to ensure a consistent dosage for each load, and it shall be added and mixed in a manner to ensure consistent distribution throughout the load.
- l) For high early strength concrete repairs, the use of accelerating admixtures shall not be permitted.

### **366.05.05                      Curing Compound**

Curing compound for concrete shall be according to OPSS 1315.

### **366.05.06                      Epoxy Adhesives**

Epoxy resins dowel adhesives used for dowel and tie bars shall be from the MTO DSM approved for horizontal applications and mixed in the nozzle (cartridge). Cementitious grouts shall not be permitted for this application.

### **366.05.07                      Expansion Joint Filler**

Expansion joint filler shall be according to OPSS 1308.

### **366.05.08                      Moisture Vapour Barrier**

Moisture vapour barrier shall be white opaque polyethylene film according to ASTM C171 and shall not be less than 100 µm thick.

### **366.05.09                      Proprietary Patching Materials**

Proprietary patching materials shall be from the Owner's list of acceptable concrete patching materials. The list of proprietary patching materials may be obtained from the Contract Administrator.

### **366.05.10                      Tie Bars, Dowel Bars and Load Transfer Devices**

Tie bars and dowel bars shall be according to OPSS 1440. Tie bars and dowel bars shall be epoxy coated according to OPSS 1442. Load transfer devices shall be according to OPSS 1441.

### **366.05.11                      Water**

Water used for curing of concrete, pre-soaking of burlap, making bonding agent and mixing proprietary patching materials shall be according to OPSS 1302.

## **366.06                              EQUIPMENT**

### **366.06.01                      Air Compressor**

The compressor for air blasting shall have a minimum capacity of 3.5 m<sup>3</sup>/min. The compressed air shall be free from oil and other contaminants.

### **366.06.02                      Batching Plant and Delivery Equipment**

The batching plant shall be according to the Batching Plant subsection of OPSS 1350. Delivery equipment shall be according to the Delivery Equipment subsection of OPSS 1350.

### **366.06.03                      Chipping Hammer**

Chipping hammers shall be hand-held and have a maximum weight of 9.0 kg prior to any handle modification, where applicable, and a maximum piston stroke of 102 mm. All hammers shall have the manufacturer's name and part or model number engraved on them by the manufacturer. All information shall be clearly legible. The manufacturer's published specifications shall be the sole basis for determining weight and piston stroke.

### **366.06.04                      Diamond Grinder**

When a diamond grinder is used, it shall be power-driven, self-propelled equipment specifically designed to grind and texture concrete surfaces. It shall be equipped with a grinding head with at least 50 diamond blades per 300 mm of shaft. The grinding head shall be at least 0.9 m wide. The grinder shall be equipped with the capability to adjust the depth, slope and cross-fall to ensure that concrete is removed to the desired dimensions and uniformly feathered and textured across the width and length of the required area.

The diamond grinder shall be equipped with a vacuum system that is, capable of removing all standing effluent, leaving the roadway in a clean, near dry condition after each pass. Residue shall not be permitted to encroach into open lanes, ditches or enter, into closed drainage systems. The management of effluent from diamond grinding operation shall be according to OPSS 350.

### **366.06.05                      Gang Drill**

The gang drill shall consist of not less than three independently powered pneumatic drills. Drilling shall not damage adjacent concrete.

### **366.06.06                      Hand Finishing Equipment**

Floats used to finish concrete shall be made of magnesium.

### **366.06.07                      Placing and Finishing Equipment**

Equipment used for placing, consolidating and finishing concrete for full depth repairs 3 m or greater in length (measured in the direction of traffic) shall be a vibratory steel screed or steel cylinder screed with integral internal vibration including automatic shut-off, and shall operate on fixed forms.

For partial depth repairs and full depth repair areas less than 3 m in length (measured in the direction of traffic), the concrete may be placed and consolidated using hand-held vibrators and finished with a straightedge.

### **366.06.08                      Straight Edge**

Straight edge shall be commercially made of metal, and 3 m long.

### **366.06.09                      Thermocouples and Dataloggers**

Thermocouples and associated instrumentation shall have an accuracy of  $\pm 1.5^{\circ}\text{C}$ , record temperatures at time intervals not exceeding 15 minutes, and shall display the temperature.

## **366.07                              CONSTRUCTION**

### **366.07.01                      Autogenous Cylinder Method Calibration Charts for High Early Strength and Fast-track Concrete Repairs**

For high early strength concrete repairs and fast-track concrete repairs, autogenous cylinder calibration charts shall be developed for the purpose of determining the rate of early strength development of the high early strength and fast-track concrete mixes. The minimum length of time for the calibration chart shall be the period of lane closure specified in the Contract Documents.

The size, preparation and testing of cylinders shall be according to the Early Strength Determination for High Early Strength and Fast-track Concrete Repairs clause.

Development of the calibration charts for high early strength concrete repair and fast-track concrete repair shall be according to the following:

- a) Compressive strength testing at each time interval shall be done on sets of two cylinders.
- b) For high early strength concrete repair, a minimum of six sets of cylinders shall be tested for compressive strength and the Contractor is responsible for determining the timing of testing of the first set of cylinders.
- c) For fast-track concrete repair, the first set of cylinders shall be tested no later than 3 hours after the cylinders are cast.
- d) After the first set of cylinders are tested, testing shall continue at a minimum frequency of every 30 minutes for the length of time of the lane closure.
- e) A thermocouple or sensor shall be installed in one of the cylinders in each set, and the temperature of the concrete shall be recorded at a minimum of every 30 minutes after casting until the time of testing.

### **366.07.02                      Trial Area for Fast-track Concrete Repairs**

A typical fast-track full depth concrete repair shall be demonstrated at the trial repair area specified in the Contract Documents a minimum of 1 week prior to any concreting operation. A trial repair area is not required if the Contractor has demonstrated successful placement of fast-track concrete repairs, meeting all specification requirements, within the last 5 years on another ministry Contract.

If a trial repair area is not specified in the Contract Documents, a location acceptable to the Contract Administrator shall be selected to demonstrate a repair. The selected repair area shall be a minimum of 2 m long by 3.75 m wide and 0.250 m deep.

The ability to fully complete the trial repair area within the time frame of the lane closure specified in the Contract Documents shall be demonstrated. The trial repair shall simulate the Contract site conditions as if it were the last repair of the closure and shall include sampling and testing as specified in the Material Sampling and Testing subsection. The trial repair shall use the same mix design and equipment as will be used for the Work. The trial repair area shall not be overlaid and shall remain exposed for at least 7 Days to permit inspection for deficiencies.

The Contractor shall verify the calibration chart for the mix design strength versus temperature and the calibration chart for the mix design temperature versus time using the autogenous cylinder method.

Five cores shall be obtained from the trial repair area according to the Coring for 28-Day Compressive Strength and Air Void System Parameter Testing clause. Three cores shall be tested for compressive strength and two cores shall be tested for AVS according to the Quality Assurance section. The compressive strength and air void system shall meet the requirements of this specification.

Repairs shall not proceed until written permission from the Contract Administrator has been received indicating that all of the above conditions have been met.

### **366.07.03                      Operational Constraints**

#### **366.07.03.01                  General**

The Contract Administrator shall be notified in writing of the intent to repair the concrete pavement or concrete base 1 week prior to the commencement of the repairs.

Concrete shall not be placed when the air temperature is below 5 °C, or is above 30 °C. Concrete shall not be placed on or against any material with a surface temperature below 5 °C, or above 30 °C.

Vehicles shall not be permitted to drive on areas where the concrete pavement or concrete base has been removed, in whole or part.

The concrete pavement or concrete base shall be protected from damage to the surface at all times when steel-tracked equipment is used. Traffic, other than foot traffic and rubber-tired sawing equipment, shall not be permitted on the concrete until it has attained a compressive strength of 20 MPa.

#### **366.07.03.02                  Concrete Base Repairs**

The Contract Administrator shall be notified 72 hours prior to the asphalt pavement removal. After asphalt pavement removal is complete, the concrete base surface shall be power swept prior to the visual inspection and/or falling weight deflectometer (FWD) testing. Access and any traffic control signing shall be provided to facilitate visual inspection and FWD testing by the Contract Administrator. Equipment which may cause vibrations in the pavement structure shall not be used within 100 m of FWD testing.

#### **366.07.03.03                  High Early Strength Concrete Repair**

Repairs to each high early strength concrete repair location shall be completed within the time frames specified in the Contract Documents.

If the repair is not progressing at a rate that will permit the opening of traffic within the specified time period, appropriate temporary measures acceptable to the Contract Administrator shall be undertaken to allow opening to traffic. These measures shall be at the Contractor's expense. A high early strength concrete repair shall replace the above temporary work during the next scheduled closure.

#### **366.07.03.04                  Fast-track Concrete Repairs**

Fast-track concrete repairs shall not be placed between October 1 and May 1. Fast-track concrete repairs shall not be performed in cold weather conditions. Fast-track concrete repairs shall be full depth.

Repairs to each fast-track concrete repair location shall be completed within the time frames specified in the Contract Documents.

If the repair is not progressing at a rate that will permit the opening to traffic within the specified time period, appropriate temporary measures acceptable to the Contract Administrator shall be undertaken to allow opening to traffic. These temporary measures shall be at the Contractor's expense. A fast-track concrete repair shall replace the above temporary work during the next scheduled closure.

#### **366.07.04 Concrete Removal**

##### **366.07.04.01 Full Depth Repairs**

Full depth repair areas shall be as specified in the Contract Documents or as demarcated by the Contract Administrator. Repairs shall extend the full width of the lane and shall be a minimum of 2 m in length. Partial lane-width repairs shall not be permitted.

The outer limits of the concrete removal area shall be sawcut full depth. Where exposed concrete pavement or concrete base conditions are sufficient to support traffic loading, advanced sawcutting is permitted up to 7 Days in advance of the expected date of removal. Sawcuts shall extend no more than 100 mm into existing adjacent concrete that is to remain in place. Sawcuts in concrete that are to remain in place shall be filled with an epoxy resin acceptable to the Owner.

Concrete removal shall be by a lift-out method rather than breaking in place. Adjoining concrete and underlying base shall remain undisturbed. Heavy breaking equipment such as hoe rams shall not be used in the removal operation.

If during the removal, the underlying material below the concrete pavement or concrete base is disturbed, removed, or damaged, the underlying materials shall be repaired and/or replaced with the same type of underlying material at no additional cost to the Owner.

When the underlying material is open graded drainage layer (OGDL), repair and/or replacement shall be according to OPSS 320. For small localized repair areas, a repair proposal using an alternative OGDL placement method may be submitted for consideration to the Contract Administrator.

When the underlying material is granular, the material requirements shall be according to OPSS 1010. Compaction of the granular materials shall be by means of:

- a) A plate tamper with a minimum mass of 80 kg, or
- b) A self-propelled (walk-behind) single or tandem steel drum with a minimum static mass of 500 kg used in vibration mode.

If during the removal process the adjacent concrete in the lane is damaged or cracked due to the removal procedure, the damaged area shall be cut back full depth to sound concrete and repaired according to this specification and as directed by the Contract Administrator. The full area shall be repaired as one continuous placement.

##### **366.07.04.02 Partial Depth Repairs**

Partial depth repair areas shall be as specified in the Contract Documents or as demarcated by the Contract Administrator. The perimeter of the repair area shall be sawcut vertically to a depth of 25 mm. The concrete within the sawcut area shall be removed using a chipping hammer to a minimum depth of 50 mm, and to a maximum depth of one-third the thickness of the existing concrete pavement or concrete base, without damaging the underlying sound concrete. Any wire mesh in the concrete shall be removed within the repair area.

If the partial depth concrete removal operation reveals deterioration extending to a depth greater than one-third the thickness of the existing concrete pavement or concrete base, the repair shall be treated as a full depth repair and concrete shall be removed according to the Full Depth Repairs clause of the Concrete Removals subsection. Full depth repair works shall not proceed without prior approval from the Contract Administrator.

If during the removal process the adjacent concrete in the lane is damaged, the damaged area shall be cut back to sound concrete and repaired according to this specification and as directed by the Contract Administrator. The full area shall be repaired as one continuous placement.

#### **366.07.05                      Preparation Work**

##### **366.07.05.01                  Full Depth Repairs**

Prior to placing concrete, the underlying material immediately ahead of the concrete placing operation shall be wetted down thoroughly. The wetting down shall be carried out without leaving standing water.

All standing water shall be removed, and any disturbed underlying material shall be repaired prior to concrete placement operation.

##### **366.07.05.02                  Partial Depth Repairs**

All concrete surfaces to receive new concrete shall be abrasive blast cleaned according to OPSS 929.

Immediately prior to wetting the concrete surface, all dust and loose material shall be removed from the prepared surface of the repair area by using compressed air.

The surface of the patch to receive new concrete shall be maintained in a wet condition for a period of 1 hour prior to placing any new concrete. Prior to placing concrete, excess water shall be removed from the surface using compressed air.

Immediately prior to filling the repair area with concrete, a thin even coat of bonding agent shall be brushed onto all vertical and horizontal prepared surfaces against which concrete will be placed. After application of the bonding agent, any fine aggregate separated from the mixture or any excess bonding agent shall be removed from the surface of the concrete.

The bonding agent shall be applied within 30 minutes after mixing and shall not be permitted to dry prior to placing any concrete on it. In the event that the bonding agent has dried, it shall be removed and reapplied prior to concrete placement. All bonding agent or concrete deposited in areas other than the intended point of discharge shall be removed immediately.

#### **366.07.06                      Joints for Full Depth Repairs**

##### **366.07.06.01                  General**

The locations and the type of the joints for concrete pavement and concrete base shall be as specified in the Contract Documents. Possible joint types specified may include construction, transverse, longitudinal, and expansion joints. All joints shall be cut or formed to the joint details specified in the Contract Documents.

A reservoir cut and sealant are not required for concrete base.

Where the operation requires a staged repair, a construction joint shall be placed between stages.

##### **366.07.06.02                  Installation of Dowel Bars and Tie Bars**

Dowel bars and tie bars shall be installed at locations specified in the Contract Documents. Where reinforcement is present in the existing concrete, tie bars and dowel bars may be adjusted  $\pm 25$  mm horizontally and  $\pm 10$  mm vertically, to avoid drilling through the steel reinforcement.

Gang drills shall be used to drill holes in the existing concrete for insertion of the dowel bars and tie bars. The diameter of the drill hole shall be no more than 5 mm larger than the diameter of the dowels or tie bars. Prior to filling the drill holes, the inside surfaces of each drill hole shall be wire brushed and then cleaned using compressed air. The dowel bars and tie bars shall be secured into the existing concrete with epoxy adhesive. The epoxy adhesive shall be injected into the back of the cleaned drill hole and the dowel or tie bar, with grout retention disks attached, shall be inserted to completely encase the bars with epoxy adhesive for the full depth of the hole.

If during the drilling process the existing concrete is cracked due to the drilling procedure, the cracked area shall be cut back full depth to sound concrete.

The dowel bars shall be placed mid-depth of the specified concrete pavement or concrete base thickness and parallel to the longitudinal axis (horizontal alignment) and the horizontal plane (vertical alignment) of the concrete pavement or concrete base within the following tolerances:

- a) Vertical alignment:  $\pm 15$  mm along the length of the dowel bar.
- b) Horizontal alignment:  $\pm 15$  mm along the length of the dowel bar.
- c) Longitudinal side shift: The centre of the dowel bar shall lie within  $\pm 50$  mm from the transverse joint.
- d) Depth:
  - i. For a specified concrete pavement or concrete base thickness of  $< 215$  mm: mid-depth  $\pm 6$  mm.
  - ii. For a specified concrete pavement or concrete base thickness from 215 to 229 mm: mid-depth  $+ 15$  /- 12 mm.
  - iii. For a specified concrete pavement or concrete base thickness of 230 mm or greater: mid-depth  $+ 25$  /- 15 mm.

The tie bars shall be installed within a tolerance of  $\pm 15$  mm from mid-depth of the specified concrete pavement or concrete base thickness. Tie bars shall not be placed within 600 mm of a transverse joint.

Dowel bars and tie bars shall be installed and secured in a manner that will ensure they remain in the proper position and orientation during the concreting operation.

The epoxy adhesive shall be fully cured prior to placing concrete. Immediately prior to placing concrete, the free end of the dowel bars (not tie bars) and the exposed vertical concrete face along the transverse joint shall be coated with bond breaker.

Where tie bars are not specified, the exposed vertical concrete face along the longitudinal joint shall be coated with bond breaker.

Holes that have been started but not completed shall be cleaned and filled with a proprietary patching material.

### **366.07.06.03                      Transverse Joints**

Transverse joints shall be cut or formed to the joint details specified in the Contract Documents and skewed if required. Joints shall have a minimum spacing of 2 m and a maximum spacing of 4 m.

Expansion joints shall be placed where specified in the Contract Documents and when replacing existing expansion joints.

### **366.07.06.04                      Mid-Lane Longitudinal Joints for Fast-track Concrete Repair**

In repair areas where the transverse joint spacing is 3 m or less in length, a longitudinal joint shall be created in the middle of the lane and for the full length of the repair.

Tie bars shall be placed at mid-depth of the concrete pavement or concrete base along the full length of the longitudinal joint. The tie bars shall be 25M deformed bars and shall be 760 mm in length. These bars shall be spaced every 400 mm and shall not be placed within 400 mm of a transverse joint.

Tie bars shall be installed and secured so that they remain in the proper position and orientation during the concreting operation.

#### **366.07.06.05                      Sawcutting, Cleaning and Sealing of Joints**

Sawcutting, cleaning and sealing of joints shall be according to OPSS 369 with the following addition:

For fast-track concrete repairs, equipment specifically designed for dry-cut joint sawing shall be used and the sawing shall be carried out within 2 hours of final finishing. In lieu of sawcutting, the joint may be formed to a minimum depth of one third the pavement thickness when the concrete is in the plastic state.

#### **366.07.07                              Production of Concrete**

Production of concrete shall be according to the General, Temperature Control, Mixing Time and Mixing Rate, and Delivery subsections in OPSS 1350.

#### **366.07.08                              Placing of Concrete**

Prior to placing concrete, the Contract Administrator may request a demonstration of the equipment.

Delivery of concrete shall be according to OPSS 1350.

Placing of concrete in the repair areas shall be according to the Placing of Concrete section of OPSS 350 with the following additions:

- a) Concrete shall be placed in such a way as to avoid disturbing or displacing tie bars, dowel bars or load transfer devices.
- b) When an interruption of more than 45 minutes occurs during placing of full depth repairs using conventional concrete, or 20 minutes for high early strength concrete or 5 minutes for fast-track concrete repairs, a transverse construction joint shall be formed. Notwithstanding the time limits, there shall be no delays which will result in a cold joint. Concrete placed in the areas between the newly formed joint and the previous joint is subject to removal and replacement at no additional cost to the Owner if the Contract Administrator deems it necessary.
- c) For high early strength concrete and fast-track concrete repairs, the use of insulation to retain heat is permitted.

#### **366.07.09                              Consolidating**

Concrete shall be thoroughly consolidated against and along the face of all forms of existing concrete and into the face of previously placed concrete. The vibrators shall not come in contact with the base, subbase, subgrade, underlying material, forms, tie bars, dowel bars or load transfer devices.

For fixed-form placement, hand-held vibrators shall be used to supplement consolidation adjacent to and along the full length of the form. They shall also be inserted at regularly spaced intervals along both sides of load transfer devices, when used.

#### **366.07.10                              Concrete Finishing**

No water or other chemical agents shall be applied to the concrete surface or finishing tools to aid in the finishing.

The concrete edge adjacent to fixed forms or existing concrete pavement or concrete base shall be finished using an edging tool prior to texturing. The edging tool shall have a radius of not more than 6 mm. The finished concrete pavement or concrete base edge shall be left smooth, true to line and grade.

#### **366.07.11                      Texturing of Pavement Surface**

The plastic surface of the concrete pavement and concrete base shall receive an initial texturing immediately after finishing and before the application of curing on the concrete. The initial texturing shall be performed by dragging burlap longitudinally to produce a uniform textured surface. The burlap shall be kept in a clean condition and free from tears and encrusted mortar. It shall be kept damp but shall not add excessive water to the concrete surface.

Concrete pavement shall receive a final texturing using equipment manufactured to produce transverse tines 3 mm  $\pm$  1 mm wide on 16 mm  $\pm$  3 mm centres with a tine depth of 4 mm  $\pm$  1 mm. Tining shall not extend within 75 mm  $\pm$  15 mm of the concrete pavement edge. The surface of the concrete shall be free in all cases from displaced aggregate particles and local projections. Tining for small or irregular areas may be done by hand methods. Manual devices may be used to provide the tined textured.

Final texturing is not required on concrete base or when diamond grinding of the concrete pavement surface is specified in the Contract Documents.

#### **366.07.12                      Curing**

Curing shall be applied within 15 minutes of placing concrete and immediately following texturing.

The curing period shall be a minimum of 7 Days for concrete cured with curing compound and for concrete subject to cold weather. For all other types of curing, the curing period shall be a minimum of 4 Days.

For high early strength and fast-track concrete repairs, only curing compound shall be used for curing and may remain in place following the 7 Day curing requirement.

For conventional concrete repairs, concrete shall be cured using one of the following methods, according to the applicable clauses in OPSS 904:

- a) Curing with Curing Compound, or
- b) Curing with Burlap and Water, except when the air temperature is below 0 °C, curing shall be according to Curing with Moisture Vapour Barrier clause in OPSS 904.

When curing compound is used, it shall not be applied to joint faces against which joint sealing compound is to be placed or to concrete surfaces to which concrete is to be bonded.

Curing compound used on the surface of a concrete base shall be removed completely prior to the application of tack coat and overlaying with asphalt pavement. The method of removal shall be by abrasive blasting according to OPSS 929 and it shall not result in any damage to the concrete surface. The removal process shall meet all environmental constraints as specified in the Contract Documents.

#### **366.07.13                      Retaining Heat for High Early Strength Concrete and Fast-Track Concrete Repairs**

Insulating blankets or protection systems of any type may be used for retaining heat to accelerate the strength gain of high early strength and fast-track concrete repairs. Insulating blankets used for the purpose of accelerating strength gain for high early strength concrete and fast-track concrete repairs are not required to meet the requirements for cold weather protection of other types of concrete.

## **366.07.14 Cold Weather Protection - Conventional and High Early Strength Concrete Repairs**

### **366.07.14.01 General**

The temperature of the concrete during cold weather shall be monitored and controlled for a period of 7 Days to ensure that the concrete temperature does not fall below 15 °C for the first 3 Days of curing and 10 °C for the subsequent 4 Days. The monitoring shall commence at the start of the concrete placing operation.

The cold weather protection system shall be designed for the worst conditions that can be reasonably anticipated from local weather records, forecasts, site conditions, and past experience for the time period during which the protection is required. For cold weather conditions, concrete shall be protected according to the Concrete Subject to Cold Weather clause in OPSS 904. The conditions shall be monitored, and the protection system modified as required.

Cold weather protection may be removed for sawcutting of joints; however, when removed, no concrete shall be left unprotected for more than 1 hour and no more than 25 linear metres of concrete shall be exposed at any one time.

### **366.07.14.02 Monitoring and Control of Temperature**

During cold weather, monitoring and control of the concrete and ambient air temperature shall be recorded and submitted to the Contract Administrator. The monitoring shall commence when the concrete is placed.

For each Day's placement of concrete, thermocouples or sensors shall be embedded within 5 mm of the concrete surface in a minimum of four locations distributed throughout the repair areas, as directed by the Contract Administrator. At least one additional thermocouple or sensor shall be installed to measure ambient air temperature above the surface of the concrete and outside of the specified cold weather protection.

The recording of concrete temperatures shall begin at the start of concrete placement. The temperature shall be recorded automatically at intervals no greater than 15 minutes. The thermocouples and instrumentation shall be left in place and temperatures recorded until the end of the temperature monitoring period.

Concrete and ambient air temperature readings shall be monitored and verified on site every 6 hours or more frequently as required for the first 3 Days, and every 12 hours or more frequently as required for the remainder of the monitoring period. Temperature verification shall be carried out in person at each concrete repair location. All necessary action shall be taken to maintain the temperature within the specified limits.

The Contract Administrator shall be provided physical and digital access to verify temperature readings.

### **366.07.14.03 Submission of Temperature Records**

At the end of each Day during the temperature monitoring period, datalogger temperature records for all of the thermocouples and sensors and a record of any actions taken to maintain control of temperature shall be submitted to the Contract Administrator. At the end of the temperature monitoring period, the complete temperature record for all thermocouples and sensors, including graphical plot of temperature versus time, shall be submitted to the Contract Administrator.

### **366.07.15 Surface Tolerance**

The surface of the concrete repair shall join flush with the existing concrete pavement or concrete base.

The surface of the concrete pavement shall be such that when tested with a 3 m long straightedge placed in any location and direction, including the edge of pavement and joints, except across the crown or drainage gutters, there shall not be a gap greater than 3 mm between the bottom of the straightedge and the surface of the concrete. For concrete base, the tolerance over a 3 m straightedge shall be maximum of 6 mm.

Use of diamond grinding to meet the above requirements shall require the prior approval of the Contract Administrator. The maximum depth of concrete removed by diamond grinding shall not exceed 10 mm.

## **366.07.16 Material Sampling and Testing**

### **366.07.16.01 Slump, Air Content and Temperature**

Plastic concrete sampling, testing, acceptance, field adjustments, visual acceptance, and submission of plastic concrete test results shall be according to the Material Sampling and Testing subsection of OPSS 1350, with the following exceptions and additions:

- a) Testing of plastic air content is not required for fast-track concrete repairs.
- b) The minimum frequency of testing slump and concrete temperature shall be once for each load of concrete.
- c) For fast-track concrete repairs, if the slump exceeds the maximum allowable slump of 230 mm, the load of concrete shall be rejected. Re-testing slump of fast-track concrete is not permitted.

### **366.07.16.02 Coring for 28-Day Compressive Strength and Air Void System Parameter Testing**

For all concrete pavement repairs including fast-track concrete repairs, cores shall be removed from the hardened concrete for acceptance testing by the Owner. Coring shall be carried out when the concrete is 7 to 10 Days of age.

Concrete shall be sampled on a lot basis according to the Quality Assurance section of this specification. For each lot, a total of five cores shall be obtained. Cores shall be taken at random locations specified by the Contract Administrator. Four cores shall be taken from one repair area in the lot within 1 m of one another; three for 28-Day compressive strength testing, and one for air void system (AVS) testing. A single core shall be taken from another repair area within the lot for AVS testing. Cores shall be 100 mm diameter and full depth.

Coring shall be carried out according to CSA A23.2-14C. Cores shall not contain steel reinforcement or other embedded material. A covermeter shall be used to establish the location of steel reinforcement and other embedded material prior to coring. No core shall be taken within 500 mm of any joint or repair area edge.

The Contract number, lot number, repair area identification information, component type (concrete pavement or concrete base), and date of concrete placement and extraction shall be marked legibly on each core with durable ink immediately after removal.

Each core shall be placed in a plastic bag and sealed to prevent loss of moisture, before they are placed in a security bag in the presence of the Contract Administrator. The cores, a transmittal form, and the MTO form PH-CC-433-A, Concrete Mix Design Submission Form A, of the concrete mix design for the concrete pavement or concrete base shall all be submitted to the Contract Administrator.

Core holes shall be filled according to OPSS 1350.

### **366.07.16.03 Early Strength Determination for Conventional Concrete Repairs**

For conventional concrete repairs, the Contractor may elect to take cores for early strength determination in addition to the cores required for determination of 28-Day compressive strength. In order to demonstrate that the pavement has achieved sufficient strength for loading of construction vehicles or traffic, one set of three cores shall be taken for each Day's placement, from the last repair placed during that Day. Cores shall be 100 mm diameter and full depth. All cores of the same set shall be removed at a location no more than 1 m from the location of the first core for that set.

When the Contractor elects to take cores for early strength determination, core removal and handling shall be carried out according to the Coring for 28-Day Compressive Strength and Air Void System Parameter Testing clause.

The Contract Administrator shall be provided with 1 Business Day advance notice to arrange testing by the designated quality assurance laboratory.

Core holes shall be filled according to OPSS 1350.

**366.07.16.04****Early Strength Determination for High Early Strength and Fast-track Concrete Repairs**

The autogenous cylinder method shall be used to determine compressive strength for purposes of opening the lane to traffic. The Contractor is responsible for the timing and frequency of testing of the autogenous cylinders and shall determine when the concrete pavement or concrete base has attained a minimum compressive strength of 20 MPa.

The Contractor shall make a minimum of three sets of two autogenous test cylinders for the final repair area of each lane closure according to CSA A23.2-3C. The cylinders shall be 150 mm in diameter and 300 mm long. Compressive strength testing of autogenous cylinders shall be carried out according to CSA A23.2-9C by the Contractor to verify that the concrete in the repair area has attained a minimum compressive strength of 20 MPa. The testing shall be performed at a laboratory certified as a concrete testing laboratory by the Canadian Council of Independent Laboratories (CCIL) that has successfully participated in the MTO correlation program. The concrete compressive strength specimen shall be tested to complete failure. These test results shall be communicated immediately to the Contract Administrator, prior to re-opening the lane to traffic.

The compressive strength of the concrete in the repair area shall be based on the following procedure:

- a) Install thermocouple or sensors at a minimum of two test locations in the final full depth repair area for each lane closure. The thermocouple or sensors shall be embedded within 5 mm of the concrete surface and at the edge of the repair area. Thermocouple or sensors shall also be embedded in each of the autogenous cylinders.
- b) Monitor and record the temperature of the repaired slab and autogenous cylinders a minimum of once every 30 minutes for high early strength concrete repairs and every 15 minutes for fast-track concrete repair.
- c) Autogenous test cylinders shall be tested in pairs for compressive strength at time intervals determined by the Contractor, until a compressive strength of 20 MPa or greater is obtained. The repaired slab shall not be opened to traffic until the slab temperature has reached at least the same temperature as the cylinders which attained a compressive strength of 20 MPa or greater.

The Contract Administrator shall be provided physical and digital access to verify temperature readings. If the datalogger does not have a digital display for verifying the temperature, the Contract Administrator shall be provided with the necessary instruments to verify thermocouple function and readings.

A record of the temperatures of the repaired slab and autogenous cylinders, and the compressive strength test results shall be submitted to the Contract Administrator for each lane closure.

**366.07.17****Unacceptable Repair Areas**

Concrete found to be unacceptable shall be removed and replaced with new concrete meeting the Contract requirements.

The area to be removed shall extend to the nearest transverse joint and longitudinal joint or edge outside the deficient area so that there are no additional joints.

Concrete which does not meet the surface tolerance may be corrected by diamond grinding in lieu of removal and replacement, subject to approval by the Owner.

**366.07.18****Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **366.08 QUALITY ASSURANCE**

### **366.08.01 Acceptance of Concrete Pavement and Concrete Base Repairs**

Concrete pavement and concrete base repairs shall be acceptable if the requirements of this specification are met, including:

- a) Compressive strength prior to opening to traffic.
- b) 28-Day compressive strength.
- c) Air void system in hardened concrete.
- d) FWD test results indicating a load transfer efficiency of greater than or equal to 70%.
- e) Surface tolerance.
- f) Defects listed in the Defects section of this specification are not present in the work.

### **366.08.02 Lot Size for 28-Day Compressive Strength and Air Void System Acceptance Testing**

Concrete shall be accepted on a lot basis. A lot shall consist of up to 400 m<sup>2</sup> of each type of repair of the same concrete mix design. Conventional concrete repairs, high early strength concrete repairs and fast-track concrete repairs shall be treated as separate lots. Partial depth and full depth repairs shall be treated as separate lots.

For each lot, one set of three cores shall be tested for 28-Day compressive strength and two cores shall be tested for AVS.

### **366.08.03 Acceptance of 28-Day Compressive Strength**

#### **366.08.03.01 General**

One set of three core samples per lot shall be tested to determine the acceptability of 28-Day compressive strength of the lot. Compressive strength shall be determined according to LS-410. The 28-Day compressive strength result of a lot shall be the average of the set of the three acceptance cores, rounded to one decimal place.

28-Day Compressive strength of a lot shall be considered acceptable when:

- a) The average 28-Day compressive strength of the set of three cores is equal to or greater than specified strength, and
- b) No individual core result is more than 10% below the specified strength.

Unacceptable lots shall be rejected. Concrete from unacceptable lots shall be removed and replaced.

Individual test results shall be forwarded to the Contractor as they become available.

#### **366.08.03.02 Referee Testing**

##### **366.08.03.02.01 General**

Referee testing for 28-Day compressive strength shall be according to OPSS 1350, except that referee testing shall be done on a new set of cores removed within 24 hours of invoking the referee testing. A set of referee cores for 28-Day compressive strength shall consist of three individual cores and shall be taken from the same repair area from which acceptance samples were obtained in the presence of the Contract Administrator. The core size and core extraction shall be according to the Coring for 28-Day Compressive Strength and Air Void System Parameter Testing clause.

All cores of the same set shall be removed at a location no more than 1 m from the location of the first core for that set.

Coring shall be carried out according to CSA A23.2-14C. No core shall be taken within 500 mm of any joint or repair area edge. The Contractor shall use a covermeter to establish the location of steel reinforcement and other embedded material prior to coring. Cores shall not contain steel reinforcement or other embedded material.

The Contract number, lot number and repair area identification information shall be marked legibly on each core with durable ink. Each core shall be placed in a plastic bag and sealed to prevent loss of moisture.

The Contractor shall fill the core holes according to OPSS 1350.

#### **366.08.03.02.02 Referee Testing Cost**

The cost of referee testing of 28-Day compressive strength shall be as specified in the Contract Documents.

When the referee results indicate that the refereed lot is acceptable, the Owner shall bear the cost. When the referee results indicate that the refereed lot is not acceptable, the Contractor shall be charged the cost of the 28-Day compressive strength referee testing.

#### **366.08.04 Acceptance of Air Void System in Hardened Concrete**

##### **366.08.04.01 General**

One half of each core shall be tested according to LS-432 to determine the acceptability of concrete AVS of the lot. The other half of each core shall be retained by the Owner for audit purposes.

For a lot to be considered acceptable, the cores shall have an air content of 3.0% or more and a spacing factor of 0.230 mm or less.

An unacceptable lot is a lot represented by one or two cores that fail to meet the air void system parameters.

Unacceptable lots shall be rejected. Concrete from unacceptable lots shall be removed and replaced.

Individual test results shall be forwarded to the Contractor as they become available.

##### **366.08.04.02 Referee Testing**

###### **366.08.04.02.01 General**

Referee testing of AVS parameters may only be invoked by the Contractor within 3 Business Days of receiving the test result.

When referee testing is invoked, all core samples representing a lot shall be referee tested and the acceptance test results discarded. The lot referee test results shall replace the acceptance test result in the acceptance requirements of this specification.

Referee testing shall be carried out on the same half of the core sample that was tested for acceptance.

Cores shall be tested according to LS-432. Referee test results shall be forwarded to the Contractor as they become available.

###### **366.08.04.02.02 Referee Testing Cost**

The cost of AVS referee testing shall be as specified in the Contract Documents.

When the referee results indicate that the refereed lot is acceptable, the Owner shall bear the cost. When the referee results indicate that the refereed lot is not acceptable, the Contractor shall be charged the cost of the air void system referee testing.

### **366.08.05                      Falling Weight Deflectometer Acceptance Testing**

#### **366.08.05.01                      General**

The work shall be made available for FWD testing by the Owner.

The Contract Administrator shall determine the load transfer efficiency across all transverse joints of the full depth concrete repair area by carrying out FWD testing. FWD testing, equipment calibration, and reporting shall be according to LS-449. The new joint shall be acceptable if the FWD test results indicate load transfer efficiency of 70% or greater. The new joint with a load transfer efficiency less than 70% shall be removed and replaced full depth and full lane width as specified in the Contract Documents.

#### **366.08.05.02                      Referee Testing**

FWD referee testing may only be invoked by the Contractor within 3 Business Days of receiving the test result. Referee testing shall be according to LS-449. The referee test result shall replace the acceptance test result in the acceptance requirements of this specification. Referee test results shall be forwarded to the Contractor, as they become available.

#### **366.08.05.03                      Referee Testing Cost**

When the referee results indicate that the refereed repair is acceptable, the Owner shall bear the cost. When the referee results indicate that the refereed repair is not acceptable, the Contractor shall be charged the cost of the FWD referee testing.

### **366.08.06                      Acceptance of Surface Tolerance**

Each repair area shall meet the requirements of the Surface Tolerance subsection of this specification. Repair areas that do not meet the surface tolerance requirements of this specification shall be considered unacceptable and shall be repaired according to this specification or removed and replaced.

#### **366.08.07                      Defects**

Concrete repair areas are unacceptable if they contain any of the following defects:

- a) Concrete with any visible surface cracks in the repair, unless the Contractor demonstrates, at no cost to the Owner, that the depth of the crack is less than 10 mm.
- b) Concrete with honeycombing or other deficiencies detected visually.
- c) Partial depth repairs with debonding identified by sounding.
- d) Dowel bars and tie bars not meeting the requirements of this specification.

Unacceptable repairs shall be removed and replaced.

**366.09 MEASUREMENT FOR PAYMENT**

**366.09.01 Actual Measurement**

**366.09.01.01**  
**Conventional Concrete Repair (Full Depth)**  
**Conventional Concrete Repair (Partial Depth)**  
**High Early Strength Concrete Repair (Full Depth)**  
**High Early Strength Concrete Repair (Partial Depth)**  
**Fast-track Concrete Repair**

Measurement of conventional concrete repair, high early strength concrete repair, and fast-track concrete repair shall be by the area of the repair in square metres. Each repair area shall be measured to the nearest 0.1 m<sup>2</sup>.

**366.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**366.10 BASIS OF PAYMENT**

**366.10.01**  
**Conventional Concrete Repair (Full Depth) - Item**  
**Conventional Concrete Repair (Partial Depth) - Item**  
**High Early Strength Concrete Repair (Full Depth) - Item**  
**High Early Strength Concrete Repair (Partial Depth) - Item**  
**Fast-track Concrete Repair - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material required to do the Work.

**TABLE 1**  
**Nominal Maximum Size of Coarse Aggregate**

| <b>Concrete Repair Depth</b> | <b>Nominal Maximum Size of Coarse Aggregate</b>                                        |
|------------------------------|----------------------------------------------------------------------------------------|
| Partial Depth                | 19.0 mm                                                                                |
| Full Depth                   | 19.0 mm or combined gradation of nominal maximum aggregate size of 37.5 mm and 19.0 mm |

## **CSA Standards**

A23.2-14C      Obtaining and Testing Drilled Cores for Compressive Strength Testing\*  
\*[Part of A23.1-19/A23.2-19 - Concrete Materials and Methods of Concrete Construction/Methods of Test and Standard Practices for Concrete]

### **369.03                      DEFINITIONS**

For the purpose of this specification, the following definitions shall apply:

**Backer Rod** means a compressible material inserted into the joint reservoir to achieve the required shape factor for the joint sealing compound and prevent loss of joint sealing compound.

**Concrete Base** means as defined in OPSS 350.

**Concrete Pavement** means as defined in OPSS 350.

**Effluent** means as defined in OPSS 350.

**Reservoir** means a sawcut cavity used in some existing concrete pavement longitudinal and transverse joints of specific dimensions designed to receive a backer rod and joint sealing compound.

**Shape Factor** means the ratio of width to depth of a field poured liquid sealant within the reservoir.

### **369.04                      DESIGN AND SUBMISSION REQUIREMENTS**

#### **369.04.01                      Submission Requirements**

##### **369.04.01.01                      Joint Sealing Compound**

The following joint sealing compound product information shall be submitted to the Contract Administrator prior to the joint sealing operations:

- a) Product name and manufacturer;
- b) The manufacturer's batch or lot number or designation;
- c) The manufacturer's recommended heating time and heating temperature range; and
- d) The manufacturer's installation procedures.

### **369.05                      MATERIALS**

#### **369.05.01                      Backer Rods**

Backer rods shall be made of polyethylene foam, cross-linked polyethylene foam, polyurethane foam, or equivalent material acceptable to the Owner.

##### **369.05.02                      Joint Sealing Compound**

Hot poured rubberized asphalt joint sealing compound shall be according to OPSS 1212 and shall be on the MTO DSM list designated for use with the joint design specified in the Contract Documents.

## **369.06 EQUIPMENT**

### **369.06.01 Air Compressor**

The air compressor used to supply the hot-compressed air lance shall be equipped with oil and moisture filters and provide a minimum pressure of 700 kPa at a minimum air volume of 4.25 cubic metres per minute (150 cfm).

### **369.06.02 Heating and Mixing Kettle for Joint Sealing Compound**

The heating and mixing kettle shall be used for the hot poured rubberized asphalt joint sealing compound.

The kettles shall be of the double boiler oil heat transfer type with a built-in agitator and equipped with two functional permanently installed dial type thermometers. The thermometers shall measure the temperature of the melted compound and the oil to an accuracy of  $\pm 2$  °C. Heating shall be controlled by an automatic thermostat to maintain the temperature of the product used within the range required by the manufacturer. Infrared or direct heat kettles shall not be used.

Certificates of calibration from an organization accredited by the Standards Council of Canada shall be available for review when requested by the Contract Administrator for each gauge certifying that the thermometers can measure the temperature within a tolerance of  $\pm 2$  °C.

### **369.06.03 Hot Compressed Air Lance**

The hot compressed air lance shall have an oil free discharge of air at a temperature greater than 200 °C and less than 500 °C, and an air velocity greater than 1,000 m per second.

### **369.06.04 Sawcutting Equipment**

The sawcutting equipment shall be self-propelled, guided, and capable of sawcutting the joints to the dimensions specified in the Contract Documents. The sawcutting equipment shall be capable of sawcutting the joints without causing spalling or damage to the adjacent concrete.

For resealing cracks with an existing reservoir, sawcutting equipment shall be capable of following the path of random cracks to create a reservoir to the dimensions specified in the Contract Documents, without causing spalling or damage to the adjacent concrete.

The saw shall be equipped with a diamond blade.

### **369.06.05 Thermometer**

A separate calibrated thermometer with an accuracy of  $\pm 2$  °C for verification of the joint sealing compound temperature shall be available on the job site.

## **369.07 CONSTRUCTION**

### **369.07.01 General**

Joints and cracks identified in the Contract Documents and in the field by the Contract Administrator shall be sealed with hot poured rubberized asphalt joint sealing compound.

The maximum width of repair shall be 25 mm for both transverse and longitudinal joints or cracks. Joints or cracks exceeding the maximum repair width shall be repaired as directed by the Contract Administrator.

### **369.07.02 Operational Constraints**

Joints may be sealed prior to or after grinding, milling, or grooving operations. Cracks shall be sealed after grinding, milling or grooving operations are completed.

Joint sealing compound shall not be placed until new concrete has cured for a minimum period of 7 Days.

Joint sealing compound shall not be placed when the ambient air or concrete pavement surface temperatures are less than 5 °C.

Joints and cracks shall be sealed between 24 and 48 hours after completion of the water flushing.

Cracks and joints shall be kept in a dry condition for a minimum period of 24 hours prior to joint sealing compound installation. This time period shall be extended only if necessary to ensure the joint or crack is dry.

For newly constructed joints, joints shall be sealed within the same calendar year in which they are constructed. For crack and joint resealing, cracks and joints shall be resealed within the same calendar year in which the existing sealant is removed.

### **369.07.03                      Removal of Existing Sealant and Seals**

All existing sealant, seals, bond breaker tapes, and backer rod shall be removed without damaging the adjacent joint or crack faces.

### **369.07.04                      Sawcutting**

#### **369.07.04.01                  Reservoir**

For resealing joints with a reservoir cut or cracks with a reservoir cut, sawcutting equipment shall be used to create a reservoir with the dimensions specified in the Contract Documents. Routers shall not be used for creating the reservoir.

The shape factor for hot poured rubberized joint sealing compound shall be 1H:1V.

When resealing joints and cracks, if the existing reservoir is determined by the Contract Administrator to be in an acceptable condition with minimal spalling, with no joint sealant adhered to the side of the joint and with proper dimensions, sawcutting shall not be required. The existing reservoir shall be cleaned according to the Joint or Crack Cleaning subsection.

When sawcutting existing joints, the least amount of concrete shall be removed to meet the specified requirements.

#### **369.07.04.02                  New Longitudinal and Transverse Joints**

New longitudinal and transverse joints, in newly constructed and repair areas of concrete pavement and concrete base shall be sawcut to the dimensions specified in the Contract Documents.

Sawcutting equipment shall be used to create the joints. Routers should not be used for creating the joints.

The initial sawcut for longitudinal and transverse joints shall be carried out as soon as the joint can be sawcut without ravelling the joint or damaging the concrete surface, and prior to any cracks developing.

Longitudinal and transverse sawcutting operations shall be carried out concurrently. Sawcutting of the joints to the specified dimensions may be done with the initial sawcut or in two parts with an initial sawcut and a final sawcut. The initial sawcut, and final sawcut, if applicable, shall be a minimum of one third the depth of the concrete slab and shall not be so deep as to cut the tie bars or dowel bars.

### **369.07.05                      Joint or Crack Cleaning**

Cleaning of joints or cracks shall remove all sawcut slurry, grinding and grooving effluent, if applicable, and any other debris from the joint or crack. Cleaning of joints or cracks shall consist of flushing the joints or cracks with water in one direction to remove slurry, effluent and debris. Additional methods of cleaning the joints or cracks may be required and shall be approved by the Contract Administrator.

Cracks shall be cleaned at a minimum between 24 and 48 hours before sealing. Joints shall be cleaned at a minimum at each of the following times:

- a) Immediately after each sawcutting operation.
- b) Immediately after final texturing for unsealed joints.
- c) Between 24 and 48 hours before sealing.

Immediately prior to sealing operations, all new or existing joint and crack faces shall be abrasive blast cleaned according to OPSS 929.

The new or existing joint or crack and adjacent concrete pavement surface shall then be blown clean and dried, using a hot compressed air lance.

When resealing joints and cracks, cleaning shall remove all existing joint sealing compound.

### **369.07.06                      Backer Rod Installation**

Backer rod installation is required when a reservoir cut is used.

Backer rods shall have a minimum diameter of 25% greater than the reservoir width. They shall be installed immediately after cleaning and drying of the joints and cracks before joint sealing compound installation. Backer rods shall be inserted uniformly to the required depth to achieve the required shape factor.

Backer rods shall be inserted using a double wheel steel roller and shall not be punctured or stretched during the installation process.

### **369.07.07                      Joint Sealing Compound Installation**

#### **369.07.07.01                  General**

Transverse joints shall be filled prior to longitudinal joints.

Joint sealing compound shall be installed according to the manufacturer's recommendations and as specified in the Contract Documents.

#### **369.07.07.02                  Joint Sealing Compound Preparation and Installation**

The joint sealing compound shall be slowly melted with constant agitation until it is in a lump-free, free-flowing state, within the application temperature range recommended by the manufacturer for application.

The Contract Administrator shall be informed at least 24 hours prior to the initial charging of the empty kettle with joint sealing compound. The initial charge of material shall be placed in an empty kettle. The Contract Administrator shall be granted access to witness the empty kettle and initial charge of joint sealing compound upon request.

Joints and cracks shall be clean and dry when the joint sealing compound is placed.

The joint sealing compound shall be placed by a manual pouring cone or hose and wand fitted with a tip from a low pressure pump connected to the heating kettle. The tip shall be small enough to fit inside the joint or crack and extend to the bottom of the sawcut or, when specified, to the top of the backer rod.

When filling joints or cracks with a reservoir, the tip of the cone or wand shall be placed to the top of the backer rod to ensure uniform application.

When filling joints without reservoir, the tip of the cone or wand shall be placed at the bottom of the sawcut to ensure uniform application.

Joints and cracks shall be filled with joint sealing compound so that upon cooling, the joint sealing compound is recessed 3 to 6 mm below the adjacent concrete pavement surface. If the initial placement of material subsides below the required recess depths, additional joint sealing compound shall be placed within 8 hours of the original placement.

Joint sealing compound shall be fully adhered to the concrete on both sides of the joint or crack.

Joint sealing compound damaged by construction traffic or by the Contractor's operations shall be removed and replaced.

Any spilled material or excess material in the joints or cracks shall be removed immediately and the concrete pavement surface cleaned.

The material heated shall be placed on the same Day. Excess heated material shall be disposed of and shall not be used on subsequent Days.

### **369.07.08 Material Sampling and Testing**

#### **369.07.08.01 Sampling of Hot Poured Rubberized Joint Sealing Compound**

During the installation of the joint sealing compound, a 4-litre sample of the joint sealing compound shall be submitted to the Contract Administrator, upon request, for testing by the Owner. The joint sealing compound shall be sampled from the heating kettle.

All containers used for sampling shall be metal, with double tight lids. The Contract Administrator shall be allowed to examine the sample containers prior to sampling to ensure they are clean and free of debris.

Samples shall be accompanied by a sample data sheet and WHMIS label. Samples shall be delivered with a transmittal form identifying the following information:

- a) Contract number.
- b) Name of Contractor and a contact person's name and telephone number.
- c) Contract Administrator's name and telephone number.
- d) Quantity, type of sample, and product name.
- e) Date sampled (yyyy-mm-dd).
- f) Temperature of the joint sealing compound in the heating kettle at the time of sampling.
- g) Date shipped.
- h) Sample location.

#### **369.07.08.02 Coring for Cleaning and Sealing Inspection**

After sealing operations are complete, the Contract Administrator may require that cores be taken at joint or crack locations to evaluate the acceptability of the joint or crack cleaning and sealing.

Coring shall be carried out according to CSA A23.2-14C. The cores shall be 100 mm in diameter and shall be drilled through the full depth of concrete pavement or concrete base, perpendicular to the surface of the concrete pavement or concrete base. No core shall be taken within 250 mm of any joint or edge of slab.

If the samples show that the joint or crack cleaning and sealing are not according to this specification, additional cores may be required at no additional cost to the Owner to determine the extent and locations of the improperly cleaned or improperly sealed joints.

Core holes shall be repaired according to OPSS 1350.

### **369.07.09 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **369.08 QUALITY ASSURANCE**

#### **369.08.01 Acceptance of Hot Poured Rubberized Joint Sealing Compound**

When hot poured rubberized joint sealing compound is tested, acceptance shall be according to OPSS 1212. Unacceptable hot poured rubberized joint sealing compound shall be removed and replaced.

#### **369.08.02 Acceptance of Cleaning and Sealing**

During and after sealing operations, the Contract Administrator will inspect the joints and cracks including any cores taken at joint or crack locations to evaluate the acceptability of the joint and crack cleaning and sealing. The Contract Administrator will reject all or a portion of the work if the inspection shows that the joint or crack cleaning and sealing is not according to this specification. Rejected portions of the work shall be removed and replaced.

### **369.09 MEASUREMENT FOR PAYMENT**

#### **369.09.01 Actual Measurement**

##### **369.09.01.01 Sealing of Cracks**

Measurement of sealing of cracks in existing concrete pavement or concrete base shall be by length in metres measured along the centreline of the crack.

##### **369.09.01.02 Resealing of Joints and Cracks**

Measurement of resealing of joints and cracks in existing concrete pavement or concrete base shall be by length in metres measured along the centreline of the joint or crack.

#### **369.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

### **369.10 BASIS OF PAYMENT**

#### **369.10.01 Sealing of Cracks - Item Resealing of Joints and Cracks - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material required to do the work.

Sawcutting, cleaning and sealing of joints in new concrete pavement shall be paid under the Concrete Pavement item according to OPSS 350.

Sawcutting and cleaning of joints in new concrete base shall be paid under the Concrete Base item according to OPSS 350.

Sawcutting, cleaning and sealing of joints for concrete pavement repairs and the sawcutting and cleaning of joints for concrete base repairs shall be paid under the appropriate tender items according to OPSS 366.

When the maximum width of repair is greater than 25 mm for both transverse and longitudinal cracks and joints, the work directed by the Contract Administrator shall be administered as a Change in the Work.

## **CONSTRUCTION SPECIFICATION FOR TRENCHING, BACKFILLING, AND COMPACTING**

### **APPENDICES**

|              |                   |
|--------------|-------------------|
| <b>401-A</b> | <b>Commentary</b> |
|--------------|-------------------|

#### **401.01 SCOPE**

This specification covers the requirements for excavating, backfilling, and compacting trenches for the installation of sanitary and storm pipe sewers; pipe culverts and end sections; pipe subdrains; forcemains and associated appurtenances; watermain and associated appurtenances; and other underground Utilities.

##### **401.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

#### **401.01.02       Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

#### **401.02                       REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## Provincial Statute

*Occupational Health and Safety Act*

R.S.O. 1990, c. O.1, as amended

Ontario Regulations 213/91 - Regulations for Construction Projects, as amended

### 401.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Additional Excavation** means all excavation ordered in writing by the Contract Administrator beyond excavation specified in the Contract Documents.

**Associated Appurtenances** means as defined in OPSS 412 and OPSS 441.

**Backfilling** means the operation of filling the trench with bedding, cover, and backfill material or embedment and backfill material.

**Backfill Material** means fill material used above the embedment or cover material and below the lower of the subgrade or finished grade or the original ground.

**Bedding Class** means a classification system that defines the depth of the bedding material.

**Bedding Material** means material as it relates to rigid pipe, from the bottom of the trench to the bottom of the cover.

**Cover Material** means the material placed from the top of the bedding to the bottom of the backfill for rigid pipe.

**Embedment Material** means material as it relates to flexible pipe, from the bottom of the trench to the bottom of the backfill.

**Excavation, Earth and Rock** means the excavation classified as earth and rock according to OPSS 206.

**Flexible Pipe** means pipe that can deflect 2% or more without cracking such as polyvinyl chloride, polyethylene, or steel pipe.

**Imported Material** means material obtained from a source other than the Working Area.

**Native Material** means the material removed to form an excavation within the Working Area for return to the same or other excavation.

**Pipe** means sanitary or storm pipe sewers, watermains, forcemains, pipe culverts, and subdrains.

**Rigid Pipe** means pipe that cannot deflect more than 2% without cracking such as concrete pipe.

**Trench** means as defined in Ontario Regulations 213/91.

**Trenching** means the earth or rock excavation required to construct a trench in which to install pipes and their associated appurtenances.

**Trench Width** means the horizontal distance between the trench walls as measured at the bedding grade.

**Unshrinkable Fill** means as defined in OPSS 1359.

## **401.05 MATERIALS**

### **401.05.01 Embedment Material**

Embedment material shall be one of the following, as specified in the Contract Documents:

- a) Granular A.
- b) Granular B, Type I, II, or III, with 100% passing the 26.5 mm sieve.
- c) Unshrinkable fill.

### **401.05.02 Bedding Material**

Bedding material shall be one of the following, as specified in the Contract Documents:

- a) Granular A.
- b) Granular B, Type I, II, or III, with 100% passing the 26.5 mm sieve.
- c) Unshrinkable fill.

### **401.05.03 Cover Material**

Cover material shall be one of the following, as specified in the Contract Documents:

- a) Granular A.
- b) Granular B, Type I, II, or III, with 100% passing the 26.5 mm sieve.
- c) Native material.

### **401.05.04 Granular Material**

Granular material shall be according to OPSS 1010.

### **401.05.05 Backfill Material**

#### **401.05.05.01 General**

Backfill material shall be one of the following, as specified in the Contract Documents:

- a) Granular A.
- b) Granular B, Type I, II, or III.
- c) Unshrinkable fill.
- d) Native material.

#### **401.05.05.02 Native and Imported Material**

Native and imported material shall be approved by the Contract Administrator. All material shall be free from frozen lumps, cinders, ashes, refuse, vegetable or organic matter, rocks and boulders over 150 mm in any dimension, and other deleterious material.

**401.05.06 Unshrinkable Fill**

Unshrinkable fill shall be according to OPSS 1359.

**401.07 CONSTRUCTION**

**401.07.01 General**

Trenches shall be stable and dry, unless designated as subaqueous work.

**401.07.02 Site Preparation**

Site preparation shall be according to OPSS 490.

**401.07.03 Preservation and Protection of Existing Facilities**

Preservation and protection of existing facilities shall be according to OPSS 491.

**401.07.04 Removals**

Removals shall be according to OPSS 510.

**401.07.05 Dewatering**

Dewatering shall be according to OPSS 517 for placement of pipe or to OPSS 902 for placement of structure.

**401.07.06 Support Systems**

Support systems shall be according to OPSS 404.

**401.07.07 Temporary Protection Systems**

The construction of all temporary protection systems shall be according to OPSS 539. When the stability, safety, or function of an existing roadway, railway, other works, or proposed works may be impaired due to the method of operation, appropriate protection shall be provided. Protection may include sheathing, shoring, and the driving of piles, when necessary.

**401.07.08 Removal of Frozen Ground**

Written permission shall be obtained from the Contract Administrator prior to starting any excavation in frozen ground. The method used for removal of frozen ground shall not cause damage to adjacent structures or Utilities.

**401.07.09 Trenching**

Trenches shall be excavated to the lines, grades, and dimensions specified in the Contract Documents. The width of the trench at the bottom shall not exceed the width at the top.

Trenching for pipe culverts shall include the excavation for frost tapers and end sections.

No more than 15 m of trench shall be open in advance of the completed pipe system.

The Contract Administrator shall be notified immediately if the bottom of the trench appears to give an unsuitable foundation.

When installing rigid pipe, if the trench is excavated wider than the allowable width without authorization, the Contract Administrator may require the use of a stronger pipe or a higher class of bedding or both.

If the trench depth is excavated beyond the limits of the required excavation without the Contract Administrator's authorization, granular material shall be placed and compacted in the trench to reinstate the required trench limits prior to backfilling the trench as specified in the Contract Documents. Alternatively, another structurally accepted design shall be provided by adjusting the limits of the excavation prior to backfilling.

Rock excavation for trenches shall be according to OPSS 403.

#### **401.07.10 Backfilling and Compacting**

##### **401.07.10.01 General**

The diameter or the span and rise of flexible pipes shall not vary from the manufactured dimensions by more than 5% during cover and backfill placing operations.

Pipe installation and backfilling shall be completed prior to the start of subbase and base course construction over the pipe location.

Compacting of embedment, bedding, cover, and backfill materials during pipe installation shall be according to OPSS 501.

Prior to allowing the movement of any construction equipment or vehicular traffic over the buried infrastructure, the depth of backfill shall be sufficient enough to protect the buried infrastructure from damage.

##### **401.07.10.02 Embedment**

Placement of embedment material shall be as described in the Bedding and Cover clauses.

##### **401.07.10.03 Bedding**

Pipe bedding shall be of the class specified in the Contract Documents.

The surface upon which the pipe is to be laid shall be true to grade and alignment.

The pipe bedding shall be shaped to the dimensions specified in the Contract Documents. When bell and spigot pipe is to be laid, recesses shall be shaped to receive the bells.

Bedding material placed in the haunches shall be compacted prior to continued placement of cover material.

Bedding material shall be placed in uniform layers not exceeding 200 mm in thickness, loose measurement, and each layer shall be compacted according to OPSS 501 before a subsequent layer is placed.

Bedding material shall be placed on each side of the pipe and shall be completed simultaneously. At no time shall the levels on each side differ by more than the 200 mm uncompacted layer.

##### **401.07.10.04 Cover**

Cover material shall be placed so that damage to or movement of the pipe is avoided.

Cover material shall be placed in uniform layers not exceeding 200 mm in thickness, loose measurement,

and each layer shall be compacted according to OPSS 501 before a subsequent layer is placed.

Cover material shall be placed on each side of the pipe and shall be completed simultaneously. At no time shall the levels on each side differ by more than the 200 mm uncompacted layer.

#### **401.07.10.05 Backfill**

Backfill material shall be placed in uniform layers not exceeding 300 mm in thickness, loose measurement, for the full width of the trench and each layer shall be compacted according to OPSS 501 before a subsequent layer is placed.

Backfill material shall be placed to a minimum depth of 900 mm above the crown of the pipe before power operated tractors or rolling equipment shall be used for compacting. Uniform layers of backfill material exceeding 300 mm in thickness may be placed with the approval of the Contract Administrator.

When the Contract specifies native backfill material, acceptable earth backfill material may be substituted with the approval of the Contract Administrator. In areas within the roadway, for a depth equal to the frost treatment, the earth backfill material shall have frost susceptible characteristics similar to the adjacent material.

#### **401.07.11 Additional Trenching, Backfilling, and Compacting**

Additional trenching, backfilling, and compacting shall be as described in the Trenching and Backfilling and Compacting subsections.

Unsuitable material shall be excavated and the resulting excavation shall be backfilled and compacted to obtain a suitable foundation.

#### **401.07.12 Site Restoration**

Site restoration shall be according to OPSS 492.

#### **401.07.13 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **401.09 MEASUREMENT FOR PAYMENT**

#### **401.09.01 Actual Measurement**

##### **401.09.01.01 Additional Trenching, Backfilling, and Compacting**

Additional trenching, backfilling, and compacting shall be based on the volume of the additional excavation measured in cubic metres prior to installation of the pipe.

The volume of the excavation that is in addition to the limits specified in the Contract Documents shall be determined.

### **401.10 BASIS OF PAYMENT**

#### **401.10.01 Trenching, Backfilling, and Compacting**

Payment at the Contract price for the appropriate tender items for the installation of sanitary and storm pipe sewers, pipe culverts and end sections, subdrains, forcemains and associated appurtenances,

watermains and associated appurtenances, and other underground Utilities shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract contains separate items for work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

Any expenses for remedial work resulting from unauthorized over-excavation of the trench width and depth shall be borne by the Contractor.

When native material is deemed unsuitable for backfill for reasons other than those attributed to the Contractor's mode of operation, any additional work done to provide acceptable backfill beyond the work herein specified shall be administered as a Change in the Work.

**401.10.02                      Additional Trenching, Backfilling, and Compacting - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**401.10.03                      Rock Excavation for Trenches**

Payment for rock excavation for trenches shall be according to OPSS 403.

**Appendix 401-A, November 2015**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

**APPENDICES**                      **Not Used**

**402.01**                      **SCOPE**

This specification covers the requirements for excavating, backfilling, and compacting for the installation of storm and sanitary pipe sewer maintenance holes, storm sewer catch basins and ditch inlets, and valve chambers for watermains and forcemains.

**402.01.01**                      **Specification Significance and Use**

This specification has been developed for use in provincial oriented Contracts. The administration, testing, and payment policies, procedures, and practices reflected in this specification correspond to those used by the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **402.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **402.02 REFERENCES**

When the Contract Documents indicate that provincial specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## **402.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Additional Excavation** means all excavation ordered in writing by the Contract Administrator beyond excavation specified in the Contract Documents.

**Backfilling** means the operation of filling the excavation with bedding and backfill material.

**Backfill Material** means approved fill material used above the bedding and below the lower of the subgrade or finished grade or original ground.

**Bedding Material** means the material used to support the maintenance hole, catch basin, ditch inlet, or valve chamber.

**Excavation, Earth and Rock** means the excavation classified as earth and rock according to OPSS 206.

**Imported Material** means material obtained from a source other than the Work Area.

**Native Material** means the material removed to form an excavation within the Work Area for return to the same or other excavation.

**Over-Excavation** means all excavation beyond that specified in the Contract Documents, performed without the written order of the Contract Administrator.

**Structure** means maintenance hole, catch basin, ditch inlet, or valve chamber.

**Unshrinkable Fill** means a controlled density cement treated aggregate material.

## **402.05 MATERIALS**

### **402.05.01 Granular Material**

Granular material shall be according to OPSS 1010.

### **402.05.02 Backfill Material**

#### **402.05.02.01 General**

Backfill material shall be as specified in the Contract Documents.

#### **402.05.02.02 Native and Imported Material**

Native and imported material shall be material approved by the Contract Administrator. All material shall be free from frozen lumps, cinders, ashes, refuse, vegetable or organic matter, rocks, and boulders over 150 mm in any dimension, and other deleterious material.

### **402.05.03 Unshrinkable Fill**

Unshrinkable fill shall be according to OPSS 1359.

**402.07 CONSTRUCTION**

**402.07.01 General**

Excavations shall be stable and dry, unless designated as subaqueous Work.

**402.07.02 Site Preparation**

Site preparation shall be according to OPSS 490.

**402.07.03 Preservation and Protection of Existing Facilities**

Preservation and protection of existing facilities shall be according to OPSS 491.

**402.07.04 Removals**

Removals shall be according to OPSS 510.

**402.07.05 Dewatering**

Dewatering shall be according to OPSS 517.

**402.07.06 Support Systems**

Support systems shall be according to OPSS 404.

**402.07.07 Removal of Frozen Ground**

Written permission shall be obtained from the Contract Administrator prior to starting an excavation in frozen ground. The method used for removal of frozen ground shall not cause damage to adjacent structures or Utilities.

**402.07.08 Excavation**

**402.07.08.01 General**

Excavation shall be performed to the lines, elevations, and dimensions specified in the Contract Documents plus an allowance for support systems, where required.

Rock excavation for maintenance holes, catch basins, ditch inlets, or valve chambers shall be according to OPSS 403.

**402.07.08.02 Additional Excavation**

Structures shall not be placed or constructed on an unsuitable foundation as may be determined by the Contract Administrator.

Unsuitable material shall be excavated and the resulting excavation shall be backfilled and compacted to obtain a suitable foundation.

**402.07.08.03 Over-Excavation**

Corrective measures ordered by the Contract Administrator to rectify deficiencies caused by over-excavation shall be performed. Soil that has become disturbed by construction methods or procedures shall be removed and replaced with granular material compacted to 95% maximum dry density where the excavated surface is below or beside the proposed structure.

**402.07.09 Backfilling and Compacting**

**402.07.09.01 Bedding**

A 150 mm layer of granular bedding material shall be placed on the bottom of the excavation and compacted according to OPSS 501, prior to the placing of a structure.

**402.07.09.02 Backfill**

Backfill material shall be placed simultaneously on all sides of the structure in layers not exceeding 300 mm in thickness, loose measurement, and compacted according to OPSS 501, prior to the placement of a subsequent layer.

Backfill material shall not commence around cast-in-place concrete structures until approval has been obtained from the Contract Administrator.

**402.07.10 Additional Excavating, Backfilling, and Compacting**

Additional excavating, backfilling, and compacting shall be as described in the Excavation and Backfilling and Compacting subsections.

The volume of the excavation that is in addition to the limits specified in the Contract Documents shall be determined.

**402.07.11 Site Restoration**

Site restoration shall be according to OPSS 492.

**402.07.12 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**402.09 MEASUREMENT FOR PAYMENT**

**402.09.01 Actual Measurement**

**402.09.01.01 Additional Excavating, Backfilling, and Compacting**

Additional excavating, backfilling, and compacting shall be based on the volume of the additional excavation measured in cubic metres prior to installation of a structure.

The volume of the additional excavation shall be determined beyond the limits specified in the Contract Documents.

**402.10 BASIS OF PAYMENT**

**402.10.01 Excavating, Backfilling, and Compacting for Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

Payment at the Contract price for the appropriate tender items for the installation of maintenance holes, catch basins, ditch inlets, and valve chambers shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract contains separate items for work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

Any expenses for remedial work resulting from over-excavation shall be borne by the Contractor.

**402.10.02                      Additional Excavating, Backfilling, and Compacting - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**402.10.03                      Rock Excavation for Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

Payment for rock excavation for maintenance holes, catch basins, ditch inlets, and valve chambers shall be according to OPSS 403.

**APPENDICES**                      **Not Used**

**403.01**                      **SCOPE**

This specification covers the rock excavation requirements for the installation of sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, and watermains and associated appurtenances; underground Utilities; and maintenance holes, catch basins, ditch inlets, and valve chambers in open cut.

**403.01.01**                      **Specification Significance and Use**

This specification has been developed for use in provincial oriented Contracts. The administration, testing, and payment policies, procedures, and practices reflected in this specification correspond to those used by the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

#### **403.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

#### **403.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Construction**

|          |                                           |
|----------|-------------------------------------------|
| OPSS 206 | Grading                                   |
| OPSS 412 | Sewage Forcemain Installation in Open Cut |
| OPSS 441 | Watermain Installation in Open Cut        |

#### **403.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Associated Appurtenances** means as defined in OPSS 412 and OPSS 441.

**Associated Structures** means a maintenance hole, catch basin, ditch inlet, or valve chamber.

**Rock** means rock as defined in OPSS 206.

#### **403.07 CONSTRUCTION**

##### **403.07.01 General**

Rock excavation to install sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, and watermain and associated appurtenances; underground Utilities; and maintenance holes, catch basins, ditch inlets, and valve chambers in open cut shall be performed to the lines and grades specified in the Contract Documents.

## **403.07.02                      Use of Explosives**

The requirements for the use of explosives shall be as specified in the Contract Documents.

## **403.07.03                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **403.09                              MEASUREMENT FOR PAYMENT**

### **403.09.01                      Actual Measurement**

#### **403.09.01.01                      Rock Excavation for Pipelines, Utilities and Associated Structures**

Measurement shall be in cubic metres.

The volume of rock excavation for pipelines, Utilities, and associated structures shall be determined by the product of the relevant following dimensions measured in place:

##### **a) Height**

The height of rock excavation for pipelines, Utilities, and associated structures is the difference in elevation between the theoretical bottom of bedding and the lower of the top of the original rock or the top of shatter.

The top of the original rock shall be determined using one of the following methods:

- i. Elevations taken after the overburden has been removed but before rock excavation.
- ii. From rock surface elevations on both sides of the excavation after rock excavation has been completed.

##### **b) Width**

The width of rock excavation for pipelines and Utilities is the actual width of trench measured horizontally to a maximum of the specified trench width.

##### **c) Length**

The length of rock excavation for pipelines and Utilities is measured horizontally along the centreline of the trench to the outside limits of the backfill for the associated structures or to the outlet end of a pipe where it emerges from the rock.

##### **d) Horizontal**

The horizontal measurement for associated structures is the:

- i. diameter at the external surfaces of a circular structure plus 300 mm all around; or
- ii. the length and width to the external surfaces of a rectangular or square structure plus 300 mm on all sides.

Where the excavation for this item overlaps rock excavation for other items there shall be no deduction for the overlap.

The volume of boulders in an excavation shall be determined by the product of the three maximum rectilinear dimensions. Where boulders classified as rock are measured for payment, only the amount

actually removed shall be considered for payment, the total volume of rock considered for payment shall not exceed the volume of excavation within the theoretical lines.

**403.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**403.10                              BASIS OF PAYMENT**

**403.10.01                      Rock Excavation for Trenches and Associated Structures - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**Note: The PROV published in November 2017 replaces OPSS 404, November 2010 with no technical content changes.**

#### **404.01 SCOPE**

This specification covers the requirements for supplying, placing, maintaining, and removing support systems required to permit the excavation and backfilling of trenches or excavations for the installation of sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, watermains and associated appurtenances, and other underground Utilities; maintenance holes, catch basins, ditch inlets, and valve chambers; and any other specified subsurface construction.

#### **404.02 REFERENCES**

This specification refers to the following standards, specifications or publications:

##### **Ontario Provincial Standard Specifications, Construction**

OPSS 412      Sewage Forcemain Installation in Open Cut

## **Provincial Statute**

*Occupational Health and Safety Act*

R.S.O. 1990,

c. O.1, as amended

Ontario Regulations 213/91 - Regulations for Construction Projects, as amended

### **404.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Associated Appurtenances** mean as defined in OPSS 412 and OPSS 441.

**Sheathing** means the vertical members of the support system that are placed up against the walls of an excavation to directly resist the pressure exerted from the walls of the excavation. Sheathing may be either wood or steel sheet piling.

**Support Systems** means as described in the *Occupational Health and Safety Act* and Regulations for Construction Projects.

**Trench** means the definition as provided in the *Occupational Health and Safety Act* and Regulations for Construction Projects.

### **404.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **404.04.01 Submission Requirements**

##### **404.04.01.01 Pre-Condition Survey**

When specified in the Contract Documents, a pre-condition survey shall be prepared for all buildings, Utilities, structures, roadway infrastructure, and facilities within 30 m of the location where the support system is to be installed. The pre-condition survey shall include, as a minimum: existing structural and cosmetic damage or defects.

A copy of the pre-condition survey shall be provided to the Contract Administrator upon request.

### **404.07 CONSTRUCTION**

#### **404.07.01 General**

Support systems shall be supplied, placed, and maintained at the locations and elevations that are necessary or required to:

- a) support and protect the sides and bottom of the excavation.
- b) prevent undue disturbance or weakening of the supporting material below or beside the works.
- c) prevent movement of ground which may disturb or damage the works, adjacent pavements, property, structures, or other works.

#### **404.07.02                      Installation**

Support systems shall be placed so they can be removed as backfilling takes place without damage to the works and without settlement of or damage to adjacent pavements, property, structures, or other works.

#### **404.07.03                      Removal, Backfilling, and Compacting**

As the excavation is backfilled, the support system shall be removed, unless it is specified in the Contract Documents to be left in place or approved by the Contract Administrator.

Support systems shall be withdrawn gradually as backfilling progresses. Backfill shall be placed and compacted in a manner that fills the voids left by pulled support systems. The procedure for extracting the support system and placing backfill shall ensure the backfill load is applied gradually and disturbance of the works or foundation material is avoided.

Backfill shall be placed and compacted around and over the support systems left in place. Support systems left in place shall be cut off as specified in the Contract Documents.

#### **404.07.04                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **404.09                              MEASUREMENT FOR PAYMENT**

#### **404.09.01                      Actual Measurement**

##### **404.09.01.01                  Support System Left in Place**

Measurement for support systems left in place shall be based on the sheathing area for all sides of the excavation in square metres according to the following:

##### **a) Height**

The vertical distance of the sheathing actually left in place. If the sheathing is cut off less than 1,200 mm from its top then the actual vertical height placed shall be used.

##### **b) Length**

The horizontal distance along the line of the supported excavation from the beginning to the end of the sheathing left in place.

### **404.10                              BASIS OF PAYMENT**

#### **404.10.01                      Support Systems**

Payment at the Contract price for the appropriate tender items for the installation of sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, watermain and associated appurtenances, and other underground Utilities; maintenance holes, catch basins, ditch inlets or valve chambers; and any other specified subsurface construction shall include full compensation for all labour, Equipment, and Material to do the work.

**404.10.02****Support Systems Left in Place - Item**

Payment at the Contract price for the above tender item shall be full compensation for all Material left in place.

No additional payment shall be made for support systems left in place at the Contractor's option.

### **405.03                      DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Backfilling** means the operation of filling the trench with embedment and backfill material.

**Backfill Material** means the material used to fill the trench above the embedment material and below the lower of the subgrade or finished grade or the original ground.

**Bedding** means the embedment material placed in the subdrain and outlet pipe trenches below the pipe.

**CCTV** means closed-circuit television.

**Embedment Material** means the material used to fill the trench from the bottom of bedding to the height specified in the Contract Documents.

**Knitted Sock Geotextile** means a textile structure produced by knitting in a continuous tube specifically intended to cover perforated subdrain. Knitted geotextiles are suitable only for wrapping of perforated subdrain pipe.

**OGDL** means open graded drainage layer.

**Outlet** means the terminal 2.5 m of the outlet pipe.

**Outlet Pipe** means a non-perforated 100 or 150 mm diameter pipe that is placed for the purpose of conveying subsurface water from a subdrain to a proper outlet.

**Subdrain** means a perforated 100 or 150 mm diameter pipe that is placed for the purpose of collecting subsurface water and conveying it to a proper outlet pipe.

## **405.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **405.04.01 Submission Requirements**

Upon request, prior to the placement of subdrain or outlet pipe, documentation from the manufacturer verifying that the material supplied meets the Contract requirements shall be submitted to the Contract Administrator.

## **405.05 MATERIALS**

### **405.05.01 General**

Subdrain shall be a perforated polyvinyl chloride pipe, polyethylene pipe, or corrugated steel pipe.

Outlet pipe shall be a non-perforated corrugated steel pipe or a non-perforated smooth inside wall pipe constructed of high density polyethylene or polyvinyl chloride.

Outlets shall be constructed of non-perforated corrugated steel pipe or double-walled polyethylene or polyvinyl chloride pipe having a minimum stiffness of 300 kPa.

### **405.05.02 Corrugated Steel Pipe Products**

Corrugated steel pipe products shall be according to OPSS 1801 and as specified in the Contract Documents.

### **405.05.03 Polyethylene Pipe Products**

Polyethylene pipe products shall be according to OPSS 1840 or BNQ 3624-115 and as specified in the Contract Documents.

### **405.05.04 Polyvinyl Chloride Pipe Products**

Polyvinyl chloride pipe products shall be according to OPSS 1841 and as specified in the Contract Documents.

### **405.05.05 Geotextiles**

Geotextiles shall be according to OPSS 1860 and as specified in the Contract Documents.

### **405.05.06 Fittings**

Fittings shall be suitable for and compatible with the class and type of pipe with which they will be used.

Caps shall be polyethylene.

Galvanizing of rodent gates shall be according to CSA G164.

### **05.05.07 Granular**

Granular material shall be according to OPSS 1010 and as specified in the Contract Documents.

### **405.05.08 Clear Stone**

Clear stone shall be 19 mm, Type I or Type II, according to OPSS 1004.

#### **405.05.09                      Open Graded Drainage Layer Aggregate**

OGDL aggregate shall be according to OPSS 320.

#### **405.07                              CONSTRUCTION**

##### **405.07.01                      General**

Contractor inspection reports shall confirm the following at each outlet pipe connection and at the midpoint between outlets:

- a) Trench alignment, grade, and width.
- b) Grade of bedding material.
- c) Condition of subdrain, outlet pipe, and geotextile.
- d) Compaction.

Contractor inspection reports shall be submitted to the Contract Administrator upon request.

Geotextile, subdrain, or outlet pipe damaged by exposure to sunlight or damaged by any other means shall be replaced.

The stability of the subdrain and outlet pipe trenches shall be maintained at all times during excavation and backfilling.

##### **405.07.02                      Excavation**

Trenches shall be excavated to the lines, grades, and dimensions specified in the Contract Documents.

The excavation shall be inspected with grade checks and certified by the Contractor prior to placement of the pipe bedding.

##### **405.07.03                      Unstable Foundations**

When unstable foundation conditions are encountered, the Contractor shall take the necessary steps to ensure a stable foundation as directed by the Contract Administrator. An inspection report to verify the foundation stability shall be submitted to the Contract Administrator upon request.

##### **405.07.04                      Geotextile**

Subdrain shall be wrapped with a knitted sock geotextile.

When a geotextile wrapped trench is specified in the Contract Documents, wrapping of the subdrain with a knitted sock geotextile shall not be required, and the geotextile shall be installed as specified in the Contract Documents.

When OGDL or 19 mm clear stone embedment are specified in the Contract Documents, the subdrain trench and outlet pipe trench shall be wrapped with geotextile.

When granular embedment and backfill material are specified for an outlet pipe connection to a catch basin, the outlet pipe trench shall not require geotextile wrap.

#### **405.07.05                      Bedding**

Bedding shall be placed in the trench to the depth specified in the Contract Documents prior to laying the subdrain or outlet pipe.

The pipe bedding grade shall be inspected with grade checks and certified by the Contractor prior to laying the subdrain or outlet pipe.

#### **405.07.06                      Laying Subdrain and Outlet Pipe**

##### **405.07.06.01                      General**

Pipe installation shall be according to OPSS 421 and as specified below.

The pipe shall be placed firmly on the bedding and secured in place to prevent any movement or disturbance during backfilling. Pipe with perforations on only one side shall be installed with perforations down. Pipe shall not be laid in water or on saturated bedding. Pipe shall not be used as a drain for the Contractor's operation.

Connections between the subdrain and outlet pipe shall be made with prefabricated 45° elbows or pre-manufactured pipe curves as required.

Outlet pipe shall be installed at all low lying areas, at the end of subdrain, and at a uniform spacing of 100 m along the length of the subdrain.

Subdrain and outlet pipe installation shall be inspected and approved by the Contractor prior to backfilling.

##### **405.07.06.02                      Outlets**

##### **405.07.06.02.01                      General**

The outlet shall have an internal diameter that is slightly larger than the outlet pipe diameter so that the outlet pipe can be inserted into the outlet a minimum distance of 300 mm.

Outlets shall extend beyond the front of the ditch or fill slope for a distance of 300 mm.

The ends of all outlets shall be fitted with galvanized rodent gates.

The joint between the outlet pipe and the outlet shall be wrapped with a 0.5 m width of geotextile.

##### **405.07.06.02.02                      Marking of Outlets**

Each outlet location shall be marked with a 25 x 25 mm square galvanized steel bar, 2.2 m long, embedded from 0.6 to 1.0 m into the ground, adjacent to the outlet, clearly visible from the driving portion of the roadway.

##### **405.07.06.03                      Connection to Drainage Structures**

Subdrain shall be connected to maintenance holes, catch basins, and ditch inlets by a 1 m section of non-perforated pipe. Subdrain and outlet pipe connections to concrete maintenance holes, catch basins, and ditch inlets shall be cored and grouted as specified in the Contract Documents.

#### **405.07.07                      Embedment and Backfill Material**

Embedment material shall be clear stone, granular, or open graded drainage layer aggregate as specified in the Contract Documents.

Backfill material shall be as specified in the Contract Documents.

The Contractor shall ensure that the subdrain and outlet pipe are not damaged or dislodged during the placement and compaction of embedment and backfill material. Damaged or dislodged subdrain and outlet pipe shall be removed and replaced.

Any earth from cave-ins and all other unsuitable material shall be removed from embedment and backfill material.

Compaction of embedment and backfill material shall be according to OPSS 501.

At the termination of a day's work, backfilling shall be complete over all subdrain and outlet pipe placed.

#### **405.07.07.01                      Winter Grading of Material**

All ice and snow shall be removed from all portions of the work area. Frozen material shall not be incorporated into the work. Material shall not be placed over frozen ground, ice or snow, except, at the Contractor's option, a single lift may be placed over frozen ground in which case final grading and compaction shall be done after the underlying materials have thawed.

#### **405.07.08                      Closed-Circuit Television Inspection**

When specified in the Contract Documents, the Contractor shall inspect the drainage system using CCTV inspection to ensure that the subdrain and outlet pipes are intact and were not crushed or damaged during construction. CCTV inspection shall be according to OPSS 409.

CCTV inspection shall be based on selected sampling at locations identified by the Contract Administrator. A minimum of 5% of the entire length of subdrain pipe and 100% of the outlet pipes shall be video inspected and recorded. Where defective, damaged, or improperly installed pipe is encountered, the Contract Administrator may request additional CCTV inspection. The inspection shall be conducted following the placement of the granular course and prior to the placement of the pavement surface.

The equipment used for CCTV inspection of the drainage system shall be according to OPSS 409 with the following exceptions:

- a) The system shall be capable of providing CCTV inspection of subdrain and outlet pipes of minimum 100 mm inside diameter within a wet environment and shall be capable of negotiating a minimum 45° bend.
- b) The system shall be capable of inspecting a length of pipe up to 90 m by push rodding, pull cabling, jetting, or tractoring the camera through the pipe.
- c) The system shall be capable of recording the distance traversed by the camera to within 150 mm.

When the CCTV inspection report shows any of the following defects, as defined by the MSCC manual, they shall be identified to the Contract Administrator and the defective, damaged, or improperly installed subdrain and outlet pipe sections shall be removed and replaced:

- a) Fracture.

- b) Broken.
- c) Large joint displacement.
- d) Large open joint.
- e) Deformed pipe such that the camera is not able to navigate through the pipe.
- f) Ponding water.

Replaced subdrain and outlet pipes shall be re-inspected by CCTV to verify installation.

#### **405.07.09 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

#### **405.08 QUALITY ASSURANCE**

The Contractor shall demonstrate the outlet pipe is on grade and unobstructed for its full length after backfilling.

##### **405.08.01 Acceptance Criteria**

Acceptance of the subdrain and outlet pipes shall be installation according to the requirements of the Contract Documents and no damage or defects as defined in this specification. Subdrain and outlet pipe with damage or defects or that is improperly installed shall be removed and replaced.

#### **405.09 MEASUREMENT FOR PAYMENT**

##### **405.09.01 Actual Measurement**

##### **405.09.01.01 Pipe Subdrain**

Measurement of pipe subdrain shall be by length in metres horizontally along the centreline of the pipe between the ends of the pipe subdrain, including outlets, or between the upstream end of the pipe subdrain and the centre of a maintenance hole, catch basin, or ditch inlet.

##### **405.09.01.02 CCTV Inspection**

Measurement for a CCTV inspection of subdrain and outlet pipe shall be by length in metres on the ground surface along the centreline of the subdrain from the centre of one drainage structure to the centre of another drainage structure or the outlet end of the subdrain.

##### **405.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**405.10****BASIS OF PAYMENT****405.10.01****Pipe Subdrain - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When excavation and backfilling of subdrain and outlet pipe overlaps the excavation and backfilling required for other work, payment for overlapping excavation and backfilling shall be made in accordance with the specifications for such other work as though no excavation and backfilling were required for pipe subdrain.

When subdrain and outlet pipe are placed below subgrade and the embedment and backfill material are the same material used in the road base or subbase, the embedment and backfill material shall be paid for with the road base or subbase item. When embedment or backfill material or both are different than the material used for the road base or subbase, payment for the embedment and backfill material shall be included in the Contract price for the pipe subdrain.

When unstable foundations are encountered, payment for stabilization shall be as Extra Work.

Maintenance of the stability of the trench shall be at no extra cost to the Owner.

Correction of any defective workmanship and defective or damaged material shall be at no extra cost to the Owner.

**405.10.02****Closed-Circuit Television Inspection - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Re-inspection by CCTV inspection to verify the installation of replaced subdrain or outlet pipe shall be at no extra cost to the Owner.

### **407.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Adjustment Units** means circular and rectangular units used between the drainage structure and the frame to adjust the elevation of the frame for grates and covers.

**Benching** means smoothed infill concrete placed between the channel pipes and the chamber walls of a maintenance hole.

**Channeling** means constructing a channel that runs through the base of the maintenance hole from incoming pipe to outflow pipe that is most typically formed by using a half pipe to form the channel through the base of the maintenance hole. The “half pipe” form creates an unobstructed flow through the maintenance hole.

**Drainage Structure** means cast-in-place and precast maintenance holes, catch basins, ditch inlets, and valve chambers.

**Floatation** means exhibition of upward movement.

**Goss Trap** means point of entry trap installed in catch basins to capture debris, sediment and oils at source.

**Joint Seal System** means system for sealing horizontal and vertical construction and butt joints in waterproof concrete structures against water.

**Mono Base** means cast as a single unit.

**Support Systems** means as described in the Occupational Health and Safety Act and Regulations for Construction Projects.

**Steel Reinforcement** means as defined in OPSS 905.

**Valve Chamber** means precast concrete sealed sump maintenance hole with factory-fitted saddles to house the pump.

#### **407.04 DESIGN AND SUBMISSION REQUIREMENTS**

##### **407.04.01 Submission Requirements**

##### **407.04.01.01 Precast Components**

The Contract Administrator shall be notified in writing a minimum of 10 Business Days prior to precast components for drainage structures being delivered to the Working Area. The notification shall include:

- a) Name of the company that shall be supplying the materials.
- b) The schedule for the delivery of each component to the Working Area.

#### **407.05 MATERIALS**

##### **407.05.01 Adjustment Units**

Concrete for precast concrete adjustment units shall be according to OPSS 1351.

Rubber adjustment units shall be according to OPSS 1853.

High density polyethylene (HDPE) and expanded polystyrene (EPS) adjustment units shall be according to OPSS 1854.

##### **407.05.02 Aluminum Safety Platforms**

Aluminum safety platforms shall be according to OPSS 1351.

##### **407.05.03 Concrete**

Concrete for cast-in-place drainage structures shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

##### **407.05.04 Frames with Covers or Grates**

Frames with covers or grates shall be according to OPSS 1850.

##### **407.05.05 Grout**

Grout shall be non-shrink.

Cementing materials for grout shall be according to OPSS 1301. Sand for grout shall be mortar sand according to OPSS 1004. Water for grout shall be according to OPSS 1302. Admixtures for grout shall be according to OPSS 1303.

The workability of the grout mix shall be suitable for the application.

##### **407.05.06 Joint Seal Systems**

Joint seal systems for precast concrete drainage structures shall be according to OPSS 1351.

#### **407.05.07 Mortar**

Mortar for joints shall be according to OPSS 904.

#### **407.05.08 Precast Concrete Components for Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

When specified in the Contract Documents, precast units shall be according to OPSS 1351.

#### **407.05.09 Resilient Connectors**

Resilient connectors between pipes and drainage structures shall be according to ASTM C923M.

#### **407.05.10 Steel Reinforcement**

Steel reinforcement for cast-in-place drainage structures shall be according to OPSS 1440.

#### **407.05.11 Steps and Ladders**

Steps shall be according to OPSS 1351.

Ladders shall be as specified in the Contract Documents.

Rubber adjustment units shall be according to OPSS 1853.

### **407.07 CONSTRUCTION**

#### **407.07.01 General**

Drainage structures shall be installed on undisturbed and competent foundations at the locations and to the elevations specified in the Contract Documents and shall be constructed plumb and true to alignment.

The top of drainage structures shall be installed below the final grade to allow for the placement of adjustment units to facilitate the placement of the top of the frame with grate or cover to the final grade.

When specified in the Contract Documents, special design drainage structures shall be according to the Contract Documents.

#### **407.07.02 Operational Constraints**

Precast concrete maintenance hole tees may be used only when the mainline pipe sewer is concrete.

Precast concrete maintenance hole tees shall not be used when a change in pipe size, longitudinal grade, or direction is required.

All work shall be protected from freezing. Drainage structures shall not be installed on frozen ground.

Damage to drainage structures due to floatation shall be prevented during construction and until Contract Completion.

#### **407.07.03 Site Preparation**

Site preparation shall be according to OPSS 490.

#### **407.07.04                      Preservation and Protection of Existing Facilities**

Preservation and protection of existing facilities shall be according to OPSS 491.

#### **407.07.05                      Transporting, Unloading, Storing, and Handling**

Manufacturer recommendations for transporting, unloading, storing, and handling of drainage structures shall be followed.

Drainage structures shall not be damaged during transporting, unloading, storing, and handling.

#### **407.07.06                      Excavating, Backfilling, and Compacting**

Excavating, backfilling, and compacting for the installation of drainage structures shall be according to OPSS 402.

#### **407.07.07                      Support Systems**

Support systems shall be according to OPSS 404.

#### **407.07.08                      Dewatering**

Dewatering shall be according to OPSS 517.

#### **407.07.09                      Cast-In-Place Drainage Structures**

Concrete placement shall be according to OPSS 904.

All inside wall projections, such as fins and bulges, shall be removed once the forms are stripped.

#### **407.07.10                      Precast Drainage Structures**

Precast or mono bases shall be placed level. Subsequent sections complete with joint seal systems shall be installed according to the manufacturer's recommendations.

Adjustment of the drainage structure shall be carried out by lifting the affected sections free of the excavation, re-levelling the base, if necessary, and re-installing the sections. Damaged sections and gaskets shall be replaced.

Lift holes shall be plugged with mortar.

Surface contaminants must be removed prior to installing the mortar.

#### **407.07.11                      Installation of Inlet and Outlet Pipes into Concrete Drainage Structures**

To accommodate inlet and outlet pipe installation into concrete drainage structure, the appropriate size opening in the wall shall be constructed as specified in the Contract Documents.

Inlet and outlet pipes shall be securely set into the drainage structure's concrete base or walls using grout or joint sealing product to ensure the drainage structure is watertight.

One of the following connections shall be provided where a pipe connects to a drainage structure:

- a) A flexible pipe joint shall be provided within 300 mm of the outside face of the drainage structure for flexible and rigid pipe.

- b) A concrete cradle to the first joint for rigid pipe.
- c) A resilient connector (i.e., a flexible, watertight connector) in the drainage structure opening for flexible and rigid pipe.

A drainage structure designed for pipe support shall be provided when specified in the Contract Documents.

An external joint sealing product shall be according to OPSS 1351.

Installation of pipe connectors shall be according to the manufacturer's recommendations. All pipes, except in valve chambers, shall be flush with the inside walls of the drainage structure.

A goss trap shall be placed at the outlet pipe of the catch basin.

#### **407.07.12 Benching and Channelling**

The inside concrete bottom of the drainage structures shall be benched and channeled to accommodate the pipe.

Where benching is hand finished, it shall have a wood float finish and channelling shall have a steel trowel finish. Channelling shall be smooth and flush with adjacent pipe inverts.

#### **407.07.13 Installation of Adjustment Units**

Installation of adjustment units shall be according to OPSS 408.

#### **407.07.14 Installation of Frames with Grates or Covers**

When precast concrete adjustment units are used, frames with grates or covers shall be set in a full bed of mortar on the precast concrete adjustment units.

When HDPE or EPS adjustment units are used, frames with grates or covers shall be installed and sealed according to the HDPE or EPS adjustment unit manufacturer's instructions.

When rubber adjustment units are used, frames with grates or covers shall be set firmly in place on the rubber adjustment unit by laying a continuous strip of butyl tape on the top surface of the rubber adjustment units and on the bottom of the frame.

When specified in the Contract Documents, ditch inlet grates shall be installed.

Installation of frames with grates or covers which lie within the flow lines of a curb and gutter system shall be according to OPSS 353.

#### **407.07.15 Installation of Aluminum Safety Platforms**

A drainage structure that has a total height of 5.0 m or more shall have a safety platform installed. Aluminum safety platforms shall be installed as specified in the Contract Documents.

#### **407.07.16 Installation of Extension Stems and Boxes for Valve Chambers**

Extension stems and boxes shall be installed as specified in the Contract Documents.

Caps for valve boxes shall be installed flush with the final grade. Guides for the valve extension stems shall be securely anchored to the valve chamber.

#### **407.07.17 Installation of Ladders and Steps**

Ladders shall be installed as specified in the Contract Documents.

Steps shall be according to OPSS 1351. If the drainage structure is being cast-in-place, steps shall be accurately set in the forms and supported to prevent their displacement during the placing of concrete.

If the first step is greater than 450 mm from the adjusted cover or grate reference elevation written approval from the Contract Administrator is required.

#### **407.07.18 Installation of Frost Straps**

Frost straps shall be installed as specified in the Contract Documents.

#### **407.07.19 Valve Chamber Insulation**

Insulation for the roof, wall, or access way of the valve chamber shall be installed as specified in the Contract Documents.

#### **407.07.20 Clean Out of Drainage Structures**

During the progress of the work and until Contract Completion, drainage structures shall be kept clean and free of all foreign material

#### **407.07.21 Site Restoration**

Site restoration shall be according to OPSS 492.

#### **407.07.22 Leakage Test**

Maintenance holes shall be tested for leakage. Leakage shall not exceed a rate of three litres per hour per metre of head above the lowest pipe invert in the maintenance hole.

The test shall be performed by plugging all pipe openings in the maintenance hole and filling the maintenance hole with water. After one hour has elapsed, the distance the surface of the water has dropped shall be measured and the leakage determined by calculating the volume of that portion of the maintenance hole formerly occupied by the water.

Maintenance holes failing the initial test shall have the leaks repaired and be re-tested until the leakage is below the allowable limit.

There shall be no visible infiltration.

#### **407.07.23 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **407.09 MEASUREMENT FOR PAYMENT**

#### **407.09.01 Actual Measurement**

##### **407.09.01.01 Maintenance Holes, Catch Basins, and Ditch Inlets Valve Chambers Rectangular Valve Chambers Special Design Drainage Structure**

For measurement purposes, a count shall be made of the number of the drainage structures installed.

**407.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**407.10                              BASIS OF PAYMENT**

**407.10.01                      Maintenance Holes, Catch Basins, and Ditch Inlets - Item**  
**Valve Chambers - Item**  
**Rectangular Valve Chambers - Item**  
**Special Design Drainage Structure - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Payment for safety platform installation for all drainage structures with a total height of 5 m or more shall be included with the above tender items.

**407.10.02                      Elevation Adjustment**

Prior to the installation of a drainage structure, the Owner may, at its sole discretion, raise or lower the invert or grate elevation by 150 mm or less, at no additional cost. Bedding elevations shall be adjusted accordingly.

A change in invert or grate elevation exceeding 150 mm shall be administered as a Change in the Work.

**CONSTRUCTION SPECIFICATION FOR ADJUSTING OR  
REBUILDING MAINTENANCE HOLES, CATCH BASINS,  
DITCH INLETS, AND VALVE CHAMBERS**

| OPSS 1301 | Cementing Materials                                                                                                                                    |
| OPSS 1302 | Water                                                                                                                                                  |
| OPSS 1308 | Joint Filler In Concrete                                                                                                                               |
| OPSS 1350 | Concrete - Materials and Production                                                                                                                    |
| OPSS 1351 | Precast Reinforced Concrete Components for Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers                                           |
| OPSS 1440 | Steel Reinforcement for Concrete                                                                                                                       |
| OPSS 1850 | Frames, Grates, Covers, and Gratings                                                                                                                   |
| OPSS 1853 | Rubber Adjustment Units for Maintenance Holes, Catch Basins, and Valve Chambers                                                                        |
| OPSS 1854 | High Density Polyethylene (HDPE) and Expanded Polystyrene (EPS) Adjustment Units for Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers |

#### **408.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Adjusting** means changing the final grade or position of the frame with a cover or grate on an existing or new drainage structure:

- a) upwards by the addition of adjustment units,
- b) downwards by removal of existing adjustment units, regardless of the size or type of drainage structure, or
- c) lateral deviation from centreline.

**Adjustment Units** means as defined in OPSS 407.

**Drainage Structure** means as defined in OPSS 407.

**Lift Rings** means circular and rectangular pre-fabricated metal or high density polyethylene units used to adjust the elevation of the grates and covers only. They are inserted between the frame and the grate or cover.

**Rebuilding** means changing the final grade of the frame with grate or cover on an existing drainage structure:

- a) upwards by the addition of precast concrete sections or bricks and mortar or,
- b) downwards by the removal of precast concrete sections or bricks and mortar, regardless of the size or type of drainage structure.

**Steel Reinforcement** means as defined in OPSS 905.

**Valve Chamber** means as defined in OPSS 407.

## **408.05 MATERIALS**

### **408.05.01 Adjustment Units**

Precast concrete adjustment units shall be according to OPSS 1351.

Rubber adjustment units shall be according to OPSS 1853.

High density polyethylene (HDPE) and expanded polystyrene (EPS) adjustment units shall be according to OPSS 1854.

### **408.05.02 Aluminum Safety Platforms**

Aluminum safety platforms shall be according to OPSS 1351.

### **408.05.03 Bonding Agent**

Bonding agent shall be according to OPSS 904.

### **408.05.04 Concrete**

Concrete for cast-in-place drainage structures shall be according to OPSS 1350 with a minimum 28-Day compressive strength of 30 MPa.

### **408.05.05 Frames with Covers or Grates**

Frames with covers or grates shall be according to OPSS 1850.

### **408.05.06 Grout**

Grout shall be non-shrink.

Cementing materials for grout shall be according to OPSS 1301. Sand for grout shall be mortar sand according to OPSS 1004. Water for grout shall be according to OPSS 1302. Admixtures for grout shall be according to OPSS 1303.

The workability of the grout mix shall be suitable for the application.

### **408.05.07 Joint Fillers**

Joint fillers shall be according to OPSS 1308.

### **408.05.08 Joint Sealing Compounds**

Joint sealing compounds shall be according to OPSS 1212.

### **408.05.09 Joint Seal Systems**

Joint seal systems for precast concrete drainage structures shall be according to OPSS 1351.

#### **408.05.10 Mortar**

Mortar for joints shall be according to OPSS 904.

#### **408.05.11 Precast Concrete Components for Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

Precast units shall be according to OPSS 1351 and as specified in the Contract Documents.

#### **408.05.12 Steel Reinforcement**

Steel reinforcement for cast-in-place drainage structures shall be according to OPSS 1440.

#### **408.05.13 Steps and Ladders**

Steps shall be according to OPSS 1351.

Ladders shall be as specified in the Contract Documents.

### **408.07 CONSTRUCTION**

#### **408.07.01 General**

The work of adjusting or rebuilding drainage structures shall:

- a) Include the removal and subsequent replacement of the frame with grate or cover.
- b) Be plumb, true to alignment and grade, and flush with adjacent finish grade of the shoulder.

During the progress of the work and until Contract Completion, all drainage structures in service shall be kept clean and free of all extraneous material.

Prior to adjusting or rebuilding a drainage structure, or the installation of a temporary frame and grate, the existing frame with cover or grate shall be carefully removed and salvaged according to OPSS 510. Suitability of the salvaged frame with cover or grate for reuse shall be determined by the Contract Administrator.

Adjustment units, frames, covers, grates, lift rings, precast concrete components, cast-in-place aprons, and joint seal systems shall be of the type specified in the Contract Documents.

All existing brickwork and mortar or adjustment units shall be removed from the top of the existing drainage structure.

When there are adjustment units on a drainage structure:

- a) There shall be a minimum of one adjustment unit on the top of the drainage structure.
- b) No more than three adjustment units are permitted on the top of the drainage structure without prior written approval from the Contract Administrator.

Adjustments shall be completed prior to placing the frame with grate or cover.

The maximum allowable total lateral deviation of catch basin covers and grates from the centreline of the drainage structure is 75 mm.

If the first step is greater than 450 mm from the adjusted cover or grate reference elevation written approval from the Contract Administrator is required.

Alterations to ladders, valve extension stems and boxes, and frost straps shall be as specified in the Contract Documents.

After adjusting or rebuilding a valve chamber, insulation shall be installed according to the manufacturer's recommendations on the roof, wall, or access way of the valve chamber when specified in the Contract Documents.

#### **408.07.02                      Site Preparation**

Site preparation shall be according to OPSS 490.

#### **408.07.03                      Preservation and Protection of Existing Facilities**

Preservation and protection of existing facilities shall be according to OPSS 491.

#### **408.07.04                      Cold Weather Work**

All work shall be protected from freezing.

#### **408.07.05                      Transporting, Unloading, and Storing and Handling**

Transporting, unloading, storing, and handling shall be according to manufacturer's recommendations. Materials that are damaged shall be rejected.

#### **408.07.06                      Excavating, Backfilling, and Compacting**

Excavating, backfilling, and compacting for the adjustment or rebuilding of drainage structures shall be according to OPSS 402.

#### **408.07.07                      Support Systems**

Support systems shall be according to OPSS 404.

#### **408.07.08                      Adjusting**

##### **408.07.08.01                  General**

The type of adjustment unit to be used shall be as specified in the Contract Documents. The different types of adjustment units are as follows:

- a) Precast concrete.
- b) High density polyethylene (HDPE) or expanded polystyrene (EPS).
- c) Rubber.

#### **408.07.08.02                    Precast Concrete Adjustment Units**

Precast concrete adjustment units shall be used to set the frame with grate or cover at the required position and elevation.

A minimum of one adjustment unit, but not more than three adjustment units are required at each drainage structure to a maximum height of 300 mm.

The first adjustment unit shall be laid in a full bed of mortar and aligned with the opening in the drainage structure. Successive adjustment units shall be laid plumb to the first adjustment unit and sealed according to manufacturer's recommendations.

#### **408.07.08.03                    High Density Polyethylene (HDPE) and Expanded Polystyrene (EPS) Adjustment Units**

When specified in the Contract Documents, HDPE or EPS adjustment units shall be used to set the frame with grate or cover at the required position and elevation.

A minimum of one adjustment unit is required at each drainage structure up to a maximum height of 100 mm.

HDPE or EPS adjustment units shall be installed and sealed according to the manufacturer's recommendations.

#### **408.07.08.04                    Rubber Adjustment Units**

One rubber adjustment unit is used to replace the top precast concrete adjustment unit per drainage structure and shall be used in conjunction with one or two precast concrete adjustment units. More than one rubber adjustment unit may be placed when wedge shaped rubber units are used to provide slope to the frame with grate or cover. In either instance, the total height of the rubber units shall be greater than 25 mm and less than 75 mm. The rubber unit is to be placed on the precast concrete adjustment unit so it provides the surface on which the frame rests.

The rubber adjustment unit shall be bonded firmly in place on the precast concrete adjustment unit by laying a continuous strip of butyl tape on the top surface of the precast concrete unit. If more than one rubber unit is used, a continuous strip of butyl tape shall be laid between each rubber adjustment unit.

Rubber adjustment units shall not be used in conjunction with HDPE or EPS adjustment units.

#### **408.07.09                        Rebuilding**

##### **408.07.09.01                    Cast-In-Place Drainage Structures**

When the top of the drainage structure is to be lowered, the concrete shall be carefully removed to the elevation specified in the Contract Documents and exposed steel reinforcement shall be cut off. The upper section of the drainage structure shall then be rebuilt to its original configuration using cast-in-place concrete and steel reinforcement.

To raise the top of drainage structures with a tapered upper section, the concrete in the drainage structure shall be removed according to OPSS 928 for the entire depth of the taper. The upper section, including straight walls and taper shall then be rebuilt to the original configuration using cast-in-place concrete and steel reinforcement.

To raise the top of straight walled drainage structures, the existing roof section, if any, shall be removed.

The existing walls shall then be extended upward and the roof section rebuilt to the original configuration using cast-in-place concrete and steel reinforcement.

When cast-in-place units are to be raised or lowered with cast-in-place concrete, the top surface of all existing walls shall be roughened and a concrete bonding agent according to OPSS 904 shall be applied to the joint before the walls are extended upwards.

All inside wall projections, such as fins and bulges, shall be removed once the forms are stripped.

#### **408.07.09.02                      Precast Concrete Drainage Structures**

Precast concrete drainage structures shall be installed according to OPSS 407.

#### **408.07.09.03                      Catch Basin Apron**

Curb and gutter with concrete aprons on existing catch basins shall be constructed at the locations specified in the Contract Documents.

The work shall include, but not be limited to, the following:

- a) Remove existing curb and gutter and existing pavement by saw cutting to the limits shown in the Contract Documents.
- b) Construction of concrete curb and gutter shall be according to OPSS 353.
- c) Placement of concrete for concrete apron shall be according to OPSS 904.
- d) Concrete for curb and gutter and apron shall be a continuous pour.
- e) Placement of joint sealing compound and joint filler in construction joints shall be according to OPSS 920.
- f) The horizontal limits of the concrete apron shall be field-fit.

#### **408.07.09.04                      Breaking into Maintenance Holes, Catch Basins, Ditch Inlets, Culverts and Sewers**

To accommodate inlet and outlet pipe installation into existing or rebuilt drainage structure, the appropriate size opening in the wall shall be constructed as specified in the Contract Documents.

Openings shall be made as necessary in an existing maintenance hole, catch basin, ditch inlet, pipe culvert, or pipe sewer to install the new pipe sewer and connect it to the drainage structure according to OPSS 407. Benching in existing maintenance holes shall be altered to accommodate the flow in the new pipe sewer system.

When specified in the Contract Documents, the opening for the connection of a subdrain outlet shall be formed by coring. The subdrain outlet pipe shall be sealed into place using grout. When specified in the Contract Documents, a 50 mm diameter weep hole shall be cored into the same wall as the subdrain connection and at the same invert elevation.

#### **408.07.10                          Temporary Frame and Grate**

The installation and removal of a temporary frame and grate to the maintenance hole or catch basins shall be at the locations and of the type specified in the Contract Documents.

The temporary frame and grates shall be installed prior to opening the detour to traffic.

The maintenance holes or catch basins shall be adjusted to match the grade of the pavement required during the construction stages.

The temporary frame and grate shall be removed according to OPSS 510. The salvaged original frame and grate shall be reinstalled after the temporary frame and grate is removed.

**408.07.11                      Site Restoration**

Restoration shall be according to OPSS 492.

**408.07.12                      Maintenance Hole Leakage Testing**

Sanitary sewer maintenance holes and storm sewer maintenance holes shall be tested for leakage according to OPSS 407.

**408.07.13                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**408.09                              MEASUREMENT FOR PAYMENT**

**408.09.01                      Actual Measurement**

**408.09.01.01                  Adjusting and Rebuilding Maintenance Holes, Catch Basins, Ditch Inlets  
and Valve Chambers  
Catch Basin Apron  
Temporary Frame and Grate**

For measurement purposes, a count shall be made of the number of drainage structures and catch basin aprons adjusted or rebuilt, and temporary frames and grates installed.

All adjustments of an existing drainage structure including those required by construction staging and winter shutdown as specified in the Contract Documents shall count as one adjustment.

**408.09.01.02                  Breaking into Maintenance Holes, Catch Basins, Ditch Inlets, Culverts and  
Sewers**

For measurement purposes, a count shall be made of the number of openings made.

**408.09.01.03                  Interim Adjustments of New Drainage Structures**

All interim adjustments of a new drainage structure required by construction staging including winter shutdown as specified in the Contract Documents shall count as one adjustment.

**408.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**408.10 BASIS OF PAYMENT**

**408.10.01 Adjusting and Rebuilding Maintenance Holes, Catch Basins, Ditch Inlets and Valve Chambers - Item**  
**Breaking into Maintenance Holes, Catch Basins, Ditch Inlets, Culverts and Sewers - Item**  
**Catch Basin Apron - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**408.10.02 Temporary Frame and Grate - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

For progress payment, 70% of the Contract price shall be paid after the installation of the temporary frame and grate. The remaining 30% of the Contract price shall be paid after the reinstallation of the existing salvaged frame and grate.

**409.01 SCOPE**

This specification covers the requirements for inspecting new and existing storm and sanitary sewers, watermains, pipe culverts or other accessible conduits by closed-circuit television (CCTV).

**409.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**CSA Standards**

PLUS 4012 (2010)    Technical Guide: Visual Inspection of Sewer Pipe

## **Water Research Centre (WRc) Publication**

MSCC Manual of Sewer Condition Classification, Third Edition, 1993.

### **409.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Business Day** means any day except Saturdays, Sundays, and statutory holidays.

**CCTV** means closed-circuit television.

**Digital Storage Device** means compact disc (CD), digital videodisc (DVD), flash memory card, hard drive, or other industry-standard digital storage mediums.

**Drainage Structure** means a catch basin, maintenance hole, or ditch inlet.

**DVD** means digital videodisc.

**MPEG** means movie photographic experts group.

**NASSCO** means North American Society of Sewer Service Companies.

**PACP** means Pipeline Assessment and Certification Program.

**Pipeline** means storm, sanitary, watermain, or other accessible conduit pipe culverts.

**USB** means universal serial bus.

### **409.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **409.04.01 Submission Requirements**

The following information shall be submitted to the Contract Administrator two weeks prior to the start of the CCTV inspection operations:

- a) A copy of the CCTV operator's NASSCO Certification Certificate. A copy of said certificate is required for each CCTV operator working on the Contract. Operators shall have been certified or re-certified within the three years prior to the start of the Contract.
- b) A sample inspection report, resolution tests of digital video recording format, and digital data file. One submission is required for each camera proposed for use on the work. The camera make, model, and serial number shall be clearly identified on each video recording.
- c) The details of the coding accuracy verification system that is to be used to verify inspection accuracy shall be submitted for approval.

### **409.05 MATERIALS**

#### **409.05.01 General**

Media storage shall be as specified in the Contract Documents.

Digital storage device with minimum USB 2.0 or higher compatibility shall be placed inside envelopes with labels displaying the following information.

- a) Owner's Name
- b) Contract Number or Project Name
- c) Sewer Identification Number
- d) City or Town
- e) Street Name
- f) Inspection Date

The digital storage device shall include a file in either Word or text format including the information provided above. The digital storage device shall be labelled. The label shall include the information in points a) and b) above to identify the content. CD and DVD shall be placed in a 5.2 mm slim-line clear jewel case with permanent labels displaying all the information above or as specified in the Contract Documents.

#### **409.05.01.01                      Photographs**

Digital photograph files shall meet or exceed a resolution of at least 640 x 480 pixels. Printed photographs shall be in colour with a minimum image size of 90 x 70 mm and shall be reproduced on premium glossy photo quality paper.

### **409.06                                  EQUIPMENT**

#### **409.06.01                              General**

Survey and camera equipment used to inspect watermains shall have been used exclusively for work in watermains only.

#### **409.06.02                              Survey Vehicle**

The survey vehicle shall contain a separate area for viewing, recording, and controlling the CCTV operation.

The viewing and control area shall be insulated against noise and extremes in temperature. Cooling and heating units shall be independent from the main vehicle engine and in good working order. External and internal sources of light shall be controlled in a manner as to ensure the light does not impede the view of the monitor screen. Seating accommodation for one person shall be provided in addition to the operator seating to clearly view the monitor screen.

All equipment used within the pipeline shall be stored outside the viewing, recording, and control area.

The vehicle shall include a cell phone or suitable alternative as agreed by the Contract Administrator for the duration of the work.

#### **409.06.03                              Survey Equipment**

The surveying equipment shall be capable of surveying a length of pipeline up to:

- a) 300 m when entry to the pipeline may be obtained at each end of the pipeline.

- b) 30 m when rodding is used.
- c) 150 m when a self-propelled unit is used when entry is at only one end of the pipeline.
- d) 200 m when being towed.

Work shall not commence in a work shift until the Contract Administrator is satisfied that all items of the survey equipment have been provided and are in full working order.

Each survey unit shall contain a means of transporting the CCTV camera in a stable condition through the pipeline.

When the CCTV camera is towed by winch and cable through the pipeline, all winches shall be stable during the entire CCTV inspection. All cables shall be of steel or of an equally non-elastic material to ensure the smooth and steady progress of the CCTV camera.

Each unit shall carry sufficient number of guides and rollers so that, when surveying, all cables are supported away from pipe and maintenance hole edges. All CCTV cables and lines used to measure the camera's location within the pipeline shall be maintained in a taut manner and set at right angles, when possible, to run through or over the measuring equipment.

#### **409.06.04 Video Equipment Quality**

The electronic systems, television camera, and monitor shall be of adequate quality to enable the following to be achieved.

##### **409.06.04.01 Camera**

The pan and tilt camera shall have the capability of panning the pipe at 360° with tilt capability of 275° to ensure complete inspections and view of all laterals and deficiencies.

Resolution:

The live picture shall be visible with no interference and capable of registering a minimum number of lines of resolution at the periphery as indicated below:

- a) Fixed view camera 350 lines of resolution.
- b) Pan and tilt camera 400 lines of resolution.

Colour Constancy:

The lighting shall be set prior to commencing the survey to ensure the camera provides optimum results when used with its own illumination source. To ensure colour constancy, no variation in illumination shall take place during the survey.

Focus, Iris, and Illumination:

The adjustment of focus and iris shall allow optimum picture quality to be achieved and shall be remotely operated. The illumination shall be such as to allow an even distribution of the light around the pipeline perimeter without the loss of contrast or flare out of picture shadowing.

#### **409.06.04.02                      Monitor**

Monitors shall be a minimum size of 21 inches and shall support resolution equal to or greater than the corresponding video camera resolution.

#### **409.06.04.03                      Digital Video Recorder**

Digital video recorders shall be able to capture in colour from the live video source with the following requirements:

- a) MPEG-2 or higher or as required by Owner.
- b) NTSC 720 x 480 @ 29.97 frames per second.

#### **409.07                                      CONSTRUCTION**

##### **409.07.01                              Pipeline Cleaning**

When specified in the Contract Documents, pipelines shall be cleaned and flushed immediately prior to CCTV inspection.

##### **409.07.02                              Resolution of Videotape and Digital MPEG Video Recordings**

Prior to the start of the CCTV inspection, the resolution of digital MPEG video playback for each camera shall be confirmed by recording a resolution chart approved by the Contract Administrator, using the following procedure:

- a) Set up the camera as is done for the actual inspection.
- b) Show the camera being introduced and reaching its final position for the test.
- c) Fill the monitoring screen with the resolution chart.
- d) Illuminate the resolution chart evenly and uniformly without reflections ensuring that the illumination source accurately simulates the lighting used in the sewer.
- e) Record a test video for 30 seconds.
- f) Identify the camera make, model, and serial number on the recording.
- g) Record the test at the start of a digital recording.

The resolution test shall be submitted to the Contract Administrator.

##### **409.07.03                              Coding Accuracy**

Prior to commencement of the CCTV inspection, a formal coding accuracy verification system shall be developed and submitted to the Contract Administrator and implemented when approved. The coding accuracy shall be based on accuracy as a function of the number of defects or construction features not recorded, and the correctness of the coding and classification shall be recorded.

Verification of coding accuracy shall be completed on a random basis on a minimum of 10% of the inspection reports. A minimum of two accuracy verifications shall be completed for each operator for each week working.

Inspections not satisfying the accuracy requirements shall be re-coded to meet the accuracy requirements and the accuracy of the inspections, immediately preceding and following the non-compliant inspection, shall be verified. This process shall be repeated until the preceding and subsequent inspections meet the accuracy requirements.

Coding accuracy checks shall be submitted to the Contract Administrator along with the corresponding video recording.

#### **409.07.04                      CCTV Inspection**

##### **409.07.04.01                  General**

The work shall include a CCTV inspection of the pipeline and the preparation of all video, digital, and written reports.

A certified, trained, and competent CCTV operator shall be used to operate the inspection equipment and code the inspection.

A fixed camera may be used for pipelines less than 300 mm in diameter. For pipelines equal to or greater than 300 mm, a pan and tilt camera shall be used. Each camera shall have an accepted sample submissions report prior to being used for inspection work. The camera lens shall be kept clean at all times during the inspection.

Flow control measures as specified in the Contract Documents shall be implemented to ensure a minimum of 80% of the height of the pipeline is visible for the entire inspection and shall be approved by the Contract Administrator.

All fog shall be evacuated from the pipeline and the pipeline kept clear of fog during the inspection.

At the start of each pipeline being surveyed, the length of pipeline from zero chainage up to the cable calibration point shall be recorded and reported in order to obtain a full record of one of the following:

- a) Pipe sewer length from the inside face of the maintenance hole to the inside face of the next maintenance hole or outlet end of the pipe sewer
- b) Pipe culvert length from one end of the pipe culvert to the other
- c) Watermain length from the valve pit entry point to the valve pit exit point or termination of the cement mortar lining.

The position meter-reading entered on to the data display at the cable calibration point shall allow for the distance from the start of the survey to the cable calibration point so that the meter-reading at the start of the survey is zero.

In the case of surveying through a maintenance hole when a new header sheet is required, the meter-reading shall be set at zero with the camera focused on the outgoing pipe entrance.

At the start of each maintenance hole length, a data generator shall electronically generate and clearly display on the viewing monitor and video recording a record of data in alphanumeric form containing the following minimum information:

- a) Automatic update of the camera's meter-reading position in the pipeline from adjusted zero.
- b) Pipeline dimensions.
- c) Maintenance hole and pipe length reference numbers.

- d) Date of survey.
- e) Road name and location.
- f) Direction of survey.
- g) Time of start of survey.
- h) Pipeline use.

Once the survey of the maintenance hole length is underway, an automatic update of the camera's meter-reading position in the pipeline from zero in metres and tenths of a metre shall be continually displayed.

The camera shall be stopped when defects are being noted on the coding sheet. Defects in each pipeline length shall be coded according to the standard being used (i.e., CSA Plus 4012, NASSCO Canadian Edition of the Pipeline and Assessment Certification Program (PACP), or WRC) or as specified in the Contract Documents. Any variation from the manual shall be noted in the survey report.

The survey shall be restarted at the opposite end of the pipeline if a blockage or obstruction is encountered.

Inspections shall be recorded in colour.

Digital video recordings may be saved to a computer hard drive and transferred to a portable hard disk drive, compact disc, or digital video for submission.

A digital format video recording of an inspection shall be produced in colour from a first generation recording by one of the following methods:

- a) A computer system and a video capture card shall be used to capture the recording continuously, regardless of the progression of the inspection. Prior to submission, the raw digital data shall be edited to remove pauses when the inspection progress was not continuous.
- b) A computer system and a video capture card shall be used to intermittently capture the recording. Prior to submission, the raw digital file shall be edited to form one continuous file.
- c) Specialized video recording equipment capable of pausing and resuming live recording shall be used to capture original recording. A single file is to be produced for submission.

Video capture equipment shall be capable of capturing digital video from first generation recordings with no frame loss.

Non-linear video editing software shall be used to edit digital videos. Edited digital files shall not be recompressed.

#### **409.07.04.02 Camera Position**

The camera lens shall be positioned centrally in a circular pipeline and at two-thirds of the vertical dimension in a non-circular pipeline with a positioning tolerance of  $\pm 10\%$  of the vertical pipeline dimension.

In all instances, the camera lens shall be positioned looking along the longitudinal axis of the pipeline.

#### **409.07.04.03 Camera Travel Speed**

The travelling speed of the camera in the pipeline shall be limited to:

- a) 0.1 m/s for pipeline of diameter less than 200 mm.
- b) 0.15 m/s for diameters exceeding 200 mm but not exceeding 310 mm.
- c) 0.20 m/s for diameters exceeding 310 mm.

#### **409.07.04.04 Camera Position Meter-Reading Device**

A suitable meter-reading device shall be used that enables the cable length to be accurately measured to indicate the location of the camera. The meter-reading device shall be accurate to  $\pm 1\%$  of the length of the sewer being surveyed. The tolerance shall be demonstrated using one or both of the following methods in conjunction with a linear measurement audit form that shall be completed each day during the survey:

- a) Cable calibration device.
- b) Tape measurement of the surface distance between maintenance holes.

If the accuracy of the measuring device fails, it is to be replaced. The Contract Administrator may require that the lengths of pipeline first inspected with the original measuring device be resurveyed using the new measuring device.

#### **409.07.05 Final Documentation**

##### **409.07.05.01 Survey Reporting**

Survey reports shall be submitted to the Contract Administrator in the following formats, with the noted number of copies, within 10 Business Days of the completion of the fieldwork:

- a) 3 copies of the printed survey report.
- b) 2 portable hard disk drives, other digital storage devices and software database as specified in the Contract Documents, each containing the identical survey report information as in the printed copies.
- c) 2 copies of the digital video recording.

Entire inspections shall be contained within one digital file on a digital storage device, as applicable. When possible, reverse set-up inspections shall be recorded immediately after the original inspection.

Each digital file shall contain the file name, as specified by the Owner and may include the following:

- a) Tender number
- b) E<Entity number>
- c) F<From entity number>
- d) T<To entity number>
- e) Street Name
- f) M<Measured length>
- g) I<Inspected length>

h) <Inspection direction:DS or US>

i) <Letter designating inspection sequence> .MPEG

For example: 910-200 E5329 F5328 T5350 BERRY M100.0 I39.2 US B.MPEG indicates that this is the second or "B" partial inspection of this entity, 39.2 m long.

All required header information fields shall be completed and verified for correctness. The software used to produce the survey report shall not allow the operator to continue inputting information until the preceding field has been completed. The report shall be machine printed and presented according to the standard used.

All dimensions in the survey report shall be metric.

The survey report shall identify major defects and shall include photographs when the need for photographs is specified in the Contract Documents.

#### **409.07.05.02 Drawings**

One clean set of the Owner's drawings showing maintenance hole numbers that coincide with the coding sheets and videotapes shall be returned to the Contract Administrator on completion of the survey. The drawings shall be clearly annotated to show any discrepancies between the drawings and the survey report. Such discrepancies shall be brought to the attention of the Contract Administrator during the survey.

#### **409.07.06 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **409.08 QUALITY ASSURANCE**

Upon submission, printed and digital inspection reports, and digital MPEG video recordings, magnetic data files, and coding accuracy checks shall be reviewed to ensure compliance with the Contract Documents.

Submittals shall be reviewed by the Contract Administrator and their acceptance confirmed within 10 Business Days of submission. Only inspections with minimum accuracy for header information of 95% and minimum detail accuracy for defects and features of 85% will be accepted. Non-compliant submissions will be returned for correction. Corrected submissions shall be returned to the Contract Administrator for review within 5 Business Days.

Operators failing to meet the coding accuracy requirements on two occasions shall not be permitted to code on the remainder of the Contract, unless they successfully re-attain NASSCO qualification based on the standard being used (i.e., Canadian Edition of PACP or WRc).

### **409.09 MEASUREMENT FOR PAYMENT**

#### **409.09.01 Actual Measurement**

Measurement for a CCTV inspection of pipeline shall be measured in metres on the ground surface along the centreline of the pipe sewer from the centre of one drainage structure to the centre of another drainage structure or outlet end of the pipe sewer. Measurement for pipe culverts shall be from one end of the pipe culvert to the other end of the pipe.

Measurement for a CCTV inspection of watermain shall be measured in metres on the ground surface along the centreline of the watermain from the valve pit entry point to the valve pit exit point or termination of the cement mortar lining.

In the event that a CCTV inspection is terminated due to a blockage or collapsed pipe or the pipe is inaccessible, measurement shall be in metres for the actual length of pipeline inspected as determined from the chainage indication on the record media.

#### **409.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

### **409.10                              BASIS OF PAYMENT**

#### **409.10.01                      CCTV Inspection - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract does not contain a separate tender item for CCTV inspection, the Contract price for the appropriate tender item for the installation of pipe sewers, pipe culverts, or the lining of watermain shall include full compensation for all labour, Equipment, and Material to do the work of CCTV inspection.

Non-compliant submissions returned for correction shall be corrected and resubmitted at no expense to the Owner.

Gravity Pipe Design Guidelines

### **CSA Standards**

B1800:21 Thermoplastic Nonpressure Piping Compendium

## **410.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Aluminum Alloy** means as defined in OPSS 421.

**Backfilling** means as defined in OPSS 421.

**Concrete Appurtenances** means as defined in OPSS 421.

**Drainage Structure** means as defined in OPSS 407.

**Elastomeric Gasket** means a gasket that is made from a silicone elastomer based material.

**Flexible Pipe** means as defined in OPSS 421.

**Gravity Pipe Installation** means as defined in OPSS 421.

**Inspection Assessment** means as defined in OPSS 421.

**Pipe Run** means a section of a pipe sewer between two drainage structures or between a drainage structure and an outlet.

**Pipe Sewer** means an installation designed for the conveyance of sanitary sewage or storm water using preformed or precast pipe sections, circular or non-circular in cross-section, laid end to end using suitable jointing material and connected by maintenance holes for sanitary pipe sewers and by maintenance holes, catch basins, ditch inlets, or concrete appurtenances for storm pipe sewers.

**Pipe Type** means a pipe's inner wall design, which can be smooth or corrugated.

**Polypropylene Plastic** means a material made with virgin polymers in which propylene is essentially the sole monomer.

**Post Installation Inspection** means quantifying the final installed condition of gravity pipe installations using accepted surveillance and measuring methods.

**Service Connection** means the pipe used to convey sanitary sewage or storm water from the property line to the main sanitary or storm pipe sewer respectively.

**Test Segment** means as defined in OPSS 421.

## **410.05 MATERIALS**

### **410.05.01 Clay Seal**

Clay seal material shall be according to OPSS 1205.

### **410.05.02 Concrete**

Concrete for concrete appurtenances shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

### **410.05.03 Geotextile**

Geotextile shall be according to OPSS 1860.

### **410.05.04 Elastomeric Seal**

Elastomeric seal (gaskets) for pipe joints shall be according to ASTM F477.

### **410.05.05 Mortar**

Mortar for joints shall be according to OPSS 904.

### **410.05.06 Pipe Materials**

#### **410.05.06.01 General**

Pipe sewer size, type, and class shall be consistent throughout a pipe run and as specified in the Contract Documents.

Fittings shall be suitable for and compatible with the pipe type and class for which they will be used.

#### **410.05.06.02 Aluminum Alloy Pipe Products**

Aluminum alloy pipe products shall be according to OPSS 421.

#### **410.05.06.03 Concrete Pipe**

Concrete pipes shall be according to OPSS 421.

#### **410.05.06.04                    Corrugated Steel Pipe Products**

Corrugated steel pipe products shall be according to OPSS 421.

#### **410.05.06.05                    Polyethylene Pipe Products**

Polyethylene pipe products shall be according to OPSS 1840.

#### **410.05.06.06                    Polypropylene Plastic Pipe Products**

Polypropylene plastic pipe products shall be according to OPSS 1843.

#### **410.05.06.07                    Polyvinyl Chloride Pipe Products**

Polyvinyl chloride pipe products shall be according to OPSS 1841.

Polyvinyl chloride service connection pipe shall be according to CSA B1800 and shall have bell and spigot joints with elastomeric gaskets.

#### **410.05.07                        Steel Reinforcement**

Steel reinforcement shall be of the size and grade specified in the Contract Documents and shall be according to OPSS 1440.

### **410.07                            CONSTRUCTION**

#### **410.07.01                        Site Preparation**

Site preparation shall be according to OPSS 490.

#### **410.07.02                        Removals**

Removals shall be according to OPSS 510.

#### **410.07.03                        Preservation and Protection of Existing Facilities**

Preservation and protection of existing facilities shall be according to OPSS 491.

#### **410.07.04                        Protection Against Floatation**

Damage to the pipeline due to floatation shall be prevented during construction and until completion of the work.

#### **410.07.05                        Cold Weather Work**

All work shall be protected from freezing. Pipes and bedding material shall not be placed on frozen ground.

#### **410.07.06                        Transporting, Unloading, Storing, and Handling Pipe**

The transporting, unloading, storing, and handling of pipe, shall be according to the manufacturer's recommendations.

All pipes, fittings, and gaskets that are unsound or damaged shall be rejected.

#### **410.07.07                      Excavation**

Excavation for the placement of pipe sewers shall be according to OPSS 401.

#### **410.07.08                      Support Systems**

Support systems shall be according to OPSS 404.

#### **410.07.09                      Dewatering**

Dewatering shall be according to OPSS 517.

#### **410.07.10                      Protection Systems**

The construction of all protection systems shall be according to OPSS 421.

#### **410.07.11                      Backfilling and Compacting**

Backfilling and compacting shall be according to OPSS 401.

#### **410.07.12                      Pipe Installation**

##### **410.07.12.01                  General**

If a universal dimple coupler or any other coupler does not follow the contour of the flexible pipe sections to be joined, polyethylene gaskets shall then be installed at all joints when such couplers are used. Polyethylene gaskets shall be installed symmetrically about the pipe joint, between the coupler and the pipe, and shall be of sufficient length to equal the circumference of the pipe plus a minimum overlap of 300 mm.

The pipe shall be laid within the alignment and grade tolerances specified in the Contract Documents. When bell and spigot pipe is laid, the bell end of the pipe shall be laid upgrade.

The pipe shall be kept clean and dry as work progresses. The trench shall be kept dry. A removable watertight bulkhead shall be installed at the open end of the last pipe laid whenever work is suspended.

The pipe shall not be laid until the preceding pipe joint has been completed and the pipe is carefully embedded and secured in place.

When installing gaskets, all pipe ends shall be thoroughly cleaned. For gaskets requiring field lubrication, a lubricant recommended by the pipe manufacturer shall be used.

When gaskets have been affixed, the pipe shall be handled in a way so that the gasket is not damaged, displaced, or contaminated with foreign matter. Any gasket displaced or contaminated shall be removed, cleaned, and lubricated, if required, and reinstalled before closure of the joint is attempted. When specified in the Contract Documents, nitrile gaskets shall be used.

The pipe shall be properly positioned by means of an appropriate mechanism. Sufficient pressure shall be applied in making the joint to ensure that the joint is in position. Sufficient restraint shall be applied to the line to ensure that joints are held in this position.

Once the pipe has been jointed, a test shall be made with a feeler gauge at intervals around the joint to ensure that the gasket has not been displaced from the spigot groove. If the gasket is found out of position, the joint shall be opened and the gasket placed in its proper position. If necessary, a new gasket shall be installed.

#### **410.07.12.02                    Circular Concrete Pipe**

All circular concrete pipe joints shall have elastomeric gaskets.

#### **410.07.12.03                    Non-Circular Concrete Pipe**

Elliptical concrete pipes and joints shall be used for storm pipe sewers only.

All non-circular concrete pipe joints shall be according to the procedures recommended by the manufacturer.

#### **410.07.12.04                    Corrugated Steel Pipe Products**

Corrugated steel pipe products shall be used for storm pipe sewers only.

Helical corrugated steel pipe without rerolled ends shall be installed so that the helix angle is constant for the total length of the installation. Each pipe section shall be installed next to the previous section so that the lockseam forms a continuous helix. For rerolled ends, the correct fit of the coupling system does not depend on the location of the helical lockseam and corrugation.

Corrugated steel pipe sections shall be joined by means of steel couplers. The couplers shall be installed to lap approximately equal portions of the pipes being connected so that the corrugations or projections of the coupler properly engage the pipe corrugations. As the coupler is being tightened, it shall be tapped with a mallet to take up the slack.

When joint seals are specified in the Contract Documents, they shall be installed immediately prior to the installation of steel couplers.

#### **410.07.12.05                    Polyethylene Pipe**

Polyethylene pipes shall be installed according to OPSS 421.

#### **410.07.12.06                    Polyvinyl Chloride Pipe**

Polyvinyl chloride pipe shall be according to OPSS 421.

#### **410.07.12.07                    Polypropylene Pipe**

Polypropylene pipe shall be according to OPSS 421.

#### **410.07.12.08                    Corrugated Aluminum Alloy Structural Plate Pipe**

Corrugated aluminum alloy structural plate pipe shall be according to OPSS 421.

#### **410.07.13                        Service Connections**

Service connections to the main pipe sewer shall be made using factory made tees or wyes, strap-on-saddles, or mortar-on saddles. Factory made tees or wyes shall be used for all service connections when the diameter of the main pipe sewer is:

- a) less than 450 mm; or
- b) less than twice the diameter of the service connection.

Strap-on-saddles shall be installed before laying the pipe.

Holes in the main pipe sewer shall be cut to the minimum diameter required to accept the service connection saddle. If mortar-on saddles are used, the inside of the pipe shall be mortared at the connection.

Service connections shall be plugged at the property line with watertight caps or plugs.

When existing service connections shall be connected to new pipe sewers or service connections, jointing methods according to gravity pipe design guidelines shall be used.

#### **410.07.14                      Marking and Recording Service Connections**

A painted temporary location marker consisting of a 50 x 75 mm stake or two short sections of lumber connected by a piece of heavy gauge wire shall be placed at the end of the plugged or capped service connection. The marker shall be placed from 300 mm below the finished grade to a point 300 mm above the plugged end of the service pipe.

A painted surface stake, 50 x 75 x 450 mm long, shall be placed after trench restoration.

Service connections shall not be backfilled until they have been inspected and measurements of location have been taken by the Contract Administrator.

#### **410.07.15                      Breaking into Maintenance Holes, Catch Basins, Ditch Inlets, Culverts, and Sewers**

Breaking into maintenance holes, catch basins, ditch inlets, culverts and sewers shall be according to OPSS 408.

#### **410.07.16                      Field Testing**

##### **410.07.16.01                  General**

Field tests shall be conducted when specified in the Contract Documents and applied to sanitary and storm pipe sewers. All tests shall be carried out in the presence of and accepted by the Contract Administrator.

When specified in the Contract Documents, leakage tests shall be carried out on completed pipe sewers 1,200 mm in diameter and smaller. There shall be no visible leakage for pipe sewers larger than 1,200 mm diameter.

Testing shall be carried out from maintenance hole to maintenance hole, including house service connections as work progresses.

The construction of new mainline pipe sewers shall not proceed when three previously placed sections of the pipe sewer have not been tested or have been tested and are unsatisfactory.

Leakage up to 25% in excess of the calculated limits shall be approved in any test section provided that the excess is offset by lower leakage measurements in adjacent sections so that the total leakage is within the allowable limits for the combined sections.

Pipe sewers shall be repaired and retested, as required, until the test results are within the limits specified in this specification. Visible leaks shall be repaired regardless of the test results.

No part of the work shall be accepted until the pipe sewers are satisfactorily tested following completion of installation of service connections and backfilling.

#### **410.07.16.02                      Prequalification Leakage Tests**

Prequalification leakage tests shall be carried out as either infiltration or exfiltration tests, as required.

The test shall be performed on the first section of the pipe sewer of each size, not less than 100 m in length, installed by each crew in order to prequalify the crew and the material. Tests may be carried out prior to service connections being installed in the section being tested.

When tests are unsatisfactory, the test section shall be repaired and retested until satisfactory results are obtained.

#### **410.07.16.03                      Infiltration Test**

Dewatering operations shall be discontinued at least 3 Days prior to conducting the test and allow for the groundwater level to stabilize. Infiltration tests shall be conducted when the groundwater level at the time of testing is 600 mm or more above the crown of the pipe for the entire length of the test section. The test section is typically between adjacent maintenance holes.

A watertight bulkhead shall be constructed at the upstream end of the test section. All service laterals, stubs, and fittings shall be plugged or capped to prevent water entering at these locations. A V-notch weir or other suitable measuring device shall be installed at the downstream end of the test section. Infiltrating water shall be allowed to build up behind the weir until the flow through the V-notch has stabilized. The rate of flow shall then be measured. The rate of flow shall not exceed the maximum allowable infiltration calculated for the test section. The allowable infiltration shall be calculated by the following:

$$\text{Allowable Infiltration} = \frac{0.075 \text{ L/mm diameter}}{100 \text{ m of pipe/hour}}$$

#### **410.07.16.04                      Exfiltration Test**

##### **410.07.16.04.01                  General**

Exfiltration tests shall be conducted when the groundwater level is lower than 600 mm above the crown of the pipe or the highest point of the highest service connection included in the test section.

The test section is typically between adjacent maintenance holes. The test section of the pipe sewer shall be isolated by temporarily plugging the downstream end and all incoming pipes of the upstream maintenance hole. All service laterals, stubs, and fittings are plugged or capped to prevent water entering at these locations.

##### **410.07.16.04.02                  Testing with Water**

The test section shall be slowly filled with water ensuring that all air is removed from the line. A period of 24 hours for absorption or expansion shall be allowed prior to starting the test, except if exfiltration requirements are met by a test carried out during the absorption period.

Water shall be added to the pipeline prior to testing until there is a head in the upstream maintenance hole of 600 mm minimum over the crown of the pipe or at least 600 mm above the existing groundwater level, whichever is greater. The maximum limit of the net internal head on the line is 8 m. In calculating the net internal head, allowance for groundwater head, if any, shall be made.

The distance from the maintenance hole frame to the surface of the water shall be measured. After allowing the water to stand for one hour, the distance from the frame to the surface of the water shall again be measured. The leakage shall be calculated using volumes.

The leakage at the end of the test period shall not exceed the maximum allowable calculated for the test section. The allowable leakage shall be calculated by the following:

$$\text{Allowable Infiltration} = \frac{0.075 \text{ L/mm diameter}}{100 \text{ m of pipe/hour}}$$

An allowance of 3.0 litres per hour per metre of head above the invert for each maintenance hole included in the test section shall be made.

Maintenance holes shall be tested separately, if the test section fails.

#### **410.07.16.04.03 Low Pressure Air Testing**

The Contract Administrator may allow or require testing by use of air when water is not readily available or the differential head in the test section is greater than 8 m or freezing temperatures exist.

Air control equipment that includes a shut off valve, safety valve, pressure regulating valve, pressure reduction valve and monitoring pressure gauge with pressure range from 0 to 35 kPa with minimum divisions of 0.5 kPa and accuracy of approximately 0.25 kPa shall be provided.

Tests shall be conducted between two consecutive maintenance holes. The test section shall be plugged at each end. One plug shall be equipped with an air inlet connection to fill the pipe sewer system with air.

The test section shall be filled slowly until a constant pressure of 24 kPa is maintained. If the groundwater is above the pipe sewer being tested, the air pressure shall be increased by 3.0 kPa for each 300 mm that the groundwater level is above the invert of the pipe.

The air pressure shall be stabilized for 5 minutes and then regulated to maintain it to 20.5 kPa plus the allowance for groundwater, if any. After the stabilization period, the time taken for a pressure loss of 3.5 kPa shall be recorded.

The time taken for a pressure drop of 3.5 kPa shall not be less than the times shown in Table 1.

If the length of the test section is greater than the length for minimum time, the new testing time shall be a product of the length of test section multiplied by the time shown in Table 1 for the appropriate size pipe.

If the results of an air test are marginal, the Contract Administrator may require the section to be retested using water.

#### **410.07.17 Cleaning and Flushing of Pipe Sewers**

At least 2 Business Days prior to the commencement of the post installation inspection, the pipe sewers shall be prepared for inspection by cleaning and flushing. The cleanout material from the cleaning and flushing operation shall be managed according to OPSS 411.

#### **410.07.18 Clay Seals**

Clay seals shall be placed according to OPSS 421.

#### **410.07.19 Concrete Appurtenances**

Concrete appurtenances shall be constructed according to OPSS 421.

## **410.07.20 Site Restoration**

Site restoration shall be according to OPSS 492.

## **410.07.21 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

## **410.08 QUALITY ASSURANCE**

### **410.08.01 Acceptance**

Acceptance shall be according to this specification, including satisfactory completion of all replacement and remedial actions associated with identified deficiencies.

### **410.08.02 Post Installation Inspection**

A post installation inspection shall be conducted by the Contractor when:

- a) Specified in the Contract Documents.
- b) A defective, damaged, or improperly installed pipe is encountered.
- c) At the request of the Contract Administrator.

When post installation inspection is conducted the following shall apply:

- a) The number of test segments per pipe sewer tender item shall account for a minimum of 25% of the total pipe sewer length in the work.
- b) On Contracts with less than four pipe runs, a minimum of one test segment shall be inspected.

## **410.09 MEASUREMENT FOR PAYMENT**

### **410.09.01 Actual Measurement**

#### **410.09.01.01 Pipe Sewer**

Measurement of pipe sewers shall be by length in metres along the horizontal centreline length of the pipe from the centre of one drainage structure to the centre of another drainage structure or outlet end of the pipe sewer. When the grade of the pipe sewer is 10% or greater, the above measurement shall then be of the slope length.

#### **410.09.01.02 Service Connections**

Measurement of the service connections shall be by length in metres along its horizontal centreline from the centreline of the main pipe sewer to the end of the service connection.

#### **410.09.01.03 Concrete Appurtenances**

Measurement for concrete appurtenances shall be by volume in cubic metres for the volume of concrete placed.

#### **410.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

#### **410.10 BASIS OF PAYMENT**

##### **410.10.01 "size, type, class" Pipe Sewer - Item Service Connections - Item Concrete Appurtenances - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

##### **410.10.02 Elevation Adjustment**

Prior to the installation of a drainage structure, the Owner may, at its sole discretion, raise or lower the invert of a pipe sewer by 150 mm or less, at no additional cost. Bedding elevations shall be adjusted accordingly.

A change in invert elevation exceeding 150 mm shall be administered as a Change in the Work.

##### **410.10.03 Clay Seal**

Payment for clay seal shall be according to OPSS 902.

**411.01 SCOPE**

This specification covers the requirements for the cleaning and flushing of pipe and concrete culverts, pipe sewers, catch basins, maintenance holes, ditch inlets, and oil-grit separators, including cleaning of concrete culverts and wall drains by means of pressure washing for the removal of corrosion deposits buildup and management of cleanout material.

**411.02 REFERENCES**

## Ontario Ministry of Transportation Publications

MTO Environmental Guide for Fisheries - Best Management Practices Manual 2020

### Others

Environmental Protection Act, R.S.O. 1990, c. E19

#### 411.03 DEFINITIONS

For the purpose of this specification the following definitions apply:

**Air Gap Method** means a clear vertical separation between the pressurized potable water supply and a non-pressurized, non-potable water receiving vessel.

**Backflow Prevention** means a device used to protect potable water supplies from contamination or pollution due to backflow.

**Cleaning** means suction and vacuuming removal of debris within pipe sewers, catch basins, maintenance holes, ditch inlets, and oil-grit separators.

**Combination Hydro-Jet Cleaner** means a service vehicle or equipment capable of pressure washing, suction vacuum cleaning of debris.

**Contaminant** means contaminant as defined in the Environmental Protection Act, R.S.O. 1990, c. E19.

**Debris** means dirt, sand, gravel, rocks, bricks, other solid and semi-solid materials, and roots, grease, and encrustations and other materials that may cause restriction to flow in culverts, pipe sewers, catch basins, maintenance holes, ditch inlets, and oil-grit separators.

**Drainage System Components** means the components required to collect and convey the stormwater and include pipe and concrete culverts, pipe sewers, catch basins, maintenance holes, ditch inlets, wall drains and oil-grit separators.

**Flushing** means hydraulic pressure washing using various nozzles, pressure and flow rates to flush debris within pipe sewer systems downstream.

**Oil-grit Separator** means an underground storage device designed to separate oil and suspended solids from stormwater.

**Pipe Culvert** means as defined in OPSS 421.

**Pipe Sewer** means as defined in OPSS 410.

**Receiving Site** means a municipal sanitary sewer or sewage treatment plant, certified waste treatment facility, or certified waste disposal site.

**Wall Drain** means perforated pipe system used to transmit water from the backfill through the wall structure into the drainage system to alleviate hydrostatic pressure on the wall and prevent erosion underneath and around the road due to unattended water overflow.

#### **411.04 DESIGN AND SUBMISSION REQUIREMENTS**

When equipment requiring an environmental compliance approval for a waste management system, issued by the Ontario Ministry of the Environment, Conservation and Parks, will be used for the work, a copy of the environmental compliance approval shall be submitted to the Contract Administrator a minimum of two weeks prior to commencement of the work.

Any approvals, releases, and agreements that are required to implement the strategy for the management of cleanout material shall be obtained.

The conditions of the site and the pipe sewer system shall be thoroughly assessed, including the degree of pipe blockage and types of debris. The equipment, nozzles, flow rates, and pressures necessary to complete the work shall be determined. Any supplemental information regarding the sewer network and the assessment method shall be as specified in the Contract Documents.

The proposed cleaning method and procedures, including method to manage effluent and cleanout material shall be submitted to the Contract Administrator at least 14 Days prior to commencing work.

The Contract Administrator shall be notified of the location where cleaning will be performed a minimum of 24 hours in advance of commencing the work.

##### **411.04.01 Permission and Release of Operators of Receiving Sites**

Written permission shall be obtained from the operator of a receiving site, prior to its use for disposal of the cleanout material. A copy of this permission shall be provided to the Contract Administrator a minimum of 14 Days prior to the commencement of such work.

#### **411.05 MATERIALS**

##### **411.05.01 Water Source**

Water source shall be as specified in the Contract Documents. When the source is not specified, water shall be clean and free from oil, acid, alkali, organic matter, or other deleterious substances.

Backflow prevention and air gap methods shall be used when water is taken from potable water systems.

#### **411.06 EQUIPMENT**

##### **411.06.01 Combination Hydro-Jet Cleaner**

A combination hydro-jet cleaner specifically designed for the purpose of cleaning pipe sewers, catch basins, maintenance holes, ditch inlets, oil-grit separators, and similar facilities, using a selection of nozzles and attachments to permit reaming and root cutting as required, shall be used for the work. The equipment shall be able to clear blockages and remove debris from pipe sewer systems with varied sizes and downstream constraints.

#### **411.07 CONSTRUCTION**

##### **411.07.01 General**

The conditions of the site and the pipe sewer system shall be thoroughly assessed prior to work commencement, including the degree of pipe blockage and types of debris.

The work shall commence at the upstream end of pipe sewer systems and progress to the downstream end.

Prior to using any mechanical equipment in pipe sewer systems, verification of utility locates shall be obtained.

Water flow volumes and pressures shall not cause damage to the pipe sewer system or flooding of property. Water flow volumes and pressures shall be appropriate for the age and condition of the pipe sewer system.

Debris that cannot be removed by flushing shall be loosened and broken up using reamers and root cutters as required.

No blockage to service connections or laterals shall occur as a result of the cleaning and flushing or cleanout operation.

Protection of waterbodies and waterbody banks shall be as specified in the Contract Documents.

When beaver dam removal is required within culvert cleanout operations, the beaver dam removal shall be performed in accordance with MTO Best Management Practice for Beaver Dam Removal as specified in MTO Environmental Guide for Fisheries - Best Management Practices Manual.

For post installation inspections, pipe culverts and pipe sewers requiring cleaning and flushing shall be as specified in the Contract Documents.

The Owner may request additional documentation of findings after cleaning and flushing operations as specified in the Contract Documents.

During the cleaning operation, any encountered defects of the drainage system components shall immediately be reported to the Contract Administrator.

The road surface immediately above the culvert shall be monitored during cleanout operations. If any visual indications that pavement or embankment sinkholes are developing during cleaning or flushing operation, the work should stop immediately and reported to the Contract Administrator.

Any damage caused to the existing drainage system components surfaces resulting from the cleaning operations shall be reported to the Contract Administrator and repaired at no additional cost to the Owner.

#### **411.07.02 Culvert Cleaning**

Pipe culverts shall be cleaned out to the bottom of the pipe, unless otherwise directed by the Contract Administrator or specified in the Contract Documents.

Open footing concrete culvert shall be cleaned out to the level of the top of footing and closed box concrete culvert shall be cleaned out to the bottom slab level, unless otherwise directed by the Contract Administrator or specified in the Contract Documents.

All works within a watercourse shall be conducted in the dry. The surface waters of the watercourse shall be protected from the entry of any disturbed sediment or other debris. Dewatering shall be according to OPSS 517. The work shall include capturing and collecting of all removed sediment. When sediment control measures are found ineffective immediate changes shall be made.

The culvert shall be considered clean when all debris, including vegetation at the inlet and outlet that obstructs the flow, sand or silt has been removed from the top, side and bottom (invert) of the culvert.

#### **411.07.03 Culvert and Wall Drain Cleaning by Pressure Washing**

The pressure wash cleaning equipment with less than 3,000 PSI pressure at the nozzle shall be used for removal of the corrosion deposits buildup in concrete culverts, around the existing wall drains and cleaning the clogged wall drains. The pressure washer shall be operated at a distance of 150 mm to 300 mm from the surface.

Pressure washing shall not be allowed when ambient temperatures are less than 4°C.

Chemical cleaning compounds shall not be allowed during pressure washing operations.

During the cleaning operation, any encountered culvert defects shall immediately be reported to the Contract Administrator.

Scraping hand tools may be used to locally remove heavy leachate deposits. Upon the completion of the pressure wash cleaning, any standing water shall be removed by mopping and/or air blasting.

Local waterbody aggregates shall be removed and reinstated at repair locations to the top of floor slab.

#### **411.07.04 Pipe Sewer Cleaning and Flushing**

Flushing shall be used to transport debris from each section of pipe sewer to the downstream maintenance hole or catch basin. Each section of pipe sewer between maintenance holes, catch basins, ditch inlets shall be cleaned and flushed before cleaning and flushing the next downstream section. Debris shall be continuously cleaned from the downstream maintenance hole or catch basin as flushing occurs.

The passage of debris from one section of pipe sewer to another shall not be permitted, unless specified in the Contract Documents. A weir or sediment trap shall be placed in the maintenance hole to prevent passage of debris from the upstream pipes. When cleaning and flushing is completed for each section, the weir or sediment trap shall be removed.

Cleaning and flushing shall continue for each section of pipe sewer until no further debris is flushed from the pipe, and the pipe sewer section is free of impediments to flow. A minimum of 90% of the pipe sewer circumference shall be free of debris.

If cleanout cannot be completed due to damaged or broken pipe sewer, catch basin, maintenance hole, or ditch inlet, the Contract Administrator shall be immediately notified.

#### **411.07.05 Catch Basin, Maintenance Hole, and Ditch Inlet Cleanout**

A combination hydro-jet cleaner shall remove debris from catch basins, maintenance holes, and ditch inlets separately.

#### **411.07.06 Oil-Grit Separator Cleanout**

Oil-grit separators shall be cleaned out by closing or blocking off the inlet and outlet pipes, dewatering the system, removal of debris by vacuum or other mechanical means, and cleaning and flushing to remove sediment. The inlet and outlet pipes shall not be reopened or unblocked until after the separator has been inspected by the Contract Administrator.

#### **411.07.07 Closed-Circuit Television Inspection**

Unless otherwise specified in the Contract Documents, pipe culverts and pipe sewers shall be inspected after cleaning by closed-circuit television (CCTV) according to OPSS 409. The Contract Administrator shall be notified a minimum 24 hours prior to the inspection.

When specified in the Contract Documents, water shall be added immediately prior to CCTV inspection to the upstream end of the pipe culvert and pipe sewer system for minimum flow to the system low point by gravity.

#### **411.07.08 Management of Cleanout Material**

Cleanout material shall be inspected to identify the presence of any visual, olfactory or other evidence of the spill of a contaminant. Material that is found during cleanout to be impacted by a spill of a contaminant shall be managed as specified in the Contract Documents.

Debris removed from culverts, pipe sewers, catch basins, maintenance holes, ditch inlets, and oil-grit separators shall be managed as excess material according to the Contract Documents.

The cleanout material shall be managed by one, or a combination of, the following:

- a) as a composite material without dewatering; or
- b) by dewatering and subsequent management of sludge component.

A copy of the weigh tickets or receipts provided by the site operator shall be submitted to the Contract Administrator. Where such documentation is not available, written confirmation that the waste has been received shall be obtained from the owner of the disposal site, and provided to the Contract Administrator, a maximum of 14 Days after disposal activities are complete.

##### **411.07.08.01 Management as a Composite Material Without Dewatering**

When cleanout is done without dewatering, the composite material shall be managed as non-hazardous solid industrial or commercial waste and shall be transported from the area designated for cleanout directly to one of the following:

- a) a landfill site with an environmental compliance approval/certificate of approval for a disposal site valid for commercial and municipal waste;
- b) a waste treatment facility with an environmental compliance approval/certificate of approval for a waste disposal site (processing), or a certificate of approval for waste disposal site (mobile processing) valid for commercial or municipal waste.

##### **411.07.08.02 Dewatering and Subsequent Management of Sludge Component**

Cleanout material shall be dewatered as necessary. Dewatering shall be by discharge of the liquid component of cleanout material directly to one or a combination of the following:

- a) a waste treatment facility with an environmental compliance approval/certificate of approval for a waste disposal site (processing), or a certificate of approval for a waste disposal site (mobile processing), valid for commercial or municipal waste;
- b) the culvert, pipe sewer or ditch from which the material was removed.

The sludge or solid component of the cleanout material shall be managed as non-hazardous solid industrial waste or commercial waste and shall be transported directly, with the exception of dewatering en route, from the area designated for cleanout to a certified receiving site.

Transportation of the cleanout material shall be done by a hauler with a certificate of approval for a waste management system that is valid for the following:

- a) the entire work period;

- b) the entire area within the limits of the work and the entire haul route;
- c) the equipment to be utilized, and
- d) non-hazardous solid industrial waste, or commercial waste.

**411.09 MEASUREMENT FOR PAYMENT**

**411.09.01 Actual Measurement**

**411.09.01.01 Clean out of Pipe Sewer**

Measurement shall be in metres and along the centreline of the pipe sewer from the centre of the maintenance hole, catch basin, or ditch inlet at each end of the pipe sewer system to be cleaned out.

When cleaning and flushing is incomplete due to a collapsed pipe or immovable blockage, the length of collapsed pipe or blockage shall be deducted from the length measured for payment.

**411.09.01.02 Clean Out of Pipe Culvert, Concrete Culvert, Catch Basin, Maintenance Hole, Ditch Inlet, and Oil-Grit Separator**

For measurement purposes, a count shall be made of the number of structures cleaned.

**411.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**411.10 BASIS OF PAYMENT**

**411.10.01 Clean Out of Pipe Culvert - Item  
Clean Out of Concrete Culvert - Item  
Clean Out of Pipe Sewer - Item  
Clean Out of Catch Basin - Item  
Clean Out of Maintenance Hole - Item  
Clean Out of Ditch Inlet - Item  
Clean Out of Oil-Grit Separator - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Payment for the management of material found, during the cleanout operation, to be contaminated by the spill of a contaminant shall be treated as a Change in the Work.

Any costs incurred due to delays in obtaining the approvals, releases, agreements or verifications required to complete the work as specified in the Contract, shall be borne by the Contractor at no additional cost to the Owner.

## **421.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Aluminum Alloy** means a material made with two or more metals in which aluminum is the predominant metal.

**Backfilling** means the operation of filling the trench with bedding, cover, and backfill material or embedment and backfill material.

**Certification Body** means an independent 3rd party agency accredited by the Standards Council of Canada that has the qualifications, skills, and expertise required to confirm that a pipe manufacturer produces pipe culvert products to the quality and requirements of an accepted standard and that has the mandate to certify the pipe culvert products produced.

**Certified** means pipe culvert products that have been marked with a certification body's logo confirming that the production of the pipe culvert product is according to the quality and requirements of the manufacturing standard.

**Concrete Appurtenances** means concrete head walls, cut-off walls, stiffeners, aprons, collars, and any other concrete fixtures associated with the pipe culvert.

**Corrugated Steel Pipe Products** means as defined in OPSS 1801.

**Culvert Inlet Grate** means a metal grate placed at the upstream end of a culvert to prevent woody debris, rocks etc from entering the culvert. Also called trash rack.

**Delivered Quality** means the pipe culvert products' physical condition upon arrival at the construction site in terms of the extent and degree of dents, scratches, cracks, pipe coating integrity, etc., that appear on the pipe culvert products delivered.

**Elastomeric Seal** means a gasket that is made from a silicone elastomer-based material.

**Flexible Pipe** means pipe that can deflect 2% or more without cracking, such as polyvinyl chloride, polyethylene, or steel pipe.

**Gravity Pipe Culvert Installation** means a constructed pipe culvert conveying surface waters under the influences of gravity only.

**Pipe Culvert** means an installation designed to provide for the conveyance of surface water, pedestrians, or livestock using preformed or precast pipe sections, circular or non-circular in cross-section, laid end to end using suitable joint materials.

**Pipe Culvert Type** means a pipe's inner wall design, which can be smooth or corrugated.

**Polypropylene Plastic** means a material made with virgin polymers in which propylene is essentially the sole monomer.

**Post Installation Inspection** means quantifying the final installed condition of gravity pipe culvert installations using accepted surveillance and measuring methods.

**Structural Plate Pipe Culvert** means a pipe culvert that consists of corrugated steel sections that are bolted together to form the required shape.

## **421.05 MATERIALS**

### **421.05.01 Clay Seal**

Clay seal material shall be according to OPSS 1205.

### **421.05.02 Concrete**

Concrete for concrete appurtenances shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

### **421.05.03 Elastomeric Seal**

Elastomeric seal (gaskets) for pipe culvert joints shall be according to ASTM F477.

### **421.05.04 Geotextile**

Geotextile shall be according to OPSS 1860.

### **421.05.05 Mortar**

Mortar for joints shall consist of one part Portland cement and two parts mortar sand, wetted with sufficient water to only make the mixture plastic. The mortar sand shall be according to OPSS 1004, the normal Portland cement shall be according to OPSS 1301, and the water shall be according to OPSS 1302.

## **421.05.06 Pipe Culvert Materials**

### **421.05.06.01 General**

Pipe size, type, and class shall be as specified in the Contract Documents.

Pipe type shall be consistent throughout the length of the pipe culvert.

Fittings shall be suitable for and compatible with the pipe type and class for which they will be used.

### **421.05.06.02 Aluminum Alloy Pipe Culvert Products**

Corrugated aluminum alloy structural plate pipe culvert products shall be according to ASTM B746M.

All corrugated aluminum alloy structural plate pipe culvert products used in the work shall be certified and supplied from a manufacturer that produces the corrugated aluminum alloy structural plate pipe culvert products according to ASTM B746M. Only products with an accepted certification body logo marking according to Figure 1 shall be used.

Inspection, testing, and record keeping for corrugated aluminum alloy structural plate pipe culvert products shall be according to ASTM B746M.

Certified corrugated aluminum alloy structural plate pipe shall be marked according to ASTM B746M and shall include as a minimum the name of the pipe manufacturer.

When requested by the Owner, a copy of the certificate of compliance issued by the certification body confirming that the manufacturer produces certified corrugated aluminum alloy structural plate pipe culvert products shall be submitted to the Contract Administrator.

Where the delivered quality of certified corrugated aluminum alloy structural plate pipe culvert products is deemed to be unacceptable by the Contract Administrator, the products shall be rejected.

### **421.05.06.03 Concrete Pipe Culvert**

Circular concrete pipe and joints shall be according to OPSS 1820.

Elliptical concrete pipe and joints shall be according to ASTM C507.

### **421.05.06.04 Corrugated Steel Pipe Culvert Products**

Corrugated steel pipe culvert products shall be according to OPSS 1801.

### **421.05.06.05 Polyethylene Pipe Culvert Products**

Polyethylene pipe culvert products shall be according to OPSS 1840.

### **421.05.06.06 Polypropylene Plastic Pipe Culvert Products**

Polypropylene plastic pipe culvert products shall be according to OPSS 1843.

### **421.05.06.07 Polyvinyl Chloride Pipe Culvert Products**

Polyvinyl chloride pipe culvert products shall be according to OPSS 1841.

#### **421.05.07 Steel Reinforcement**

Steel reinforcement shall be of the size and grade specified in the Contract Documents and shall be according to OPSS 1440.

#### **421.07 CONSTRUCTION**

##### **421.07.01 Site Preparation**

Site preparation shall be according to OPSS 490.

##### **421.07.02 Removals**

Removals shall be according to OPSS 510.

##### **421.07.03 Preservation and Protection of Existing Facilities**

Preservation and protection of existing facilities shall be according to OPSS 491.

##### **421.07.04 Protection Against Floatation**

Damage to the pipe culvert due to floatation shall be prevented during construction and until completion of the work.

##### **421.07.05 Cold Weather Installation**

All work shall be protected from freezing. Pipes and bedding material shall not be placed on frozen ground.

##### **421.07.06 Transporting, Unloading, Storing, and Handling of Pipe**

The transporting, unloading, storing, and handling of pipe, shall be according to the manufacturer's recommendations.

All pipe, fittings, and gaskets that are unsound or damaged shall be rejected.

##### **421.07.07 Excavation**

Excavation for the placement of pipe shall be according to OPSS 401.

##### **421.07.08 Support Systems**

Support systems shall be according to OPSS 404.

##### **421.07.09 Dewatering**

Dewatering shall be according to OPSS 517.

##### **421.07.10 Protection Systems**

The construction of all protection systems shall be according to OPSS 539. When the stability, safety or function of an existing Roadway, railway, other works, or proposed works may be impaired due to the method of operation, such protection as may be required shall be provided. Protection may include sheathing, shoring and driving piles, when necessary, to prevent damage to such works or proposed works.

#### **421.07.11 Backfilling and Compacting**

Backfilling and compacting shall be according to OPSS 401.

#### **421.07.12 Pipe Culvert Installation**

##### **421.07.12.01 General**

If a universal dimple coupler or any other coupler does not follow the contour of the flexible pipe culvert sections to be joined, polyethylene gaskets shall then be installed at all joints when such couplers are used. Polyethylene gaskets shall be installed symmetrically about the pipe joint, between the coupler and the pipe, and shall be of sufficient length to equal the circumference of the pipe plus a minimum overlap of 300 mm.

Pipe shall be laid within the alignment and grade tolerances specified in the Contract Documents. When bell and spigot pipe is laid, the bell end of the pipe shall be laid upgrade.

Pipe shall be kept clean and dry as work progresses. The trench shall be kept dry. A removable watertight bulkhead shall be installed at the open end of the last pipe laid whenever work is suspended.

Pipe shall not be laid until the preceding pipe joint has been completed and the pipe is carefully embedded and secured in place.

The pipe culvert cut-end finish, end sections, and safety slope end treatments shall be as specified in the Contract Documents.

When installing gaskets, all pipe culvert ends shall be thoroughly cleaned. For gaskets requiring field lubrication, a lubricant recommended by the pipe manufacturer shall be used.

When gaskets have been affixed, the pipe shall be handled in a way so that the gasket is not damaged, displaced, or contaminated with foreign matter. Any gasket displaced or contaminated shall be removed, cleaned, and lubricated, if required, and reinstalled before closure of the joint is attempted. When specified in the Contract Documents, nitrile gaskets shall be used.

The pipe shall be properly positioned by means of an appropriate mechanism. Sufficient pressure shall be applied in making the joint to ensure that the joint is in position. Sufficient restraint shall be applied to the line to ensure that joints are held in this position.

Once the pipe has been jointed, a test shall be made with a feeler gauge at intervals around the joint to ensure that the gasket has not been displaced from the spigot groove. If the gasket is found out of position, the joint shall be opened, and the gasket placed in its proper position. If necessary, a new gasket shall be installed.

##### **421.07.12.02 Circular Concrete Pipe Culvert**

All circular concrete pipe culvert joints shall have elastomeric gaskets.

##### **421.07.12.03 Non-Circular Concrete Pipe Culvert**

All non-circular concrete pipe culvert joints shall be according to the procedures recommended by the manufacturer.

**421.07.12.04****Corrugated Steel Pipe Culvert Products**

Helical corrugated steel pipe without rerolled ends shall be installed so that the helix angle is constant for the total length of the installation. Each pipe culvert section shall be installed next to the previous section so that the lock seam forms a continuous helix. For rerolled ends, the correct fit of the coupling system does not depend on the location of the helical lock seam and corrugation.

Corrugated steel pipe culvert sections shall be joined by means of steel couplers. The couplers shall be installed to lap approximately equal portions of the pipe culvert being connected so that the corrugations or projections of the coupler properly engage the pipe culvert corrugations. As the coupler is being tightened, it shall be tapped with a mallet to take up the slack.

When joint seals are specified in the Contract Documents, they shall be installed immediately prior to the installation of steel couplers.

Structural plate pipe culverts may be assembled in the trench or beside the excavation. If the assembled structure must be moved to its final position, it shall be moved so that no damage or distortion is caused to the structure.

When the structural plate pipe culvert has been placed to the alignment and grade specified in the Contract Documents, all assembly bolts shall be tightened so that the torque on the bolts prior to backfilling is between 200 and 340 Nm.

Before backfilling, at least 5% of the bolts used in each circumferential and longitudinal connection shall be tested after assembly.

**421.07.12.05****Polyethylene Pipe Culvert**

Polyethylene pipe culvert shall be jointed by one of the following methods, as recommended by the pipe manufacturer:

- a) Bell and Spigot.
- b) Welded Joint.
- c) Thermal Fusion Joint.
- d) Screw-on Coupler.
- e) Split Coupler.
- f) Threaded Joint.
- g) Mechanical Restrained Joint with Gasket.

**421.07.12.06****Polyvinyl Chloride Pipe Culvert**

Polyvinyl chloride pipe culvert shall be jointed, as recommended by the manufacturer, using a bell and spigot joint with an elastomeric gasket.

At the end of a Day's work, the last pipe shall be blocked as may be required to prevent movement.

**421.07.12.07****Polypropylene Pipe Culvert**

Polypropylene pipe culvert shall be jointed by means of a bell and spigot joint with elastomeric gasket or a coupler joint according to the manufacturer's recommendations to satisfy the pipe joint specification.

#### **421.07.12.08                    Corrugated Aluminum Alloy Structural Plate Pipe Culvert**

Corrugated aluminum alloy structural plate pipe culvert shall be jointed by means of bolts according to the manufacturer's recommendations to satisfy the pipe joint specification.

#### **421.07.13                    Cleaning and Flushing of Pipe Culverts**

At least 2 Business Days prior to the commencement of the post installation inspection, the pipe culverts shall be prepared for inspection by cleaning and flushing. The material from the cleaning and flushing operation shall be managed according to OPSS 411.

#### **421.07.14                    Clay Seals**

Clay seals shall be placed as specified in the Contract Documents and compacted to 95% of the proctor maximum dry density.

#### **421.07.15                    Concrete Appurtenances**

Concrete appurtenances shall be as specified in the Contract Documents. Concrete in concrete appurtenances shall be placed according to OPSS 904. Steel reinforcement shall be placed according to OPSS 905. Culvert inlet grates shall be installed when specified in the Contract Documents.

#### **421.07.16                    Site Restoration**

Site restoration shall be according to OPSS 492.

#### **421.07.17                    Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **421.08                    QUALITY ASSURANCE**

#### **421.08.01                    Acceptance**

Acceptance shall be according to this specification, including satisfactory completion of all replacement and remedial actions associated with identified deficiencies.

#### **421.08.02                    Post Installation Inspection**

A post installation inspection shall be conducted by the Contractor when:

- a) Specified in the Contract Documents.
- b) A defective, damaged, or improperly installed pipe is encountered.
- c) At the request of the Contract Administrator.

### **421.09                    MEASUREMENT FOR PAYMENT**

#### **421.09.01                    Actual Measurement**

##### **421.09.01.01                    Pipe Culvert Pipe Culvert Extension**

## **Non-Circular Pipe Culvert**

### **Non-Circular Pipe Culvert Extension**

Measurement of pipe culverts, non-circular pipe culverts, pipe culvert extensions, and non-circular pipe culvert extensions shall be along the horizontal length of the pipe culvert in metres, from one end of the pipe culvert or pipe culvert end section to the other end of the pipe culvert or the other pipe culvert end section. When the grade of the pipe culvert is 10% or greater, the above measurement shall then be of the slope length.

#### **421.09.01.02 Concrete Appurtenances**

Measurement for concrete appurtenances shall be by volume in cubic metres for the volume of concrete placed.

#### **421.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **421.10 BASIS OF PAYMENT**

- 421.10.01**      **“size, type, class” Pipe Culvert - Item**  
**“size, type, class” Pipe Culvert Extension - Item**  
**“size, type, class” Non-Circular Pipe Culvert - Item**  
**“size, type, class” Non-Circular Pipe Culvert Extension - Item**  
**Concrete Appurtenances - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

#### **421.10.02 Elevation Adjustment**

Prior to the installation of a drainage structure, the Owner may, at its sole discretion, raise or lower the invert of a pipe culvert by 150 mm or less, at no additional cost. Bedding elevations shall be adjusted accordingly.

A change in invert elevation exceeding 150 mm shall be administered as a Change in the Work.

#### **421.10.03 Clay Seal**

Payment for clay seal shall be according to OPSS 902.

**FIGURE 1**

**422.01 SCOPE**

This specification covers the requirements for the installation of precast reinforced concrete box culverts with span 3 m or less (including imperial sized spans of 3.048 m) in open cut and includes the requirements for concrete appurtenances, excavation, bedding, backfilling, granular cover and protection layer.

**422.02 REFERENCES**

## 422.03 DEFINITIONS

For the purpose of this specification the following definitions apply:

**Backfill** means earth, rock, or granular material used as fill within the excavation placed beyond the limits of bedding and cover below the subgrade elevation, including frost tapers.

**Bedding** means the material used to cushion and evenly distribute the soil reaction at the bottom of the structure.

**Box Culvert** means as defined in OPSS 1821.

**Box Unit** means as defined in OPSS 1821.

**Competent Native Material** means rock, or soil with a density of compact or greater or a consistency of firm or greater, or otherwise determined by the Contract Administrator to be suitable as a foundation material.

**Concrete Appurtenances** means head walls, cut-off walls, aprons, collars, and any other concrete fixtures associated with the box culverts.

**Protection Layer** means the material placed around the box unit to prevent damage to the box unit.

**Distribution Slab** means a reinforced concrete slab placed directly on the top slab of a box culvert when there is less than 600 mm of earth fill cover to improve load distribution on box culvert.

**Earth** means as defined in OPSS 206.

**Granular Cover** means the material placed as a protection layer above the box culvert to prevent damage to the box culvert.

**Lot** means as defined in OPSS 1821.

**Native Material** means the original material removed to form an excavation.

**Protection Slab** means a reinforced concrete slab that may be placed on the top of the culvert in an area exposed to chlorides.

**Rock** means as defined in OPSS 206.

**Soil** means as defined in OPSS 902.

#### **422.04 DESIGN AND SUBMISSION REQUIREMENTS**

##### **422.04.01 Design Requirements**

The design of the box culvert shall be according to CSA S6 and as specified in the Contract Documents.

##### **422.04.02 Submission Requirements**

##### **422.04.02.01 Working Drawings**

Electronic file of the fabrication and assembly drawings, including handling details, joint sealing compound, preformed gaskets material, placement of preformed seal produced by the manufacturer shall be submitted to the Contract Administrator 2 weeks prior to delivery of the box units. All Working Drawings shall bear the seal and signature of an Engineer certifying they are according to the Contract Documents.

##### **422.04.02.02 Concrete Mix Designs**

The concrete mix for concrete appurtenances, protection and distribution slabs shall be designed to provide adequate strength and durability for the intended use and to meet the requirements as specified in the Contract Documents. The concrete mix design shall be submitted according to the Mix Design clause of OPSS 1350.

#### **422.05 MATERIALS**

##### **422.05.01 Backfill**

Granular backfill material shall be according to OPSS 1010.

Earth backfill shall be classified as Group I, Group II according to Table 1. Within the areas of the Roadway, earth backfill shall have frost susceptibility characteristics similar to the native material for a depth equal to the frost treatment depth.

Rock backfill shall be according to the Rock Backfill to Structure subsection of OPSS 206.

#### **422.05.02                      Bedding**

Bedding shall be as specified in the Contract Documents.

Earth bedding material shall be classified as Group I or Group II according to Table 1.

Granular aggregate materials shall be according to OPSS 1010.

#### **422.05.03                      Clay Seal**

Clay seal shall be according to OPSS 1205.

#### **422.05.04                      Concrete**

Concrete for appurtenances, protection slab, and distribution slab shall be according to OPSS 1350.

#### **422.05.05                      Connector Plates**

Connector plates shall be according to ASTM 240M Type 304. Stainless steel threaded rods shall be according to ASTM F593 Type 316 with nuts according to ASTM F594.

#### **422.05.06                      Geotextile**

Geotextile shall be according to OPSS 1860. Geotextile type shall be as specified in the Contract Documents and free of defects, rips, holes, flaws, and deterioration.

#### **422.05.07                      Granular Cover**

Granular cover shall be according to OPSS 1010 and one of the following, or as specified in the Contract Documents:

- a) Granular A.
- b) Granular B, Type I or II, with 100% passing the 26.5 mm sieve.

#### **422.05.08                      Grout**

Grout shall be non-shrink.

Cementing materials for grout shall be according to OPSS 1301. Sand for grout shall be a mortar sand according to OPSS 1004. Water for grout shall be according to OPSS 1302. Admixtures for grout shall be according to OPSS 1303.

The workability of the grout mix shall be suitable for the application.

#### **422.05.09                      Joint Sealing Compound**

Joint sealing compound shall be as specified by the manufacturer of the box units.

**422.05.10                      Leveling Course**

Leveling course shall be fine aggregate according to OPSS 1002.

**422.05.11                      Mortar**

Mortar for joints and filling lift holes shall be according to OPSS 904.

**422.05.12                      Native Material**

Classification of native material shall be according to ASTM D2487. The Contract Administrator shall determine if the native material is acceptable for use in the work.

**422.05.13                      Box Units**

Box units shall be according to OPSS 1821.

**422.05.14                      Preformed Gasket**

Preformed gaskets shall be as specified by the manufacturer of the box units.

**422.05.05                      Protection Layer**

Protection layer shall be as specified in the Contract Documents.

Protection layer shall be free of stones having a diameter greater than 75 mm, debris, or frozen materials.

**422.05.16                      Steel Reinforcement**

Steel reinforcement for concrete appurtenances, protection slab and distribution slab shall be according to OPSS 1440.

**422.07                          CONSTRUCTION**

**422.07.01                      Selection of Box Units**

The box units shall be according to OPSS 1821 based on the dimensions and height of fill as specified in the Contract Documents.

**422.07.02                      Delivery and Storage**

The Contract Administrator shall be notified in writing a minimum of 3 Business Days prior to delivery of the box units.

Delivery shall include transportation, loading and unloading, and storage of the box units. Transportation and storage of the box units shall be according to CSA A23.4.

Box units shall be loaded for shipping in such a manner that they can be transported and unloaded at their destination without being damaged or exposed to stresses for which they were not designed. Box units shall be stored in such a manner to avoid damage or excessive stress.

Storage includes, but is not limited to, storage while awaiting delivery in temporary locations and/or, at the Working Area.

Lifting, storing, and transporting of box units shall be as specified in the Working Drawings.

Advertising by means of removable signing shall be permitted on box units only while in transit to the site. Any permanent markings on a surface that would be visible after installation shall not be permitted.

#### **422.07.03                      Excavation**

The excavation for the installation of the box units shall be according to OPSS 902.

#### **422.07.04                      Support Systems**

Support systems shall be according to OPSS 404.

#### **422.07.05                      Dewatering**

Dewatering shall be according to OPSS 517.

#### **422.07.06                      Temporary Protection Systems**

Temporary protection systems shall be according to OPSS 539.

#### **422.07.07                      Foundation**

The foundation shall be as specified in the Contract Documents.

The excavation shall not disturb the material beyond the excavation limits.

When directed by the Contract Administrator, native material encountered at the excavation limits that is not considered to be competent shall be:

- a) sub-excavated to competent native soil or rock, in the presence of the Contract Administrator; and
- b) the sub-excavation backfilled with material acceptable to the Contract Administrator and compacted according to OPSS 501.

#### **422.07.08                      Bedding**

Bedding shall be placed to the dimensions specified in the Contract Documents.

Bedding shall be placed in layers not exceeding 200 mm in thickness, uncompacted measurement, and each layer shall be compacted according to OPSS 501.

Bedding shall not be placed on frozen earth grade.

#### **422.07.09                      Levelling Course**

The surface prepared to support the box units shall have a 75 mm minimum thickness of uncompacted levelling course.

#### **422.07.10                      Installing Box Units**

##### **422.07.10.01                  General**

Box units shall be installed to the alignment and grade specified in the Contract Documents.

Box units shall not be installed on bedding containing frozen material.

Box unit installation and backfill shall be completed prior to the start of any Subbase and Base course construction over the box unit location.

End units to accommodate concrete appurtenances shall be as specified in the Contract Documents. End box units shall be a minimum of 2.0 m in length, all other box units shall be a minimum of 0.914 m in length. All box units shall be less than 3.1 m in length. The box units shall be installed to make a continuous line forming a box culvert.

Installation of the box units shall commence at the outlet end and proceed in the upstream direction with the bell ends of the box units facing upgrade. The box units shall be placed with the base of each box unit in uniform contact with the prepared bedding throughout its full length. The ends of the box units shall be joined so there is no unevenness along the inside. The box units and joint surfaces shall be kept clean as work progresses. Water shall not be allowed to flow through the box units during installation. The excavation shall be kept dry and the box units shall not be installed in water.

The gap at box unit joints shall not exceed 20 mm.

For box units placed in parallel for multiple cell installations, a 60 mm  $\pm$  10 mm gap filled with grout between adjacent cells shall be provided.

#### **422.07.10.02                      Connector Plates**

Connector plates shall be installed as specified in the Contract Documents.

#### **422.07.10.03                      Joint Treatment**

Joints between box units shall be provided with a preformed seal. All joints, including the bottom side of box culvert, shall be effectively covered to prevent influx of material from the backfill or native soil through the joints. Unless otherwise specified, material for the joint cover shall be geotextile.

The geotextile shall be according to the requirements of OPSS 1860 and be free of defects, rips, holes, flaws, deterioration or damage incurred during manufacture, transportation or storage.

The geotextile cover layer shall have a minimum overlaps of 500 mm and shall be pinned together or adhered to the concrete surface.

#### **422.07.10.04                      Mortared Joints**

When mortared joints are specified in the Contract Documents, the joints shall be thoroughly cleaned and wetted. Mortar shall then be applied around the inner and outer perimeter over the joint. After the mortar joint is complete, the joint inside shall be wiped clean and smooth.

#### **422.07.10.05                      Preformed Seal**

Preformed seal shall be placed according to the manufacturer's recommendations.

#### **422.07.10.06                      Lift Holes**

All lift holes shall be filled with mortar after installation of the box units.

#### **422.07.10.07                      Inspection After the Installation of the Box Culvert and Prior to Waterproofing**

After installation of all box units within a construction stage, and prior to waterproofing, installation of distribution slab or protection slab when specified in the Contract Documents, MTO form PH-CC-701, Request to Proceed shall be submitted to the Contract Administrator. The next operation shall not proceed until MTO form PH-CC-702, Notice to Proceed has been received from the Contract Administrator.

#### **422.07.10.08                      Waterproofing of the Culvert**

When waterproofing of the culvert is specified, it shall be according to the Contract Documents.

#### **422.07.11                      Concrete Appurtenances, Protection and Distribution Slabs**

Concrete placement, curing, and quality assurance for cast-in-place concrete appurtenances, protection slabs or distribution slabs shall be according to OPSS 904. Steel reinforcement shall be placed according to OPSS 905.

When a protection slab or distribution slab is specified, it shall be according to the Contract Documents. The protection slab or distribution slab shall be placed without any damage to or movement of the box culvert.

#### **422.07.12                      Backfill**

Backfill shall be placed in layers not exceeding an uncompacted thickness measurement of 300 mm. Compaction shall be according to OPSS 501.

Backfilling on each side of the box units shall be completed simultaneously without any movement of the box culvert or any damage to it. At no time shall the levels on each side differ by more than 400 mm. Within the areas of the Roadway, earth backfill shall have frost susceptibility characteristics similar to the native material for a depth equal to the frost treatment depth.

Rock may be used as backfill provided the installed box units are protected by a protection layer having a minimum thickness as specified in the Contract Documents.

#### **422.07.13                      Granular Cover**

Granular cover shall be placed in layers not exceeding an uncompacted thickness measurement of 200 mm, and each layer shall be compacted according to OPSS 501. The granular cover shall be placed without any damage to or movement of the culvert.

#### **422.07.14                      Clay Seal**

When a clay seal is specified in the Contract Documents, the clay seal shall be placed to the dimensions specified in the Contract Documents and compacted to a minimum of 95% of the maximum dry density (MDD). The MDD shall be carried out on a single representative sample according to LS-706. Field density and field moisture determinations shall be made according to ASTM D6938.

#### **422.07.15                      Access for Quality Assurance**

Unhindered access for inspection and testing of all the work shall be provided to the Contract Administrator or the Owner's representative. Any debris and obstructions shall be removed to allow access for the purposes of dimensional measurements and/or inspection.

#### **422.07.16                      Management of Excess Materials**

Management of excess material shall be as specified in the Contract Documents.

### **422.08                      QUALITY ASSURANCE**

#### **422.08.01                      General**

The acceptance of the box culvert shall be according to the requirements of this specification, including satisfactory completion of any repairs.

#### **422.08.02                      Installation Deficiencies**

The Contract Administrator shall carry out an inspection of the box culvert to determine if the completed work contains any installation deficiencies. An installed box culvert not meeting the following tolerances, shall be deemed rejectable:

- a) Alignment of box units:  $\pm 10$  mm
- b) Joint Gap: 20 mm maximum
- c) Gap between adjacent side-by-side box (multi-cell) culverts:  $\pm 10$  mm

When the installation is rejectable, a proposal for remediation signed and sealed by an Engineer shall be submitted to the Contract Administrator for acceptance.

#### **422.08.03                      Defects**

The Contract Administrator shall carry out an inspection of the box culvert to determine if the completed work contains cracks, spalls or delaminations. Any box unit with a crack width  $> 0.3$  mm, or any delamination, or spall shall be deemed rejectable.

Where the crack width is between 0.3 mm and 1.0 mm, or where a spall or delamination is  $< 0.1\text{m}^2$ , a proposal for repair or remediation signed and sealed by an Engineer may be submitted to the Contract Administrator for acceptance.

#### **422.08.04                      Repair Proposal and Assessment of Repairs**

If the repair proposal is deemed acceptable by the Owner, the box culvert or box unit shall be repaired according to the proposal. Repairs shall not be carried out without the prior written acceptance of the proposal by the Contract Administrator. If the repair proposal is not acceptable to the Owner, the box unit or box culvert shall be replaced.

The Contract Administrator shall inspect the repaired work. This inspection may include covermeter surveys, coring, and any other testing deemed necessary to assess the effectiveness and acceptability of the repair.

### **422.09                      MEASUREMENT FOR PAYMENT**

#### **422.09.01                      Actual Measurement**

##### **422.09.01.01                      Precast Concrete Box Culvert, Fabrication**

Measurement for the fabrication of precast concrete box culverts shall be by the horizontal length in metres along the centerline of the invert of the culvert.

##### **422.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

## **422.10 BASIS OF PAYMENT**

### **422.10.01 Precast Concrete Box Culvert, Fabrication (Span 1800 mm) - Item Precast Concrete Box Culvert, Fabrication (Span 2400 mm) - Item Precast Concrete Box Culvert, Fabrication (Span 3000 mm) - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work, subject to payment adjustments.

#### **422.10.01.01 Payment Adjustment for Air Void System in Hardened Concrete**

The payment adjustment for concrete without silica fume shall be calculated based on individual lots and applied as follows:

Payment reduction for a lot = Lot quantity/tender quantity x Price x ((100 - P)/100)

Where:

Lot quantity = volume of concrete in a lot (m<sup>3</sup>) (calculated based on plan dimension)

Tender quantity = volume of concrete in tender (m<sup>3</sup>) (calculated based on plan dimension)

Price = Contract price for the fabrication tender item

P = pay factor for the lot according to the spacing factor specified below:

| <b>Spacing Factor, mm</b> | <b>Pay Factor (P)</b> |
|---------------------------|-----------------------|
| > 0.200 but ≤ 0.220       | 90                    |
| > 0.220 but ≤ 0.240       | 80                    |
| > 0.240 but ≤ 0.250       | 70                    |

#### **422.10.01.02 Payment Adjustment for Rapid Chloride Permeability**

The payment adjustment shall be calculated based on individual lots according to OPSS 1821 and applied as follows:

Payment adjustment = Lot quantity x (C-2500)/5

Where:

Payment adjustment = payment adjustment of a lot (\$)

C = rapid chloride permeability of a lot (coulombs)

Lot quantity = volume of concrete in a lot (m<sup>3</sup>) (calculated based on plan dimension)

The payment adjustment for concrete containing silica fume shall be calculated based on individual lots and applied as follows:

Payment adjustment = Lot quantity x (C-1000)/5

Where:

Payment adjustment = payment adjustment of a Lot (\$)

C = rapid chloride permeability of a lot (coulombs)

Lot quantity = volume of concrete in a lot (m<sup>3</sup>) (calculated based on plan dimension)

**422.10.02                      Precast Concrete Box Culvert, Delivery and Installation (Span 1800 mm) - Item**  
**Precast Concrete Box Culvert, Delivery and Installation (Span 2400 mm) - Item**  
**Precast Concrete Box Culvert, Delivery and Installation (Span 3000 mm) - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Corrective work, including investigation of defects and deficiencies, design of repairs, site access, traffic staging and removal of existing work, shall be at no additional cost to the Owner.

Payment at the Contract price for the above tender items shall also include support systems.

**422.10.03                      Clay Seal - Item**

Payment for clay seal shall be at the Contract price for the tender item "Clay Seal" according to OPSS 902.

**422.10.04                      Granular - Item**

Granular material used for bedding, backfill, granular cover, and frost tapers shall be paid for under the appropriate granular items specified in the Contract Documents.

Payment will not be made for granular used to fill any area excavated beyond the lines specified in the Contract Documents or used as backfill when acceptable quality native material is available.

**422.10.05                      Steel Reinforcement in Concrete Appurtenances, Protection and Distribution Slabs**

Payment shall be at the Contract price for the tender items "Reinforcing Steel Bar", "Stainless Steel Reinforcing Bar", "Mechanical Connectors" and "Stainless Steel Mechanical Connectors" according to OPSS 905.

**422.10.06                      Concrete in Appurtenances, Protection and Distribution Slabs**

Payment shall be at the Contract price for the tender item "Concrete in Culverts", according to OPSS 904.

**422.10.07                      Excavation for Box Culverts**

Payment for earth and rock excavation shall be at the Contract price for the tender items "Earth Excavation for Structure" and "Rock Excavation for Structure", according to OPSS 902.

When material not considered to be competent native material is encountered at the excavation limits, any subexcavation and backfill work directed by the Contract Administrator shall be administered as a Change in the Work.

**422.10.08                      Swamp Excavation**

Payment for swamp excavation shall be at the Contract price for the tender item Earth Excavation, Grading, according to OPSS 206.

Payment shall not be made for the removal of materials that slide or slough inside the excavation limits.

**TABLE 1**  
**Soil Gradation Requirements for Earth Bedding, Backfill and Protection Layer**

| Group | Grain Size   | Description                                                                   | Symbols |
|-------|--------------|-------------------------------------------------------------------------------|---------|
| I     | 16-64 mm     | Well-Graded Gravel, Gravel-Sand Mixtures, little or no fines                  | GW      |
|       | 16-64 mm     | Poorly-Graded Gravel, Gravel-Sand Mixtures, little or no fines                | GP      |
|       | 0.5-2 mm     | Well-Graded Sand, Gravelly Sand, little or no fines                           | SW      |
|       | 0.5-2 mm     | Poorly-Graded Sand, Gravelly Sand, little or no fines                         | SP      |
| II    | 4-16 mm      | Clayey Gravel or Gravel-Sand-Clay Mixtures                                    | GC      |
|       | 0.25-0.5 mm  | Clayey Sand or Sand-Clay Mixtures                                             | SC      |
|       | 0.25-0.5 mm  | Silty Sand or Sand-Silt Mixtures                                              | SM      |
|       | 4-16 mm      | Silty Gravels or Gravel-Sand-Silt Mixtures                                    | GM      |
|       | 0.06-0.25 mm | Inorganic Silts and Very Fine Sands, Silty or Clayey Fine Sands, Clayey Silts | ML      |

**441.01 SCOPE**

This specification covers the requirements for the installation of watermains, service connections, and associated appurtenances in open cut.

**441.01.01 Specification Significance and Use**

This specification has been developed for use in provincial oriented Contracts. The administration, testing, and payment policies, procedures, and practices reflected in this specification correspond to those used by the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **441.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **441.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:
