## **NSF International**

61-2008 Drinking Water System Components - Health Effects

### **441.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Associated Appurtenance** means structures, devices, and appliances, other than pipe and conduit, which are used in connection with a water distribution system, such as valves, hydrants, corporation cocks, services, and thrust restraints.

**Backfilling** means the operation of filling a trench with bedding, cover, and backfill material, or embedment and backfill material.

**End Covers** means temporary cover installed at the factory over both ends of uninstalled watermain pipe to prevent the entry of contaminants during shipping and storage.

**Excavation, Earth and Rock** means the excavation classified as earth and rock according to OPSS 206.

**Fitting** means connections, appliances, and adjuncts designed to be used in connection with pipe: for example, elbows and bends to alter the direction of a pipe; tees and crosses to connect a branch with a main; plugs and caps to close an end; and bushings, diminishers, or reducers to couple two pipes of different diameters.

**Service Connection** means the system used to supply water from the watermain to the property line.

**Service Connection Appurtenance Set** means the main stop, curb stop, couplings, service box, service box support, and service saddle used in the installation of a service connection.

**Watermain** means an installation designed for the conveyance of water under pressure using circular pipe.

### **441.05 MATERIALS**

#### **441.05.01 General**

The pipe size shall be according to the size specified in the Contract Documents. Pipe type and class shall be as specified in the Contract Documents.

Fittings shall be suitable for and compatible with the pipe material and class with which they are used.

All material for watermains shall be NSF/ANSI 61 compliant.

#### **441.05.02 Ductile Iron Pipe**

Ductile iron pipe shall be according to AWWA C151/A21.51.

Fittings shall be gray iron according to AWWA C110/A21.10 or ductile iron according to AWWA C110/A21.10 or AWWA C153.

Ductile iron pipe and fittings shall be cement lined according to AWWA C104/A21.4.

Rubber gaskets for push-on or mechanical joints shall be according to AWWA C111/A21.11.

#### **441.05.03 Concrete Pressure Pipe**

Concrete cylinder pipe including joints and fittings shall be according to AWWA C301 or AWWA C303.

Non-cylinder pipe and joints shall be according to AWWA C302 or ASTM C 361. Fittings shall be according to AWWA C302.

#### **441.05.04 Polyvinyl Chloride Pipe**

##### **441.05.04.01 General**

Flexible elastomeric seals for bell and spigot joints shall be according to ASTM D 3139.

Fittings for polyvinyl chloride (PVC) and molecularly oriented polyvinyl chloride (PVCO) pipe shall be either:

- a) Gray iron according to AWWA C110/A21.10.
- b) Ductile iron according to C110/A21.10 or AWWA C153 and shall be cement lined according to AWWA C104/A21.4.
- c) Injection moulded polyvinyl chloride, blue in colour and according to AWWA C907 and CSA B137.2.
- d) Prefabricated polyvinyl chloride, blue in colour and according to AWWA C905 and CSA B137.3.

##### **441.05.04.02 Polyvinyl Chloride Pipe (PVC)**

Polyvinyl chloride pipe shall be according to AWWA C900 or AWWA C905 and CSA B137.3, and shall be blue in colour and supplied complete with gaskets.

##### **441.05.04.03 Molecularly Oriented Polyvinyl Chloride Pipe (PVCO)**

Molecularly oriented polyvinyl chloride pipe shall be according to AWWA C909 and CSA B137.3.1, and shall be blue in colour and supplied complete with gaskets.

#### **441.05.05 Polyethylene Pipe**

Polyethylene pressure pipe shall be according to OPSS 1842.

Fittings shall be either:

- a) Flanged gray iron according to AWWA C110/A21.10.
- b) Flanged ductile iron according to AWWA C110/A21.10 or AWWA C153 and shall be cement lined according to AWWA C104/A21.4.
- c) Polyethylene according to OPSS 1842.
- d) Heat fusion or insert or compression type fittings according to CSA 137.1.

#### **441.05.06 Steel Pipe**

Steel pipe shall be according to AWWA C200. Fittings shall be according to AWWA C208. Steel pipe shall have a cement-mortar protective lining and coating according to AWWA C205.

#### **441.05.07 Copper Pipe**

Copper pipe for service connections shall be according to ASTM B 88 and shall be type K soft copper.

#### **441.05.08 Composite Pipe**

Crosslink polyethylene/aluminum/crosslink polyethylene composite pressure pipe for service connections shall be according to CSA B137.10.

#### **441.05.09 Valves**

##### **441.05.09.01 General**

All valves shall open by operating in a counter clockwise direction.

Valves shall be designed for a minimum cold water working pressure of 1,035 kPa.

Valve types shall be one of the following:

- a) Valves less than 75 mm shall be brass or bronze gate valves.
- b) Valves greater than or equal to 75 mm, and less than or equal to 300 mm, shall be cast or ductile iron gate valves.
- c) Valves greater than 300 mm up to and including 500 mm shall be gate or butterfly valves.
- d) Valves greater than 500 mm shall be butterfly valves.

Fasteners shall be made from material meeting the strength requirements of ASTM A 307 with dimensions according to ASME B18.2.1. Bolts, studs, and nuts shall be cadmium plated according to ASTM B 766 or zinc coated according to ASTM A 153 or ASTM B 633. Fasteners for mechanical joints shall be ductile iron according to AWWA C111/A21.11.

##### **441.05.09.02 Service Line Valves**

Valves shall be according to AWWA C800. Type, pressure class, and end connections shall be as specified in the Contract Documents.

##### **441.05.09.03 Gate Valves**

Gate valves shall be according to AWWA C509.

Stem sealing on non-rising stem valves shall use O-ring type seals that do not require adjustment.

The gate valve end configuration shall be as specified in the Contract Documents.

##### **441.05.09.04 Butterfly Valves**

Butterfly valves shall be according to AWWA C504.

Valves shall be short body flanged or mechanical-joint, class 150B.

Valve shafts shall be stainless steel and, when they project through the body, shall have seals that do not require adjustment.

A vertical operating nut shall be provided. Valves shall be provided with an external indicator showing valve position by means of a pointer operating through a 90° arc from open to close.

#### **441.05.09.05                      Air Release and Air/Vacuum Valves**

Air release and air/vacuum valves shall be single acting type.

#### **441.05.10                        Hydrants**

Hydrants shall be according to AWWA C502. The type shall be as specified in the Contract Documents.

#### **441.05.11                        Double Check Valve Backflow Preventers**

Double check valve backflow preventers shall be according to CSA B64.5 or AWWA C510.

#### **441.05.12                        Service Connection Fittings and Appurtenances**

Main stops, curb stops, couplings, service boxes, and service saddles shall be as recommended by the manufacturer of the service connection pipe.

#### **441.05.13                        Concrete**

Concrete for thrust blocks and fitting and appurtenance supports shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 20 MPa.

#### **441.05.14                        Mortar**

Mortar for joints shall be composed of one part Portland cement and three parts mortar sand, wetted with sufficient water to make the mixture plastic.

The mortar sand shall be according to OPSS 1004, the Portland cement shall be according to OPSS 1301, and the water shall be according to OPSS 1302.

#### **441.05.15                        Straps, Tie-Rods, Angles, Nuts, and Bolts**

Stainless steel straps, tie-rods, angles, nuts, and bolts used with concrete thrust blocks shall be according to ASTM A 276, Type 316 stainless steel.

### **441.07                              CONSTRUCTION**

#### **441.07.01                        General**

The work for the installation of watermains shall include all watermain pipe, bends, tees, fittings, and thrust restraints and the testing of the watermain system.

The interior of all pipe, fittings, and other accessories shall be kept clean and free from undesirable material at all times.

**441.07.02                      Site Preparation**

Site preparation shall be according to OPSS 490.

**441.07.03                      Removals**

Removals shall be according to OPSS 510.

**441.07.04                      Preservation and Protection of Existing Facilities**

Preservation and protection of existing facilities shall be according to OPSS 491.

**441.07.05                      Protection Against Floatation**

Damage to the pipeline due to floatation shall be prevented during construction and until completion of the works.

**441.07.06                      Cold Weather Work**

All work shall be protected from freezing. Pipe and bedding material shall not be placed on frozen ground.

**441.07.07                      Transporting, Unloading, Storing, and Handling Pipe**

All pipe, fittings, and gaskets that are unsound or damaged shall be rejected.

All pipe up to and including 600 mm diameter shall be delivered to the Work Area with end covers and a tamper evident seal on only the bell end. These components shall adhere sufficiently to withstand the stresses caused during shipment.

A waterproof seal is not required on the end covers.

Tamper evident seals shall display the manufacturers name or logo or both. Seals shall straddle the end cover and the pipe. Removal of the cover shall render the tamper evident seal unusable either by breaking the seal or by leaving a message such as "VOID" on the pipe. Tamper evident seals are not required for non-reusable heat shrink plastic covers or foam plugs with punch-out centres.

Pipe delivered to the construction site with damaged or missing end covers shall be field cleaned to remove all undesirable material along the entire length of the interior of the pipe and the end covers reinstalled.

Manufacturer's recommendations for transporting, unloading, storing, and handling of materials shall be followed.

**441.07.08                      Excavation**

Excavation for the installation of watermain shall be according to OPSS 401.

**441.07.09                      Support Systems**

Support systems shall be according to OPSS 404.

#### **441.07.10                      Dewatering**

Dewatering shall be according to OPSS 517.

#### **441.07.11                      Temporary Protection Systems**

The construction of temporary protection systems shall be according to OPSS 539.

When the stability, safety, or function of an existing roadway, railway, watercourse, other works, or proposed works may be impaired due to the method of operation, protection shall be provided. Protection may include sheathing, shoring, and piling when necessary to prevent damage to such works or proposed works.

#### **441.07.12                      Temporary Potable Water Supply Services**

Temporary potable water supply services shall be according to OPSS 493.

#### **441.07.13                      Backfilling and Compacting**

Backfilling and compacting shall be according to OPSS 401.

#### **441.07.14                      Installation of Pipe**

Pipe shall be laid in a dry trench.

Pipe shall be laid within the alignment and grade tolerances specified in the Contract Documents. The barrel of each pipe shall be in contact with the shaped bed throughout its full length.

When the Owner raises or lowers the invert of a watermain by up to 150 mm, it shall not constitute a Change in the Work and no adjustment shall be made to the payment. When the invert of a watermain is raised or lowered by more than 150 mm, then this shall constitute a Change in the Work for the full extent of the change from the original grade.

Pipe shall be kept clean and dry as work progresses. A removable watertight bulkhead shall be installed at the open end of the last pipe laid whenever work is suspended.

Pipe shall not be laid until the preceding pipe joint has been completed and the pipe carefully embedded and secured in place.

#### **441.07.15                      Jointing**

##### **441.07.15.01                  General**

End covers shall be removed immediately prior to jointing. Joint surfaces shall be clean. Pipe ends shall be lubricated with material recommended by the pipe manufacturer.

Manufacturer's instructions for jointing pipe shall be followed.

Joints and all connections shall be made watertight.

All bolts, nuts, couplings, rubber rings, and connecting pieces shall be cleaned thoroughly before installation.

Pipe shall be aligned on centreline to previously laid pipe.

Pipe shall be pulled or pushed only by a hand-operated winch. A backhoe shall not be used for pushing pipe.

Joints shall be prevented from opening after the pipe has been laid.

#### **441.07.15.02                    Ductile Iron Pipe**

Mechanical Joints:

The gland shall be positioned on the pipe with the lip extension toward the joint. The gasket shall be slipped on the pipe with the thick edge towards the gland. The spigot end shall be pushed to its seat in the bell. The gasket shall be pressed to seat it evenly around the joint.

The gland shall be positioned for bolting and the bolts shall be inserted. All nuts shall be hand tightened.

The nuts shall be tightened half a turn at a time with a calibrated torque wrench. All nuts shall be tightened uniformly to the torque specified in AWWA C111/A21.11.

Bell and Spigot Joints:

The gasket shall be placed in the groove of the bell making certain it is properly seated.

The gasket shall be lubricated.

Pipe to be joined shall be aligned and the spigot shall be carefully entered into the bell until the spigot end just makes contact with the gasket.

The entry of the spigot into the bell shall be completed by hand or by the use of a hand operated winch until the second reference mark is flush with the face of the bell.

#### **441.07.15.03                    Concrete Pressure Pipe**

Bell and Spigot Joints:

A cotton or burlap diaper shall be placed around the bell end of the pipe already in place.

A rubber gasket shall be placed on the spigot end of the pipe to be laid ensuring that the stretch and volume of the gasket is equalized around the entire circumference of the pipe. The gasket and spigot shall be lubricated prior to the spigot end being inserted home into the bell end.

The pipe shall be aligned and the spigot end shall be inserted into the bell of the pipe already in place.

Steel inserts shall be placed in the joints to prevent the spigot from entering the full depth of the bell. The location of the rubber gasket shall be checked around the entire circumference of the joint. The steel insert shall be removed and the pipe pushed until the spigot enters the full depth of the socket and is retained in position.

Ensure that the diaper is carefully placed around the joint recess. Cement mortar shall be poured around the assembled joint.

#### **441.07.15.04                    Polyvinyl Chloride Pressure Pipe - PVC and PVCO**

Joints shall be bell and spigot with rubber gaskets. If gaskets are supplied separately, they shall be inserted in the groove of the bell end of the pipe.

The spigot shall be lubricated. The spigot end shall be inserted and pushed into the bell up to but not beyond the depth of the stop reference mark.

#### **441.07.15.05 Polyethylene Pressure Pipe**

Polyethylene pipe 100 mm diameter and larger shall be joined by the thermal butt fusion process. Procedures recommended by the pipe manufacturer shall be followed.

Polyethylene pipe 75 mm diameter and smaller shall be joined with heat fusion or insert or compression type fittings that are recommended by the pipe manufacturer and that prevent pull-out and resist creep deformation at full test pressure.

Connections to non-polyethylene fittings and appurtenances 50 mm diameter and larger shall be made with flanged joints according to the manufacturer's recommendations. Bolts shall be tightened to the torque specified by the manufacturer for the particular size and type of stub end.

#### **441.07.15.06 Steel Pipe**

Steel pipe shall be jointed according to AWWA C200. Field welding for joints shall be according to AWWA C206.

#### **441.07.15.07 Service Connection Pipe**

Service connection pipe shall be jointed as recommended by the manufacturer.

#### **441.07.16 Cutting of Pipe**

Whenever cutting of pipe is required, the pipe shall be cut according to the recommendations of the pipe manufacturer. After cutting the pipe, the interior of the pipe shall be cleaned and the end cover replaced until the pipe is installed.

#### **441.07.17 Change in Line and Grade**

##### **441.07.17.01 Ductile Iron Pipe**

Fabricated bends shall be provided for changes in line and grade of 11.25° or more.

Deflections of less than 11.25° may be made using a series of pipe joint deflections. The manufacturer's recommendation in deflecting any single pipe joint shall not be exceeded.

##### **441.07.17.02 Concrete Pressure Pipe**

Fabricated bends, bevel adaptors, or elbows shall be used for changes in line or grade greater than 5°. Changes in line or grade less than 5° shall be made using a manufactured joint or bevel connection or may be made over several joints. The manufacturer's joint deflection recommendations shall not be exceeded.

##### **441.07.17.03 Polyvinyl Chloride Pipe - PVC and PVCO**

Polyvinyl chloride pipe joints may be deflected but shall not exceed the manufacturer's recommendations. Otherwise, fabricated bends shall be used.

##### **441.07.17.04 Polyethylene Pipe**

Use of pipe flexibility may be allowed but shall not exceed the manufacturer's recommendations.

#### **441.07.17.05 Steel Pipe**

Fabricated bends shall be used at all changes in line or grade, unless the change can be accomplished by deflections at pipe joints without exceeding the manufacturer's recommendation for deflection at pipe joints.

#### **441.07.18 Installation of Valves and Fittings**

##### **441.07.18.01 General**

The work for the installation of valves and fittings shall include the valves and couplings and valve boxes, when valve boxes are specified in the Contract Documents. Valves and fittings shall be installed in locations and be of the type specified in the Contract Documents. Valves and connecting pipe shall be aligned accurately and supported as specified in the Contract Documents. Valves and fittings do not require end covers but shall be field cleaned prior to installation.

##### **441.07.18.02 Air Release and Air/Vacuum Valves**

Air release and air/vacuum valves shall be installed at locations specified in the Contract Documents.

Each air release and air/vacuum valve shall be provided with an isolating valve.

#### **441.07.19 Installation of Hydrant Sets**

The work for the installation of hydrant sets shall include the placing of hydrants, hydrant isolating valves, hydrant leads, restraining devices, and support devices.

Hydrant sets shall be installed at locations specified in the Contract Documents.

The hydrant shall be plumb with the nozzles parallel to the edge of pavement or curb line and the pumper connection facing the roadway.

#### **441.07.20 Installation of Service Connections**

A service connection shall consist of a service connection pipe and a service connection appurtenance set and shall be installed at locations and be of the size specified in the Contract Documents.

Service connection pipe shall be installed by pressure tap connection or saddles. Service connections on plastic watermain shall be installed using service saddles or tapped couplings.

Curb stop valve boxes shall be installed vertically and flush with the final grade elevation.

#### **441.07.21 Shutting Down or Charging Mains**

At no time shall watermain be shut down or charged or valves operated without permission from the Contract Administrator.

#### **441.07.22 Connections to Existing Watermain**

The work of connecting to existing watermain shall include the removal of all plugs, caps, blow offs, and thrust blocks from an existing watermain or fitting, and the installation of the connection.

All connections to existing watermain shall be made under the supervision of the Contract Administrator.

#### **441.07.23 Thrust Restraints**

All connections, caps, and bends shall be restrained by concrete blocking and/or restrained joints as specified in the Contract Documents. Concrete for thrust blocks shall be placed against undisturbed ground. Joints and couplings shall remain free from concrete. Only restrained joint products specifically designed for use with the pipe material shall be used.

#### **441.07.24 Hydrostatic Testing**

##### **441.07.24.01 General**

Hydrostatic testing shall be conducted under the supervision of the Contract Administrator upon completion of the watermain, including services and backfilling.

A test section shall be either a section between valves or the completed watermain.

Test pressure shall be 1,035 kPa.

The test section shall be filled slowly with water and all air shall be removed from the pipeline. A 24-hour absorption period may be allowed before starting the test. The test section shall be subjected to the specified continuous test pressure for 2 hours.

##### **441.07.24.02 Polyethylene Pipe**

The test procedure shall consist of initial expansion and test phases.

During the initial expansion phase, the test section shall be pressurized to the test pressure and sufficient make-up water added each hour for 3 hours to return to test pressure. The test phase begins after the initial expansion phase.

The test phase shall be 2 hours after which a measured amount of make-up water is added to return the test pressure. If the amount of make-up water added does not exceed the value in Table 1, leakage is not indicated.

If the amount of make-up water exceeds the Table 1 value, all leaks shall be located and repaired and the test section shall be retested until a satisfactory result is obtained.

The test duration should not exceed 8 hours. If the pressure test is not completed, the test section shall be de-pressurized and allowed to relax for at least 8 hours before bringing the test section up to pressure again.

##### **441.07.24.03 Other Pipe**

A period of 24 hours shall be allowed before starting the test.

The test section shall be subject to the specified continuous test pressure for 2 hours.

The leakage is the amount of water added to the test section to maintain the specified test pressure for the test duration. The measured leakage shall be compared with the allowable leakage as calculated for the test section. The allowable leakage is 0.082 litres per millimetre of pipe diameter per kilometre of pipe for the 2-hour test period.

If the measured leakage exceeds the allowable leakage, all leaks shall be located and repaired and the test section shall be retested until a satisfactory result is obtained.

#### **441.07.25                      Flushing and Disinfecting Watermains**

Flushing and disinfecting operations shall be conducted under the supervision of the Contract Administrator. The watermain shall be flushed to achieve a minimum velocity of 0.76 m/sec otherwise the watermain shall be swabbed. The Contract Administrator shall be notified at least 2 Business Days in advance of the proposed date on which flushing and disinfecting operations are to commence.

Watermains shall be flushed in a sequence approved by the Contract Administrator. The Contract Administrator may permit or require the flushing to be carried out in stages as sections of the system are completed. Flushed sections shall be protected from contamination.

After flushing is completed, water from the existing distribution system shall be allowed to flow at a controlled rate into the new pipeline. Liquid chlorine solution shall be introduced so that the chlorine is distributed throughout the section being disinfected. The chlorine shall be applied so that the chlorine concentration is 50 mg/litre minimum throughout the section. The system shall be left charged with the chlorine solution for 24 hours.

Sampling and testing for chlorine residual shall be carried out by the Contract Administrator. The chlorine residual shall be tested in the section after 24 hours. If tests indicate a chlorine residual of 25 mg/litre minimum, the section shall be flushed completely and recharged with water normal to the operation of the system. If the test does not meet the requirements, the chlorination procedure shall be repeated until satisfactory results are obtained.

Twenty-four hours after the system has been recharged, the Contract Administrator shall take samples for bacteriological tests. Samples shall be collected from every 350 m of the new watermain plus one sample from the end of each of the line and at least one sample from each branch. If there is indication of contamination, the disinfection procedure shall be repeated.

The system shall not be put into operation until approval has been given by the Contract Administrator.

#### **441.07.26                      Site Restoration**

Site restoration shall be according to OPSS 492.

#### **441.07.27                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

All chlorinated water used for testing, flushing, or disinfecting watermains shall be disposed of safely.

The method of disposal of chlorinated water is subject to the approval of the Contract Administrator.

### **441.09                              MEASUREMENT FOR PAYMENT**

#### **441.09.01                      Actual Measurement**

##### **441.09.01.01                  Watermains**

Measurement of watermains shall be by length in metres along the horizontal centreline of the pipe from the point of connection to a chamber, water treatment plant, or existing watermain to a point vertically above the end of the new watermain.

**441.09.01.02                    Valves**

For measurement purposes, a count shall be made of the number of valves installed, regardless of the type and size.

**441.09.01.03                    Hydrant Sets**

For measurement purposes, a count shall be made of the number of hydrant sets installed, regardless of the type.

**441.09.01.04                    Service Connection Pipe**

Measurement of service connection pipe shall be by length in metres along the horizontal centreline of the pipe from the point of connection at the watermain to a point vertically above the end of the service connection.

**441.09.01.05                    Service Connection Appurtenance Sets**

For measurement purposes, a count shall be made of the number of service connection appurtenance sets installed.

**441.09.01.06                    Connections to Existing Watermains**

For measurement purposes, a count shall be made of the number of connections made to existing watermains.

**441.09.02                        Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**441.10                            BASIS OF PAYMENT**

- 441.10.01                    Watermains - Item**  
**Valves - Item**  
**Hydrant Sets - Item**  
**Service Connection Pipe - Item**  
**Service Connection Appurtenance Sets - Item**  
**Connections to Existing Watermains - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**TABLE 1**  
**Test Phase Make-Up Amount for Pressure Polyethylene Pipe**

| <b>Pipe Diameter<br/>mm</b> | <b>Make-Up Water<br/>litre/km</b> |
|-----------------------------|-----------------------------------|
| 30                          | 12.38                             |
| 40                          | 12.38                             |
| 50                          | 13.62                             |
| 75                          | 18.60                             |
| 100                         | 31.00                             |
| 150                         | 74.50                             |
| 200                         | 124.20                            |
| 250                         | 161.40                            |
| 275                         | 248.30                            |
| 300                         | 285.60                            |
| 350                         | 335.20                            |
| 400                         | 409.70                            |

**490.01 SCOPE**

This specification covers the requirements of site preparation for the installation of sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, watermain and associated appurtenances, and other underground Utilities; maintenance holes, catch basins, ditch inlets, or valve chambers; and any other specified subsurface construction.

**490.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**Ontario Provincial Standard Specifications, Construction**

|          |                                                                                   |

| OPSS 805 | Temporary Erosion and Sediment Control Measures |

#### **490.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Associated Appurtenances** means as defined in OPSS 412 for a sewer system and OPSS 441 for a watermain.

#### **490.07 CONSTRUCTION**

##### **490.07.01 General**

Site preparatory work shall be performed prior to the installation of the pipelines, Utilities, and associated structures.

##### **490.07.02 Removal of Existing Signing**

Removal of existing signing shall be according to OPSS 706.

##### **490.07.03 Clearing and Grubbing**

Clearing and grubbing and related work shall be according to OPSS 201.

##### **490.07.04 Shrub and Tree Relocation**

Shrubs and trees to be relocated shall be protected according to OPSS 801 in their original and final locations.

Shrub and tree relocation shall be as specified in the Contract Documents.

##### **490.07.05 Tree Protection and Pruning**

Tree protection and pruning shall be according to OPSS 801.

##### **490.07.06 Stripping and Stockpiling Topsoil**

Stripping of topsoil shall be according to OPSS 206. Topsoil shall be removed carefully in the Work Areas and shall not be mixed with subsoil or other materials.

Stockpiling of topsoil shall be according to OPSS 802 and as specified in the Contract Documents. Topsoil shall not be placed in or near tree stands, along flood plains, and in areas containing natural wildlife habitats. Perimeter drainage ditches shall be constructed to intercept and divert run-off to adjacent settling ponds. Temporary erosion and sediment control measures shall be according to OPSS 805. Stockpiles shall be protected to ensure minimum environmental interference.

##### **490.07.07 Removal of Fences and Guide Rails**

Property owners or occupants shall be given at least 24 hours notice in advance of dismantling fences. Fences and guide rails shall be dismantled, where necessary. All components that are broken, bent, or damaged as a result of the operation shall be removed from the site and replaced with new components. All reusable components shall be stored and protected.

**490.07.08                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**490.10                              BASIS OF PAYMENT**

Payment at the Contract price for the appropriate tender items for the installation of sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, watermain and associated appurtenances, and other underground Utilities; maintenance holes, catch basins, ditch inlets, or valve chambers; and any other specified subsurface construction shall be full compensation for all labour, Equipment, and Material to do the work of site preparation.

When the Contract contains separate items for work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

**491.01 SCOPE**

This specification covers the requirements of preservation, protection, replacement, and reconstruction of existing services and structures during the installation or removal of sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, watermains and associated appurtenances, and other underground Utilities; maintenance holes, catch basins, ditch inlets, or valve chambers; and any other specified subsurface construction.

**491.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**Ontario Provincial Standard Specifications, Construction**

|----------|-------------------------------------------|
| OPSS 412 | Sewage Forcemain Installation in Open Cut |
| OPSS 441 | Watermain Installation in Open Cut        |

### **491.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Associated Appurtenances** means as defined in OPSS 412 and OPSS 441.

### **491.07 CONSTRUCTION**

#### **491.07.01 General**

The requirements and regulations of road authorities, Utility companies, and railway companies shall be adhered to at all times.

#### **491.07.02 Notification**

All road authorities, Utility companies, and railway companies shall be notified in writing at least 48 hours before approaching their facilities or entering their rights-of-way.

All owners of underground services shall be requested to locate, stake, and clearly mark in the field all underground services which are located on or near the line of the proposed work. Certificates shall be obtained from all owners of underground services having facilities in the area of the proposed work certifying that their facilities have been marked to confirm the Utility location.

Necessary arrangements shall be made with railway companies for the support and protection of their tracks.

#### **491.07.03 Existing Services and Structures**

All water or gas mains, sewers or drains, conduits, cables, service pipes, sidewalks, curbs, and all other structures or property in the vicinity of the work, whether above or underground shall be sustained in place and protected from damage. All water and gas service and flow in all sewers, drains, house or inlet connections, and all watercourses encountered during the progress of the work shall be maintained.

Excavation shall be performed with care to expose buried pipes, cables, conduits, and structures whenever trenching operations approach the indicated location of buried services.

If any Utility is broken or damaged, the Utility company shall be immediately notified.

Access to fire hydrants and water and gas valves shall be maintained at all times to the satisfaction of the local authority.

#### **491.07.04 Reconstruction of Existing Facilities**

Where an existing Utility is within the limits of or crosses an excavation and cannot be sustained in place, the existing facility shall be removed, realigned, relocated, or replaced as directed in writing by the Contract Administrator. All materials comprising the Utility shall be handled with care, cleaned, salvaged, and inspected before reconstruction commences.

#### **491.07.05 Contamination**

The contents of any sewer, drain, or inlet connection shall not be allowed to flow into an excavation.

All offensive matter shall be removed from the proximity of the work.

**491.07.06                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**491.10                              BASIS OF PAYMENT**

Payment at the Contract price for the appropriate tender items for the installation of sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, watermains and associated appurtenances, and other underground Utilities; maintenance holes, catch basins, ditch inlets or valve chambers; and any other specified subsurface construction, shall be full compensation for all labour, Equipment, and Material to do the work of the preservation, protection, or reconstruction of existing facilities.

When the Contract contains separate items for work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

**Note: The PROV published in November 2018 replaces OPSS 492 COMMON, November 2015 with no technical content changes.**

### **492.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Associated Appurtenances** means as defined in OPSS 412 for a sewer system and OPSS 441 for a watermain.

### **492.05 MATERIALS**

#### **492.05.01 Granular Materials**

Granular materials shall be according to OPSS 1010.

#### **492.05.02 Barbed Wire**

Barbed wire shall be according to CAN/CGSB-138.2.

#### **492.05.03 Electric Fence Wire**

Electric fence wire shall be 2 mm diameter hot dipped galvanized wire.

#### **492.05.04 Wood Fence**

Wood fence material shall be according to OPSS 1601.

##### **492.05.04.01 Board or Split Rail Fence**

Posts and boards shall be the same size and type as used in the original fence.

Rails shall be split cedar in good condition and of adequate lengths to build either a straight or snake fence.

**492.05.04.02                    Wood Braces for Wire Fence**

Diagonal wood braces shall be according to OPSS 1540.

**492.05.05                    Highway Fence**

Highway fence material shall be according to OPSS 1540.

**492.05.06                    Steel Posts**

Steel posts shall be according to OPSS 1540.

**492.05.07                    Chain-Link Fence**

Chain-link fence material shall be according to OPSS 1541.

**492.05.08                    Gates**

Gates shall be fabricated from material suitable to the fence on either side of the gate opening. Material for highway fence gates shall be according to OPSS 1540. Material for chain-link fence gates shall be according to OPSS 1541.

**492.05.09                    Guide Rail**

Guide rail material shall be according to OPSS 721.

**492.05.10                    Concrete**

Concrete for sidewalks shall be according to OPSS 351.

Concrete for curb and gutter shall be according to OPSS 353.

**492.07                    CONSTRUCTION**

**492.07.01                    General**

All disturbed areas shall be restored to an equivalent or better condition than existed prior to the commencement of construction.

**492.07.02                    Grading**

Rough grading shall be performed to the levels, grades, and contours as specified in the Contract Documents allowing for the placement of surface materials. Soil shall not be disturbed within the drip line of trees and shrubs during grading.

Final grading shall be performed to the lines and elevations specified in the Contract Documents. The final grading shall be according to OPSS 206.

**492.07.03                    Roadway Restoration**

The restoration of the roadway shall be scheduled to follow closely behind trench backfilling. The roadway shall be made and maintained safe for the passage of vehicular and pedestrian traffic after

completion of backfilling and until permanent restoration takes place, as specified in the Contract Documents.

Granular subbase and base courses of the type specified in the Contract Documents shall be placed on the prepared subgrade to the dimensions specified in the Contract Documents and shall be according to OPSS 314.

The surface course of the type specified in the Contract Documents shall be placed on the prepared base course to the dimensions specified in the Contract Documents in accordance as follows:

- a) Asphalt pavement shall be according to OPSS 313 as specified in the Contract Documents.
- b) Concrete paving shall be not less than 150 mm in thickness and shall be according to OPSS 350.
- c) Gravel surface courses shall be according to OPSS 314.
- d) Surface treatment shall be according to OPSS 304.

#### **492.07.04                      Fences and Guide Rails**

Fences and guide rails shall be restored with the same type of fence or guide rail that existed prior to construction along the lines and levels specified in the Contract Documents. A maximum clearance of 150 mm from ground level shall be maintained at any point along the fence line.

The installation of highway fence shall be according to OPSS 771.

The installation of chain-link fence shall be according to OPSS 772.

Posts for fences other than highway and chain-link fences shall be installed to the spacing that existed prior to construction.

Gates shall be installed at the same location and height as the gates that existed prior to construction. Gate size shall be according to the dimensions of the gate that existed prior to construction. Gates shall be secured with fittings to match the fence complete with latches, hinges, stops, and all necessary fittings.

Colour and finish material of the restored fence shall match the existing colour scheme and finish material. Where required, two coats of finish material shall be applied.

The construction of guide rails shall be according to OPSS 721.

#### **492.07.05                      Topsoil**

Topsoil shall be placed after final grading operations have been completed and immediately prior to seeding or sodding operations. Topsoil shall be obtained from stockpiles prepared according to OPSS 490 or, if the required quantity is not obtainable from stockpiles, the required topsoil shall be imported.

The quality of the topsoil and the construction methods for placing topsoil shall be according to OPSS 802. Stockpile sites within or adjacent to the Contract limits shall be restored to the original condition or to a condition acceptable to the Contract Administrator.

#### **492.07.06                      Shrub and Tree Replanting**

Shrubs and trees shall be replanted as specified in the Contract Documents.

#### **492.07.07 Sodding and Seeding**

Lawns and grassed areas shall be sodded or seeded and covered as specified in the Contract Documents.

Sodding shall be according to OPSS 803.

Seeding and cover shall be according to OPSS 804.

#### **492.07.08 Sidewalk and Concrete Curb and Gutter Systems**

Concrete sidewalk shall be placed according to OPSS 351. Alignment and dimensions shall match existing sidewalk on either end of the restored sidewalk. Damaged sections of any sidewalk slab shall be removed and replaced to the nearest joint on either end of the damaged section.

Concrete curb and gutter systems shall be placed according to OPSS 353. Alignment and dimensions shall match the existing curb and gutter systems on either side of the restored curb and gutter. Damaged sections of curb and gutter shall be removed and replaced to the nearest joint or neat saw cut.

Placement of Granular A shall be according to OPSS 314 with a minimum depth of 100 mm as a base for the curb and gutter and sidewalk.

#### **492.07.09 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

#### **492.10 BASIS OF PAYMENT**

Payment at the Contract price for the appropriate tender items for the installation of sanitary and storm pipe sewers, pipe culverts and end sections, forcemains and associated appurtenances, watermain and associated appurtenances, and other underground utilities; maintenance holes, catch basins, ditch inlets, or valve chambers; and any other specified subsurface construction shall be full compensation for all labour, Equipment, and Material to do the work of site restoration.

When the Contract contains separate items for work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

## **CONSTRUCTION SPECIFICATION FOR TEMPORARY POTABLE WATER SUPPLY SERVICES**

## **NSF International**

61-2014a Drinking Water System Components - Health Effects

### **493.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Associated Appurtenance** means structures, devices, and appliances, other than pipe and conduit that are used in connection with a water distribution system, such as valves, hydrants, corporation cocks, services, and thrust restraints.

**Excavation, Earth and Rock** means the excavation classified as earth and rock according to OPSS 206.

**Temporary Hydrant** means temporary fire hydrant and all associated temporary appurtenances.

**Temporary Potable Water Supply Services** means temporary watermains, services, hydrants, and all associated appurtenances.

**Temporary Services** means temporary potable water supply services installed on or just below the ground surface for the purpose of providing potable water to customers while the existing watermain is out of service.

**Temporary Watermain** means temporary potable water supply hose or pipe installed on or just below the ground surface for the purpose of providing potable water to temporary services and temporary fire hydrants while the existing watermain is out of service.

**Watermain** means an installation designed for the conveyance of water under pressure using circular pipe.

### **493.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **493.04.01 Submission Requirements**

The following information shall be submitted to the Contract Administrator 14 Days prior to the commencement of any work requiring temporary potable water supply services:

- a) Temporary potable water supply services plans including installation, operation, testing procedures, and a list of material and equipment to be used.
- b) Temporary hydrant details.

## **493.05 MATERIALS**

### **493.05.01 General**

The pipe size, type, and class shall be as specified in the Contract Documents.

Fittings shall be suitable for and compatible with the pipe material and class with which they are used.

All materials in contact with potable water shall be NSF 61 compliant and, if being reused, shall have been used exclusively for potable water services in the past.

All materials shall be capable of withstanding 860 kPa pressure and all other conditions of use.

### **493.05.02 Temporary Potable Water Supply Services**

The pipe, hose, and all other materials used in conjunction with the temporary potable water supply services shall be as follows:

- a) Flexible hose jackets shall be abrasion resistant, either double jacket or specially coated, and be capable of being driven over by vehicles periodically without short term effects.
- b) Hose lining shall be of material that does not impart any taste or odour to the water.
- c) Hose shall come complete with aluminium couplings with threads.
- d) Rigid pipe shall be made of class 12454-B PVC material according to ASTM D1784. Material shall have a minimum hydrostatic design stress of 14 MPa.
- e) PVC shall be formulated with impact modifiers, heat stabilizers, and ultraviolet inhibitors.
- f) Pipe extrusion shall meet or exceed all requirements of ASTM D2241.
- g) Joints and couplings shall be according to ASTM D3139.
- h) O-rings shall be according to ASTM F477.
- i) Double check valve backflow preventers shall be according to CSA B64.5 and AWWA C510.

### **493.05.03 Valves**

Valves shall be according to OPSS 441.

### **493.05.04 Temporary Hydrants**

Temporary hydrants shall be as specified in the Contract Documents.

## **493.07 CONSTRUCTION**

### **493.07.01 General**

Written notices to all affected property owners are required a minimum of 48 hours prior to any disruption of water service as a result of the temporary by-pass.

Temporary water services shall be connected to the temporary watermain for each single residential unit or other building.

Connection to the private plumbing system of a residential unit shall be via a wye at an outside tap or an existing water service as specified in the Contract Documents. The connection of single residential units in series is not permitted. Each temporary water service shall have its own valved connection to the temporary watermain.

Connection to other buildings shall be as specified in the Contract Documents.

An adequate water supply shall always be available. Emergency repairs shall be performed whenever there is a failure or cessation of the operation of any component or components of the temporary potable water system. If the temporary potable water supply service fails, it shall be reported to the Contract Administrator immediately and restored as soon as possible. Repair service shall be provided 24-7 for the duration of the Contract.

Care shall be exercised during the installation of temporary potable water supply services to avoid contamination of the services.

No work shall be done during freezing weather unless directed by the Contract Administrator. No temporary watermain or temporary water services shall be installed or operated during freezing weather. Pipes already in use shall be removed or drained and existing services restored when so directed by the Contract Administrator.

### **493.07.02 Shutting Down or Charging Watermains**

Shutting down or charging watermains shall be according to OPSS 441.

### **493.07.03 Temporary Watermains**

Installation of a temporary watermain shall be according to OPSS 441.

A double check valve backflow preventer shall be installed at any connection of a temporary watermain to the water supply and distribution system (e.g., at hydrants). Source connections shall be as specified in the Contract Documents.

### **493.07.04 Temporary Potable Water Supply Services**

Temporary potable water supply services for single residential units and other users, including flow to maintain fire protection systems, shall be as specified in the Contract Documents.

The temporary potable water supply service connections shall be valved near the point of connection to the temporary watermain and near the point of connection to a private plumbing system so that both the temporary watermain and the temporary potable water supply services may be disinfected.

### **493.07.05 Temporary Hydrants**

When a hydrant is removed from service, a temporary hydrant and the necessary valves and fittings shall be installed as specified in the Contract Documents.

Before permanently shutting down the existing watermain, the temporary hydrants shall be tested to ensure that they are in proper working order.

The hydrants that are out of service during construction operations shall be bagged and clearly marked with a "HYDRANT OUT OF SERVICE" tag.

Once in use, the temporary hydrants shall be maintained until the existing or new hydrants are restored to service.

All temporary potable water supply service attachments to fire hydrants shall be easily removable for fire protection purposes.

All temporary hydrants shall have reflective tape on the barrel for increased visibility. The temporary hydrants shall be in an upright position at all times.

#### **493.07.06 Valves**

Valves shall be installed at each branch of a temporary watermain.

Before permanently shutting down the existing watermain, the valves shall be tested to ensure that they are in proper working order.

#### **493.07.07 Protection**

Protection shall be provided to the temporary potable water supply services at locations such as road crossings, sidewalks, driveways, and walkways.

When temporary watermain cross over the roadway, the asphalt pavement shall be saw cut and removed and the temporary watermain shall be buried. Under no circumstance is a pipe road crossing to remain open and unprotected from vehicular and pedestrian traffic. If a concrete road base exists, it shall not be disturbed.

When temporary potable water supply services are used on full right-of-way reconstruction projects, the temporary potable water supply service piping shall also be buried at all sidewalks, driveways, and walkways.

When temporary potable water supply services are used on projects where the road surface is not being reconstructed, the temporary service piping shall be buried only at all road crossings. When temporary watermain or temporary potable water supply services cross a driveway or a sidewalk, asphalt or another acceptable material shall be mounded over the pipe. A polyethylene sheet shall be placed as a barrier on concrete or interlocking driveways. If the protection work performed or material used is not to the satisfaction of the Contract Administrator, action shall be taken to rectify the problem at no additional cost to the Owner. Safety flashers and barricades, as may be required, shall be furnished and maintained. In general, the temporary potable water supply service pipe shall be laid where it causes the least obstruction and is least likely to be damaged.

The temporary potable water supply services installed across all road crossings, sidewalks, driveways, and walkways shall be protected for the duration of the work. This shall include earth excavation, backfill, asphalt reinstatement, and ramping material required as directed by the Contract Administrator.

Adequate signage shall be provided at locations where hoses are exposed and may present a public safety hazard, such as blow off hoses at catchbasins.

#### **493.07.08                      Leakage Testing**

The temporary potable water supply service shall be watertight. Testing of the temporary watermain and services shall be at system pressure.

Leakage testing shall be conducted in the presence of the Contract Administrator upon completion of the watermain, including services. All leaks shall be repaired prior to covering the pipe and at no cost to the Owner.

#### **493.07.09                      Flushing and Disinfecting Temporary Watermains and Services**

Flushing and disinfecting temporary watermains and services shall be according to the flushing and disinfecting watermains subsection as specified in OPSS 441.

#### **493.07.10                      Removal of Temporary Potable Water Supply Services**

Temporary potable water supply services may be used from approximately mid-April to mid-October. All temporary services shall be completely removed by mid-November. Any deviation from this timing window shall be approved by the Contract Administrator.

Site and roadway restoration shall be according to OPSS 492.

#### **493.07.11                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

All chlorinated water used for testing, flushing, or disinfecting watermains shall be directed to an acceptable outlet in a manner that meets the requirements of all applicable regulations.

### **493.10                          BASIS OF PAYMENT**

#### **493.10.01                      Temporary Potable Water Supply Services - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

On completion of the supply, installation, flushing, disinfecting, and testing of the temporary potable water supply services prior to putting it in operation, a progress payment to 60% of the above item shall be made. The balance shall be prorated over the remainder of the working period.

Removal or draining of the temporary potable water supply services during freezing weather and its subsequent return to service shall be at no additional cost to the Owner.

|--------------|-------------------|

### **501.01 SCOPE**

This specification covers the requirements for compaction of earth and granular materials.

#### **501.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **501.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **501.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

OPSS 206      Grading  
OPSS 401      Trenching, Backfilling, and Compacting

### **Ontario Provincial Standards Specifications, Materials**

OPSS 1010      Aggregates - Base, Subbase, Select Subgrade, and Backfill Material

### **Ontario Ministry of Transportation Publications**

LS-706      Moisture - Density Relationship of Soils Using 2.5 kg Rammer and 305 mm Drop

MTO Forms:  
PH-CC-009      Field Compaction Report

### **ASTM International**

D 6938-10      Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)

### **501.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Backfill Material** means as defined in OPSS 401.

**Bedding Material** means as defined in OPSS 401.

**Cover Material** means as defined in OPSS 401.

**Earth** means as defined in OPSS 206.

**Embedment Material** means as defined in OPSS 401.

**Rut** means a sunken track or groove made at the surface by the passage of vehicles.

**Utility Structures** means maintenance holes, catch basins, valve chambers, ditch inlets, and other similar structures used to access services such as sewer, water, electric, and telephone to carry out maintenance and repair work.

### **501.05 MATERIALS**

#### **501.05.01 Granular Material**

Granular material shall be according to OPSS 1010.

#### **501.05.02 Water**

Water shall be free of contaminants that could adversely affect fill material or the environment.

### **501.06 EQUIPMENT**

#### **501.06.01 Compaction**

##### **501.06.01.01 General**

The type of compaction equipment used shall be suited to the material to be compacted, degree of compaction required, and space available.

Compaction equipment for control strips shall have a minimum static weight of 9,000 kg.

##### **501.06.01.02 Hand Operated Vibratory Equipment**

Hand operated vibratory equipment shall have a power output no greater than 9.9 kW.

##### **501.06.02 Water**

Equipment for applying water shall be capable of uniform distribution with proper flow control.

### **501.06.03                      Nuclear Moisture and Density Gauge**

Each nuclear moisture and density gauge (gauge) shall have been calibrated within the last 12 months either by the manufacturer or other qualified agent against certified density and moisture reference blocks. In addition, the Density Standard Count and the Moisture Standard Count shall be within 2.0% and 4.0%, respectively, of the most recent calibration values. The registered owner of the gauge shall maintain a valid Radioisotope License for each gauge.

## **501.07                              CONSTRUCTION**

### **501.07.01                      General**

The method of placing and lift thickness of earth or granular material shall be according to the specifications that govern the Work. When field tests indicate that the required degree of compaction cannot be obtained with the equipment in use or the procedure being followed, the operations shall be modified so that the equipment and procedures will produce the required results.

### **501.07.02                      Restricted Zones**

Hand operated vibratory type compaction equipment shall be used behind all retaining structures to compact fill material within restricted zones as follows:

#### **a)    Abutments and Retaining Walls**

An area within a plane extending from the base of the back face of the wall where it contacts the footing upwards at a slope of 1H:1.5V to a maximum distance of 2.5 m from the wall.

#### **b)    Wingwalls**

An area within 1.5 m from the back face of the wall.

### **501.07.03                      Water for Compaction**

Water shall be applied, as necessary, to achieve the degree of compaction required.

When the Contract includes a separate item for water for compaction, the water shall be applied with the approval of the Contract Administrator.

### **501.07.04                      Quality Control**

#### **501.07.04.01                  General**

Quality control (QC) testing shall be carried out to ensure that earth and granular materials used in the Work are compacted according to the requirements as specified in the Contract Documents.

Field density and field moisture determinations shall be made according to ASTM D 6938.

#### **501.07.04.02                  Compaction Requirements**

##### **501.07.04.02.01              General**

Compaction testing shall be based on material placed and compacted in the Work on a lot-by-lot basis according to the Lot Testing clause.

Compaction acceptance shall be according to the Acceptance clause and shall be based on target densities established according to the Target Density clause, QC compaction field test results, and, where applicable, a statistical analysis of those results.

#### **501.07.04.02.02          Submission of Test Data**

Prior to construction of a control strip, a copy of all QC laboratory test results for LS-706 required by the Control Strip clause to determine optimum moisture content (OMC) of the control strip material shall be delivered to the Contract Administrator.

All field test results and associated information relating to the control strip, including target density, lot location, lift thickness, probe depth, moisture content, wet density, and all QC lot compaction calculations shall be recorded at the time of testing on MTO form PH-CC-009. This form shall be available at any time for review, upon request, and shall be submitted to the Contract Administrator prior to placement of any subsequent lift and within 2 Business Days following the completion of a lot.

#### **501.07.04.02.03          Test Equipment and Operator Training**

##### **501.07.04.02.03.01          General**

Field density and field moisture measurements for QC compaction testing of earth and granular materials shall be carried out using gauges and ancillary equipment.

Only qualified operators using properly calibrated gauges shall conduct QC compaction testing.

##### **501.07.04.02.03.02          Nuclear Moisture and Density Gauge Requirements**

A copy of a valid calibration certificate, including the make, model number, and serial number for each gauge, shall be submitted to the Contract Administrator, prior to use of the gauge in compaction testing.

In addition, the Contract Administrator may request that the operator perform a standardization procedure according to ASTM D 6939.

If the gauge does not meet the standardization requirements or exhibits malfunctions of any kind, the gauge shall be replaced.

##### **501.07.04.02.03.03          Operator Requirements**

Each operator shall have been trained in the safe operation, transportation, and handling of the gauge.

Prior to conducting QC compaction testing, the operator shall provide acceptable proof of proficiency in the use of a gauge and the correct procedures to determine lot and subplot sizes, field dry density, percent relative compaction, mean, standard deviation, and the Quality Index of a compacted lot of material by submitting one of the following:

- a) a gauge operator certification document or card from a training program acceptable to the Owner and conducted within the Province of Ontario within the last 2 years; or
- b) a document (e.g., instruction notice or letter) signed by the Owner showing that the operator has demonstrated proficiency on a Contract either constructed or being constructed for the same Owner within the same construction year as the compaction testing being carried out for this Contract.

If the operator cannot provide either of the two documents stated above, then at the Contract Administrator's discretion, the operator shall demonstrate his or her proficiency to the Owner. In this case, arrangements shall be made with the Contract Administrator regarding the schedule, location, and materials for such demonstrations. The first 2 demonstrations may include up to 5 operators and 5 gauges and shall be carried out at no charge. Additional demonstrations shall be charged at the rate of \$500. Where a demonstration is carried out, acceptability of the operator shall be valid for the current calendar year only.

#### **501.07.04.02.04 Target Density**

New target densities shall be established for each separate component of the Work (e.g., backfilling of a trench, construction of a granular base, or placement of cover) at the following times:

- a) For earth and granular materials:
  - i. At the time of initial use of each source.
  - ii. When there is a perceptible change in the appearance or gradation of materials or both.
  - iii. At least once per calendar year on all carry-over Contracts.
- b) For earth, after each 10 QC lots of material have been completed, whether accepted or rejected, on the basis of one set of target density values.
- c) For granular materials, after each 25 QC lots of material have been completed, whether accepted or rejected, on the basis of one set of target density values.

The target density shall be established by the construction of a control strip according to the Control Strip clause.

When a control strip cannot be reasonably constructed or is impractical, with the consent of the Contract Administrator, the target density shall be based on the maximum dry density (MDD) as determined by LS-706, not more than 14 Days prior to placing the material. In this case, the MDD used for the new target density shall be based on the average of all individual MDD's calculated from a minimum of 3 independent samples selected from materials to be used in the Work.

#### **501.07.04.02.04.01 Control Strip**

Prior to construction of a control strip, the Contractor shall:

- a) Give a minimum notice of 24 hours to the Contract Administrator.
- b) Determine the optimum moisture content (OMC) according to LS-706.

Each control strip shall consist of a single uniform lift not more than 0.30 m in depth and covering at least 400 m<sup>2</sup> in area.

During construction of the control strip, the average field moisture content shall be maintained within the range of no less than 2.0% lower than and no more than 1.0% greater than the OMC of the control strip material.

After initial placement of the material, the compaction equipment for that operation shall make 6 passes over the entire surface of the control strip. The field wet density and field moisture content shall be determined at a minimum of 3 randomly selected locations. The dry density shall be calculated for each of these locations and the average dry density and moisture content values used as the initial values for dry density and moisture content.

The compaction equipment shall then make 2 additional passes over the entire surface of the control strip.

All passes of the compaction equipment for the control strip shall be carried out in vibratory mode at a speed of no more than 5 km/hour.

A minimum of 3 separate random field density and moisture content determinations shall then be made and a new average dry density and moisture content shall be calculated.

If the new average dry density exceeds the previous value by more than  $0.030 \text{ t/m}^3$ , additional passes of the equipment shall be carried out as described above. If the new average dry density does not exceed the previous value by more than  $0.030 \text{ t/m}^3$ , the compaction of the control strip shall be considered satisfactory and complete.

Upon satisfactory completion of the control strip, an additional 7 field wet density and moisture content tests shall be taken at random locations and the dry density and moisture content values determined. The final dry density and moisture content of the control strip shall be the average of these 7 values plus the 3 most recent values that were obtained upon completion of the control strip. If the final moisture content lies within the allowable range of the OMC specified above, then the final dry density that was determined shall be the target density of the control strip.

#### **501.07.04.02.05            Lot Testing**

For compaction control, a unique set of lots distinguished from each other by an appropriate letter or number designation, shall be established for each of the following:

- a) Each separate component of the Work (e.g., backfilling a structure or a trench or construction of a granular base).
- b) Materials from different sources.
- c) Materials with different compaction properties.
- d) When recompaction is carried out following restoration, scarification, or placement of additional material onto previously tested and accepted lots.
- e) When directed by the Contract Administrator.

The individual lots within each unique set of lots shall be consecutively numbered and with no duplication. Lot sizes shall not exceed the limits as shown in Table 1.

All visibly soft or loose areas shall be compacted prior to testing.

For the situations described in Table 1, Part IV, a minimum of 2 field density and moisture content tests shall be carried out at random locations within each lot.

For all other situations, each lot shall be divided into 4 equal sublots and a minimum of one field density and moisture test shall be carried out at random locations within each subplot and the results used to calculate the Quality Index according to the Quality Index clause.

In addition, regardless of the situation, when a lot of material is split between both sides of a pipe, sewer, or culvert, at least one field density and moisture content test shall be taken on each side of that pipe, sewer, or culvert.

The gauge probe shall extend to the full depth of the lift, unless otherwise allowed by the Modified Layer Compaction Method according to OPSS 206. The probe shall not extend beyond the lift being tested.

During the compaction process, the field wet density value and moisture content for each gauge test shall be recorded on MTO form PH-CC-009. The field dry density of each subplot shall then be calculated as a percentage of the target density to the nearest 0.1%. The mean and standard deviation and the Quality Index, where applicable, of the field dry density values shall be calculated to the nearest 0.1% and recorded on the form for each lot.

MTO form PH-CC-009 shall be constantly updated with new test data and the associated calculations completed as the testing is being done. This form shall be made available to the Contract Administrator at any time, upon request.

#### 501.07.04.02.06 Quality Index

The Quality Index ( $Q_i$ ), shall be calculated from the mean ( $\bar{x}$ ) and standard deviation ( $s$ ) of the percent target density which has been determined from all sublots within a QC compaction lot during the compaction process. The values for Quality Index, lot mean, and lot standard deviation shall be computed as follows:

- a) For materials placed in embankments within 50 m of a structure; placed as bedding, embedment cover, or backfill material to pipes, sewers, or culverts; or placed as backfill to structures, utility structures, or small foundations (e.g., anchor blocks, sign posts, and formwork):

$$\text{For earth materials: } Q_i = \frac{\bar{x} - 95}{s}$$

$$\text{For granular materials: } Q_i = \frac{\bar{x} - 98}{s}$$

- b) For materials placed in all other situations:

$$\text{For earth materials: } Q_i = \frac{\bar{x} - 90}{s}$$

$$\text{For granular materials: } Q_i = \frac{\bar{x} - 95}{s}$$

Where:

$Q_i$  = Quality Index, calculated to two decimal places.

$\bar{x}$  = Lot mean, the statistical value that describes the arithmetic average of subplot test results (dry density expressed as a percentage of the target density). Lot mean is the sum of individual subplot test results divided by the number of test results, calculated to 0.1% as follows:

$$\bar{x} = \frac{x_1 + x_2 + x_3 + x_4}{4} = \frac{1}{4} \sum_{i=1}^4 x_i$$

$S$  = Lot standard deviation ( $\sigma_{n-1}$ ), the statistical value that describes the distribution of subplot test results (dry density expressed as a percentage of the target density) about the lot mean. Standard deviation is the square root of the sum of the squares of the difference between each subplot test result and the lot mean divided by the number of test results minus one. It is calculated to 0.1% using the following expression:

$$s = \sqrt{\frac{\sum_{i=1}^4 (x_i - \bar{x})^2}{3}}$$

#### **501.07.04.02.07 Acceptance**

For the situations described in Table 1, Part IV, acceptance or rejection of a QC lot for compaction shall be based on 2 or more random field density and moisture content tests taken within the lot. For a lot to be acceptable, all tests shall be at least 100% and 98% of the target density established for granular and earth materials, respectively. Otherwise, the QC lot shall be rejected for compaction.

For all other situations, acceptance or rejection of a QC lot for compaction shall be established by calculation of the Quality Index, according to the Quality Index clause. When  $Q_i$  has a value equal to or greater than 1.47, the QC lot shall be accepted; otherwise, the lot shall be rejected for compaction.

Accepted QC lots damaged by vehicular traffic shall be restored prior to placement of any overlying material. Surfaces of accepted QC lots with ruts greater than 50 mm in depth in earth or 25 mm in depth in granular materials shall be regraded and the upper lift recompacted to meet the specified compaction requirements. Materials that cannot be successfully recompacted shall be removed and replaced with new material.

#### **501.07.04.02.07.01 Rejected Lots**

If a QC lot is rejected for compaction, the lot shall be recompacted with adjustment to the moisture content, as required, until satisfactory compaction is achieved. The recompacted lot shall be retested and a decision made, as described in the Acceptance clause.

When compaction of a QC lot does not meet the acceptance criteria and when the Contract Administrator has been satisfied that this is not a result of the Contractor's operation or equipment, a new target density shall be established for that operation.

#### **501.07.05 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **501.08 QUALITY ASSURANCE**

#### **501.08.01 General**

Field density and field moisture determinations shall be made in accordance with ASTM D 6938.

#### **501.08.02 Compaction**

##### **501.08.02.01 General**

The Contract Administrator shall conduct random testing or inspection of QC records or both to establish the acceptability of the QC compaction testing and verification of the field moisture content, field dry density, OMC, MDD, target density, and the Quality Index, where applicable.

The Contract Administrator may verify that the target density established for a control strip is based on the use of suitable compaction equipment. Provided that the MDD and OMC values determined by LS-706, as applicable, indicate an adequate target density is being achieved, the compaction equipment shall be considered suitable. If the compaction equipment is not capable of obtaining an adequate target density at the required moisture content, the equipment shall be considered unsuitable and shall be replaced with equipment that is able to obtain an appropriate target density.

Reasonable access to a control strip or to compacted QC lots shall be provided prior to placement of subsequent lifts of material. Subsequent lifts, including HMA, may not be placed until QA testing has been conducted or waived by the Contract Administrator.

#### **501.08.02.02 Gauge Verification**

Gauge verification QA shall consist of taking 4 random field density and moisture content measurements of a compacted lot or control strip and the subsequent calculation of the average dry density. Provided that the average dry density determined by QC test results for the same material is within 139 kg/m<sup>3</sup> for granulars and 150 kg/m<sup>3</sup> for earth when compared with the QA average dry density, the QC test results shall be considered valid.

#### **501.08.02.03 Compaction**

For the situations described in Table 1, Part IV, compaction QA shall consist of taking 2 or more random field density and moisture content measurements of each compacted lot and the subsequent determination of percent target density.

For all other situations, compaction QA shall consist of taking 4 random field density and moisture measurements of a compacted lot or control strip and the subsequent calculation of the Quality Index for the lot.

Provided that the lot is acceptable, according to the requirements specified in the Acceptance clause, no further action shall be taken.

However, if the lot is rejected based on compaction testing or demonstrates errors in QC reporting, an investigation shall take place to determine and resolve the discrepancies. The investigation may include, but is not limited to, any of the following:

- a) Recompaction of the lot.
- b) Retesting of the lot by the Contractor.
- c) Establishment of a new target density by control strip.
- d) Re-inspection of the gauge or operator or both by the Owner.
- e) Recalibration of the gauges.
- f) Removal of unsuitable materials.

#### **501.08.02.04 Quality Control Records Inspections**

QC records of the lot or control strip selected by the Contract Administrator shall be inspected for calculation errors, missing test data, or improper lot quantities. If errors or omissions are found that identify insufficiently compacted or improperly or untested lots, the Contractor shall make all such lots available and recompact or retest these lots or both so that they comply with the specified compaction requirements.

#### **501.08.02.05 Charges**

The Contract Administrator shall charge the Contractor \$450.00 for each lot that requires retesting which has been identified through QA compaction testing or a review of QC records. In addition, immediately following the discovery of a discrepancy or inadequate compaction, all new lots shall be subjected to QA compaction testing prior to acceptance. If any of the new lots do not meet the specified compaction requirements, the Contractor shall be charged a fee of \$450.00 for each lot. These conditions shall continue until 3 consecutive new lots have met the specified compaction requirements.

#### **501.09 MEASUREMENT FOR PAYMENT**

##### **501.09.01 Actual Measurement**

##### **501.09.01.01 Water for Compaction**

Measurement of water for compaction shall be in cubic metres using one of the following methods:

- a) The mass of the water shall be determined by weighing as specified in the Contract Documents. The mass of the water shall be converted to cubic metres using a factor of 1,000 kg to 1 m<sup>3</sup>.
- b) The water tank shall be measured and its volume computed in cubic metres.
- c) The water shall be measured through a water meter of approved design.

#### **501.10 BASIS OF PAYMENT**

##### **501.10.01 Compaction**

Payment at the Contract price of the appropriate tender item requiring compaction of earth and granular materials shall be full compensation for all labour, Equipment, and Material to do the work of compacting, including the water used for compaction, unless the Contract contains a separate tender item for Water for Compaction.

Any work required to repair or remove and replace damaged QC lots accepted shall be at no additional cost to the Owner.

Replacement of unsuitable equipment to obtain an appropriate target density shall be at no additional cost to the Owner.

Replacement of a gauge shall be at no additional cost to the Owner.

Any work required to recompact or retest material as a result of QA compaction testing or QC records inspection shall be at no additional cost to the Owner.

##### **501.10.02 Water for Compaction - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract does not contain a separate tender item for water for compaction, the Contract price for the tender item in which the water for compaction is used shall include full compensation for all labour, Equipment, and Material to do the work.

**TABLE 1**  
**Compaction Lot Size**

| <b>Part</b>                                                                                                                                                                                   | <b>Construction</b>                                                                                                                                                                                                                                               | <b>Lot Size</b>                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| I                                                                                                                                                                                             | Earth embankments, granular base, granular subbase, and granular shoulders.                                                                                                                                                                                       | Every lift, 500 m maximum length.<br>(Note 1) |
| II                                                                                                                                                                                            | Structure approach fill for earth.                                                                                                                                                                                                                                | Every lift,<br>50 m maximum length            |
| III                                                                                                                                                                                           | Bedding, embedment, cover, or backfill material for pipe and sewer sections > 20.0 m in length that are being placed in one operation, earth or granular.                                                                                                         | Every lift, 200 m maximum length.             |
| IV                                                                                                                                                                                            | Bedding, embedment, cover, or backfill material for pipes and sewer sections ≤ 20.0 m in length that are being placed in one operation or backfill to utility structures or small foundations (e.g., anchor blocks, sign posts, and formwork), earth or granular. | Every lift, 20 m maximum length.              |
| V                                                                                                                                                                                             | Structure backfill and culvert bedding, embedment, cover, or backfill material, granular.                                                                                                                                                                         | Every lift for every stage of construction.   |
| <p>Note:</p> <p>1. The width of the lot shall be the limits established for the placement of current material only and shall not include adjacent material to be placed at a future date.</p> |                                                                                                                                                                                                                                                                   |                                               |

**Appendix 501-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

### **510.01 SCOPE**

This specification covers the requirements for demolition, salvage, removal, and in-place abandonment, either completely or partially, of those materials and structures so designated, including the requirements for backfilling resulting excavations, trenches, holes, and pits.

#### **510.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **510.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **510.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Ministry of Transportation Publications**

Structural Manual

### **CSA Standards**

S6-00 Canadian Highway Bridge Design Code

### **510.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Bridge Structure** means that portion of a bridge and associated wing and retaining walls above the bridge footing, excluding modular bridges.

**CIR** means cold in-place recycling.

**CIREAM** means cold in-place recycling with expanded asphalt.

**Concrete Appurtenances** means as defined in OPSS 410, 421, and 422.

**Culvert** means a single or multiple cell structure designed to provide an opening under a roadway, pedestrian way, railway, or side entrance for the passage of surface water, livestock, or pedestrians.

**Curb and Gutter** means any combination of curb, gutter, curb with gutter, gutter setbacks, bullnoses, gutter outlets, and spillways.

**HIR** means hot in-place recycling.

**Pipe** means any closed conduit originally designed to convey liquid or gas.

**Sundry Asphalt Pavements** means paved islands, medians, boulevards, and walkways.

### **510.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **510.04.01 Design Requirements**

Caps for capping maintenance holes, catch basins, ditch inlets, and valve chambers shall be designed according to CAN/CSA S6 and the Structural Manual.

#### **510.04.02 Submission Requirements**

##### **510.04.02.01 Removal of Bridge Structures**

Two weeks prior to commencement of the work, a work plan shall be submitted to the Contract Administrator outlining the equipment to be used, dust and debris control, and the sequence of removals for bridge demolition.

Where any portion of the bridge structure is to support traffic or equipment loading during demolition, the entire structure shall be evaluated for load carrying capacity according to the CAN/CSA S6 and the Structural Manual.

All submissions shall bear the seal and signature of the design Engineer and design check Engineer.

### **510.05 MATERIAL**

#### **510.05.01 Mortar**

Mortar shall consist of a mixture of one part Portland cement according to OPSS 1301 and three parts mortar sand according to OPSS 1004, wetted with sufficient water to make the mixture plastic. Water shall be according to OPSS 1302.

## **510.05.02 Concrete**

Concrete for concrete seals shall be according to OPSS 1350 with minimum specified 28-Day compressive strength of 30 MPa.

Concrete for filling abandoned pipes shall be according to OPSS 1350 with minimum specified 28-Day compressive strength of 15 MPa.

## **510.05.03 Grout**

Grout shall consist of a mixture of one part Portland cement according to OPSS 1301 and two parts mortar sand according to OPSS 1004, wetted with sufficient water to make the mixture plastic. Water shall be according to OPSS 1302.

## **510.07 CONSTRUCTION**

### **510.07.01 General**

Removal, abandonment, demolition, or salvage of a particular item shall be as specified in the Contract Documents.

The work shall include all associated excavation, backfill, compaction, trimming, plugging, capping, filling, sealing, and right-of-way preparation.

If provided, existing drawings from the Owner pertaining to bridge structures, modular bridges, culverts, and noise barriers designated for removal shall be reviewed prior to commencement of any activities.

Stockpiling requirements shall be as specified in the Contract Documents.

Where work is done in waterbodies and on waterbody banks, the work shall be according to the Contract Documents.

### **510.07.01.01 Excavation**

Excavation required for the removal work to be carried out shall be part of the removal operation and shall be performed in such a manner as to leave undisturbed any portions not designated for removal.

### **510.07.01.02 Removal**

Removal shall be performed in such a manner and with such equipment as to leave undisturbed and undamaged any portion not designated for removal or salvage. All damaged or disturbed portions shall be corrected expeditiously and repaired to the satisfaction of the Contract Administrator. The broken edges of portions to be left in place that are visible after construction shall be squared and neatly trimmed.

### **510.07.01.03 Salvage**

Any material designated for salvage shall remain the property of the Owner and shall be maintained in a reasonable condition and stockpiled in a manner acceptable to the Contract Administrator.

Salvaged materials that are surplus to the Contract requirements shall be delivered to the location specified in the Contract Documents. When designated for salvage and surplus to the Contract requirements, salvaged frames and related grates or covers shall be kept together as a unit for delivery and stockpiling.

Any material designated for salvage damaged by the Contractor's operations or lost by the Contractor at any time prior to re-use or stockpiling shall be replaced with new material.

#### **510.07.01.04 Backfilling, Compacting, and Trimming**

Where a removal or partial removal requires the filling of a resulting trench, hole, or pit, backfilling shall be to the required grade using either suitable excavated material or imported material as required or as specified in the Contract Documents, and shall include levelling and trimming of the site to match required contours and provide adequate drainage. Backfill material shall be placed in layers not exceeding 300 mm and compacted according to OPSS 501.

#### **510.07.02 Bridge Work**

##### **510.07.02.01 Removal of Bridge Structures and Bridge Footings**

The work of bridge structure removal shall include the complete removal of bridge structure components above the top of the bridge footings to the lines and grades specified in the Contract Documents.

The work of bridge footings removal shall include cutting the piles to the underside of the footing and the complete removal of the bridge footings.

##### **510.07.02.02 Removal of Modular Bridges**

The work of modular bridge removal shall include the dismantling and removal and salvage of the modular bridge components, all timber in the deck, curbs, running strips, and steel beam guide rail system attached to the bridge. The work shall include the unloading and erection of the launching nose and subsequent dismantling.

Modular bridge components that are the property of the Owner, including the dismantled launching nose, shall be loaded onto transport vehicles, supported on 100 x 100 mm timber to allow forklift access, securely fastened, and then transported to the location specified in the Contract Documents.

All components shall be delivered in good condition during normal working hours and neatly stockpiled. All small parts shall be crated to prevent loss.

The approximate weight of the modular bridge, as specified in the Contract Documents, includes the weight of the steel components of the bridge, the ramps, and the launching nose, but excludes the weight of the wooden deck, construction tools, and rollers.

Vehicles required to transport the launching nose and the modular bridge components and parts shall be provided by the Contractor and of sufficient size to fully support the modular bridge components.

##### **510.07.02.02.01 Operational Constraints**

Prior to dismantling of the modular bridge, qualification information shall be provided to the Contract Administrator to ensure that the person supervising the removal of the modular bridge is competent to successfully fulfill such duties.

The Contract Administrator shall be notified a minimum of 7 Days in advance of the date on which modular bridge removal is to commence. The Owner shall make the launching nose available to the Contractor, following such notification.

##### **510.07.02.02.02 Removal of Modular Bridge Substructures**

The work shall include the removal of modular bridge substructures, bank seats, cribs, and timber or steel bents, and any rock in the cribs.

Modular bridge substructure materials shall be removed from the right-of-way or managed as specified in the Contract Documents.

Rocks from cribs shall not be placed in any waterbody.

### **510.07.03                      Drainage Work**

#### **510.07.03.01                      General**

Any sediment or deposited material required to be removed shall not be allowed to enter any waterbody.

Frames with grates or covers and watermain appurtenances, within valve chambers that are to be removed, shall be salvaged.

#### **510.07.03.02                      Removal of Curb and Gutter**

The work shall include the removal of asphalt, concrete, and cut stone curb and gutter. Cut stone curb shall be salvaged.

#### **510.07.03.03                      Removal of Asphalt Curb and Gutter**

The work shall include the removal of asphalt curb and gutter.

#### **510.07.03.04                      Removal of Concrete Curb and Gutter**

The work shall include the removal of concrete curb and gutter.

#### **510.07.03.05                      Removal of Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

The work shall consist of the removal of maintenance holes, catch basins, ditch inlets, and valve chambers.

#### **510.07.03.06                      Abandonment of Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

The work shall include the partial removal of maintenance holes, catch basins, ditch inlets, and valve chambers where structures and the Utility systems therein are abandoned. Such partial removal, when within the roadway, shall be to a minimum of 1.0 m below subgrade.

Prior to backfilling, the bottom of each structure designated for partial removal shall be broken to allow for the free movement of groundwater.

As an alternative to partial removal, maintenance holes, catch basins, ditch inlets, or valve chambers may be removed in their entirety.

#### **510.07.03.07                      Capping Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

The work shall include the capping of maintenance holes, catch basins, ditch inlets, and valve chambers where the Utility systems therein are to remain in service. Such capping shall include the removal of all adjustment units. Where the structure exists within the roadbed, the upper portion of the structure shall be removed to a minimum of 1.0 m below subgrade and the walls of the structure shall be saw cut or similarly finished to produce a neat horizontal cut suitable for placing a concrete cap.

#### **510.07.03.08 Removal of Pipes and Culverts**

The work shall include the removal of pipes and culverts of 200 mm diameter and greater, including multiple cell timber culverts.

Concrete, clay, and plastic pipes may be removed by rupturing or collapsing the pipe with suitable equipment and leaving the debris in place in a manner as to eliminate all voids and so as not to be detrimental to the work.

When removing pipes that enter into a concrete culvert, maintenance hole, catch basin, ditch inlet, or valve chamber and the structure is to remain in service, the openings left in the structures from the pipe shall be sealed with concrete or brick suitable for outdoor use and mortar. Brick seals shall be a minimum thickness of one brick length. The contact surface of each brick shall be coated with mortar to provide a watertight seal. Concrete seals shall be the minimum thickness of the structure wall.

#### **510.07.03.09 Abandonment of Pipes and Culverts**

The work shall include the filling of all pipes and culverts when the Contract Documents specify abandonment.

Abandoned sections of pipes and culverts up to 1,200 mm in diameter shall be filled with grout or concrete.

Access points shall be provided to allow for confirmation that the pipe has been completely filled.

When abandoning pipes that enter into a concrete culvert, maintenance hole, catch basin, ditch inlet, or valve chamber and the structure is to remain in service, the openings in the structure shall be sealed according to the Removal of Pipes and Culverts clause.

#### **510.07.03.10 Removal of Pipe Subdrains**

The work shall include the removal of pipe subdrains smaller than 200 mm in diameter.

Excavate, as required, to remove existing pipe subdrains, backfill the resulting trenches with native material, and compact.

#### **510.07.03.11 Removal of Hydrants, Valves, and Watermain Appurtenances**

The work shall include the removal or abandonment of hydrants, valves, and watermain appurtenances.

When a hydrant is removed, the hydrant shall be removed with its boot intact and salvaged.

When the mainline is to remain in service after a removal, the work shall include capping at the tee at the mainline.

When a mainline valve is to be abandoned and the valve is not in a valve chamber, the valve box shall be removed.

When a water service connection is abandoned, the work shall include shutting off the service at the mainline.

#### **510.07.04 Fence and Noise Barrier Work**

##### **510.07.04.01 Removal of Fence**

The work shall include the removal of all fences, regardless of type.

The work shall consist of the dismantling and removal of the fence, including all posts, fence fabric, footings, gates, components, and fittings forming part of the fence designated for removal.

When the means of egress and ingress between the right-of-way and adjacent property is being controlled by an existing fence designated for removal, that control shall be maintained for the duration of the Contract.

When only part of an existing fence is removed, repairs to match the existing fence shall be made to the ends remaining.

#### **510.07.04.02                      Removal of Noise Barriers**

The work shall include the dismantling of the noise barrier including posts, panels, framing, doors, fire access openings, and the removal of concrete footings to a depth of 1.3 m.

#### **510.07.05                      Delineators, Traffic Barriers, and Energy Attenuator Work**

##### **510.07.05.01                      Removal of Delineator Posts**

The work shall include the removal of delineator and guide posts, including wooden, metal, and flexible posts, and associated hardware.

##### **510.07.05.02                      Removal of Guide Rail Systems**

The work shall include the removal of cable guide rail, steel beam guide rail, and box beam guide rail systems, including cables, steel beams, box beams, channels, hardware, posts, anchor blocks, and anchoring systems to the limits specified in the Contract Documents.

##### **510.07.05.03                      Removal of Concrete Barriers**

The work shall include the removal of cast-in-place concrete barriers; the removal and salvage of precast concrete barriers; the removal of back to back installed concrete barriers, concrete or granular fill between the back to back concrete barriers, barrier transition sections; and the removal of associated pads and hardware as specified in the Contract Documents.

##### **510.07.05.04                      Removal of Energy Attenuators**

The work shall include the removal of energy attenuators, including pads and anchoring devices. At specified locations, the energy attenuators shall be dismantled and salvaged as a complete system, including all hardware.

##### **510.07.05.05                      Removal of Ramp Closure Gates**

The work shall include removal of ramp closure gate concrete footings, gates, signs, and all associated hardware.

The gates and associated hardware shall be salvaged and delivered to the location specified in the Contract Documents.

#### **510.07.06                      Pavement Work**

##### **510.07.06.01                      General**

During pavement removal operations, care shall be taken to prevent contamination with granular and other foreign materials.

Removal shall be performed in such a manner as to leave adjacent pavement and structures remaining in place undisturbed.

When the roadway is to be opened to traffic after the daily shut down and full width pavement removal is required, the following shall apply:

- a) For two-lane highways, removal shall be done to the same station for the full pavement width prior to shutdown at the end of the day.
- b) For multi-lane highways, removal shall be done to essentially the same station for the full pavement width for a specific direction prior to shutdown at the end of the day.
- c) Prior to opening the lanes to traffic, temporary ramping shall be provided as specified in the Contract Documents.

Asphalt pavement material from removal operations that is to be used on this Contract or stockpiled for future use by the Owner shall be weighed according to the Contract Documents then processed prior to stockpiling so 100% of the resultant material passes the 26.5 mm sieve. RAP shall be stockpiled according to the requirements of OPSS 1150 or OPSS 1151, as applicable to the Contract.

Removed asphalt pavement materials that are different due to the removal equipment used or pavement type shall be stockpiled separately.

#### **510.07.06.02                      Cutting Existing Pavement**

Pavement shall be cut for neat removal to the depth specified in the Contract Documents.

Suitable mechanical sawing equipment or pavement milling equipment capable of producing a straight clean vertical face shall be used for cutting the pavement. The existing pavement type, thickness, and, if any, size of reinforcement shall be as specified in the Contract Documents.

#### **510.07.06.03                      Removal of Pavement, Treated Base, and Concrete Base**

The work shall include the full-depth removal of asphalt pavement, concrete pavement, asphalt pavement from concrete surfaces and concrete base, cement-treated base, and asphalt-treated base. All materials shall be managed as specified in the Contract Documents.

When removed material is to remain temporarily on site due to construction operations, the removed material shall be placed on an asphalt or concrete surface until final disposition.

When the operation for full-depth asphalt removal from concrete base or concrete surfaces other than structures causes thickness reductions or surface variations exceeding 10 mm, the removal operations shall be corrected expeditiously and the damaged concrete areas repaired.

As part of the work of full-depth pavement removal, where public traffic is to be maintained throughout the work without the use of a temporary bypass, temporary granular ramping shall be constructed and maintained to convey public traffic through the area. The ramping shall be at 20H:1V. Temporary ramps shall be removed to accommodate subsequent construction after traffic has been routed off the temporary ramp.

Following pavement removal, the existing roadway granular shall be restored according to OPSS 301, when such roadway is not designated for abandonment.

Prime, surface treatments, and mulch pavements greater than 50 mm in depth are considered to be asphalt pavement.

This work shall not include removal of materials for jointing done as part of a paving operation.

**510.07.06.04****Removal of Asphalt Pavement, Partial-Depth**

The work shall include the partial-depth removal of asphalt pavement. Such material shall be managed as specified in the Contract Documents.

The asphalt pavement shall be removed to the average depth specified in the Contract Documents.

Prior to commencing removal operations, all debris, deleterious material, and existing windrows shall be removed from the roadway surface, including material beyond the theoretical roadway width to provide positive drainage.

If the remaining asphalt pavement does not require further processing or if the remaining asphalt pavement is to be recycled using CIR or CIREAM or HIR processes, then the equipment used for partial depth removal shall be automatically controlled for grade and slope during removal. The surface remaining after removal shall have a constant and continuous crossfall matching the intended surface course crossfall. The surface remaining after removal shall have an even texture and be free of significantly different grooves and ridges in all directions.

Removed asphalt pavement material shall not remain on the roadway after completion of the day's operation. Placing of the material on grade other than a bituminous surface prior to hauling to a stockpile shall not be permitted.

After partial depth removal, the gap between the top of milled surface and the bottom of a 3 m straightedge placed anywhere in any direction on the milled surface shall not exceed 6 mm.

Prior to opening the lane to traffic after partial-depth pavement removal, adjacent granular shoulder material shall be reshaped and compacted to ensure proper drainage of the milled surface and adjoining shoulders.

Partial-depth asphalt pavement removal operations and the resulting surfaces from partial-depth asphalt removal operations shall not be permitted between November 16<sup>th</sup> and June 1<sup>st</sup>, unless approved by the Contract Administrator.

**510.07.06.04.01****Temporary Ramping**

As part of the work of partial-depth pavement removal, at the end of each completed portion and prior to opening to traffic, temporary transverse ramping shall be constructed at a slope not steeper than 120H:1V. The temporary transverse ramping shall be removed as part of continuing the removal of asphalt pavement, partial-depth operation from the ramping location or prior to placing pavement materials at the ramping location.

If, due to unforeseen circumstances, partial depth pavement removal cannot be completed to the same station for the full pavement width prior to shut down at the end of the day, then as part of the work of partial-depth pavement removal, temporary longitudinal ramping, when permitted, shall be constructed at a slope not steeper than 10H:1V prior to opening to traffic. The temporary longitudinal ramping shall be removed within 1 Day or as agreed to by the Contract Administrator in the event of weather or access restrictions.

Temporary longitudinal ramping shall not be permitted when either of the following conditions exist:

- a) the ramping height would be greater than 50 mm, or
- b) the pavement slope would cause water to accumulate at the edge of the ramping and extend onto an adjacent lane or shoulder that will be open to traffic.

All costs associated with temporary ramping, including ramping material, shall be deemed to be included in the item price for Removal of Asphalt Pavement, Partial Depth.

**510.07.06.05****Removal of Asphalt Pavement from Concrete Surfaces on Structures**

The work shall include the removal of asphalt pavement and waterproofing from the concrete surfaces on structures. All materials shall be managed as specified in the Contract Documents.

When pavement-milling equipment is used, the weight of milling equipment shall be limited to:

- a) 43 tonnes maximum weight for post-tensioned decks and rigid frame decks,
- b) 26 tonnes maximum weight for thin slab concrete bridge deck on girders. For thin slab concrete bridge deck on girders, the equipment shall not travel laterally beyond 1.0 m from the centreline of the exterior girder.

When the method of asphalt removal results in impact damage or excessive vibration is observed, operations shall be modified to eliminate these effects.

Unless the Contract Documents specify a concrete or latex-modified concrete overlay is to be placed on the existing concrete deck, the milling operation shall be controlled such that the milling teeth do not come in contact with the concrete deck surface and bridge joints. Any remaining asphalt pavement and waterproofing not removed by rotary milling equipment shall be removed by other methods.

If the milling operation damages the surface of the concrete deck, causing surface variations or concrete thickness reductions exceeding 2 mm, the milling operation shall be corrected expeditiously and the damaged concrete areas repaired. The proposed repair method shall be submitted in writing to the Contract Administrator, prior to commencing repairs. Surface preparation, placement, and curing of the repair materials shall be according to the repair material manufacturer's instructions.

**510.07.06.06****Removal of Concrete Pavement, Partial-Depth**

The concrete pavement shall be removed to the depths indicated in the Contract Documents.

The equipment used for partial-depth concrete pavement removal shall be automatically controlled for grade and slope during removal. The surface remaining after removal shall have a constant and continuous cross fall matching the intended surface cross fall. The surface remaining after removal shall have an even texture free of significantly different grooves and ridges in all directions.

The removed concrete pavement material shall not remain on the roadway after completion of the day's operation.

After partial-depth removal of existing concrete pavement, the Contractor shall reshape and compact the existing shoulder material to ensure proper drainage of the remaining surface and adjoining shoulders.

Removal operations and resulting surfaces from removal operations shall not be permitted during the winter months on highways with posted speeds of 80 km/h or higher.

**510.07.07****Concrete Work****510.07.07.01****Removal of Concrete**

The work shall include the removal of retaining walls; footings; foundations; concrete culverts, including associated wingwalls and retaining walls; concrete appurtenances; and similar concrete structures specified in the Contract Documents.

**510.07.08 Right-of-Way Work**

**510.07.08.01 Preparing Right-of-Way**

When preparing the right-of-way is specified in the Contract Documents, all objects and materials within the specified road allowance that interfere with the execution of the work and are not covered under separate removal items, shall be removed under this work. The work includes, but is not limited to the removal of trees less than 150 mm diameter, tree roots and stumps, brush and hedges, culverts, wooden and steel posts, signs, sidewalks, precast or poured driveway curbs, asphalt curbs, boulders, stone walls and retaining walls, and other surface materials that require removal in order to complete all parts of the Contract.

Any precast concrete slabs, bricks and stones, cut stone curbs, timbers, or similar landscaping elements that are removed shall remain the property of the adjacent property owner and shall be piled neatly on such adjacent property.

**510.07.08.02 Removal of Driveways, Sidewalks, and Sundry Asphalt Pavements**

When collective work to remove driveways and sidewalks needs to be done, work shall include the removal of asphalt, concrete, stone or brick driveways and sidewalks, and sundry asphalt pavements.

**510.07.08.03 Removal of Concrete Sidewalk**

The work shall include the removal of concrete sidewalk.

**510.07.08.04 Removal of Gabions**

The work shall include the removal of gabions, including rock and wire.

**510.07.09 Overhead Signs and Sign Support Structure Work**

Overhead signs and sign support structures shall be salvaged.

Sign support structure footings shall be removed to a minimum of 1.3 m below subgrade.

**510.07.10 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**510.09 MEASUREMENT FOR PAYMENT**

**510.09.01 Actual Measurement**

**510.09.01.01 Removal of Bridge Footings**

Measurement of removal of bridge footings shall be the volume in cubic metres of the concrete removed.

**510.09.01.02 Removal of Curb and Gutter  
Removal of Asphalt Curb and Gutter  
Removal of Concrete Curb and Gutter**

Measurement of removal of curb and gutter shall be the length in metres horizontally along the flow lines of the curb and gutter removed, whether straight or circular, without separation into types. When the slope of the curb and gutter is 4H:1V or steeper, then the above measurement is of the slope length.

No deduction shall be made from the measured length for the spaces occupied by maintenance hole and catch basin castings. Where the removal includes runs of curb and gutter that converge to form bullnoses, each run shall be measured for payment and such measurement shall be deemed to include the concrete fillet within the bullnose.

**510.09.01.03                      Removal of Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

For measurement purposes, a count shall be made of the number of maintenance holes, catch basins, ditch inlets, and valve chambers removed regardless of type, depth, or size.

**510.09.01.04                      Abandonment of Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers, Partial-Depth**

For measurement purposes, a count shall be made of the number of maintenance holes, catch basins, ditch inlets, and valve chambers abandoned regardless of type or size.

**510.09.01.05                      Capping of Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers**

For measurement purposes, a count shall be made of the number of maintenance holes, catch basins, ditch inlets, and valve chambers capped regardless of type or size.

**510.09.01.06                      Removal of Pipes and Culverts**

Measurement of removal of pipes and culverts shall be the length in metres horizontally along the pipe or culvert, from one end or end section to the other end or the other end section. Where the grade of the pipe or culvert is 10% or greater, then the above measurement is of the slope length. Pipes and culverts smaller than 200 mm diameter shall be treated as part of the excavation work.

No deduction shall be made from the measured length for the spaces occupied by intermediate maintenance holes, catch basins, ditch inlets, and valve chambers.

**510.09.01.07                      Abandonment of Pipes and Culverts**

Measurement of abandonment of pipes and culverts shall be by length in metres horizontally along the pipe or culvert, from one end or end section to the other end or the other end section. Where the grade of the pipe or culvert is 10% or greater, then the above measurement is of the slope length.

**510.09.01.08                      Removal of Pipe Subdrains**

Measurement of removal of pipe subdrains shall be by length in metres horizontally along the centerline of the pipe subdrains, including outlets.

**510.09.01.09                      Removal of Hydrants  
Removal of Valves  
Removal of Watermain Appurtenances**

For measurement purposes, a count shall be made of the number of hydrants, valves, and watermain appurtenances removed.

**510.09.01.10                      Removal of Fence  
Removal of Noise Barrier**

Measurement of removal of fence and noise barrier shall be the length in metres, horizontally along each fence or noise barrier removed.

**510.09.01.11                      Removal of Delineator Posts**

For measurement purposes, a count shall be made of the number of delineator and guide posts removed.

**510.09.01.12                      Removal of Cable Guide Rail  
Removal of Concrete Barrier  
Removal of Steel Beam Guide Rail  
Removal of Steel Box Beam Barrier**

Measurement of removal of traffic barrier shall be the length in metres horizontally along each type of traffic barrier removed, excluding energy attenuators.

Where cable guide rail and steel box beam barrier are anchored to concrete anchor blocks, measurement shall be made between the end anchor points with no additional measurement made of the overlapping sections at intermediate anchorages.

**510.09.01.13                      Removal of Anchor Blocks**

For measurement purposes, a count shall be made of the number of anchor blocks removed.

**510.09.01.14                      Removal of Energy Attenuators**

For measurement purposes, a count shall be made of the number of complete energy attenuators systems removed.

**510.09.01.15                      Removal of Ramp Closure Gates**

For measurement purposes, a count shall be made of the number of ramp closure gates removed.

**510.09.01.16                      Cutting Existing Pavement**

Measurement of cutting of existing pavement shall be by length in metres along each cut.

**510.09.01.17                      Removal of Asphalt Pavement  
Removal of Asphalt Pavement from Concrete Surfaces  
Removal of Concrete Pavement  
Removal of Asphalt-Treated Base  
Removal of Cement-Treated Base  
Removal of Concrete Base**

Measurement of removal of asphalt pavement, asphalt pavement from concrete surfaces, concrete pavement, asphalt-treated base, cement-treated base, and concrete base shall be by area in square metres.

No deductions shall be made from the area for the space occupied by maintenance holes, catch basins, and valve chambers.

The full-depth removal of asphalt pavement, asphalt pavement from concrete surfaces, concrete pavement, asphalt-treated base, cement-treated base, and concrete base shall be measured for payment whether on the roadway surface or within an excavation, where such pavement or base has remained in place since its construction.

**510.09.01.18                      Removal of Asphalt Pavement, Partial-Depth  
Removal of Concrete Pavement, Partial-Depth**

Measurement of removal of partial-depth asphalt or concrete pavement shall be by area in square metres or by mass in tonnes as specified in the Contract Documents.

**510.09.01.19                      Removal of Asphalt Pavement from Concrete Surfaces on Structures**

Measurement of removal of asphalt pavement from concrete surfaces on structures shall be by area in square metres.

**510.09.01.20                      Removal of Concrete**

Measurement of removal of concrete shall be by volume in cubic metres.

When broken concrete or masonry is used as rip-rap or rock protection, deductions shall not be made from the concrete removal item.

**510.09.01.21                      Removal of Driveways, Sidewalks, and Sundry Asphalt Pavements**

Measurement of removal of driveways, sidewalks, and sundry asphalt pavements shall be by horizontal area in square metres.

**510.09.01.22                      Removal of Concrete Sidewalk**

Measurement of removal of concrete sidewalks shall be by horizontal area in square metres.

**510.09.01.23                      Removal of Gabions**

Measurement of removal of gabions shall be by volume in cubic metres.

**510.09.01.24                      Removal of Sign Support Structure  
Removal of Sign Support Structure Footings**

For measurement purposes, a count shall be made of the number of sign supports and sign support footings removed.

**510.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**510.10****BASIS OF PAYMENT****510.10.01**

Removal of Bridge Structure - Item  
Removal of Bridge Footings - Item  
Removal of Modular Bridge - Item  
Removal of Modular Bridge Substructure - Item  
Removal of Curb and Gutter - Item  
Removal of Asphalt Curb and Gutter - Item  
Removal of Concrete Curb and Gutter - Item  
Removal of Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers - Item  
Abandonment of Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers Partial-Depth - Item  
Capping of Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers - Item  
Removal of Pipe and Culverts - Item  
Abandonment of Pipes and Culverts - Item  
Removal of Pipe Subdrains - Item  
Removal of Hydrants - Item  
Removal of Valves - Item  
Removal of Watermain Appurtenances - Item  
Removal of Fence - Item  
Removal of Noise Barriers - Item  
Removal of Delineator Posts - Item  
Removal of Cable Guide Rail - Item  
Removal of Concrete Barrier - Item  
Removal of Steel Beam Guide Rail - Item  
Removal of Steel Box Beam Barrier - Item  
Removal of Anchor Blocks - Item  
Removal of Energy Attenuators - Item  
Removal of Ramp Closure Gates - Item

Removal of Asphalt Pavement from Concrete Surfaces on Structures - Item  
Removal of Concrete Pavement, Partial-Depth  
Removal of Concrete - Item  
Preparing Right-of-Way - Item  
Removal of Driveways, Sidewalks, and Sundry Asphalt Pavements - Item  
Removal of Concrete Sidewalk - Item  
Removal of Gabions - Item  
Removal of Sign Support Structure - Item  
Removal of Sign Support Structure Footings - Item

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Imported backfill shall be paid for separately according to the tender item of the material specified in the Contract Documents.

Payment at the Contract price for the appropriate removal tender item shall be full compensation for all labour and Equipment for earth excavation required in the course of the removal operations.

Material designated for salvage but damaged by Contractor operations or lost by the Contractor shall be replaced with new material at no additional cost to the Owner.

If the Contractor elects to remove maintenance holes, catch basins, ditch inlets, and valve chambers in their entirety rather than as a partial removal, the removal shall be at no additional cost to the Owner.

When the Contract does not contain a separate item for the removal of pipe subdrain, the contract price for the items directly associated with the removal of pipe subdrain shall include full compensation for all labour, Equipment, and Materials required to do the work described in this specification.

Disturbed or damaged portions not designated for removal or salvage that result from the Contractor's operations shall be corrected or repaired at no additional cost to the Owner.

#### **510.10.02                      Excavation for Underpavement Objects**

When the Contract contains separate items for the removal of concrete pavement, asphalt pavement, concrete base, cement-treated base, sidewalk, and curb and gutter, such items removed because of the removal of under-pavement objects such as sewers, culverts, Utilities, and watermains, payment shall be at the Contract prices and according to the specifications for the removal of concrete pavement, asphalt pavement, concrete base, cement-treated base, sidewalk, or curb and gutter, respectively.

#### **510.10.03                      Excavation for Removal**

When excavation for removal overlaps the excavation required for other work under the Contract, the overlapping excavation for the removal shall be paid for in accordance with the specification for other work.

No deductions shall be made to the quantities of concrete base, cement-treated base, sidewalk, curb and gutter, and any other structure or portion of structure where these items removed are included within the established lines of an excavation item measured for separate payment.

**Appendix 510-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

**511.01 SCOPE**

This specification covers the requirements for the installation of rip-rap, rock protection, granular sheeting, and geotextile.

**511.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**Ontario Provincial Standard Specifications, Material**

|           |                            |
|-----------|----------------------------|
| OPSS 1004 | Aggregates - Miscellaneous |
| OPSS 1860 | Geotextiles                |

## **511.05 MATERIALS**

### **511.05.01 Rip-Rap, Rock Protection, and Granular Sheeting**

Rip-rap shall be according to OPSS 1004 and as specified in the Contract Documents.

Rock protection and granular sheeting shall be according to OPSS 1004.

### **511.05.02 Geotextile**

Geotextile shall be nonwoven, Class II according to OPSS 1860, with an FOS of 75-150 µm, unless otherwise specified in the Contract Documents.

## **511.07 CONSTRUCTION**

### **511.07.01 Excavation**

Prior to placing any material, the area shall be excavated or filled or both to the lines and dimensions specified in the Contract Documents and fine graded to a uniform even surface.

### **511.07.02 Placing Material**

#### **511.07.02.01 General**

Material shall be placed to the lines and dimensions specified in the Contract Documents.

When rip-rap or rock protection is being placed on slopes, the rock shall commence at the toe of the slope and progress up the slope.

When geotextile is specified in the Contract Documents, rip-rap, rock protection, and granular sheeting shall be placed in a manner so as not to damage the geotextile.

#### **511.07.02.02 Rip-Rap**

Rip-rap shall be placed in a set and stable manner, flat on the slope with the largest dimension parallel to the slope contours. The larger pieces of rip-rap shall be placed in the bottom courses. The rip-rap shall be laid closely so that a reasonable semblance of courses is achieved. Smaller pieces of rip-rap shall be used to fill the voids.

#### **511.07.02.03 Rock Protection**

Rock protection shall be placed in a random, but stable manner.

#### **511.07.02.04 Granular Sheeting**

Granular sheeting operations shall follow earth excavation operations as closely as practical and possible.

Compaction of granular sheeting material is not required.

#### **511.07.02.05 Geotextile**

Geotextile shall be free of folds, tears, and punctures and as specified in the Contract Documents. The geotextile shall be joined so that the material overlaps a minimum of 500 mm and shall be pinned together. Alternatively, the geotextile shall be joined to conform to the seam requirements of OPSS 1860.

Geotextiles shall be fixed to prevent movement during installation. Geotextile shall be wrapped down into the ground a minimum 300 mm at termination points.

**511.07.03                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**511.09                              MEASUREMENT FOR PAYMENT**

**511.09.01                      Actual Measurement**

**511.09.01.01                  Rip-Rap**

Measurement of rip-rap shall be by area in square metres following the contour of the ground.

**511.09.01.02                  Rock Protection**

Measurement of rock protection shall be by volume in cubic metres. The volume is a product of the area of the rock protection measured following the contour of the ground by its depth.

Truck box measurement shall be used when it is not possible to take an in place measurement.

**511.09.01.03                  Granular Sheeting**

Measurement of granular sheeting shall be by area in square metres following the contour of the ground.

**511.09.01.04                  Geotextile**

Measurement of geotextile shall be by area in square metres following the contour of the ground, without any allowance made for overlaps.

**511.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**511.10                              BASIS OF PAYMENT**

**511.10.01                      Rip-Rap - Item  
Rock Protection - Item  
Granular Sheeting - Item  
Geotextile - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When there is not a separate tender item for geotextile, payment for the geotextile shall be included in the tender item for rip-rap, rock protection, or granular sheeting, as appropriate.

## **CONSTRUCTION SPECIFICATION FOR INSTALLATION OF GABIONS**

### **APPENDICES**

|              |                   |
|--------------|-------------------|
| <b>512-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **512.01 SCOPE**

This specification covers the requirements for the installation of gabions and gabion structures not exceeding 2 metres in height.

#### **512.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **512.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **512.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

|          |                                                                      |

## **512.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Gabion** means a gabion basket or a gabion mat filled with gabion stones.

**Gabion Structure** means a vertical or near vertical stacked installation of gabions.

**512.05 MATERIALS**

**512.05.01 Gabion Baskets and Gabion Mats**

Gabion baskets and gabion mats shall be according to OPSS 1430.

Gabion baskets shall be manufactured from galvanized steel wire mesh or PVC coated galvanized steel wire mesh as specified in the Contract Documents. When the type of mesh is not specified in the Contract Documents, the gabion baskets shall be manufactured from PVC coated galvanized steel wire mesh.

Gabion mats shall be manufactured from PVC coated galvanized steel wire mesh.

**512.05.02 Gabion Stones**

Gabion stones shall be according to OPSS 1004 and as specified in the Contract Documents.

**512.05.03 Geotextile**

Geotextile shall be non-woven, Class II according to OPSS 1860, with an FOS of 75-150 µm, unless otherwise specified in the Contract Documents.

**512.07 CONSTRUCTION**

**512.07.01 Site Preparation**

Site preparation shall be according to OPSS 490.

**512.07.02 Dewatering**

Dewatering shall be according to OPSS 517.

**512.07.03 Temporary Erosion and Sediment Control Measures**

Temporary erosion and sediment control measures according to OPSS 805 shall be implemented when gabions are placed in or along a watercourse.

**512.07.04 Excavation, Bedding, and Backfill**

Excavation for gabions shall be according to OPSS 206.

Corrective measures ordered by the Contract Administrator to rectify deficiencies caused by over-excavation shall be performed. Material placed in the over-excavated area shall be compacted to the density requirements of OPSS 501.

Bedding and backfill shall be as specified in the Contract Documents.

#### **512.07.04.01                      Excavation, Bedding and Backfill for Gabion Structure Not Exceeding 2.0 m Height**

For gabion structures, excavation and the placing of bedding and backfill shall be according to OPSS 902.

#### **512.07.05                      Assembly of Gabions**

Gabions shall be installed at the locations and to the line, grade, and dimensions specified in the Contract Documents.

Gabions shall be assembled according to the manufacturer's instructions and as specified in the Contract Documents.

Gabions shall be assembled so that wire ends do not project outside the units on any exposed surface.

Gabion stones shall be placed in a manner as not to damage the wire mesh or the PVC coating on the wire or cause deformation of the gabion. Gabion stones shall be placed to minimize the voids between the stones. When specified in the Contract Documents, the front face of exposed wall surfaces shall be hand placed gabion stone to ensure a uniform appearance.

Prior to securing the lids on the gabion basket, the gabion basket shall be slightly overfilled by 25 to 50 mm of gabion stone in order to allow for settlement of the stone within the units.

#### **512.07.06                      Placing of Internal Connecting Wires**

Internal connecting wires shall be installed according to the manufacturer's recommendations. When gabions are used as a channelling revetment, internal connecting wires are not necessary.

#### **512.07.07                      Securing Lids**

When the gabion has been filled, the gabion lid shall be bent over until all lid edges coincide with the front and side edges of the gabion and shall be secured to the front and sides by wire according to manufacturer's instructions and as specified in the Contract Documents.

#### **512.07.08                      Geotextile**

Geotextile shall be placed uniformly, free of folds, tears or punctures and as specified in the Contract Documents. The geotextile shall be joined so that the material overlaps a minimum of 500 mm and shall be pinned together. Alternatively, the geotextile shall be joined to conform to the seam requirements of OPSS 1860. Geotextile shall be fixed to prevent movement during installation.

#### **512.07.09                      Protection Systems**

The construction of all protection systems shall be according to OPSS 539. Where the stability, safety, or function of an existing roadway, railway, other works, or proposed works may be impaired due to the method of operation, such protection as may be required shall be provided. Protection may include sheathing, shoring, and the driving of piles where necessary to prevent damage to such works or proposed works.

#### **512.07.10                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**512.09 MEASUREMENT FOR PAYMENT**

**512.09.01 Actual Measurement**

**512.09.01.01 Gabions**

Measurement of gabions shall be by volume in cubic metres based on the nominal dimensions of the gabions used. When the gabion excavation overlaps excavation required for other work, the measurement shall be made as specified with no deduction for overlaps.

Geotextile used with gabions shall not be measured for payment.

**512.09.01.02 Gabion Structures Not Exceeding 2.0 m Height**

Measurement of gabion structures not exceeding 2.0 m height shall be by volume in cubic metres based on the nominal dimensions of the gabions used. Height is measured from the base of the gabion structure and includes embedment depth, when applicable.

Geotextile used with gabion structures not exceeding 2.0 m height shall not be measured for payment.

**512.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**512.10 BASIS OF PAYMENT**

**512.10.01 Gabions - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Any costs associated with an unauthorized over-excavation shall be the Contractor's responsibility and at no extra cost to the Owner.

**512.10.02 Gabion Structures Not Exceeding 2.0 m Height - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Granular bedding and backfill for gabion structures shall be paid under the granular item for the material specified according to OPSS 902.

For gabion structures, excavation, bedding and backfilling shall be paid under the item Earth Excavation for Structure and Rock Excavation for Structure according to OPSS 902.

Where excavation required for gabion structure overlaps excavation required for other work, payment for excavation shall be made in accordance with the specification for the other work as though no excavation were required for the gabions and the gabion structures.

**Appendix 512-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

**Designer Action/Considerations**

|--------------|-------------------|
| <b>517-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **517.01 SCOPE**

This specification covers the requirements for the design, operation, and removal of a dewatering or temporary flow passage system to control water during construction, and the control of the water prior to discharge to the natural environment and sewer systems.

#### **517.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## 517.01.02 Appendices Significance and Use

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## 517.02 REFERENCES

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## 517.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Automatic Transfer Switch** means an electrical device that transfers power supply to a backup power source when there is an outage of the primary power source.

**Cofferdam** means as defined in OPSS 539.

**Cut-Off Wall** means a below grade wall that restricts groundwater flow and/or supports excavations, typically using soil-bentonite or cement-bentonite.

**Design Flow Rate** means the volume of water per unit of time expected to flow into the area of construction during or after the design storm event, and may include groundwater discharge.

**Design Storm Return Period** means the average number of years based upon probability, between the occurrences of a storm event of a certain severity or greater.

**Dewatering System** means the components required to control water to permit construction work to proceed under specified conditions, and may include a groundwater control system, impermeable barriers, pumps, and/or equipment to carry out unwatering.

**Groundwater Control System** means sump pumps, oversized excavations with perimeter ditches, deep wells or well points or other systems used to lower the groundwater table.

**Plug** means an impervious, natural, or constructed drainage work that blocks water.

**Sediment** means soil particles detached from an earth surface by erosion.

**Sediment Control Measure** means a measure to remove sediment from water prior to discharge to the natural environment and sewer systems.

**Temporary Flow Control Device** means a material or a group of materials that are used to control water flow into and out of a temporary flow passage system and can include a plug.

**Temporary Flow Passage System** means temporary flow control devices, channels, pipes, and other materials used to convey or divert water past an area under construction.

**Unwatering** means the removal of ponded or flowing surface water.

**Vegetated Discharge Area** means a sloped, open area of land with existing vegetation suitable to prevent erosion.

**Waterbody** means as any permanent or intermittent, natural or constructed body of water including lakes, ponds, wetlands and watercourses, but does not include sewage works as defined in the Ontario Water Resources Act.

**Watercourse** means a stream, creek, river, or channel including ditches, in which the flow of water is permanent, intermittent, or temporary.

## **517.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **517.04.01 Design Requirements**

A dewatering or temporary flow passage system shall be designed to control water at the locations specified in the Contract Documents and at any other location where a system is necessary to complete the work. The design of the system shall be sufficient to permit the work at each location to be carried out as specified in the Contract Documents.

The design shall meet the requirements of the Contract Documents, and where a waterbody is present, shall include channel and inlet and outlet protection measures as required to protect the environment in the event of system failure or the design flow rate being exceeded.

The design shall not include the use of embankments and/or structures in public use, either existing or to be constructed as part of the Work, to control or stop water flow, unless approved by the Contract Administrator.

The design shall not result in displacement or damage to property, buildings, structures, utilities and other facilities adjacent to the Working Area, including from drawdown related settlement or other groundwater related effects.

The system shall be designed to prevent soil loss or erosion where water is removed, pumped, or discharged. The system shall be designed to prevent basal heave or instability.

Where the system involves the taking of water from a waterbody, the design shall maintain the flow of water and the natural functions of the waterbody upstream and downstream of the work area, and shall not interfere with other uses of the water.

Temporary flow passage systems shall be designed, as a minimum, for a 2 year design storm return period or the period specified in the Contract Documents, and groundwater discharge. A longer return period shall be used when determined appropriate for the work.

Temporary diversion channels that are part of a temporary flow passage system design shall include provision for fish passage during low flows.

#### **517.04.02 Submission Requirements**

The submission of Working Drawings is only required for the dewatering system item and temporary flow passage system item locations specified in the Contract Documents. Other locations requiring a system do not require the submission of Working Drawings.

Three (3) sets of Working Drawings shall be submitted to the Contract Administrator at least 7 Days prior to commencement of the dewatering system installation, for information purposes only. Prior to submission of Working Drawings, the seals and signatures of a design Engineer and a design-checking Engineer shall be affixed on the Working Drawings verifying that the drawings are consistent with the Contract Documents.

One person shall not perform both the design Engineer and design-checking Engineer roles for a system.

Where multi-discipline engineering work is depicted on the same Working Drawing and the design or design-checking Engineer or both are unable to seal and sign the Working Drawing for all aspects of the work, the drawing shall be sealed and signed by as many additional design and design-checking Engineers as necessary.

The following information and details shall be shown on the Working Drawings, where applicable:

a) Plans, Elevations, and Details

- i. Type of system.
- ii. Design calculations demonstrating adequacy of the system and equipment.
- iii. Design flow rate(s).
- iv. Plan location, description, and dimensions of system components, including dams, cofferdams, cut-off walls, temporary channels, pipes, culverts, sewers, groundwater control systems employing wells and/or well points, sedimentation basins, tanks, pumps, power supply, and standby equipment.
- v. Method of management of pumped water and plan location of all dewatering discharge points.
- vi. Profile drawings shall extend through and immediately beyond the limits of the system.
- vii. Water elevations upstream and downstream of the system at design flow rate.
- viii. Dam height or crest elevation, cofferdam depth and tip elevation, cutoff wall depth or base elevation, pipe invert elevations, depths of wells and wellpoints, pump intake elevation, and sedimentation basin depth or base elevation.
- ix. Plan location, elevation, and dimensions of environmental protection measures.
- x. Pipe type, size, and length, pump capacity, and tank capacity.
- xi. Material and construction standards to be used for the work.
- xii. Method for establishing and monitoring construction site groundwater levels.
- xiii. Criteria and method of removal of the system.

b) Procedures for the system construction, operation, and maintenance, including daily start-up sequence where applicable, and operation shut down.

- c) Procedures for the removal of the system, including the removal sequence, and well decommissioning.
- d) Stand-by power or pumping system requirements and the use of automatic transfer switching, when required to protect the environment and the Work.
- e) A copy of the Permit to Take Water issued by the Ministry of the Environment and Climate Change or confirmation of registration of water taking for construction dewatering, if a permit or registration is required by provincial regulation.
- f) When applicable, a copy of the water taking report and discharge plan required by provincial regulation.
- g) A copy of any necessary permits for the discharge of water to a sanitary sewer, or stormwater sewer system, stormwater pond, or other facility.

#### **517.04.03                      Preconstruction Survey**

When a groundwater control system by wells or a well point system will be used, a condition survey of property and structures that may be affected by the work shall be carried out. The condition survey shall include the location and condition of adjacent properties, buildings, underground structures, water wells, Utilities, and structures, within the preconstruction survey distance specified in the Contract Documents from the groundwater control system. In addition, all water wells used as a supply of drinking water and located within the preconstruction survey distance specified in the Contract Documents from the groundwater control system shall be tested for compliance with Ontario Drinking Water Quality Standards.

Water wells within the preconstruction survey distance can be located using the website <https://www.ontario.ca/environment-and-energy/map-well-records> or its successor site.

Copies of the condition survey and water quality test results shall be submitted to the Contract Administrator prior to the operation of the groundwater control system.

### **517.07                              CONSTRUCTION**

#### **517.07.01                      General**

Dewatering systems and temporary flow passage systems shall be constructed and operated according to the Working Drawings, where applicable.

When required, support systems shall be according to OPSS 404, and temporary protection systems shall be according to OPSS 539.

Temporary erosion and sediment control measures, including to control the discharge of water, shall be according to OPSS 805. Measures not specified in OPSS 805 shall be according to the Working Drawings. Temporary erosion and sediment control measures and cover material to protect exposed soils, as required by the Working Drawings, shall be installed as soon as is practical.

Stranded fish shall be managed as specified in the Contract Documents.

Unwatering shall be carried out as necessary.

Water suspected of being contaminated as indicated by visual or olfactory observations shall be reported to the Contract Administrator.

## **517.07.02                      Dewatering System**

The dewatering system shall be continuously operational to control buoyancy forces until such forces can be resisted by backfill and structure self-weight, to keep excavations stable, to avoid erosion impacts from the release of accumulated water, and to keep the work area in the condition required to complete the associated work as specified in the Contract Documents.

The dewatering shall be discontinued in a manner that does not disturb any structure, pipeline, or flow channel. Operation of the dewatering system shall be shut down according to the procedures specified in the Working Drawings, where applicable.

## **517.07.03                      Temporary Flow Passage System**

### **517.07.03.01                      General**

Installation and removal of temporary flow passage systems shall be according to this subsection, and the Working Drawings if applicable.

The temporary flow passage system shall be revised or realigned as required by construction staging.

When a temporary flow passage system is to remain operational through a seasonal shutdown period, the Contractor shall be responsible for any maintenance or repair costs due to the temporary flow passage system during the seasonal shutdown period.

### **517.07.03.02                      Activation**

#### **517.07.03.02.01                      Outside of a Waterbody**

Temporary flow passage systems outside of a waterbody shall be activated according to the following sequential steps:

- a) The temporary flow passage system shall be constructed in its entirety, with upstream and downstream plugs separating the original waterbody channel and the temporary flow passage system remaining in place.
- b) The downstream plug shall be opened to allow water into the temporary flow passage system and water pressure shall be allowed to equalize between the original waterbody channel and the temporary flow passage system.
- c) The upstream plug shall be opened to allow water to flow through both the original waterbody channel and the temporary flow passage system.
- d) A plug shall be installed in the original waterbody channel, at the inflow confluence of the original waterbody channel and the temporary flow passage system, to fully divert the water to flow through the temporary flow passage system.
- e) A plug shall be installed in the original waterbody channel, at the outflow confluence of the temporary flow passage system and the original waterbody channel, to prevent backflow into the original waterbody channel.

#### **517.07.03.02.02                      Within a Waterbody**

Temporary flow passage systems within a waterbody shall be activated according to the following sequential steps:

- a) An upstream temporary flow control device shall be installed to divert water flow into the temporary flow passage system.

- b) A plug shall be installed in the original waterbody, at the inflow confluence of the original waterbody channel and the temporary flow passage system, to fully divert the water to flow through the temporary flow passage system.
- b) A plug shall be installed in the original waterbody, at the outflow confluence of the temporary flow passage system and the original waterbody, to prevent backflow into the original waterbody channel.

#### **517.07.04 Discharge of Water**

Water from dewatering and unwatering operations shall be directed to a sediment control measure and/or a vegetated discharge area 30 m away from waterbodies or as far away as practicable from the top of the bank of any waterbody, prior to discharge to the natural environment.

Equipment and materials shall not be used or stored in vegetated discharge areas.

The discharge of water to the natural environment shall not be directed across pavements, sidewalks, curb and gutter or similar hard surfaces except through appurtenances as specified in the Contract Documents.

#### **517.07.05 Monitoring**

The Contract Administrator shall be notified of any complaints and any action taken or proposed to be taken in response to complaints.

Daily external visual monitoring of the surrounding area and property and structures on the preconstruction survey, if applicable, for impacts such as settlement and erosion shall be completed. Any observed impacts shall be immediately reported to the Contract Administrator. When public safety, the environment, or property is impacted or potentially impacted, the design Engineer shall, without delay, make a full assessment and direct changes to the system to eliminate impacts or potential impacts. Any changes shall be documented according to the System Amendments subsection.

When a groundwater control system is observed to negatively impact water supplies obtained from any adequate sources that were in use prior to groundwater control system operation, then water shall be supplied to the affected water users. The water shall be equivalent in quantity and quality to the normal water takings of the users. Supply shall continue until the negative impacts on the water supplies are removed, or until Contract Completion, whichever occurs first.

#### **517.07.06 System Amendments**

When displacement or damage to embankments and/or structures, or property adjacent to the Working Area, occurs due to the operation of the system, or soil loss or erosion occurs where water is removed, pumped, or discharged, the dewatering or temporary flow passage system design shall be amended to stop the displacement, damage, soil loss, or erosion.

When Working Drawings are required for the work, amendments shall be submitted to the Contract Administrator within two Business Days of the system being amended, on revised Working Drawings bearing the seal and signature of the design Engineer and design-checking Engineer.

#### **517.07.07 Temporary Flow Passage System Deactivation**

##### **517.07.07.01 Outside of a Waterbody**

Deactivation of temporary flow passage systems outside of a waterbody shall be according to the following sequential steps:

- a) The downstream plug in the original waterbody channel shall be opened to allow water into the original waterbody channel and water pressure shall be allowed to equalize between the original waterbody channel and the temporary flow passage system.
- b) The upstream plug in the original waterbody channel shall be opened to allow water to flow through both the original waterbody channel and the temporary flow passage system.
- c) A plug shall be installed at the inflow confluence of the original waterbody channel and the temporary flow passage system, to fully divert the water to flow through the original waterbody channel.
- d) A plug shall be installed at the outflow confluence of the original waterbody channel and the temporary flow passage system, to prevent backflow into the temporary flow passage system.

#### **517.07.02                      Within a Waterbody**

Deactivation of temporary flow passage systems within a waterbody shall be according to the following sequential steps:

- a) The downstream plug shall be removed.
- b) The upstream plug shall be removed.

#### **517.07.08                      Removal**

Dewatering and temporary flow passage system components shall be removed when no longer required. Removal of system components shall be according to the procedures specified on the Working Drawings, where applicable, and as specified in the Contract Documents.

Removal of temporary drainage work shall be according to OPSS 510.

Environmental protection measures and cut-off walls shall be removed, unless approved otherwise by the Contract Administrator.

Sedimentation basins and other excavations shall be backfilled with the original soil excavated, unless approved otherwise by the Contract Administrator. All disturbed areas shall be restored to an equivalent or better condition than existed prior to the commencement of construction.

Site restoration shall be according to OPSS 492.

#### **517.07.09                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **517.10                              BASIS OF PAYMENT**

#### **517.10.01                      Dewatering System – Item Temporary Flow Passage System - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Progress payment for the above tender items shall be based on the following percentages of the Contract price:

- a) 40% for system installation,

- b) 40% for system operation, prorated over the duration of the system operation, and
- c) 20% for system removal.

When the system is passive and does not require active operation of pumps or other equipment or ongoing maintenance, the 40% prorated payment for system operation shall be paid after system installation.

When the Contract does not contain separate tender item(s) for dewatering system or temporary flow passage system; or when dewatering is required outside the specified limits of the dewatering system or temporary flow passage system tender items, the Contract price for the items directly associated with the required dewatering shall include full compensation for all labour, Equipment, and Material to do the work.

**Appendix 517-A, November 2010**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

| <b>539-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **539.01 SCOPE**

This specification covers the requirements for the design, construction, maintenance, monitoring, and removal of a temporary protection system made necessary by excavation, embankment construction, dewatering, or other work.

#### **539.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **539.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **539.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## **International Organization for Standardization/International Electrotechnical Commission (ISO/IEC)**

17025 General Requirements for the Competence of the Testing and Calibration Laboratories

### **539.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply.

**Anchor** means:

- a) A system consisting of prestressed tendons or non-prestressed rods installed in predrilled holes and encapsulated in grout or concrete. A system that derives its load carrying capacity in bond between the grout and concrete body and the surrounding soil or rock; or
- b) A tie back to a deadman.

**Bracing** means the system of walers, struts, anchorages, and like members that connect frames, shores, or panels of a sheathing system to resist external pressures and to provide stability against lateral movement.

**Certificate of Conformance** means a document issued by the Quality Verification Engineer confirming that the specified components of the Work are in General Conformance with the requirements of the Contract Documents.

**Cofferdam** means a watertight enclosure.

**Dredge Line** means the exposed lower limit of the protection system.

**Erector** means a supervisory person that undertakes the construction of a protection system.

**Protection System** means the construction necessary to mechanically support existing or proposed work so that its function shall not be affected or construction necessary to support work such as open excavations during actual construction operations for safety and convenience.

**Quality Verification Engineer** means an Engineer retained by the Contractor qualified to provide the services as specified in the Contract Documents.

**Raker** means a structural member inclined to the front of the shoring wall providing lateral support.

**Shoring Wall** means a structural wall consisting of wood, steel, or concrete or any combination of these materials that supports earth or rock and any structure, materials, Utilities, or other facility contained in or on the supported earth or rock mass.

**Top of Shoring Wall** means the upper limit of the protection system.

## **539.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **539.04.01 Design Requirements**

#### **539.04.01.01 General**

The protection system shall be designed for the performance level as specified in the Contract Documents.

Except for Owner designed protection systems, the Contractor shall be responsible for the complete detailed design of the protection system required to carry out the work as specified in the Contract Documents.

Protection systems that are not as specified in the Contract Documents shall be assigned an appropriate performance level for design by the design Engineer. The Contract Administrator shall review the performance level selected at the time of submission of the specified Working Drawings.

The geotechnical and foundation portions of the design shall be based on a method published in AASHTO Guide Design Specification for Bridge Temporary Works and in general conformance with CAN/CSA-S6. The design shall be appropriate for the specific site conditions. Design methods not meeting the AASHTO and CSA design specifications may only be used on this Contract, if approved by the Owner.

A protection system shall be designed to provide protection for excavations at the locations as specified in the Contract Documents and at any other location where the stability, safety, or function of an existing structure or Utility may be impaired by construction work.

The temporary slope geometry used to determine requirements of the protection system shall be according to the Occupational Health and Safety Act.

Performance levels for protection systems are as follows:

| <b>Performance Level</b> | <b>Maximum Angular Distortion</b> | <b>Maximum Horizontal Displacement</b> |
|--------------------------|-----------------------------------|----------------------------------------|
| 1a                       | 1:1000                            | 5 mm                                   |
| 1b                       | 1:1000                            | 10 mm                                  |
| 2                        | 1:200                             | 25 mm                                  |
| 3                        | 1:100                             | 50 mm                                  |

Where:

Angular Distortion =  $\pm \Delta/H$

$\Delta$  = Horizontal displacement in mm at height H

H = Height in mm above dredge line to point of measurement or height above the nearest system restraining support.

When performance level 1a is specified, the bracing system shall be preloaded.

Where the bracing systems are preloaded, the effects of the preload shall not cause damage to adjacent facilities.

Protection systems with a face within a horizontal distance of  $1/3H$  of any part of a structure foundation shall be designed for performance level 1a.

#### **539.04.01.02 Designer Qualifications**

The design Engineer and design-checking Engineer shall have demonstrated expertise for the work. As well, the design Engineer and design-checking Engineer shall have a minimum of 5 years experience in designing protection systems of similar nature and scope to the required work.

One person shall not perform both the design Engineer and design-checking Engineer roles for a protection system.

#### **539.04.01.03 Design Assumptions**

The design assumptions shall accurately represent the subsurface conditions prevalent at the site and shall be specific to the type of protection system used. The design shall address the subsurface conditions at the project site as specified in the Contract Documents.

#### **539.04.01.04 Vertical and Horizontal Loadings**

Vertical and horizontal design loadings used shall represent existing conditions and accepted design practice. Future loadings that are known and may affect the protection system during its useful life shall be considered.

#### **539.04.02 Submissions**

##### **539.04.02.01 Working Drawings**

The Contractor shall submit 3 sets of Working Drawings to the Contract Administrator at least 7 Days prior to commencement of the protection system installation, for information purposes only. Prior to making a submission, the seals and signatures of a design Engineer and a design-checking Engineer shall be affixed on the Working Drawings verifying that the drawings are consistent with the Contract Documents.

Where multi-discipline engineering work is depicted on the same Working Drawing and the design or design-checking Engineer or both are unable to seal and sign the Working Drawing for all aspects of the work, the drawing shall be sealed and signed by as many additional design and design-checking Engineers as necessary.

Prestressed anchor submissions shall be according to OPSS 942.

When other authorities are involved, 1 set of Working Drawings shall be submitted for each authority at least 5 weeks prior to the commencement of falsework construction. The requirements of each authority shall be satisfied prior to commencement of the protection system installation.

The Contractor shall have a copy of the Working Drawings at the site during protection system installation.

For protection systems that are not specified in the Contract Documents, the Contractor shall submit the Working Drawings for these systems to the Contract Administrator at least 3 weeks prior to the commencement of any construction.

The following information and details shall be shown on the Working Drawings:

a) Plans, Elevations, and Details

- i. Location of protection system and station limits.
- ii. Plan and elevation of shoring showing the extent of the protection system.
- iii. Details of the shoring system, including cross-sections.
- iv. Details of internal bracing.

b) Design Criteria

- i. Pressure diagrams including values of horizontal and vertical loads, dead load, and live load surcharge.
- ii. Design assumptions and parameters.
- iii. Anchor bond stresses.
- iv. Pile design.
- v. Anchor system stressing schedule specifying working loads, stressing loads, and lock in loads.
- vi. Details of preload, when required.
- vii. For protection systems not specified in the Contract Document, the performance level shall be designated.

c) Materials

- i. Grade of structural steel and grade and species of structural wood.
- ii. Concrete strengths.
- iii. Grout strengths.
- iv. Details of protection from rain and frost action.
- v. Wood lagging and size.
- vi. Mill certificates or test reports from an independent organization certified by the Standards Council of Canada certifying that the steel meets the requirements of the grade, where specified.
- vii. Details of patented accessories, including load test data.

d) Installation Procedure

- i. Installation sequence and procedure, including to the installation of piling, lagging, anchor systems, and rakers.

e) Monitoring Method

- i. The proposed method of monitoring the performance of the protection system during installation and use. The method of monitoring shall be consistent with the requirements specified in the Quality Control subsection.

f) Removal of Protection System

- i. The details of the procedures associated with the removal of the protection system indicating: method, sequence of work, and removal limits, except when the protection system is specified in the Contract Documents to be left in place.

**539.04.02.02 Amendments to Protection Systems**

Work shall not proceed on amendments to the protection system until the Contractor has received sealed and signed approval to proceed from the design Engineer and design-checking Engineer and has submitted a copy of the approval to the Contract Administrator.

Amendments to the protection system shall be submitted to the Contract Administrator on revised Working Drawings bearing the seal and signature of the design Engineer and design-checking Engineer.

#### **539.04.02.03                    Preconstruction Survey**

Prior to commencing the work, the Contractor shall submit to the Contract Administrator, a condition survey of property and structures that may be affected by the work. The survey shall include the locations and conditions of adjacent properties; buildings; underground structures; Utility services; and structures, such as walls abutting the site within a horizontal distance of  $2H_w$  from the face of the protection system, where  $H_w$  is the height of the wall from the ground surface to the dredge line.

#### **539.04.02.04                    Materials**

##### **539.04.02.04.01                Structural Steel**

##### **539.04.02.04.01.01          Mill Certificates**

The Contractor shall submit to the Contract Administrator at the time of delivery 1 copy of the mill certificates, indicating that the steel meets the requirements for the appropriate standards for H-piles, tube piles, casings, and sheet piles.

Where mill test certificates originate from a mill outside Canada or the United States of America the Contractor shall have the information on the mill certificates verified by testing by a Canadian laboratory. The laboratory shall be certified by an organization accredited by the Standards Council of Canada to comply with the requirements of ISO/IEC 17025 for the specific tests or type of tests required by the material standard specified on the mill test certificate. The mill test certificates shall be stamped with the name of the Canadian testing laboratory and appropriate wording stating that the material conforms to the specified material requirements. The stamp shall include the appropriate material specification number, the date (i.e., yyyy-mm-dd), and the signature of an authorized officer of the Canadian testing laboratory.

For Contractor designed protection systems using previously used structural steel that a mill test certificate is not available and coupons have not been tested to verify the steel's material properties, a mill test certificate is not required when the yield strength specified on the Working Drawings does not exceed 250 MPa. If the yield strength specified exceeds 250 MPa, the Contract Administrator may request that the material be tested to confirm the material properties indicated on the Working Drawings. The costs of this testing shall be at the expense of the Owner if the test results indicate that the material is according to the Working Drawings, and at the expense of the Contractor if the test results indicate that the material is not according to Working Drawings.

#### **539.04.02.05                    Milestone Inspections**

##### **539.04.02.05.01                Excavation Depths Less Than or Equal to Three Metres**

The Quality Verification Engineer shall witness interim inspections of the following work:

- a) Installation of protection system, including excavation to dredge line.
- b) Removal of protection system.

A copy of the written permission to proceed shall be submitted to the Contract Administrator prior to commencement of the successive operation.

#### **539.04.02.05.02           Excavation Depths Exceeding Three Metres**

The Quality Verification Engineer shall witness interim inspections of the following work:

- a) Layout and extent of protection system.
- b) Piling.
- c) Installation of protection system, including excavation to dredge line.
- d) Removal of protection system.

A copy of the written permission to proceed shall be submitted to the Contract Administrator prior to commencement of the successive operation.

#### **539.05                       MATERIALS**

##### **539.05.01               Wood**

Wood shall be according to OPSS 1601.

Wood shall be of the size, grade, and species shown on the Working Drawings and shall be in sound condition, free from defects that may impair its strength. Wood lagging does not have to be grade-stamped.

##### **539.05.02               Proprietary Shoring and Patented Accessories**

Where proprietary shoring or patented accessories are to be used, the Contractor shall follow the manufacturers' recommendations for load carrying capacity. The recommended load carrying capacities shall be supported by test results from an accredited testing laboratory approved by the Owner.

##### **539.05.03               Concrete**

Concrete shall be according to OPSS 1350.

##### **539.05.04               Other Materials**

The design Engineer may consider other suitable materials when sufficient information is available to quantify the allowable design loads or when the manufacturer's recommendations regarding load carrying capacities are supported by test results from an independent organization accredited by the Standards Council of Canada.

#### **539.07                       CONSTRUCTION**

##### **539.07.01               General**

The Contractor shall be responsible for the design, materials, construction, maintenance, monitoring, and removal of a temporary protection system.

The erector shall be experienced in the method of construction of protection systems. Such experience shall have been obtained within the preceding 5 years on projects of similar nature and scope to the required work.

Protection systems shall be built according to the specifications and the Working Drawings.

Piling shall be according to OPSS 903 and the Working Drawings.

Concrete construction shall be according to OPSS 904. Concrete shall be placed in the dry. Where cofferdams are used, they shall be sealed sufficiently to permit concrete to be placed in the dry.

The Contractor shall carry out dewatering, as required, to facilitate the installation of the protection system.

Tremie concrete shall be placed according to the requirements of OPSS 904.

Structural steel shall be according to OPSS 906 and the Working Drawings.

Prestressed anchors shall be supplied, installed, and stressed according to OPSS 942.

The protection system shall be protected from the detrimental effects of rain and frost action.

Material used in the protection system shall remain the property of the Contractor.

Loss of soil from behind the shoring shall be prevented during and following the installation of the lagging.

#### **539.07.02                      Removal of Protection Systems**

Protection systems may be left in place, unless otherwise specified.

Where protection systems are left in place, the top shall be removed to at least 1.2 m below the finished grade or ground level or at least 0.6 m below the streambed.

Where protection systems are specified for removal or the Contractor elects to remove, the method and sequence of removal shall be so that there shall be no damage to the new work, existing work, and facility being protected.

All disturbed areas shall be restored to an equivalent or better condition than existed prior to the commencement of construction.

#### **539.07.03                      Quality Control**

##### **539.07.03.01                  General**

In addition to the quality control measures instituted by the Contractor, the Contractor shall complete a preconstruction condition survey and monitor the protection system installation as specified herein, and as shown on the Working Drawings.

##### **539.07.03.02                  Inspection of Welds**

The Contractor shall be responsible for visual inspection of all welds. Any required testing of welds shall be as specified by the design Engineer of the protection system.

##### **539.07.03.03                  Monitoring**

##### **539.07.03.03.01              General**

Monitoring shall be conducted by a Registered Ontario Land Surveyor or an Engineer according to the program submitted with the Working Drawings.

The minimum requirements for monitoring shall include the survey measurements of scaled targets attached to the shoring wall at the elevations specified. The scaled targets shall be placed at a maximum spacing of 6 m with targets placed at the extreme ends and the targets distributed between the outer limits. The survey targets shall be monitored for horizontal displacement from the vertical at the frequency specified.

All test results, observations, and records, including the preconstruction survey, taken during construction and operation of the protection system shall be available on the site for review by the Contract Administrator.

If movement of the protection system is more rapid than is expected, or if movement approaches the allowable limit, the Contract Administrator shall be notified immediately and suitable measures shall be taken to ensure stability of the protection system and to ensure movement does not exceed the performance level specified in the Contract Documents.

#### **539.07.03.03.02            Excavation Depths Less Than or Equal to Three Metres**

The protection systems shall be monitored during construction. Readings shall be taken during installation of the protection system at the top of the protection system at each construction stage during the installation. After installation, the above readings shall be taken every two weeks.

#### **539.07.03.03.03            Excavation Depths Exceeding Three Metres**

The protection systems shall be monitored during construction. Readings shall be taken during installation of the protection system at the top, at each restraint point, at the dredge line, and halfway between the restraint points at each construction stage during the installation of the protection system. After installation, the above readings shall be taken weekly.

#### **539.07.03.04                Certificates of Conformance**

##### **539.07.03.04.01            Excavation Depths Less Than or Equal to Three Metres**

For protection systems to facilitate excavation depths less than or equal to 3 m and provided that surcharge loading due to vehicular traffic, construction equipment and materials, or other is beyond a horizontal distance defined by a 1H:2V line projected from the dredge line at the face of the protection system to the roadway surface, a completed Certificate of Conformance shall be submitted to the Contract Administrator upon completion of the operation of the protection system and removal of the protection system. The Qualification Verification Engineer's seal and signature shall be affixed on the completed Certificate of Conformance confirming that the protection system was installed, monitored, and subsequently removed in general conformance with the Working Drawings and as specified in the Contract Documents.

Should traffic be within a horizontal distance defined by a 1H:2V line projected from the dredge line at the face of the protection system to the roadway surface, the Certificate of Conformance requirements as specified in the Excavation Depths Exceeding Three Metres clause shall apply.

#### **539.07.03.04.02                      Excavation Depths Exceeding Three Metres**

For protection systems to facilitate excavation depths that exceed 3 m or should traffic, construction equipment and materials, or other be within a horizontal distance defined by a 1H:1V line projected from the dredge line at the face of the protection system to the roadway surface, a completed Certificate of Conformance shall be submitted to the Contract Administrator upon completion of the operation of the protection system and removal of the protection system. The Qualification Verification Engineer's seal and signature shall be affixed on the completed Certificate of Conformance confirming that the materials have been supplied and installed in general conformance with the Working Drawings and that the protection system was installed, monitored, and subsequently removed in general conformance with the Working Drawings and as specified in the Contract Documents.

#### **539.07.04                              Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **539.10                                  BASIS OF PAYMENT**

#### **539.10.01                              Protection System - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract does not contain a separate item for protection systems, the Contract price for the items directly associated with the protection system shall include full compensation for all labour, Equipment, and Material to do the work described in this specification.

**Appendix 539-A, November 2014**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

### **578.01 SCOPE**

This specification covers the requirements for the placement of unshrinkable fill.

#### **578.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **578.01.02 Appendices Significance and Use**

Appendices are not for use in provincial Contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner.

Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their Contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **578.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

|-----------|--------------------------------------------------------------------------------------------------------|

### 578.03 DEFINITIONS

For the purpose of this specification, the following definition applies:

**Unshrinkable Fill** means a self-compacting cement treated aggregate with flowable consistency and controlled low strength properties.

### 578.04 DESIGN AND SUBMISSION REQUIREMENTS

#### 578.04.01 Design Requirements

Unshrinkable fill shall be according to the following:

- The mix shall be designed to provide appropriate strength and performance characteristics for the intended use, and to meet the requirements as specified in the contract documents.
- The unshrinkable fill shall contain 25 kg/m<sup>3</sup> of Type GU or GUL cement according to CSA A3001 and may contain additional supplementary cementing materials to aid in placement.
- The mix may contain foaming agents to aid in placement.
- Slump at point of discharge shall be a minimum of 150 mm and the unshrinkable fill shall be uniformly mixed throughout.
- The material shall be designed such that it can flow into the excavation and fill the entire space without vibration, and without segregation.
- The 28-Day compressive strength shall be a maximum of 0.40 MPa.

#### 578.04.02 Submission Requirements

The Contractor shall be responsible for designing the unshrinkable fill mix and shall submit the unshrinkable fill mix design according to OPSS 1350 except the use of reclaimed concrete material and the amount used expressed in percent by mass of the total aggregate shall be identified on Forms A and B.

**578.05 MATERIALS**

**578.05.01 Cementing Materials**

Cementing materials shall be according to OPSS 1301.

**578.05.02 Water**

Water shall be according to OPSS 1302.

**578.05.03 Aggregates**

Aggregates shall be according to OPSS 1001 and this specification.

Except as noted below or elsewhere in the Contract Documents, aggregates may be sands, gravel, quarried rock or reclaimed concrete material provided the source is of such a nature and extent as to ensure acceptable processed aggregates of a consistent grading and quality. When any change in the character of the aggregate occurs or when the performance of aggregate meeting the requirements of OPSS 1001 and this specification is found to be unsatisfactory, use of the aggregate shall be discontinued until a reappraisal by the Contractor, with the approval of the Contract Administrator, proves the source to be satisfactory or another source is selected.

Fine and coarse aggregates shall meet the grading requirements of Table 1 and the physical property requirements of Table 2.

**578.05.03.01 Reclaimed Concrete Material**

Reclaimed concrete material may be used up to a maximum of 25 % by mass of the total aggregate. Reclaimed concrete material shall not be used in unshrinkable fill to be placed in contact with sulphate-bearing soil or ground water with sulphate.

**578.06 EQUIPMENT**

**578.06.01 Mixing Equipment**

A central mixing, dry batch plant, capable of accurately proportioning aggregate, cement, and water shall be used. The plant shall be certified according to OPSS 1350.

**578.06.02 Transport Equipment**

Unshrinkable fill shall be transported to the site by means of ready mix trucks.

**578.07 CONSTRUCTION**

**578.07.01 Operational Constraints**

Where vehicular traffic, including construction equipment, is to be accommodated, the unshrinkable fill shall be protected by covering it with a steel plate suitable for the traffic loading for a minimum of 24 hours.

Hot mix asphalt or any other material shall not be placed on unshrinkable fill until a minimum of four hours after the placing of unshrinkable fill.

**578.07.02****Unshrinkable Fill Placement Requirements**

Individual loads of unshrinkable fill shall be placed within 2 hours from the time of batching.

When placed into excavations, unshrinkable fill shall be placed so that it fills the entire excavation without voids beneath horizontal projections or in other locations within the excavation. When unshrinkable fill is to be placed in an excavation subject to the entry of flowing water, the excavation shall be dewatered according to OPSS 517 prior to placement of the unshrinkable fill.

When placed adjacent to culverts, arches, rigid frames, integral abutments and piers, the unshrinkable fill shall be placed in alternating layers on each side of the structure to balance the earth pressure forces. Unless specified in the Contract Documents, the unshrinkable fill layers shall not exceed 500 mm in thickness and the height of the layers shall be approximately the same. At no time shall the elevation difference between the sides be greater than 500 mm. Each layer shall set for a minimum of four hours before a new layer is placed.

When shoring, bracing, or sheeting is used to support the sides of the excavation or to prevent movements that could damage other services or adjacent pavements, and this support system is to be removed, it shall be removed as filling proceeds to ensure stability of the excavation.

The unshrinkable fill material shall be protected from cold weather according to OPSS 350 with the exception that unshrinkable fill shall be protected from freezing after placement but need not be monitored with thermocouples nor maintained above 15° C.

**578.07.03****Field Sampling and Testing**

The Contractor shall be responsible for testing of slump, casting, initial storage and transportation of cylinders for compressive strength determination by the Owner.

Field sampling and testing of concrete shall be performed by a person holding either of the following certifications:

- a) CCIL Certified Concrete Testing Technician, or
- b) ACI Concrete Field Testing Technician, Grade 1.

Such persons shall have a valid original card issued by the certifying agency in their possession at all times.

Unshrinkable fill shall be tested for slump according to CSA A23.2-5C when directed by the Contract Administrator. Unshrinkable fill that does not meet the slump requirement shall be adjusted to meet the slump requirement or rejected and removed from the Working Area.

For the determination of compressive strength, a set of two cylinders, 150 mm diameter 300 mm long, shall be cast each Day of production and placement, when directed by the Contract Administrator. When there is more than one supplier of unshrinkable fill, a separate set of two cylinders for each supplier shall be cast each Day of production and placement.

Cylinders shall be cast and transported according to CSA A23.2-3C except that only cardboard moulds shall be used to cast the test cylinders. A disc of wax paper matching the inside diameter of the cylinder mould shall be placed at the base of the cylinder mould prior to casting. The interior sidewalls of the cardboard mould shall be treated with a light coating of release agent.

For the first 24 hours after casting, test cylinders shall be stored within the Working Area either covered or in a shaded area.

Test information shall be recorded on MTO form PH-CC-322, a copy of which shall be submitted with each set of compressive strength cylinders.

The Contractor shall transport the cylinders to the designated quality assurance laboratory specified in the Contract Documents, for testing.

## **578.08 QUALITY ASSURANCE**

### **578.08.01 Testing Requirements**

Compressive strength testing shall be according to LS-407. The results of the set of two cylinders cast each Day shall be averaged to provide the test result for the Day.

### **578.08.02 Acceptance**

Unshrinkable fill shall be accepted when:

- a) The material does not deform under traffic loading.
- b) The compressive strength requirements are met.
- c) Materials used comply with the requirements of this specification.

## **578.09 MEASUREMENT FOR PAYMENT**

### **578.09.01 Actual Measurement**

Measurement of unshrinkable fill shall be by volume in cubic metres.

### **578.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **578.10.0 BASIS OF PAYMENT**

### **578.10.01 Unshrinkable Fill – Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

| LS-610                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Organic Impurities, Organic plate number (Note 1)         | 3                |
| LS-619                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Micro-Deval Abrasion, fine aggregates, maximum (Note 2)   | 30%              |
| LS-618                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Micro-Deval Abrasion, coarse aggregates, maximum (Note 2) | 25%              |
| CSA A23.2-3B<br>CSA A23.2-8B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Sulphate content (SO <sub>4</sub> ), maximum (Note 3)     | 1.5%             |
| ASTM D1411                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Water soluble chloride maximum, (Note 4)                  | 0.010%           |
| Notes:<br>1. For the natural sand component only. An aggregate that produces a colour darker than standard colour No. 3 shall be considered to have failed this requirement.<br>2. Test samples shall be prepared by blending all aggregate components based on their individual percentages stated in the mix design. The blended aggregate shall be split on the 4.75 mm sieve and the individual coarse and fine aggregate fractions set aside for testing as required.<br>3. For unshrinkable fill in contact with permanent concrete elements, the limit of SO <sub>4</sub> shall be a maximum of 0.20% unless the permanent concrete element meets the requirements of S1, S2, or S3 of CSA A23.1-14 Table 3 as appropriate.<br>4. This requirement is specified where the unshrinkable fill will be in direct contact with concrete or steel pipe. |                                                           |                  |

## **602.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Electrical Chamber** means a structure or chamber for placing and maintaining conductors, cables, ducts, or electrical equipment. Electrical chamber is a general name for electrical maintenance holes and handholes.

**Rock** means as defined in OPSS 206.

**602.05 MATERIALS**

**602.05.01 Concrete**

Concrete for cast-in-place electrical maintenance holes shall be according to OPSS 1350 with a nominal 28-Day compressive strength of 30 MPa.

**602.05.02 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

**602.05.03 Sand Bedding**

Sand bedding shall consist of sand conforming to the gradation requirements of mortar sand according to OPSS 1004.

**602.05.04 Precast Concrete Electrical Maintenance Holes**

Precast concrete electrical maintenance holes shall be according to OPSS 1351 and the Contract Documents. The requirement for a Prequalification Certificate issued under the Plant Prequalification Program stated in OPSS 1351 does not apply to precast concrete electrical maintenance holes.

**602.05.05 Electrical Handholes**

Electrical handholes shall be according to OPSS 2401 and the Contract Documents.

**602.05.06 Steps**

Steps for electrical maintenance holes shall be according to OPSS 1351.

**602.05.07 Adjustment Units**

Precast adjustment units shall be according to OPSS 1351 and as specified in the Contract Documents.

**602.05.08 Frames with Covers**

Maintenance hole frames with covers shall be according to OPSS 1850 and the Contract Documents.

Frames with covers for handholes shall be cast ferrous alloy according to ASTM A 48, Class No. 30 C, and the Contract Document.

**602.05.09 Pulling Irons**

Pulling irons for cast-in-place maintenance holes shall be galvanized wrought steel according to CSA C83, Item C83.48.

Pulling irons for precast concrete maintenance holes shall be 20 mm diameter, 200 mm long galvanized steel straight thimble eye bolts with heavy square nuts, and 100 x 100 x 10 mm square washers according to CSA C83, Items C83.65 and C83.30, No. 3.

**602.05.10 Drain Pipe and Fittings**

Drain pipe and fittings shall be 100 mm diameter non-perforated, corrugated high density polyethylene, according to BNQ 3624-115.

Plugs shall be polyethylene according to C22.2 No. 42.

Corrugated steel end sections and fittings shall be according to OPSS 1801.

Rodent gates shall be galvanized according to CSA G164.

**602.05.11 Mortar**

Mortar shall consist of a mixture of one part Portland cement according to OPSS 1301 and two parts mortar sand according to OPSS 1004, wetted with sufficient water to make the mixture plastic. Water shall be according to OPSS 1302. Air entrainment shall be 12%.

**602.05.12 Waterproofing**

Waterproofing material shall be emulsified asphalt, anionic slow-setting type according to OPSS 1103.

**602.05.13 Grounding Materials**

Grounding materials shall be according to OPSS 609.

**602.05.14 Granular Material**

Granular material for bedding and backfill shall be according to OPSS 1010.

**602.05.15 Flexible Utility Marker**

Flexible utility marker shall be according to the Contract Documents.

**602.07 CONSTRUCTION**

**602.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

Electrical chambers of the type specified in the Contract Documents shall be installed on firm foundations at the locations and to the elevations specified in the Contract Documents and shall be constructed plumb and true to alignment.

The top of structures shall be installed below the final grade to allow for the placing of adjustment units to facilitate the placing of the top of the frame with grate or cover to the final grade.

Flexible utility markers for electrical chambers shall be installed at locations specified in the Contract Documents.

**602.07.02 Removals**

Removals shall be according to OPSS 610.

**602.07.03 Site Preparation**

Site preparation shall be according to OPSS 490.

**602.07.04 Preservation and Protection of Existing Facilities**

Preservation and protection of existing facilities shall be according to OPSS 491.

**602.07.05 Cold Weather Work**

All work shall be protected from freezing. Structures shall not be installed on frozen ground.

**602.07.06 Transporting, Unloading, Storing, and Handling Materials**

Manufacturer's recommendations for transporting, unloading, storing, and handling of materials shall be followed.

Materials that are unsound or damaged shall be rejected.

**602.07.07 Excavating, Backfilling, and Compacting**

Excavating, backfilling, and compacting for the installation of electrical chambers shall be according to OPSS 402.

Earth shall be excavated to accommodate at least 300 mm of granular backfill around the outer walls of the unit. When specified in the Contract Documents, a drainage pocket or drainage facilities lower than the electrical chamber floor shall be excavated and backfilled with 19 mm clear crushed rock.

Earth shall be excavated for separate drainage pockets and drain pipes as specified in the Contract Documents.

Backfill around the walls of units shall be according to OPSS 402, except that acceptable native material may be used when any part of the electrical chamber is 1.5 m or more beyond the outside edge of the shoulder.

Backfill for electrical chambers installed in grassed areas shall be native backfill.

Granular backfill or unshrinkable backfill, or material approved by the Contract Administrator shall be used for electrical chambers within 1.5 m of the outside edge of the shoulder.

**602.07.08 Support Systems**

Support systems shall be according to OPSS 404.

**602.07.09 Dewatering**

Dewatering shall be according to OPSS 517.

**602.07.10 Electrical Chamber Drains**

Drainage facilities shall be as specified in the Contract Documents.

The drain pipe shall be installed as specified in the Contract Documents and according to OPSS 401. Holes in electrical chamber drains shall be formed by core drilling or other approved methods.

Ends of cut steel bars shall be coated with epoxy paste and the drain pipe shall be mortared in place so that it does not protrude into the structure cavity.

The drain pipe shall have a formed trap in all cases when drainage is connected to a storm sewer system.

The drain pipe shall be provided with a 150 mm diameter corrugated steel end section and rodent gate in all cases when drainage is connected to an embankment slope or ditch is specified. The drain pipe shall be inserted at least 300 mm into the end section.

Drain pipes shall be laid in a trench between 300 and 400 mm wide, with a minimum grade of 400H 1V. Sand bedding and backfill of 150 mm each shall be placed when the drain pipe is installed in rock.

#### **602.07.11 Installation**

##### **602.07.11.01 Electrical Maintenance Holes**

Maintenance holes shall be oriented so that ducts and duct bank entries have an angle of 90° between the maintenance hole wall and the axis of the ducts and duct bank. If this is not possible, the angle shall not be less than 45°.

Maintenance holes shall be oriented so that maintenance hole steps are placed on the maintenance hole wall nearest to the travelled edge of pavement.

All inside wall protuberances shall be ground smooth prior to installation of wiring baffles and mechanical supports for cables.

All liquid and debris shall be cleaned from the electrical chambers upon completion and prior to the acceptance of work by the Contract Administrator.

When the Contract Documents specify that a maintenance hole is to be constructed on existing runs of rigid duct, either direct buried, in steel liner, or concrete encased; the ducts, concrete encasement, reinforcing steel, and steel liners shall be cut back and removed to suit the maintenance hole dimensions. The Contractor may,

- a) construct a cast-in-place electrical maintenance hole around the duct structure and modify the duct after placing the maintenance hole, or
- b) cut the duct structure back to a minimum of 300 mm beyond the outer maintenance hole walls, install a precast unit, and reinstate ducts into the maintenance hole.

Pulling irons shall be mounted on all maintenance hole walls opposite to the rigid duct entry and, when specified in the Contract Documents, in the floor of the units, and centred under the cover opening. Pulling irons shall be installed as specified in the Contract Documents and before waterproofing the unit. When pulling irons are installed after concrete has been poured, a 22 mm diameter hole shall be drilled in the wall and an eyebolt installed with a square washer and nut on each side of the wall.

##### **602.07.11.01.01 Precast Electrical Maintenance Holes**

Precast maintenance holes shall be supplied to the depth specified in the Contract Documents or to the depths necessary to accommodate the depths of ducts, duct banks, or cable required to enter the precast unit. When the vertical location of ducts are adjusted for Utility clearance or drainage and a deeper maintenance hole is required, the additional depth may be obtained by additional courses of brick or precast adjustment units up to 255 mm depth.

Precast maintenance holes shall be installed on a level surface and then backfilled and compacted to maintain the specified unit plumb and true to the required alignment and grades.

Precast or mono bases shall be placed level. Subsequent sections, complete with joint seal systems, shall be installed according to the manufacturer's recommendations.

During installation, all duct openings and drainage facilities shall be fitted to the required orientation and location and all segmental sections, gaskets, and PVC waterstops shall be firmly seated.

Adjustment of the structure shall be carried out by lifting the affected sections free of the excavation, re-leveling the base, if necessary, and re-installing the sections. Damaged sections and gaskets shall be replaced.

Lift holes shall be plugged with mortar.

#### **602.07.11.01.02            Cast-In-Place Electrical Maintenance Holes**

Cast-in-place maintenance holes shall be cast plumb and true to the alignment and grades specified in the Contract Documents.

Concrete shall be placed, cured, protected, and finished according to OPSS 904. Steel reinforcement shall be placed according to OPSS 905.

Formwork for duct openings shall be accurately located to the dimensions specified in the Contract Document and shall consist of either non-metallic or removable forms. Ducts, duct banks, duct end bells, and liners shall be set in the framework prior to pouring concrete and shall be installed to provide an opening for later installation of these items.

#### **602.07.11.02            Electrical Handholes**

Electrical handholes shall be cast-in-place concrete handholes, precast concrete handholes, or prefabricated handholes made of semi-concrete or non-concrete materials.

Electrical handholes shall be installed plumb, true to alignment and grade, and firmly bedded on the drainage pocket backfill.

During installation, the duct entry holes shall be oriented in the required direction. The enlarging of duct entry holes is prohibited.

#### **602.07.11.02.01            Cast-In-Place Concrete Electrical Handholes**

Formwork for cast-in-place electrical handholes shall be secured to form a concrete envelope of uniform wall thickness and shall be set plumb and firmly bedded on the drainage pocket backfill. The cast iron frame and all ducts shall be installed in the formwork prior to pouring concrete.

Concrete shall be poured, cured, protected, and finished according to OPSS 904.

Outside formwork shall be removed to at least 150 mm below finished grade.

#### **602.07.12            Duct Entry Holes**

Duct entry holes shall be provided in the walls of electrical chambers in the orientation and number specified in the Contract Documents.

Any unused duct entry holes shall be firmly plugged from the inside with plastic plugs or, when waterproofing is specified, with mortar to the full thickness of the concrete walls.

When concrete encased duct banks are installed in maintenance hole units, the steel reinforcement of the duct bank shall be inserted 75 mm into the maintenance hole wall. The duct bank encasement shall be completely surrounded and bonded to the concrete wall. When direct buried rigid ducts, rigid ducts by subsurface installation or steel liners are installed in maintenance hole units, they shall be completely surrounded with concrete or grouted in place with mortar to the full thickness of the maintenance hole wall.

### **602.07.13                      Grounding**

Grounding shall be according to OPSS 609.

Metal cable racks and maintenance hole frames shall be connected to the system ground wire. When a ground rod is required at a maintenance hole, the system ground wire shall exit and re-enter the maintenance hole to enable ground rod connection as specified in the Contract Documents.

Grounding for handhole and maintenance hole covers shall be as specified in the Contract Documents.

### **602.07.14                      Waterproofing**

When specified in the Contract Documents, waterproofing material shall be applied to the outside walls, top, and adjustment units of concrete electrical chambers. For precast electrical chambers, the underside of the floor slab shall have a similar application. For cast-in-place electrical chambers, 300 µm polyethylene sheeting shall be installed between the underside of the floor and the bedding prior to pouring concrete. All holes not used shall be grouted with mortar.

Waterproofing material shall be applied at the rate of 0.8 L/m<sup>2</sup> of surface.

### **602.07.15                      Installation of Adjustment Units**

The installation of precast adjustment units shall be according to OPSS 407 and as specified in the Contract Documents.

### **602.07.16                      Installation of Frames and Covers**

Frames with covers shall be installed according to OPSS 407 and as specified in the Contract Documents.

Maintenance hole covers and gaskets shall be secured as specified in the Contract Documents.

Cast iron frames for handhole covers shall be adjusted to the required elevation and crossfall. Mortar shall be used to smooth out any edges protruding above the concrete envelope.

Cast iron covers for handholes shall be secured as specified in the Contract Documents.

Covers for prefabricated handholes shall be firmly seated according to the manufacturer's instructions.

### **602.07.17                      Adjusting and Rebuilding Electrical Chambers**

The adjusting and rebuilding of existing electrical chambers shall be according to OPSS 408 and as specified in the Contract Documents.

### **602.07.18                      Quality Control**

#### **602.07.18.01                  Pre-Installation Testing and Inspection**

Electrical chambers and chamber drain components shall be inspected prior to installation to ensure that they are according to the Contract Documents.

Certification from the manufacturer that the product is according to the Contract Documents shall be submitted to the Contract Administrator.

**602.07.18.02                      Pre-Installation Strength Testing of Semi-Concrete and Non-Concrete Handholes**

Ten percent of the handholes shall be selected for strength testing. For each handhole selected, the handhole shall be placed on a flat surface with only the bottom of the handhole in contact with the ground. No external support shall be provided for the sides of the handhole. A weight of 2,000 kg shall be placed on top of the handhole for ten minutes. At the end of each test, the handhole shall be inspected. The handhole shall not exhibit any signs of cracking or deformation. If the handhole is deformed, cracked, or damaged in any way, it shall be considered failed and shall be replaced. If one or more handholes fail, then another 10% of the handholes shall be selected and tested. If one or more of those handholes fail, then all of the handholes shall be tested.

The results of the strength testing shall be submitted to the Contract Administrator.

**602.07.18.03                      Electrical Chamber Installations**

The Contractor shall ensure that the following are according to the requirements specified in the Contract Documents:

- a) Properly seated and aligned to a plumb position.
- b) Type of backfill.
- c) Compaction of backfill.
- d) All unused holes and spaces are filled.
- e) Waterproofing has been correctly applied.
- f) All frames and covers are secured and adjusted to grade.

**602.07.19                          Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except that the work shall include the removal of the installations when they are no longer required.

**602.07.20                          Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

**602.09                              MEASUREMENT FOR PAYMENT**

**602.09.01                          Actual Measurement**

**602.09.01.01                      Electrical Maintenance Holes  
Electrical Handholes**

For measurement purposes, a count shall be made of the number of complete electrical chambers installed.

**602.09.01.02                      Adjusting and Rebuilding Electrical Chambers**

For measurement purposes, a count shall be made of the number of electrical chambers adjusted or rebuilt.

**602.09.01.03                      Electrical Chamber Drains**

Measurement of electrical chamber drains shall be by length in metres along the horizontal centreline of the drain pipe from the centre of the electrical chamber to the centre of the drainage pocket, storm sewer structure, storm sewer pipe, or concrete culvert or outlet end of the drain terminating at an embankment slope or ditch.

**602.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**602.10                      BASIS OF PAYMENT**

**602.10.01                      Electrical Maintenance Holes - Item  
Electrical Handholes - Item  
Adjusting and Rebuilding Electrical Chambers - Item  
Electrical Chamber Drains - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**602.10.02                      Electrical Maintenance Holes, Temporary - Item  
Electrical Handholes, Temporary - Item  
Electrical Chamber Drains, Temporary - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Progress payment for temporary installation of above tender items shall be based on the following percentages of the Contract price:

80% for supply and installation

20% for removal

**602.10.03                      Rock Excavation for Trenches and Associated Structures**

Payment for rock excavation for trenches and associated structures shall be according to OPSS 403.

**Note: The PROV published in November 2017 replaces OPSS 603 COMMON, November 2015 with no technical content changes.**

#### **603.01 SCOPE**

This specification covers the requirements for the installation of flexible ducts, rigid ducts concrete encased, rigid ducts direct buried, rigid ducts by subsurface installation, rigid ducts steel encased by subsurface installation, and surface mounted duct systems. This specification also covers the requirements for rock excavation for all electrical work.

#### **603.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

## **603.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Electrical Junction Boxes** means surface mounted or embedded boxes for use with electrical wirings or devices.

**Horizontal Directional Drilling (HDD)** means directional boring or guided horizontal boring.

**Rock** means as defined in OPSS 206.

**603.05 MATERIALS**

**603.05.01 Concrete**

Concrete shall be according to OPSS 1350 with a nominal 28-Day compressive strength of 20 MPa.

**603.05.02 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

**603.05.03 Sand Bedding**

Sand bedding shall consist of sand conforming to the gradation requirements of mortar sand according to OPSS 1004.

**603.05.04 Fish Line and Trace Wire**

Fish line shall be nylon or polypropylene material with a minimum test strength of 400 N. Trace wire shall be minimum #12 AWG copper wire, green insulation.

**603.05.05 Steel Liner**

Steel liner shall be according to OPSS 1802.

**603.05.06 Mortar**

Mortar shall consist of a mixture of one part Portland cement according to OPSS 1301 and two parts mortar sand according to OPSS 1004, wetted with sufficient water to make the mixture plastic. Water shall be according to OPSS 1302. Air entrainment shall be 12%.

**603.05.07 Unshrinkable Backfill**

Unshrinkable backfill shall be according to OPSS 1359.

**603.05.08 Ducts and Fittings**

Ducts and fittings shall be according to the applicable standards shown in Table 1.

For surface mounted duct systems when runs of ducts exceed 50 m, rigid ducts and fittings shall be of regular wall thickness with watertight reinforced thermosetting resin conduit (RTRC) duct. Hanger support systems shall consist of galvanized steel supports and fibreglass tubular spacers with galvanized steel hardware. Support systems shall allow for multiple sizes of duct in each horizontal layer.

For surface mounted duct systems when runs of ducts are 50 m and under, they shall be rigid polyvinyl chloride (PVC) conduit or rigid galvanized steel conduit.

Ducts for HDD shall be solvent-free, mechanical spline connected with hydraulic seal, and rigid PVC ducts certified to CSA C22.2 No. 211.2.

**603.05.09 Marker Tape**

Marker tape shall be 75 mm wide polyethylene (PE) or copolymer material, colour red, with repeating black lettering "Caution - Buried Electric Line" or a similar message.

### **603.05.10 Concrete Anchors**

Concrete anchors for surface mounted duct systems shall be of the epoxy resin system type when runs of ducts exceed 50 m. When runs are 50 m or less, the anchors shall be either of the epoxy resin type or metal expansion anchors. Each anchor shall have a minimum pullout strength of 60 kN for an embedment depth of 200 mm or less.

## **603.07 CONSTRUCTION**

### **603.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

Ducts shall be installed as specified in the Contract Documents.

Ducts for communication cables shall be installed in trenches with varying depth so that drainage is provided. A minimum depth of cover of 450 mm may be used in flat terrain in order to ensure that the ducts slope towards a maintenance hole. When the terrain allows natural drainage due to its slope, the depth of cover shall be 550 mm.

Non-metallic ducts installed and used when exposed to direct rays of the sun shall be specifically approved for the purpose and be marked (e.g., "SR," "Outdoor," "RTRC Type AG") according to the Ontario Electrical Safety Code.

Wobble joint fittings with expanded polystyrene bedding shall be installed when direct buried rigid ducts terminate at concrete structures such as electrical maintenance holes, footings, bridge structures, retaining walls, and duct banks.

### **603.07.02 Protection During Construction**

When ducts are installed prior to placing roadbed granular materials, the ducts shall be protected with a minimum cover of 300 mm of compacted backfill material.

### **603.07.03 Removals**

Removals shall be according to OPSS 610.

### **603.07.04 Locating Existing Ducts**

The Contractor shall locate all existing ducts requiring modification or usage.

### **603.07.05 Excavation**

#### **603.07.05.01 General**

Trenches shall be excavated to the widths, depths, and alignment as specified in the Contract Documents. Such dimensions may be adjusted to obtain proper clearances with Utilities or other works.

The trench bottom shall be free of sharp rock fragments or debris and uniformly graded to support the ducts.

#### **603.07.05.02 Earth Excavation**

When unsuitable earth material is encountered in the trench bottom, it shall be removed and replaced with suitable material, as directed by the Contract Administrator.

The trench bottom shall be undisturbed earth or suitable imported material compacted according to OPSS 501.

When trenches are to be constructed prior to the completion of final grades, the Contractor may excavate trenches to give a minimum temporary cover of 300 mm for the ducts.

#### **603.07.05.03                      Rock Excavation for Electrical Installations**

Rock excavation for the installation of ducts shall be according to OPSS 206.

#### **603.07.06                              Flexible Ducts**

Flexible ducts shall be laid loosely in the trench to allow for expansion and contraction. Ducts shall be installed free of kinks or flattening and without sharp objects in the trench.

Couplings used for flexible ducts made of PE shall be PVC serrated couplings or shall consist of a 450 mm piece of the duct, one size larger than the flexible duct, slotted, and centred over the butted joint and securely fastened using stainless steel strapping. When PE pipe is used, pulling points for cable shall be similarly constructed.

For the PE flexible ducts for communication fibre-optic cable, installation of runs between maintenance holes up to 120 m in length shall be done with a single run of non-spliced duct. For runs up to 240 m in length, one splice is allowed. For runs exceeding 240 m, one splice per 120 m maximum is allowed. Such duct splices shall be fully waterproofed using silicon sealant and plasticized waterproofing sealant and shall be inspected by the Contract Administrator prior to backfilling.

Couplings used for flexible ducts made of electrical non-metallic tubing (ENT) shall be according to manufacturer's drawings or instructions. When ENTs are used, pulling points for cable shall be at the electrical chambers.

High density polyethylene (HDPE) couplings shall be used for HDPE duct and shall be according to manufacturer's drawings or instructions. When HDPE ducts are used, pulling points for cable shall be at the electrical chambers.

Flexible ducts shall be installed so that stacking or crossovers within the trench are not required, except for the purpose of entering concrete encased rigid ducts or electrical chamber sleeves.

Flexible ducts shall be installed within all underpavement crossings not having an electrical chamber on each end.

At direct buried poles, flexible ducts shall be inserted into the wiring aperture and turned up to within 450 mm of the pole handhole.

At concrete footings for base mounted poles, flexible ducts shall be inserted through the sleeves to at least 750 mm above the foundation.

At entries to pad mounted substations and to pad mounted traffic signal controllers, flexible ducts shall be installed within the sleeves and cut off flush with the top of the sleeves. The void between the duct and the sleeve shall be sealed with an electrical sealant for pad mounted controllers.

When it is required to join flexible ducts with rigid ducts, serrated adapter couplings shall be installed.

When flexible ducts are brought into electrical chambers, the ducts shall remain free in the entry holes of handholes and grouted into entry holes of maintenance holes.

When flexible ducts are specified in the Contract Documents, the Contractor shall have the option of using rigid ducts of the same inside diameter.

#### **603.07.07                      Rigid Ducts, Concrete Encased**

Plastic spacers, suitable to the size and type of ducts and the duct separation specified in the Contract Documents, shall be installed along the trench bottom at 1.5 m maximum intervals. When transitions in grade are required, the trench bottom shall be adjusted to allow the spacers to seat firmly and hold any required duct bends.

Steel reinforcement shall be installed according to OPSS 905. Rods shall overlap by at least 60 mm and shall be tied to the plastic spacers. Lengths of duct shall be connected using couplings suitable to the size and type of duct. Couplings shall be staggered to obtain a minimum of 50 mm clearance between ducts or couplings. Ducts shall be tied to the spacers. The assembly shall be anchored securely to prevent shifting during placing of concrete.

Concrete may be poured directly into the trench or form work installed along the sides of the duct bank. The method of transporting, placing, and consolidating the concrete shall be such as to prevent segregation. Concrete placing and transporting devices shall not be supported by the steel reinforcement. Concrete shall be deposited within 1.5 m of its final position. Chutes shall have sufficient slope to deliver concrete of the approved consistency and shall have a maximum length of 15 m. When concrete is to be dropped more than 1.5 m, fully enclosed vertical drop chutes extending to the point of deposit shall be used. Concrete shall be placed at a steady rate such that a monolithic concrete is obtained without the formation of cold joints. The finish shall be raked or trimmed to produce a flat surface.

Rigid ducts shall be installed with a minimum slope of 400H:1V. Where deviations in vertical grade are required to avoid Utilities or other works, ducts shall be installed so that water cannot accumulate in the ducts.

Except where connections to electrical maintenance holes are required, rigid ducts and casing crossing paved areas shall extend 1.0 m beyond the back face of the curb or to the back edge of the shoulder.

When it is required to install transition sections between different types of rigid duct installations, the Contractor shall use deflection couplings or bend the ducts as required over a maximum of two standard duct lengths to obtain the required configuration.

#### **603.07.08                      Rigid Ducts, Direct Buried**

The trench bottom shall be shaped and uniformly graded to support the entire duct. Lengths of duct shall be connected using couplings suitable to the size and type of duct supplied.

#### **603.07.09                      Flexible and Rigid Ducts by Subsurface Installation**

Pits required for subsurface installation operations shall be set back a minimum distance from the edge of pavement or back of curb so that excavation is not done within a 1H:1V slope from the edge of pavement or back of curb to the bottom of the pit.

Bore holes shall only be 50 mm larger in diameter than the rigid duct being installed. When rigid ducts are being installed using the push-pull method, the steel rod shall be accurately aligned and pushed through the target pit. The push cap shall be replaced by a suitably sized expander unit and pulled back to the operating pit.

Lengths of duct shall be connected using couplings suitable to the size and type of duct supplied.

All temporary piling or supports used for boring or jacking equipment shall be removed or cut off to a minimum of 1.0 m below finished grade. All excavations or holes shall be backfilled and all temporary fill shall be removed.

When steel encasements are being installed using the boring and jacking method, the steel encasement shall be advanced so that the bore hole wall is supported by the steel encasement to within 300 mm of the head of the auger.

For HDD method, no drilling pit is required. Installation shall be according to the HDD machinery and duct manufacturers' guidelines and recommendations.

#### **603.07.10 Surface Mounted Duct Systems**

The Contractor shall not drill through bridge reinforcing steel. The Contractor shall locate reinforcing steel with a cover meter and position anchors accordingly.

For surface mounted duct systems, when the runs exceed 50 m horizontally:

- a) The installation of the support systems and ducts shall be carried out according to the duct manufacturer's installation procedures.
- b) Rigid ducts shall be installed parallel to the structural surfaces, either horizontally or vertically, using offset bends or fittings where changes in alignment are necessary.

For surface mounted duct systems, when runs are 50 m or less horizontally:

- a) Conduit fittings and junction boxes shall be installed in neat straight lines in the locations specified in the Contract Documents
- b) Rigid conduits shall be installed parallel to the structural surfaces, either horizontally or vertically, using offset bends or fittings where changes in alignment are necessary.

Appropriate fittings and deflection couplings shall be used for the installation. PVC boxes shall be mounted to provide the least interference with at least two stainless steel bolts and expansion anchors. Duct connection shall be cemented to the PVC box adapters.

Conduits shall be secured at intervals using conduit straps according to the Ontario Electrical Safety Code.

Conduit straps and junction boxes shall be fastened to concrete surfaces by drilling and inserting concrete anchors and securing the equipment with stainless steel bolts.

Conduit straps and junction boxes shall be fastened to steel structural members using stainless steel hardware.

#### **603.07.11 Utility Clearance**

When Utilities interfere with the specified elevation of any ducts, the Contractor shall notify the Contract Administrator to arrange inspection of the crossing point. The Contractor shall adjust the location of the ducts to obtain the clearance required and shall construct any concrete saddle or alternative protection approved by the Utility company.

#### **603.07.12 Breaking Into Concrete Structures**

When specified in the Contract Documents, the Contractor shall break into existing electrical chambers and existing substation or controller pads for installing ducts.

The space between the duct and the opening shall be filled with mortar.

#### **603.07.13                      Extension of Existing Duct Bank**

Extension of existing duct banks shall be as specified in the Contract Documents.

#### **603.07.14                      Cable and Duct Protection and Marking**

The Contractor shall install cable bricks or concrete protection at locations specified in the Contract Documents. Marker tape shall be installed along the centreline of the trench approximately 250 mm below finished grade or asphalt or concrete surfaces.

Cable brick shall be seated on uniformly graded and compacted material and butted end to end. Multiple rows of bricks shall be installed in trenches with direct buried high-voltage cables and when the width of the trench exceeds 300 mm.

Concrete protection shall be poured on uniformly graded and compacted material occupying the full width of the excavated trench to a minimum depth of 50 mm.

#### **603.07.15                      Termination**

All ducts shall be temporarily plugged or sealed until wiring is installed. All ducts with wiring installed that terminate in traffic signal control cabinets, Advanced Traffic Management Systems (ATMS) control cabinets, or distribution assemblies shall be sealed.

When ducts are specified in the Contract Documents as spare or intended for future use, the duct ends shall be plugged with plastic plugs.

#### **603.07.16                      Backfilling**

Except when unshrinkable backfill is used, backfilling shall be according to OPSS 401. Backfill material containing rock fragments and stone larger than 50 mm in diameter shall not be placed within 300 mm of the duct.

Sand bedding shall be placed in trenches for flexible duct when the trench bottom contains sharp rock fragments and when crossover of flexible ducts is required.

Backfill for concrete encased rigid ducts shall be placed at least 24 hours after pouring concrete.

Unshrinkable or granular backfill in trench for rigid ducts crossing paved areas shall extend to the wall of maintenance hole when maintenance holes are required; otherwise, 1.0 m beyond the back face of curb or, when there is no curb, to the back edge of shoulder.

#### **603.07.17                      End Marking**

The location of the ends of all ducts not terminating in electrical chambers or pole foundations shall be marked by a concrete marker that is flush with the finished grade and located 300 mm beyond the shoulder edge or by a 50 x 50 mm cut cross on curbs, sidewalks, or barriers. The marker shall have an impressed arrow indicating the position of the ducts.

Concrete 400 x 300 x 50 mm markers shall be installed over runs of ducts for communication cables deviating from a straight line. A marker shall be installed wherever a tangent section meets a circular section. When the circular section is more than 20 m in length, an intermediate marker shall be installed.

Concrete markers shall be installed within 72 hours of backfilling of the trench.

### **603.07.18 Fish Line and Trace Wire**

Fish line and trace wire shall be installed in all ducts specified in the Contract Documents as being spare or intended for future use. A 1.5 m length of fish line and trace wire shall extend out of each end of the duct beside the plastic plug, remain coiled, and tied in an accessible location.

### **603.07.19 Quality Control**

#### **603.07.19.01 Pre-Installation Testing and Inspection**

All ducts shall be inspected to ensure that they are as specified in the Contract Documents.

All ducts shall be inspected to ensure they are stamped with the appropriate CSA designation, strength, and type. During installation, all ducts shall be inspected to ensure they are properly bedded, have sufficient depth of cover, and are coupled or connected to electrical chambers, poles, or other devices as specified in the Contract Documents.

#### **603.07.19.02 Proof of Performance Testing and Inspection**

All ducts shall be inspected and tested to ensure that they are as specified in the Contract Documents. All ducts shall be tested to ensure that they are free of debris, water, breakage, or distortion.

### **603.07.20 Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except that the work shall include the removal of the installations when they are no longer required.

### **603.07.21 Site Restoration**

Site restoration shall be according to OPSS 492.

### **603.07.22 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **603.08 QUALITY ASSURANCE**

The Owner may perform field tests required for concrete according to OPSS 1350.

The Owner may perform tests for compaction according to OPSS 501.

## **603.09 MEASUREMENT FOR PAYMENT**

### **603.09.01 Actual Measurement**

- 603.09.01.01 Flexible Ducts**
- Rigid Ducts, Concrete Encased**
- Rigid Ducts, Direct Buried**
- Rigid Ducts by Subsurface Installation**
- Rigid Ducts, Steel Encased by Subsurface Installation**
- Flexible Ducts by Subsurface Installation**

Measurement of ducts shall be by length in metres horizontally along the longitudinal axis of the duct or trench; from centre to centre of poles, pole footings, electrical chambers, junction boxes, sign footings, and traffic signal controller cabinet pads; and to the face of bridge structures, retaining walls, and substation pads.

#### **603.09.01.02                      Rock Excavation for Electrical Installations**

Measurement of rock excavation shall be by volume in cubic metres based on the quantity of rock below the upper limit and within the theoretical lines specified in the Contract Documents. The upper limit is the existing rock surface as measured after removal of overburden, but prior to rock excavation or the lowest elevation of all other excavation specified in the Contract Document, whichever is lower.

The volume of boulders in an excavation shall be based on 3 maximum rectilinear dimensions. When boulders classified as rock are measured for payment, only the amount removed shall be considered for payment. The total volume of rock considered for payment shall not exceed the volume of excavation within the theoretical lines.

#### **603.09.01.03                      Surface Mounted Duct Systems**

Measurement of surface mounted duct systems shall be by length in metres horizontally along the duct, without deductions for junction boxes, from one point of attachment to other points of attachment.

#### **603.09.02                              Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurements.

### **603.10                                  BASIS OF PAYMENT**

- 603.10.01                      Flexible Ducts - Item**
- Rigid Ducts, Concrete Encased - Item**
- Rigid Ducts, Direct Buried - Item**
- Rigid Ducts by Subsurface Installation - Item**
- Rigid Ducts, Steel Encased by Subsurface Installation - Item**
- Rock Excavation for Electrical Installation - Item**
- Surface Mounted Duct Systems - Item**
- Flexible Ducts by Subsurface Installation - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

If the Contractor chooses to substitute flexible ducts with rigid ducts, payment for those rigid ducts shall be at the unit price bid for the tender item Flexible Ducts.

When drilling and blasting are required as a part of the work, progress payment shall be made according to OPSS 206.

The work of providing clearance for required Utility crossing shall be administered as Change in the Work.

- 603.10.02                      Flexible Ducts, Temporary - Item**
- Rigid Ducts, Concrete Encased, Temporary - Item**
- Rigid Ducts, Direct Buried, Temporary - Item**
- Rigid Ducts by Subsurface Installation, Temporary - Item**
- Rigid Ducts, Steel Encased by Subsurface Installation, Temporary - Item**
- Surface Mounted Duct Systems, Temporary - Item**

### **Flexible Ducts by Subsurface Installation, Temporary - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Materials to do the work.

Progress payment for temporary installation of the above tender items shall be based on the following percentages of the Contract price:

80% for supply and installation

20% for removal

**TABLE 1**

#### **604.01 SCOPE**

This specification covers the requirements for the installation of high-voltage, low-voltage, and extra low-voltage cables, including cable splicing and terminations.

#### **604.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

### Electrical Safety Authority (ESA)

Ontario Electrical Safety Code

### Others

Electrical and Utilities Safety Association of Ontario Rule Book

## 604.05 MATERIALS

### 604.05.01 General

All cables exposed to direct rays of the sun shall be approved for exposure to direct rays of the sun and shall be marked as such according to the Ontario Electrical Safety Code (e.g., SR and Sunlight Resistant).

### 604.05.02 High-Voltage Cables

#### 604.05.02.01 General

High-voltage cables shall be as specified in the Contract Documents.

### **604.05.03 Low-Voltage Cables**

#### **604.05.03.01 General**

Low-voltage multiconductor cables shall be according to CAN/CSA C22.2 No. 239.

Low-voltage single conductor cables shall be type RWU90 according to CSA C22.2 No. 38.

Low-voltage neutral supported cables with one, two, or three insulated aluminum conductors and ACSR neutral shall be 600 V type NS-90 and shall be according to CSA C22.2 No. 129.

Low-voltage multiconductor traffic signal cable shall be according to OPSS 2409.

#### **604.05.03.02 Conductors**

Conductors shall be insulated stranded copper and be according to CAN/CSA C22.2 No. 239.

### **604.05.04 Extra Low-Voltage Cables**

Extra low-voltage cables for use with traffic signal interconnection systems shall be according to IMSA No. 19-2.

Extra low-voltage cables for use with traffic signal actuation devices shall be according to OPSS 2410.

### **604.05.05 Messenger Cables**

Messenger cables shall be stranded galvanized steel according to CAN/CSA G12.

### **604.05.06 Hardware and Fittings**

Hardware and fittings for aerial cable installations shall be according to CAN/CSA C83.

### **604.05.07 Connectors**

Cable connectors shall be according to CSA C22.2 No. 65 and CSA C57.

### **604.05.08 Electrical Insulating Tape**

Electrical insulating tape shall be according to CSA C22.2 No. 197 and rated for 600 V and -10 to 90 °C working temperatures.

### **604.05.09 High-Voltage Splices and Terminations**

High-voltage splices, stress relief termination kits, potheads, and cable terminations shall be suitable for indoor or outdoor application as required; shall suit the size, type, and rating of cable used; and shall be according to the requirements of the power supply authority.

### **604.05.10 Low-Voltage Splices**

Low-voltage splices shall be of the type specified in the Contract Documents.

### **604.05.11 Sand Bedding**

Sand bedding shall consist of sand conforming to the gradation requirements of mortar sand according to OPSS 1004.

#### **604.05.12 Fish Line**

Fish line shall be nylon or polypropylene material with minimum test strength of 400 N.

#### **604.05.13 Cable Marking**

Minimum markings shall consist of manufacturer's name, size of conductor, voltage rating, temperature rating, and type of insulation.

Coloured coded SR rated cables shall be solid coloured or tri-stripe coloured cable and shall be approved according to the Ontario Electrical Safety Code.

### **604.07 CONSTRUCTION**

#### **604.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

#### **604.07.02 Removals**

Removal shall be according to OPSS 610.

#### **604.07.03 Excavation, Sand Bedding, Backfill, and Compaction**

Earth and rock excavation, sand bedding, backfill, and compaction for the installation of direct buried cables shall be according to OPSS 603.

#### **604.07.04 Cable Protection Bricks**

Cable protection bricks for direct buried cables shall be installed according to OPSS 603.

#### **604.07.05 Fish Line**

A fish line shall be installed in all ducts or conduits when traffic signal cables are installed. A 1.5 m length of fish line shall remain coiled, tied, and accessible in each pole handhole, electrical maintenance hole, junction box, and controller.

#### **604.07.06 Coils and Slack Cable**

When specified in the Contract Documents, coils of cable and slack cable shall remain for future extension by others. Coils shall be neatly taped and remain in a readily accessible location. Cable ends shall be sealed with heat shrink tubing boots.

A minimum 300 mm length of lighting and power cables shall remain at all accessible pulling points, splicing points, or cable termination points. A coil length of low-voltage, traffic signal, and extra low-voltage cables shall remain at all electrical maintenance holes and underground junction boxes so that a minimum of 1.0 m total length of cable may be pulled out above finished grade.

#### **604.07.07 Mechanical Support**

High-voltage cables passing through electrical maintenance holes shall be wall-mounted on porcelain saddles with galvanized steel cable racks and installed in locations specified in the Contract Documents.

Low-voltage and extra low-voltage cables passing through electrical maintenance holes shall be wall-mounted on galvanized steel cable racks where unsupported lengths of cable exceed 1.2 m. Bend radii shall be kept greater than the minimum recommended by the cable manufacturer and fastened with

mechanical supports, where required. All cable and duct expansion joints shall be accurately formed and mechanically supported as specified in the Contract Documents.

Cable splices shall be supported in a similar manner with racks positioned approximately 150 mm on each side of the splice and mounted between 400 and 600 mm below finished grade.

All cables shall be trained to the maintenance hole walls and supported on cable racks. Sufficient rack arms shall be provided to adequately support the cables. All cables shall be bundled neatly with black outdoor nylon cable ties and each circuit identified with vinyl marking bands.

Nylon or stainless steel mesh cable grips shall be installed to support vertical cable runs when the unsupported cable mass exceeds 25 kg.

#### **604.07.08 Barriers**

When specified in the Contract Documents, barriers shall be installed between high-voltage and low-voltage cables, between communication and power cables, and between cables with different disconnecting means. Barriers shall be according to the Ontario Electrical Safety Code.

#### **604.07.09 Low Temperature Handling**

Cables shall be warmed to at least 0 °C at point of installation prior to installation. Cable shall not be installed when the ambient temperature is below -25 °C.

#### **604.07.10 Cables in Ducts**

Cable shall be pulled through ducts using compatible cable lubricant, mechanical aids, and pulling cables or ropes as required. The pulling tension and sidewall bearing pressure (SWBP) shall not exceed the safe tension recommended by the cable manufacturer.

When intermediate pulling points are required for the installation of cables in flexible duct, the flexible duct shall be cut and spliced according to OPSS 603.

#### **604.07.11 Cables, Direct Buried**

Cables shall be installed in sand bedding using the cable spacing and depth specified in the Contract Documents. When it is necessary for cables to cross over other cables, a minimum depth of 100 mm of sand bedding material shall be placed between the cables at the point of crossing. When it is necessary for cables to cross Utilities, a minimum separation of 300 mm shall be maintained, above or below the Utility. Such separation shall be backfilled with sand bedding material and a minimum of three cable protection bricks shall be installed over the cables according to OPSS 603.

Marker tape shall be installed along the centreline of all trenches.

#### **604.07.12 Cables, Aerial**

Cables shall be tensioned to obtain the sag, clearance, and tension values specified in the Contract Documents for the particular installation temperature.

When specified in the Contract Documents, cables shall be installed on messenger cables. When lashing of cable to a messenger strand is required, a mechanical lashing machine shall be used to install single wound 1.14 mm diameter stainless steel lashing wires. In lieu of lashing wires, and when specified in the Contract Documents, black outdoor nylon cable ties may be used.

Drip loops and expansion loops shall be formed at each pole or conduit entry and held free of the pole or other cables and connections.

Cables shall be re-tensioned, as necessary, to maintain the required cable clearances.

All work shall be according to CAN/CSA C22.3 No. 1, the Ontario Electrical Safety Code, and the Electrical and Utilities Safety Association of Ontario Rule Book.

#### **604.07.13                      Splices and Terminations**

Cable splices and terminations shall be made at locations specified in the Contract Documents.

Ends of all insulated cables shall be sealed or capped to prevent the ingress of moisture prior to splicing or termination.

High-voltage cable splices and terminations shall be according to the manufacturer's recommendations for the rating and type of cable used.

Low-voltage cable splices for single-stranded conductors installed in electrical chambers shall be made with compression connectors and protected with waterproof covers. Waterproof splices shall be installed according to the manufacturer's recommendations.

Low-voltage and extra low-voltage cable splices for cable installed aerially or above ground shall be made with compression connectors protected with insulating covers.

Low-voltage and extra low-voltage cable splices shall be made by twisting the conductors together with a minimum 12 mm length overlap and connected by the installation of solderless connectors as specified in the Contract Documents. For inductive loop applications, connections shall be soldered. Above ground soldered splices shall be insulated with insulated boots.

All conductors, insulation, and jackets shall be carefully cleaned prior to installing connections, splices, or terminations. All ground shields, braids, or tapes shall be securely connected to a ground wire according to OPSS 609.

Low-voltage and extra low-voltage splices shall be made only in accessible locations such as electrical maintenance holes, junction boxes, and pole handholes.

Traffic signal conductors terminated in pole handholes shall be twisted together and provided with a watertight spring connector. Stranded conductors shall be connected to the terminal strips using the insulated fork tongue compression connectors. Solid conductors shall be connected directly to the terminal board.

#### **604.07.14                      Cable Systems**

The work of cable systems shall be as described in the Cables in Ducts; Cables, Direct Buried; Cables, Aerial; and Splices and Terminations subsections.

#### **604.07.15                      Quality Control**

##### **604.07.15.01                  General**

The Contract Administrator shall be given 24 hours notice of when tests are to be performed. The Contract Administrator may witness all tests and all splice installations.

Tests shall be performed at 500 V for cable insulation rated at less than 600 V and at 1,000 V for cable installation rated 600 V or greater.

#### **604.07.15.02 Pre-Installation Testing and Inspection**

Cables, splicing, and connection components shall be inspected prior to installation to ensure that they meet the requirements of the Contract Documents.

#### **604.07.15.03 Proof of Performance Testing and Inspection**

The Contractor shall ensure that all cables are installed, tested, and spliced as specified in the Contract Documents and that all cables are energized and in working order.

The test results shall be submitted to the Contract Administrator.

#### **604.07.15.04 High-Voltage Systems**

All high-voltage cable systems shall be checked upon completion of the installation of cables, splices, and terminations and prior to connection to switch gear or the source of energy. High potential tests shall be performed on all cables according to Table 1.

#### **604.07.15.05 Low-Voltage Systems**

Tests shall be limited to approximately 10% of the total cable system and shall be completed at random locations selected by the Contract Administrator. In the event of failure of any test, the Contract Administrator may choose another 10% of the system for further testing.

The following tests shall be performed prior to energizing the system:

- a) The continuity of selected cables shall be checked by means of an ohmmeter test.

Accumulated resistance shall not exceed the nominal resistance of the cable length, as specified by the cable manufacturer, plus an allowable resistance of 20% per splice or connection.

- b) Resistance to ground tests.

Leakage to ground of selected cables shall be checked by means of a megger test. Resistance to ground shall be 10 megohm or greater.

#### **604.07.15.06 Extra Low-Voltage Systems**

Continuity of all cables and connections shall be checked by means of an ohmmeter test prior to energizing the system. This test shall be completed with temporary jumpers installed to by-pass any active system elements or any passive DC blocking devices.

Cables shall be tested for leakage to ground by means of a megger test. Resistance to ground shall be 10 megohm or greater.

#### **604.07.16 Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except that the work shall include the removal of the installations when they are no longer required.

#### **604.07.17 Site Restoration**

Site restoration shall be according to OPSS 492.

**604.07.18 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

**604.09 MEASUREMENT FOR PAYMENT**

**604.09.01 Actual Measurement**

**604.09.01.01 Cable**

Measurement for cable shall be by length in metres horizontally along the longitudinal axis of the duct, trench, or aerial cable; from centre to centre of poles, pole footings, electrical chambers, junction boxes, sign footings, and traffic signal controller cabinet pads; and to the face of bridge structures, retaining walls, and substation pads.

**604.09.01.02 High-Voltage Terminations and Splices**

For measurement purposes, a count shall be made of the number of high-voltage splices and terminations completed, regardless of the type, size, or rating.

**604.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**604.10 BASIS OF PAYMENT**

#### **609.01 SCOPE**

This specification covers the requirements for the installation of electrical grounding equipment and grounding systems.

#### **609.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Construction**

|          |                                                                                            |

## **CSA Standards**

C22.2 No. 38-18                      Thermoset-Insulated Wires and Cables  
C22.2 No. 41-13 (R2017)        Grounding and Bonding Equipment  
G40.20/G40.21- 13 (R2018)    General Requirements for Rolled or Welded Structural Quality Steel/Structural Quality Steel  
G164-18                                Hot Dip Galvanizing of Irregularly Shaped Articles

## **ASTM International**

B 3-13 (R2018)        Soft or Annealed Copper Wire

## **Electrical Safety Authority (ESA)**

Ontario Electrical Safety Code

## **Underwriters Laboratories (UL)**

UL 467-March 2013        Grounding and Bonding Equipment

## **Others**

IEEE 837-2002        Standard for Qualifying Permanent Connections Used in Substation Grounding

## **609.05                      MATERIALS**

### **609.05.01                      Ground Rods**

Ground rods shall be solid steel, 19 mm diameter, 3 m long, copper clad for the full length and shall be according to CSA C22.2 No 41.

### **609.05.02                      Ground Plates**

Ground plates shall be hot dip galvanized solid steel, 600 x 600 x 10 mm minimum dimensions. Steel shall be according to CAN/CSA G40.20/G40.21, Grade 260W, and shall be galvanized according to CAN/CSA G164.

### **609.05.03                      Bare Ground Wire**

Bare ground wire shall be soft drawn stranded copper and shall be according to ASTM B 3.

### **609.05.04                      Insulated Ground Wire**

Insulated ground wire shall be stranded copper, insulation colour green and shall be according to CSA C22.2 No. 38, type RWU 90 - cross-link.

### **609.05.05                      Ground Connectors**

Moulded connectors shall consist of metallic alloys and fusible powder mixtures held in place by suitable moulds and connected using an exothermic type welding process. Physical requirements of the connection shall be according to CSA C22.2 No. 41.

Mechanical connectors shall be according to CSA C22.2 No. 41 or UL 467.

High pressure irreversible compression connectors shall be:

- a) Made of pure wrought copper extrusion.
- b) Made of the same material as the conductors.
- c) According to CSA 22.2 No. 41, UL 467, and IEEE 837.
- d) Connected according to the manufacturer's recommendations.
- e) Connected using a minimum compressive force of 100 kN and a minimum compressive pressure of 70 MPa.

High pressure irreversible compression connectors shall have crimp verification for the inspection and verification of CSA and UL compliance markings.

#### **609.05.06 Solder**

Solder shall be 60/40, tin/lead mix, resin core type.

#### **609.05.07 Sand Bedding**

Sand bedding shall consist of sand conforming to the gradation requirements of mortar sand according to OPSS 1004.

#### **609.05.08 Ducts and Fittings**

Ducts and fittings shall be as specified in the Contract Documents and approved according to the Ontario Electrical Safety Code.

### **609.07 CONSTRUCTION**

#### **609.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

All metallic components shall be connected to system ground.

All compaction shall be according to OPSS 501.

#### **609.07.02 Removals**

Removals shall be according to OPSS 610.

#### **609.07.03 Excavation and Backfill**

Earth and rock excavation and backfill shall be according to OPSS 603.

#### **609.07.04 Ground Wire in Ducts**

Ground wire shall be pulled through ducts using cable lubricant, mechanical aids, and pulling cables or ropes as required. The pulling tension shall be according to the cable manufacturer's specifications.

#### **609.07.05                      Ground Wire, Direct Buried**

When ground wire crosses over direct buried cables, a minimum depth of 100 mm of sand bedding material shall be placed between the ground wire and the buried cables at the point of crossing.

When ground wire does not share a common trench with ducts or direct buried cable, the ground wire shall be installed at a minimum depth of 600 mm below finished grade.

#### **609.07.06                      Ground Wire on Poles or Open Surfaces**

Ground wire installed on concrete or metal poles shall be run in rigid duct. Ground wire installed on wooden poles shall be run in protective moulding or in rigid duct. In both cases, the conduit or moulding shall be aligned in straight runs complementing the taper of the pole.

Conduit shall be mechanically fastened to wooden poles using PVC conduit clamps and galvanized lag screws. Moulding shall be mechanically fastened to wooden poles using galvanized steel staples. Stainless steel strapping shall be installed to secure conduit on concrete or metal poles.

When ground wire is to be installed on a concrete surface, the concrete shall be drilled to accommodate expandable metal anchors for nylon cable clamps held in place with stainless steel bolts. For installation on wooden surfaces, galvanized steel staples shall be installed. For installation on metal surfaces, nylon cable clamps and stainless steel screws or bolts, nuts, and washers shall be installed. The ground wire shall be installed in straight, neat lines and shall be supported at maximum intervals of 450 mm.

#### **609.07.07                      Ground Wire in Electrical Chambers or Enclosures**

Ground wires in electrical chambers and enclosures shall be trained towards the structure walls with bend radii greater than the minimum recommended by the cable manufacturer. Ground wires shall be fastened with mechanical supports when required.

Ground wire in electrical chambers shall be connected to ground lugs attached to the frame. For electrical chambers with metallic covers and non-metallic frames, the ground wire shall be connected to the ground lugs attached to the cover. Ground wire in electrical enclosures shall be connected to the ground lug provided.

#### **609.07.08                      Ground Wire Connections**

Ground connectors shall be used on all ground wire connections. All surfaces shall be cleaned to bare metal prior to making ground connections.

Moulded connectors or high pressure irreversible compression connectors shall be used at pad mounted electrical-electronic equipment, power supply locations, and all locations where the ground connectors are direct buried or inaccessible.

Messenger cables shall be grounded using compression connectors.

#### **609.07.09                      Coils of Ground Wire**

Coiled ground wire shall be left at the locations shown in the Contract Documents. Coils shall be neatly taped and left in a safe readily accessible location.

#### **609.07.10                      Ground Electrodes**

##### **609.07.10.01                  General**

The installation of ground electrodes shall be according to the Ontario Electrical Safety Code.

The work for ground electrodes shall include the work to install ground rods, ground plates, and the associated work described in this specification.

When bedrock, rock fill, or similar materials unsuitable for driving ground rods are encountered at depths of 450 mm to 2.0 m below finished grade, the ground rod shall be replaced with a ground plate.

When bedrock, rock fill, or similar materials are encountered at less than 450 mm below finished grade, the ground electrode shall be installed at a different location when driving of a ground rod or installation of a ground plate is possible.

#### **609.07.10.02                      Ground Rods**

Ground rods shall be driven in a vertical position when soil conditions allow. When rocks, stones, or similar materials are encountered, ground rods may be driven at a maximum angle of 45° to the vertical.

#### **609.07.10.03                      Ground Plates**

Ground plates shall be installed on a minimum 150 mm thick compacted bed of suitable native earth material over rock.

#### **609.07.11                              Bonding Jumpers**

The work for bonding jumpers shall include the work described for ground wire on poles or open surfaces, and ground wire connections.

#### **609.07.12                              Grounding Systems**

The work included shall be as described for ground wires, ground electrodes, and bonding jumpers.

#### **609.07.13                              Quality Control**

##### **609.07.13.01                      Pre-Installation Testing and Inspection**

Grounding cables, bonding jumpers, ground electrodes, and connection components are to be inspected prior to and during installation to ensure that they meet the requirements of the Contract Documents.

##### **609.07.13.02                      Proof of Performance Testing and Inspection**

All system and components grounding shall be inspected and tested to ensure that they meet the requirements of the Contract Documents. All electrical grounding connections and splices shall be inspected to ensure they have been properly installed.

At pad and pole mounted power supply locations, the resistance to ground of the grounding grid shall be tested and measured in the presence of the Contract Administrator. A written notice shall be submitted to the Contract Administrator five Business Days prior to the testing with the date, time and location for each testing.

The measurements shall be undertaken under dry soil conditions and when frost penetration does not exceed 150 mm. Readings shall not exceed 25 ohms. In soils of low conductivity, additional ground rods, ground plates, and ground wires shall be added, as required. Copies of all test documentation shall be submitted to the Contract Administrator.

A Request to Proceed shall be submitted to the Contract Administrator after completion of the proof of performance testing and inspection.

The next operation after the proof of performance testing and inspection shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

**609.07.14 Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except the work shall include the removal of the installations when they are no longer required.

**609.07.15 Restoration**

Site restoration shall be according to OPSS 492.

**609.07.16 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**609.09 MEASUREMENT FOR PAYMENT**

**609.09.01 Actual Measurement**

**609.09.01.01 Ground Wires**

Measurement for ground wire shall be by length in metres horizontally along the longitudinal axis of the duct or trench, or open surface, from centre to centre of poles, pole footings, electrical chambers, or enclosures; sign footings; controller cabinet pads, and ground electrodes; or the face of bridge structures, retaining walls, and substation pads.

**609.09.01.02 Ground Electrodes**

For measurement purposes, a count shall be made of the number of ground electrodes installed.

**609.09.01.03 Bonding Jumpers**

For measurement purposes, a count shall be made of the number of bonding jumpers installed.

**609.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**609.10 BASIS OF PAYMENT**

**609.10.01 Ground Wires - Item  
Ground Electrodes - Item  
Bonding Jumpers - Item  
Grounding Systems - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract contains separate items for the work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

**609.10.02**                      **Ground Wires (Temporary) - Item**  
                                         **Ground Electrodes (Temporary) - Item**  
                                         **Bonding Jumpers (Temporary) - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Progress payment for temporary installation of the above tender items shall be based on the following percentages of the Contract price:

80% for supply and installation  
20% for removal

**609.10.03**                      **Rock Excavation for Electrical Installation**

Payment for rock excavation for electrical installation shall be according to OPSS 603.

## **CONSTRUCTION SPECIFICATION FOR REMOVAL OF ELECTRICAL EQUIPMENT AND MATERIALS**

### **APPENDICES**

|              |                   |
|--------------|-------------------|
| <b>610-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **610.01 SCOPE**

This specification covers the requirements for demolition, salvage, and removal, either completely or partially, of electrical equipment and materials.

#### **610.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **610.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **610.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

|          |                                                                                        |
|----------|----------------------------------------------------------------------------------------|
| OPSS 492 | Site Restoration Following Installation of Pipes, Utilities, and Associated Structures |
| OPSS 510 | Removal                                                                                |

## **610.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **610.04.01 Submission Requirements**

#### **610.04.01.01 Operations Plans**

An operations plan shall be submitted to the Contract Administrator a minimum of 3 weeks prior to the commencement of polychlorinated biphenyl (PCB) related activities. The plan shall describe the overall approach to the work and include the following:

- a) Operational methodologies.
- b) Work area delineation and security details.
- c) Environmental impact management, such as spill prevention and containment and emergency response plan.
- d) Contamination control.

- e) Equipment and area decontamination procedures.
- f) Ontario Ministry of the Environment and Climate Change (MOECC) Compliance Approval numbers as applicable for transportation and transfer facilities.

PCB wastes and PCB related wastes to be moved to a transfer facility shall be included in the operations plan with details regarding their eventual transport to a disposal facility for destruction.

## **610.07 CONSTRUCTION**

### **610.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

Demolition, salvage, and removal of electrical equipment and materials shall be as specified in the Contract Documents.

The Contractor shall acquire all releases and agreements necessary to do the work.

### **610.07.02 Timing of Work**

Existing electrical systems required to continue in-service shall remain functional during construction operations until new or modified systems are operational.

### **610.07.03 Removal**

Removal of non-electrical material and objects required for the removal of electrical equipment and material shall be according to OPSS 510.

Electrical concrete structures shall be removed to a minimum of 1.0 m below finished grade.

Where partial removal of pavement, sidewalk, curb and gutter, or other structures is required for removal of electrical equipment, the broken edges of the object to remain in place shall be squared up and trimmed along straight lines at a minimum distance of 300 mm from any area disturbed by removal operations.

Steel reinforcement, conduits, ducts, wires, and debris associated with the removed portions of such structures shall be removed for disposal.

### **610.07.04 Demolition**

Demolition of concrete, brick, timber, and masonry structures, including pole footings, equipment pads, concrete poles, and substation buildings shall be carried out in such a manner and with such equipment as not to disturb adjacent pavement, Utilities, other works, or electrical equipment and material to remain in place and with such care as to leave material designated to be salvaged in an undamaged condition.

### **610.07.05 Luminaires**

Prior to removing luminaires, all lamps and glass shall be removed.

### **610.07.06 Cables and Conduits**

Underground cables shall be completely removed and conduit systems shall be cut back to a depth of 600 mm below finished grade and abandoned in place.

#### **610.07.07 Transformers**

Transformers containing PCBs, including all internal components, and all PCB related wastes shall be removed and managed as subject waste as specified in the Contract Documents.

Transformers not containing PCBs shall be removed, salvaged, and transported to storage sites specified in the Contract Documents.

#### **610.07.08 Temporary Installations**

Equipment and materials supplied by the Contractor for use with temporary installations shall be removed. Equipment and materials supplied by the Owner for use with temporary installations shall be removed and salvaged as specified in the Contract Documents.

#### **610.07.09 Salvage of Equipment**

##### **610.07.09.01 Damages**

Prior to removal operations, the Contract Administrator shall be notified of any equipment that is broken or deteriorated to the point where salvage is not practical.

Equipment and materials damaged through improper handling or through loss after removal shall be repaired or replaced at no additional cost to the Owner.

##### **610.07.09.02 Packaging of Electrical Equipment and Materials**

Electrical equipment and materials that has been removed shall be packed for protection against damage.

All equipment or material in excess of 100 kg shall be securely mounted on wooden pallets suitable for handling by forklift trucks.

##### **610.07.09.03 Shipping of Salvaged Electrical Equipment and Materials**

All salvaged equipment and materials shall be loaded, transported, and unloaded at the sites specified in the Contract Documents.

Delivery to any Owner unloading sites shall be made between 09:00 and 15:30, local time. The Contract Administrator shall be notified 3 Business Days in advance of delivery to the Owner's unloading sites.

#### **610.07.10 Quality Control**

##### **610.07.10.01 Pre-Removal Testing and Inspection**

Components specified for removal shall be inspected prior to removal. If the components are to be salvaged for reuse within the Working Area or for storage at the Owner's premises, the Contractor shall make a list of any imperfections of those components and shall submit the list to the Contract Administrator 3 Business Days prior to the commencement of removal.

##### **610.07.10.02 Proof of Performance Testing and Inspection**

The removal work shall be inspected to ensure that all electrical removals have been carried out and that all components requiring disposal at approved sites have been completed so that no such materials remain on the Owner's lands.

**610.07.11                      Site Restoration**

Site restoration shall be according to OPSS 492.

**610.07.12                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**610.10                              BASIS OF PAYMENT**

**610.10.01                      Removal of Electrical Equipment - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Work required to salvage and transport liquid type transformers shall be administered as a Change in the Work.

**Appendix 610-A, November 2016**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

### **611.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **611.04.01 Submission Requirements**

A photometric test report shall be submitted for each photometric curve used in the luminaires to be installed under the Contract. The testing and test reports for high intensity discharge (HID) luminaires (e.g., high pressure sodium) shall be according to IESNA LM-63. The testing and test reports for LED luminaires shall be according to IESNA LM-79. The testing and test reports shall be completed by an independent laboratory or a National Voluntary Laboratory Accreditation Program (NVLAP) accredited laboratory, which is accredited for testing the type of luminaire to be installed under the Contract (i.e., accredited for IESNA LM-63 for HID luminaires or IESNA LM-79 for LED luminaires). Each test report shall be dated and signed. The test reports shall be submitted to the Contract Administrator prior to the commencement of fabrication.

### **611.05 MATERIALS**

#### **611.05.01 Luminaires**

Underpass luminaires shall be according to OPSS 2434 and the Contract Documents.

#### **611.05.02 Lamps**

Lamps shall be clear or coated as specified in the Contract Documents and shall meet the requirements of ANSI C78.380.

#### **611.05.03 Low-Voltage Cables**

Single conductor low-voltage cables for use in conduit systems shall be according to OPSS 604.

Low-voltage cable for entry to luminaires shall be single conductor stranded copper and shall be according to CSA C22.2 No. 49, Type GTF.

#### **611.05.04 Wire Connectors**

Wire connectors shall be of the insulated spring or compression type and shall be according to CAN/CSA C22.2 No. 65.

#### **611.05.05 Ground Wire**

Ground wire shall be Type GTF.

#### **611.05.06 Fuses**

Fuses shall be according to CSA C22.2 No. 248.8, 600V, 10 amps rating.

#### **611.05.07 Ducts and Fittings**

Non-metallic flexible liquid-tight ducts and connectors shall be according to CAN/CSA C22.2 No. 227.2.1.

#### **611.05.08 Tape**

Electrical insulating tape shall be according to CSA C22.2 No. 197 rated for 600 V and -10 to 90 °C working temperature.

#### **611.05.09 Luminaire Mounting Brackets**

Luminaire brackets shall be steel according to CSA G40.20/G40.21, Grade 260W, and shall be hot dip galvanized according to CSA G164.

Welding of members shall be carried out according to CSA W59.

#### **611.05.10 Protective Guard**

The luminaires shall be supplied with the luminaire manufacturer's protective guard as specified in the Contract Documents.

### **611.07 CONSTRUCTION**

#### **611.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

The work for the installation, replacement, or relamping of the luminaires shall include all required hardware and fixtures to ensure operation of the unit.

#### **611.07.01.01 Ordering Luminaires**

Immediately following the award of the Contract, the Contractor shall order the luminaires as required for this Contract.

The Contractor shall obtain verification of the delivery dates of the luminaires from the supplier and notify the Contract Administrator of the delivery dates within 72 hours after the award of the Contract.

The Contractor shall ensure timely and accurate communication with both the Owner and the supplier regarding the delivery, schedules, and requirements for the luminaires.

Delivery and off-loading of the luminaires shall be completed in a timely and efficient manner.

#### **611.07.02 Removals**

Removals shall be according to OPSS 610.

#### **611.07.03 Surface-Mounted Ducts**

Non-metallic, flexible, liquid-tight ducts and connectors shall be used for connecting the underpass luminaires to the closest junction boxes as specified in the Contract Documents.

Surface-mounted ducts shall be installed according to OPSS 603.

#### **611.07.04 Luminaire Mounting Brackets**

When specified in the Contract Documents, the luminaries shall be installed on mounting brackets.

Luminaire mounting brackets shall be fastened to concrete surfaces by drilling and inserting metal expansion anchors and securing the bracket with 10 mm diameter stainless steel machine bolts and lock washers.

Luminaire mounting brackets shall be fastened to steel structural members as specified in the Contract Documents, using stainless steel hardware.

The luminaire mounting bracket shall be fastened to the surfaces to allow the level installation of the luminaire.

#### **611.07.05 Wiring**

Wiring shall be installed according to OPSS 604. Each luminaire shall be individually protected with a fuse. The fuse shall be located either in the junction box or in the luminaire. All connectors shall be insulated and secured with tape.

Each luminaire shall be wired with Type GTF conductors connected to the ballast leads with insulated spring connectors secured with tape. GTF conductors shall be connected to the underpass lighting circuits in the junction box with insulated spring connectors secured with tape.

#### **611.07.06 Grounding**

Underpass luminaires shall be connected to the system ground according to OPSS 609.

#### **611.07.07 Installation of Luminaires**

Luminaires shall be protected from conditions where moisture or dirt could damage the ballasts or reflecting surfaces of the optical system.

Luminaires shall be mounted on concrete surfaces specified in the Contract Documents by drilling and inserting metal expansion anchors and securing the luminaires with 10 mm diameter stainless steel machine bolts, lock washers, and PVC spacers.

Luminaires shall be mounted on the steel structural members specified in the Contract Documents, using stainless steel hardware.

All underpass luminaires are to be installed level using stainless steel hardware.

The luminaire reflector and refractor shall be thoroughly cleaned prior to installing lamps.

The wire guard and housing hardware shall be securely fastened in place.

#### **611.07.08 Replacing Luminaires**

When specified in the Contract Documents, existing luminaires, associated flexible conduit, and wiring shall be removed and new luminaires, associated flexible conduit, fittings, and wiring shall be installed.

When new luminaires are of a different style than the existing luminaires, new concrete anchors or mounting hardware shall be installed.

#### **611.07.09 Relamping**

Existing lamps shall be removed, the luminaires thoroughly cleaned, and new lamps installed.

#### **611.07.10 Quality Control**

##### **611.07.10.01 Pre-Installation Testing and Inspection**

Luminaires, brackets, socket setting, refractor type, and ballast type shall be inspected to ensure they meet the requirements of the Contract Documents.

A Request to Proceed shall be submitted to the Contract Administrator after completion of the pre-installation testing and inspection.

The next operation after the completion of the pre-installation testing and inspection shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

##### **611.07.10.02 Proof of Performance Testing and Inspection**

Luminaires shall be inspected and tested to ensure that they meet the requirements of the Contract Documents. All luminaires shall undergo a minimum burning-in period of 100 consecutive nighttime hours prior to acceptance of the work by the Contract Administrator. For daytime tunnel illumination systems, the burning-in period shall be 100 consecutive daytime hours.

Low-voltage system tests required on the wiring system shall be performed according to OPSS 604.

A Request to Proceed shall be submitted to the Contract Administrator after completion of the proof of performance testing and inspection.

The next operation after the completion of the proof of performance testing and inspection shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **611.07.11 Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except the work shall include the removal of the installations when they are no longer required.

#### **611.07.12 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

**611.09 MEASUREMENT FOR PAYMENT**

**611.09.01 Actual Measurement**

**611.09.01.01 Underpass Luminaires  
LED Underpass Luminaires**

For measurement purposes, a count shall be made of the number of underpass luminaires installed.

**611.09.01.02 Replace Underpass Luminaires  
Replace LED Underpass Luminaires**

For measurement purposes, a count shall be made of the number of underpass luminaires replaced.

**611.09.01.03 Relamp Underpass Luminaires**

For measurement purposes, a count shall be made of the number of underpass luminaires relamped.

**611.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**611.10 BASIS OF PAYMENT**

**611.10.01 Underpass Luminaires - Item  
LED Underpass Luminaires - Item  
Replace Underpass Luminaires - Item  
Replace LED Underpass Luminaires - Item  
Relamp Underpass Luminaires - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract contains separate items for the work required by this specification, payment shall be at the Contract prices and according to the specifications for such work.

**611.10.02 Underpass Luminaires, Temporary - Item  
LED Underpass Luminaires, Temporary - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Progress payments for temporary installation of the above tender item shall be based on the following percentages of the Contract price:

80% for supply and installation  
20% for removal

## **CONSTRUCTION SPECIFICATION FOR INSTALLATION OF POWER SUPPLY EQUIPMENT**

## **Electrical Safety Authority (ESA)**

Ontario Electrical Safety Code

### **614.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Service Box** means an approved assembly consisting of an enclosure designed and constructed so that it can be effectually locked or sealed, contain either service fuses and a service switch or a circuit breaker, and allow the switch or circuit breaker to be manually operated.

### **614.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **614.04.01 Submission Requirements**

The following information shall be submitted to the Contract Administrator:

- a) Actual breakdown cost of Utility work, such as hook up, transformation, etc.
- b) Utility company contact person's name, title, address, and telephone and mobile phone numbers.

Working drawings shall be submitted according to OPSS 2414.

A Manufacturer's Certificate of Conformance and Request to Proceed shall be submitted to the Contract Administrator upon completion of the fabrication of the power supply equipment.

The power supply equipment shall not be delivered to the site until the Contract Administrator has received the Manufacturer's Certificate of Conformance, Request to Proceed, and issued a Notice to Proceed.

### **614.05 MATERIALS**

#### **614.05.01 Distribution Assemblies**

Distribution assemblies shall be according to OPSS 2414 and the Contract Documents.

#### **614.05.02 Supply Control Cabinet Assemblies**

Supply control cabinet assemblies shall be according to OPSS 2414 and the Contract Documents.

Supply control cabinet assemblies shall include an Arc Flash and Shock Hazard warning label according to Figure 1. The warning sign shall be prominently displayed on the outside of each exterior door. The Contractor shall enter the location information in Figure 1 as indicated by the local MTO electrical coordinator.

The AC arc flash analysis and results in Figure 1 are applicable to ministry highway electrical systems with the following characteristics:

- a) Single phase.
- b) Nominal system voltage of 240 VAC or less.

- c) Continuous current rating of main breaker of 100 A or less.
- d) Size of upstream transformer of 100 kVA or less.
- e) Condition of electrical plant shall be in good condition and well maintained.

#### **614.05.03 Service Boxes**

Non-metallic enclosures for service boxes shall be certified or approved and marked Suitable for Use as Service Equipment.

#### **614.05.04 Photoelectric Controllers**

Photoelectric controllers shall be according to OPSS 2485.

#### **614.05.05 Cables and Cable Connectors**

Cables and cable connectors shall be according to OPSS 604.

#### **614.05.06 Grounding Materials**

Grounding materials shall be according to OPSS 609.

#### **614.05.07 Conduit and Fittings**

Rigid ducts and fittings shall be according to OPSS 603.

### **614.07 CONSTRUCTION**

#### **614.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

Concrete pads shall be according to OPSS 616 and as specified in the Contract Documents.

#### **614.07.02 Distribution Assemblies**

Equipment enclosures shall be installed squarely and symmetrically on concrete pads.

A neoprene gasket shall be attached squarely and symmetrically on the bottom base H-beam of the enclosure prior to installation. Base H-beam anchor bolts shall be secured in place at locations specified in the Contract Documents.

#### **614.07.03 Supply Control Cabinet Assemblies**

Supply control cabinet assemblies shall be mounted securely on poles using stainless steel strapping.

Rigid ducts and fittings shall be installed on wooden poles using two-hole galvanized pipe straps one trade size larger with galvanized lag screws and on metal or concrete poles using stainless steel strapping, at intervals specified in the Ontario Electrical Safety Code. The conduit system shall be installed in straight lengths to follow the taper of the pole. Offset bends, meter hubs, terminal adapters, and fittings shall be used when required to avoid pole attachments and be kept free of kinks or scorch marks.

When specified in the Contract Documents, a meter socket, acceptable to the power supply authority, shall be installed.

#### **614.07.04 Cables and Fuses**

Cables, terminations, and connections shall be installed according to OPSS 604. Service cables from the point of service connection to the main disconnecting means shall be installed according to the Ontario Electrical Safety Code and the requirements of the power supply authority.

Only high-voltage fuses that have a current rating approved by the power supply authority shall be installed.

#### **614.07.05 Grounding**

All grounding work shall be according to OPSS 609.

All concrete pad mounted equipment shall be bonded by means of bonding jumpers connected between the equipment ground bus and the exterior ground grid. Lightning arrestors shall have the ground cable connected securely to the equipment ground bus. The neutral bus of the main disconnecting means or the secondary neutral terminal of the transformer shall be grounded.

The system ground wire and the service ground wire shall be connected to the neutral bus in supply control cabinet assemblies.

#### **614.07.06 Photoelectric Controllers**

##### **614.07.06.01 General**

Photo-conductive cell windows shall be set to face in a northerly direction and away from any nearby light sources.

##### **614.07.06.02 Distribution Assemblies**

Photoelectric controllers shall be installed according to the Contract Documents.

##### **614.07.06.03 Supply Control Cabinet Assemblies**

Photoelectric controllers shall be installed on poles with twist lock mounting sockets and brackets. Brackets shall be mounted on metal or concrete poles with stainless steel strapping or on wooden poles with galvanized lag screws.

#### **614.07.07 Quality Control**

##### **614.07.07.01 Pre-Installation Testing and Inspection**

Power supply equipment shall be inspected prior to installation to ensure that it meets the requirements of the Contract Documents. A visual inspection of all the power supply equipment shall be performed prior to its delivery. The following components shall be inspected to ensure that they meet the requirements of the Contract Documents:

- |                          |                          |
|--------------------------|--------------------------|
| a) Barriers and raceways | k) Grounding connections |
| b) Breakers              | l) Insulation            |
| c) Cabinet materials     | m) Labels                |

- |                                    |                              |
|------------------------------------|------------------------------|
| d) Conduits and tubings            | n) Lightning arrestors       |
| e) Contactors                      | o) Panelboards               |
| f) Disconnect switches             | p) Photoelectric controllers |
| g) Doors and latching mechanisms   | q) Switches                  |
| h) Enclosure materials             | r) Transformers              |
| i) Cabinet general appearance      | s) Wires and connectors      |
| j) Grounding and bonding materials |                              |

A Request to Proceed shall be submitted to the Contract Administrator after completion of the pre-installation testing and inspection.

The next operation after the completion of the pre-installation testing shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **614.07.07.02                      Proof of Performance Testing and Inspection**

The installed power supply equipment shall be inspected and tested. All components listed under the Pre-Installation Testing and Inspection clause shall be inspected. Low voltage system tests shall be performed on wiring of the equipment according to OPSS 604. Grounding of equipment shall be tested according to OPSS 609.

A Request to Proceed shall be submitted to the Contract Administrator after completion of the proof of performance testing and inspection.

The next operation after the completion of the proof of performance testing and inspection shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **614.07.08                      As Constructed Drawings**

In the event changes to the accepted Working Drawings are necessary, as constructed drawings bearing the stamp and signature of an Engineer shall be submitted to the Contract Administrator.

#### **614.07.09                      Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except the work shall include the removal of the installations when they are no longer required.

#### **614.07.10                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**614.09 MEASUREMENT FOR PAYMENT**

**614.09.01 Actual Measurement**

**614.09.01.01 Distribution Assemblies  
Supply Control Cabinet Assemblies**

For measurement purposes, a count shall be made of the number of assemblies installed.

**614.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**614.10 BASIS OF PAYMENT**

**614.10.01 Distribution Assemblies - Item  
Supply Control Cabinet Assemblies - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**614.10.02 Distribution Assemblies, Temporary - Item  
Supply Control Cabinet Assemblies, Temporary - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, Material to do the work.

Progress payment for temporary installation of the above tender items shall be based on the following percentages of the Contract price:

80% for supply and installation  
20% for removal

Additional payment shall not be made for the electrical energy and service required to do the work.

**Figure 1**  
**Arc Flash and Shock Hazard Warning Label**

|                                                                                     |                                             |
|-------------------------------------------------------------------------------------|---------------------------------------------|

### **615.01 SCOPE**

This specification covers the requirements for the installation of poles used for the mounting of lighting equipment, traffic signals and control equipment, low-voltage aerial cables, and extra low-voltage aerial cables.

#### **615.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **615.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **615.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## **Others**

Ontario Electrical Safety Code

### **615.05 MATERIALS**

#### **615.05.01 Concrete**

Concrete shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

#### **615.05.02 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

#### **615.05.03 Poles**

Concrete poles shall be according to OPSS 2421.

Steel poles for base mounting shall be according to OPSS 2423.

Aluminum poles for base mounting shall be according to OPSS 2452.

Sectional steel poles for direct burial or base mounting shall be according to OPSS 2453. Where sectional steel poles have heights not listed in OPSS 2453, the sectional steel poles shall be according to OPSS 2453 in all other respects.

Wooden poles shall be according to OPSS 2420.

Heavy class steel poles and heavy class sectional steel poles shall be according to OPSS 2422. This class is required for poles with mast arms longer than 5.5 m.

Heavy class steel sectional poles and heavy class steel poles of the same height may be substituted for one another provided that the poles are fully compatible with the installation and all other associated work is according to the Contract Documents.

#### **615.05.04 Frangible Bases**

Frangible bases shall be as specified in the Contract Documents.

#### **615.05.05 Pole Hardware and Accessories**

Pole line hardware shall be according to CSA C83.

Steel guy cable shall be according to CAN/CSA G12.

Guy anchors shall be of the helical power driven or direct buried expandable type with a minimum diameter of 250 mm and a minimum anchor rod ultimate strength of 50 kN.

The hardware and accessories for wood pole anchors installed in rock shall be according to Table 1.

## **615.07 CONSTRUCTION**

### **615.07.01 General**

The general requirements for electrical work shall be as specified in the Contract Documents.

Concrete, wooden, and metal poles shall be installed at locations specified in the Contract Documents.

All compaction shall be according to OPSS 501.

Grounding of poles shall be according to OPSS 609 and the Contract Documents.

#### **615.07.01.01 Pole Orientation**

Concrete and metal poles shall be installed with the handhole location on the pole as specified in the Contract Documents and such that the top wiring aperture is at right angles to the centreline of the road being served.

#### **615.07.01.02 Pole Handling**

Poles shall be handled using suitable non-abrasive slings at the pole pick up points as specified by the pole manufacturer.

#### **615.07.01.03 Removals**

Removals shall be according to OPSS 610.

### **615.07.02 Sectional Steel Poles**

#### **615.07.02.01 Assembly**

Sectional steel poles shall be assembled in order of section number, taper, and diameter. Sections with wiring apertures shall be set with consideration given to the handhole location.

All sections shall be assembled by compression according to the manufacturer's instructions such that each section meets the normal overlap limits marked on the pole or refusal. Seam welds shall be slightly offset during assembly. The finished length of the pole shall be less than or equal to the nominal pole length.

Pole lengths of 5.64 m or more shall be assembled using three self-tapping screws or impact inserted pins. Screws and pins shall be installed in the overlap of all sections below the signal bracket so that they are spaced equally around the pole.

#### **615.07.03 Direct Buried Poles**

##### **615.07.03.01 Installation in Earth**

Excavation shall be by auger or by other suitable means to obtain a hole large enough to accommodate concrete encasement and backfill. Where the excavation extends beyond the neat limits specified in the Contract Documents, and, where concrete encasement is specified in the Contract Documents, concrete may be placed to the undisturbed earth or the encasement may be formed with the remainder of the backfill made up of native material.

### **615.07.03.02                      Installation in Rock**

Where rock is encountered, the method of installation shall be chosen from those specified in the Contract Documents and be based on the depth of rock below finished grade. Each method of installation in rock shall be approved by the Contract Administrator prior to construction.

Rock anchors, bolts for rock mounts, and steel dowel bars shall be installed in drilled holes and grouted in place with non-shrink grout. Poles shall be cut off at the top end to provide the correct top of pole elevation. Wooden poles that have been cut off shall have the ends treated with preservative according to the pole manufacturer's specifications.

Concrete levelling pads, concrete backfill up to the top of the rock grade, and formed concrete encasement shall be placed according to OPSS 904.

Native or imported earth material shall be used as backfill above or around the concrete encasement and compacted.

Rock excavation shall be according to OPSS 603.

### **615.07.03.03                      Pole Alignment**

Direct buried poles shall be held plumb by using a suitable temporary support assembly during concrete setting time and during backfilling operations.

### **615.07.04                          Base Mounted Poles**

#### **615.07.04.01                      Preparation**

Anchorage templates shall be removed prior to installation of poles and frangible bases.

All studs, bolts, and nuts shall be cleaned and coated with white lithium-based grease.

#### **615.07.04.02                      Installation of Frangible Bases**

When frangible bases are specified in the Contract Documents, they shall be installed according to manufacturer's specifications.

#### **615.07.04.03                      Pole Installation**

When specified in the Contract Documents, poles shall be installed on frangible bases.

Poles shall be set plumb.

#### **615.07.05                          Apertures**

Drilled apertures shall be accurately aligned to suit pole attachments or equipment. Wiring apertures in metal poles shall be provided with rubber grommets. Apertures in metal poles shall be deburred, and in galvanized steel poles, be coated with grey zinc-rich paint and allowed to dry before placing rubber grommets in them.

Unused pole apertures shall be plugged with rubber, neoprene, or plastic plugs.

#### **615.07.06                          Guy Anchors**

Guy anchors and associated hardware shall be installed as specified in the Contract Documents and the Ontario Electrical Safety Code. Anchorage plates shall be installed at the specified guy lead distance and

adjusted to remain clear of any existing guy anchors by a minimum distance of 600 mm and then backfilled with native material and compacted.

Guy anchors shall be installed with single or double guy cable sets as specified in the Contract Documents.

All guy cables shall be installed to a snug condition prior to aerial cable stringing and readjusted upon completion to maintain poles in a plumb position.

Guy cables shall be tightened to maintain pole alignment and aerial cable clearances.

#### **615.07.07                      Quality Control**

##### **615.07.07.01                      Pre-Installation Testing and Inspection**

Poles shall be inspected for any obvious flaws, prior to installation.

Heavy class steel and sectional steel poles shall be certified that they are according to the supplier's design and drawings as specified in OPSS 2422. The certification shall reference the supplier's drawing numbers.

Sectional steel poles shall be certified that they are according to the supplier's design and drawing numbers as specified in OPSS 2453. The certification shall reference the supplier's drawing numbers.

##### **615.07.07.02                      Proof of Performance Testing and Inspection**

The work of pole installation shall be inspected to ensure that it is according to the Contract Documents. The inspection shall ensure that:

- a) Poles and appurtenances have been properly installed.
- b) Poles are plumb.
- c) Anchorage assemblies and frangible bases are installed correctly.

#### **615.07.08                      Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except the work shall include the removal of the installations when they are no longer required.

#### **615.07.09                      Site Restoration**

Site restoration shall be according to OPSS 492.

#### **615.07.10                      Management of Excess Materials**

Management of excess material shall be as specified in the Contract Documents.

**615.09 MEASUREMENT FOR PAYMENT**

**615.09.01 Actual Measurement**

**615.09.01.01 Poles**

For measurement purposes, a count shall be made of the number of poles installed regardless of the type and size of the poles, and shall include any frangible bases and guy anchors installed with the poles.

**615.09.01.02 Sectional Steel Poles, Direct Buried in Earth**

For measurement purposes, a count shall be made of the number of sectional steel poles direct buried in earth.

**615.09.01.03 Concrete Poles, Direct Buried in Earth**

For measurement purposes, a count shall be made of the number of concrete poles direct buried in earth.

**615.09.01.04 Wooden Poles, Direct Buried in Earth**

For measurement purposes, a count shall be made of the number of wooden poles direct buried in earth.

**615.09.01.05 Sectional Steel Poles, Direct Buried in Rock**

For measurement purposes, a count shall be made of the number of sectional steel poles direct buried in rock.

**615.09.01.06 Concrete Steel Poles, Direct Buried in Rock**

For measurement purposes, a count shall be made of the number of concrete poles direct buried in rock

**615.09.01.07 Wooden Poles, Direct Buried in Rock**

For measurement purposes, a count shall be made of the number of wooden poles direct buried in rock.

**615.09.01.08 Sectional Steel Poles, Base Mounted**

For measurement purposes, a count shall be made of the number of base mounted sectional steel poles installed.

**615.09.01.09 Heavy Class Sectional Steel Poles, Base Mounted**

For measurement purposes, a count shall be made of the number of base mounted heavy class sectional steel poles installed.

**615.09.01.10 Steel Poles, Base Mounted**

For measurement purposes, a count shall be made of the number of base mounted steel poles installed.

**615.09.01.11 Heavy Class Steel Poles, Base Mounted**

For measurement purposes, a count shall be made of the number of base mounted heavy class steel poles installed.

**615.09.01.12 Aluminum Poles, Base Mounted**

For measurement purposes, a count shall be made of the number of base mounted aluminum poles installed.

**615.09.01.13 Frangible Bases**

For measurement purposes, a count shall be made of the number of frangible bases installed.

**615.09.01.14 Guy Anchors**

For measurement purposes, a count shall be made of the number of guy anchors installed, regardless of the size and type.

**615.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**615.10 BASIS OF PAYMENT**

**615.10.01 Poles - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Materials to do the work.

**615.10.02**                      **Sectional Steel Poles, Direct Buried in Earth - Item**  
**Concrete Poles, Direct Buried in Earth - Item**  
**Wooden Poles, Direct Buried in Earth - Item**  
**Sectional Steel Poles, Direct Buried in Rock - Item**  
**Concrete Poles, Direct Buried in Rock - Item**  
**Wooden Poles, Direct Buried in Rock - Item**  
**Sectional Steel Poles, Base Mounted - Item**  
**Heavy Class Sectional Steel Poles, Base Mounted - Item**  
**Steel Poles, Base Mounted - Item**  
**Heavy Class Steel Poles, Base Mounted - Item**  
**Aluminum Poles, Base Mounted - Item**  
**Frangible Bases - Item**  
**Guy Anchors - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**615.10.03**                      **Sectional Steel Poles, Direct Buried in Earth (Temporary) - Item**  
**Concrete Poles, Direct Buried in Earth (Temporary) - Item**  
**Wooden Poles, Direct Buried in Earth (Temporary) - Item**  
**Sectional Steel Poles, Direct Buried in Rock (Temporary) - Item**  
**Concrete Poles, Direct Buried in Rock (Temporary) - Item**  
**Wooden Poles, Direct Buried in Rock (Temporary) - Item**  
**Sectional Steel Poles, Base Mounted (Temporary) - Item**  
**Steel Poles, Base Mounted (Temporary) - Item**  
**Aluminum Poles, Base Mounted (Temporary) - Item**  
**Frangible Bases (Temporary) - Item**

### **Guy Anchors (Temporary) - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Materials to do the work.

Progress payment for the above tender items shall be based on the following percentages of the Contract price:

- a) 80% for supply and installation.
- b) 20% for removal.

### **615.10.04                      Rock Excavation**

Payment for rock excavation shall be according to OPSS 603.

Rock excavation shall not include holes drilled in rock for the placement of steel dowel bars.

**TABLE 1**  
**Hardware and Accessories for Wood Pole Anchors in Rock**

| <b>Manufacturer</b>                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>Product Identity</b>                        | <b>Model</b> | <b>Assembly #</b>                             | <b>Product Notes</b>                                                       |

## **American National Standards Institute (ANSI)**

B18.22.1-1965 (R2008) Plain Washers

## **Society of Automobile Engineers (SAE)**

J403 - Dec 2014 Chemical Composition of SAE Carbon Steels

## **616.05 MATERIALS**

### **616.05.01 Concrete**

Concrete shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

### **616.05.02 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

### **616.05.03 Granular Material**

Granular materials shall be Granular A or B according to OPSS 1010.

### **616.05.04 Ducts and Fittings**

Ducts and fittings shall be according to OPSS 603.

### **616.05.05 Anchorage Assemblies and Hardware**

All steel components shall be hot dipped galvanized according to CAN/CSA G164.

#### **616.05.05.01                    Anchor Assembly Struts**

Anchor assembly struts shall be grade SAE 1030 steel according to SAE J403.

#### **616.05.05.02                    Studs, Nuts, and Washers**

Studs shall be grade SAE C1541 steel according to SAE J403, high tensile stress proof with a yield strength of 690 MPa, and a tensile strength of 860 MPa.

Hex nuts shall be steel grade B steel according to ASTM A 563.

Washers shall be according to ANSI B18.22.1.

#### **616.05.05.03                    Ferrules**

Steel ferrules shall be grade AISI C12L14 rotoprobed bar according to SAE J403.

#### **616.05.06                        Steel Footings and Hardware**

Steel footings and hardware shall be grade SAE 1020 steel according to SAE J403.

Steel top plates and steel equipment base plate shall be according to CSA G40.20/G40.21, Grade 260WT minimum.

Steel for footing shafts smaller than 150 mm in diameter shall be according to ASTM A 53.

Steel for footing shafts 150 mm and larger in diameter shall be hollow structural sections according to CSA G40.20/G40.21, Grade 350 W minimum.

Welding of the top plate shall be according to CSA W59 minimum.

Steel footings, steel equipment base plate, and mounting hardware shall be hot dip galvanized according to CSA G164.

Stainless steel bolts, nuts, and flat washers shall be according to ASTM A 193.

#### **616.05.07                        H-Section Assemblies and Hardware**

H-section assemblies and hardware shall be grade SAE 1020 steel according to SAE J403.

Steel plate for H-section and the H-section shall be according to CSA G40.20/G40.21, Grade 260WT minimum.

H-section shall be HP200x54.

All welding shall be according to CSA W59 minimum.

H-section anchorage assemblies and mounting hardware shall be hot dip galvanized according to CAN/CSA G164.

#### **616.05.08                        Joint Filler**

Expansion joint filler shall be type A or B according to OPSS 1308.

#### **616.05.09 Grout**

Grout shall consist of a mixture of one part Portland cement according to OPSS 1301 and two parts mortar sand according to OPSS 1004, wetted with sufficient water to make the mixture plastic. Water shall be according to OPSS 1302.

#### **616.05.10 Wooden Pads**

Wooden pads for controller cabinet shall be as specified in the Contract Documents.

### **616.06 EQUIPMENT**

Equipment for the installation of steel footings shall be according to the following minimum requirements:

- a) Boom truck complete with hydraulic take-off.
- b) Hydraulically operated torque head with a minimum torque rating of 16,000 N·m complete with Kelly bar drive.
- c) Kelly bar adapter and universal driving plate.
- d) Torque indicator.

### **616.07 CONSTRUCTION**

#### **616.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

#### **616.07.02 Removal**

Removals shall be according to OPSS 610.

#### **616.07.03 Concrete Footings and Pads**

##### **616.07.03.01 General**

##### **616.07.03.01.01 Excavation**

Earth excavation for footings shall be carried out by mechanical excavation or by hand digging. When additional excavation is required beyond the neat limits, such excavation shall be a minimum of 300 mm width beyond the neat dimensions of the footing to accommodate granular backfill.

When unsuitable material is encountered in the excavation, it shall be removed and replaced with material approved by the Contract Administrator.

Rock excavation shall be according OPSS 206.

##### **616.07.03.01.02 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 905.

#### **616.07.03.01.03          Concrete**

Concrete shall be placed, finished, cured, and protected according to OPSS 904. Concrete shall be sampled and tested according to OPSS 1350.

Concrete in earth shall be placed directly against the undisturbed walls of the excavation or may be formed in place, provided that a minimum of 300 mm width is available for placing granular backfill. The upper portion of the footing shall be formed to a minimum of 75 mm below grade level.

When concrete is placed immediately adjacent to other concrete structures or pavement, expansion joint filler shall be installed around the abutting edge of the footing.

Concrete finish for footings installed in concrete barrier wall shall match the barrier wall finish.

#### **616.07.03.01.04          Grading**

Fill material shall be excavated and placed to the finished grade elevation according to OPSS 206.

#### **616.07.03.02          Concrete Footings**

##### **616.07.03.02.01          Sleeves and Ducts**

Sleeves for footings shall be accurately located to suit incoming ducts or cable systems and shall be securely tied to the steel reinforcement prior to placing concrete.

All sleeves or ducts shall be cut off cleanly above the footing at the height specified in the Contract Documents.

Sleeves or ducts shall be temporarily plugged or sealed until wiring is installed. Where ducts or sleeves are specified as spare or intended for future use, the ducts or sleeves shall be plugged with plastic plugs.

Location of sleeves or ducts shall be marked on the top of the concrete footing with a 50 x 50 mm cut or formed cross.

##### **616.07.03.02.02          Anchorage Assemblies**

Anchorage assemblies shall be installed using studs as specified in the Contract Documents.

Anchorage assemblies of the size and type specified in the Contract Documents shall be accurately positioned in the pole and sign footings. The alignment of the studs shall be parallel to the edge of the driving lane. Anchorage assemblies shall be securely tied to the steel reinforcement.

Studs shall be factory inserted in the ferrules and held in place with a pre-applied thread locking compound. A wooden template shall be provided. Nuts and washers shall be installed hand tight by the fabricator. Studs shall have the exposed threads above the ferrule coated with factory applied white lithium grease. The integrity of the compound shall be maintained throughout the installation and no attempt shall be made to remove or adjust the studs.

The anchorage assembly shall be installed and adjusted level in all directions on the wooden template using a carpenter's level. Upon initial concrete set, the wooden template shall be removed and the drainage channels and other surface features shall be completed.

When the removal of the studs for repair or replacement purposes is required, the ferrules and the studs shall be cleaned to remove the old thread locking compound. New thread locking compound shall be applied to the insertion length of the studs prior to tightening to full depth.

#### **616.07.03.02.03 H-Section Assemblies**

H-section for barrier walls shall be accurately positioned in the concrete footings under the concrete barrier. The alignment of the studs shall be parallel to the edge of the driving lane. The plumb position of the anchorage assemblies shall be maintained during the placing of concrete.

#### **616.07.03.02.04 Concrete**

Concrete pole footings shall be placed so that the top of the footing is within  $\pm 25$  mm of the elevation specified in the Contract Documents.

#### **616.07.03.02.05 Granular Backfill**

When granular backfill is specified in the Contract Documents or, when granular backfill is placed around footings, it shall be compacted according to OPSS 501.

#### **616.07.03.02.06 Concrete Footings in Earth**

Concrete footings in earth shall be placed at locations specified in the Contract Documents.

#### **616.07.03.02.07 Concrete Footings in Rock**

The work for concrete footings in rock shall include placing dowels and concrete. Concrete footings in rock shall to be placed at locations specified in the Contract Documents.

#### **616.07.03.02.07.01 Dowels in Rock**

When specified in the Contract Documents, steel dowel bars shall be installed. Dowel bars shall be grouted in holes drilled into rock using non-shrink grout.

#### **616.07.03.03 Concrete Pads**

Concrete pads shall be placed at locations specified in the Contract Documents.

#### **616.07.03.03.01 Granular Bases**

Granular material shall be placed as foundation for concrete pads. Granular material shall be placed in conjunction with the installation of ducts under the concrete pads. The granular base shall be compacted according to OPSS 501.

#### **616.07.03.03.02 Sleeves and Ducts**

Sleeves and ducts shall be located within the concrete pads as specified in the Contract Documents so that cables may be installed vertically to the cable terminations in the pad mounted equipment.

Ducts shall be installed below pads according to OPSS 603 and shall be suitably aligned for connection to exterior duct or cable systems.

#### **616.07.04 Steel Footings**

##### **616.07.04.01 Installation**

Steel footings larger than 150 mm diameter shall be installed using the equipment as outlined in the Equipment section. Alternate methods of applying torque are permitted for 150 mm diameter or smaller steel footings.

During installation, the steel footing shall be maintained in a plumb position by use of a carpenter's level or a survey instrument. In all cases, the steel footing shall be installed so that the final location of the top plate rests on or is slightly below final grade. Steel footings to be used for poles shall be oriented such that the top plate is either perpendicular to or parallel to the edge of pavement, as required by duct orientation. Steel footings for other equipment mounting shall be oriented to suit the equipment to be mounted.

Steel footings shall be installed by turning the units into the earth at locations specified in the Contract Documents. Torque on footings larger than 150 mm in diameter shall be monitored and recorded during the turning operation and shall show a consistent and gradually increasing torque as the footing advances in depth.

When difficulties are encountered installing the steel footing due to the presence of boulders or rock fragments; or where the torque required to install the footing exceeds 20,000 N·m; or where the torque is less than 5,000 N·m when the shaft is fully driven into the ground, the footing shall be withdrawn and relocated 1.0 m minimum away from the original position, as directed by the Contract Administrator. If turning of the footing proves impractical, a pilot hole of 150 mm diameter may be pre-drilled and the footings then turned into the pilot hole. If this method proves impractical, a hole of 300 mm maximum diameter may be augured and the footing then installed into the hole. Compacted limestone screenings or expandable foam backfill shall be placed around the shaft to the bottom of the wiring aperture. Backfill of native material shall be placed above this level and compacted according to OPSS 501.

If the steel footings cannot be installed due to local conditions, a concrete footing shall be installed.

#### **616.07.04.02                      Mounting Hardware and Steel Equipment Base Plate**

The mounting hardware and steel equipment base plate shall be installed as specified in the Contract Documents.

#### **616.07.05                          Wooden Pads**

##### **616.07.05.01                      Installation**

Wooden pads for controller cabinets shall be fabricated and placed at locations specified in the Contract Documents.

##### **616.07.05.02                      Granular Bases**

A granular base shall be installed as a foundation for wooden pads. Granular material shall be placed in conjunction with the installation of ducts under the wooden pads. The granular base shall be compacted according to OPSS 501.

##### **616.07.05.03                      Sleeves and Ducts**

Sleeves in wooden pads shall be located so that cables may be installed vertically to the cable terminations in the pad mounted equipment. Ducts shall be installed below the pads according to OPSS 603 and shall be suitably aligned for connection to exterior duct or cable systems.

#### **616.07.06                          Quality Control**

##### **616.07.06.01                      Pre-Installation Testing and Inspection**

Anchorage assemblies, studs or bolts, and connection components shall be inspected prior to installation to ensure that they are according to the Contract Documents.

#### **616.07.06.02                      Proof of Performance Testing and Inspection**

The work shall be inspected to ensure that it is according to the Contract Documents. The work shall be inspected to ensure that all components are installed and that all footings and pads, including anchorage assemblies, are properly oriented and in working order.

#### **616.07.07                              Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except that the work shall include the removal of the installations when they are no longer required.

#### **616.07.08                              Site Restoration**

Site restoration shall be according to OPSS 492.

#### **616.07.09                              Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **616.08                                      QUALITY ASSURANCE**

The Owner may perform tests for concrete according to OPSS 1350.

The Owner may perform tests for compaction according to OPSS 501.

The Owner may inspect each pole footing as specified in the Contract Documents.

### **616.09                                      MEASUREMENT FOR PAYMENT**

#### **616.09.01                              Actual Measurement**

##### **616.09.01.01                      Concrete Footings in Earth**

For measurement purposes, a count shall be made of the number of concrete footings installed in earth.

##### **616.09.01.02                      Concrete Footings in Rock**

For measurement purposes, a count shall be made of the number of concrete footings installed in rock.

##### **616.09.01.03                      Concrete Pads**

For measurement purposes, a count shall be made of the number of concrete pads installed.

##### **616.09.01.04                      Steel Footings**

For measurement purposes, a count shall be made of the number of steel footings installed.

##### **616.09.01.05                      Wooden Pads**

For measurement purposes, a count shall be made of the number of wooden pads installed.

**616.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**616.10 BASIS OF PAYMENT**

**616.10.01 Concrete Footings in Earth - Item  
Concrete Footings in Rock - Item  
Concrete Pads - Item  
Steel Footings - Item  
Wooden Pads - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When a specified steel footing cannot be placed due to local conditions and a concrete footing is installed in its place, such work shall be paid as Extra Work.

**616.10.02 Concrete Footings in Earth, Temporary - Item  
Concrete Footings in Rock, Temporary - Item  
Concrete Pads, Temporary - Item  
Steel Footings, Temporary - Item  
Wooden Pads, Temporary - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Progress payment for the above tender items shall be based on the following percentages of the Contract price:

80% for supply and installation  
20% for removal

## **CONSTRUCTION SPECIFICATION FOR INSTALLATION OF ROADWAY LUMINAIRES**

#### **617.01 SCOPE**

This specification covers the requirements for the installation of luminaires and brackets on poles complete with associated wiring and connections.

#### **617.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Construction**

### **617.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **617.04.01 Submission Requirements**

A photometric test report shall be submitted for each photometric curve used in the luminaires to be installed under the Contract. The testing and test reports for high intensity discharge (HID) luminaires (e.g., high pressure sodium) shall be according to IESNA LM-63. The testing and test reports for LED luminaires shall be according to IESNA LM-79. The testing and test reports shall be completed by an independent laboratory or a National Voluntary Laboratory Accreditation Program (NVLAP) accredited laboratory, which is accredited for testing the type of luminaire to be installed under the Contract (i.e., accredited for IESNA LM-63 for HID luminaires or IESNA LM-79 for LED luminaires). Each test report shall be dated and signed. The test reports shall be submitted to the Contract Administrator prior to the commencement of fabrication.

### **617.05 MATERIALS**

#### **617.05.01 Luminaires**

##### **617.05.01.01 Roadway Lighting Type**

Roadway lighting luminaires shall be according to OPSS 2432 and the Contract Documents.

##### **617.05.01.02 High Mast Lighting Type**

High mast lighting luminaires shall be according to OPSS 2432 and the Contract Documents.

##### **617.05.01.03 Floodlighting Type**

Floodlighting luminaires shall be according to CSA C22.2 No. 9.0 and the Contract Documents.

##### **617.05.01.04 LED Roadway Lighting Type**

LED roadway lighting luminaires shall be according to the Contract Documents.

##### **617.05.01.05 LED High Mast Lighting Type**

High mast lighting luminaires shall be according to the Contract Documents.

## **617.05.02                    Lamps**

Lamps shall be high pressure sodium according to ANSI C78.380 with ANSI lamp designations shown in Table 1. Lamp wattages shall be permanently marked using a label affixed to the underside of the luminaires as specified in the Contract Documents.

## **617.05.03                    Low-Voltage Cables**

Single conductor low-voltage cables shall be according to OPSS 604.

## **617.05.04                    Wire Connectors**

Wire connectors shall be of the compression type and shall be according to CAN/CSA C22.2 No. 65.

## **617.05.05                    Insulating Covers**

Insulating covers for connectors shall be of the vinyl snap lock type or heat shrink tubing type and rated at 600 V.

## **617.05.06                    Brackets**

Brackets shall be as specified in the Contract Documents.

## **617.05.07                    Conduit and Fittings**

Conduit and fittings required for wooden pole mounting shall be of the rigid PVC type according to CSA C22.2 No. 211.2.

## **617.05.08                    Hardware**

Hardware for wooden pole mounting shall be according to CSA C83.

## **617.05.09                    Grounding Materials**

Ground wire and connectors shall be according to OPSS 609.

## **617.05.10                    Fuse Holders and Fuses**

Fuse holders shall be of the in-line type suitable for use with #12 AWG conductors, rated 600 V, and shall be complete with protective boots. Fuses shall be according to CSA C22.2 No. 248.8, 600 V with a current rating as specified in the Contract Documents.

## **617.07                        CONSTRUCTION**

### **617.07.01                    General**

General requirements for electrical work shall be as specified in the Contract Documents.

### **617.07.01.01                Ordering Luminaires**

Immediately following the award of the Contract, the Contractor shall order the luminaires as required for this Contract.

The Contractor shall obtain verification of the delivery dates of the luminaires from the supplier and notify the Contract Administrator of the delivery dates within 72 hours after the award of the Contract.

The Contractor shall ensure there is timely and accurate communication with both the Owner and the supplier regarding the delivery, schedules, and requirements for the luminaires.

Delivery and off-loading of the luminaires shall be completed in a timely and efficient manner.

#### **617.07.02 Removals**

Removals shall be according to OPSS 610.

#### **617.07.03 Lamp Installation**

Lamps shall be installed after poles have been installed and the brackets and luminaires mounted and levelled.

#### **617.07.04 Brackets**

##### **617.07.04.01 Roadway Lighting Type**

Brackets shall be installed at right angles to the centreline of the roadway being served. Bracket clamping assemblies shall be securely tightened. Brackets shall be mounted on wooden poles using 16 mm diameter galvanized steel square head through bolts, nuts, and 50 x 50 mm washers.

##### **617.07.04.02 Floodlighting Type**

Bracket assemblies shall be oriented to give the floodlight aiming specified in the Contract Documents. Bracket clamping assemblies shall be securely tightened.

#### **617.07.05 Luminaires**

##### **617.07.05.01 General**

Luminaires shall be stored in conditions free of moisture, dirt, and other factors that could damage the ballasts or reflecting surfaces of the optical system.

Luminaires shall be mounted on brackets and shall be installed level along both the longitudinal and transverse axis.

Luminaire clamping assemblies shall be securely tightened upon completion of levelling.

Luminaires shall be orientated and aimed using the horizontal and vertical angles specified in the Contract Documents. When instructed by the Contract Administrator, each luminaire or luminaire component shall be readjusted once under nighttime operating conditions.

Glass refractors shall be installed complete with gaskets. Mounting hardware shall be securely tightened. The luminaire reflector and refractor shall be thoroughly cleaned prior to installing lamps. Lamps shall be installed with the installation date marked on the lamp base.

If required, the refractor and the lamp holder shall be reset or replaced according to manufacturer's instructions to give the proper type of light distribution specified in the Contract Documents.

When specified in the Contract Documents, the luminaires shall be equipped with shields. The shields shall be mounted in such a manner to prevent loosening, turning, or falling when subject to vibration or wind loading in the installed position and to permit relamping without removing or distorting the alignment of the shields.

The shield shall be installed according to the manufacturer's instructions. The orientation of each shield shall be as specified in the Contract Documents. After the shield is attached to the luminaire-retaining

ring, it shall be rotated such that its centre (the deepest point) is aligned with the specified angle. The angle specified is based on geometric rotation with the true north as its reference (0 degrees). Once the shield is aligned to the specified angle, it shall be secured in place by tightening the holding ring.

The luminaire assembly when closed and in the operating position shall not be subject to damage by vibration.

#### **617.07.05.02 High Mast Lighting Type**

A maximum of one luminaire shall be installed on each arm of the luminaire ring.

Each luminaire shall be bolted and secured onto its respective luminaire arm.

#### **617.07.06 Wiring and Connections**

Riser wires in metal and concrete poles shall be terminated at the luminaire terminal block and installed through the bracket and pole to the pole handhole.

Riser wires on wooden poles shall enter the bracket with a drip loop and shall be installed in conduit when the distance from the bracket to the low voltage bus exceeds 450 mm.

Connections or riser wires to the assigned feeder conductors shall be made with compression connectors insulated with insulating covers.

In-line fuse holders and fuses shall be installed in the pole handhole and placed in an accessible location. For wooden poles, in-line fuse holder and fuses shall be installed at the point of connection.

#### **617.07.07 Grounding**

Grounding shall be according to OPSS 609.

For metal or concrete pole mounting, a #12 AWG insulated (green) stranded copper ground wire shall be installed between the luminaire housing ground terminal and the ground stud in the pole handhole.

For wooden pole mounting, a #12 AWG insulated (green) stranded copper ground wire shall be installed between the luminaire housing ground terminal and the system ground.

#### **617.07.08 Replacing Luminaires**

Existing luminaires shall be removed and new luminaires installed according to the Contract Documents. Existing riser wires and luminaire ground wire shall be salvaged and connected to the new luminaires.

#### **617.07.09 Relamping**

When required, existing lamps shall be removed. The existing luminaires shall be thoroughly cleaned and new lamps installed according to the Contract Documents.

#### **617.07.10 Quality Control**

##### **617.07.10.01 Pre-Installation Testing and Inspection**

Luminaires, brackets, socket setting, refractor type, and ballast type shall be inspected to ensure they meet the requirements of the Contract Documents.

A Request to Proceed shall be submitted to the Contract Administrator after completion of the pre-installation testing and inspection.

The next operation after the completion of the pre-installation testing and inspection shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **617.07.10.02                      Proof of Performance Testing and Inspection**

Luminaires shall be tested and inspected to ensure that they are levelled correctly and according to the Contract Documents. All luminaires shall have a minimum burning-in period of 100 nighttime hours prior to acceptance of the work by the Contract Administrator. All luminaire shielding shall be installed prior to the start of the burn-in period.

All tests required on the wiring system shall be according to OPSS 604.

A Request to Proceed shall be submitted to the Contract Administrator after completion of the proof of performance testing and inspection.

The next operation after the completion of the proof of performance testing and inspection shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **617.07.11                              Temporary Electrical Work**

The work for temporary electrical installations shall be the same as for permanent installations of the same type of work, except the work shall include the removal of the installations when they are no longer required.

#### **617.07.12                              Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **617.09                                  MEASUREMENT FOR PAYMENT**

#### **617.09.01                              Actual Measurement**

##### **617.09.01.01                          Roadway Lighting Luminaires and Bracket Assemblies LED Roadway Lighting Luminaires and Bracket Assemblies**

For measurement purposes, a count shall be made of the number of roadway lighting luminaires and bracket assemblies installed.

### **620.01 SCOPE**

This specification covers the requirements for the installation of traffic signal equipment, including traffic signal heads, mast arms, brackets, signal hangers, optically directed lens assemblies, LED modules, aerial mounting equipment and equipment modifications.

#### **620.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **620.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **620.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications or publications:

### **Ontario Provincial Standard Specifications, Construction**

## 620.03

## DEFINITIONS

For the purpose of this specification the following definitions apply:

**Auxiliary Signal Head** means a traffic signal head that is supplementary to the primary and secondary heads and which may be necessary due to local conditions.

**Backboard** means a panel surrounding a signal head.

**Conflict Monitor** means a device used to prevent conflicting signal phases.

**Controller unit** means a traffic signal controller

**Highway Signal Head** means a traffic signal head with 300 mm diameter red, amber and green lenses.

**Light Emitting Diode (LED)** means a semiconductor device that emits incoherent monochromatic light when electrically biased in the forward direction. This effect is a form of electroluminescence. The colour depends on the semiconducting material used, and can be near-ultraviolet, visible or infrared. These LEDs are used to provide red, amber, green or green arrow, etc. indications in traffic signal heads.

**Load Switch** means a device used to switch 120-volt power to the traffic control signal heads. Load switches are normally semi-conductor devices, which are switched by low voltage signal from the controller unit.

**Pedestrian Signal Head** means a traffic signal head comprising of a "walk" and "don't walk" symbol.

**Primary Signal Head** means a traffic signal head mounted on the far right side of an intersection approach.

**Quality Verification Engineer (QVE)** means an Engineer retained by the Contractor qualified to provide the services specified in the Contract Documents.

**Secondary Signal Head** means a traffic signal head mounted on the far left side or in the median of an intersection approach.

**Signal Head** means an assembly containing the signal face.

**Special Signal Head** means a traffic signal head comprised of a combination of sections with red, amber and green or green arrow indications.

**Standard Signal Head** means a traffic signal head with 200 mm diameter red, amber and green lenses.

## 620.05

## MATERIALS

### 620.05.01

### Traffic Signal and Pedestrian Heads

Each traffic signal head shall be provided with LED modules unless otherwise specified in the Contract Documents.

Each traffic signal head shall be a highway signal head unless otherwise specified in the Contract Documents.

Traffic signal heads and pedestrian heads shall be according to OPSS 2461.

## **620.05.02 Mast Arms, Brackets, Signal Hangers**

Mast arms, brackets and signal hangers shall be according to OPSS 2460. Signal hangers shall be adjustable mid-section hanger or dual-end hanger as specified in the Contract Documents.

## **620.05.03 Traffic Signal Cables**

Traffic signal cables shall be according to OPSS 2409.

## **620.05.04 Tape**

Electrical insulating tape shall be according to CSA C22.2 No. 197, rated for -10 °C to 90 °C use, 600 V.

## **620.05.05 LED Modules**

LED modules shall be according to OPSS 2461.

## **620.05.06 Conduits and Fittings**

Rigid PVC conduits and fittings shall be according to CSA C22.2 No. 211.2. Rigid aluminum conduits and fittings shall be according to CSA C22.2 No. 45.2.

## **620.05.07 Wire Connectors**

Wire connectors shall be of the insulated wing nut vibration proof spring type and shall be according to CSA C22.2 No 65.

## **620.05.08 Junction Boxes and Fittings**

PVC junction boxes and fittings shall be according to CAN/CSA C22.2 No. 85.

## **620.05.09 Strapping**

Stainless steel strapping and buckles shall have a minimum ultimate strength of 4.5 KN.

## **620.05.10 Traffic Signal Mounting Equipment**

Fittings, accessories and hardware shall meet the requirements specified in the Contract Documents.

## **620.05.11 Grommets**

Grommets shall be rubber or neoprene sized to suit the aperture metal thickness and cable diameter.

## **620.05.12 Grounding Materials**

Grounding materials shall be according to OPSS 609.

## **620.07 CONSTRUCTION**

### **620.07.01 Mast Arms**

The attachment point of the mast arm shall be set on the pole to obtain the required clearance from finished grade to the bottom of the signal head. When two or more mast arms are mounted on the same pole, the

primary head shall be set to obtain the required clearance height specified in the Contract Documents. Other mast arms, with secondary or auxiliary heads, shall be adjusted on the pole so that a minimum separation of one pole diameter is obtained between fittings or bolts touching the pole.

For wood pole mounting, holes shall be drilled to accommodate through bolts. Nuts shall be tightened to obtain a minimum wood compression of 3 mm under the washers.

Mast arm attachment to steel poles using "U" bolts or pole plates shall be tightened to a point where the pole just begins to deform.

Mast arms shall be installed perpendicular to the through lanes of traffic being served.

#### **620.07.02                      Traffic Signal Hangers**

Traffic signal hangers shall be slip-fitted on the tenon of the mast arm and secured in position with the signal heads adjusted to vertical.

Installation of the signal hanger shall be according to the manufacturer's instructions.

#### **620.07.03                      Double Arm Brackets**

Double arm brackets shall be assembled on signal heads prior to pole mounting. The arm shall be installed in parallel alignment and all locknuts securely tightened.

Pole plates shall be mounted on the side of the pole so the bottom of the signal head meets the required clearance height from finished grade. Pole plates shall be secured with stainless steel strapping which shall not overlap or secure any other equipment on the pole.

#### **620.07.04                      Signal Heads**

Signal heads shall be installed facing the direction of approaching traffic according to the legal drawing, Form PHM-125, approved for the intersection.

Signal heads shall be securely covered with an opaque covering and shall remain in place until all tests have been completed and the signal heads are put into operation. Pedestrian heads shall be turned to face the pole prior to operation.

Signal heads shall be adjusted for maximum visibility and focusing prior to final tightening or sealing of hardware. Unused hubs in signal heads shall be plugged with sealing caps, without a gasket.

#### **620.07.05                      Wiring Apertures**

In metal poles, wiring apertures shall be drilled as required. Apertures shall be located clear of the vertical seam and overlapping sections of sectional steel poles. Apertures shall be de-burred and painted with grey zinc rich paint. Rubber grommets shall be installed after paint is dry.

#### **620.07.06                      Pole Mounted Conduit Systems**

Pole mounted conduit systems including rigid PVC junction boxes and all necessary fittings and hardware shall be installed where traffic signal equipment is to be installed on concrete or wood poles. Conduit shall be installed in straight lengths to follow the taper of the pole using stainless steel strapping or galvanized lag screws at 1.5 m maximum spacing. Offset bends shall be used where required to avoid pole attachments and conduits shall be kept free of kinks or scorch marks.

**620.07.07****Wiring**

Traffic signal cable shall be installed between the signal head and either the pole handhole or the pole mounted PVC junction box. Wiring shall be run through the mast arms, signal hangers and the upper arm of double arm brackets. A minimum length of 600 mm of riser cable shall be left in pole handholes.

Drip loops shall be left on all external cable. Cable shall be protected with rigid PVC conduit where slack lengths of more than 450 mm are externally exposed. Aerial cable from the PVC junction box to the signal head shall be installed according to OPSS 604.

Riser cables shall be connected to LED modules via terminal blocks, or with insulated wing nut vibration proof spring connectors. Termination of spare conductors and handhole or junction box connections shall be made with insulated spring connectors. All insulated spring connectors shall be held in place with three half laps of electrical vinyl tape. Upon completion of connections, all conductors shall be neatly bundled together and secured with four wraps of electrical vinyl tape.

Metal signal heads shall be grounded according to OPSS 609 by use of the designated spare conductor in the riser cable, connected securely to the ground terminal in the signal head and either the pole ground stud or the system ground wire in PVC junction boxes.

**620.07.08****Optically Directed Signal Heads**

Optically directed signal heads shall be installed according to the manufacturer's instructions. Signal heads shall be adjusted to focus along the designated roadways or traffic lanes.

**620.07.09****Aerial Mounted Equipment**

All equipment and fittings, hardware, PVC junction boxes, and accessories necessary for the mounting of equipment on aerial messenger cable systems shall be installed as specified in the Contract Documents. All compression nuts, locknuts and fitting hardware shall be securely tightened to prevent shifting of equipment by natural elements (i.e. wind, rain, ice or snow, etc.)

**620.07.10****Equipment Modifications**

Removal of existing equipment shall be according to OPSS 610. Installation of new, refurbished or modified equipment shall be according to the requirements for installation of the particular items of equipment as described herein.

**620.07.11****Quality Control****Pre-installation Testing and Inspection (PIT):**

Signal heads, mast arm, double arm brackets and connection components shall be inspected prior to installation to ensure that they are according to the Contract Documents.

**Proof of Performance Testing and Inspection (POP):**

The work shall be inspected and tested to ensure that it meets the requirements of the Contract Documents and without limiting the foregoing, to ensure the following:

- a) All components are installed, tested and proven as specified in the Contract Documents
- b) All cables are energized and in working order prior to activating the traffic signals for public display.

The inspection, testing, and test results shall be witnessed by the Quality Verification Engineer.

A Certificate of Conformance shall be submitted to the Contract Administrator upon completion of the work. The Quality Verification Engineer shall affix his or her seal and signature to the completed Certificate of Conformance confirming that the following are in general conformance with the requirements of the Contract Documents:

- a) Work
- b) Material and installations
- c) Inspection, testing, and test results

## **620.08                      QUALITY ASSURANCE**

The Contract Administrator may provide direction for the aiming of signal heads, optically directed lens assemblies and LED modules. At any time, the Contract Administrator may test-drive the controlled traffic lanes and notify the Contractor of any adjustments required.

## **620.09                      MEASUREMENT FOR PAYMENT**

### **620.09.01                  Actual Measurement**

#### **620.09.01.01              Single Member Arms and Signal Hangers Single Member Arms and Signal Hangers (Temporary) Overbrace Arms and Signal Hangers Overbrace Arms and Signal Hangers (Temporary) Double Arm Brackets Double Arm Brackets (Temporary) Highway Type Signal Heads Highway Type Signal Heads (Temporary) Special Type Signal Heads Special Type Signal Heads (Temporary) Standard Type Signal Heads Standard Type Signal Heads (Temporary) Pedestrian Type Signal Heads Pedestrian Type Signal Heads (Temporary) Single Signal Head Section Single Signal Head Section (Temporary) Optically Directed Signal Heads Optically Directed Signal Heads (Temporary)**

For measurement purposes, a count shall be made of the number of arms, hangers, brackets, and signal heads installed.

### **620.09.01.02              Traffic Signal Equipment Modifications**

For measurement purposes, a count shall be made of the number of intersection locations where traffic signal equipment modification is carried out.

**620.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**620.10 BASIS OF PAYMENT**

- 620.10.01**
- Single Member Arms and Signal Hangers – Item**
  - Single Member Arms and Signal Hangers (Temporary) – Item**
  - Overbrace Arms and Signal Hangers – Item**
  - Overbrace Arms and Signal Hangers (Temporary) – Item**
  - Double Arm Brackets – Item**
  - Double Arm Brackets (Temporary) – Item**
  - Highway Type Signal Heads – Item**
  - Highway Type Signal Heads (Temporary) – Item**
  - Special Type Signal Heads – Item**
  - Special Type Signal Heads (Temporary) – Item**
  - Standard Type Signal Heads – Item**
  - Standard Type Signal Heads (Temporary) – Item**

#### **621.01 SCOPE**

This specification covers the requirements for the installation of traffic control devices including flasher beacons, flasher mechanisms, downlights, sign light assemblies and internally illuminated signs.

#### **621.02 REFERENCES**

This specification refers to the following standards, specifications or publications:

##### **Ontario Provincial Standard Specifications, Construction**

## **621.05                      MATERIALS**

### **621.05.01                      Flasher Beacons**

Flasher beacons shall be according to OPSS 2461.

Each flasher beacon that provides intersection control and each red flasher beacon shall be 300 mm diameter unless otherwise indicated in the Contract Documents.

### **621.05.02                      Lamps and LED Modules**

Lamps and LED modules shall be according to OPSS 2461.

### **621.05.03                      Internally Illuminated Signs**

Internally illuminated signs shall be according to the general requirements of CSA C22.2 No. 207 and as specified in the Contract Documents.

### **621.05.04                      Cable**

Cables shall be according to OPSS 604.

### **621.05.05                      Connectors**

Connectors shall be according to OPSS 604 and OPSS 609.

### **621.05.06                      Conduit and Fittings**

Rigid PVC conduit and fittings shall be according to CSA C22.2 No. 211.2.

Rigid galvanized steel conduit and fittings shall be according to CSA C22.2 No. 45.1.

Rigid aluminum conduit and fittings shall be according to CSA C22.2 No. 45.2.

### **621.05.07                      Junction Boxes and Fittings**

Junction boxes and fittings shall be according to CSA C22.2 No. 85.

## **621.05.08                      Grounding Materials**

Grounding materials shall be according to OPSS 609.

## **621.07                              CONSTRUCTION**

### **621.07.01                      Flasher Beacons and Downlights**

Flasher beacons and downlights for post top mounting shall be aligned facing the direction of approaching traffic and secured with set screws tightened to bite into the pole top tenon by approximately 1 mm.

Flasher beacons for pole front or side mounting shall be aligned facing the direction of approaching traffic and mounted on double arm brackets or mast arms and signal hangers according to OPSS 620.

Flasher beacons, single or in multiple clusters, for aerial mounting shall be arranged on the overhead support cable to provide the required visibility and clearances for each direction of approaching traffic. Mounting hardware shall be securely tightened.

### **621.07.02                      Flasher Mechanisms**

Flasher mechanisms shall be mounted on poles or in enclosures with the accompanying conduit, conduit fittings and wiring systems.

### **621.07.03                      Sign Light Assemblies**

Sign light assemblies shall be constructed of rigid aluminum conduit and fittings, lamp holders and lamps and shall be installed facing the direction of approaching traffic. Lengths of conduit shall be secured against fittings with lock nuts.

### **621.07.04                      Internally Illuminated Signs**

Internally illuminated signs shall be installed on double arm brackets, mast arms and signal hangers or aerial support cables according to OPSS 620.

### **621.07.05                      Wiring**

Wiring between the traffic control device and the pole handhole or pole mounted junction box shall be installed and connected according to OPSS 620.

### **621.07.06                      Grounding**

Traffic control devices shall be grounded according to OPSS 609.

### **621.07.07                      Removals**

Removal of traffic control devices necessary for the installation of work described herein shall be according to OPSS 610.

## **621.07.08                      Quality Control**

### Pre-installation Testing and Inspection (PIT)

Traffic control devices and connection components shall be inspected prior to installation to ensure that they meet the requirements of the Contract Documents.

### Proof of Performance Testing and Inspection (POP)

The work shall be inspected and tested to ensure that it meets the requirements of the Contract Documents; and, without limiting the foregoing, the work shall be inspected to ensure the following:

- a) All components are installed, tested and proven as specified in the Contract Documents
- b) All cables are energized and in working order prior to activating the flasher beacons for public display.

The testing and inspection results shall be documented in a report and submitted to the Contract Administrator within 3 Days of completion of the testing and inspection.

## **621.09                              MEASUREMENT FOR PAYMENT**

### **621.09.01                      Actual Measurement**

#### **621.09.01.01              Flasher Beacons Flasher Beacons and Downlights Sign Light Assemblies for Keep Right Signs Internally Illuminated Signs Flasher Mechanisms**

For measurement purposes, a count shall be made of the number of flasher beacons and downlight combinations, flasher beacons, flasher mechanisms, sign light assemblies and internally illuminated signs installed.

### **621.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **621.10                              BASIS OF PAYMENT**

### **621.10.01                      Flasher Beacons - Item Flasher Beacons and Downlights - Item Sign Light Assemblies for Keep Right Signs - Item Internally Illuminated Signs - Item Flasher Mechanisms – Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Materials to do the work.

When the Contract contains a separate item for the Removal of Electrical Equipment, payment shall be at the Contract price and according to OPSS 610.

## **CONSTRUCTION SPECIFICATION FOR THE INSTALLATION OF TRAFFIC SIGNAL CONTROLLERS**

|---------------|--------------|
| <b>622.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for the installation of traffic signal controllers and associated components.

#### **622.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **622.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **622.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications or publications:

MTO 170/332 Training Manual

### **Others**

Caltrans Transportation Electrical Equipment Specifications (TEES)

## **622.03 DEFINITIONS**

For the purpose of this specification the following definitions apply:

**AC+** means 120 V AC, 60 Hz power bus.

**AC-** means 120 V AC, 60 Hz neutral bus, grounded at power source.

**Conflict Monitor** means a device for detecting and interrupting conflicts in the traffic signal output circuits.

**Controller** means a complete traffic signal control equipment package including cabinet, controller unit and all associated power control, actuation or interconnection devices.

**Controller Cabinet** means an outdoor enclosure used for the housing of the controller unit and all associated power, control, activation or interconnection devices.

**Controller Unit** means that portion of the controller assembly devoted to the selection and timing of traffic movements.

**Detection** means the operation of a detector sensor unit in registering the presence or passage of a vehicle or pedestrian.

**Hold** means a command to the controller unit which causes it to retain the existing traffic signal phase.

**Interconnection** means the system of cables and devices which operate traffic signal controllers at consecutive intersections in a fixed or preprogrammed timing sequence.

**Interval** means the part or parts of the signal cycle during which signal indications do not change.

**Interval Sequence** means the order of appearance of signal indications during successive intervals.

**Interval Sequence Chart** means a chart designating the order in which the signal phases occur and the associated signal display for each interval.

**Light Emitting Diode (LED)** means as defined in OPSS 620.

**Microprocessor** means a small, self-contained limited capability computer with the central processing unit on a single chip.

**Motherboard** means a printed circuit connector interface board with no active or passive components.

**Phase Skip** means a controller function used to provide omission of a phase in the absence of actuations on that phase.

**Pre-emption** means the transfer of the normal control of signals to a special control mode which may be required by railroad trains at crossings, emergency vehicles, mass transit vehicles, or other special needs.

**Vehicle Extension** means the time in seconds added to the green interval to permit additional green time upon actuation by a vehicle approaching the intersection.

## **622.05 MATERIALS**

### **622.05.01 Conduits and Fittings**

Rigid PVC conduits and fittings shall be according to CSA C 22.2 No. 211.2.

### **622.05.02 Low Voltage Cables**

Low voltage cables single conductor, shall be stranded copper type TWH according to CSA C 22.2 No. 75.

### **622.05.03 Wire Connectors**

Wire connectors shall be of the fork tongue compression type for terminal connections of the insulated wing nut vibration proof spring type for wire to wire connections and shall be according to CSA C 22.2. No. 65.

### **622.05.04 Electrical Insulating Tape**

Electrical insulating tape shall be rated for 600 V at -10°C to 90°C working temperature and conform to CSA C22.2 No. 197.

### **622.05.05 Grounding Materials**

Ground wire and connectors shall be according to OPSS 609.

### **622.05.06 Traffic Signal Controllers**

A used traffic signal controller may be used for a temporary installation provided that it is in good condition and it complies with the requirements of the contract.

### **622.05.07 Concrete**

Concrete shall be 30 MPa class according to OPSS 1350.

### **622.05.08 Solder**

Solder shall be 60% tin and 40% lead mix resin core type.

### **622.05.09 Uninterruptible Power Supply (UPS) System**

The UPS system shall be according to the OPSS 2475.

Used UPS systems may be used for temporary installations provided that they are in good condition and meet the requirements of the Contract Documents.

The information contained in this specification covers the UPS system to be used with a Model 332 controller cabinet. If the Contractor uses a different type of traffic signal controller cabinet, such as a NEMA cabinet, then the Contractor shall make all necessary modifications to suit the type of cabinet used.

Uninterruptible power supply systems for LED traffic signals shall include an Arc Flash and Shock Hazard warning label according to Figure 1. The warning sign shall be prominently displayed on the outside of each exterior door. The Contractor shall enter the location information in Figure 1 as indicated by the local MTO electrical coordinator.

The DC arc flash analysis and results in Figure 1 are applicable only to ministry traffic signal UPS systems with the following characteristics:

- a) Application – DC system for back-up power for traffic signals
- b) Nominal DC system voltage of 60 VDC or less.
- c) DC system short circuit current of 5000 A or less.
- d) Condition of electrical plant shall be in good condition and well maintained.

#### **622.05.10                      Forced Flash Relay**

The forced flash relay shall be 10 Amp, 60 Hz, Double Pole Double Throw (DP DT) relay.

#### **622.05.11                      Heater/Fan Breaker**

The heater/fan breaker shall be 15 Amp breaker mounted on the service panel.

### **622.07                              CONSTRUCTION**

#### **622.07.01                      Controller Supplied by the Owner**

When the controller is supplied by the Owner, the controller shall be picked up and transported from the location specified in the Contract Documents. The Contractor shall ensure that all components are safely connected, secured or packaged prior to transporting the controller.

The Owner guarantees to the Contractor that the controller and all associated equipment is free of any defects.

#### **622.07.02                      Controller Supplied by the Contractor**

When the Contractor supplies the controller, the Contractor shall carry out all pre-shipping shop tests specified in the Pre-installation Testing and Inspection clause.

Acceptable storage and testing facilities with temperature and humidity regulated environment shall be provided.

Each traffic signal controller cabinet shall be a model 332 traffic signal controller cabinet capable of 2 to 8 phase operation. Each traffic signal controller cabinet shall be complete with mounting pedestal base, uninterruptible power supply (UPS), 170 type traffic signal controller, conflict monitor, and all other equipment required to perform its intended function, either in standalone operation or as part of the ministry's traffic signal control system, according to the timing sheets, PHM-125 drawing, and the Contract Documents. Without limiting the foregoing, each traffic signal controller cabinet shall include the components listed in Table 1.

All traffic signal control equipment shall be according to the Ontario Traffic Signal Control Equipment Specifications (OTSCES) or the Caltrans Transportation Electrical Equipment Specifications (TEES).

Each traffic signal controller cabinet shall be supplied fully assembled and tested. The testing shall be carried out according to the MTO Operation Guidelines and Procedures in the MTO 170/332 Training Manual. The MTO 170/332 Training Manual may be purchased from the Ontario Section of the International Municipal Signal Association.

All temporary traffic signal controllers shall be equipped with an UPS system.

### **622.07.03                      Timing of Work**

The controller shall be installed and the controller cabinet shall be energized within 48 hours of shipment from the place of storage.

### **622.07.04                      Signal Controller Cabinet and UPS Cabinet**

#### **622.07.04.01                      Pole Mounted Controller Cabinet**

Cabinets shall be installed complete with all mounting brackets, hardware stainless steel strapping and pole mounted conduits and fittings.

Pole mounted controller cabinets shall be located such that:

- a) A person operating the controls will be facing the intersection.
- b) The edges of the cabinet do not protrude over a sidewalk or beyond the pole in the direction of the pavement.
- c) Pole handholes and pedestrian push-buttons remain unobstructed.

#### **622.07.04.02                      Pad Mounted Controller Cabinet**

The cabinet shall be installed complete with all hardware and accessories in an orientation that allows a person operating the controls to face the intersection.

The neoprene gasket shall be attached squarely and symmetrically on the bottom channel of the cabinet prior to installation, with holes for mounting bolts drilled where necessary.

Anchor bolts shall be secured in place in the locations specified in the manufacturer's instructions or where bolt holes have been provided.

Clear silicone shall be used as a sealant between the top of an extension and the bottom of the controller cabinet.

#### **622.07.04.03                      Pedestal Mounted Controller Cabinet**

Pedestals for controller cabinet mounting shall be installed in an orientation that allows a person operating the controls to face the intersection.

In earth, where the excavation extends beyond the neat limits, concrete may be placed to the undisturbed ground or the concrete encasement may be formed.

The excavation shall be backfilled with native material and compacted according to OPSS 501.

Where bedrock is encountered, rock excavation shall be done such that a minimum of 600 mm length of steel pedestal can be installed in sound rock. The bottom of the pedestal shall be cut off to obtain the proper controller mounting height above finished grade. Rock excavation shall be according to OPSS 603.

The cabinet shall be installed complete with all hardware and accessories.

#### **622.07.04.04                      Power Connection**

Low voltage feeder cables shall be connected to the controller cabinet. The neutral shall be connected to the AC-terminal bus.

#### **622.07.04.05                      Equipment Ground**

Stranded copper ground cable shall be installed between the controller cabinet ground bus and the service ground bus. Connections shall be according to OPSS 609 and the manufacturer's drawings or instructions.

For microprocessor type controllers, the AC-terminal bus shall not be grounded to the cabinet or connected to logic ground.

#### **622.07.04.06                      Pad Mounted UPS Cabinet**

The pad mounted UPS cabinet shall be installed on a pedestal manufactured of the same material as the traffic signal controller cabinet and supplied with the same lock and key. The pedestal shall be anchored to the pad and secured in place at the location specified according to the Contract Documents.

The UPS control unit and the UPS automatic switch shall be installed in the traffic signal controller cabinet according to the Contract Documents. A forced flash relay shall be installed in the traffic signal controller cabinet to allow flash operation when initiated by the UPS control unit. All wiring shall be according to the Contract Documents.

#### **622.07.04.07                      Pole Mounted UPS Cabinet**

The pole mounted UPS cabinet including batteries and heating pads shall be installed complete with all mounting brackets, hardware, stainless steel strapping and pole mounting conduits and fittings.

The edges of the cabinet shall not protrude over a sidewalk or roadway pavement. The cabinet shall not obstruct access to the pole handhole and pedestrian pushbuttons.

The UPS control unit and the UPS automatic switch shall be installed in the signal controller cabinet according to the Contract Documents. A forced flash relay shall be installed in the traffic signal controller cabinet to allow flash operation when initiated by the UPS control unit. All wiring shall be according to the Contract Documents.

#### **622.07.04.08                      UPS Automatic Switch, Forced Flash Relay and Heater/Fan breaker**

The UPS automatic switch, forced flash relay, heater/fan breaker and terminal block shall be installed in the signal controller cabinet according to the Contract Documents.

## **622.07.05 Installation of Controller Equipment**

### **622.07.05.01 Shelf-mounted Equipment**

Shelf-mounted controller equipment shall be neatly and suitably arranged on the shelves such that all preformed wiring harnesses are of adequate length to allow connections and may be trained to out-of-the-way locations. Similar items of equipment shall be grouped together. All equipment shall be installed with the front facing outward such that the main operational controls and switches are readily accessible.

### **622.07.05.02 Rack-mounted and Jack-mounted Equipment**

Controller equipment shall be installed only in the racks or jacks intended for use with the particular item of equipment. Equipment shall be installed within the guide provided and shall be set snug so as to lock into any motherboard, channel or connection specified.

### **622.07.05.03 Cabinet Wall-mounted Equipment**

Equipment shall be installed level and clear of nearby components. The equipment shall be bolted in place with 5 mm diameter stainless steel machine bolts, nuts and lock washers.

### **622.07.05.04 Identification of Equipment**

Equipment used for different traffic phases or operations shall be identified by traffic phase with labels of plastic embossed tape.

### **622.07.05.05 Wiring and Connections**

All connections to terminal boards or screw type equipment terminals shall be made with insulated fork-tongue compression connectors only when using stranded cable. All wiring to bulkhead connectors on equipment housings shall be made with military specification (MS) bayonet type connectors according to the Contract Documents or in the manufacturer's drawings.

All connector joints for use with extra-low voltage systems shall be soldered, with the joint metals preheated to the flow temperature of the solder.

Traffic signal cables shall be connected to the terminal board address as assigned on the Contract Drawings. The controller output circuit assigned shall match the proper traffic signal cable circuit. The traffic signal cable neutral(s) shall be securely connected to the AC-bus in the cabinet.

Extra-low voltage cables and interconnection cables shall have the outer jacket removed to expose approximately 150 mm of the shielding and/or drain wire. The shielding or drain wire for all cables serving a similar function shall be twisted together and soldered with a green #10 AWG minimum insulated ground lead securely connected to the cabinet ground bus.

Upon completion of wiring and connections, all incoming cables shall be bundled and held in place with nylon cable ties.

Unused conductors shall be terminated with insulated wing nut vibration proof spring connectors, leaving sufficient cable to reach terminal boards. Incoming cables shall be identified as follows:

- a) Extra-low voltage cable shall be identified with PVC sleeve wire markers having the same number as the traffic phase served.

- b) Traffic signal cable shall be identified with PVC sleeve wire markers placed over the outer multi conductor cable, naming the corner of the intersection that the cable is routed towards such as "northeast", "south-west", etc.
- c) Interconnection cable shall be identified similar to traffic signal cable, naming the direction that the cable is routed towards such as "north", "south", etc.

#### **622.07.05.06                      Controller Security**

The controller cabinet shall be kept locked during all non-working times. Upon completion of the work, the controller keys shall be given to the Contact Administrator.

#### **622.07.06                      Quality Control**

##### **622.07.06.01                      Pre-installation Testing and Inspection**

##### **622.07.06.01.01                      General**

All tests shall be completed prior to transporting the controller to the Working Area.

Traffic signal controllers, UPS systems, and other components shall be inspected prior to installation to ensure that they are according to the Contract Documents.

##### **622.07.06.01.02                      Cabinet Assembly and Components**

A visual check shall be made to ensure that all components necessary to the complete controller are present and that all pre-assembled equipment is securely mounted and connected.

##### **622.07.06.01.03                      Circuit Output**

The output terminal board voltage shall be tested for 108 V minimum output from load switches and for proper terminal assignment according to the manufacturer's wiring diagram.

##### **622.07.06.01.04                      Interval Sequence**

With the proper programming for the intersection in operation but with modified timing values suitable to test conditions, the controller unit shall be cycled through all phases for a minimum of six hours. Controller output shall be tested to ensure that the proper phases and phase intervals appear in the correct sequence by use of a 120 V test board with lamps or by use of a 24 V test board with LED or other appropriate indicators wired to the input side of the load switches. Test results shall be confirmed a minimum of six times.

##### **622.07.06.01.05                      Actuation**

With an appropriate test board, the effect of detection devices and pedestrian push-buttons in entering a call to the controller unit shall be tested. All modes of detector sensor unit program and vehicle extension calls shall be tested. Tests shall confirm that all calls are registered, activated and are associated with the correct traffic phase.

##### **622.07.06.01.06                      Conflict Monitor**

The conflict monitor shall be tested by removal of the monitor programming card or by methods recommended by the manufacturer. Diode breakouts in the monitor card shall be according to the signal operation required. All flash and reset functions shall be tested.

**622.07.06.01.07 Flasher**

The output of flasher units and flash transfer relays shall be tested for proper functioning over a two hour period.

**622.07.06.01.08 Recall**

Recall switch functions for each phase shall be tested to ensure that the controller recalls to the phase selected and remains on 'hold' in the absence of a call on an opposing phase.

**622.07.06.01.09 Programming**

With actual phase timing for the intersection operational, the controller programming or cam breakouts shall be tested to ensure that the intended operation is accomplished. This test shall include all possible combinations of actuation and recall settings together with any special features such as advance green, phase skip, pre-emption or co-ordination.

**622.07.06.01.10 Manual Control**

The manual over-ride controls shall be tested for proper operation under all possible switching combinations.

**622.07.06.01.11 Environmental Protection**

The heater element and circuitry shall be tested for continuity and proper resistance. The ventilation fan shall be checked for proper operation in conjunction with the thermostat control system. If the average temperature during the installation period is below 5°C and falling, the cover plate shall be installed over the louvres and the heater circuit shall be prepared for operation.

**622.07.06.02 Proof of Performance Testing and Inspection**

**622.07.06.02.01 Controller**

These tests shall be performed upon installation of the controller. The controller shall be allowed to operate functionally only after all testing has been completed and all components are operational.

The Contract Administrator and ministry electrical staff shall be notified of the time and location of all testing 3 Business Days prior to the start of each test.

The work shall be inspected and tested 3 Business Days prior to the actual switch on of the signals to ensure that it according to the requirements of the Contract Documents and without limiting the foregoing, the Contractor shall ensure the following:

- a) All components are installed, tested and proven as indicated in the Contract Documents.
- b) All systems are energized and in working order
- c) The signal timing is consistent and complete, without activating the traffic signals for public display.

The testing and inspection results shall be documented in a report and submitted to the Contract Administrator within 3 Days of completion of the testing and inspection.

#### **622.07.06.02.02          Signal Cable**

All traffic signal cable circuits shall be tested disconnected for continuity and the absence of short circuits as determined by an ohmmeter test.

#### **622.07.06.02.03          120 V Test**

The operation of all signal head lamps and the absence of short circuits shall be tested by progressively connecting each active signal cable conductor to the AC+ bus through a temporary 10A fuse bypassing the load switches.

#### **622.07.06.02.04          Interval Sequence**

With the proper programming and timing functions in operation, the controller shall be cycled through all phases for a minimum of 1 hour with all signal circuits connected but with signal heads covered.

#### **622.07.06.02.05          Actuation**

All calls shall be observed to be registered and activated. Actuation equipment shall be tested according to OPSS 623.

#### **622.07.06.03          Testing of UPS System**

The UPS system shall be activated according to the manufacturer's recommendations. The Contractor shall be responsible for all testing and documentation required to establish acceptance of the installation and operation of material supplied.

##### **622.07.06.03.01          Pre-installation Testing and Inspection of UPS System**

Prior to the installation of the UPS system, the UPS system shall be tested and inspected to verify that it performs according the manufacturer's specifications and the Contract Documents. In particular, and without limiting the foregoing, the UPS system shall be operated and tested to verify the following:

- a) Transfer time in case of power failure is less than 60 milliseconds.
- b) Voltage regulation at 120 VAC is +/- 3 percent.
- c) Frequency regulation at 60 Hz is +/- 3 Hz.
- d) Thermostat controlled battery heating mats operate according to the manufacturer's specifications.
- e) When powered by the batteries alone, the UPS system provides full signal operation at full load for a minimum of 4 hours, and then switches over to flashing operation and provides flashing operation for a further 6 hours.

Prior to installation, certification from the manufacturer stating that the product is according to the Contract Documents shall be submitted to the Contract Administrator. This certification shall include an explicit certification that, when powered by the batteries alone, the UPS system provides full signal operation at full load for a minimum of 4 hours, and then switches over to flashing operation and provides flashing operation for a further 6 hours.

#### **622.07.06.03.02 Proof of Performance Testing and Inspection**

The UPS system and all components shall be tested and inspected to verify that it performs according to the manufacturer's specifications and the Contract Documents.

The proof of performance testing and inspection shall include all testing and inspection identified under the Pre-installation Testing and Inspection clause and the testing of grounding equipment according to OPSS 609.

In particular, and without limiting the foregoing, the Contractor shall ensure that all components are installed, tested and proven as specified in the Contract Documents. In addition, the Contractor shall perform visual inspection on the installed UPS system and perform all tests on grounding of equipment according to OPSS 609.

The testing and inspection results shall be documented in a report and submitted to the Contract Administrator within 3 Days of completion of the testing and inspection.

#### **622.07.06.03.03 Testing for New UPS System "Switch On"**

A new UPS system installed at a location not previously equipped with a UPS system or to replace an existing UPS system shall be initially switched on for operation according to the following requirements:

- a) The Contract Administrator shall be given a minimum of 3 Business Days notice of when the UPS system is to be installed or switched over and 24 hours notice prior to the start of the work.
- b) All repairs or replacement of defective components shall be completed prior to activation.
- c) Switch on for operation of UPS shall not be permitted on Fridays, Saturdays, Sundays, Mondays, and statutory holidays.
- d) Switch on for operation of UPS shall be under police supervision.

#### **622.07.07 Traffic Signal Controller Modifications**

Traffic signal controller modifications shall include the following:

- a) Relocation, rearrangement repair or replacement of traffic signal controller components.
- b) Modification to actuation equipment.
- c) Modification to interconnection equipment.
- d) Removal and salvage or disposal of components according to OPSS 610.

#### **622.07.08 Traffic Signal Control Programming and Timing**

Traffic signal interval timing as provided on the Generic Signal Timing Sheet specified in the Contract Documents shall be installed into the traffic signal controller only after verifying that it is complete and consistent and all controller and conflict monitor programming is installed and all timing controls, switches and programming controls are set.

The temporary traffic signals shall have full manual mode operation functionality to allow an operator to interrupt the other modes (e.g. fixed time or actuated) and return to the previous mode when finished.

When directed by the Contract Administrator, the traffic signal operation shall be manually overridden to operate in fixed/actuated or manual as required to reduce or eliminate queuing traffic. The date, start and end time of each manual override occurrence shall be recorded in a log book as specified elsewhere in the Contract Documents.

All routine and emergency maintenance work required for 24-hour operation of the temporary traffic signals shall be performed as specified in the Contract Documents.

## **622.08 QUALITY ASSURANCE**

The testing of the traffic signal controller and UPS system performed by the Contractor shall be witnessed by the Contract Administrator and the Ministry electrical coordinator or inspector. The Contract Administrator shall also be in attendance during the "turn-on" of the traffic signal.

## **622.09 MEASUREMENT FOR PAYMENT**

### **622.09.01 Actual Measurement**

#### **622.09.01.01 Traffic Signal Controllers**

For measurement purposes, a count shall be made of the number of traffic signal controllers installed.

#### **622.09.01.02 Traffic Signal Controllers Modifications**

For measurement purposes, a count shall be made of the number of traffic signal controllers modified.

### **622.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **622.10 BASIS OF PAYMENT**

### **622.10.01 Traffic Signal Controllers - Item**

Payment at the Contract price for the above items shall be full compensation for all labour, Equipment, and Materials to do the work.

#### **622.10.02 Traffic Signal Controller Modifications – Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Materials required to modify traffic signal controllers, and such work shall include the removal, salvage, installation, relocation, rearrangement, repair or replacement of components.

### **622.10.03 Rock Excavation**

Payment for rock excavation shall be according to OPSS 603.

## **International Municipal Signal Association Specification**

IMSA No. 51-5, Loop Wire

## **Canadian and Provincial Statutes**

Accessibility for Ontarians with Disabilities Act (AODA), 2005, - O. Reg. 413/12: Integrated Accessibility Standards

### **623.03 DEFINITIONS**

For the purpose of this specification the following definitions apply:

**Non-Intrusive Detection** means the operation of an aerial sensor unit in detecting and registering the presence of a vehicle

**Non-Intrusive Detection System** means an assembly of interdependent components composed of one or more microwave, radar, video, or other aerial detectors; software, firmware and hardware for processing of the detector signal; and, power and communication links providing traffic actuation inputs to a traffic signal controller or similar device.

### **623.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **623.04.01 Submission Requirements**

##### **623.04.01.01 Documentation**

Three (3) copies of service manuals for the following equipment shall be submitted to the Contract Administrator:

- a) Non-intrusive detection system equipment
- b) Accessible pedestrian signals.

The service manuals for the equipment shall be according to the manufacturer's specifications and the Contract Documents.

## **623.05 MATERIALS**

### **623.05.01 Cables**

Cables for loop detectors shall be #14 AWG type RWU 90, x-link - 40°C rated 1000 V stranded copper conductor according to CSA C22.2 No. 38.

Cables for loop detectors in tubing shall be #14 AWG THHN rated 600 V stranded copper conductor with polyethylene tube, according to IMSA No. 51-5.

### **623.05.02 Probe Detectors**

Probe detectors shall be as specified in the Contract Documents.

### **623.05.03 Ducts and Fittings**

Flexible polyethylene ducts and fittings shall be according to CSA B137.1, Series 75.

Rigid PVC conduits and fittings shall be according to CSA C22.2 No. 211.2.

Electrical non-metallic tubing and fittings shall be according to CSA C22.2 No. 227.1.

### **623.05.04 Electrical Insulating Tape**

Electrical insulating tape shall be according to CSA C22.2 No. 197, rated for - 18°C to 105°C use, 600 V.

### **623.05.05 Pedestrian Pushbuttons and Signs**

Pedestrian pushbuttons shall be as specified in the Contract Documents.

Pedestrian pushbutton signs shall be according to the Ontario Traffic Manual.

### **623.05.06 Solder**

Solder shall be 60/40 tin/lead mix, resin core type.

### **623.05.07 Sealant Compound**

Sealant compound shall be of cold type or hot poured type.

### **623.05.08 Extra Low Voltage Splice Insulation Kit**

Extra low voltage splice insulation kit shall be as specified in the Contract Documents.

### **623.05.09 Aerial Mounting Equipment**

Fittings, accessories and hardware shall be as specified in the Contract Documents.

### **623.05.10 Junction Boxes and Fittings**

Junction boxes and fittings shall be according to CSA C22.2 No. 85.

### **623.05.11 Prefabricated Detector Loops**

Prefabricated detector loops shall be either prefabricated PVC detector loops or prefabricated heavy-duty rubber detector loops as specified in the Contract Documents.

#### **623.05.11.01 Prefabricated PVC Detector Loops**

Prefabricated PVC detector loops shall be constructed with rigid PVC conduit, filled with a flexible urethane. The corner of the loops shall be rounded to a radius of 100 mm with the same continued conduit without any visible malformation. A "T" type access conduit fitting shall complete the loops geometric form and allow for the junction lead-in conduit. The number of turns of the wires shall be as specified in the Contract Documents.

The wires in the prefabricated detector loop conduit shall come out of the "T" type fitting and be of adequate length to reach the traffic count station or the handholes without splices. After wiring, the end of the prefabricated PVC detector loop conduit shall be injected with malleable urethane. The number of turns per loop shall be as specified in the Contract Documents.

#### **623.05.11.02 Prefabricated Heavy-Duty Detector Loops**

Prefabricated heavy-duty rubber detector loops shall be constructed with 9 mm I.D. (17 mm O.D) reinforced rubber hose with a 1.72 MPa internal pressure rating. The hose for the loops shall be of one continuous piece. Hose "T" type connections constructed of high temperature rubber shall complete the loops geometric form and allow for the junction lead-in conduit. The ends of the "T" type access conduit fitting shall be of proper sizes to attach directly to the hose. The number of turns in the detector loop shall be as specified in the Contract Documents.

The wires used shall be No.16 THWN stranded copper. The wires shall come out of the "T" type fitting and be of adequate length to reach the traffic count station without any splice. The wires shall be twisted a minimum of ten turns per metre. After the insertion of the detector loop and lead-in wires, the hose shall be filled and sealed with a flexible sealant.

### **623.05.12 Traffic Count Station Type 1**

#### **623.05.12.01 Post**

The post for the traffic count station type 1 shall be wooden; pressure treated and of the dimensions specified in the Contract Documents.

#### **623.05.12.02 Terminal Electric Box**

The terminal electric box (TEB) shall consist of a PVC electrical panel, conduit opening, and double-row barrier terminal block(s) with current capacity equal to the ampacity of #14 AWG stranded copper wire. The size and number of the terminal blocks and the size of the conduit opening shall suit the number of the detector loop cable leads.

The TEB for the traffic count station type 1 shall be constructed using a durable non-corrosive material, grey in colour, and shall be of the size specified in the Contract Documents.

The TEB shall have a cover of similar material or a piano hinge and hasp of similar non-corrosive material. The cover shall be attached to the TEB with four non-corrosive screws.

### **623.05.12.03 Assembly**

The traffic count station Type 1 shall be completely assembled and installed as specified in the Contract Documents.

### **623.05.13 Traffic Count Station Type 2**

#### **623.05.13.01 Base**

The base of the traffic count station type 2 shall be a pre-fabricated surface pin-lock base (SPLB). The base shall be constructed of a durable, non-corrosive material, which is black in colour. The dimension of the base diameter shall be smaller than the diameter of the electrical handhole cover over which the base shall be installed. The base shall be constructed in a way so that it can be attached to the electrical handhole, using non-corrosive replaceable fasteners.

#### **623.05.13.02 Post**

The post of the traffic count station type 2 shall be pre-fabricated, tubular in shape and made from a flexible, durable, non-discolouring white polypropylene. The post shall be strong enough to hold a terminal electric box. The post shall have two 75 mm wide strips of reflective high intensity amber sheeting, approximately 75 mm apart, located on its upper end. The post shall be of 914 mm in length and shall have a diameter, allowing the accommodation of the necessary number of detector loop cables.

The upper end of the post shall have an additionally installed 60 mm diameter PVC rigid reducer bushing, necessary for the installation of the terminal electric box on the post.

The lower end of the post shall be constructed in such a way that it can easily be mounted on the base (SPLB).

#### **623.05.13.03 Terminal Electric Box**

The TEB of the traffic count station type 2 shall be a PVC Rigid Conduit Access Fitting, Type LB ("L" shaped with back entry), constructed using a durable, UV and impact resistant, non-corrosive and non-metallic material, which is grey in colour.

The TEB shall have a cover of the same material and colour, and shall be fastened to the back of the box using two non-corrosive screws.

An ABS fitting cleanout adaptor with a plug having a minimum diameter of 25 mm shall be attached to the front of the TEB.

The bottom of the TEB shall be constructed in such a way, so that it can be mounted on the reducer bushing, already assembled together with the post.

#### **623.05.13.04 Assembly**

The traffic count station Type 2 shall be completely assembled with the parts listed above and installed as specified in the Contract Documents.

### **623.05.14 Accessible Pedestrian Signals**

Accessible pedestrian signals (APS) shall meet the requirements of the Accessibility for Ontarians with Disabilities Act (AODA), Ontario Regulation 413/12 as specified in the Contract Documents.

Accessible pedestrian signals shall consist of all material required for the operation of the APS, including but not limited to, all APS displays, pushbuttons, hardware, software, firmware, housings, wiring, and all setup hardware and software required to set up and configure the APS.

Accessible pedestrian signals shall have a locator tone that is distinct from a walk indicator tone. The accessible pedestrian signals shall include both audible and vibro-tactile walk indicators.

The APS shall include both manual and automatic activation features.

The pushbutton locating tone shall be repeated every 1 second and each tone shall be less than 0.15 seconds in duration. The locator tone must be audible up to but not beyond 3.7 m from the pushbutton. The APS shall automatically adjust the locating tone to maintain the tone at 2 to 5 dB over the ambient noise level.

The industry standard “cuckoo” sound shall be used for the north-south direction of travel, and the “Canadian APS melody” sound shall be used for the east-west direction of travel. Where two APS assemblies are installed at the same corner, they must be a minimum of 3000 mm apart. If the separation of 3000 mm cannot be achieved due to site constraints, each APS assembly at that particular corner must play a verbal announcement stating which crossing is active. Each verbal announcement shall be as specified in the Contract Documents.

#### **623.05.15 Non-Intrusive Detection System**

The non-intrusive detection system equipment shall be according to the requirements as specified in the Contract Documents.

All hardware and software, including but not limited to all connecting cables, mounting brackets, detector port hubs, interface panels, cabinet wiring harnesses, processor units, set-up hardware, testing hardware, and firmware, shall be according to the non-intrusive detection system manufacturer's specifications and the Contract Documents.

### **623.06 EQUIPMENT**

#### **623.06.01 Slot-cutting Equipment**

Slot-cutting equipment shall include a minimum 18 hp engine and a minimum 250 mm diameter diamond tooth blade adjustable between 20 mm and 100 mm depth of cut.

### **623.07 CONSTRUCTION**

#### **623.07.01 Loop Detectors**

##### **623.07.01.01 Layout**

Loops detectors shall be laid out on the pavement accurate to the dimensions specified in the Contract Documents. Slot cutting lines shall be marked with non-permanent materials. Saw cutting of slots shall not begin until the loop layout has been inspected by the Contract Administrator.

Locations where the layout of a loop crosses a major pavement crack, butt, expansion joint or transition area shall be reported to the Contract Administrator. In such instances, the treatment for crossing the pavement irregularity shall be as specified in the Contract Documents; or, at the discretion of the Contract Administrator, the loop shall be re-marked into 2 separate loops, each beginning approximately 300 mm away from the irregularity.

#### **623.07.01.02                      Saw Cutting**

Saw cutting of loop slots in pavement shall be in straight lines with slot depths and widths as specified in the Contract Documents. Corner cutting for slots shall be extended only far enough past each corner point to obtain the full depth of the slot. Slot crossing of pavement irregularities shall be constructed using additional widths and depths of slots as specified in the Contract Documents.

Where specified in the Contract Documents, saw cut marks shall be made on the curbs to indicate location of the loop.

#### **623.07.01.03                      Slot Preparation**

Upon completion of saw cutting, the slot shall be cleaned with a pressurized water stream and dried by means of compressed air forced through a nozzle at a minimum pressure of 300 kPa. The air shall be heated to a maximum of 160 °C where required to remove excess moisture.

The corners of all slots shall be rounded using hand tools. All slots and corners shall be examined for protrusions of sharp stone aggregates or debris which may damage cable. Any such protrusions or debris shall be removed. Final slot preparation shall be done immediately prior to the installation of cable.

#### **623.07.01.04                      Flexible Duct Installation**

A hole shall be drilled through the pavement to accommodate a flexible duct at the location specified in the Contract Documents.

All work for flexible duct installation, including earth excavation, backfill, removal and restoration, shall be according to OPSS 603.

#### **623.07.01.05                      Loop Cable**

The loop shall be installed with the size, winding direction, configurations, number of turns and type of cables as specified in the Contract Documents.

The loop cable end which progresses clockwise shall be marked at the splice point with two bands of electrical insulating tape.

Cable in slots shall be firmly and carefully tamped in place using a blunt instrument on each successive turn of cable. To prevent floating, cables shall be held in place using 25 mm lengths of foam backer rod at 600 mm centres.

Where cables are installed in slots crossing pavement irregularities, all cables shall be installed through split neoprene tubing.

Loop cables between the loop and the splice point, including those in the slot, shall be twisted together to form a consistent lay of 10 turns per metre. The entire loop and lead cable system shall be formed of a continuous and unspliced length of cable.

Each loop cable and extra low voltage cable shall be identified with a vinyl sleeve wire marker in the splice point as shown on the Contract Drawings.

#### **623.07.01.06 Sealant**

All sealing compounds shall be installed in slots as protection for detector loop cables according to the manufacturer's instructions and recommendations for the type of installation (e.g. installation in top course versus installation in binder course).

The sealing compound shall be allowed to set prior to allowing vehicles to cross over the loop. Cement dust may be added to tacky sealant where necessary. Spilled detector loop sealant or other excess loop sealant on the road surface that is not within the detector loop slot shall be removed from the road surface.

##### **a) Cold Type**

Cold pumped sealant shall be installed using a pressure pump or cartridge gun.

##### **b) Cold Type Single Component Polyurethane**

Cold pumped single component polyurethane sealant shall be installed using a pressure pump or cartridge gun. Single component polyurethane sealant shall not be used when detector loops are to be installed in the binder course pavement prior to placement of the top course of pavement over the loops.

"Summer Grade" cold pumped single component polyurethane sealant shall not be used at ambient temperatures less than 20 °C.

"Winter Grade" cold pumped single component polyurethane sealant shall not be used at ambient temperatures less than 0 °C.

##### **c) Hot-Poured Type**

Hot poured sealant shall not be used when detector loops are to be installed in the binder course pavement prior to placement of the top course of pavement over the loops.

Hot poured sealant shall not be used when the ambient temperature is greater than 0 °C or less than minus 18 °C.

#### **623.07.01.07 Splicing**

Splices of cables shall be made only at the designated splice point. Cables shall be stripped of approximately 12 mm of insulation, twisted together with a minimum of four turns and soldered to produce a bonded connection with a maximum resistance of 0.1 Ohm.

Splices shall be insulated with four half-laps of electrical insulating tape and encased in a resin splice with the splices positioned to obtain a minimum coverage of 6 mm of resin around each splice. The black conductor of the extra low voltage cable shall be connected to the clockwise winding lead cable as specified in the Loop Cable clause.

The metallic shield of cables shall be cut off cleanly and left unconnected in the resin splice.

#### **623.07.02 Probe Detectors**

Slot preparation, flexible duct installation and splicing for probe detectors shall be as specified in the Loop Detectors subsection.

#### **623.07.02.01                      Aerial Installation**

Probe detectors, cables, equipment and fittings, hardware, PVC junction boxes, and accessories necessary for the mounting of equipment on aerial messenger cable system shall be installed as specified in the Contract Documents. All compression nuts, locknuts and fitting hardware shall be securely tightened to prevent shifting of equipment by wind.

#### **623.07.02.02                      Underpavement Installation**

Probe detectors shall be installed in holes vertically, according to the manufacturer's instructions.

Cable in slots shall be firmly and carefully tamped in place using a blunt instrument on each successive turn of cable. To prevent floating, cables shall be held in place using 25 mm lengths of foam backer rod at 600 mm centres.

Where cables are installed in slots crossing pavement irregularities, they shall be installed through split neoprene tubing.

#### **623.07.02.03                      Saw Cutting and Drilling**

Saw cutting of slots in pavement shall be in straight lines with slot depths and widths as specified in the Contract Documents. Slot crossing of pavement irregularities shall be constructed using additional widths and depths of slots as specified in the Contract Documents.

Holes for probe detectors shall be 25 mm diameter at a depth of 460 mm below grade and in line with the saw cut slot.

#### **623.07.02.04                      Bedding and Sealant**

Clean and dry silica sand shall be used as bedding for probe detectors. Sealant shall then be applied to the upper portion of the hole. Cold pumped sealant compound shall be installed using a pressure pump or cartridge gun according to the manufacturer's instructions.

The sealant compound shall be allowed to set according to the manufacturer's instruction prior to allowing vehicles to cross the probe detectors. Cement dust may be added to tacky sealant where necessary.

#### **623.07.03                              Pedestrian Pushbuttons**

##### **623.07.03.01                      Installation**

Pedestrian pushbuttons and signs shall be mounted on the side of the pole such that the pedestrian signal pushbutton sign arrow indicates the proper direction for which roadway crossing is required.

Pedestrian pushbuttons shall be installed with stainless steel self-tapping screws or stainless steel straps. A wiring aperture shall be drilled in metal poles and fitted with a rubber gromet or a rigid conduit shall be installed on poles, for wiring access.

Pushbuttons for metal poles shall be installed with an integral sign frame or separately mounted with stainless steel straps or screws where specified in the Contract Documents.

#### **623.07.04                              Prefabricated Loops**

##### **623.07.04.01                      Installation**

Prefabricated loops shall be installed as specified in the Contract Documents and as described below.

Prefabricated detector loops shall be accurately laid out to the dimensions specified in the Contract Documents when covered by paving materials.

Prefabricated PVC detector loops shall be installed for burial in granular base, for saw cut installation in subsurface pavement course, open-graded drainage layer, or for embedding in concrete.

Heavy-duty rubber detector loops shall be installed for saw cut installation in subsurface pavement course, open-graded drainage layer, or for embedding in concrete.

When installed in concrete with rebar, prefabricated detector loops shall be mounted a minimum 50 mm above the rebar grid and as specified in the Contract Documents.

Any extra length of wiring of the prefabricated detector loop shall be coiled in the electrical handhole.

#### **623.07.04.02                      Flexible Duct Installation**

Flexible duct installation, including earth excavation, backfill, removal and restoration, shall be according to OPSS 603.

#### **623.07.05                      Traffic Count Station Installation**

The work for traffic count station shall include the installation of traffic count station, regardless of type.

The traffic count station and all associated equipment shall be installed as specified in the Contract Documents.

#### **623.07.06                      Accessible Pedestrian Signals**

The installation of APS shall meet the requirements of the AODA Ontario Regulation 413/12 and shall be installed according to the manufacturer's recommendations and the Contract Documents.

Accessible pedestrian signal pushbuttons shall be installed within 1,500 mm of the edge of the curb, and shall be mounted at a maximum of 1,100 mm above ground level as specified in the Contract Documents.

Accessible pedestrian signals shall have tactile arrows that align with the direction of crossing.

#### **623.07.07                      Non-Intrusive Detection System**

Detectors shall be installed at locations and mounting heights specified in the Contract Documents and according to the manufacturer's guidelines. The detectors shall be oriented and configured for operation according to the manufacturer's specifications and the Contract Documents.

Wiring and cabling shall be installed according to OPSS 604 and shall run continuously from source to destination. Splicing of wires and cables shall not be permitted.

All cabling and equipment required to transmit, receive, and process non-intrusive detection signals shall be installed according to the manufacturer's specifications and the Contract Documents.

Anti-seize compound shall be applied to the mounting bracket.

Drip loops and expansion loops shall be formed at each pole or conduit entry and held free of the pole or of other cables or connections.

Cable shall be protected with rigid PVC conduit where slack lengths of more than 450 mm are externally exposed.

Setup equipment shall be ruggedized and shall have 1 serial port, 1 USB port, 1 ethernet port, and a daylight-readable display. The setup equipment shall include a ruggedized notebook or equivalent device. The setup equipment shall operate correctly in ambient temperatures from 5 to 35 °C.

Metal detector housings shall be connected to the pole ground connector, or the system ground wire in surface mounted PVC junction boxes. All grounding work shall be according to OPSS 609.

For installation on metal poles, wiring apertures shall be drilled as required. The apertures shall be located clear of the vertical seam and overlapping sections of sectional steel poles. Apertures shall be deburred and painted with grey zinc rich paint. Rubber grommets shall be installed after the paint has dried.

## **623.07.08                      Quality Control**

### **623.07.08.01                      Pre-installation Testing and Inspection**

Prior to installation, an inspection of the following shall be conducted to ensure they are according to the Contract Documents:

- a) Detection devices and connection components
- b) Prefabricated detector loops and components
- c) Traffic count stations

The Contractor shall ensure that the temperature is within allowable limits prior to saw cutting and ensure that any dampness or precipitation can be successfully blown out of saw cut slots prior to beginning installation.

Prior to the overlaying of asphalt, detector loop wiring shall be tested for continuity, for leakage to ground and for inductance. Resistance to ground shall be 10 megohm or greater. Inductance shall be within 25% of the value indicated in the Contract Documents using a 100 kHz signal at 5V. Any prefabricated detector loop not passing these tests shall be replaced.

Prior to installation of probe detectors, the coil resistance shall be tested and shall be within 25% of the manufacturer's rated resistance. For multiple installations of probe detectors, the set shall be tested for total resistance value. Any detector not passing the foregoing tests shall not be used.

#### **623.07.08.01.01                      Accessible Pedestrian Signals**

Actuation devices and connection components shall have been inspected prior to installation to ensure that they meet the requirements of Ontario Regulation 413/12 of the AODA and the Contract Documents.

#### **623.07.08.01.02                      Non-Intrusive Detection System Equipment**

Non-intrusive detection system equipment shall be tested and inspected prior to installation to verify that it performs according to the manufacturer's specifications and the Contract Documents.

### **623.07.08.02                      Proof of Performance Testing and Inspection**

The Work shall be inspected and tested to ensure that all components are according to the requirements of the Contract Documents.

When the installation of traffic signals is included in the contract, all auxiliary components such as sensor units shall be tested to ensure they are in working order without activating the traffic signals for public display.

The testing and inspection results shall be documented in a report and submitted to the Contract Administrator.

#### **623.07.08.02.01            Detector Loops**

Loop wiring shall be tested for continuity, leakage to the ground and for inductance as follows:

- a) Prior to sealing slots.
- b) At the controller cabinet upon the completion of splices, installation of extra low voltage cable, sealing of slots and backfilling of trenches.

Testing requirements shall be the same as specified in the Pre-installation Testing and Inspection clause. Any loop not passing these tests shall be replaced.

Loops to be replaced shall be re-cut in cut in the original slot with new wiring and sealant installed and retested.

#### **623.07.08.02.02            Probe Detectors**

Probe detectors shall be tested at the splice point for coil resistance and leakage to the ground prior to sealing all slots and holes. Testing requirements shall be the same as specified in the Pre-installation Testing and Inspection clause.

For aerial installations, the coil resistance shall be tested at the controller cabinet upon the completion of splices to extra low voltage cables.

#### **623.07.08.02.03            Pedestrian Pushbuttons**

Upon completion of the installation of pedestrian pushbuttons, the APS system shall be tested at the controller cabinet.

#### **623.07.08.02.04            Prefabricated Detector Loops**

Loop wiring shall be tested for continuity, leakage to the ground and for inductance as follows:

- a) After covering with paving materials.
- b) At the controller cabinet or the traffic count station upon the completion of splices, installation of extra low voltage cable, sealing of slots and backfilling of trenches.

Resistance to ground shall be 10 megohm or greater. Inductance shall be within 25% of the value indicated in the Contract Documents.

#### **623.07.08.02.05            Traffic Count Station**

Upon completion of the installation of the traffic count station and the connection to the loops, the APS system shall be tested for its wiring continuity, leakage to ground and inductance, as specified in the Prefabricated Detector Loops clause.

#### **623.07.08.02.06 Accessible Pedestrian Signals**

The installed APS shall be inspected and tested to confirm that they meet the requirements of Ontario Regulation 413/12 of the AODA and the Contract Documents. The APS shall be tested according to the manufacturer's recommendations.

#### **623.07.08.02.07 Non-Intrusive Detection System**

Each non-intrusive detection system shall be inspected and tested to verify that it performs according to the manufacturer's specifications and the Contract Documents. In particular, and without limiting the foregoing, the Contractor shall ensure that all components are installed, tested, and proven to work as indicated in the Contract Documents, and that all cables are energized and in working order.

#### **623.07.08.03 Testing and Training for Non-Intrusive Detection System "Switch On"**

A new non-intrusive detection system at a location not previously equipped with a non-intrusive detection system, or a new non-intrusive detection system to replace an existing detection system, shall be switched on for operation according to the following requirements:

- a) The Contract Administrator shall be given a minimum of 3 Business Days' notice of when the new detection system will be installed or switched over, and shall reconfirm that the work will be done as scheduled 24 hours prior to doing the work.
- b) The Contractor shall provide training from the manufacturer to ministry staff, up to a maximum of six (6) persons, on the following topics:
  - i. Overview of the non-intrusive detection system
  - ii. Hardware and software operation
  - iii. Field setup procedures (detection zones setup)
  - iv. Configuration procedures and techniques
  - v. Operation and maintenance of the detection system
- c) The training shall include hand-outs and reference material for each participant.
- d) Training shall be completed on or before the detection system is installed and operational.
- e) The setup equipment shall be handed over to the MTO electrical coordinator responsible for the maintenance of the non-intrusive detection system equipment, at the time of training.
- f) All repairs or replacement of defective components shall be complete prior to activation.
- g) Non-intrusive detection system "Switch On" for operation shall not be permitted on Fridays, Saturdays, Sundays, Mondays, or statutory holidays.
- h) Traffic shall be under police supervision during this operation.

The Contract Administrator may witness any test performed and may make random inspections of the work.

The accessible pedestrian signals shall be tested in the presence of the Contract Administrator and the ministry's electrical coordinator.

The Contract Administrator may provide direction for the aiming of non-intrusive detectors or the adjustment of the non-intrusive detection system.

## **623.08 QUALITY ASSURANCE**

### **623.08.01 General**

The Contractor shall give the Contract Administrator 24 hours notice of when final tests are to be performed. The final tests shall be done after all work is completed.

The Contract Administrator shall witness all final tests. All test results shall be submitted to the Contract Administrator.

The accessible pedestrian signals shall be tested in the presence of the Contract Administrator and the ministry's electrical coordinator.

The Contract Administrator and the ministry's electrical coordinator may witness any testing performed and may make random inspections of the work.

The Contract Administrator may provide direction for the aiming of non-intrusive detectors or the adjustment of the non-intrusive detection system.

The Contract Administrator may witness any test and may make random inspections of the work.

### **623.08.02 Loop Detectors**

Prior to sealing slots, loop wiring shall be tested for continuity, for leakage to ground and for inductance. Resistance to ground shall be 10 mega ohm or greater. Inductance shall be within 25% of the value indicated in the contract using a 100 kHz signal at 5V.

Upon completion of splices, installation of extra low voltage cable, sealing of slots and backfilling of trenches, the foregoing tests shall be repeated at the controller cabinet.

Any loop detector required to be replaced shall be re-cut in the original slot with new wiring and sealant installed. All such loops shall be tested to conform to the foregoing requirements.

### **623.08.03 Probe Detectors**

Prior to installation of probe detectors, the coil resistance shall be tested and shall be within 25% of the manufacturer's rated resistance. For multiple installations of probe detectors, the set shall be tested for total resistance value. Any detector not passing the foregoing tests shall not be used.

#### **623.08.03.01 Aerial Installation**

Upon completion of splices, installation of extra low voltage cable, the coil resistance shall be tested at the controller cabinet.

#### **623.08.03.02 Underpavement Installation**

Prior to sealing of slots and holes for probe detectors, the coil resistance shall be tested at the splice point. The probe detectors shall also be tested for leakage to ground at the splice point.

### **623.08.04 Pedestrian Pushbuttons**

Upon completion of the installation of the pedestrian pushbuttons, the system shall be tested at the controller cabinet.

**623.09 MEASUREMENT FOR PAYMENT**

**623.09.01 Actual Measurement**

**623.09.01.01**  
**Loop Detectors**  
**Loop Detectors (Temporary)**  
**Probe Detectors**  
**Probe Detectors (Temporary)**  
**Pedestrian Pushbuttons**  
**Pedestrian Pushbuttons (Temporary)**  
**Prefabricated Detector Loops**  
**Traffic Count Station**

For measurement purposes, a count shall be made of the number of loops, detectors, pushbuttons and traffic count stations installed.

**623.09.01.02**  
**Accessible Pedestrian Signals**  
**Accessible Pedestrian Signals (Temporary)**  
**Non-Intrusive Detection Systems**  
**Non-Intrusive Detection Systems (Temporary)**

For measurement purposes, a count shall be made of the number of intersections where accessible pedestrian signals and non-intrusive detection systems are installed. Each intersection shall be counted only once, regardless of the number of times all or part of the accessible pedestrian signals or non-intrusive detection systems are relocated.

**623.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**623.10 BASIS OF PAYMENT**

**623.10.01**  
**Loop Detectors - Item**  
**Loop Detectors (Temporary) – Item**  
**Probe Detectors - Item**  
**Probe Detectors (Temporary) - Item**  
**Pedestrian Pushbuttons – Item**  
**Pedestrian Pushbuttons (Temporary) - Item**  
**Prefabricated Detector Loops - Item**  
**Traffic Count Station - Item**  
**Accessible Pedestrian Signals – Item**  
**Accessible Pedestrian Signals (Temporary) - Item**  
**Non-Intrusive Detection Systems – Item**  
**Non-Intrusive Detection Systems (Temporary) – Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Materials required to do the work, including, but not limited to, installation, removal, salvage, relocation, reinstallation, rearrangement, and recalibration of all equipment system components.

Payment for loop detectors that were to be constructed as a single loop but constructed as two loops due to pavement irregularities, as directed by the Contract Administrator, shall be made at the Contract price plus 20%.

|               |              |
|---------------|--------------|
| <b>630.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for the installation of sectional steel high mast lighting poles complete with raising and lowering equipment, including mechanical and electrical components.

**630.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **630.01.02                      Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **630.02                      REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Material**

|           |                                                             |

## **630.03                      DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Certificate of Conformance** means a document issued by the Quality Verification Engineer confirming that the specified components of the Work are in general conformance with the requirements of the Contract Documents.

**Quality Verification Engineer (QVE)** means an Engineer retained by the Contractor qualified to provide the services specified in the Contract Documents.

## **630.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **630.04.01 Submission Requirements**

#### **630.04.01.01 Assembly of Sectional Steel High Mast Lighting Poles**

Installation drawings, calculations, and procedures shall be submitted to the Contract Administrator at least 14 Days prior to the commencement of scheduled start of pole assembly for approval. An Engineer shall affix his or her seal and signature on the installation drawings, calculations, and procedures verifying that they are consistent with the Contract Documents and sound engineering practices.

These installation drawings, calculations, and procedures shall include all details of equipment to be used in jacking the sections together and lifting the assembled pole, including placing and securing it on the anchorage assembly.

#### **630.04.01.02 Training Certificate**

A certificate of training from the manufacturer of the high mast lighting raising and lowering equipment for each person who will be doing the installation work shall be submitted to the Contract Administrator. The certificates shall be submitted 14 Days prior to the commencement of the installation work, and the work shall not proceed until the certificates are accepted by the Contract Administrator. Training certificates that are 5 years old or more shall not be accepted.

The training certificate shall state that the manufacturer certifies that the individual has successfully completed training in the following areas:

- a) Assembly of the pole sections.
- b) Assembly of the raising and lowering equipment.
- c) Operation of the raising and lowering equipment.
- d) Installation of high mast poles and lighting equipment.
- e) Levelling of the luminaire ring assembly.
- f) Inspection of high mast poles and lighting equipment.
- g) Maintenance and repair techniques for sectional steel high mast lighting equipment.
- h) Safety procedures.

The training certificate shall be dated and signed by officers of the manufacturer and shall indicate the dates that the training was provided.

## **630.05 MATERIALS**

### **630.05.01 Sectional Steel High Mast Lighting Poles**

Sectional steel high mast lighting poles shall be according to OPSS 2471 and as specified in the Contract Documents.

#### **630.05.02 Raising and Lowering Equipment**

Raising and lowering equipment shall be according to OPSS 2476.

**630.07 CONSTRUCTION**

**630.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

**630.07.01.01 Ordering Sectional Steel High Mast Lighting Poles and Raising and Lowering Equipment**

Immediately following the award of the Contract, the high mast lighting poles and the raising and lowering equipment shall be ordered, as required for this Contract. All necessary measures shall be taken to ensure sectional steel high mast lighting poles and the raising and lowering equipment are 100% compatible and fully functional.

Verification of the delivery dates of the high mast lighting poles and the raising and lowering equipment shall be obtained from the suppliers and submitted to the Contract Administrator within 72 hours after the award of the Contract.

Timely and accurate communication shall be maintained with both the Owner and the suppliers regarding the delivery, schedules, and requirements for the high mast lighting poles and the raising and lowering equipment.

Delivery and off-loading of the sectional steel high mast lighting poles and the raising and lowering equipment shall be completed in a timely and efficient manner.

**630.07.02 Sectional Steel High Mast Lighting Poles and Equipment**

**630.07.02.01 Assembly of Sectional Steel High Mast Lighting Poles**

The lifting equipment used in contact with the pole sections shall be non-abrasive in nature.

Sectional steel high mast lighting poles shall be assembled so that all sections for individual poles are matched as fabricated. The completed sectional steel high mast lighting pole shall be according to the overall tolerances specified in the Contract Documents.

**630.07.02.02 Raising and Lowering Equipment**

The raising and lowering equipment and the mechanical and electrical components shall be installed according to the manufacturer's specifications and recommendations.

The raising and lowering equipment manufacturer shall be present during the equipment installation to ensure proper assembly procedures and commissioning.

**630.07.02.03 Pole Installation**

At least 14 Days prior to the start of pole installation, the Contract Administrator shall be informed, in writing, of the pending operation.

The anchorage setting templates shall be removed prior to installation of lighting poles.

The pole shall be installed plumb, with the base plate positioned and the door orientated as specified in the Contract Documents. The pole shall have adequate support during installation. The pole shall not be considered self-supporting until all fasteners in the base are tightened by the turn-of-nut method according to CSA S6.

A 12 mm square, welded, 19 AWG galvanized steel metal mesh shall be placed around the outside circumference of the anchor bolt circle, between the pole base plate and the footing after pole installation is completed.

The orientation of the high mast lighting pole shall be as specified in the Contract Documents.

#### **630.07.02.04 High Mast Lighting Equipment**

High mast lighting equipment shall be installed as specified in the Contract Documents.

#### **630.07.03 Quality Control**

##### **630.07.03.01 Pre-Installation Testing and Inspection**

The pre-installation testing and inspection of the high mast lighting pole complete with raising and lowering equipment, including mechanical and electrical components, shall be according to manufacturer's specification and the Contract Documents.

A letter of compliance from the manufacturer of the sectional steel high mast lighting pole equipment, certifying that the sectional steel high mast lighting pole equipment is according to the Contract Documents shall be submitted to the Contract Administrator by the Contractor.

Testing on the torque limiter shall be conducted on the internal drive raising and lowering equipment and on the portable power drill for the external drive raising and lowering equipment unit. The Contractor shall ensure that the torque limiter is set and functions according to the manufacturer's recommendations. The cord connecting the control to each raising and lowering motor or portable power drill shall be a minimum length of 13 m.

##### **630.07.03.02 Proof of Performance Testing and Inspection**

The ring assembly, including luminaires, and the raising and lowering equipment shall be fully raised, latched, unlatched, and fully lowered a minimum of five times for each installed sectional steel high mast lighting pole. After each raising and lowering sequence, every piece of the raising and lowering equipment shall be inspected to ensure that all components are functioning properly and are not damaged. The cables inside the pole shall be inspected. Twisted cables shall be untwisted prior to each subsequent raising and lowering sequence.

The following shall be inspected:

- a) Winch gear and housing.
- b) Winch cable.
- c) Supporting cables.
- d) Power cable.
- e) Ring assembly.
- f) Latching system.

If problems or deficiencies occur during the testing, the test shall be stopped and the problem or deficiency corrected. Once the problem or deficiency has been corrected, the testing process of the pole and associated material shall be repeated in full.

Each ring assembly and supporting cable shall be inspected and adjusted to ensure that the ring is level.

#### **630.07.03.02.01            Certificate of Conformance**

A Certificate of Conformance shall be submitted to the Contract Administrator upon completion of the work. The Quality Verification Engineer shall affix his or her seal and signature to the completed Certificate of Conformance confirming the following:

- a) All of the high mast equipment at each high mast pole was tested and inspected.
- b) The high mast lighting raising and lowering equipment is in general conformance with the requirements of the Contract Documents.
- c) Each sectional steel high mast lighting pole has been installed plumb with the base plate positioned as specified in the Contract Documents.
- d) Each sectional steel high mast lighting pole and raising and lowering equipment passed the proof of performance testing and inspection.
- e) The torque limiter has been fully tested and verified to be fully functional according to the manufacturer's recommendations and the Contract Documents.
- f) The sectional steel high mast lighting pole jacking and installation procedures have been carried out according to the installation drawings, calculations, and procedures.
- g) At the end of the testing at each sectional steel high mast lighting pole, the ring assembly has been levelled, raised to the top of the pole, and fully and properly docked and latched to the head frame assembly at the top of the pole.

#### **630.07.04                    Document Submission**

The service manual for the high mast lighting equipment shall document in detail the installation and operation of the high mast lighting equipment and components. It shall include clear and detailed illustrations indicating layouts of controls, displays, schematic and wiring diagrams, and other information required to correctly operate a fully assembled and operational high mast lighting unit, as well as the maintenance and service aspects of individual components.

The service manual for the high mast lighting equipment shall include part numbers and settings and options of installation and operation. The manual shall provide sections that completely describe the theory of operation using block diagrams, wiring and schematic diagrams, diagnostic and repair procedures, assembly instructions and drawings, component layout drawings, and acceptable manufacturers and suppliers of miscellaneous component parts.

Each manual for the high mast lighting equipment shall detail all major assembling, adjusting, and aligning procedures and identify all acceptable tolerances or variances. Manuals shall also include:

- a) Detailed specifications of major components.
- b) Copies of the Working Drawings specified in OPSS 2471 and OPSS 2476 reduced to 8½ x 11" paper format.
- c) Component warranty certificates.
- d) Operating instructions.
- e) All other relevant documents or drawings.

**630.07.05                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**630.08                              QUALITY ASSURANCE**

The Owner may make random inspections of individual high mast lighting poles, visually check for proper assembly with related equipment, and witness the raising and lowering of the ring assembly.

**630.09                              MEASUREMENT FOR PAYMENT**

**630.09.01                      Actual Measurement**

**630.09.01.01                      25 m Sectional Steel High Mast Lighting Poles and Equipment  
30 m Sectional Steel High Mast Lighting Poles and Equipment  
35 m Sectional Steel High Mast Lighting Poles and Equipment  
40 m Sectional Steel High Mast Lighting Poles and Equipment  
45 m Sectional Steel High Mast Lighting Poles and Equipment**

For measurement purposes, a count shall be made of the number of each size of sectional steel high mast lighting poles and equipment installed.

**630.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**630.10                              BASIS OF PAYMENT**

**630.10.01                      25 m Sectional Steel High Mast Lighting Poles and Equipment - Item  
30 m Sectional Steel High Mast Lighting Poles and Equipment - Item  
35 m Sectional Steel High Mast Lighting Poles and Equipment - Item  
40 m Sectional Steel High Mast Lighting Poles and Equipment - Item  
45 m Sectional Steel High Mast Lighting Poles and Equipment - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Progress payments shall be based on the following percentages of the Contract price for milestones accepted by the Contract Administrator:

- a) 35% for delivery of all high mast lighting poles and equipment
- b) 5% for certificate of training
- c) 20% for installation of all high mast lighting poles and equipment
- d) 40% for completed and signed Certificate of Conformance for all High Mast Lighting Poles and Equipment

**Appendix 630-A, November 2016**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

**Designer Action/Considerations**

OPSS 1440        Steel Reinforcement for Concrete  
OPSS 1801        Corrugated Steel Pipe (CSP) Products  
OPSS 2474        Anchorage Assembly - High Mast Lighting Pole

**631.03            DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Earth** means as defined in OPSS 206.

**631.05            MATERIALS**

**631.05.01        Concrete**

Concrete shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

**631.05.02        Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

**631.05.03        Structural Steel**

Structural steel shall be according to OPSS 906.

**631.05.04        Corrugated Steel Pipe**

Corrugated steel pipe shall be according to OPSS 1801 and as specified in the Contract Documents.

**631.05.05        Neoprene Pad**

Neoprene pad shall be according to the plain bearing requirements specified OPSS 1202.

**631.05.06        Granular A**

Granular A shall be according to OPSS 1010.

**631.05.07        Sleeves and Ducts**

Sleeves and ducts shall be according to OPSS 603.

**631.05.08        Anchorage Assemblies**

Anchorage assemblies shall be according to OPSS 2474.

## **631.07 CONSTRUCTION**

### **631.07.01 General**

General requirements for electrical work shall be as specified in the Contract Documents.

Concrete footings and maintenance platforms for high mast lighting poles shall be as specified in the Contract Documents.

### **631.07.02 Concrete Footings for High Mast Lighting Poles**

#### **631.07.02.01 Earth Excavation**

Excavation of the pole base shall be to the neat lines and grades specified in the Contract Documents. When additional excavation beyond the neat limits is required, such excavation shall be a minimum of 300 mm beyond the neat dimensions of the footing to accommodate backfill.

The Contractor is responsible for constructing excavations without disturbing the sides or bases of the excavation.

When rock is encountered, the earth excavation shall be widened to the dimensions suitable for rock excavation or rock drilling operations. Rock excavation shall be according to OPSS 603.

The Contractor is advised that variable subsurface conditions may be encountered at the high mast pole locations. When a Foundation Investigation Report containing information on the subsurface conditions is included in the Contract Documents, reference shall be made to the record of borehole nearest the high mast pole footings for an indication of subsurface conditions.

The Contractor shall assume that overburden has zones of non-cohesive soil and occasional cobbles and boulders, and that groundwater levels are near the surface. The Contractor is advised that non-cohesive soil is susceptible to disturbance under conditions of unbalanced hydrostatic head.

#### **631.07.02.02 Caisson Pile**

Caisson piles shall be as specified in the Contract Documents and placed according to OPSS 903.

The base of the caisson or shallow foundation shall be cleaned of loosened or softened materials or both and inspected prior to pouring concrete. Complete documentation of the inspection and installation of each caisson shall be maintained and submitted to the Contract Administrator.

#### **631.07.02.03 Steel Reinforcement**

Steel reinforcement shall be placed according to OPSS 905.

#### **631.07.02.04 Anchorage Assemblies**

Anchorage assemblies of the size, diameter, length, and type specified in the Contract Documents shall be positioned in footings to obtain the proper position and handhole orientation.

The anchorage assemblies, sleeves, and ducts shall be properly placed in the centre of the concrete footings within a 15 mm tolerance.

Anchorage assemblies shall be securely tied to the steel reinforcement and provided with supports to maintain the position of the anchorage assembly during the placing of concrete. The anchorage assembly shall not be welded to the steel reinforcement.

The anchorage setting templates shall remain in place until immediately prior to the installation of the poles.

#### **631.07.02.05                      Sleeves and Ducts**

Sleeves and ducts for footings shall be located to suit incoming duct or cable systems and shall be securely tied to the steel reinforcement and supported prior to the placing of concrete.

The number of sleeves shall be as specified in the Contract Documents.

Sleeves shall be cut off cleanly above the footing to a minimum of 150 mm above the pole base plate.

Sleeves shall be temporarily plugged or sealed until wiring is installed.

#### **631.07.02.06                      Concrete**

Concrete shall be placed according to OPSS 904, except as noted herein.

In earth, concrete may be placed directly against the undisturbed earth or may be formed in place such that a minimum of 300 mm all around the footing is available for the placing of granular backfill. The upper portion of the footing shall be formed to a minimum of 150 mm below grade level. Formwork shall be removed to a minimum depth of 150 mm below finished grade prior to placing granular backfill.

In rock, concrete shall be placed directly against the excavated rock surfaces. Portions of footings in earth above the top of the rock surface shall be formed as noted in the previous paragraph.

Prior to the installation of the pole, the concrete shall have reached the minimum strength specified in the Contract Documents.

Concrete for the high mast lighting pole footings shall be cured according to OPSS 904, except as noted herein.

- a) Wet burlap shall be applied to the top surface of the footing immediately after completion of the finishing operation without damaging or marring the surface of the concrete and shall be kept wet during the curing period.
- b) When white pigmented membrane is used as a curing compound on adjacent concrete barrier wall, a minimum of one coat of the curing compound shall be applied to the concrete footing immediately after completion of the curing cycle for the footing. Additional curing compound shall be applied as necessary to ensure colour uniformity with the adjacent concrete barrier wall.
- c) The curing compound shall only be used on the exposed final surfaces of the footing. Curing compound shall not be applied to construction joints.

#### **631.07.02.07                      Granular Backfill**

Granular A backfill shall be placed around footings in earth and compacted according to OPSS 501.

#### **631.07.02.08                      Granular Apron**

A granular apron consisting of Granular A shall be placed around each high mast lighting pole footing as specified in the Contract Documents.

**631.07.02.09                      Grading**

Earth grading around the high mast lighting pole footings shall be as specified in the Contract Documents and OPSS 206.

**631.07.03                      Maintenance Platforms for High Mast Lighting Poles**

**631.07.03.01                      Neoprene Pad**

The size of the neoprene pad shall be as specified in the Contract Documents.

**631.07.03.02                      Fabrication, Delivery, and Installation**

Fabrication, delivery, and installation of the platform and railing shall be according to OPSS 906 and the Contract Documents.

**631.07.03.03                      Grounding**

Grounding shall be according to OPSS 609.

**631.07.03.04                      Mechanical Concrete Anchors**

Mechanical concrete anchors shall be installed in accordance with the manufacturer's recommendations.

**631.07.04                      Inspection before Installation of High Mast Lighting Poles**

A Request to Proceed shall be submitted to the Contract Administrator prior to the placement of concrete.

The placement of concrete shall not proceed until the Contract Administrator has completed the inspection for earth excavation, caisson pile, steel reinforcement, anchorage assemblies, and sleeves and ducts, and has issued a Notice to Proceed.

**631.07.05                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**631.09                      MEASUREMENT FOR PAYMENT**

**631.09.01                      Actual Measurement**

**631.09.01.01                      Concrete Footings for High Mast Lighting Poles**

For payment purposes, a count shall be made of the number of concrete footings for high mast lighting poles installed.

**631.09.01.02                      Maintenance Platform for High Mast Lighting Poles**

For payment purposes, a count shall be made of the number of maintenance platforms for high mast lighting poles installed.

**631.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**631.10****BASIS OF PAYMENT****631.10.01****Concrete Footings for High Mast Lighting Poles - Item  
Maintenance Platform for High Mast Lighting Poles - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**631.10.02****Rock Excavation for Electrical Installation**

Payment for rock excavation for electrical installation shall be according to OPSS 603.

## 703.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Metal Components** means components including slide assembly, collar assembly, and pipe post.

**Relocation** means to move an existing permanent sign to a new chainage or offset or both.

**Removal** means to remove and dispose of an existing permanent sign or support system or both.

**Sign and Sign Board** means a traffic control device mounted on a fixed support that conveys a specific message by means of symbols and or words, and is officially installed for the purpose of regulating, warning, informing, and guiding traffic.

**Sign Support System** means a wooden or steel post of specified dimensions, hardware, and material installed vertically into the ground or on top of concrete median barrier for mounting signs at a specified height above the roadway.

**Sign Hardware** means metal hardware including, but not limited to, nuts, bolts, washers, spacers, and lock washers for attaching signs to sign support systems.

**Small Sign Assembly** means one or more signs mounted on a sign support system with specified sign hardware having a total sign or sign board area not greater than 3.6 m<sup>2</sup> for ground mounted signs and 1.35 m<sup>2</sup> for signs mounted on concrete median barrier.

## 703.05 MATERIALS

### 703.05.01 General

The Contractor shall select a sign support system for each small sign assembly installation as specified in the Contract Documents.

All supplied components shall be according to the manufacturer's specifications and as specified in the Contract Documents. All sign hardware shall be hot dip galvanized according to ASTM A 153. New sign boards shall be supplied as specified in the Contract Documents.

## **703.05.02                      Wooden Posts**

### **703.05.02.01                  General**

All wooden posts shall be in dressed sizes and pressure treated with wood preservative.

The tolerance on the cross-sectional dimensions of all wooden posts shall be  $\pm 2$  mm.

### **703.05.02.02                  Wood Preservative**

Wood preservative shall be according to CAN/CSA O80 Series, Use Category UC 4.1.

### **703.05.02.03                  Marking of Wood for Identification of Grade and Species**

All wooden posts shall be stamped for species and grading according to CSA O141 by an approved agency authorized by the National Lumber Grade Authority (NLGA). The stamp shall be visible after installation and located at least 1.5 m above the finished grade.

### **703.05.02.04                  Marking of Wood for Identification of Preservative Treatment**

All wooden posts shall be stamped for wood preservative treatment from a treatment plant certified under the Canadian Wood Preservation Certification Authority (CWPCA). The wood preservative stamp shall be visible after installation and located at least 1.5 m above the finished grade.

## **703.05.03                      Metal Posts**

### **703.05.03.01                  Metal Components and Hardware**

All metal components and hardware shall be as specified in the Contract Documents.

All metal components after fabrication shall be filed smooth and surface free of foreign materials before being hot dip galvanized according to ASTM A 123.

All sign hardware except setscrews shall be hot dip galvanized according to ASTM A 153. All setscrews shall be stainless steel.

## **703.05.04                      Signs**

Signs shall be according to OPSS 2001.

## **703.07                          CONSTRUCTION**

### **703.07.01                      General**

All breakaway and non-breakaway sign support systems shall be installed according to the manufacturer's specifications and as specified in the Contract Documents at locations specified in the Contract Documents.

All sign boards shall be installed according to OTM Book 1B and as specified in the Contract Documents.

All signs shall be installed, relocated, or removed at locations specified in the Contract Documents. Signs shall be installed so that they do not obstruct and are not obstructed by existing permanent signs or other objects. The Contract Administrator shall be notified prior to installation of sign supports if it is not possible to install a new or relocated sign as specified in the Contract Documents due to this requirement.

Signs shall be covered temporarily for traffic operational reasons when directed by the Contract Administrator. Signs shall be covered so they are not visible to approaching motorists. The cover shall remain securely in place until the signs are appropriate for display as directed by the Contract Administrator. The covering material shall not damage or make any marks on the signs.

Acceptable material from post hole excavation shall be used as backfill around posts and compacted according to OPSS 501.

Posts shall be plumbed within a tolerance of  $\pm 20$  mm. The sign shall be levelled on a multiple post system within a tolerance of  $\pm 10$  mm.

Back-to-back signs may be installed on single or multiple posts. The sign support system shall be selected based on the largest sign area on one side of the post.

Cut ends and field drilled holes shall receive two applications of 2% copper naphthenate wood preservative. Field applied wood preservative that comes in contact with any metal components shall be removed immediately.

Damaged and cut areas of hot dip galvanized coatings on any galvanized components shall be repaired according to ASTM A 780.

#### **703.07.02 Sign Supply**

Signs shall be supplied by the Owner or by the Contractor as specified in the Contract Documents.

##### **703.07.02.01 Owner Supplied Signs**

###### **703.07.02.01.01 Sign Ordering**

The Contractor shall submit a list of signs required for this Contract to the Contract Administrator. The list of signs shall contain the quantity and details of the signs and the date for pick up by the Contractor. The list of signs shall be submitted a minimum of 12 weeks prior to the pickup date.

###### **703.07.02.01.02 Sign Pickup**

The Contractor shall pickup all the ordered signs on the list of required signs at a location provided in the Contract Documents to be supplied by the Owner within 10 Business Days of receiving notice from the Contract Administrator that the signs are ready for pickup. The Contractor shall ensure that all signs are safely secured and packaged prior to transporting the signs.

###### **703.07.02.01.03 Sign Confirmation and Inspection**

The Contractor shall within 5 Business Days confirm in writing with the Contract Administrator that all the ordered signs were received in accordance with the list of required signs. The Owner shall be notified of any incorrect signs identified by the Contractor. The Contractor shall be responsible for the cost of replacing all damaged, missing, and incorrect signs subsequent to the Contractor's order confirmation.

##### **703.07.02.02 Contractor Supplied Signs**

The Contractor shall supply all signs as specified in the Contract Documents.

### **703.07.03 New Signs**

New sign boards shall be attached to new sign support systems with sign hardware as specified in the Contract Documents.

### **703.07.04 Installation on Concrete Median Barrier**

All sign support systems on top of concrete median barrier shall be installed as specified in the Contract Documents.

The top of all concrete barriers shall be ground smooth to provide a uniform flat surface over the length of the slide assembly and steel base prior to installation of anchors.

### **703.07.05 Relocation of Signs**

Relocated sign boards shall be attached to new support systems with sign hardware as specified in the Contract Documents. No portion of the existing sign, support system, and sign hardware shall be left at the original sign location and any excess material including support system and sign hardware shall be managed as specified in the Contract Documents or as directed by the Contract Administrator.

### **703.07.06 Removal of Signs**

Upon removal, sign boards shall be defaced with commercially available paint in a manner that makes them unusable to guide traffic.

No portion of the removed sign, support system, and sign hardware shall be left at the original sign location and any excess materials shall be managed as specified in the Contract Documents.

### **703.07.07 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **703.09 MEASUREMENT FOR PAYMENT**

### **703.09.01 Actual Measurement**

#### **703.09.01.01 Small Signs, Ground Mounted, New Small Signs, Concrete Median Barrier Mounted with Wooden Post, New Small Signs, Concrete Median Barrier Mounted with Metal Post, New**

For measurement purposes, a count shall be made of the number of new small sign assemblies installed.

#### **703.09.01.02 Small Signs, Relocation**

For measurement purposes, a count shall be made of the number of small sign assemblies relocated.

#### **703.09.01.03 Small Signs, Removal**

For measurement purposes, a count shall be made of the number of small sign assemblies removed.

### **703.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**703.10**

**BASIS OF PAYMENT**

**703.10.01**

**Small Signs, Ground Mounted, New - Item**

**Small Signs, Concrete Median Barrier Mounted with Wooden Post, New - Item**

**Small Signs, Concrete Median Barrier Mounted with Metal Post, New - Item**

**Small Signs, Relocation - Item**

**Small Signs, Removal - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

## **CONSTRUCTION SPECIFICATION FOR POST MOUNTED DELINEATORS**

### **704.01 SCOPE**

This specification covers the requirements for the installation of post mounted delineators.

### **704.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

#### **Ontario Provincial Standard Specifications, Material**

OPSS 2001    Signs

#### **Ontario Ministry of Transportation Publications**

Ontario Traffic Manual (OTM):  
Book 11 - Pavement, Hazard and Delineation Markings

#### **ASTM International**

A36 / A36M - 19    Carbon Structural Steel

A123 / A123M - 17 Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products  
A153 / A153M - 16a Zinc Coating (Hot-Dip) on Iron and Steel Hardware  
D4956 - 19 Retroreflective Sheeting for Traffic Control

## **704.05 MATERIALS**

### **704.05.01 Delineator Posts**

Delineator post dimensions shall be as specified in the Contract Documents.

Delineator posts shall be fabricated from steel according to ASTM A36M and hot dip galvanized after fabrication according to ASTM A123M.

### **704.05.02 Hardware**

Hardware shall be as specified in the Contract Documents. All hardware shall be hot dip galvanized according to ASTM A153M.

### **704.05.03 Delineators**

Delineators shall be outfitted with high intensity retroreflective sheeting according to ASTM D4956, Type III or IV; and the colour according to OTM Book 11. Dimensions shall be as specified in the Contract Documents. Sign blanks shall be metal and according to OPSS 2001 with dimensions as specified in the Contract Documents.

## **704.07 CONSTRUCTION**

### **704.07.01 General**

Post mounted delineators shall be installed plumb and set according to alignment and grade according to and at the locations and spacing specified in the Contract Documents.

### **704.07.02 Delineators**

Delineators shall be mounted on the posts as specified in the Contract Documents. Delineators shall be centred vertically and horizontally over the post holes. The type shall be as specified in the Contract Documents.

### **704.07.03 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **704.09 MEASUREMENT FOR PAYMENT**

### **704.09.01 Actual Measurement**

#### **704.09.01.01 Post Mounted Delineators**

For measurement purposes, a count shall be made of the number of complete post mounted delineators installed.

**704.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**704.10 BASIS OF PAYMENT**

**704.10.01 Post Mounted Delineators - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Costs associated with any required removals and replacement or repairs of defective work and materials shall be the Contractor's responsibility at no additional cost to the Owner.

Designated Sources for Materials (DSM)

## **ASTM International**

D4956 - 19     Retroreflective Sheeting for Traffic Control

### **705.03                      DEFINITIONS**

For the purpose of this specification, the following definition applies:

**Flexible Delineator Post** means a tubular plastic marker installed vertically for the purpose of channelizing traffic or delineating roadside features in temporary or permanent applications. The tubular post is securely fixed to the ground surface by hinged (flexible) connection to a solid base. When impacted by a vehicle, the post has the ability to bend 90° from vertical and self-restore following impacts.

### **705.04                      DESIGN AND SUBMISSION REQUIREMENTS**

#### **705.04.01                      Submission Requirements**

One copy of the manufacturer's installation instructions shall be submitted to the Contract Administrator.

Installation of the flexible delineator posts shall not commence until the Contract Administrator has received the copy of the instructions.

### **705.05                      MATERIALS**

#### **705.05.01                      Flexible Delineator Posts**

Flexible delineator posts shall be supplied from a source named on the ministry's DSM.

All supplied system components shall be according to the manufacturer's specifications.

The height of the post shall be as specified in the Contract Documents.

The post colour shall match the colour of the reflective sheeting.

To maintain a visually consistent installation, only one product shall be used on the Contract.

#### **705.05.02                      Anchor and Support Hardware**

Anchor and support hardware used to fix the flexible delineator post to the ground surface shall be supplied by the manufacturer.

#### **705.05.03                      Reflective Sheeting**

Flexible delineator posts shall be outfitted with high intensity retroreflective sheeting according to ASTM D4956, Type III or IV. For permanent conditions, the colour shall be according to OTM Book 11. For temporary conditions, the colour shall be according to OTM Book 7. Dimensions, spacing, and quantity shall be as specified in the Contract Documents.

#### **705.05.04 Temporary Flexible Delineator Posts**

Temporary flexible delineator posts may be reused provided each post meets each of the following criteria:

- a) The ability to bend 90° from vertical and self-restore to a vertical position after impacts.
- b) The base is intact and permits anchorage to the ground surface that is equivalent to a new post.
- c) The post is intact without any cracks or fissures.
- d) The retroreflective sheeting is fully intact with only minor tears or scratches that do not affect the reflectivity of the sheeting.

#### **705.07 CONSTRUCTION**

##### **705.07.01 General**

Permanent and temporary flexible delineator posts shall be installed and securely fixed to the ground surface according to the manufacturer's instructions at locations specified in the Contract Documents.

##### **705.07.02 Relocation of Temporary Flexible Delineator Posts**

Flexible delineator posts shall be relocated as specified in the Contract Documents, including the removal of existing and installation of new anchorage hardware and adhesives.

All holes resulting from the relocation of the delineator post assemblies shall be filled with a hot poured rubberized asphalt joint sealing compound according to OPSS 1212 when they are located in areas not to be resurfaced as part of the Work. At the time of filling, the holes shall be dry and free of dust and debris.

##### **705.07.03 Maintenance of Temporary Flexible Delineator Posts**

Flexible delineator posts shall be maintained for the duration of the construction period for which they are required.

Flexible delineator posts shall be monitored daily. Missing or broken flexible delineator posts shall be replaced within 48 hours.

Posts that do not have a uniform or satisfactory appearance to the satisfaction of the Contract Administrator shall be replaced or corrected within 48 hours of notification.

##### **705.07.04 Removal of Temporary Flexible Delineator Posts**

Flexible delineator posts and associated hardware and adhesives shall be removed at the completion of the construction period for which they were required.

All holes resulting from the removal of the delineator post assemblies shall be filled with a hot poured rubberized asphalt joint sealing compound according to OPSS 1212 when located in areas not to be resurfaced as part of the Work. At the time of filling, the holes shall be dry and free of dust and debris.

##### **705.07.05 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**705.09 MEASUREMENT FOR PAYMENT**

**705.09.01 Actual Measurement**

**705.09.01.01 Flexible Delineator Post - Permanent**

For measurement purposes, a count shall be made of the number of complete flexible delineator posts installed.

**705.09.01.02 Flexible Delineator Post - Temporary**

For measurement purposes, a count shall be made of the number of complete flexible delineator posts installed and removed, up to the maximum number of flexible delineator posts required to be in place at any one time during the Contract.

**705.09.01.03 Flexible Delineator Post - Relocation**

For measurement purposes, a count shall be made of the number of complete flexible delineator posts relocated. Flexible delineator posts that are temporarily surplus and are required for future stages shall be paid for as one relocation for the combined moves into and out of storage, including any off-site storage required due to on-site restrictions.

**705.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**705.10 BASIS OF PAYMENT**

**705.10.01 Flexible Delineator Post - Permanent - Item  
Flexible Delineator Post - Temporary - Item  
Flexible Delineator Post - Relocation - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract contains separate items for the work required by this specification, payment shall be at the Contract price and according to the specification for such work.

Costs associated with any required removals and replacement or repairs of defective work and materials shall be the Contractor's responsibility at no additional cost to the Owner.

|---------------|--------------|
| <b>706.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for the use of temporary traffic control devices during construction.

#### **706.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **706.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **706.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications or publications:

### **Ontario Provincial Standard Specifications, Construction**

OPSS 703                      Permanent Small Signs and Support Systems

### **Ontario Provincial Standard Specifications, Material**

OPSS 2001                      Signs

### **Ontario Ministry of Transportation Publications**

Ontario Traffic Manual (OTM):  
Book 7 – Temporary Conditions (Office and Field Editions)

Designated Sources for Materials (DSM)

## **706.03 DEFINITIONS**

**Temporary Traffic Control Signs** means all traffic control signs and associated devices identified in OTM Book 7, including vehicles and sign trailers required to support signs and equipment to supply sign lighting; but excludes highway number markers.

**Small Sign** means small sign as defined in OPSS 703.

## **706.04 DESIGN AND SUBMISSION REQUIREMENTS**

A copy of the traffic control plan shall be submitted to the Contract Administrator at the pre-work meeting.

## **706.05 MATERIALS**

### **706.05.01 Retroreflective Sheeting**

Retroreflective sheeting shall be according to OPSS 2001.

### **706.05.02 Automated Flagger Assistance Devices**

Automated flagger assistance devices (AFAD) shall be according to OTM Book 7.

### **706.05.03 Temporary Traffic Control Signs**

Temporary traffic control signs shall be according to OTM Book 7.

### **706.05.04 Portable Variable Message Signs**

Portable variable message signs (PVMS) shall be supplied from a source named on the ministry's DSM.

#### **706.05.04.01 Modem**

Modem requirements for PVMS shall be as specified in the Contract Documents.

## **706.07 CONSTRUCTION**

### **706.07.01 Temporary Traffic Control Signs**

#### **706.07.01.01 General**

The work of temporary traffic control signs shall include:

- a) Installation and relocation according to OTM Book 7 unless otherwise specified in the Contract Documents.
- b) Temporarily relocating, modifying as required, and reinstalling existing small signs.
- c) Installing and removing contract information signs.
- d) Installing and removing Speed Fines Doubled (TC-90) signs.

Messaging for all temporary traffic control signs shall be according to OTM Book 7 unless otherwise specified in the Contract Documents.

When a Contract is in a designated bilingual area, bilingual temporary traffic control signs shall be installed. If a bilingual temporary traffic control sign is not available, then the French temporary traffic control sign shall be installed. A French Construction Zone Begins sign (Rb-90AF) and a French Construction Zone Ends sign (Rb-90BF) shall be installed next to the corresponding English Rb-90A and Rb-90B signs. All other French temporary traffic control signs shall be installed 150 m downstream from the English sign.

Temporary traffic control signs shall be installed before work affecting traffic begins, remain operational throughout the duration of the operation requiring signs and be removed upon completion of the operation.

Prior to seasonal shutdown, temporary traffic control signs shall be reviewed and signs that are not required during the seasonal shutdown period shall be removed. At the end of the seasonal shutdown period, the removed signs shall be reinstalled as required.

The condition of the temporary traffic control signs shall meet the quality replacement guidelines specified in OTM Book 7 for the duration of the Work. Signs that do not meet the guidelines shall be removed and replaced.

#### **706.07.01.02                      Existing Small Signs**

Any existing small signs, excluding Tourism-Oriented Directional Signing and Logo Sign Program signs, removed to accommodate construction shall be kept operational by placement on a temporary support. Temporarily relocated existing small signs shall be kept at the same height, offset and approximate location from traffic as before relocation. All existing small signs shall be reinstalled, at or as close as possible to the original location, according to OPSS 703 upon completion of the Work.

Temporary modifications to existing small signs shall be according to OTM Book 7 unless otherwise specified in the Contract Documents.

#### **706.07.01.03                      Contract Information Signs**

Contract information signs shall be installed according to OTM Book 7 and removed upon completion of the Work. Contract information signs shall be either a TC-81 sign or an Owner supplied contract information sign.

Owner supplied contract information signs shall be picked up at the location specified in the Contract Documents. The Contractor shall arrange for the pickup of the signs. At Contract Completion, Owner supplied contract information signs shall be returned to the Owner at a location specified by the Contract Administrator.

#### **706.07.02                              Road Closing/Restriction Notice Sign (TC-64)**

Road closing/restriction notice (TC-64) signs shall be installed and relocated at locations specified in the Contract Documents. Timing requirements for TC-64 signs shall be as specified in OTM Book 7.

The Contract Administrator shall be notified when the Contractor's operations results in changes to the TC-64 sign message details (i.e. dates, times, etc.).

#### **706.07.03                              Automated Flagger Assistance Devices**

AFAD shall be installed, relocated and removed at locations as specified in the Contract Documents.

If the closure extends across an entrance or side road, a traffic control person shall also be present to direct traffic with a stop/slow paddle according to OTM Book 7.

#### **706.07.04                              Portable Variable Message Sign**

Installation, including the construction of a temporary base, relocation, and messaging on the PVMS shall be as specified in the Contract Documents. The exact location of the PVMS shall be proposed by the Contractor and shall meet the following criteria:

- a) Maximizes visibility for motorists without impacting safety in accordance with the ministry's clear zone requirements.
- b) Installed on a level surface with adequate bearing capacity to support the weight of the PVMS and temporary base materials.

The Contract Administrator shall approve the location of the PVMS prior to it being deployed. The Contractor Administrator shall be notified at least 2 Business days in advance regarding the delivery, relocation, and removal of PVMS within the construction work zone.

Modem installation, testing, and decommissioning for the PVMS shall be as specified in the Contract Documents.

The PVMS control box shall be secured from entry by unauthorized personnel. There shall be security measures or devices in place to prevent message tampering of the sign.

All PVMS and any temporary base shall be removed upon completion of the Work.

#### **706.07.04.01 Maintenance of Portable Variable Message Sign**

Maintenance shall be performed for the continuous operation of the PVMS, as required, throughout the duration of the Contract. Daily inspection of the PVMS shall be conducted to ensure that the PVMS meets the following maintenance requirements:

- a) PVMS sign face is aimed with the sign sight tube to the center of the approach roadway approximately 200m upstream of the sign to ensure maximum visibility.
- b) Solar panels are tilted and rotated to face south.
- c) All pixels and LEDs in the sign face remain operational.
- d) Sign is elevated to its maximum height with the locking pin in place; sign face is to be regularly cleaned from dirt, road salt or debris that may obstruct the visibility of the sign.
- e) Batteries are replaced as needed to ensure that battery levels are maintained per the supplier's operational requirements.
- f) Modems and other remote communications equipment remain operational.

Immediate repairs shall be required whenever there is a failure or cessation of the operation of any component or components of the PVMS. The Contract Administrator shall be notified immediately each time repair work is performed on a PVMS.

#### **706.07.05 Management of Excess Materials**

Management of excess materials shall be according to the Contract Documents.

### **706.09 MEASUREMENT FOR PAYMENT**

#### **706.09.01 Actual Measurement**

##### **706.09.01.01 Automated Flagger Assistance Devices**

For measurement purposes, a count shall be made of the number of AFAD installed.

**706.09.01.02                      Portable Variable Message Sign (Temporary)**

For measurement purposes, a count shall be made of the number of PVMS installed.

**706.09.01.03                      Portable Variable Message Sign, Relocation**

For measurement purposes, a count shall be made of the number of PVMS relocated.

PVMS that are temporarily surplus for intermediate stages but will be required later shall be paid as one relocation for the combined moves into and out of the site storage, including any off-site storage required due to space restrictions.

**706.09.01.04                      Road Closing/Restriction Notice Signs (TC-64)**

For measurement purposes, a count shall be made of the number of TC-64 signs installed.

**706.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**706.10                                BASIS OF PAYMENT**

**706.10.01                          Automated Flagger Assistance Devices – Item  
Portable Variable Message Sign (Temporary) – Item  
Portable Variable Message Sign, Relocation - Item**

Payment at the Contract price for the above item shall be full compensation for all labour, Equipment, and Material to do the work.

**706.10.02                          Temporary Traffic Control Signs - Item**

Payment at the Contract price for the above item shall be full compensation for all labour, Equipment, and Material to do the work.

For progress payment, fifty percent of the Contract price shall be paid upon the supply and installation of the complete initial traffic control plan. The balance will be prorated over the balance of the Contract Time.

Reinstallation of temporary traffic control signs after seasonal shutdown shall be at no additional cost to the Owner.

**706.10.03                          Road Closing/Restriction Notice Signs (TC-64) - Item**

Payment at the Contract price for the above item shall be full compensation for all labour, Equipment, and Material to do the work.

Changes to the TC-64 sign message details (i.e. dates, times, etc.) required as a result of the Contractor's operations shall be completed at no additional cost to the Owner.

Progress payments shall be made as follows:      60% of the unit price per sign upon installation;  
                                                                                 20% of the unit price per sign upon relocation;  
                                                                                 20% of the unit price per sign upon removal.

If no relocation is required:

60% of the unit price per sign upon installation;  
40% of the unit price per sign upon removal.

On each occasion when the Contractor fails to install the TC-64 signs according to the requirements of this specification, or fails to remove the TC-64 signs within two hours of re-opening of the affected roadway, a payment reduction of \$2,000.00 shall be assessed. A further payment reduction of \$2,000.00 per Day, or part thereof, with no maximum payment reduction, shall be assessed until such time as the TC-64 signs are removed.

#### **706.10.04                      Removals and Replacements**

The removal and replacement of defective workmanship or materials shall be at no additional cost to the Owner.

**Appendix 706-A, November 2016**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

**Designer Action/Considerations**

|               |              |
|---------------|--------------|
| <b>707.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for the installation of new overlay signboards on existing overhead extruded signboards.

|               |                     |
|---------------|---------------------|
| <b>707.07</b> | <b>CONSTRUCTION</b> |
|---------------|---------------------|

|                  |                |
|------------------|----------------|
| <b>707.07.01</b> | <b>General</b> |
|------------------|----------------|

All existing overlay signboard panels shall be removed by drilling out all pop rivets used to fasten it to the extruded sign.

New overlay signboard panels shall be installed according to the sign details.

Aluminum pop rivets, 1/8" X 7/16", shall be used to install the overlay panel directly on top of the existing extruded sign. The rivets shall be spaced around the perimeter of each overlay panel 25 mm (1") from the edge of the panel at 150 mm (6") centre to centre spacing.

Inside each 1220 mm (4') panel, 6 aluminum pop rivets shall be inserted equally spaced 610 mm (24") from the edge of the panel. Inside each 914 mm (3') panel, 6 aluminum pop rivets shall be inserted equally spaced 450 mm (18") from the edge of the panel. If the panel is over 1830 mm (6') in height, 6 pop rivets shall be installed equally spaced 450 mm (18") from the edge of the panel.

To ensure panels do not peel, ¼ " stainless steel self-tapping screws shall be attached to the corners of all overlay panels, regardless of size.

#### **707.07.02 Sign Ordering**

The following shall be submitted to the Contract Administrator a minimum of 12 weeks prior to the installation date:

- a) List of all required overlay signboards,
- b) Sign details for the overlay signboards, and
- c) Date for pick-up.

#### **707.07.03 Sign Pick up**

All ordered signboards shall be picked up at the location specified in the "Schedule of Materials to be Supplied by the Owner" within 10 Business Days of receiving notice from the Contract Administrator that the signs are ready for pick up.

#### **707.07.04 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **707.09 MEASUREMENT FOR PAYMENT**

#### **707.09.01 Actual Measurement**

##### **707.09.01.01 Modified Overhead Signboards**

For measurement purposes, a count shall be made of each modified signboard installed.

#### **707.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

### **707.10 BASIS OF PAYMENT**

#### **707.10.01 Modified Overhead Signboards - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

### **APPENDICES**

|              |                   |
|--------------|-------------------|
| <b>708-A</b> | <b>Commentary</b> |
|--------------|-------------------|

|               |              |
|---------------|--------------|
| <b>708.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for the installation, operation and maintenance of portable temporary traffic signals.

#### **708.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **708.01.02                      Appendices Significance and Use**

Appendices are not for use in provincial Contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner.

Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their Contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **708.02                      REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Ministry of Transportation Publications**

Designated Sources for Materials (DSM)

Ontario Traffic Manual (OTM):  
Book 7, Temporary Conditions  
Book 12, Traffic Signals

## **708.03                      DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Portable Temporary Traffic Signals (PTTS)** means two traffic control signal heads mounted onto a movable trailer.

## **708.05                      MATERIALS**

### **708.05.01                      Portable Temporary Traffic Signals**

Portable temporary traffic signals shall be supplied from a source named on the ministry's DSM.

The traffic control signal heads shall have a minimum vertical mounting height of 5 metres for both the primary and secondary signal heads.

The primary and secondary signal heads shall be separated by a minimum of 3.0 metres measured laterally.

The signal heads shall be reversible on the trailer's boom.

Highway yellow backboards shall be used on each signal head.

All signal lenses shall comply with the Institute of Transportation Engineers interim/final specifications for incandescent or light emitting diode lamps for chromaticity and luminous intensity.

#### **708.05.02 Temporary Illumination**

Temporary illumination shall be provided for all PTTS installations being used at night. Temporary illumination shall meet the following requirements:

- a) A minimum of one luminaire shall be mounted over each PTTS trailer.
- b) Each luminaire shall have a minimum light output of 22,000 lumens.
- c) Each luminaire shall be mounted a minimum of 9 metres vertically above the roadway surface.
- d) The temporary illumination shall be powered by generator or line power.
- e) Temporary illumination shall be on from dusk until dawn. If the temporary illumination has a photo controller, then the temporary illumination shall be switched on when ambient light levels are at 16 Lux and lower and switched off when ambient light levels are at 50 Lux and higher.

#### **708.07 CONSTRUCTION**

##### **708.07.01 General**

PTTS and its temporary illumination shall be installed and relocated at the locations specified in the Contract Documents, or on the signed legal drawing (PHM-125). PTTS shall be installed on a level and stable surface that allows for on-site maintenance and service of the units.

The PTTS shall be positioned to prevent displacement or damage by weather, maintenance activities, vehicle impact or vandalism.

The Contract Administrator shall be given a minimum of 24-hour notice prior to the activation of the PTTS. The PTTS shall be activated in the presence of the Contract Administrator.

##### **708.07.02 Operational Constraints**

Operation of PTTS shall be permitted between April 1st and November 30th of each calendar year. The operation of PTTS outside of this period shall not be permitted unless otherwise specified in the Contract Documents. If PTTS are permitted outside of this period, the PTTS shall be configured with environmental controls to permit operation at any temperature.

When not in use, the PTTS shall be removed or the traffic control signal heads covered or turned up and/or away from the roadway.

### **708.07.03 Operational Capabilities**

#### **708.07.03.01 Portable Traffic Control Signals**

The installation and operation of portable temporary traffic signals shall be according to the OTM Book 7 and the traffic control signal head display criteria specified in OTM Book 12.

PTTS shall have the following operational capabilities:

- a) Pre-timed signal operations where the green time, the amber clearance, and the all red times can be manually input to the controller.
- b) Fully actuated operation using a variety of detection devices including loops, microwave, video or non-loop in-pavement detection equipment that will:
  - i) Place a call for a green indication when red or amber is being displayed.
  - ii) Extend the green indication from a minimum to a maximum green time by a user selectable amount each time a vehicle is detected during the green display (extension time).
- c) Rest in red or the last phase served. The user must be able to select this mode through software input on a construction site.
- d) The user must be able to manually enter a minimum green time, a maximum green time, and an extension time for actuated operations.
- e) All timing intervals are capable of being set in increments of one second.
- f) Default mode – flashing red shall display in both directions (at both master and local trailers) at the same time.
- g) Manual mode – shall allow an operator to interrupt the other modes and return to the previous mode when finished.
- h) Default mode warning system – the PTTS shall have the email, text messaging or cell/satellite paging warning system activated and monitored, to advise the Owner/operator and/or Contractor when the signals have gone into the “default mode”.
- i) Be able to communicate between the master and local units through either radio or hardwire with conflict monitoring enabled to ensure malfunctions are identified. The units shall be set up so that if communications are lost, both units will revert to “default mode” operation.
- j) All conflicts must be recorded in an error log with the exact date and time of the occurrence. The error log must be retrievable by the Owner.

#### **708.07.03.02 Trailer Unit**

Each PTTS trailer unit shall have the following operational capabilities:

- a) Be able to operate as either a master or local.
- b) Be interconnected by either hardwire or radio.

#### **708.07.03.03 Controller**

Each controller shall have the following operational capabilities:

- a) Be capable of providing variable all red clearance intervals between 0 – 600 seconds.
- b) Have circuitry that detects low voltage and prevents the occurrence of an unsafe (conflicting) signal indication. In the event of low voltage the signal must default to a flashing all red.
- c) Must be password protected or have other security devices in place to prevent program tampering.
- d) Provide a red flash cycle that is flashed continuously at a rate of 50 – 60 times per minute with a 50% duty cycle.
- e) If a radio interconnection is used then the system must have a mobile license from Industry Canada.

#### **708.07.03.04                      Power Supply**

The PTTS shall be powered by one or more of the following methods:

- a) Generator
- b) Solar power
- c) Electrical line power

If a generator is being used to power the PTTS and temporary illumination, suitable housing and sound reduction measures shall be installed to enclose the generator and reduce external noise levels to less than 45 dBA measured at a distance of 7 metres from the generator. The housing shall provide sufficient ventilation to prevent overheating and permit exhausting of any hazardous fumes.

The PTTS shall have a battery backup with a battery capacity sufficient to operate the system for a minimum of 14 days without recharging.

The power supply and other electronic controls shall be completely inaccessible to unauthorized personnel and protected by a sturdy, lockable metal enclosure.

#### **708.07.04                      Traffic Signal Control Programming and Timing**

A technical expert knowledgeable in the operation of the PTTS shall be at the site to provide assistance during the initial set-up of the unit and shall remain on site until the unit is operating to the satisfaction of the Contract Administrator.

The traffic signal timing as specified in the Contract Documents shall be programmed into the traffic signal controller.

The controller shall be set up by performing all programming, setting all timing controls, switch settings and conflict monitoring.

#### **708.07.05                      Temporary Traffic Signals Supplied by Owner**

Where the Owner supplies the PTTS, the PTTS shall be picked up and transported from the Owner's premises as specified in the Contract Documents. Once the PTTS is placed into operation, the operation, and maintenance of the PTTS shall be completed at no additional cost to the Owner.

PTTS shall be returned to the Owner's premises or to an alternate site specified by the Contract Administrator within 7 Days of being taken out of operation.

#### **708.07.06 Maintenance of Portable Temporary Traffic Signals**

Routine, non-routine and emergency maintenance work required for continuous and proper operation of the PTTS shall be performed as specified in the Contract Documents.

A technical expert shall be available on-call 24 hours a day, 7 days a week, to troubleshoot any PTTS problems on site and perform all work required to restore the PTTS to full operation.

When directed by the Contract Administrator, the traffic signal operation shall be manually overridden to reduce or eliminate queuing traffic.

A logbook shall be maintained and kept with the PTTS or at a location agreed upon with the Owner. The logbook shall record any fieldwork performed on the PTTS system, including the replacement of any hardware, changes to the software, or changes to the configuration, phasing, or timing parameters. The time and date of each entry in the logbook shall be signed by the individual making the entry.

#### **708.09 MEASUREMENT FOR PAYMENT**

##### **708.09.01 Portable Temporary Traffic Signals**

For measurement purposes, a count shall be made of the number of PTTS installed. Each PTTS shall be counted only once, regardless of the number of times it is relocated.

##### **708.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

#### **708.10 BASIS OF PAYMENT**

##### **708.10.01 Portable Temporary Traffic Signals - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work, including all relocations of the PTTS.

Site visits by the technical expert required to restore the PTTS to full operation shall be at no additional cost to the Owner.

**Appendix 708-A, November 2016**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

## 709.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Intermediate Sign Assembly** means one or more plywood sign boards with a total area not greater than 7.2 m<sup>2</sup> mounted on a metal post breakaway sign support system with specified sign hardware.

**Relocation** means to move an existing permanent sign to a new chainage or offset or both.

**Removal** means to remove and dispose of an existing permanent sign or support system or both.

**Sign Board** means a traffic control device mounted on a fixed support that conveys a specific message by means of symbols and or words, and is officially installed for the purpose of regulating, warning, informing, and guiding traffic.

**Sign Hardware** means hardware including, but not limited to, nuts, bolts, washers, spacers, and lock washers for attaching sign boards to sign support systems.

**Sign Support System** means a steel post of specified dimensions, hardware, and material embedded vertically into the ground for mounting sign boards at a specified height above the roadway and ground. The system may consist of a single, double, or triple post configuration.

## 709.05 MATERIALS

### 709.05.01 General

A sign support system shall be used for each intermediate sign assembly installation as specified in the Contract Documents.

New sign boards shall be supplied as specified in the Contract Documents.

### 709.05.02 Metal Posts and Components

All supplied metal posts, bolts, washers, keeper plates, and nuts shall be according to the manufacturer's specifications and as specified in the Contract Documents.

All metal posts shall be hot dip galvanized after fabrication according to ASTM A 123.

All sign hardware shall be hot dip galvanized according to ASTM A 153.

### 709.05.03 Signs

Signs shall be according to OPSS 2001.

## **709.07 CONSTRUCTION**

### **709.07.01 General**

Intermediate sign support systems shall be installed at locations specified in the Contract Documents and according to the manufacturer's instructions by installers trained by the manufacturer's direct representative.

All sign boards shall be installed according to OTM Book 1B and as specified in the Contract Documents.

All sign boards shall be installed, relocated, or removed at locations specified in the Contract Documents. Sign boards shall be installed so that they do not obstruct and are not obstructed by existing permanent sign boards or other objects. The Contract Administrator shall be notified prior to installation of sign supports if it is not possible to install a new or relocated sign board as specified in the Contract Documents due to this requirement.

Sign boards shall be covered temporarily for traffic operational reasons when directed by the Contract Administrator. Sign boards shall be covered so they are not visible to approaching motorists. The cover shall remain securely in place until the sign boards are appropriate for display as directed by the Contract Administrator. The covering material shall not damage or make any marks on the sign boards.

Acceptable material from post hole excavation shall be used as backfill around posts and compacted according to OPSS 501.

Posts shall be plumb within a tolerance of  $\pm 20$  mm. The sign board shall be levelled on a two-post system within a tolerance of  $\pm 10$  mm.

Damaged and cut areas of hot dip galvanized coatings on any galvanized components shall be repaired according to ASTM A 780.

### **709.07.02 Sign Board Supply**

Sign boards shall be supplied by the Owner or by the Contractor as specified in the Contract Documents.

#### **709.07.02.01 Owner Supplied Sign Boards**

#### **709.07.02.02 Sign Board Ordering**

The Contractor shall submit a list of sign boards required for this Contract to the Contract Administrator. The list of sign boards shall contain the quantity and details of the sign boards and the date for pick up by the Contractor. The list of sign boards shall be submitted a minimum of 12 weeks prior to the pickup date.

#### **709.07.02.03 Sign Board Pickup**

The Contractor shall pickup all the ordered sign boards on the list of required sign boards at a location provided in the Contract Documents to be supplied by the Owner within 10 Business Days of receiving notice from the Contract Administrator that the sign boards are ready for pickup. The Contractor shall ensure that all sign boards are safely secured and packaged prior to transporting the sign boards.

#### **709.07.02.04 Sign Board Confirmation and Inspection**

The Contractor shall within 5 Business Days confirm in writing with the Contract Administrator that all the ordered sign boards were received in accordance with the list of required sign boards. The Owner shall be notified of any incorrect sign boards identified by the Contractor. The Contractor shall be responsible

for the cost of replacing all damaged, missing, and incorrect sign boards subsequent to the Contractor's order confirmation.

**709.07.02.05 Contractor Supplied Sign Boards**

The Contractor shall supply all sign boards as specified in the Contract Documents.

**709.07.03 New Sign Boards**

New sign boards shall be attached to new sign support systems with sign hardware as specified in the Contract Documents.

**709.07.04 Relocation of Sign Boards**

Relocated sign boards shall be attached to new support systems with sign hardware as specified in the Contract Documents. No portion of the existing sign board, support system, and sign hardware shall be left at the original sign location and any excess material including support system and sign hardware shall be managed as specified in the Contract Documents or as directed by the Contract Administrator.

**709.07.05 Removal of Sign Boards**

No portion of the removed sign board, support system, and sign hardware shall be left at the original sign location.

Upon removal, sign boards shall be defaced with commercially available paint in a manner that makes them unusable to guide traffic.

**709.07.06 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**709.09.0 MEASUREMENT FOR PAYMENT**

**709.09.01 Actual Measurement**

**709.09.01.01 Intermediate Signs, Ground Mounted, New**

For measurement purposes, a count shall be made of the number of new intermediate sign assemblies installed.

**709.09.01.02 Intermediate Signs, Relocation**

For measurement purposes, a count shall be made of the number of intermediate sign assemblies relocated.

**709.09.01.03 Intermediate Signs, Removal**

For measurement purposes, a count shall be made of the number of intermediate sign assemblies removed.

**709.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**709.10.0 BASIS OF PAYMENT**

**709.10.01 Intermediate Signs, Ground Mounted, New - Item  
Intermediate Signs, Relocation - Item  
Intermediate Signs, Removal - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Costs associated with any required repairs or removals and replacements of defective materials shall be the Contractor's responsibility at no additional cost to the Owner.

## **CONSTRUCTION SPECIFICATION FOR STEEL BEAM GUIDE RAIL AND CABLE GUIDE RAIL**

| <b>721.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for the installation of steel beam guide rail and cable guide rail systems.

#### **721.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **721.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **721.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

OPSS 501      Compacting

### **Ontario Provincial Standard Specifications, Material**

OPSS 1350      Concrete - Materials and Production  
OPSS 1503      Cable Guide Rail  
OPSS 1504      Steel Beam Guide Rail  
OPSS 1505      Channel Components for Steel Beam Guide Rail  
OPSS 1601      Wood, Preservative Treatment, and Shop Fabrication

### **Ontario Ministry of Transportation Publications**

### **721.05 MATERIALS**

#### **721.05.01 Cable Guide Rail**

Guide rail cable, fittings, cable clamps and nails, and steel sections for anchor blocks shall be according to OPSS 1503.

Guide rail posts shall be clean peeled according to CAN/CSA O56, and according to OPSS 1601.

Precast concrete anchor blocks shall be according to OPSS 1503.

Reflectorized strips on 0.5 mm thick aluminum sheet shall be according to OTM Book 11 and as specified in the Contract Documents.

#### **721.05.02 Steel Beam Guide Rail**

Steel beam guide rail shall be according to OPSS 1504.

Channel components shall be according to OPSS 1505.

Wooden posts and blocks shall be according to OPSS 1601.

Plastic blocks shall be as specified in the Contract Documents.

Steel sleeves and spacer tubes used in transition treatments to concrete structures shall be fabricated from Schedule 40 galvanized steel pipe.

Steel posts, sleeves, and spacer tubes shall be hot dip galvanized after fabrication according to CSA G164.

Steel posts shall be according to ASTM A 36.

Reflectors shall have a minimum reflective surface of 100 x 100 mm; high intensity retroreflective sheeting according to ASTM D 4956, Type VII; colour according to OTM Book 11; and flexibility to bend 90 degrees from vertical and self restore.

#### **721.05.03 Fabricated Steel Bases**

Fabricated steel bases shall be according to OPSS 1503.

#### **721.05.04 Concrete**

Concrete shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

## **721.07 CONSTRUCTION**

### **721.07.01 General**

Guide rail systems shall be installed plumb and to the alignment and grade as specified in the Contract Documents, regardless of the material encountered.

Tops of wooden posts shall be cut as specified in the Contract Documents and treated with two coats of 2% copper naphthenate wood preservative. Field applied wood preservative that comes in contact with any galvanized components shall be removed immediately.

Acceptable material from posthole or anchor block excavation shall be used as backfill around posts and compacted according to OPSS 501.

When required, fabricated steel bases shall be installed level and square to the centreline of the roadway.

Cut ends, field drilled holes, and damaged areas of hot dip galvanized coatings on any galvanized component shall be repaired according to ASTM A 780.

Flame cutting shall not be permitted.

### **721.07.02 Cable Guide Rail**

#### **721.07.02.01 Installation**

Cable guide rail shall be installed as specified in the Contract Documents.

Wooden posts shall be installed to the specified depth with the larger end of the post in the ground.

Cable shall be attached to guide rail posts using cable clamps and nail fasteners.

Cable mounting height shall be measured from the top of final shoulder grade at the post face. Cable height shall be adjusted to provide a smooth installation.

Cables shall be tensioned so that the sag between posts shall be a maximum of 6 mm.

Cable splices occurring on the same cable shall be spaced a minimum length of 15 m apart.

There shall be only one cable splice per panel, regardless of the number of cables in the system.

#### **721.07.02.02 Anchor Blocks**

Precast or cast-in-place cubical or cylindrical anchor blocks shall be installed as specified in the Contract Documents, regardless of the material encountered.

In porous or crumbly soil, forms for cast-in-place anchors shall be used to prevent contamination of the concrete. Forms may be left in place or removed.

Earth backfill and granular materials shall be compacted according to OPSS 501.

### **721.07.02.03                      Reflectorized Strips**

Reflectorized strips shall be installed:

- a) starting at the second post from the approach end.
- b) at a maximum interval of every fifth post on tangent.
- c) at a maximum interval of every third post on curves.
- d) ending on the second to last post.

The reflectorized strip shall be fastened on posts as specified in the Contract Documents using two 50 mm aluminum nails.

### **721.07.02.04                      Adjust Cable Guide Rail**

Cable guide rail shall be adjusted at locations as specified in the Contract Documents.

Cable guide rail adjustment shall be as specified in the Contract Documents and include:

- a) the removal of the following:
  - i. staples and spacers or cable clamps and nails
  - ii. reflectorized strips
  - iii. cables as salvage
- b) the installation of the following:
  - i. salvaged cables
  - ii. new cable clamps and nails
  - iii. new reflectorized strips

To facilitate cable tensioning, one new turnbuckle assembly shall be installed on each cable between each set of adjacent anchor blocks. Cables shall be tensioned so that the sag between posts shall be a maximum of 6 mm.

### **721.07.02.05                      Cable Guide Rail Post Replacement**

Existing cable guide rail posts shall be removed and replaced with new cable guide rail posts at locations as specified in the Contract Documents and installed as specified in the Cable Guide Rail Installation clause. The Contractor shall confirm the locations with the Contractor Administrator prior to commencing the removal of existing posts.

### **721.07.03                          Steel Beam Guide Rail**

#### **721.07.03.01                      Installation**

Steel beam guide rail shall be installed as specified in the Contract Documents.

Each steel beam guide rail installation may incorporate either steel posts with either plastic or routed wooden blocks or wooden posts with wooden blocks, but not both. Wooden posts shall only be permitted within steel post installations when wooden posts are specified for guide rail end treatments. Extension of an existing wooden post installation using steel posts shall only be permitted when the extension length is greater than 100 m.

Different types of plastic and wooden blocks shall not be used together within a steel beam guide rail installation.

When a transition to a rigid obstacle is required, the offset block for the channel may be either wood or a pipe sleeve over the connecting bolt. The pipe sleeve shall be 89 mm OD galvanized steel pipe cut to the required length.

Backup plates, steel spacer tubes, and pipe sleeves shall be installed as specified in the Contract Documents.

All joints shall be lapped in the direction of traffic.

Bolts shall be tightened to 100 N·m. Bolts for wooden post installations shall be field cut as required to maintain a maximum protrusion of 10 mm beyond the nut. The cut end of the bolt shall be ground smooth with all sharp edges and burrs removed.

Steel beam guide rail mounting heights shall be measured vertically from the top of the steel beam guide rail.

Steel beam guide rail without channel mounting heights shall be within the following ranges:

- a) 685 to 760 mm during construction and seasonal shutdown.
- b) 685 to 735 mm upon completion of the work.

Steel beam guide rail with channel mounting heights shall be within the following ranges:

- a) 685 to 785 mm during construction and seasonal shutdown.
- b) 735 to 785 mm upon completion of the work.

Where curb with gutter is required, steel beam guide rail mounting heights shall be measured:

- a) Vertically at face of steel beam guide rail, when face of steel beam guide rail is more than 300 mm beyond the gutter line.
- b) Vertically at the gutter line, when face of steel beam guide rail is 300 mm or less beyond the gutter line.

#### **721.07.03.02 Reflectors**

Reflectors shall be installed:

- a) starting at the fifth post from the approach end of a steel beam guide rail end treatment.
- b) at a maximum interval of every tenth post on tangent.
- c) as specified in OTM Book 11, Table 4, on curves.
- d) ending on the last post of the steel beam guide rail installation.
- e) on the posts at the four adjacent steel beam guide rail splices at the approach and leaving end of structures.

The reflector shall be fastened to the post using adhesives, bolts and nuts, or screws with reflective surfaces clear above the top of the posts. One-sided reflectors shall be installed on divided highways and two-sided reflectors shall be installed on undivided highways.

#### **721.07.03.03                      Steel Beam Guide Rail Structure Connections**

Steel beam guide rail shall be connected to new or existing structure walls as specified in the Contract Documents.

#### **721.07.03.04                      Adjust Steel Beam Guide Rail**

Steel beam guide rail shall be adjusted at locations as specified in the Contract Documents.

Steel beam rail elements, channel elements, and offset blocks shall be disassembled from the posts. Post bolts, washers, nuts and existing steel offset blocks shall be removed and disposed of as specified in the Contract Documents.

Steel beam rail elements, channel elements, wooden offset blocks, and plastic offset blocks, shall be salvaged for reinstallation. Washers from the front face of the existing steel beam guide rail shall not be reinstalled.

Salvaged steel beam rail elements, channel elements, and wooden or plastic offset blocks shall be reinstalled within the mounting height ranges as specified in the Steel Beam Guide Rail Installation clause using new post bolts, washers, and nuts.

For steel post adjustment, the post shall be raised a minimum of 50 mm above the specified height and then driven down to the required depth before the salvaged steel beam guide rail components are reinstalled. When existing steel offset blocks have been removed, new wooden or plastic offset blocks shall be installed. A new hole shall be field punched through the existing post as specified in the Contract Documents.

For wooden post adjustment, a new hole shall be field drilled through the existing post as specified in the Contract Documents. The top of the offset block shall not extend beyond the top of the existing post. When channel elements are being reinstalled, an additional hole shall be field drilled through the existing post as specified in the Contract Documents.

New reflectors shall be supplied and installed as specified in the Reflectors clause. When new reflectors are installed on a wooden post system, the reflector shall be installed on the approach transverse face of the wooden offset block with one edge 12 mm from edge of post.

#### **721.07.04                              Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **721.09                                  MEASUREMENT FOR PAYMENT**

#### **721.09.01                              Actual Measurement**

##### **721.09.01.01                          Cable Guide Rail**

Measurement of cable guide rail shall be by length in metres along the centreline of the system from centre of anchor block to centre of anchor block at each end of an installation. No additions shall be made for the overlapping length of cable at intermediate anchor blocks.

#### **721.09.01.02                      Adjust Cable Guide Rail**

Measurement of adjust cable guide rail shall be by length in metres along the centreline of the system from centre of anchor block to centre of anchor block at each end of an installation. No additions shall be made for the overlapping length of cable at intermediate anchor blocks.

#### **721.09.01.03                      Cable Guide Rail Post Replacement**

For measurement purposes, a count shall be made of the number of cable guide rail post replacement installed.

#### **721.09.01.04                      Anchor Blocks**

For measurement purposes, a count shall be made of the number of anchor blocks installed.

#### **721.09.01.05                      Single Rail Steel Beam Guide Rail Single Rail Steel Beam Guide Rail with Channel Double Rail Steel Beam Guide Rail**

Measurement of steel beam guide rail shall be by length in metres along the centreline of the system from end to end of each steel beam guide rail installation. The length includes all treatments, transitions, and connections, but does not include terminal systems.

#### **721.09.01.06                      Adjust Steel Beam Guide Rail, Wooden Posts Adjust Steel Beam Guide Rail, Steel Posts Adjust Steel Beam Guide Rail, Steel Posts with Steel Offset Blocks**

Measurement of adjust steel beam guide rail shall be by length in metres along the centreline of the adjusted system from end to end of each steel beam guide rail installation. The length includes all treatments, transitions, connections, and terminal systems.

#### **721.09.01.07                      Steel Beam Guide Rail Structure Connections**

For measurement purposes, a count shall be made of the number of steel beam guide rail structure connections installed.

#### **721.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

#### **721.10                                BASIS OF PAYMENT**

**721.10.01                          Cable Guide Rail - Item  
Adjust Cable Guide Rail - Item  
Cable Guide Rail Post Replacement - Item  
Anchor Blocks - Item  
Single Rail Steel Beam Guide Rail - Item  
Single Rail Steel Beam Guide Rail with Channel - Item  
Double Rail Steel Beam Guide Rail - Item  
Adjust Steel Beam Guide Rail, Wooden Posts - Item  
Adjust Steel Beam Guide Rail, Steel Posts - Item  
Adjust Steel Beam Guide Rail, Steel Posts with Steel Offset Blocks - Item  
Steel Beam Guide Rail Structure Connections - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When there is not a separate tender item for steel beam guide rail structure connections, payment at the Contract price for single rail steel beam guide rail with channel shall include full compensation for all labour, Equipment, and Material to do the work of connecting steel beam guide rail to a structure.

Costs associated with any required repairs or removal and replacement of defective materials shall be the Contractor's responsibility at no additional cost to the Owner.

**Appendix 721-A, November 2015**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

|--------------|-------------------|
| <b>723-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **723.01 SCOPE**

This specification covers the requirements for the installation of permanent and temporary energy attenuators and relocation of temporary energy attenuators.

#### **723.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **723.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **723.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

### **723.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Dual Duty** means a new high exposure energy attenuator that is supplied and installed in a temporary configuration during construction, temporarily relocated as required, and then relocated to its permanent location prior to the end of the Work.

**High Exposure** means an energy attenuator that is installed in a location where the risk of impact is expected to be high such as in gore areas at exit ramps and express - collector transfers.

**Reduced Exposure** means a temporary energy attenuator that is installed in a location where the risk of impact is expected to be low. These energy attenuators should be specified in a location where they will be required for short duration of less than four months, are frequently relocated, and where they are not required during seasonal shutdown.

### **723.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **723.04.01 Design Requirements**

The energy attenuator manufacturer shall complete the design of any non-standard details (e.g., a connection or transition to a rigid object other than a concrete barrier or temporary concrete barrier) at locations specified in the Contract Documents.

#### **723.04.02 Submission Requirements**

One copy of the manufacturer's installation instructions and Working Drawings shall be submitted to the Contract Administrator.

Installation of the energy attenuator shall not commence until the Contract Administrator has received the copy of the instructions and Working Drawings.

#### **723.04.02.01 Submission Requirements for Non-Standard Details**

Three copies of Working Drawings, prepared by the manufacturer, for any non-standard details shall be submitted to the Contract Administrator prior to the commencement of construction. The Working Drawings shall show full details of the materials and installation procedures. An Engineer's seal and signature shall be affixed on the Working Drawings verifying that the drawings are consistent with the Contract Documents. The submission of Working Drawings shall be accompanied by 3 copies of a letter that has been signed by the manufacturer, on company letterhead, summarizing the details of the proposed design.

Installation of the energy attenuator shall not commence until the Contract Administrator has received and accepted the copy of the letters and Working Drawings.

## **723.05 MATERIALS**

### **723.05.01 General**

All supplied system components shall be according to the manufacturer's specifications.

### **723.05.02 Energy Attenuator Systems**

The names of systems acceptable for the Energy Attenuator - Permanent items are shown in Table 1.

The names of systems acceptable for the Energy Attenuator - Temporary items are shown in Table 2.

The Contractor shall have the option of supplying and installing any of these approved systems shown for the appropriate tender item.

### **723.05.03 Concrete**

Concrete for pads and anchor blocks shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

### **723.05.04 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

### **723.05.05 Anchor Bolts**

Anchor bolts shall be supplied and installed according to energy attenuator manufacturer recommendations.

### **723.05.06 Bolts for Connection of BB-BEAT System to Concrete Barrier**

Bolts used to connect the BB-BEAT system to the concrete barrier shall be according to ASTM A 325 and shall be hot dip galvanized according to ASTM A 123.

### **723.05.07 U Channel Posts**

Posts shall be 2.44 m long perforated steel U channel with 11 mm diameter holes spaced on 50 mm centres, minimum weight of 4.46 kg/m, and hot dip galvanized according to ASTM A 123.

### **723.05.08 Flexible Delineator Posts**

Flexible delineator posts shall be according to OPSS 705. The post colour shall be orange.

### **723.05.09 Reflective Sheeting**

Flexible delineator posts shall be outfitted with high intensity retroreflective sheeting according to ASTM D 4956, Type IV; white colour; and to the dimensions specified in the Contract Documents.

### **723.05.10 Reuse of Materials**

Notwithstanding subsection GC 5.02, Quality of Material, paragraph 01 of the General Conditions of Contract, the reuse of materials is permitted for temporary energy attenuator installations and relocations, provided the components have not been damaged to affect the safety performance of the system.

## **723.07 CONSTRUCTION**

### **723.07.01 General**

Permanent and temporary energy attenuators shall be installed according to manufacturer's instructions at locations specified in the Contract Documents. A reference for energy attenuator Contract Drawing Notation is shown in Table 3.

Energy attenuators shall not be placed on surfaces with a crossfall greater than 6%.

### **723.07.02 Permanent Installation**

#### **723.07.02.01 New Concrete Pads**

Levelling and site preparation required for the existing granular base shall be performed prior to placing the concrete pad. The concrete pad shall be constructed as specified in the Contract Documents. Concrete shall be placed, cured, and finished according to OPSS 904.

The granular base below new concrete pads shall be a minimum depth of 150 mm of existing or new Granular A and shall be according to OPSS 314.

#### **723.07.02.02 Existing Concrete Surfaces and Pads**

When specified in the Contract Documents, existing 200 mm thick concrete surfaces, pads, or precast pads may be used to support the energy attenuator.

#### **723.07.02.03 Connection of BB-BEAT and QuadTrend Systems to Concrete Barrier**

When the BB-BEAT or QuadTrend system is connected to new concrete barrier, the adjacent 4.0 m of concrete barrier shall be according to OPSS 740 and the Contract Documents.

When the BB-BEAT or QuadTrend system is connected to existing concrete barrier, the adjacent 4.0 m of existing concrete barrier shall be removed according to OPSS 510 and a new 4.0 m section of concrete barrier shall be installed according to OPSS 740 and the Contract Documents.

#### **723.07.02.04 Rear Cable Anchor Blocks for QuadTrend Systems**

Rear cable anchor blocks shall be as specified in the Contract Documents. In both earth and rock fills, rear cable anchor blocks shall be placed on slopes 3H:1V or flatter. The cable supplied with the unit shall be used to determine the proper location of the rear cable anchor block.

In porous or crumbly soils, forms for cast-in-place anchor blocks shall be used to prevent contamination of the concrete. Forms may be left in place or removed.

The top of the concrete block shall be flush with the embankment slope and the rear cable anchor assembly shall not protrude more than 100 mm above ground.

#### **723.07.02.05 Damage to Galvanizing**

Precautions shall be taken to protect galvanizing against damage. Minor abrasions shall be repaired according to ASTM A 780. Components with major abrasions shall be replaced.

The method of repair for any damage shall be approved by the Contract Administrator prior to the commencement of such work.

#### **723.07.02.06 Posts for BB-BEAT Systems**

All posts shall be set to the alignment specified in the Contract Documents, regardless of the material encountered. Permissible tolerance for plumb shall be 20 mm maximum over the post length above the ground. The driving of posts shall be accomplished with methods and equipment that leave the posts free of distortion, burring, and any other damage.

All lower end posts shall be installed so that not more than 100 mm is exposed above finished grade.

#### **723.07.03 Temporary Installation**

##### **723.07.03.01 Existing Concrete Surface**

Existing 200 mm minimum thick concrete surfaces, pads, or precast pads may be used to support the energy attenuator.

##### **723.07.03.02 Asphalt Over Concrete**

Existing or new 75 mm minimum thick asphalt over 75 mm minimum thick concrete pavement may be used to support the energy attenuator.

##### **723.07.03.03 Asphalt Over Compacted Granular**

Existing or new 150 mm minimum thick asphalt over 150 mm minimum thick compacted granular base may be used to support the energy attenuator. The asphalt shall extend a minimum of 500 mm beyond the anchor bolts.

##### **723.07.03.04 Reduced Exposure**

When water filled energy attenuator systems are in use, the temperature shall be monitored on a daily basis. When the temperature is predicted to fall below freezing, antifreeze agents according to manufacturer recommendations shall be added to the water. The use of a water filled energy attenuator system when frozen is not permissible.

Water filled energy attenuator systems shall not be left in place during a seasonal shutdown period without approval from the Contract Administrator. When approval from the Contract Administrator is not granted, water filled energy attenuator systems shall be replaced with another approved energy attenuator listed for the reduced exposure tender item for the duration of the seasonal shutdown period.

Disposal of liquid materials shall be managed according to the Contract Documents.

##### **723.07.03.05 Dual Duty**

A new high exposure energy attenuator shall be supplied and installed in a temporary configuration during construction at the locations specified in the Contract Documents.

##### **723.07.03.06 Relocation**

Temporary energy attenuators, object markers, oversize snowplow markers, object marker posts, and flexible delineator posts shall be relocated as specified in the Contract Documents, including the removal of existing and installation of new anchor bolts and mounting hardware.

Prior to completion of the Contract, dual duty energy attenuators and associated object markers, oversize snowplow markers, and object marker posts including the replacement of anchor bolts and mounting hardware, shall be relocated to their permanent locations as specified in the Contract Documents and in accordance with the General and Permanent Installation subsections.

### **723.07.03.07                      Permanent and Temporary Concrete Barriers**

Temporary concrete barriers shall be modified and installed as specified in the Contract Documents and the modified surfaces shall be smooth. Temporary concrete barriers shall be anchored as specified in the Contract Documents.

Permanent existing concrete barriers shall be modified as specified in the Contract Documents and the modified surfaces shall be smooth.

### **723.07.04                      Delineation**

#### **723.07.04.01                      Object Markers and Oversize Snowplow Markers**

A Wa-33 object marker according to OTM Book 6, a Wz-2 oversize snowplow marker, and galvanized mounting hardware shall be installed at each energy attenuator.

When installed on a paved surface, the object marker and oversize snowplow marker shall be integrally attached to a surface mounted flexible post. The signs and post shall be supplied by the manufacturer as a complete unit. The post shall have the ability to bend 90° from vertical and self-restore after impacts. The minimum outside diameter of the post shall be 60 mm. The post shall be anchored to the pavement according to manufacturer's recommendations.

When installed on a granular surface, the Wa-33 object marker and Wz-2 oversize snowplow marker shall be securely fastened to a U channel post and the post shall be direct buried to a minimum embedment depth of 900 mm.

Posts shall be installed at locations specified in the Contract Documents.

#### **723.07.04.02                      Flexible Delineator Posts**

Flexible delineator posts shall be installed according to OPSS 705 at locations specified in the Contract Documents.

### **723.07.05                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **723.09                      MEASUREMENT FOR PAYMENT**

### **723.09.01                      Actual Measurement**

#### **723.09.01.01                      Energy Attenuator - Permanent, Narrow Energy Attenuator - Permanent, Wide Energy Attenuator - Permanent, Extra Wide Energy Attenuator - Permanent, Super Wide Energy Attenuator - Permanent, High Exposure Energy Attenuator - Permanent, Single-Sided**

For measurement purposes, a count shall be made of the number of complete energy attenuator systems installed.

#### **723.09.01.02                      Energy Attenuator - Temporary, Narrow Energy Attenuator - Temporary, Wide Energy Attenuator - Temporary, Extra Wide Energy Attenuator - Temporary, Super Wide**

**Energy Attenuator - Temporary, Reduced Exposure**  
**Energy Attenuator - Temporary, Dual Duty**

For measurement purposes, a count shall be made of the number of complete energy attenuator systems installed and removed, up to the maximum number of systems required to be in place at any one time during the Contract.

**723.09.01.03**      **Energy Attenuator - Relocation, Narrow**  
**Energy Attenuator - Relocation, Wide**  
**Energy Attenuator - Relocation, Extra Wide**  
**Energy Attenuator - Relocation, Super Wide**  
**Energy Attenuator - Relocation, Reduced Exposure**  
**Energy Attenuator - Relocation, Dual Duty**

For measurement purposes, a count shall be made of the number of complete energy attenuator systems relocated. Systems that are temporarily surplus and are required for future stages shall be paid for as one relocation for the combined moves into and out of storage, including any off-site storage required due to on-site restrictions.

**723.09.02**      **Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**723.10**      **BASIS OF PAYMENT**

**723.10.01**      **Energy Attenuator - Permanent, Narrow - Item**  
**Energy Attenuator - Permanent, Wide - Item**  
**Energy Attenuator - Permanent, Extra Wide - Item**  
**Energy Attenuator - Permanent, Super Wide - Item**  
**Energy Attenuator - Permanent, High Exposure - Item**  
**Energy Attenuator - Permanent, Single-Sided - Item**  
**Energy Attenuator - Temporary, Narrow - Item**  
**Energy Attenuator - Temporary, Wide - Item**  
**Energy Attenuator - Temporary, Extra Wide - Item**  
**Energy Attenuator - Temporary, Super Wide - Item**  
**Energy Attenuator - Temporary, Reduced Exposure - Item**  
**Energy Attenuator - Temporary, Dual Duty - Item**  
**Energy Attenuator - Relocation, Narrow - Item**  
**Energy Attenuator - Relocation, Wide - Item**  
**Energy Attenuator - Relocation, Extra Wide - Item**  
**Energy Attenuator - Relocation, Super Wide - Item**  
**Energy Attenuator - Relocation, Reduced Exposure - Item**  
**Energy Attenuator - Relocation, Dual Duty - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract contains separate items for the work required by this specification, payment shall be at the Contract price and according to the specification for such work.

Costs associated with any required removals and replacement or repairs of defective work and materials shall be the Contractor's responsibility at no additional cost to the Owner.

|---------------|--------------|
| <b>732.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the requirements for the installation of steel beam energy attenuating terminal (SBEAT) systems.

**732.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **732.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **732.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Material**

OPSS 1601 Wood, Preservative Treatment, and Shop Fabrication

### **Ontario Ministry of Transportation Publications**

Ontario Traffic Manual (OTM):  
Book 6 - Warning Signs

### **ASTM International**

A 123/A 123M-09 Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products  
A 780/A 780M-09 Standard Practice for Repair of Damaged and Uncoated Areas of Hot Dip Galvanized Coatings

## **732.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **732.04.01 Submission Requirements**

One copy of the manufacturer's installation instructions and Working Drawings for each type of SBEAT system to be installed shall be submitted to the Contract Administrator.

Installation of the SBEAT system shall not commence until the Contract Administrator has received the copy of the installation instructions and Working Drawings.

## **732.05 MATERIALS**

### **732.05.01 General**

All supplied system components shall be according to the manufacturer's specifications.

### **732.05.02 U Channel Posts**

Posts shall be 2.44 m long perforated steel U channel with 11 mm diameter holes spaced on 50 mm centres, minimum weight of 4.46 kg/m, and hot dip galvanized according to ASTM A 123/A 123M.

## **732.07 CONSTRUCTION**

### **732.07.01 General**

SBEAT systems shall be installed according to manufacturer's instructions at the locations specified in the Contract Documents.

When an SBEAT system is specified in the Contract Documents, the Contractor has the option of using one of the following systems:

- a) Extruder Terminal system
- b) Sequential Kinking Terminal system
- c) X-Lite Tangent Terminal system
- d) SoftStop Terminal system

When an SBEAT Type M system is specified in the Contract Documents, the Contractor has the option of using one of the following systems:

- a) MGS – ET-Plus 31 Terminal System
- b) MGS – SoftStop Terminal System
- c) MGS – Sequential Kinking Terminal System
- d) MGS – X-Lite Terminal System

SBEAT systems with steel posts shall be installed to steel beam guide rail systems with steel posts.

SBEAT systems with wooden posts shall be installed to steel beam guide rail systems with wooden or steel posts.

SBEAT systems shall be installed according to the manufacturer's instructions at locations as specified in the Contract Documents using only the components supplied for a particular SBEAT system unit.

A minimum 2 m wide area behind the posts, measured from the back of the posts shall be clear of all obstacles for the entire length of the SBEAT system.

### **732.07.02 Posts and Steel Foundation Tubes**

All posts and steel foundation tubes shall be set to the depth and alignment at locations specified in the Contract Documents, regardless of the material encountered.

Wooden post tops shall be cut to the height and to the chamfer as specified in the Contract Documents.

All holes shall be drilled in the wooden posts prior to installation and in the steel posts prior to galvanizing.

The predrilled holes and the cut tops of the wooden posts shall be treated with two coats of an approved wood preservative according to OPSS 1601.

All lower hinge break away posts, steel foundation tubes, and soil plates shall be installed so that no more than 100 mm is exposed above finished grade.

#### **732.07.03 Steel Beam Guide Rails**

SBEAT systems shall be connected to new or existing steel beam guide rail as specified in the Contract Documents.

SBEAT system and SBEAT Type M System mounting heights shall be measured vertically from the top of the steel beam guide rail to the ground or gutter line. SBEAT system mounting heights shall be within the ranges in Table 1. SBEAT Type M system mounting heights shall be within the ranges in Table 2.

Where curb with gutter is required, steel beam guide rail mounting height shall be measured:

- a) Vertically at face of steel beam guide rail, when face of steel beam guide rail is more than 300 mm beyond gutter line.
- b) Vertically at gutter line, when face of steel beam guide rail is 300 mm or less beyond the gutter line.

Channel shall not be used within the SBEAT system.

#### **732.07.04 Damage to Galvanizing**

Precautions shall be taken to protect galvanizing against damage. Minor abrasions shall be repaired according to ASTM A 780/A 780M. Components with major abrasions shall be replaced.

The method of repair for any damage shall be approved by the Contract Administrator prior to the commencement of such work.

#### **732.07.05 Object Markers and Oversize Plow Markers**

A Wa-33 object marker according to OTM Book 6, a Wz-2 oversize snow plow marker, and galvanized mounting hardware shall be installed at each energy attenuator.

When installed on a paved surface, the object marker and oversize snow plow marker shall be integrally attached to a surface mounted flexible post. The signs and post shall be supplied by the manufacturer as a complete unit. The post shall have the ability to bend 90 degrees from vertical and self-restore after impacts. The minimum outside diameter of the post shall be 60 mm. The post shall be anchored to the pavement according to the manufacturer's recommendations.

When installed on a granular surface, the Wa-33 object marker and Wz-2 oversize snow plow marker shall be securely fastened to a U channel post and the post shall be direct buried to a minimum embedment depth of 900 mm.

Posts shall be installed at locations as specified in the Contract Documents.

**732.07.06                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**732.09                              MEASUREMENT FOR PAYMENT**

**732.09.01                      Actual Measurement**

**732.09.01.01                  Steel Beam Energy Attenuating Terminal System**

For measurement purposes, a count shall be made of each complete steel beam energy attenuating terminal system installed, regardless of the type of steel beam energy attenuating terminal system placed.

**732.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the unit shown in the clause under Actual Measurement.

**732.10                              BASIS OF PAYMENT**

**732.10.01                      Steel Beam Energy Attenuating Terminal System - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Costs associated with any required removals and replacement or repairs of defective materials shall be the Contractor's responsibility at no additional cost to the Owner.

**TABLE 1**  
**SBEAT System Mounting Heights**

| <b>System</b>               | <b>Height During Construction<br/>and Seasonal Shutdown<br/>mm</b> | <b>Height for Completion<br/>of the Work<br/>mm</b> |
|-----------------------------|--------------------------------------------------------------------|-----------------------------------------------------|
| Extruder Terminal           | 685 to 760                                                         | 685 to 735                                          |
| Sequential Kinking Terminal | 685 to 760                                                         | 685 to 735                                          |
| X-Lite Tangent Terminal     | 685 to 760                                                         | 685 to 735                                          |
| SoftStop Terminal           | 760 to 810                                                         | 760 to 810                                          |

**TABLE 2**  
**SBEAT Type M System Mounting Heights**

| <b>System</b>                   | <b>Height During Construction<br/>and Seasonal Shutdown<br/>mm</b> | <b>Height for Completion<br/>of the Work<br/>mm</b> |
|---------------------------------|--------------------------------------------------------------------|-----------------------------------------------------|
| MGS ET-Plus 31 Terminal         | 760 to 810                                                         | 760 to 810                                          |
| MGS SoftStop Terminal           | 760 to 810                                                         | 760 to 810                                          |
| MGS Sequential Kinking Terminal | 760 to 810                                                         | 760 to 810                                          |
| MGS X-Lite Tangent Terminal     | 760 to 810                                                         | 760 to 810                                          |

| A 780/A 780M-09 (2015) | Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings |

## **733.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **733.04.01 Submission Requirements**

Installation of the SBT system shall not commence until the Contract Administrator has received one copy of the manufacturer's installation instructions.

## **733.05 MATERIALS**

### **733.05.01 General**

All supplied system components shall be according to the manufacturer's specifications.

### **733.05.02 U Channel Posts**

Posts shall be 2.44 m long perforated steel U channel with 11 mm diameter holes spaced on 50 mm centres, minimum weight of 4.46 kg/m, and hot dip galvanized according to ASTM A 123.

## **733.07 CONSTRUCTION**

### **733.07.01 General**

SBT systems shall be installed according to the manufacturer's instructions at locations specified in the Contract Documents using only the components supplied for a particular steel beam terminal system.

The MASH Slotted Rail Terminal (MSRT) M10 Guardrail End Treatment system shall be used for all SBT installations.

A minimum 2 m wide area behind the posts, measured from the back of the posts, shall be clear of all obstacles for the entire length of the SBT.

### **733.07.02 Posts and Steel Foundation Tubes**

All posts and steel foundation tubes shall be set to the depth and alignment at locations specified in the Contract Documents, regardless of the material encountered.

The lower anchor cable release steel post shall be installed so that no more than 100 mm is exposed above finished grade.

### **733.07.03 Steel Beam Guide Rails**

SBT systems shall be connected to new or existing steel beam guide rail as specified in the Contract Documents.

SBT system mounting heights shall be measured vertically from the top of the steel beam guide rail to the ground. SBT system mounting heights shall be within the ranges in Table 1.

### **733.07.04 Damage to Galvanizing**

Precautions shall be taken to protect galvanizing against damage. Minor abrasions shall be repaired according to ASTM A 780. Components with major abrasions shall be replaced.

The method of repair for any damage shall be approved by the Contract Administrator prior to the commencement of such work.

**733.07.05                      Object Markers and Oversize Plow Markers**

A Wa-33 object marker according to OTM Book 6, a Wz-2 oversize snow plow marker, and galvanized mounting hardware shall be installed at each SBT.

When installed on a granular surface, the Wa-33 object marker and Wz-2 oversize snow plow marker shall be securely fastened to a U channel post and the post shall be direct buried to a minimum embedment depth of 900 mm.

Posts shall be installed at locations as specified in the Contract Documents.

**733.07.06                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**733.09                              MEASUREMENT FOR PAYMENT**

**733.09.01                      Actual Measurement**

**733.09.01.01                  Steel Beam Terminal System**

For measurement purposes, a count shall be made of each complete steel beam terminal system installed, regardless of the type of steel beam end terminal system placed.

**733.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the unit shown in the clause under Actual Measurement.

**733.10                              BASIS OF PAYMENT**

**733.10.01                      Steel Beam Terminal System - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Costs associated with any required removals and replacement or repairs of defective work and materials shall be the Contractor's responsibility at no additional cost to the Owner.

**TABLE 1**  
**Steel Beam Terminal System Mounting Heights**

| <b>System</b>                         | <b>Height During Construction<br/>and Seasonal Shutdown<br/>mm</b> | <b>Height for Completion<br/>of the Work<br/>mm</b> |
|---------------------------------------|--------------------------------------------------------------------|-----------------------------------------------------|
| MASH Slotted Rail Terminal (MSRT) M10 | 760 to 810                                                         | 760 to 810                                          |

### **740.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Asymmetric** means the barrier placed where the pavement elevations on each side of the barrier differ.

### **740.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **740.04.01 Submission Requirements**

A request shall be submitted to the Contract Administrator for permission to use a concrete barrier design other than as specified in the Contract Documents. The request shall be submitted at least 4 weeks prior to starting any work affected by the proposed change.

### **740.05 MATERIALS**

#### **740.05.01 Concrete**

Concrete shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa, except that tall wall concrete barrier shall have a nominal minimum 28-Day compressive strength of 35 MPa. Coarse aggregate for the concrete shall have a nominal maximum size of 19.0 mm.

All coarse aggregate used for slip-formed tall wall concrete barrier shall have all faces crushed.

#### **740.05.02 Curing**

Membrane curing compound shall be according to OPSS 1315. Burlap shall be according to OPSS 1306 and moisture vapour barrier shall be according to OPSS 1305.

**740.05.03                      Joint Filler**

Joint filler for permanent concrete barrier shall be according to OPSS 1308.

**740.05.04                      Formwork**

Formwork for permanent concrete barrier shall be according to OPSS 919.

**740.05.05                      Reinforcing Steel**

Steel reinforcement shall be according to OPSS 1440.

Dowel bars shall be according to OPSS 1442.

**740.05.06                      Asphaltic Concrete**

Asphaltic concrete shall be according to OPSS 1151.

**740.05.07                      Granular**

Granular foundation material shall be according to OPSS 1010.

**740.05.08                      Interlocking Components**

Hollow structural steel and wide flange steel sections used in permanent precast concrete barrier shall be according to CSA G40.21, grade 350W, and shall be hot dip galvanized after fabrication according to CSA G164.

**740.05.09                      Marking**

The following information shall be permanently marked on the top or sides of the precast sections:

- a) Name or trademark of the manufacturer.
- b) Identification of plant if manufacturer has more than one plant.
- c) The date of manufacture.

**740.07                              CONSTRUCTION**

**740.07.01                      Concrete Barrier**

Concrete barriers shall be installed at locations as specified in the Contract Documents.

Construction of concrete barrier shall be by the following methods:

- a) Conventional wooden or steel formwork.
- b) Slip-form.
- c) Precast concrete barrier units.

Precast concrete barrier containing the I-Lock connection, may be used in permanent installations. The precast concrete barrier shall be secured in place as specified on the Contract Documents.

#### **740.07.01.01                      Foundation Preparation**

Preparation of the granular foundation shall be according to OPSS 314 and OPSS 301, as appropriate. Immediately ahead of placing the concrete, the subgrade shall be wet down by means of a uniform spray of water sufficient to wet the subgrade thoroughly without leaving standing water.

Placement of asphaltic concrete pavement beneath and adjacent to the precast concrete barrier shall be according to OPSS 313.

#### **740.07.01.02                      Tolerances**

Dimensions of the completed barrier shall not deviate by more than 10 mm from the dimensions as specified in the Contract Documents.

The horizontal alignment shall not deviate more than 10 mm from the required lines as specified in the Contract Documents.

When a 3 m long straight edge is placed on the top and faces of the concrete barrier surface, the surface of the concrete shall not vary more than 6 mm from the edge of the straight edge.

When the slip-formed concrete barrier does not conform to the tolerances, the concrete barrier may be corrected to the required tolerances using a magnesium float, while the concrete is still plastic, providing the surface and/or the barrier is not damaged during such adjustments.

#### **740.07.01.03                      Surface Finish**

The surface of the concrete barrier placed with conventional forms shall have a surface finish according to OPSS 904.

Slip-formed barrier surface shall not be brushed. Offsets and fins shall be removed immediately by light trowelling. Surface blemishes 10 mm or less in diameter shall be left untouched. If surface blemishes larger than 10 mm diameter occur, adjustments in the operation shall be made to correct the condition. If the adjustments do not correct the condition within 10 m, the operation shall be halted until the condition is corrected either by adjustments to the operation or to the concrete mix.

The use of water on the completed barrier to correct imperfections shall not be permitted.

#### **740.07.01.04                      Curing**

Curing shall be according to OPSS 904 with the exception that white pigmented curing compound is permitted with slip-formed concrete.

Curing for formed surfaces shall be according to OPSS 904.

When joints are made after the application of curing compound, the exposed face of the barrier in the vicinity of the joint shall be retreated with curing compound.

When white pigmented membrane is used as curing compound on slip-formed barrier, it shall also be used on adjacent preformed barrier sections for colour uniformity.

#### **740.07.01.05 Concrete Subject to Cold Weather**

Concrete shall not be placed by slip-forming when the ambient air temperature is below 0 °C.

When the concrete is placed at temperatures of 5 °C or less, the concrete in the barrier wall shall be maintained at a minimum temperature of 5 °C for 3 Days. The compressive strength cylinders shall be cast and cured with the barrier wall. The 3-Day compressive strength cylinders shall be at least 80% of the minimum specified 28-Day compressive strength of the wall. If these conditions cannot be met, then the concrete shall be protected according to OPSS 904, for footings and slabs on the ground.

#### **740.07.01.06 Expansion Joints**

Expansion joints 12 mm minimum in width shall be installed where concrete barrier abuts a structure, adjacent to piers, over existing deck expansion joints, and at the locations as specified in the Contract Documents. The expansion joint shall be filled with Type A expansion joint filler.

If forming the joint is performed before the concrete has hardened, the adjacent portions of the barrier shall be supported firmly to ensure the design shape of the barrier wall is constructed as specified in the Contract Documents.

#### **740.07.01.07 Construction Joints**

Construction joints shall be vertical and square with a rough joint face. Joints shall be created by sawcutting the hardened concrete to a depth of 45 mm ± 5 mm around the outside of the barrier and removing the remaining loose and excess concrete.

Curing compound shall be applied to the joint face.

Transition sections between barrier and treatments for high mast lighting poles, overhead sign structures, and bridge piers in median shall be one-piece construction of the same class of concrete as the barrier. No portion of the transition shall be slip-formed.

Dowels shall only be used at transitions.

Continuity between transition sections and barrier wall sections shall be accomplished by using three size 25M by 1.0 m long, epoxy coated smooth reinforcing bars placed horizontally in the wall. The three bars shall be embedded 500 mm into the squared end of the constructed wall and shall be located on the barrier centre line, commencing 150 mm from the top of the barrier and equally spaced vertically at 150 mm intervals. Construction joints at transition sections for tall wall concrete barrier shall consist of five horizontal epoxy coated smooth reinforcing bars installed.

Prior to constructing the addition, the exposed horizontal bars and the squared end of the barrier wall shall be greased to inhibit bonding.

Transitions for high mast lighting poles and overhead sign structures shall be one-piece construction of the same class of concrete as the barrier wall.

#### **740.07.01.08 Treatment at Bridge Piers**

Granular A material with asphalt surface shall be used to fill the area between concrete barriers where separation occurs at bridge piers or at other locations where separation of the barriers is required. Compaction of granular shall be according to OPSS 501. The asphalt surface shall be according to OPSS 313.

#### **740.07.01.09                      Isolation and Contraction Joints**

All joints shall be formed in the plastic concrete immediately following the slip-form equipment. Joints shall be formed using a grooving tool with a minimum 40 mm deep bit and shall be continuous along the front and back vertical face, excluding the top of the barrier. Tooling marks or other surface defects adjacent to the newly formed joint shall be trowelled smooth. A proposal may be submitted to sawcut the contraction joints in lieu of scoring, which may be permitted subject to a demonstration of the proposed technique and prior approval by the Contract Administrator.

Isolation joints shall be placed on each side of the outside perimeter of all sub-surface structural elements such as storm-water and maintenance access structures to accommodate vertical differential movement.

Contraction joints shall be equally spaced along the barrier wall at 4 m intervals. This interval may be locally modified to a length between 3 to 5 m to avoid being within 3 m of any other joint.

The construction joint at the end of the day shall coincide with a contraction or isolation joint.

Cracks outside the joints are unacceptable. The section containing the cracks shall be removed and replaced. The limits of removal shall extend to the nearest joint on each side of the crack.

#### **740.07.02                      Reflectors**

Reflectors placed on permanent concrete barrier shall be according to the OTM Book 11.

#### **740.07.03                      Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **740.08                      QUALITY ASSURANCE**

#### **740.08.01                      Acceptance Criteria for Precast Concrete Barrier**

Final inspection of the precast units will not be made until they have been installed.

All concrete barrier units shall meet the following criteria:

- a) There shall be no exposed coarse aggregate, such as honeycombing. The top and bottom surface of the precast unit are excluded from this condition.
- b) Cracks shall not extend through the precast unit.

### **740.09                      MEASUREMENT FOR PAYMENT**

#### **740.09.01                      Actual Measurement**

##### **740.09.01.01                      Concrete Barrier Tall Wall Barrier Asymmetric Concrete Barrier Asymmetric Tall Wall Barrier**

Measurement shall be made in metres along the centreline of the barrier, from end to end of installation, and shall include the length required for lighting pole footings and overhead sign structure footings.

Where two concrete barriers are constructed back to back, Type A-2, TW-2, and M-2; they shall be treated as a single installation and the length will be measured only once for payment purposes.

**740.09.01.02                      Granular**

Measurement shall be according to OPSS 314.

**740.09.01.03                      Asphaltic Concrete**

Measurement shall be according to OPSS 313.

**740.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**740.10                                BASIS OF PAYMENT**

**740.10.01                          Concrete Barrier - Item  
Tall Wall Barrier - Item  
Asymmetric Concrete Barrier - Item  
Asymmetric Tall Wall Barrier - Item**

Payment at the Contract price for the above items shall be full compensation for all labour, Equipment, and Material required to construct the barriers, including any concrete backfill between Type A-2, TW-2, or M-2 concrete barriers at the location of bridge piers or transitions.

**740.10.02                          Granular**

Granular material used as backfill between concrete barriers shall be paid for at the Contract price for the appropriate granular items.

**740.10.03                          Asphaltic Concrete**

Asphaltic concrete laid as a foundation or used as asphalt surface at bridge piers shall be paid for at the Contract price for the appropriate hot mix item.

## **CONSTRUCTION SPECIFICATION FOR TEMPORARY CONSTRUCTION BARRIERS (TCB)**

**741.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Movable Temporary Construction Barrier (MTCB)** means a concrete temporary construction barrier that can be quickly shifted laterally using a barrier transfer machine.

**Relocation** means the movement of a temporary construction barrier or movable temporary construction barrier system from one location to another, which typically occurs when construction operations move from one stage to the next.

**Shift** means the lateral displacement of a movable temporary construction barrier system, which is typically completed to facilitate the opening or closing of traffic lane(s). The lateral displacement may vary throughout the length of a barrier installation.

**Temporary Construction Barrier (TCB)** means a concrete or steel barrier device which provides a physical limitation, through which a vehicle would not normally pass, and is intended to contain or redirect an errant vehicle of a particular size range, at a given speed and angle of impact.

**741.04 DESIGN AND SUBMISSION REQUIREMENTS**

**741.04.01 Submission Requirements**

**741.04.01.01 Temporary Construction Barrier**

The Contract Administrator shall be notified in writing of the selection of the types and locations of all temporary construction barrier selected, including all applicable Standard Drawings 7 Days prior to the first placement.

When a proposal is made to change the staging and barrier arrangement that will result in the width of the level area between the back of the barrier and the upper edge of an excavation to be less than 1 metre, a memorandum for each installation not meeting the 1 metre width shall be submitted to the Contract Administrator. Each memorandum shall indicate how the proposal meets Ontario Regulation 213/91, include a slope stability evaluation for each proposed barrier installation adjacent to an excavation, and be signed and sealed by an Engineer.

#### **741.04.01.02 Steel Temporary Construction Barrier**

One copy of the manufacturer's installation instructions and Working Drawings shall be submitted to the Contract Administrator prior to the installation of steel TCB.

Installation of steel TCB shall not commence until the Contract Administrator has received the copy of the instructions and Working Drawings.

#### **741.04.02.03 Movable Temporary Construction Barrier**

Working Drawings, a copy of the manufacturer's specifications, and installation instructions shall be submitted to the Contract Administrator prior to the installation of MTCB.

Installation of MTCB shall not commence until the Contract Administrator has received the copy of the installation instructions and manufacturer's specifications.

### **741.05 MATERIALS**

#### **741.05.01 Concrete Temporary Construction Barrier**

##### **741.05.01.01 General**

Concrete for the manufacture of TCB units shall be according to OPSS 1350, except that the restrictions on volume batching shall not apply. The following specific requirements shall apply:

- a) Class of concrete: Exposure class C-1 according to CSA A23.1.
- b) Coarse aggregate: 19.0 mm nominal maximum size.

##### **741.05.01.02 Marking**

All concrete TCB units shall be permanently and legibly marked by the manufacturer as follows:

- a) Name or trademark of manufacturer on file with Owner including identification of plant if manufacturer has more than one plant and year of manufacture embossed on top of each concrete TCB at one end.
- b) Owner approved three-digit code of manufacturer and plant identification, and six-digit code for date of manufacture (Year Month Day, example January 15, 2008 is 080115) stencilled in minimum 50 mm high digits with indelible ink or paint on top of each concrete TCB at opposite end of embossed markings.
- c) Duplicate three-digit code of manufacturer and plant identification, and six-digit code for date of manufacture, stencilled in minimum 50 mm high digits with indelible ink or paint on the vertical face of one end elevation of each concrete TCB.
- d) Markings are not permitted on traffic faces of concrete TCB.

##### **741.05.01.03 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440 and as specified in the Contract Documents.

##### **741.05.01.04 Connection Assembly Components**

Connection assembly components for non-proprietary concrete TCB systems shall be as specified in the Contract Documents. Connection assembly components for proprietary concrete TCB systems shall be according to manufacturer's specifications and as specified in the Contract Documents.

#### **741.05.01.05                    Restraint Systems, Type M Connection Only**

All materials required for the restraint systems as specified in the Contract Documents.

#### **741.05.01.06                    Thrie Beam Guide Rails, Bolts, and Nuts**

Thrie beam guide rails shall be fabricated according to OPSS 1504 and as specified in the Contract Documents. Bolts and nuts shall be according to OPSS 1504.

#### **741.05.01.07                    Steel Plates, Bolts, and Nuts**

Steel plates shall be fabricated according to CSA G40.20/G40.21 and as specified in the Contract Documents. Steel plates shall have minimum yield strength of 345 Mpa. All steel plates shall be hot dip galvanized after fabrication according to ASTM A123. Bolts and nuts shall be according to OPSS 1504.

#### **741.05.01.08                    Wooden Blocks**

Wooden blocks shall be according to OPSS 1601.

#### **741.05.02                        Delineators**

Delineators shall be two-sided, and each side shall have a minimum reflective surface of 100 × 100 mm; high intensity retroreflective sheeting according to ASTM D4956, Type VIII; orange colour; and flexibility to bend 90 degrees from vertical and self-restore.

#### **741.05.03                        Steel Temporary Construction Barrier**

All supplied components shall conform to the manufacturer's specifications.

Table 1 lists the manufacturers and barrier systems that are acceptable for steel TCBs. The choice to supply and install any of the approved systems in Table 1 is allowed.

### **741.06                            EQUIPMENT**

#### **741.06.01                        Barrier Transfer Machine for Movable Temporary Construction Barrier**

Barrier transfer machines required to shift MTCB shall be supplied from a source named on the ministry's

### **741.07                            CONSTRUCTION**

#### **741.07.01                        Temporary Construction Barrier**

##### **741.07.01.01                  General**

Where a temporary construction barrier, restraints permitted item is used, the TCB shall meet the minimum category in Table 2.

Where a temporary construction barrier, freestanding item is used, the TCB shall meet the minimum category in Table 3.

Where a temporary construction barrier, end restraints only item is used, the TCB shall meet the minimum category in Table 4.

Where a temporary construction barrier, freestanding, narrow item is used, the TCB shall meet the minimum category in Table 5.

Where a temporary construction barrier, restrained, narrow item is used, the TCB shall meet the minimum category in Table 6.

Temporary construction barriers shall be installed at locations as specified in the Contract Documents and according to the convention defined in Table 7.

Temporary construction barrier of higher deflection categories is also acceptable for use for lower categories within the same restraint type (i.e., freestanding, restraints permitted or end restraints only). For example, deflection category II, III and IV items (if available for the restraint type) are also acceptable for use for Category I items of the same restraint type.

#### **741.07.01.02            Type M Connection**

Type M connection used for concrete TCB restraint systems shall have been manufactured after October 2011, as verified by the markings.

Mechanical and adhesive anchoring systems shall be installed according to the manufacturer's specifications to the minimum embedment depth as specified in the Contract Documents.

All welds shall be according to CSA W59.

#### **741.07.02                Movable Temporary Construction Barrier**

##### **741.07.02.01            General**

The MTCB system shall be installed and relocated at the locations as specified in the Contract Documents, the Working Drawings, and according to the manufacturer's installation instructions and specifications.

The MTCB shall be installed on a paved surface having a maximum crossfall of 6% measured perpendicular to the installation and shall be in place prior to the opening of traffic operations.

Gaps between barriers shall be kept clear of debris at all times.

The MTCB system shall be removed from the Working Area when no longer required.

##### **741.07.02.02            Shifting**

The shift of MTCB, including the shift of energy attenuators, shall be at the locations as specified in the Contract Documents. The method and procedure for the shift shall be according to the manufacturer's installation instructions. The MTCB and energy attenuators shall be shifted back to the original location when required. Shifting of the MTCB and energy attenuators at the locations as specified in the Contract Documents shall be completed as many times as is necessary to complete the work requiring the shift.

#### **741.07.03                Maximum Deflection**

Table 2, Table 3, or Table 4 shall be used to determine acceptable barrier types for "restraints permitted", "freestanding", and "end restraints only" items respectively. The back face of a barrier system shall not be placed less than the minimum distance from the top of an excavation or fixed object as specified in the Contract Documents, regardless of the deflection category corresponding to the tender item.

#### **741.07.04                Foundation Preparation**

Temporary construction barrier shall be installed on a paved surface having a maximum crossfall of 6% measured perpendicular to the installation and shall be in place prior to the opening of traffic operations. 2 Days shall be allowed between the placement of final asphalt surface and placement of temporary construction barrier. Temporary construction barrier shall be in place prior to the opening of traffic operations.

Drainage shall be maintained under the temporary construction barrier.

#### **741.07.05                      Installation**

Temporary construction barrier shall be installed at locations as specified in the Contract Documents.

Construction of temporary construction barrier shall be by use of precast concrete or prefabricated steel barrier units.

Temporary construction barrier shall be installed with connections properly engaged. Proprietary systems shall be installed according to the manufacturer's installation instructions.

#### **741.07.06                      Anchorages**

Steel TCB shall be installed and anchored according to the manufacturer's installation instructions for the specified configuration.

#### **741.07.07                      Transitions**

##### **741.07.07.01                  Concrete Temporary Construction Barrier**

Transition from one type of concrete TCB to another type of concrete TCB is permitted by using the concrete TCB transition detail as specified in the Contract Documents.

The proportion of each type of approved concrete TCB used for the Work shall be at the Contractor's discretion. However, a minimum continuous length of 100 m of any one type of concrete TCB is required prior to transitioning to another type.

Transitions between unrestrained concrete TCB and permanent concrete barrier shall be as specified in the Contract Documents.

Transitions between reduced deflection concrete TCBs and unrestrained concrete TCBs shall be as specified in the Contract Documents.

##### **741.07.07.02                  Type M Connection Only**

Transitions between restrained concrete TCB and unrestrained concrete TCB shall be as specified in the Contract Documents.

##### **741.07.07.03                  Steel Temporary Construction Barrier**

Transitions between two different steel TCB systems or between steel and concrete TCB shall not be permitted.

Transitions between permanent concrete barrier and steel TCB shall not be permitted.

Transitions between steel beam guiderail and steel TCB shall not be permitted.

#### **741.07.08                      End Treatment**

##### **741.07.08.01                  Steel Temporary Construction Barrier**

One end or both ends, as specified in the Contract Documents, of the steel TCB installation shall be protected with an energy attenuator according to the manufacturer's specifications according to OPSS 723.

##### **741.07.08.02                  Movable Temporary Construction Barrier**

One end or both ends, as specified in the Contract Documents, of the MTCB installation shall be protected with an energy attenuator according to the manufacturer's specifications and according to OPSS 723.

## **741.07.09                      Drainage Gaps for Concrete Temporary Construction Barrier**

Gaps for drainage for concrete TCB shall be installed as identified in the field to accommodate surface runoff using the three beam transition as specified in the Contract Documents.

## **741.07.10                      Tolerances**

The horizontal and vertical alignment at the junction of each barrier section shall be within 15 mm. The minimum radius on which the barrier may be placed shall be according to the manufacturer's requirements for each type of connection.

## **741.07.11                      Construction Markers**

Construction markers shall be placed in advance of the temporary construction barrier installation to assist in directing the traffic away from the flared approach end treatment. Taper length for full lane closures and the maximum distance between markers shall be according to OTM Book 7.

## **741.07.12                      Quality Control for Temporary Construction Barrier**

### **741.07.12.01                  General**

Temporary construction barrier units shall be certified that it meets the acceptance criteria. A completed MTO Form PH-CC-876 shall be submitted to the Contract Administrator within 24 hours of installation or relocation of the units. An inspection of temporary construction barrier units shall be performed pre- and post-installation. Certification shall be done by an authorized representative of the Contractor.

When the installed or relocated temporary construction barrier units do not meet the acceptance criteria, they shall be removed and replaced within 48 hours with units that meet the acceptance criteria.

Units damaged while in service as part of the Work or the alignment discontinuity is beyond that allowable by the acceptance criteria shall be replaced or reinstalled as necessary. The repair shall be performed within a 48-hour period starting at the occurrence or first awareness of the damage.

### **741.07.12.02                  Concrete Temporary Construction Barrier**

Repaired precast concrete TCB units may be used provided that the structural integrity of the unit is maintained. An Engineer's seal and signature shall be affixed to documentation certifying that the repair method used shall not impact the structural integrity of the unit.

### **741.07.12.03                  Movable Temporary Construction Barrier**

Certification is not required after shifting of MTCB.

## **741.07.13                      Acceptance Criteria for Temporary Construction Barrier**

### **741.07.13.01                  Concrete Temporary Construction Barrier**

For all applications, any concrete TCB unit that fails one or more of the following acceptance criteria shall be rejected:

- a) Dimensions of each unit shall not deviate from those specified by more than the following tolerance:
  - i. Specified dimensions up to 300 mm  $\pm$  5 mm
  - ii. Specified dimensions greater than 300 mm  $\pm$  10 mm
- b) Steel elements of each connecting device shall be free of visible fracture, distortion, and perforation.
- c) Concrete within 200 mm of a connecting device shall be free of visible cracks that are greater than 0.3 mm in width, measured at the widest point of the crack.

- d) All cracks greater than 0.3 mm in width, other than addressed in c), shall neither extend through the precast unit nor be greater than 300 mm in length.
- e) The unit shall be free of honeycombing.
- f) The end of any unit shall not be located greater than 50 mm from the horizontal alignment of the installation.

In addition to the above criteria, when the precast units are used on facilities with a posted regulatory speed limit of 80 km/h or higher, any unit that fails one or more of the following acceptance criteria shall be rejected:

- a) Damage to edges shall not extend greater than 100 mm onto any adjacent face. When edge damage extends greater than 50 mm onto such a face, damage to the opposite side of that edge shall not extend greater than 50 mm onto the opposite face.
- b) The total length of concrete breakout damage to edges flanking the connecting devices, whether repaired or not, shall not exceed 25% of the respective connecting device length on each side of each connecting device.
- c) The concrete damage in the area of the drainage recess shall not reach higher than one third of the lower sloped surface containing the recess.
- d) Concrete breakouts on the traffic faces or on the top of the precast unit other than addressed in a) to c) above shall not be greater than 150 mm in any direction measured on the surface, nor shall the breakout depth at any point be greater than 25 mm measured perpendicularly to the face.
- e) Accumulated total concrete breakouts addressed in d) on the traffic sides of the unit shall not exceed 10% of the total surface area of the respective side.
- f) Drilled holes into the barrier shall not have diameter greater than 40 mm.
- g) The horizontal and vertical alignment discontinuity between adjacent units shall not be greater than 20 mm, as measured with a 1 m straightedge.

#### **741.07.13.02 Steel Temporary Construction Barrier**

Any steel TCB unit that fails one or more of the following acceptance criteria shall be rejected:

- a) Dimensions of each unit shall not deviate from those specified by more than the following tolerances:
  - i. For specified dimensions up to 300 mm, the tolerance shall be  $\pm 5$  mm.
  - ii. For specified dimensions greater than 300 mm, the tolerance shall be  $\pm 10$  mm.
- b) Connecting devices shall be free of visible fracture, distortion, or perforation.
- c) Surface impact deformations shall not exceed 25% of the barrier faces. Surface deformations shall not be greater than 25 mm in depth as measured perpendicularly to the face.
- d) All steel surfaces shall be free of visible gaps.
- e) All welds shall be in visibly cracks or rips.
- f) All steel surfaces shall be free of rust.

#### **741.07.13.03 Movable Temporary Construction Barrier**

Any MTCB unit that fails one or more of the following acceptance criteria shall be rejected:

- a) Dimensions of each unit shall not deviate from those specified by more than the following tolerances:

- i. For specified dimensions up to 300 mm, the tolerance shall be  $\pm 5$  mm.
  - ii. For specified dimensions greater than 300 mm, the tolerance shall be  $\pm 10$  mm.
- b) Steel elements of each connecting device shall be free of visible fracture, distortion, and perforation.
- c) Top or head of each unit shall not expose mesh or rebar nor have damage greater than 75 mm deep.
- d) Bottom or foot of each unit shall not have:
  - i. Damage greater than 250 mm long measured parallel to roadway.
  - ii. Damage greater than 75 mm wide measured perpendicular to roadway.
  - iii. Damage greater than 150 mm high.
- e) All cracks greater than 0.3 mm in width shall neither extend through the unit nor be greater than 300 mm in length.
- f) The unit shall be free of honeycombing.

#### **741.07.14 Restoration of Asphalt and Concrete Surfaces**

Restoration of asphalt and concrete surfaces disturbed during the installation and removal of restrained temporary construction barrier shall be as specified in the Contract Documents.

#### **741.07.15 Delineators**

Delineators according to OTM Book 11 shall be installed at 4 m intervals on concrete TCBs and at the barrier unit connections on steel TCBs.

Delineators shall be securely fastened to the top of the temporary construction barrier with reflective surfaces clearly visible.

Delineators shall be maintained at all times.

#### **741.07.16 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **741.08 QUALITY ASSURANCE**

The Owner may conduct random quality assurance checks on units that have been supplied and installed or relocated to verify the Contractor's ability to ensure compliance with the acceptance criteria. Units that are identified by the Owner's representative as not meeting the acceptance criteria or those units that have been repaired and do not have documentation certifying the method of repair must be removed and replaced with units that meet the acceptance criteria for temporary construction barrier. This shall be done within a 48-hour period of notice to the Contractor, unless agreed otherwise in writing.

### **741.10 MEASUREMENT FOR PAYMENT**

#### **741.09.01 Actual Measurement**

- 741.09.01.01**
  - TCB, Restraints Permitted, Category I, II, III or IV
  - TCB, Freestanding, Category I, II, III or IV
  - TCB, Freestanding, Narrow, Category I
  - TCB, Restrained, Narrow, Category IV
  - TCB, End Restraints Only, Category I
  - Movable TCB

Measurement of barriers shall be by length in metres along the centreline of the barrier, from end to end, including temporary end sections installed and removed, up to the maximum length of barriers required to be placed at any one time during the Contract.

**741.09.01.02                    TCB, Relocation  
Movable TCB, Relocation**

Measurement of barriers shall be by length in metres along the centreline of the barrier, from end to end, including temporary end sections relocated.

Barriers that are temporarily surplus to a Contract or a stage within a Contract, including for seasonal shutdown requirements, which are required for future stages shall be paid for as one relocation for the combined moves into and out of storage, including any off-site storage required due to on-site restrictions.

**741.09.02                    Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**741.10                    BASIS OF PAYMENT**

**741.10.01                    TCB, Restraints Permitted, Category I, II, III, or IV - Item  
TCB, Freestanding, Category I, II, III, or IV - Item  
TCB, Freestanding, Narrow, Category I - Item  
TCB, Restrained, Narrow, Category IV - Item  
TCB, End Restraints Only, Category I - Item  
TCB, Relocation - Item  
Movable TCB - Item  
Movable TCB, Relocation - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**741.10.02                    Movable TCB, Shift - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Payment shall be prorated over the time requiring shifting of movable temporary construction barrier.

**TABLE 1**  
**Acceptable Steel TCB Systems**

| <b>Manufacturer</b> | <b>System</b>    |
|---------------------|------------------|
| Laura Metaal        | BarrierGuard 800 |
| Hill and Smith Inc  | Zoneguard        |
| Laura Metaal        | Safezone         |
| Safe Barriers       | Defender Barrier |
| Saferoads           | HV2              |
| Highway Care        | HighwayGuard     |

**TABLE 2**  
**Deflection Categories for TCB, Restraints Permitted (Note 1)**

### **753.05 MATERIALS**

#### **753.05.01 Concrete**

Concrete shall be according to OPSS 1350 with a nominal minimum 28-Day compressive strength of 30 MPa.

#### **753.05.02 Granular Base**

Granular base shall be Granular A according to OPSS 1010.

#### **753.05.03 Reinforcing Steel Bars**

Reinforcing steel bars for concrete backwall shall be according to OPSS 1440.

#### **753.05.04 Fasteners**

Bolts, nuts, washers, and spacers shall be according to ASTM A307 and hot dip galvanized according to ASTM A153.

#### **753.05.05 Steel Cylinders**

Cylinders shall be fabricated from steel according to CSA G40.21, Grade 300W, and hot dip galvanized after fabrication to provide a zinc coating not less than 610 g/m<sup>2</sup> according to ASTM A123.

Cylinders shall be cut square and seamless or electric welded. The finished cylinder shall be within 15 mm of true round. Each cylinder shall be labelled at the top with the designated A to N alphabetical character.

All edges shall be machined and free of burrs and sharp edges.

#### **753.05.06 Steel Rails**

Steel rails shall be fabricated as specified in the Contract Documents from flat stock steel according to CSA G40.21, Grade 300W, and hot dip galvanized after fabrication to provide a zinc coating not less than 610 g/m<sup>2</sup> according to ASTM A123.

#### **753.05.07 Steel Straps, Lid Support Angles, and Lifting Devices**

Steel straps, lid support angles, and lifting devices shall be steel according to CSA G40.21, Grade 300W. All straps shall be cut to the width and length and welded to the cylinder as specified in the Contract Documents.

#### **753.05.08 Steel Pipes**

Steel pipes shall be 48.3 mm OD, standard weight, Schedule 40 steel pipe according to ASTM A53 and welded to one side of the cylinder as specified in the Contract Documents.

#### **753.05.09 Steel Pipe Retainers**

Steel pipe retainers shall be 50 mm by 32 mm OD, standard weight, Schedule 40 steel pipe according to ASTM A53 and welded to the side of the cylinder as specified in the Contract Documents.

#### **753.05.10 Lids**

Lids shall be fabricated from low-density polyethylene composed of 25% recycled plastic materials. Lids shall be black in colour and UV stabilized to a minimum rating of UV8D. The lid shall be of sufficient strength to support a centred point load having a mass of 60 kg producing a maximum deflection of 100 mm.

Each lid shall have a steel restraining chain for attachment of the lid to the cylinder.

Associated metal hardware for the lids, such as washers, eye bolts, chains, and screws shall be hot dip galvanized according to ASTM A153 or equivalent electroplated or anodized treated.

#### **753.05.11 Welds**

All welding shall be according to CSA W47.1 and CSA W59.

### **753.07 CONSTRUCTION**

#### **753.07.01 General**

Connecticut Impact Attenuation Systems shall be installed according to and at locations specified in the Contract Documents.

#### **753.07.02 Concrete Pads and Backwalls**

Levelling and site preparation required for the existing granular base shall be performed prior to placing the concrete pad and backwall.

Concrete pads and backwalls shall be constructed as specified in the Contract Documents. Concrete shall be placed, cured, and finished according to OPSS 904. Cross fall of the concrete pad is desirably 6% or less and shall not exceed 10%. All exposed edges of the backwall shall have a 25 mm chamfer. Drilling of anchor holes shall commence a minimum of five days after concrete has been placed.

#### **753.07.03 Granular Base**

The granular base below the concrete pad shall be a minimum depth of 150 mm and shall be placed according to OPSS 314. The granular material shall be compacted to 95% of the maximum dry density.

#### **753.07.04 Connection to Barriers**

The concrete backwall shall be connected to the barrier as specified in the Contract Documents.

#### **753.07.05 Delineation**

Delineation shall be provided as specified in the Contract Documents.

**753.07.06                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**753.09                              MEASUREMENT FOR PAYMENT**

**753.09.01                      Actual Measurement**

**753.09.01.01                  Connecticut Impact Attenuation System (CIAS)**

For measurement purposes, a count shall be made of the number of complete Connecticut Impact Attenuation Systems installed.

**753.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**753.10                              BASIS OF PAYMENT**

**753.10.01                      Connecticut Impact Attenuation System (CIAS) - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

## **CONSTRUCTION SPECIFICATION FOR STANDARD HIGHWAY FENCE**

### **771.01 SCOPE**

This specification covers the requirements for the installation of highway fence, brace panels, and gates.

### **771.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

#### **Ontario Provincial Standard Specifications, Construction**

OPSS 510          Removal

#### **Ontario Provincial Standard Specifications, Material**

OPSS 1540          Standard Highway Fence Components

#### **ASTM International**

A 780 / A 780M-09   Standard Practice for Repair of Damaged and Uncoated Areas of Hot Dip Galvanized Coatings

**771.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Brace Post** means the wooden post installed to anchor the diagonal wooden brace within the brace panel.

**Corner Post** means the terminal post installed at horizontal deflections in the fenceline greater than 22 degrees.

**Cross Fences** means intersecting wire fences.

**Line Post** means the fence post spaced at regular intervals between terminal posts throughout each section of fence.

**Line Wire** means the horizontal wire of the fence fabric.

**Stay Wire** means the vertical wire that is woven or wrapped around the line wire to form the rectangular opening of the fence fabric.

**Steel Brace Panel** means the steel brace, steel line post, angle iron, and grout.

**Straining Post** means the terminal post installed at changes in vertical deflections in the fence line greater than 22 degrees or at approximately 200 m intervals.

**Terminal Post** means end, gate, corner, and straining posts.

**Twitch-Stick Method** means the tensioning of wires by inserting and rotating a twitch stick between the space of the diagonal wires as they cross.

**Wooden Brace Panel** means the diagonal wooden brace, wooden brace post, brace wire, fasteners, and when installed in rock, steel T-rail posts with 3.5 mm wire and grout.

**771.05 MATERIALS****771.05.01 Highway Fence**

Highway fence components shall be according to OPSS 1540.

**771.05.02 Fence Fabric**

Only one type of fence fabric shall be used within the limits of the Contract.

**771.07 CONSTRUCTION****771.07.01 Removal**

Removal of existing fence shall be according to OPSS 510.

## **771.07.02 Site Preparation**

Prior to the commencement of fencing operations, all debris shall be removed and ground undulations shall be corrected along the fenceline to obtain a smooth and uniform gradient.

All trees, stumps, and brush along the fenceline shall be cut off at ground level and all logs and overhanging branches that interfere with the installation of the fence shall be removed.

### **771.07.02.01 Selective Clearing**

When fencing is required through wooded areas that are not designated for clearing and grubbing, only selective clearing shall be permitted in order to gain access to the fenceline and to permit fence installation with lightweight equipment. Clearing shall be kept to a minimum and shall be subject to the approval of the Contract Administrator prior to the commencement of any clearing operation. Travel around obstructions may be required.

The location of access points shall be based on the least amount of clearing required and the frequency of access points shall be subject to reasonable material delivery requirements. The access points shall be approved by the Contract Administrator.

## **771.07.03 Highway Fence**

### **771.07.03.01 General**

Highway fence shall be installed at locations as specified in the Contract Documents.

Survey reference points or permanent property boundary markers shall not be disturbed or moved without the authorization of the Contract Administrator. When it is necessary to set posts adjacent to such points, the posts shall be placed on the roadway side of the property line as close as feasible to the monuments or markers.

### **771.07.03.02 Post Installation**

#### **771.07.03.02.01 General**

All posts shall be installed plumb and to the depth as specified in the Contract Documents.

Terminal posts shall be installed at all highway fence ends, both sides of all openings and gates, locations with changes in horizontal or vertical deflections greater than 22 degrees in the fenceline, and at locations identified for straining purposes. Terminal posts shall be installed on each side of watercourse crossings. Line posts shall be installed as specified in the Contract Documents.

#### **771.07.03.02.02 Post Installation in Earth, Shale, or Loose or Friable Rock**

Postholes for wooden posts shall be excavated to 150 mm greater than the diameter of the larger end of the post. The large end of the post shall be placed in the bottom of the posthole. Material resulting from posthole excavation shall be used as backfill around the posts and compacted to 90% modified proctor density.

Steel posts shall be driven with care to ensure they will not be bent or burred.

#### **771.07.03.02.03 Post Installation in Rock**

Posts installed in solid rock shall be steel posts as specified in the Contract Documents.

Postholes for steel posts shall be drilled in rock to a maximum diameter of 150 mm. Overburden shall be

excavated to a maximum diameter of 300 mm. Posts shall be placed in the postholes and filled as specified in the Contract Documents.

#### **771.07.03.03                    Brace Panels**

Brace panels shall include the installation of the diagonal wooden braces or diagonal angle iron braces; diagonal brace wires; and fasteners, as appropriate.

Diagonal brace wires may be tensioned using the twitch-stick method.

When cross fence separates property owners, three brace panels shall be installed at the end post of cross fences. When the cross fence does not separate property owners, one brace panel shall be installed on the cross fence at the end post.

Brace panels at straining posts shall be installed at equal intervals of approximately 200 m without any intervals greater than 230 m. Brace panels shall be installed on each side of a corner, straining, opening, or gate locations.

Brace panels shall be installed at terminal posts on each side of watercourse crossings.

When fences are to be partially removed, brace panels shall be installed at the terminal ends of the remaining fence.

#### **771.07.03.04                    Fence Fabric**

Fence fabric shall be placed on the side of the post nearest the roadway, except on curves with a radius of less than or equal to 1,750 m. In this situation, the fabric shall be placed on the side of the post away from the centre of the curve.

Fence fabric shall be uniformly tensioned so that its line wires are tight and parallel and the stay wires are straight, uniformly spaced, and at right angles to the line wires.

Staples for fence fabric with design numbers 948-12-9.75 and 949-12-9 shall be set diagonally to the grain of the wooden post and driven securely. Top wire shall be double stapled and all other wires single stapled.

Staples for fence fabric with design number 949-12-12.5 shall be set diagonally to the grain of the wooden post and driven securely, but shall allow for movement of the horizontal line wires as a result of thermal expansion and contraction.

Fence fabric shall be fastened to the steel post using wire ties at all nine line wires.

Fencing fabric shall be tensioned and properly terminated with the wire wrapped around the terminal posts at least once and around itself at least four complete turns and stapled to the terminal posts.

Rolls of fence fabric with design numbers 948-12-9.75 and 949-12-9 shall be spliced together by wrapping adjacent line wires, using mechanical splicing units or using crimp sleeves. The same method shall be used throughout the limits of the Contract.

Rolls of fence fabric with design number 949-12-12.5 shall be spliced together using mechanical splicing units or crimp sleeves.

When splicing is achieved by wrapping adjacent line wires, wrap the overhanging line wires around the corresponding line wires on the adjacent roll, at least four complete turns as specified in the Contract Documents.

Mechanical splicing units and crimp sleeves shall be installed according to the manufacturer's instructions and as specified in the Contract Documents.

After splicing, all projecting ends of the line wires shall be removed. Terminal posts shall not be installed for splice purposes only.

#### **771.07.04 Cross Fences**

Cross fences shall be secured to the adjacent post prior to cutting the fence at the brace panel.

#### **771.07.05 Gates**

Gates shall be installed at locations and be of the type and size as specified in the Contract Documents.

When gates are required without adjacent fencing, terminal posts with brace panels shall be installed on each side of the gate.

Gates shall be installed to open away from the roadway and to close by gravity.

#### **771.07.06 Marking**

Identification plates, provided by the material supplier, shall be securely attached to the completed fence installation at the following intervals:

- a) At the start and end of each fence installation.
- b) At a maximum interval of 300 m.

The fence identification plate shall be located within 300 mm of a terminal post with the top of the plate located approximately 300 mm from the top of the fence fabric. The maximum dimensions of the plate shall be 200 by 200 mm. The plate shall be made from 0.81 mm thick anodized aluminum sheet according to ASTM B 209 series 1100 or 5005-H34.

Each fence identification plate shall be engraved with the following information:

- a) Contract number.
- b) Name or trademark of fence Subcontractor.
- c) Name or trademark of fence supplier (i.e., suppliers of fence fabric and posts).
- d) Date of completed installation (i.e., yyyy-mm).

The height of the letters and numerals shall be within the range of 6 to 32 mm.

#### **771.07.07 Zinc Coating Repairs**

Cut ends, field drilled holes, and damaged areas of hot dip galvanized coatings on galvanized components, except fence fabric, shall be repaired according to ASTM A 780.

#### **771.07.08 Site Restoration**

After fence installation, the site shall be cleaned and trimmed and the ground restored to a neat condition.

## **771.07.09 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **771.08 QUALITY ASSURANCE**

### **771.08.01 Construction**

The Contract Administrator may perform a spot visual inspection to determine conformance with the workmanship, design, and dimensional requirements of this specification.

Failure to conform to this specification may result in a partial or complete inspection of the installation by the Owner and removal and replacement of all defective workmanship or materials by the Contractor.

### **771.08.02 Material Certification**

Certificates of compliance for each fence component used in the installation shall be provided to the Contract Administrator. The certificate of compliance shall indicate that the material was manufactured, sampled, tested, and inspected according to the reference specification and has been found to meet the requirements.

Each certificate of compliance shall include the following information typed on company letterhead:

- a) Manufacturer's name or trademark.
- b) General description of the component.
- c) Reference specification for material (e.g., CGSB 138.1, Fence Fabric for Chain-Link Fence).
- d) Signed and dated by the manufacturer's authorized representative.

All certificates of compliance shall be assembled and submitted to the Contract Administrator prior to completion of the Work.

### **771.08.03 Material Sampling**

The Contract Administrator may obtain and test samples to ensure compliance with the specifications. Products represented by the test samples that are not in compliance shall be removed from the Work Area and replaced.

## **771.09 MEASUREMENT FOR PAYMENT**

### **771.09.01 Actual Measurement**

#### **771.09.01.01 Highway Fence**

Measurement of highway fence shall be by length in metres along the contour of the ground for the actual length of highway fence installed and shall include gate openings and brace panels.

#### **771.09.01.02 Brace Panels**

For measurement purposes, a count shall be made of the number of brace panels installed, regardless of material type.

**771.09.01.03                      Gates**

For measurement purposes, a count shall be made of the gates installed, regardless of the size and type. Double gates shall be counted as one gate.

**771.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**771.10                      BASIS OF PAYMENT**

**771.10.01                      Highway Fence - Item  
Brace Panels - Item  
Gates - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

### 772.03 DEFINITIONS

For the purpose of this specification, the following definitions shall apply:

**Barbed Wire** means the twisted longitudinal wires, termed line wires, to which the barbs are attached.

**Barbed Wire Arm** means the metal arm used to support the barbed wire.

**Bottom Wire** means the wire installed at the bottom of the fence which is fastened to the bottom of the fence fabric and extends throughout each section of fence between terminal posts.

**Brace Band** means a symmetrically formed strip of metal shaped to fit around a post and used with a carriage bolt and nut to attach the rail end or brace rail end to the post. Also, used for attaching barbed wire, tension wire, and other items to a terminal post.

**Brace Rail** means a tubular, fabricated or roll-formed steel section used for bracing terminal posts.

**Corner Post** means a terminal post at a point where the line of fence changes in two or more directions.

**Diagonal Brace Wire** means the wire used for bracing terminal posts.

**End Post** means the fence post positioned at the ends of a section of fence.

**Fence Fabric** means the chain-link mesh installed between the fence posts.

**Fence Post** means an upright tubular, fabricated or roll-formed steel member for supporting fencing material.

**Fitting** means the mechanical connection of various designs, shapes, and metals to join fence components into an integral structure.

**Gatepost** means a terminal post on each side of a gate forming a gateway.

**Hog Ring** means a preformed open wire clip designed to close up into a ring to secure chain-link fabric to horizontal top and bottom wires.

**Knuckled** means the type of selvage obtained by interlocking adjacent wire ends in pairs and then bending the wire ends back into a closed loop.

**Line Post** means the fence post spaced at regular intervals between terminal posts throughout each section of fence.

**Line Post Cap** means a cap with a loop or hole used to position the top rail or top wire atop of the line posts. It also prevents water from entering the tubular post.

**Marcelled Tension Wire** means a type of wire manufactured with either a uniform helix or a series of waves put into the wire to facilitate tensioning the wire when installed to support the top or bottom of the chain-link fence fabric.

**Post Sleeve** means a length of tube or pipe that is embedded into a concrete retaining wall, and used to hold fence posts in place.

**Rail End** means a cup-shaped fitting used with a brace band to connect the top rail or brace to a post.

**Selvage** means the edge finish on woven chain-link fabric joining pairs of pickets. The selvage may be knuckled or twisted.

**Straining Post (or Pull Post)** means a terminal post in a line of fence used to brace a long stretch or to effect a change in elevation along a fence line.

**Tension Band** means an offset strip of metal shaped to fit around the terminal post and used with a carriage bolt and nut to attach the tension bar to the post.

**Tension Bar** means the bar used with tension bands to secure the fence fabric to a terminal post.

**Terminal Post** means end, gate, corner, and straining post.

**Terminal Post Cap** means a cap atop a post (end, gate, corner or straining post) that prevents water from entering the tubular post.

**Top Rail** means a tubular, fabricated or roll formed steel section continuously joined by means of sleeves or couplings throughout all sections of fence extending between terminal posts.

**Top Rail Sleeve** means a fitting used to join two pieces of top rail when swedged top rail is not used.

**Top Wire** means the wire installed at the top of the fence and extends continuously throughout all sections of fence between terminal posts.

**Twisted** means the type of selvage obtained by interlocking adjacent wire ends in pairs and then twisting the wire at least two turns with the wire ends above the twist.

**Wire Ties** means the wire used to tie chain-link fence fabric to line posts, bottom wires, and top rails or top wires.

## **772.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **772.04.01 Submission Requirements**

#### **772.04.01.01 Proprietary Systems**

When a proprietary fence is installed, one copy of the manufacturer's installation instructions and Working Drawings for each type of proprietary fence system to be installed shall be submitted to the Contract Administrator.

Installation of a proprietary fence shall not commence until the Contract Administrator has received a copy of the installation instructions and Working Drawings.

## **772.05 MATERIALS**

### **772.05.01 Chain-Link Fence**

Chain-link fence components shall be according to OPSS 1541.

#### **772.05.02 Concrete**

Concrete shall be according OPSS 1350 and have a nominal minimum 28-Day compressive strength of 20 MPa.

## **772.07 CONSTRUCTION**

### **772.07.01 Site Preparation**

Prior to the commencement of the fencing operations, all debris shall be removed and ground undulations shall be corrected along the fenceline to obtain a smooth and uniform gradient.

All trees, stumps, and brush along the fenceline shall be cut off at ground level and all logs and overhanging branches that interfere with the installation of the fence shall be removed.

### **772.07.02 Proprietary Systems**

Proprietary fences shall be installed according to manufacturer's installation instructions at the locations specified in the Contract Documents.

The following proprietary system may be installed as an alternative to chain link fence:

- a) Cochrane Global ClearVu

### **772.07.03 Chain-Link Fence**

#### **772.07.03.01 General**

Chain-link fence shall be installed at locations specified in the Contract Documents.

Survey reference points or permanent property boundary markers shall not be disturbed or moved without the authorization of the Contract Administrator. When it is necessary to set posts adjacent to such points, the posts shall be placed on the roadway side of the property line as close as feasible to the monuments or markers.

#### **772.07.03.02 Post Installation**

##### **772.07.03.02.01 General**

All posts shall be installed plumb and to the depth specified in the Contract Documents.

Posts shall be cut to the required height above the ground to present a smooth and uniform profile. Line post spacing shall be in equal horizontal distances with a maximum of 3,000 mm between line posts.

Tubular posts shall be fitted with waterproof post caps designed to fit and fasten securely over the posts.

Corner posts shall be installed at horizontal deflections in the fence line of 10 degrees or more.

Straining posts shall be installed at equal intervals not exceeding 150 m. Additional straining posts shall be installed when changes in vertical alignment of the fence exceed 30 degrees.

##### **772.07.03.02.02 Posts on Concrete Barrier**

All posts installed on concrete barrier shall be according to the Contract Documents.

Each post shall be fabricated with a welded steel base plate grade 300W, hot dip galvanized according to ASTM A123M, and according to the Contract Documents. All welds shall be to a low hydrogen classification according to CSA W59. Electrodes used for manual welding shall be E7015, E7016, or E7018. All welds shall be continuous.

##### **772.07.03.02.03 Footings**

All posts shall be installed according to the Contract Documents. Roll-formed steel line posts may be direct driven when bedrock is not present.

Concrete placing, curing, and protection from the elements shall be according to OPSS 904.

Concrete material sampling and testing shall be according to OPSS 1350.

#### **772.07.03.03                    Bracing**

A brace rail or brace wire shall be placed diagonally across the panel at all ends and gateposts. Corner and straining posts shall be supported with diagonal braces placed on both sides of the post. The higher end of the diagonal brace shall be connected at the terminal post.

End fittings shall be secured by a 6 mm bolt placed through the fitting and braced at both ends of the brace.

#### **772.07.03.04                    Top Rails, Top Wires, and Bottom Wires**

Top rails or top wires shall be installed as specified in the Contract Documents.

All line post caps shall carry either the top rail or top wire as specified in the Contract Documents. Top rails or top wires shall be fastened securely to tubular line post tops using waterproof post caps. Roll-formed steel shape posts do not require waterproof post caps.

In sag locations, the post and post cap shall be drilled and fastened with a self-tapping screw to ensure a secure fit.

Top rails shall be fastened to terminal posts with centre bands.

Top and bottom wires shall be stretched tight and securely fastened to terminal posts with turnbuckles and centre bands.

One turnbuckle shall be used between terminal posts.

#### **772.07.03.05                    Fence Fabric**

Fence fabric shall not be installed until the concrete footings have cured for a minimum of 5 Days.

The fabric shall be stretched tight and securely fastened to terminal posts with steel tension bars and steel or aluminum tension bands. The longitudinal axis of the diamond pattern shall be perpendicular to the slope of the top rail or top wire.

The fabric shall be placed on the side of the post nearest the roadway with the barbed edge at the top, except on curves of 50 m or smaller radius, the fabric shall be placed on the side of the post away from the centre of the curve.

The fabric shall be securely fastened to the line posts, bottom wire, and top rail or top wire with wire ties. The fabric shall not be fastened to any diagonal braces.

Manually fastened round wire ties shall engage one strand of the chain-link fence fabric with one end of the tie by wrapping it with two 360 degree turns and then wrapping the body of the tie around the post or top rail a minimum of 180 degrees. The remaining end of the tie shall be secured to the second strand of the chain-link fence fabric by wrapping it with two 360 degree turns. The fabric and the main body of the tie shall be drawn tightly to the rail or post.

Power fastened wire ties shall engage two strands of the chain-link fence fabric at a diamond joint closest to the post or top rail. The manufacturer's installation instructions shall be followed to complete the operation. The ends shall be twisted three full twists or one and one-half machine turns. The end of the tie shall be positioned on the post or rail so that it is parallel to the chain-link fence fabric.

The ends of wire ties shall not protrude beyond the vertical plane on either side of the chain-link fence fabric. Protruding ends of wire ties shall be removed.

The hog rings on top and bottom wires shall be installed according to the Contract Documents.

#### **772.07.03.06 Barbed Wire**

Barbed wire shall be installed when specified in the Contract Documents. The barbed wire shall be pulled taut to remove all slack and shall be firmly installed in the slots of the barbed wire arms. The ends of the barbed wire shall be securely connected at the terminal posts with brace bands. Barbed wire arms shall be installed with the arm pointing away from the roadway.

#### **772.07.04 Gates**

##### **772.07.04.01 General**

Gates shall be installed at locations and of the type and size specified in the Contract Documents.

##### **772.07.04.02 Gate Installation**

Gates shall be constructed with the fabric on the side furthest from the roadway with the barbed edge at the top.

All gates shall have a chain hook to hold gates open and double gates shall have a steel gate centre rest with a drop bolt for the closed position.

The surface grade within the required gate sweep area shall be low enough to permit free movement of the gate.

#### **772.07.05 Marking**

Identification plates, provided by the material supplier, shall be securely attached to the completed fence installation at the following intervals:

- a) At the start and end of each fence installation.
- b) At a maximum interval of 300 m.

The fence identification plate shall be located within 300 mm of a terminal post with the top of the plate located approximately 300 mm from the top of the fence fabric. The maximum dimensions of the plate shall be 200 mm by 200 mm. The plate shall be made from 0.81 mm thick anodized aluminum sheet according to ASTM B209 series 1100 or 5005-H34.

Each fence identification plate shall be engraved with the following information:

- a) Contract number.
- b) Name or trademark of fence Subcontractor.
- c) Name or trademark of fence supplier (i.e., supplier(s) of fence fabric and posts)
- d) Date of completed installation (i.e., yyyy-mm).

The height of the letters and numerals shall be within the range of 6 to 32 mm.

#### **772.07.06 Zinc Coating Repairs**

Cut ends, field drilled holes, and damaged areas of hot dip galvanized coatings on galvanized components shall be repaired according to ASTM A780M.

## **772.07.07 Site Restoration**

After fence installation, the site shall be cleaned, trimmed and the ground restored to a neat and original condition existent prior to the fencing operations.

## **772.07.08 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **772.08 QUALITY ASSURANCE**

### **772.08.01 Construction**

The Contract Administrator may perform a spot visual inspection to determine conformance with the workmanship, design, and dimensional requirements of this specification.

Failure to conform to the specification may result in a partial or complete inspection of the installation and removal and replacement of all defective workmanship or materials.

### **772.08.02 Material Certification**

Certificates of compliance for each fence component used in the installation shall be provided to the Contract Administrator. The certificate of compliance shall indicate that the material was manufactured, sampled, tested, and inspected according to the reference specification and has been found to meet the requirements.

Each certificate of compliance shall include the following information on company letterhead:

- a) Manufacturer's name or trademark.
- b) General description of the component.
- c) Reference specification for material (e.g., CAN/CGSB 138.1 Fence Fabric for Chain-Link Fence).
- d) Signed and dated by the manufacturer's authorized representative.

All certificates of compliance shall be assembled and submitted to the Contract Administrator prior to completion of the work.

### **772.08.03 Material Sampling**

The Contract Administrator may obtain and test samples to ensure compliance with the specifications. Products represented by the test samples that are not in compliance shall be removed from the Work Area and replaced.

### **772.08.04 Concrete**

Concrete footing acceptance shall be according to OPSS 1350.

## **772.09 MEASUREMENT FOR PAYMENT**

### **772.09.01 Actual Measurement**

#### **772.09.01.01 Chain-Link Fence**

Measurement of chain-link fence shall be by length in metres along the contour of the ground for the actual length of fence installed and shall include gate openings.

**772.09.01.02                    Gates**

For measurement purposes, a count shall be made of the number of gates installed, regardless of the size and type. Double gates shall be counted as one gate.

**772.09.02                        Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**772.10                            BASIS OF PAYMENT**

**772.10.01                      Chain-Link Fence - Item  
Gates - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**CONSTRUCTION SPECIFICATION FOR  
REQUIREMENTS FOR ANTI-GLARE SCREENS**

**791.04 DESIGN AND SUBMISSION REQUIREMENTS**

**791.04.01 Installation Instructions**

One copy of the manufacturer's installation instructions shall be submitted to the Contract Administrator prior to installation of any proprietary paddle-type anti-glare screen.

## **791.05 MATERIALS**

### **791.05.01 Mesh**

Steel mesh panels shall be fabricated from expanding quality hot rolled sheets according to ASTM A1011M.

Aluminum mesh panels shall be fabricated from expanding utility grade 3003 H14 sheets or 1100 H14 rolls.

Mesh panels shall consist of regular 19 mm diamond shaped patterns formed by expanding 1.6 mm thick panels to provide panels 600 mm or 1,200 mm in width and a minimum of 2,400 mm plus one diamond width in length. The diamonds shall be according to the following:

- a) Width of diamond, centre to centre of strand shall be 22 mm.
- b) Length of diamond, centre to centre of strand shall be 50 mm.
- c) Width of strand shall be 5 mm.
- d) Cut-off angle shall be a minimum of 21 degrees.

Mesh panels installed on concrete barrier and steel beam guide rail shall be 600 mm in width.

Mesh panels installed on chain-link fence shall be 1,200 mm in width.

The size of the finished mesh panels shall not deviate more than 3 mm from the specified width and more than 12 mm from the specified length.

Mesh panels shall be levelled and wire brushed after the expanding operation.

Mesh panels fabricated from steel sheets shall be hot dip galvanized after fabrication to provide a mass of zinc coating not less than 610 g/m<sup>2</sup> of total surface.

### **791.05.02 Hardware**

Washers, nuts, and bolts shall be according to ASTM A325. All hardware shall be galvanized according to ASTM A153 and to provide a mass of zinc coating of not less than 305 g/m<sup>2</sup> of total surface.

Metal discs used to fasten mesh panels to the chain-link fence fabric shall be fabricated from 1.6 mm thick steel and hot dip galvanized after fabrication to provide a mass of zinc coating of not less than 610 g/m<sup>2</sup> of the total surface.

## **791.07 CONSTRUCTION**

### **791.07.01 General**

Anti-glare screens shall be installed at locations specified in the Contract Documents. Mesh panels shall be oriented as specified in the Contract Documents.

### **791.07.02 Expanded Metal Anti-Glare Screens on Chain-Link Fence**

Mesh panels shall be fastened to the chain-link fence as specified in the Contract Documents.

### **791.07.03 Marking**

Identification plates, provided by the material supplier, shall be securely attached to the completed expanded metal anti-glare screen installation at the following intervals:

- a) At the start and end of each expanded metal anti-glare screen installation.

- b) At a maximum interval of 300 m.

The expanded metal anti-glare screen identification plate shall be located within 300 mm of a terminal post with the top of the plate located approximately 300 mm from the top of the expanded metal anti-glare screen. The maximum dimensions of the plate shall be 200 by 200 mm. The plate shall be made from 0.81 mm thick anodized aluminum sheet according to ASTM B209 series 1100 or 5005H34.

Each expanded metal anti-glare screen identification plate shall be engraved with the following information:

- a) Contract number.
- b) Name or trademark of anti-glare screen Subcontractor.
- c) Name or trademark of anti-glare screen supplier (i.e., suppliers) of expanded metal anti-glare screen and posts.
- d) Date of completed installation (i.e., yyyy-mm).

The height of the letters and numerals shall be within the range of 6 to 32 mm.

#### **791.07.04 Paddle Type Anti Glare Screen**

Paddle type anti-glare screens shall be installed at locations specified in the Contract Documents in accordance with the manufacturer's installation instructions. Work shall not begin until the Contract Administrator has received a copy of the installation instructions for the type of barrier being installed on.

Acceptable paddle type anti-glare screens shall be one of the following systems:

- a) Safe-Hit® Glarescreen System
- b) GlareGaard

Paddle type anti-glare screens may be used on temporary construction barriers in accordance with the manufacturer's specifications. Screen bases shall be installed such that all portions of a base are installed on a single barrier unit.

#### **791.07.05 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **791.08 QUALITY ASSURANCE**

#### **791.08.01 Construction**

The Contract Administrator may perform a spot visual inspection to determine conformance with the workmanship, design, and dimensional requirements of this specification.

Failure to conform to the specifications may result in a partial or complete inspection of the installation and removal and replacement of all defective workmanship or materials.

**791.10 MEASUREMENT OF PAYMENT**

**791.09.01 Actual Measurement**

**791.09.01.01 Expanded Metal Anti-Glare Screen  
Paddle Type Anti-Glare Screen  
Paddle Type Anti Glare Screen, Temporary**

Measurement of anti-glare screen shall be by length in metres along the length of chain-link fence, concrete barrier, or temporary construction barrier for the actual length of screen installed.

**791.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**791.10 BASIS OF PAYMENT**

**791.10.01 Expanded Metal Anti-Glare Screen - Item  
Paddle Type Anti-Glare Screen - Item  
Paddle Type Anti-Glare Screen, Temporary - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Costs associated with any required repairs or removal and replacement of defective materials shall be the Contractor's responsibility at no additional cost to the Owner.

**Note:** The PROV published in April 2018 replaces OPSS 801 COMMON, November 2010 with no technical content changes.

| <b>801.10</b> | <b>BASIS OF PAYMENT</b>                              |

### **801.01 SCOPE**

This specification describes the measures required to protect trees not designated for removal.

### **801.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Barrier** means a fence placed around a single tree or group of trees to protect them from removal and injury.

**Dripline** means the location on the ground surface directly beneath the theoretical vertical line from the tips of the outermost branches of the trees.

## **801.07 CONSTRUCTION**

### **801.07.01 Operational Constraints**

Trees not designated for removal shall not be damaged and shall be protected from flooding and sediment deposits from construction operations.

Equipment and vehicles shall not be operated within the dripline of trees not designated for removal unless specified in the Contract Documents. In such cases, operation of equipment shall be kept to the minimum necessary to perform the work required.

Equipment or vehicles shall not be parked, repaired, or fuelled within the dripline of any tree not designated for removal.

Construction materials and earth shall not be stockpiled within the dripline of any tree not designated for removal.

### **801.07.02 Barrier for Tree Protection**

Barriers for tree protection shall be a minimum height of 1.2 m consisting of material approved by the Contract Administrator, supported by steel posts. The number of steel posts shall be enough to keep the material from sagging and the fence erect.

The barriers shall be erected at the dripline of trees or woodlot edges within the Working Area, prior to commencement of construction operations at locations specified in the Contract Documents. Where a clearance zone of 1.5 m cannot be established between the barrier at the dripline and the limit of grading, the barrier may be placed within the dripline, subject to the approval of the Contract Administrator. When the barrier is placed within the dripline,

- a) a minimum distance of 0.75 m shall be maintained between the trunk of the tree and the barrier, and
- b) a distance of 1.5 m shall be maintained between the barrier and the limit of grading.

When the trunks of trees are less than 4.5 m apart, the trees shall be considered a woodlot and the barrier shall be placed so it forms a continuous barricade around the woodlot as specified in the Contract Documents.

A barrier is not required where an existing fence serves the same purpose. At such locations, the barrier shall terminate at the existing fence so that a continuous barricade is provided between the trees and the area of work.

The barriers shall be maintained erect and in good repair throughout the duration of construction operations without breaks and unsupported sections and shall be removed upon completion of the work.

### **801.07.03 Tree Repair**

Trees not designated for removal that are damaged by construction operations shall be repaired as follows, within 5 Days of the damage:

- a) Branches 25 mm or greater in diameter that are broken shall be cut back cleanly on the tree side of the break or to within 10 mm of their base, if a substantial portion of the branch is damaged.
- b) Roots 25 mm or larger in diameter that are exposed shall be cut back cleanly to the soil surface.
- c) Bark that is damaged shall be neatly trimmed back to uninjured bark without causing further injury to the tree.

**801.07.04                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**801.09                              MEASUREMENT FOR PAYMENT**

**801.09.01                      Actual Measurement**

**801.09.01.01                  Barrier for Tree Protection**

Measurement shall be in linear metres measured along the length of the barrier. Overlaps shall not be measured.

**801.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**801.10                              BASIS FOR PAYMENT**

**801.10.01                      Barrier for Tree Protection - Item**

Payment at the Contract price for the above item shall be full compensation for all labour, Equipment, and Material required to do the work.

Progress payments shall be based on the following percentage of the Contract price:

60% for supply and erection  
25% for maintenance  
15% for removal

When there is not a separate item for Barrier for Tree Protection, payment at the Contract price for the applicable tender items of the Contract that necessitate the placing of barriers for tree protection shall include full compensation for all labour, Equipment, and Material to do the work of protecting and repairing trees not designated for removal.

## **CONSTRUCTION SPECIFICATION FOR VEGETATIVE COVER**

#### **803.01 SCOPE**

This specification covers the requirements for the application of vegetative cover.

#### **803.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Construction**

|          |                            |
|----------|----------------------------|
| OPSS 206 | Grading                    |
| OPSS 802 | Topsoil                    |
| OPSS 804 | Temporary Erosion Control  |
| OPSS 805 | Temporary Sediment Control |

##### **Canadian and Provincial Statutes**

Seeds Act (R.S., 1985, c. S-8)  
Invasive Species Act (S.O. 2015)  
Weed Control Act (R.S.O., 1990, c.W.5)

## 803.03

### DEFINITIONS

For the purposes of this specification the definitions in OPSS 182 and the following definitions shall apply:

**Invasive Species** means as defined in the Invasive Species Act.

**Local Seed Bank** means the seeds of species native to a project site and the topsoil the seeds are contained in, located within a vegetated area.

**Local Vegetation Block** means a salvaged layer of topsoil containing grass and herbaceous plant material that has a dense, intact root structure.

**Northern Ontario** means the area of Ontario north of a line joining Waubesaushene, Severn Bridge, Bancroft and Ottawa.

**Noxious Vegetation** means a plant that has been listed in the Schedule of Noxious Weeds found in Regulation 1096 made under the Weed Control Act.

**Seeded Earth Area** means the prepared earth area that has received the applied seed and fertilizer.

**Southern Ontario** means the area of Ontario between the northern and southern boundaries of Southwestern Ontario and Northern Ontario respectively.

**Southwestern Ontario** means the area of Ontario south of a line joining Grand Bend and Clarkson.

**Vegetative Cover** means seed, sod, local seed bank, and local vegetation blocks.

**Winter dormant period** means as defined in Table 1 and 2 for the specified vegetative cover.

## 803.04

### DESIGN AND SUBMISSION REQUIREMENTS

#### 803.04.01

##### Submission Requirements

A certificate of seed analysis from a seed testing laboratory approved by the Canadian Food Inspection Agency for all permanent seed mixes to be used in the Work shall be submitted to the Contract Administrator for review a minimum of 24 hours prior to any seeding operations.

The certificate of seed analysis shall identify the seed supplier's lot designation numbers, germination and purity for each seed species of the mix, as well as the seed mix composition expressed as a percentage of each seed species by mass for each seed mix as specified in the Contract Documents.

Written confirmation shall be submitted to the Contract Administrator within 30 Days of the pre-start meeting that the seeds specified in the Contract Documents have been sourced.

## 803.05

### MATERIALS

#### 803.05.01

##### Local Seed Bank

Local seed bank shall be sourced on-site from designated salvage areas as specified in the Contract Documents and shall not contain invasive species.

#### 803.05.02

##### Local Vegetation Blocks

Local vegetation blocks shall be sourced on-site from designated salvage areas as specified in the Contract Documents and shall not contain invasive species.

### **803.05.03 Seed**

#### **803.05.03.01 Certificate of Seed Analysis**

Permanent seed mixes shall have a valid certificate of seed analysis.

#### **803.05.03.02 Seed Packaging, Labeling, and Storage**

All permanent seed mixes and annual nurse crop seeds shall be in the original factory sealed package with the original label securely attached.

Labeling shall be in accordance with the requirements of the Seeds Act and Regulations. Each package shall be labeled to show:

- a) The name and address of the seed supplier.
- b) The name of the seed mix and the various individual seed species that comprise the seed mix and the percentage by mass of each.
- c) The grade of the seed or seed mix.
- d) The supplier's lot designation number corresponding to the certificate of seed analysis.
- e) Mass in kilograms of the seed mix.
- f) The inoculant type, strain, and expiry date.

All seed and inoculant shall be stored in cool, dry locations until use. Inoculant is only required for permanent seed mixes containing crown vetch or Birdsfoot trefoil.

#### **803.05.03.03 Permanent Seed Mixes**

Permanent seed mixes shall be according to Table 3.

#### **803.05.03.04 Annual Nurse Cover Crop Seed**

Annual nurse crop seed sowing time shall be according to Table 4.

#### **803.05.04 Seed Fertilizer**

Fertilizer shall be supplied in original factory sealed bags bearing the manufacturer's original label indicating mass and analysis. All fertilizer shall be in granular form being dry, free flowing, free from lumps, and according to Table 5.

### **803.06 EQUIPMENT**

#### **803.06.01 Drill Seeder**

The drill seeder shall be a pasture or rangeland type. It shall accommodate the seed sizes and weight of seed to be applied using as many compartments as required. Seeds of compatible size and weight may be mixed and placed in the same compartment. The seeder shall be capable of planting seeds 6 to 13 mm in depth.

### **803.06.02                      Hydraulic Seeder**

The hydraulic seeder shall be capable of mixing the materials into a homogeneous slurry and maintaining the slurry in a homogeneous state until it is applied. The discharge pumps and gun nozzles shall be capable of applying the materials uniformly over the specified area. A hose extension for the hydraulic seeder shall be on site and available for use for areas outside of the range of the gun nozzle. Equipment shall provide constant agitation to prevent seed and slurry from clogging equipment.

The seeding equipment shall be calibrated to provide the coverage shown in Table 5.

### **803.06.03                      Mechanical Seeder**

A manually operated mechanical or broadcast seeder may be used for smaller or inaccessible locations as specified in the Contract Documents, or as approved by the Contract Administrator.

## **803.07                              CONSTRUCTION**

### **803.07.01                      General**

When placement of vegetative cover is required on a waterbody bank, material from the waterbody bank shall not enter the waterbody during preparation or grading of the waterbody bank.

### **803.07.01.01                      Control of Spread of Invasive Species and Noxious Vegetation**

Work shall occur in a manner to prevent the spread of invasive species and noxious vegetation to, from and within the Working Area.

Soil from areas impacted by invasive species shall not be stockpiled for reuse.

Debris including earth clods and invasive and noxious vegetation material attached to the outside surfaces of equipment is prohibited from entering the Working Area. Equipment coming on site shall be inspected as close to the site entrance as possible for debris. If present, debris shall be completely removed prior to the equipment proceeding to the Working Area and shall be collected and managed by disposal to a licensed waste disposal site as non-hazardous solid industrial waste prior to the equipment proceeding to the Working Area.

Equipment shall also be inspected for debris prior to leaving the Working Area. Any debris shall be removed and managed as specified above, and in a manner that prevents equipment from coming into further contact with standing, sprayed or cut invasive or noxious vegetation.

### **803.07.02                      Seeding**

### **803.07.02.01                      General**

Seed shall not enter any waterbodies.

The seeding operation shall not commence until the Contract Administrator has accepted that the surface preparation is according to OPSS 802 and the layout of seed mix locations are as specified in the Contract Documents.

Seeding on final grade shall occur prior to the application of temporary erosion control according to OPSS 804, unless the Contract Administrator approves the simultaneous application of seeding and temporary erosion control.

Seed applications or re-applications shall not be carried out under adverse weather conditions such as high wind or heavy rain or when field conditions are not conducive to seed germination such as frozen soil or soil covered with snow, ice, or standing water.

Where advanced seeding around high-risk areas is specified in the Contract Documents, seed and temporary erosion control shall be applied within 48 hours of final grade.

Seeding shall overlap the adjoining established ground cover by 300 mm.

#### **803.07.02.02                      Surface Preparation for Seeding**

The surface to be seeded shall be prepared according to OPSS 802 and not more than five Days prior to the seeding operation.

At the time of seeding, all surface areas designated for seeding shall exhibit no evidence of erosion and shall be uniformly cultivated to a minimum depth of 50 mm.

Two weeks prior to seeding a prepared surface with the Native Grass and Forb mixes, a non-selective herbicide shall be applied.

#### **803.07.02.03                      Layout for Seeding**

Seeding areas shall be staked out as specified in the Contract Documents.

#### **803.07.02.04                      Application Rates for Seed, Fertilizer, and Water**

Application rates for permanent seed mixes, annual nurse crop seed, and fertilizer shall be as shown in Table 5.

##### **803.07.02.04.01                      Hydraulic Seeding**

There shall be a uniform dispersal of the mixed material over the entire area designated for seeding. The spray shall not dislodge soil or cause erosion.

##### **803.07.02.04.02                      Drill Seeding**

Seeds shall be applied uniformly over the specified area at a depth of 6 mm to 8 mm and shall be applied along the contours of the ground.

##### **803.07.02.04.03                      Mechanical Seeding**

Seeds shall be sown in two directions with 50% of the seed applied with each direction. The application of these two directions shall be perpendicular to each other.

After application of seeds is complete, they shall be covered by raking and/or chain harrowing. If soil is uneven soil may be rolled with roller not exceeding 50 kg where conditions warrant.

Once the seed is covered the area shall be watered to a minimum depth of 50 mm. The application of water shall not cause movement of seeds or erosion.

#### **803.07.02.05                      Cleanup**

When seed is applied to the foliage of trees, shrubs, or other susceptible plant material, the seed shall be immediately removed from the trees, shrubs, or plant material, and the trees, shrubs, and plant material washed with clean water.

When seed is applied to areas or objects other than those designated, the seed shall be removed from the areas and objects.

### **803.07.03 Sodding**

#### **803.07.03.01 Fertilizer Application for Sodding**

Fertilizer shall be applied uniformly to the surface area designated for sodding, a maximum of 48 hours prior to sod placement, at the rate specified on its bag by the manufacturer.

#### **803.07.03.02 Sod Placement**

The locations specified for placement of sod shall be prepared and graded prior to placement according to OPSS 206.

Sod shall not be separated from its mineral soil base and not damaged during transportation, handling, and placement.

Sod shall be securely placed lengthwise across the face of slopes and parallel to the centreline of ditches in the locations as specified in the Contract Documents. Voids shall not be left between the soil portion of the sod and the underlying ground surface. Sod shall be countersunk to existing grade level at all edges.

End joints of adjacent sod pieces shall be staggered. The edges of adjacent sod pieces shall be placed tightly against one another without overlapping. Joints shall be tamped to a uniform surface. Sod shall be placed up to the subgrade elevation on the roadway front slope.

Where required, sod shall be staked to the grade to avoid movement.

#### **803.07.03.03 Maintenance of Completed Sodding**

Sod shall be maintained for 30 Days following placement. During this period, the placed sod shall be kept actively growing and green in colour. This requirement shall be suspended during the specified winter dormant period.

### **803.07.04 Local Seed Bank Salvage**

Local seed bank shall be salvaged prior to the specified winter dormant period.

Designated salvage areas for local seed bank shall be excavated to a depth of 150 mm to 300 mm or as specified in the Contract Documents.

#### **803.07.04.01 Local Seed Bank Stockpiles**

Salvaged local seed bank may be stockpiled for storage in locations specified in the Contract Documents or as approved by the Contract Administrator for up to six months if it cannot be installed on designated receiving sites immediately.

Local seed bank stockpiles shall not be placed in areas with invasive or noxious vegetation and shall not exceed 1500 mm in height. Machinery shall not be allowed on stockpiles. Compaction of stockpiles shall be avoided.

Local seed bank stockpiles shall be kept moist to prevent seeds from drying out during storage.

To prevent soil erosion and contamination by weeds during storage local seed bank stockpiles shall be covered with tarps or apply temporary erosion control according to OPSS 804.

Light duty sediment barrier according to OPSS 805 shall be installed around the entire base of local seed bank stockpiles.

#### **803.07.04.02 Local Seed Bank Installation**

Salvaged local seed bank shall be installed on designated receiving sites as specified in the Contract Documents immediately, when practicable.

If any designated receiving area is subsequently re-graded after installation of local seed bank, additional local seed bank shall be salvaged and installed according to this specification.

Should local seed bank no longer be available, vegetative cover and temporary erosion control shall be applied to the area according to this specification and OPSS 804 respectively.

### **803.07.05 Local Vegetation Blocks**

#### **803.07.05.01 Local Vegetation Block Harvest and Installation**

The locations specified for placement of local vegetation blocks shall be prepared and graded prior to placement as specified in the Contract Documents and according to OPSS 206.

Local vegetation blocks shall remain intact and undamaged during harvesting and installation.

Local vegetation blocks shall be mechanically harvested from and installed at the locations as specified in the Contract Documents on the same Day, or otherwise within 24 hours, and prior to the winter dormant period. Local vegetation blocks shall be sized as specified in the Contract Documents.

After harvesting, seed and temporary erosion control shall be applied to the source location of the vegetation blocks according to this specification and OPSS 804 respectively.

### **803.07.06 Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be as specified in the Contract Documents.

#### **803.07.07 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

## **803.08 QUALITY ASSURANCE**

### **803.08.01 Seeding**

#### **803.08.01.01 Acceptance Criteria for Seeding**

An inspection shall take place a minimum of 60 Days after the application of any seed. If application is completed too late in the year to achieve the performance measures after 60 Days, then the inspection will take place a minimum of 60 Days after the end of the specified winter dormant period.

Southwestern and Southern Ontario:

The following criteria shall be met for acceptance during the inspection:

- a) The annual nurse crop shall be evident at mature height in an evenly dispersed, uniform ground cover.
- b) Germination of the specified permanent seed species shall be visually evident in an evenly dispersed uniform ground cover.
- c) A total of 65% of the total area shall be covered with permanent seeded species.
- d) Bare areas shall not exceed 10% of the total seeded area.

Northern Ontario:

The following criteria shall be met for acceptance during the inspection:

- a) The annual nurse crop shall be evident in an evenly dispersed, uniform ground cover.

- b) Germination of the specified permanent seed species shall be visually evident in an evenly dispersed uniform ground cover.
- c) A total of 50% of the total area shall be covered with permanent seeded species.
- d) Bare areas shall not exceed 10% of the total seeded area.

Inspections shall not be made when site conditions prohibit a visual field inspection.

#### **803.08.01.02                      Failure to Meet Acceptance**

If the completed work does not meet the acceptance criteria, written notification of the failed areas will be provided by the Contract Administrator. The specified permanent seed mixes and annual nurse crop seed shall be re-applied according to this specification within 14 Days of receipt of the notification, or within 14 Days of the end of the specified winter dormant period.

Upon reapplication of the specified permanent seed mixes and annual nurse crop seed the areas that did not previously meet acceptance will be inspected until the requirements in the Acceptance Criteria for Seeding clause have been achieved.

Locations that are specified in the Contract Documents to receive vegetative cover, that fail to meet the acceptance criteria specified in the Quality Assurance section by the winter dormant period, or where vegetative cover has not been applied prior to the winter dormant period, shall be protected from erosion according to OPSS 804 until vegetative cover can be applied or reapplied.

#### **803.08.02                              Sodding**

##### **803.08.02.01                      Acceptance of Sod**

After the 30 Days maintenance period has ended, the Contract Administrator shall inspect all placed sod based on the requirements specified in the Maintenance of Completed Sodding clause. If placement of sod is completed less than 30 Days prior to the start of the winter dormant period, then the inspection will take place 30 Days after the end of the winter dormant period.

The sod shall be in the same location as originally placed and shall not have moved, eroded, slipped, or sloughed. Sod shall show evidence of rooting into the underlying soil. The sod shall be of sufficient density that no surface soil is visible and there shall be no competitive growth, emerging from the sod or from between the sod joints.

##### **803.08.02.02                      Failure to Meet Acceptance**

When the work does not meet the requirements specified herein, written notification will be provided by the Contract Administrator, and sod shall be reapplied according to this specification within 14 Days of receipt of the notification.

The site shall be maintained, and temporary erosion control will be provided OPSS 804 until the sod has been replaced.

Upon replacement of sod in the locations that did not previously meet acceptance will be inspected until the requirements in the Acceptance of Sod clause have been achieved.

#### **803.09                                      MEASUREMENT FOR PAYMENT**

##### **803.09.01                              Actual Measurement**

##### **803.09.01.01                      Seed**

Measurement shall be by area in square metres following the contours of the ground.

**803.09.01.02 Sod**

Measurement shall be by area in square metres following the contours of the ground.

**803.09.01.03 Local Seed Bank**

Measurement shall be by area in square metres following the contours of the ground.

**803.09.01.04 Local Vegetation Blocks**

Measurement shall be by area in square metres following the contours of the ground.

**803.09.02 Plan Quantity Payment**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**803.10 BASIS OF PAYMENT**

**803.10.01 Seed - Item  
Sod - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Progress payments shall be based on the following percentages of the Contract price for milestones accepted by the Contract Administrator:

- a) 50% for installation
- b) 50% upon acceptance.

**803.10.02 Local Seed Bank - Item  
Local Vegetation Blocks - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

#### **804.01 SCOPE**

This specification covers the requirements for temporary erosion control measures to protect disturbed earth surfaces during construction, minimize sedimentation and support the establishment of vegetation.

#### **804.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

## **804.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Diversion Ditch** means a temporary runoff control channel to intercept and convey overland flow away from areas of disturbed or erodible soil and to minimize erosion of slopes from sheet flow.

**Earth** means as defined in OPSS 206.

**Erosion** means the physical removal or detachment of sediment from an earth surface, followed by the transport of detached sediment to another location by the action of a mobile agent including rain, flowing water, wind, equipment and vehicles.

**Fibre Roll** means an assembled or commercially available flexible, tubular structure that provides erosion and/or sediment control and may provide run-off filtration and includes wattles, filter socks and filter berms.

**Permanent Cover** means the final cover treatment as specified in the Contract Documents to provide permanent erosion control on earth surfaces and may include, but not be limited to: rock protection, rip-rap, granular sheeting, established vegetative cover meeting the requirements of the Quality Assurance section of OPSS 803, gabions and retained soil systems.

**Significant Rainfall** means a rainfall event exceeding 15 mm within a 24-hour period.

**Sediment** means soil particles detached from an earth surface by erosion.

**Slope Drain** means a temporary surface water runoff control measure that directs water into a pipe or lined channel to prevent water flowing over disturbed earth surfaces on slopes and causing erosion.

**Slope Texturing** means contouring and roughening disturbed earth surfaces to increase water infiltration and retention, reduce runoff velocity, reduce sediment transport, and reduce soil erosion.

**Temporary Seeding** means the application of seed to stockpiles of erodible construction materials, excess or surplus materials, or disturbed earth surfaces to provide temporary erosion control until the materials are needed for construction, removed from the site, or until permanent cover is applied.

## **804.05 MATERIALS**

### **804.05.01 Mulch and Matrix**

#### **804.05.01.01 Mulch**

Mulch shall be either a mixture of straw mulch and organic straw mulch tackifier or hydraulic mulch.

#### **804.05.01.02 Straw Mulch**

Straw shall be supplied in bales, dry, and free of weeds and other foreign materials.

Organic straw mulch tackifiers may include wood and fibre paper mulch or guar and starch based tackifiers. Asphalt based tackifiers shall not be used.

#### **804.05.01.03                    Hydraulic Mulch**

Hydraulic mulch shall consist of shredded wood or paper fibres or both, and water or a stabilizing emulsion or both.

Stabilizing emulsions shall consist of an organic tackifier or an inorganic polymer.

Hydraulic mulch shall be capable of dispersing rapidly in water to form a homogeneous slurry.

Hydraulic mulch shall be dry, free of weeds and other foreign materials, and shall be supplied in factory sealed packages bearing the manufacturer's label indicating the product name, its mass and content.

#### **804.05.01.04                    Hydraulic Matrix**

Matrix shall be bonded fibre matrix (BFM) or fibre reinforced matrix (FRM).

##### **804.05.01.04.01                Bonded Fibre Matrix (BFM) and Fibre Reinforced Matrix (FRM)**

The BFM and FRM shall be capable of being hydraulically applied and after application be capable of adhering to the soil. In a dry state, BFM and FRM shall be comprised of greater than or equal to 70% by weight of long stranded wood fibres held together by organic or mineral bonding agents or both. The bonding agent shall not dissolve or disperse upon re-wetting.

The curing period for BFM shall be less than 24 hours. The FRM shall not have a curing period.

#### **804.05.02                        Erosion Control Blanket (ECB)**

The ECB shall be of a consistent thickness with a 100% biodegradable, even fibre distribution. The ECB shall be covered on top with a non-plastic biodegradable mesh or sewn together with biodegradable thread.

The ECB shall be supplied in a dry rolled mat protected with an outer waterproof wrap bearing the manufacturer's original label indicating product name and application instructions.

##### **804.05.02.01                    Erosion Control Blanket (ECB) Staples**

The ECB staples shall be according to manufacturer's specifications. The ECB staples shall have the strength and length to satisfy control measure installation, performance and maintenance requirements.

#### **804.05.03                        Fibre Rolls**

Fibre rolls shall be of a consistent internal thickness with even fibre distribution throughout the roll.

Fibre rolls shall be covered on the outside with an open-weave, biodegradable mesh or netting that securely contains the fibres within the rolls.

Fibre rolls shall be filled with 100% organic, biodegradable material such as shredded straw, wood fibres or compost and may contain seed according to OPSS 803.

#### **804.05.04                        Rock**

Rock for rock flow check dams shall be according to the requirements for rip-rap and gabion stone according to OPSS 1004.

#### **804.05.05                      Pipe for Slope Drains**

Slope drains shall be constructed with non-perforated, corrugated steel pipe according to OPSS 1801 or polyethylene plastic pipe according to OPSS 1840. Pipe diameter shall be as specified in the Contract Documents.

#### **804.05.05.01                  End Sections for Slope Drains**

End sections for the inlet and outlet of slope drains shall be according to OPSS 1801.

#### **804.05.06                      Plastic Sheeting**

Plastic sheeting shall be a minimum thickness of 6 mm of polyethylene.

### **804.06                          EQUIPMENT**

#### **804.06.01                      Hydraulic Mulcher**

The hydraulic mulcher shall be capable of mixing the materials into homogeneous slurry and of maintaining the slurry in a homogeneous state until it is applied.

The discharge pumps and gun nozzles shall be capable of applying the materials uniformly over the specified area. A hose extension for the hydraulic mulcher shall be on site and available for use for areas outside of the range of the gun nozzle.

#### **804.06.02                      Straw Mulch Blower**

Where straw mulch is applied mechanically by blower, the straw mulch blower shall be capable of separating straw from the bales without chopping it into short lengths and applying the straw mulch in a uniform, cohesive mat.

When tackifiers are used, the straw mulch blower shall be capable of applying straw mulch and tackifiers simultaneously.

The straw mulch blower shall be equipped with a minimum of two nozzles located inside the end of the blower pipe to coat the straw with the tackifier. Crimping may also be used to secure the straw mulch.

### **804.07                          CONSTRUCTION**

#### **804.07.01                      General**

Riparian vegetation areas to be preserved as specified in the Contract Documents shall be clearly marked in the field.

Temporary erosion control shall be applied and inspected within 24 hours prior to forecasted significant rainfall events.

Temporary erosion control materials and products shall not come in contact with the foliage of any trees, shrubs, or other vegetation, except as specified in OPSS 803 and shall not come in contact with waterbodies.

All stockpiles of erodible construction materials and excess or surplus materials within 30 m of a waterbody shall be protected from erosion within 48 hours of being built until they are required for construction or removed from the site.

Hydraulic mulch shall not inhibit growth or germination of the seed mix when applied to protect disturbed earth surfaces during the establishment of vegetative cover.

#### **804.07.02 Temporary Cover**

The measures, materials, products, and/or methods of temporary cover shall be selected and applied to be most suitable for the site conditions, operations and duration of the construction project. Temporary cover shall be applied to protect disturbed earth surfaces during construction to prevent erosion from occurring until permanent cover can be established.

Temporary cover measures, materials, products, and/or methods applied to, include but are not limited to:

- a) Materials or products including straw mulch, hydraulic mulch, fibre matrix, hydraulic matrix, wood chips, compost, plastic sheeting, temporary seeding, temporary sodding, rolled erosion control products, flow check dams and grade breaks.
- b) Methods such as but not limited to diversion of water from disturbed earth surfaces, slope texturing, staging of original vegetation or other permanent cover removal (e.g. deferring clearing and/or grubbing) and/or replacement (e.g. advancing permanent cover placement) and retaining vegetative buffers around waterbodies.

The Contract Administrator shall be notified in writing of the selected temporary cover measures, materials, products, and/or methods prior to either the removal of original permanent cover, or to a change in the selected method of temporary cover.

Temporary cover measures, materials, products, and/or methods selected shall be according to this specification and the instructions of the material or product manufacturer or supplier as applicable.

##### **804.07.02.01 Application**

The locations and application limits for temporary cover shall be clearly staked out as specified in the Contract Documents. Temporary cover shall be applied at these locations and any additional locations shall be at the discretion of the Contract Administrator.

Temporary cover is not required in areas where the permanent cover is applied immediately after existing cover removal provided there is no presence of erosion or sedimentation as confirmed by the Contract Administrator.

##### **804.07.02.02 Timing**

Temporary cover shall be applied prior to any forecasted precipitation and less than 48 hours after the removal of any portion of the existing vegetative cover or other earth cover.

Where the retention of existing vegetative cover, or other permanent cover, is the chosen temporary cover option, this existing cover will be retained until immediately prior to construction. This operation will be timed so that there will be less than 48 hours between the removal of existing cover and the placement of permanent cover.

Where grubbing is specified temporary cover shall be applied prior to any forecasted precipitation and less than 48 hours after any grubbing.

Temporary cover shall remain in place until the placement of the permanent cover, except for when work on disturbed earth surfaces is required or as specified in the Contract Documents.

#### **804.07.03 Straw Mulch**

Straw mulch shall be either applied manually by hand or mechanically by blower and secured using a tackifier or by crimping.

Straw mulch shall be applied to form a uniform, cohesive mat over 100% of the specified disturbed earth surface. The straw mulch shall be applied to a depth of greater than 25 mm and less than 50 mm as measured at the time of application.

#### **804.07.04 Hydraulic Mulch**

The hydraulic mulcher shall be calibrated to provide the coverage as specified for each of the hydraulically applied mulches.

Hydraulic mulch shall be applied at the rate of 2,000 kg of dry product per 10,000 m<sup>2</sup>. Hydraulic mulch shall be thoroughly mixed with water into a homogeneous slurry.

The hydraulic mulch slurry shall be applied to the specified disturbed earth surface by nozzle sprayer or extension hose. The mixed material shall be evenly dispersed over the entire disturbed earth surface to form a uniform, cohesive mat. The spray shall not dislodge soil or cause erosion.

#### **804.07.05 Bonded Fibre Matrix (BFM) or Fibre Reinforced Matrix (FRM)**

Hydrated BFM and FRM shall be applied to the specified disturbed earth surfaces to form a viscous material that dries to a high strength, porous, and erosion-resistant uniform, cohesive mat.

The BFM and FRM shall not be applied when rainfall is expected within 24 hours, during rainfall, or within 12 hours after rainfall.

#### **804.07.06 Erosion Control Blanket (ECB)**

The ECB shall be placed into position over the entire specified disturbed earth surface. The ECB shall be overlapped a minimum of 300 mm along parallel runs and on adjoining end runs.

The ECB shall be installed in direct contact with the ground surface to form a uniform, cohesive mat over the specified disturbed earth surface. The ECB shall be stapled to ensure direct contact with the soil over the entire area.

Overlapping and direct contact with the ground surface shall be maintained.

On slopes, the uppermost edge of the ECB shall be extended 1 m beyond the crest of the slope and anchored in a 150 mm wide by 150 mm deep trench excavation. The trench shall be backfilled with the excavated native material and compacted. When extension beyond the crest of the slope is not possible, the ECB shall be anchored at the top of the slope preventing any movement.

#### **804.07.07 Fibre Roll Grade Breaks**

Fibre roll grade breaks shall be constructed as specified in the Contract Documents.

Fibre rolls shall be installed horizontally starting from the toe of the slope and working up to the top of the slope. Any rills and gullies on the slope face shall be filled in as the fibre rolls are installed.

Fibre rolls shall be installed along the contour of the ground into trenches that have been excavated into the soil perpendicular to the slope face and width across the slope.

Fibre rolls shall be installed so that their base is in continuous contact with the underlying soil along their entire length without gaps and angled upslope at each end run in a "J" pattern. The ends of adjacent fibre roll segments shall be tightly butted up against each other and shall not be overlapped vertically or horizontally.

A metal bar shall be used to make pilot holes perpendicular to the slope face through the centre of the fibre rolls as specified in the Contract Documents. Pilot holes shall also be made at the ends of each fibre roll segment angled towards the next abutting fibre roll to hold adjacent rolls together.

Wooden stakes shall be driven into the pilot holes perpendicular to the slope face to secure the fibre rolls to the slope along their entire length. Additional stakes shall be driven into the fibre rolls along the downslope side at every grade change or if soils are very loose and uncompacted or the slope is steep.

Soil excavated from the trenches shall be placed along the upslope side of the fibre rolls and well compacted into the front of the trench to minimize possible undermining by runoff.

The soil on the upslope and downslope sides of the fibre rolls shall be seeded according to OPSS 803.

#### **804.07.08                      Flow Check Dams - General**

Flow check dams are fibre roll flow check dams, sandbag flow check dams, or rock flow check dams.

When the flow check dam item is specified, any of the flow check dams or any combination of them may be used.

Flow check dams shall be constructed such that the spillway level of the downstream flow check dam is the same as the base of the upstream flow check dam when they are specified in series.

Flow check dams shall be constructed without gaps and without undermining to prevent sediment passage through, under, or around the flow check dam.

Flow check dams shall include protection placed against the downstream side at the lowest point of the flow check dam so that any overflow of the flow check dam is prevented from causing soil scour and erosion.

#### **804.07.08.01                  Fibre Roll Flow Check Dams**

Fibre roll flow check dams shall be constructed as specified in the Contract Documents.

#### **804.07.08.02                  Sandbag Flow Check Dams**

Sandbag flow check dams shall be constructed as specified in the Contract Documents.

#### **804.07.08.03                  Rock Flow Check Dams**

Rock flow check dams shall be constructed as specified in the Contract Documents.

#### **804.07.09                      Slope Drains**

Slope drains shall be constructed as specified in the Contract Documents.

When slope drains are specified in the Contract Documents, the slope drain and associated berm barrier shall be constructed on the same Day.

Slope drains shall be constructed as a single control measure consisting of a corrugated pipe, two end sections including an inlet and an outlet, and a sediment trap constructed at the outlet end of the pipe.

The pipe inlet shall be placed through a berm barrier. Placement shall allow water to enter the pipe inlet without scouring of the berm. The toe plate of the inlet end section shall be fully imbedded into the ground surface.

Pipes shall be maintained in place without gaps and without undermining so that water is conveyed from the upstream side of the berm and collected in the sediment trap.

#### **804.07.10                      Diversion Ditches**

Diversion ditches shall be constructed as specified in the Contract Documents.

When diversion ditches are specified to be lined with rolled erosion control blanket it shall be installed along their entire length.

When flow check dams are specified to be installed within diversion ditches, they shall be installed at regular intervals along the entire length of the diversion ditches according to this specification.

Where diversion ditches are specified to be lined with rip-rap or granular sheeting it shall be according to OPSS 511.

#### **804.07.11                      Monitoring and Documentation**

All temporary erosion control shall be monitored to ensure it is effective. Monitoring shall be completed for the following conditions:

- a) A minimum of every seven Days.
- b) The 24 hours prior to a forecasted significant rainfall event.
- c) Within 24 hours after significant rainfall events.

Monitoring shall include the following:

- a) Visual inspection of the condition and effectiveness of all installed temporary erosion control; and
- b) visual inspection of slopes for signs of erosion including rills, gullies, channels and dust.

Observations shall be documented and any concerns such as observed erosion, issues with construction staging, or with stockpiles of erodible construction materials and excess or surplus materials, shall be reported immediately to the Contract Administrator. Monitoring documentation shall be provided to the Contract Administrator upon request within 24 hours.

#### **804.07.12                      Maintenance**

Temporary erosion control shall be maintained and repaired or replaced as required, to function effectively until placement of the specified permanent cover.

When temporary cover is found by quality assurance check to be ineffective at any location, a different material, product or method more suitable for the site conditions shall be selected, applied and maintained within 48 hours.

#### **804.07.13                      Removal**

Temporary erosion control shall be removed prior to the placement of permanent cover as specified in the Contract Documents. Temporary erosion control that will not interfere with the placement, establishment or performance of specified permanent cover, may be left in place as permitted by the Contract Administrator.

Any temporary sediment control that is located within and around the area protected by temporary erosion control shall be left in place and removed according to OPSS 805.

#### **804.07.14 Cleanup**

When temporary erosion control materials or products are applied to the foliage of trees, shrubs, or other susceptible plant material, the material or product shall be immediately removed, and trees, shrubs, and plant material shall be washed with clean water.

#### **804.07.15 Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be as specified in the Contract Documents.

#### **804.07.16 Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

### **804.08 QUALITY ASSURANCE**

#### **804.08.01 Acceptance of Temporary Erosion Control**

Temporary erosion control shall be acceptable if they meet the requirements of this specification and as specified in the Contract Documents.

The Owner may conduct random quality assurance checks on temporary erosion control measures, materials, and/or products that have been selected, installed or removed to verify they are in accordance with the requirements of this specification and as specified in the Contract Documents.

Temporary erosion control that is identified by the Owner as deficient shall be removed and replaced or reapplied to meet the requirements of this specification and as specified in the Contract Documents. Removal and replacement or reapplication shall be carried out at no additional cost to the Owner within 48 hours of the Owner providing notice to the Contractor, unless otherwise agreed to in writing.

### **804.09 MEASUREMENT FOR PAYMENT**

#### **804.09.01 Actual Measurement**

##### **804.09.01.01 Temporary Cover**

Measurement shall be by area in square metres following the contours of the ground without any allowance for overlap.

##### **804.09.01.02 Mulch**

Measurement shall be by area in square metres following the contours of the ground without any allowance for overlap.

##### **804.09.01.03 Matrix**

Measurement shall be by area in square metres following the contours of the ground without any allowance for overlap.

**804.09.01.04                      Erosion Control Blanket**

Measurement shall be by area in square metres following the contours of the ground.

**804.09.01.05                      Fibre Roll Grade Breaks**

Measurement shall be the length of fibre rolls in linear metres from end to end following the contours of the ground.

**804.09.01.06                      Flow Check Dams  
Fibre Roll Flow Check Dams  
Sandbag Flow Check Dams  
Rock Flow Check Dams**

For measurement purposes, a count shall be made of the flow check dams constructed.

**804.09.01.07                      Slope Drains and Diversion Ditches**

For measurement purposes, a count shall be made of the number of slope drains and diversion ditches constructed or installed. Component parts shall not be counted separately for payment.

**804.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**804.10                                BASIS OF PAYMENT**

**804.10.01                          Temporary Cover - Item  
Mulch - Item  
Matrix - Item  
Erosion Control Blanket - Item  
Fibre Roll Grade Breaks - Item  
Flow Check Dams - Item  
Fibre Roll Flow Check Dams - Item  
Sandbag Flow Check Dams - Item  
Rock Flow Check Dams - Item  
Slope Drains - Item  
Diversion Ditches - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Progress payments for temporary erosion control shall be made as follows:

- a) 30% for initial construction.
- b) 50% for monitoring and maintenance.
- c) 20% for removal.

When removal of measures is not required, progress payments for temporary erosion control shall be made as follows:

- a) 50% for initial construction.
- b) 50% for monitoring and maintenance.

Payment for temporary erosion control at additional locations if required and approved by the Contract Administrator shall be administered as a Change in the Work.

## **CONSTRUCTION SPECIFICATION FOR TEMPORARY SEDIMENT CONTROL**

**805.01 SCOPE**

This specification describes the requirements for the installation, maintenance, and removal of temporary sediment control during construction.

**805.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**Ontario Provincial Standard Specifications, Construction**

## **805.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Earth** means as defined in OPSS 206.

**Erosion** means as defined in OPSS 804.

**Fibre Roll** means as defined in OPSS 804.

**Significant Rainfall** means as defined in OPSS 804.

**Sediment** means as defined in OPSS 804.

**Sediment Barrier** means a barrier used to trap sediment in overland flow.

**Turbidity Barrier** means turbidity curtains or turbidity dams used to isolate the Working Area to prevent the release of sediment and debris from the Working Area into the surrounding waterbody.

**Turbidity Curtain** means a flexible barrier used to trap sediment in waterbodies.

**Turbidity Dam** means a non-flexible barrier used to trap sediment in waterbodies.

**Temporary Sediment Control** means control of sediment produced by erosion some distance away from the sediment source using sediment barriers, bags and traps and turbidity barriers.

## **805.05 MATERIALS**

### **805.05.02 Geosynthetics**

#### **805.05.02.01 Geotextile**

Geotextile shall be free of holes, tears, and punctures.

#### **805.05.02.02 Sediment Fence Geotextile**

Geotextile for sediment fence shall be according to OPSS 1860, Table 3.

Geotextile for sediment fence may be separate from the stakes used to install it as a sediment barrier.

#### **805.05.02.03 Berm Barrier Geotextile**

Geotextile for berm barriers and rock flow check dams shall be a woven, Class II geotextile according to OPSS 1860. The filtration opening size (FOS) shall be no greater than 300 µm.

#### **805.05.02.04 Turbidity Curtain Geosynthetic**

Turbidity curtain geosynthetics shall have a grab tensile strength of at least 990 N, according to OPSS 1860 and be one of geotextile or geomembrane.

Geotextile shall be a woven material. The FOS shall be no greater than 300 µm, according to OPSS 1860.

Geomembrane shall be a low-permeability synthetic material or a geotextile impregnated with elastomeric spray.

**805.05.02.05 Filter Bags**

Geotextile for filter bags shall be non-woven, polypropylene, Class I according to Table 1 of OPSS 1860 or as specified in the Contract Documents.

**805.05.03 Plastic Sheeting**

Plastic sheeting shall be according to OPSS 804.

**805.05.04 Stakes**

Stakes shall be of sufficient strength and length to satisfy temporary sediment control installation, performance and maintenance requirements.

**805.05.05 Wire Fence**

Wire fence used in wire-backed sediment fence barrier shall be 1.63 mm diameter galvanized steel fence with a 5 cm by 10 cm weave and a 0.91 m height.

**805.05.05.01 Posts**

Posts to support wire-backed sediment fence barriers shall be metal T-posts. Metal ties shall be used to secure the sediment fence to the metal T-posts.

**805.05.06 Berm Barriers**

Berm barriers shall be constructed using non-erodible earth or organic materials such as, sand, gravel, brush or compost.

**805.05.07 Sandbags**

Sandbags shall be made from heavy gauge plastic, agricultural burlap, or sediment fence geotextile. Heavy gauge plastic shall contain stabilizers or inhibitors resistant to deterioration by ultraviolet radiation. Sandbags shall be filled with clean sand, 19 mm gravel or 6 mm pea gravel, containing no silt or clay.

**805.05.08 Fibre Rolls**

Fibre rolls shall be according to OPSS 804.

**805.05.09 Turbidity Curtain**

Turbidity curtain shall be weighted at the bottom to ensure that sediment does not travel under the curtain. Turbidity curtain shall be supported at the top through a flotation system.

**805.05.09 Turbidity Dam**

Turbidity dams shall be constructed with materials specified in the Contract Documents.

**805.07 CONSTRUCTION****805.07.01 General****805.07.01.02 Protection of Stockpiled Materials**

All stockpiles of erodible construction materials, and excess or surplus materials, shall be protected from sediment transport within 48 hours of being built unless as specified in the Contract Documents.

#### **805.07.01.03            Dewatering**

Dewatering shall be according to OPSS 517.

#### **805.07.01.04            Turbidity Curtains and Turbidity Dams**

Equipment shall not be operated in a waterbody outside a turbidity curtain or turbidity dam other than hand held equipment or boats, unless specified in the Contract Documents.

#### **805.07.01.05            Construction and Removal of Measures**

The timing of construction and removal of temporary sediment control shall be as specified in the Contract Documents.

#### **805.07.02                Light-Duty Sediment Barriers, General**

Light-duty sediment barriers are sediment fence barriers, or fibre roll barriers.

Light-duty sediment barriers shall be constructed as specified in the Contract Documents.

Light-duty sediment barriers shall not be installed in or across waterbodies.

When the Light-Duty Sediment Barrier item is specified in the Contract Documents, any light-duty sediment barriers may be used. When a specific light-duty sediment barrier is specified in the Contract Documents, no substitution shall be permitted.

Light-duty sediment barriers shall be installed such that soil scour and erosion is prevented at the low points of the barrier on the downslope side.

#### **805.07.02.02            Sediment Fence Barriers**

Sediment fence barriers shall not have plastic or wire mesh backing.

Sediment fence barriers shall be constructed as specified in the Contract Documents and according to the following:

- a) Within a trench excavated along the contour of the ground such that the elevation of the above ground portion of the fence is the same along its entire length except at the ends.
- b) Without breaks or gaps along their entire length.
- c) On flat ground with a minimum offset of 2 m from the toe of the slope being protected. When a longer sediment barrier is required, additional sediment fence barriers shall be installed as specified in the Contract Documents.
- d) With the geotextile attached firmly, without sagging, to the upslope side of the stakes and the stakes spaced to ensure the geotextile remains vertical.
- e) With the geotextile joined to provide a continuous run, with the ends overlapped a minimum of 500 mm and securely fastened to the stakes using cable ties or soft wire at the top of the geotextile only.

- f) With the geotextile angled upslope at the ends of each run in a “J” pattern and so that the ends are at a higher elevation than the bottom of the run.

When geotextile is supplied without stakes attached, the geotextile shall be installed into the trench in the ground first, the stakes shall be driven into the ground behind the geotextile, and the geotextile shall be attached to the upslope side of the stakes using cable ties or soft wire at the top of the geotextile only.

### **805.07.02.03                      Fibre Roll Barriers**

Fibre roll barriers shall be sized and constructed as specified in the Contract Documents and according to the following:

- a) Along the contour of the ground into trenches that have been excavated into the soil perpendicular to the slope face to a depth of approximately one half the roll diameter across the width of the slope unless otherwise specified by the manufacturer of a commercial product.
- b) After any rills and gullies on the slope where fibre roll barriers are to be installed have been filled in.
- c) On flat ground with a minimum offset of 2 m from the toe of the slope being protected. When a longer sediment barrier is required, additional fibre roll barriers shall be installed tightly butted against each other as specified in the Contract Documents.
- d) With their base in continuous contact with the underlying soil along their entire length without gaps and angled upslope at end of each run in a “J” pattern.
- e) With the ends of adjacent fibre roll segments tightly butted against each other without being overlapped vertically or horizontally.

After placement, a metal bar shall be used to make pilot holes perpendicular to the slope face through the centre of the fibre rolls as specified in the Contract Documents. Pilot holes shall also be made at the ends of each fibre roll segment angled towards the next abutting fibre roll to hold adjacent rolls together.

Wooden stakes shall be driven into the pilot holes as specified in the Contract Documents.

Soil excavated from the trenches shall be placed along the upslope side of the fibre rolls and compacted into the front of the trench to minimize possible undermining by runoff.

The soil on the upslope and downslope sides of the fibre rolls shall be seeded as specified in the Contract Documents and according to OPSS 803.

### **805.07.03                      Heavy-Duty Sediment Barriers, General**

Heavy-duty sediment barriers are wire-backed sediment fence barriers, berm barriers, or sandbag barriers.

Heavy-duty sediment barriers shall be constructed as specified in the Contract Documents, without gaps and without undermining to prevent sediment passage through, under, or around the barrier.

When the Heavy-Duty Sediment Barrier item is specified in the Contract Documents, the option is available to select any of the heavy-duty sediment barriers or any combination of them. When a specific heavy-duty sediment barrier is specified in the Contract Documents, no substitution shall be permitted.

Heavy-duty sediment barriers shall be installed such that soil scour and erosion is prevented at the low points of the barrier on the downslope side.

**805.07.03.01****Wire-Backed Sediment Fence Barriers**

Wire-backed sediment fence barriers shall not be used for perimeter control or property line delineation unless specified in the Contract Documents.

Wire-backed sediment fence barriers shall be constructed as specified in the Contract Documents and according to the following:

- a) Within a trench excavated along the contour of the ground such that the elevation of the bottom of the fence is the same along its entire length except at the ends.
- b) Without breaks or gaps along their entire length.
- c) On flat ground with a minimum offset of 2 m from the toe of the slope being protected. When a longer sediment barrier is required, additional wire-backed sediment fence barriers shall be installed as specified in the Contract Documents.
- d) With the wire fence installed into the trench first, the geotextile installed next on the upslope side of the wire fence and T-posts installed into the ground behind the geotextile and wire fence and spaced to ensure the geotextile and wire fence remain vertical.
- e) With the geotextile and the wire fence attached securely to the T-posts using wire ties at the top of the geotextile and wire fence only.
- f) With the geotextile and the wire fence joined to provide a continuous run, with their ends overlapped a minimum of 500 mm, and securely fastened to T-posts using wire ties at the top of the geotextile or wire fence only.
- g) With the wire-backed sediment fence angled upslope at the ends of each run in a "J" pattern and so that the ends are at a higher elevation than the bottom of the run.

**805.07.03.02****Berm Barriers**

Berm barriers shall be constructed and wrapped in geotextile or plastic sheeting as specified in the Contract Documents unless they are constructed using compost. The geotextile or plastic sheeting shall be secured to the ground.

**805.07.03.03****Sandbag Barriers**

Sandbags shall be securely tied at the top.

Sandbag barriers shall be constructed as specified in the Contract Documents.

Sandbags within each row shall be placed with the sides of the bags butted tightly against one another without gaps. The ends of sandbags in adjacent rows shall be butted tightly against one another without gaps.

When sandbag barriers are constructed on earth surfaces, they shall be placed into an excavated trench, backfilled with excavated material to existing grade and compacted.

When sandbag barriers are to be constructed on sod, erosion control blanket, existing turf, or bedrock, they shall be placed so there are no gaps between the sandbags and the underlying surface.

Sandbag barriers shall be maintained with undamaged bags that are firmly seated.

#### **805.07.04 Sediment Trap in Ditch**

Sediment traps in a ditch shall be constructed as specified in the Contract Documents to prevent sediment transport from the upstream to the downstream side of the trap and so that the majority of the sediment is collected in the excavated basin.

Sediment traps shall be constructed as a single control measure consisting of an excavated basin and a rock flow check dam according to OPSS 804.

#### **805.07.05 Sediment Traps for Dewatering**

Sediment traps for dewatering shall be according to OPSS 517 and as specified in the Contract Documents.

A sediment barrier shall be constructed as specified in the Contract Documents and according to this specification to completely surround the sediment trap for dewatering with its ends overlapping a minimum of 500 mm where they meet. The rock flow check dam shall be constructed according to OPSS 804 and be located at the low point of the sediment barrier.

A temporary construction fence shall be erected around the sediment trap to restrict public access.

#### **805.07.06 Filter Bags**

Filter bags, hoses and pumps shall be sized appropriately to the volume of water to be filtered as specified in the Contract Documents. Bags shall have a FOS as specified in the Contract Documents.

Filter bags shall be situated in a vegetated area or placed on a permeable surface on a slight slope with the opening of the bag facing upslope a minimum of 30 m away from waterbodies and sensitive environmental receptors or as far as practicable from the top of the bank of any waterbody.

All filter bags shall be completely surrounded at their perimeter by a sediment barrier constructed according to this specification with its ends overlapping a minimum of 500 mm where they meet.

The opening of the filter bag shall be securely attached with mechanical connections to the discharge hose using commercially available hose couplers and placed in the retention facility to be dewatered.

Discharge of water from filter bags shall be according to OPSS 517.

A filter bag shall be replaced when trapped sediment has accumulated to 50% of the bag capacity or in accordance with the manufacturer's recommendations.

#### **805.07.07 Turbidity Barriers**

Turbidity barriers shall be constructed as specified in the Contract Documents, without gaps and without undermining to prevent turbid water from passing through, under, or around the barriers.

##### **805.07.07.01 Turbidity Curtains**

Turbidity curtains shall be constructed as specified in the Contract Documents.

Turbidity curtains shall not be used across flowing watercourses.

Turbidity curtains shall be free of tears and gaps. The bottom edge of the curtain shall be in continuous and secured contact with the waterbody bed to prevent sediment passage from the enclosed area.

Turbidity curtains shall be constructed according to the following:

- a) Turbidity curtains shall be oriented parallel to the direction of flow to the greatest extent possible.
- b) Turbidity curtains shall be firmly anchored in place. The alignment of the curtain shall be set as close to the Working Area as possible but not so close as to be disturbed by construction equipment.
- c) The height of turbidity curtains shall be 20% greater than the depth of the water where they are to be installed to allow for water level fluctuations.
- d) The area that turbidity curtains protect shall not contain large culverts or drainage areas that if flows occur behind the curtain it would cause a breach or lost contact with the waterbody bed at the bottom surface of the curtain.
- e) When water depths at the design alignment are minimal, the toe of the curtain may be anchored in place by staking. Supplemental anchors of the toe of the curtain shall be used, as needed, depending on water surface disturbances such as from boats and wave action.
- f) Shallow installations may be made by securing the top of the curtain using staking rather than a flotation system.

#### **805.07.07.02 Turbidity Dam**

Turbidity dams shall be constructed as specified in the Contract Documents.

#### **805.07.08 Monitoring and Documentation**

All temporary sediment control shall be monitored to ensure it is effective. Monitoring shall be completed for the following conditions:

- a) A minimum of every seven Days.
- b) The 24 hours prior to a forecasted significant rainfall event.
- c) Within 24 hours after significant rainfall events.

Monitoring shall include the following:

- a) Visual inspection of the condition and effectiveness of all installed temporary sediment controls; and
- b) Visual inspection for sediment leaving the Working Area and for entering waterbodies and sensitive environmental receptors.

Observations shall be documented and any concerns such as observed breaches of temporary sediment control, or sediment transport to a waterbody, sensitive receptor or private property shall be reported immediately to the Contract Administrator. Monitoring documentation shall be provided to the Contract Administrator upon request within 24 hours.

#### **805.07.09 Maintenance**

All temporary sediment control constructed under this specification shall be maintained in an effective, functioning, stable condition.

When temporary sediment control is found to be ineffective at any location, a different material, product or method more suitable for the site conditions shall be selected, installed and maintained within 48 hours.

**805.07.09.01****Sediment Removal**

Sediment contained by temporary sediment control shall be removed and managed as specified in the Contract Documents in a manner that avoids escape of the sediment to the downstream side and avoids damage to the temporary erosion control materials or products. Sediment shall be removed to the level of the grade existing at the time the temporary sediment control was constructed and be according to the following:

- a) For light-duty sediment barriers, accumulated sediment shall be removed once it reaches the lesser of the following:
  - i. A depth of one-half the effective height of the sediment barrier.
  - ii. A depth of 300 mm immediately upstream of the sediment barrier.
- b) For heavy-duty sediment barriers, sediment traps in ditches, and sediment traps for dewatering, accumulated sediment shall be removed once it reaches one-half the effective height or depth of the sediment barrier or trap.
- c) For sediment traps for dewatering, sediment shall be removed when sediment diminishes the storage volume by 50%.
- d) For all temporary sediment control, accumulated sediment shall be removed as necessary to perform maintenance repairs.
- e) Accumulated sediment shall be removed immediately prior to the final removal of the temporary sediment control.

**805.07.10****Removal**

Temporary sediment control shall be removed, and associated excavations backfilled and compacted when the area being protected has been completely stabilized by final cover placement. When the final cover is vegetated and placement could not be advanced to allow establishment and stabilization of the site prior to Contract Completion, temporary sediment control shall be left in place.

Temporary sediment control shall also be removed without entry of equipment to any waterbody other than hand-held equipment or boats as may be required, and in a manner that minimizes release of sediment and debris to any waterbody, sensitive receptor or private property.

Prior to removal of in-water turbidity barriers, any sediment laden water shall be allowed to settle out or be pumped out of the area enclosed by the turbidity barrier.

Any existing, seed, sod, temporary erosion control, or final design cover disturbed by removal or backfilling of temporary sediment control and removal of accumulated sediment, shall be brought to final grade and restored as specified in the Contract Documents.

Filter bags that have reached capacity or are no longer in use, and any captured sediment within the filter bag or its light-duty sediment barrier enclosure shall be managed as excess material as specified in the Contract Documents.

**805.07.11****Protection of Waterbodies and Sensitive Environmental Receptors**

Protection of waterbodies, waterbody banks and sensitive environmental receptors shall be as specified in the Contract Documents.

## **805.07.12 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **805.08 QUALITY ASSURANCE**

### **805.08.01 Acceptance of Temporary Sediment Control**

The acceptance of temporary sediment control shall be according to the requirements of this specification and, as specified in the Contract Documents. Acceptance for each type of temporary sediment control shall be determined through visual inspection by the Contract Administrator and random quality assurance checks by the Owner.

The Owner may conduct random quality assurance checks on temporary sediment control that has been installed or removed to verify they are in accordance with the requirements of this specification, and as specified in the Contract Documents.

Temporary sediment control that is identified by the Owner as deficient shall be removed and replaced or reapplied with measures that meet the requirements of this specification and, as specified in the Contract Documents. Removal and replacement or reapplication shall be carried out at no additional cost to the Owner within 48 hours of the Owner providing notice to the Contractor, unless otherwise agreed to in writing.

## **805.09 MEASUREMENT FOR PAYMENT**

### **805.09.01 Actual Measurement**

#### **805.09.01.01 Light-Duty Sediment Barriers Sediment Fence Barriers Fibre Roll Barriers Heavy-Duty Sediment Barriers Wire-Backed Sediment Fence Barriers Berm Barriers Sandbag Barriers**

Measurement shall be the length in linear metres from end to end of the barrier, following the contours of the ground.

#### **805.09.01.02 Sediment Traps in Ditch Sediment Traps for Dewatering Filter Bags**

For measurement purposes, a count shall be made of the number of sediment traps in a ditch, sediment traps for dewatering and filter bags constructed or installed. Component parts shall not be counted separately for payment.

#### **805.09.01.03 Turbidity Curtains**

Measurement of turbidity curtain shall be made in linear metres along its length from end to end between tie-downs for each turbidity curtain installed.

#### **805.09.01.04 Turbidity Dams**

For measurement purposes, a count shall be made of the number of turbidity dams constructed.

**805.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**805.10 BASIS OF PAYMENT**

**805.10.01**      **Light-Duty Sediment Barriers - Item**  
**Sediment Fence Barriers - Item**  
**Fibre Roll Barriers - Item**  
**Heavy-Duty Sediment Barriers - Item**  
**Wire-Backed Sediment Fence Barriers - Item**  
**Berm Barriers - Item**  
**Sandbag Barriers - Item**  
**Sediment Traps in Ditch - Item**  
**Sediment Traps for Dewatering - Item**  
**Filter Bags - Item**  
**Turbidity Curtains - Item**  
**Turbidity Dams - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material required to do the work.

Progress payments for the sediment control measures shall be made as follows:

- a) 30% for initial construction.
- b) 50% for maintenance.
- c) 20% for removal.

## **CONSTRUCTION SPECIFICATION FOR ROOTWAD STRUCTURES**

|           |                                  |
|-----------|----------------------------------|
| OPSS 1440 | Steel Reinforcement for Concrete |
|-----------|----------------------------------|

### **810.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Anchoring Stone** means large stones used to anchor rootwad structures into a waterbody bank.

**Excavated Bank Material** means the existing earth material removed from the waterbody bank prior to the installation of a rootwad structure and replaced on top of the anchoring stone when backfilling the installation.

**Footer Log** means a log used to provide support under the rootwad trunk of a rootwad structure installed into a waterbody bank.

**Rootfan** means the root mass at the end of a rootwad trunk.

**Rootwad Structure** means the trunk of a tree with the limbs removed and the rootfan attached and exposed from earth that is installed along the toe of a waterbody bank to stabilize the slope and provide fish habitat, and includes a footer log, anchoring stone, and may include reinforcing steel.

**Rootwad Trunk** means the trunk of a tree used in a rootwad structure.

### **810.05 MATERIALS**

#### **810.05.01 General**

All materials shall be free of deleterious substances.

#### **810.05.02 Trees**

Trees used for rootwad structures and footer logs shall be natural and untreated oak, maple, cedar, spruce, pine, or beech, unless otherwise specified in the Contract Documents.

Preference shall be given to trees sourced on-site.

#### **810.05.03 Rootwad Trunk**

The rootwad trunk shall be sized as specified in the Contract Documents. All limbs shall be removed from the rootwad trunk.

#### **810.05.04 Rootfan**

The rootfan shall be maintained intact at the end of the rootwad trunk.

#### **810.05.05 Footer Log**

Footer logs shall be generally straight and sized as specified in the Contract Documents.

#### **810.05.06 Anchoring Stone**

Anchoring stone shall be large field stone or quarried bedrock.

#### **810.05.07 Reinforcing Steel**

Reinforcing steel shall be according to OPSS 1440.

## **810.07 CONSTRUCTION**

### **810.07.01 General**

Rootwad structures shall be installed in the dry. The outside edge of the rootfan of a rootwad structure shall be installed so that it is no lower than the bottom of the waterbody or otherwise so that it is 1/3 below the low water level of the waterbody as specified in the Contract Documents.

### **810.07.02 Installation**

Installation of rootwad structures shall be completed in the following sequence:

- a) The waterbody bed and waterbody bank shall be excavated to accommodate the entire length of the rootwad trunk and the footer log. The excavation shall be slightly angled to become deeper further inland from the edge of the waterbody.
- b) The excavated bank materials shall be reused for the final layer when backfilling.
- c) The footer log shall be installed so that it sits at the waterbody edge of the excavation, parallel to the waterbody bank, and at the depth specified in the Contract Documents. When more than one rootwad structure is to be installed in series, the footer logs shall be installed starting at the downstream end of the installation.
- d) The rootwad trunk shall be placed in the excavation resting on the footer log so that it is embedded into the waterbody bank up to the rootfan. The rootwad trunk shall be angled slightly in the excavation so that the rootwad structure is facing upstream at an angle, as specified in the Contract Documents, to the waterbody bank and shall be anchored into the bank with reinforcing steel if specified in the Contract Documents.
- e) Anchoring stone shall be installed on the rootwad trunk and footer log to secure the rootwad structure in place. The anchoring stone shall cover minimum 1.5 times the diameter of the rootwad trunk, both in horizontal and vertical directions, and the entire length of the rootwad trunk and the footer log so that neither is visible from above.
- f) The previously excavated bank material shall be placed over the anchoring stone and graded according to OPSS 206.
- g) Vegetative cover shall be applied to the graded area as specified in the Contract Documents.

### **810.07.03 Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be as specified in the Contract Documents.

### **810.07.04 Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control shall be according to OPSS 517.

### **810.07.05 Management of Excess Materials**

Management of excess materials shall be as specified in the Contract Documents.

**810.09 MEASUREMENT FOR PAYMENT**

**810.09.01 Actual Measurement**

**810.09.01.01 Rootwad Structure**

For measurement purposes, a count shall be made of the number of rootwad structures installed along the waterbody bank.

**810.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**810.10 BASIS OF PAYMENT**

**810.10.01 Rootwad Structure - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

| OPSS 1004 | Aggregates - Miscellaneous |
|-----------|----------------------------|

### **811.03**

### **DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Backfill Stone** means a stone mixture used to hold in place large woody debris installed at the toe of a waterbody bank.

**Excavated Bank Material** means the existing earth material removed from the waterbody bank prior to the installation of large woody debris and replaced on top of the backfill stone when backfilling the installation.

**Large Woody Debris** means one or more woody materials including, natural logs, tree trunks and limbs, or tree stumps with rootfans intertwined together and applied along the toe of a waterbody bank when the toe of the waterbody bank is being eroded and includes backfill stone.

**Rootfan** means the root mass at the end of the trunk of a tree.

### **811.05**

### **MATERIALS**

#### **811.05.01**

#### **Large Woody Debris**

Large woody debris materials shall be sized as specified in the Contract Documents.

Preference shall be given to wood debris and dead trees sourced on-site.

#### **811.05.02**

#### **Backfill Stone**

Backfill stone shall be pit run material according to OPSS 1004 and as specified in the Contract Documents. Alternatively, previously excavated waterbody bank material may be used if specified in the Contract Documents.

### **811.07**

### **CONSTRUCTION**

#### **811.07.01**

#### **General**

Large woody debris shall be installed in the dry.

Adjacent to, but not within the installation area, the large woody debris shall be intertwined to create a mass, sized as specified in the Contract Documents.

#### **811.07.02**

#### **Installation**

Installation of large woody debris shall be completed in the following sequence:

- a) The installation area shall be excavated as specified in the Contract Documents. Excavated material shall be reused for the final layer when backfilling.
- b) The large woody debris shall be intertwined together to create a mass. The mass shall be placed in the excavation, ensuring that the large woody debris is situated in an irregular fashion as specified in the Contract Documents. The large woody debris mass shall extend to the back of the excavation and also extend into the waterbody as specified in the Contract Documents.

- c) The large woody debris shall be covered with backfill stone as specified in the Contract Documents and tamped down. The backfill stone shall be covered with a layer of the previously excavated bank material and graded according to OPSS 206.
- d) Vegetative cover shall be applied to the graded area as specified in the Contract Documents.

**811.07.03                      Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be as specified in the Contract Documents.

**811.07.04                      Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control shall be according to OPSS 517.

**811.07.05                      Management of Excess Materials**

Management of excess materials shall be as specified in the Contract Documents.

**811.09                              MEASUREMENT FOR PAYMENT**

**811.09.01                      Actual Measurement**

**811.09.01.01                  Large Woody Debris**

Measurement of large woody debris shall be in linear metres, in place, as measured along the top of the waterbody bank.

**811.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**811.10                              BASIS OF PAYMENT**

**811.10.01                      Large Woody Debris - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

## **CONSTRUCTION SPECIFICATION FOR LUNKERS**

### **812.01 SCOPE**

This specification covers the requirements for the construction of LUNKERS for the stability of waterbody banks and fish habitat enhancement.

### **812.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

#### **Ontario Provincial Standard Specifications, Construction**

OPSS 206 Grading  
OPSS 517 Dewatering

#### **Ontario Provincial Standard Specifications, Materials**

OPSS 1005 Aggregates - Waterbody  
OPSS 1010 Aggregates - Base, Subbase, Select Subgrade, and Backfill Material  
OPSS 1440 Steel Reinforcement for Concrete

## **812.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Cover Stone** means one or more large stones used to create the top of stone LUNKERS.

**Excavated Bank Material** means the existing earth material removed from the waterbody bank prior to the installation of LUNKERS and replaced on waterbody bank when backfilling the installation.

**LUNKERS** means an acronym for Little Underwater Neighbourhood Keepers Encompassing Rheotactic Salmonids that are crib-like, wooden, or stone structures installed along the toe of a waterbody bank.

**Spacer Stone** means a stone installed under the cover stone of stone LUNKERS and on top of the waterbody aggregate to create space under the cover stone.

## **812.05 MATERIALS**

### **812.05.01 General**

All materials shall be free of deleterious substances.

### **812.05.02 Wood**

Wood LUNKERS shall be constructed of local wood, untreated lumber or rough-hewn logs.

Wood LUNKERS planks, stringers, backboards, and posts shall be as specified in the Contract Documents.

Planks shall be placed side-by-side, without any gaps.

### **812.05.03 Waterbody Aggregates**

Waterbody aggregates shall be according to OPSS 1005 and as specified in the Contract Documents.

### **812.05.04 Granular B Aggregate**

Granular B aggregate shall be according to OPSS 1010, except that it may not contain reclaimed asphalt pavement, reclaimed concrete material, glass, ceramic, fly ash, any type of slag, or any other industrial by-product, and shall be made from unwashed, quarried bedrock.

### **812.05.05 Spacer and Cover Stones**

Spacer and cover stones shall be as specified in the Contract Documents.

### **812.05.06 Reinforcing Steel**

Reinforcing steel shall be according to OPSS 1440.

## **812.07 CONSTRUCTION**

### **812.07.01 General**

LUNKERS shall be installed in the dry.

## **812.07.02                      Installation**

### **812.07.02.01                      Wood LUNKERS**

Wood LUNKERS shall be constructed on land outside the waterbody as specified in the Contract Documents, prior to installation in the waterbody bank.

Installation of wood LUNKERS shall be completed in the following sequence:

- a) The waterbody bed and bank shall be excavated to accommodate wood LUNKERS as specified in the Contract Documents. Excavated bank materials shall be reused for the final layer when backfilling.
- b) Wood LUNKERS shall be installed in the excavation as specified in the Contract Documents. Adjustments to level and stabilize wood LUNKERS shall be made by hand.
- c) Holes shall be drilled through the posts of wood LUNKERS to accommodate the reinforcing steel and the reinforcing steel shall be driven through wood LUNKERS and into the waterbody bed.
- d) Waterbody aggregates shall be placed on wood LUNKERS and extend to the high water level of the waterbody to re-establish the waterbody bank as specified in the Contract Documents. Granular B aggregate shall be installed at the rear of the excavation as specified in the Contract Documents.

The previously excavated waterbody bank material shall be installed on top of the waterbody aggregates I and Granular B aggregate as specified in the Contract Documents and graded according to OPSS 206. Vegetative cover shall be applied to the graded area as specified in the Contract Documents.

### **812.07.02.02                      Stone LUNKERS**

Stone LUNKERS shall be installed in the dry.

Installation of stone LUNKERS shall be completed in the following sequence:

- a) The waterbody bed shall be excavated to accommodate stone LUNKERS as specified in the Contract Documents. Excavated bank material shall be reused for the final layer when backfilling.
- b) Waterbody aggregates shall be placed on the waterbody bed to create a flat, stable base for stone LUNKERS as specified in the Contract Documents.
- c) Spacer stones shall be installed on the waterbody aggregates as specified in the Contract Documents. Spacer stones shall be installed to be at the mid-point and at each end of the length of the cover stone. The cover stone shall then be lowered onto the spacer stones. Adjustments shall be made to level and stabilize stone LUNKERS.
- d) Waterbody aggregates shall be placed on the cover stone of stone LUNKERS to re-establish the waterbody bank as specified Contract Documents. Granular B aggregate shall be installed on top of the waterbody aggregates and extend to the high water level of the waterbody as specified in the Contract Documents.
- e) The previously excavated bank material shall be placed over the Granular B aggregate as specified in the Contract Documents and graded according to OPSS 206.
- f) Vegetative cover shall be applied to the graded area as specified in the Contract Documents.

**812.07.03                      Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be as specified in the Contract Documents.

**812.07.04                      Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control shall be according to OPSS 517.

**812.07.05                      Management of Excess Materials**

Management of excess materials shall be as specified in the Contract Documents.

**812.09                          MEASUREMENT FOR PAYMENT**

**812.09.01                      Actual Measurement**

**812.09.01                      Wood LUNKERS  
Stone LUNKERS**

Measurement of wood and stone LUNKERS shall be in linear metres, in place, as measured along the top of the waterbody bank.

**812.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**812.10                          BASIS OF PAYMENT**

**812.10.01                      Wood LUNKERS - Item  
Stone LUNKERS - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

## **CONSTRUCTION SPECIFICATION FOR RIFFLES**

### **820.01 SCOPE**

This specification covers the requirements for the construction of riffles to maintain and enhance fish passage in a waterbody.

### **820.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

#### **Ontario Provincial Standard Specifications, Construction**

OPSS 517 Dewatering  
OPSS 823 Low Flow Channels

#### **Ontario Provincial Standard Specifications, Material**

OPSS 1005 Aggregates - Waterbody

### **820.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Anchor Stones** means large waterbody aggregates used to create a stable base.

**Interstitial Space** means an empty space or gap between spaces full of structure or matter.

**Low Flow Channel** means as defined by OPSS 823.

**Riffle** means shallow areas of a waterbody with the steepest waterbody bed slopes and shallowest depths where waterbody aggregates that break up the flow of water.

**Riffle Crest** means the highest point of a riffle at its upstream end.

**Waterbody Aggregates** means as defined by OPSS 1005.

## **820.05 MATERIALS**

### **820.05.01 Waterbody Aggregate**

Waterbody aggregates shall be according to OPSS 1005 and as specified in the Contract Documents.

## **820.07 CONSTRUCTION**

### **820.07.01 General**

Riffles shall be constructed in the dry.

### **820.07.02 Waterbody Bed Excavation**

All required waterbody bed excavation shall be carried out as specified in the Contract Documents.

### **820.07.03 Waterbody aggregates**

The waterbody aggregates shall be blended on site and as specified in the Contract Documents. Approximately 10 - 20% of the largest size of waterbody aggregates to be used shall be set aside and positioned on top of the smaller waterbody aggregates to direct the stream flow.

Waterbody aggregates placement shall commence at the downstream end of the waterbody as specified in the Contract Documents and progress to the upstream end. Waterbody aggregates shall be compacted and interstitial spaces shall be filled as specified in the Contract Documents.

The riffle crest shall be constructed across the waterbody bed with large diameter waterbody aggregates backed up with the next largest waterbody aggregates size downstream. Anchor stones shall be placed on the waterbody bed to create the upstream slope of the riffle and shall extend to the high water level on both sides of the waterbody as specified in the Contract Documents. The thickness of each riffle crest shall be two to three times the diameter of the largest waterbody aggregates size.

The surface of the downstream face of the riffle shall have large waterbody aggregates placed so that they are spaced 20 - 30 cm apart to form gaps as specified in the Contract Documents.

Once placed, the waterbody aggregates shall form a non-uniform surface with larger stones protruding above smaller stones.

### **820.07.04 Low Flow Channel**

A low flow channel shall be installed within the riffle according to OPSS 823.

**820.07.05                      Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be according to the Contract Documents.

**820.07.06                      Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control shall be according to OPSS 517.

**820.07.07                      Management of Excess Materials**

Management of excess materials shall be according to the Contract Documents.

**820.09                          MEASUREMENT FOR PAYMENT**

**820.09.01                      Actual Measurement**

**820.09.01.01                  Riffles**

Measurement for riffles shall be by horizontal area in square metres.

**820.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**820.10                          BASIS OF PAYMENT**

**820.10.01                      Riffles - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

### **821.01 SCOPE**

This specification covers the requirements for the construction of pools in waterbody beds.

### **821.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

#### **Ontario Provincial Standard Specifications, Construction**

OPSS 517 Dewatering

#### **Ontario Provincial Standard Specifications, Material**

OPSS 1005 Aggregates - Waterbody

### **821.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Pool** means hydrologic segments of a waterbody where the water is deeper and slower.

**Waterbody Aggregates** means as defined by OPSS 1005.

## **821.05 MATERIALS**

### **821.05.01 Waterbody Aggregates**

Waterbody aggregates shall be according to OPSS 1005 and as specified in the Contract Documents.

## **821.07 CONSTRUCTION**

### **821.07.01 General**

Pools shall be excavated in the dry.

Any materials to be reused that must be temporarily removed from the waterbody bed shall be stored on-site as specified in the Contract Documents.

### **821.07.02 Pool Excavation**

Pools shall be excavated in the waterbody bed as specified in the Contract Documents.

### **821.07.03 Waterbody Aggregates**

Waterbody aggregates shall be installed as specified in the Contract Documents.

### **821.07.04 Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be according to the Contract Documents.

### **821.07.05 Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control for construction in waterbodies shall be according to OPSS 517.

### **821.07.06 Management of Excess Materials**

Management of excess materials shall be according to the Contract Documents.

## **821.09 MEASUREMENT FOR PAYMENT**

### **821.09.01 Actual Measurement**

#### **821.09.01.01 Pools**

Measurement for pools shall be by horizontal area in square metres.

#### **821.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**821.10 BASIS OF PAYMENT**

**821.10.01 Pools - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

| <b>822.08</b> | <b>QUALITY ASSURANCE - Not Used</b>                  |
| <b>822.09</b> | <b>MEASUREMENT FOR PAYMENT</b>                       |
| <b>822.10</b> | <b>BASIS OF PAYMENT</b>                              |

#### **822.01 SCOPE**

This specification covers the requirements for the construction of rocky ramps on waterbody beds.

#### **822.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Construction**

OPSS 517     Dewatering

##### **Ontario Provincial Standard Specifications, Material**

OPSS 1005     Aggregates – Waterbody

#### **822.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Anchor Stones** means large waterbody aggregates used to create a stable base.

**Boulder Weir** means a grade control structure to slow water behind it.

**Boulder Weir Crest** means the top of the boulder weir.

**In-stream Obstruction** means a barrier in a waterbody that prohibits fish passage.

**Pool** means as defined by OPSS 821.

**Rocky Ramp** means a longitudinal series of boulder weirs and pools creating a low slope that simulates a rocky waterbody bed.

**Waterbody Aggregate** means as defined by OPSS 1005.

## **822.05 MATERIALS**

### **822.05.01 Waterbody Aggregate**

Waterbody aggregate shall be according to OPSS 1005 and as specified in the Contract Documents.

## **822.07 CONSTRUCTION**

### **822.07.01 General**

Rocky ramps shall be constructed in the dry.

### **822.07.02 Removal of In-Stream Obstructions to Fish Passage from Waterbodies**

Pre-existing, in-stream obstructions to fish passage shall be removed from the waterbody as specified in the Contract Documents.

### **822.07.03 Waterbody Bed Excavation**

Prior to construction of rocky ramps, the waterbody bed shall be graded to create the slope and pools as specified in the Contract Documents.

The top layer of the excavated waterbody bed material shall be stockpiled on-site and reused later as the top layer of the rocky ramp as specified in the Contract Documents.

### **822.07.04 Waterbody Aggregate**

All imported waterbody aggregate shall be stockpiled within graded piles on-site adjacent to the rocky ramp construction location.

The downstream end of the rocky ramp shall be flatter than the rest of the ramp, approximately 10H:1V or as specified in the Contract Documents.

Waterbody aggregate placement shall commence at the downstream end of the waterbody as specified in the Contract Documents and progress to the upstream end. Waterbody aggregate shall be placed first in the centre of the boulder weir crest and then outwards toward the waterbody banks.

Each boulder weir shall be shaped like an arch so that adjacent waterbody aggregates support each other along the length of the boulder weir. Individual pieces of waterbody aggregate shall be carefully placed in a manner that allows the material to be rotated for precise alignment and fitting during construction.

Anchor stones shall form the first layer of waterbody aggregate and be placed below the elevation of the final grade to support a second row of waterbody aggregate.

The top row of waterbody aggregate shall then be placed against the anchor stones and slightly upstream of them so that they are supported with multiple points of contact.

When the arch of the boulder weir is complete, each boulder shall bear against its downstream neighbour and against the two anchor stones below it.

Anchor stones shall also be placed at the ends of each boulder weir well into the waterbody banks to the high water level and backfilled as specified in the Contract Documents.

Each pool shall be lined with waterbody aggregate as specified in the Contract Documents.

The bottom of each subsequent boulder weir shall be equal to the elevation of the crest of the boulder weir immediately downstream as specified in the Contract Documents.

Well-graded waterbody aggregate with some fines shall be placed on the upstream side of the boulder weir as specified in the Contract Documents.

Upon completion of construction of the rocky ramp, the center stone of each boulder weir crest shall be removed to form a notch for a low flow channel.

#### **822.07.05                      Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be according to the Contract Documents.

#### **822.07.06                      Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control shall be according to OPSS 517.

#### **822.07.07                      Management of Excess Materials**

Management of excess materials shall be according to the Contract Documents.

### **822.09                              MEASUREMENT FOR PAYMENT**

#### **822.09.01                      Actual Measurement**

##### **822.09.01.01                  Rocky Ramps**

Measurement for rocky ramps shall be by horizontal area in square metres.

#### **822.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**822.10 BASIS OF PAYMENT**

**822.10.01 Rocky Ramps - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

## **CONSTRUCTION SPECIFICATION FOR LOW FLOW CHANNELS**

#### **823.01 SCOPE**

This specification covers the requirements for the construction of low flow channels to maintain and enhance fish passage in a waterbody or a culvert.

#### **823.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Construction**

OPSS 517 Dewatering

##### **Ontario Provincial Standard Specifications, Materials**

OPSS 1005 Aggregates - Waterbody

## **823.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Low Flow Channel** means the part of a waterbody bed occupied by water during periods of low flow.

**Waterbody Aggregate** means as defined by OPSS 1005.

## **823.05 MATERIALS**

### **823.05.01 Waterbody Aggregate**

When the installation of a low flow channel includes supply of waterbody aggregate, it shall be according to OPSS 1005 and as specified in the Contract Documents.

## **823.07 CONSTRUCTION**

### **823.07.01 General**

Low flow channels shall be installed in the dry.

Excavation of the waterbody bed and supply of waterbody aggregate from off-site may not be required if the existing waterbody bed material can be adjusted to create the required low flow channel as specified in the Contract Documents.

When excavation of the waterbody bed and supply of waterbody aggregate are required to achieve the design as specified in the Contract Documents, any materials that are suitable for reuse that must be temporarily removed from the waterbody bed shall be stored on-site as specified in the Contract Documents.

### **823.07.02 Low Flow Channel**

Once the waterbody bed has been prepared, waterbody aggregate according to OPSS 1005 shall be installed as specified in the Contract Documents.

Waterbody aggregate placement shall be adjusted as necessary to achieve the design as specified in the Contract Documents.

Proper function shall be verified to ensure the flow is contained within the low flow channel, as constructed, when waterbody flow has been reinstated and that the grade and transition areas from the low flow channel to the waterbody do not present any barriers to flow or fish passage or direct flow outward towards the waterbody banks.

Waterbody aggregate placement may need to be adjusted to rectify any of these conditions.

### **823.07.03 Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be according to the Contract Documents.

### **823.07.04 Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control shall be according to OPSS 517.

**823.07.05                      Management of Excess Materials**

Management of excess materials shall be according to the Contract Documents.

**823.09                              MEASUREMENT FOR PAYMENT**

**823.09.01                      Actual Measurement**

**823.09.01.01                  Low Flow Channel**

Measurement of low flow channels using existing waterbody aggregate shall be in linear metres installed.

Measurement of low flow channels that include supply of waterbody aggregate shall be by mass in tonnes of waterbody aggregate.

**823.09.02                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**823.10                              BASIS OF PAYMENT**

**823.10.01                      Low Flow Channel - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

## **CONSTRUCTION SPECIFICATION FOR BAFFLES IN A CULVERT**

### **824.01 SCOPE**

This specification covers the requirements for the construction of baffles in culverts using streambed material to direct the flow of water within the culverts and to enhance fish passage through the culverts.

#### **824.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are written to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **824.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **824.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

OPSS 517      Dewatering

### **Ontario Provincial Standard Specifications, Materials**

OPSS 1005      Aggregates - Streambed Material

## **824.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Baffle** means one or a series of partial obstructions in a channel designed to increase flow depth or dissipate the energy of water flowing at high velocity while at the same time providing fish passage.

**Culvert** means a structure that provides an opening through an embankment and to which roadway loads are distributed through fill or that is designated as a culvert in the Contract Documents.

**Low Flow Channel** means the part of a streambed occupied by water during periods of low flow.

**Streambed Material** means as defined by OPSS 1005.

**824.05 MATERIALS**

**824.05.01 Streambed Material**

Streambed material used to construct baffles in a culvert shall be according to OPSS 1005 and as specified in the Contract Documents.

**824.07 CONSTRUCTION**

**824.07.01 General**

All baffles shall be constructed in the dry.

**824.07.02 Baffles in a Culvert**

Baffles shall be installed in a culvert to be a permanent feature within the culvert as specified in the Contract Documents.

When the construction of the baffles in a culvert is complete and the waterbody flow has been reinstated, streambed material placement shall be adjusted by hand to achieve the design specified in the Contract Documents.

The baffles in a culvert shall be monitored after installation is complete to verify that the grade and transition of flow to the low flow channel within the culvert does not present any barriers to fish passage.

The placement of streambed material shall be adjusted to rectify any barriers to fish passage.

**824.07.03 Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be according to the Contract Documents.

**824.07.04 Dewatering and Temporary Flow Control**

Dewatering and/or temporary flow control shall be according to OPSS 517.

**824.07.05 Management of Excess Materials**

Management of excess materials shall be according to the Contract Documents.

**824.09 MEASUREMENT FOR PAYMENT**

**824.09.01 Actual Measurement**

**824.09.01.01 Baffles in a Culvert**

For measurement purposes, a count shall be made of the number of baffles installed in a culvert.

**824.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**824.10**

**BASIS OF PAYMENT**

**824.10.01**

**Baffles in a Culvert - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**CONSTRUCTION SPECIFICATION FOR  
PLACEMENT OF AGGREGATES IN WATERBODIES**

| <b>825.06</b> | <b>EQUIPMENT - Not Used</b>                          |
| <b>825.07</b> | <b>CONSTRUCTION</b>                                  |
| <b>825.08</b> | <b>QUALITY ASSURANCE- Not Used</b>                   |
| <b>825.09</b> | <b>MEASUREMENT FOR PAYMENT</b>                       |
| <b>825.10</b> | <b>BASIS OF PAYMENT</b>                              |

**825.01 SCOPE**

This specification covers the requirements for the placement of aggregates in waterbodies.

**825.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**Ontario Provincial Standard Specifications, Construction**

OPSS 517      Dewatering

**Ontario Provincial Standard Specifications, Material**

OPSS 1005      Aggregates - Waterbody

**825.03 DEFINITIONS**

For the purpose of this specification, the definitions in OPSS 182 shall apply.

**825.05 MATERIALS**

Aggregates in waterbodies shall be according to OPSS 1005 and as specified in the Contract Documents.

**825.07 CONSTRUCTION**

**825.07.01 Waterbody Bed Excavation**

Waterbody beds shall be excavated to the limits specified in the Contract Documents. The placement locations shall be graded to a uniform and even surface prior to material placement.

**825.07.02 Placement**

Placement of aggregates shall be at the locations specified in the Contract Documents.

Placement of aggregates shall occur in an isolated work area. Dewatering and/or temporary flow passage systems for the placement of aggregates shall be according to OPSS 517.

Where aggregate is to be placed on a slope with a grade greater than 2%, placement shall commence at the toe of the slope and progress up the slope from that point to the termination location as specified in the Contract Documents.

**825.07.03 Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be according to the Contract Documents.

**825.07.04 Management of Excess Materials**

Management of excess materials shall be according to the Contract Documents.

**825.09 MEASUREMENT FOR PAYMENT**

**825.09.01 Actual Measurement**

**825.09.01.01 Placement of Waterbody Aggregates**

Measurement for the placement of aggregates shall be volume in cubic metres.

**825.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**825.10 BASIS OF PAYMENT**

**825.10.01 Placement of Waterbody Aggregates - Item**

Payment at the Contract price of the above tender item shall be full compensation for all labour, Equipment and Material to do the work.

## CONSTRUCTION SPECIFICATION FOR BIOENGINEERING MEASURES

## Canadian and Provincial Statutes

Invasive Species Act, 2015, as amended

### 832.03 DEFINITIONS

For the purpose of this specification, the definitions in OPSS 182 and the following definitions apply:

**Basal End** means the root producing end of a live cutting.

**Bioengineering Measures** means live stakes, brush layers, vegetated soil lifts and vegetated rock applied to waterbody banks for soil stabilization.

**Brush Layers** means alternating layers of live cuttings and soil placed along contours of a waterbody bank.

**Dormant** means after buds have closed or before buds open.

**Invasive Species** means as in the Invasive Species Act.

**Live Cuttings** means portions cut from dormant, live plants of a specified woody species that are not an invasive species, with branches and bark left intact.

**Live Stakes** means dormant, live cuttings with the branches trimmed off.

**Significant Rainfall** means a rainfall event exceeding 15 mm within a 24 hour period.

**Soil Lifts** means layers of soil wrapped in biodegradable erosion control blankets material placed along contours of a waterbody bank.

**Vegetated Rock** means live cuttings or plant material inserted between rocks placed along contours of a waterbody bank.

### 832.05 MATERIALS

#### 832.05.01 Live Cuttings and Live Stakes

Live cuttings and stakes shall be as specified in the Contract Documents and shall be sourced on site or from a supplier.

Live cuttings and stakes shall be free of disease and damage.

#### 832.05.02 Plant Material

Plant material shall be free of disease and damage and shall be as specified in the Contract Documents.

#### 832.05.03 Rock

Rock shall be as specified in the Contract Documents.

#### 832.05.04 Topsoil

Soil shall be according to OPSS 802.

**832.05.05 Twine**

Twine shall be inert and biodegradable.

**832.07 CONSTRUCTION**

**832.07.01 Operational Constraints**

Bioengineering measures shall not be installed during significant rainfall events or periods of drought. Dry soils shall be watered prior to installation.

Excavated materials that are suitable for reuse as backfill material shall be stockpiled on-site and controlled as specified in the Contract Documents.

Live cuttings shall be installed within 12 hours of collection on-site or arrival from a supplier or shall otherwise be stored according to this specification.

Live cuttings shall not be planted if buds have broken open or if they are split, dried out, sprouting, or moldy.

Material from the waterbody bank shall not enter the waterbody during grading.

**832.07.02 Waterbody Bank Preparation**

The waterbody bank shall be graded and prepared prior to placement of the bioengineering measures as specified in the Contract Documents and according to OPSS 206.

**832.07.03 Harvest, Transport and Storage of Live Cuttings and Live Stakes**

**832.07.03.01 Harvest**

Sharp, clean hand tools shall be used for harvesting live cuttings and stakes.

Live cuttings shall be harvested when they are dormant. Harvesting of live cutting and stakes shall not occur until October 15<sup>th</sup>.

Live cuttings collected on-site shall be cut from the crown of dormant plants. No more than 2/3 of the existing plant shall be removed.

Live stakes shall be taken from live cuttings with the basal ends cut at a 45 degree angle and the top cut square.

Live cuttings and live stakes shall be sized to the dimensions specified in the Contract Documents.

**832.07.03.02 Transport**

Live cuttings shall be bound in bundles with all of the growing tips aligned in the same direction and tied with twine for ease of transport.

Live cuttings and stakes being transported shall be covered to prevent them from drying out.

### **832.07.03.03 Storage**

When live cuttings or stakes cannot be planted within 12 hours of collection on-site or arrival from a supplier, they shall be stored in locations that will be continually shaded and protected from the wind and shall have the basal ends kept in water, or heeled into damp soil.

### **832.07.04 Installation**

#### **832.07.04.01 Brush Layers**

The waterbody bank shall be excavated, and the brush layers installed as specified in the Contract Documents and according to the following:

- a) Excavation shall begin at the base of the waterbody bank and proceed upland above a stable toe structure as specified in the Contract Documents,
- b) Excavation shall be 0.5 to 1.0 metres deep with the surface of the bench angling back into the waterbody bankmaking the back of the constructed bench 150 to 300 mm lower than the front edge.
- c) The brush layers shall be installed so that the branches of the live cuttings are long enough so that the cut basal ends touch the back of the excavation, and the growing tips protrude from the face of the fill no more than 1/3 their total depth once installed on the excavated benches.
- d) The brush layers shall be covered with topsoil. The topsoil shall be sifted onto the brush layers tamping them into place ensuring that there are no air voids.

#### **832.07.04.02 Live Stakes**

Live stakes shall be 15 to 40 mm in diameter and 600 to 900 mm in length.

Live stakes shall be installed the day that they are harvested or removed from storage.

Live stakes shall be installed into the ground as specified in the Contract Documents at a right angle to the slope using a rubber mallet. Once installed, live stakes should have 20 to 25 % of the stake exposed above ground. At least two buds or bud scars should be present above the ground in the final installation.

If live stakes cannot be inserted into the ground to meet the above requirements, pilot holes shall be made by driving a steel rod into the ground. The soil surrounding the live stakes shall be tamped down.

#### **832.07.04.03 Soil Lifts**

The waterbody bank shall be excavated, and the soil lifts installed as specified in the Contract Documents

The soil lift shall be graded so that the lift slopes back into the waterbody bank, making the back of the constructed bench 150 to 300 mm lower than the front edge.

Soil lifts should be a maximum of 300 mm high and as specified in the Contract Documents.

Biodegradable erosion control blankets shall be as specified in the Contract Documents and wrapped a minimum of 1 metre under the bank.

Soil shall be placed creating a lift and mechanically compacted to the depth as specified it the Contract Documents.

#### **832.07.04.04                    Vegetated Rock**

The waterbody bank shall be excavated, and the vegetated rock installed as specified in the Contract Documents.

#### **832.07.05                    Vegetative Cover**

Vegetative cover shall be applied as specified in the Contract Documents and according to OPSS 803.

#### **832.07.06                    Temporary Erosion and Sediment Control**

Temporary erosion and sediment control measures shall be applied as specified in the Contract Documents and according to OPSS 804 and OPSS 805.

#### **832.07.07                    Protection of Waterbodies and Waterbody Banks**

Protection of waterbodies and waterbody banks shall be as specified the Contract Documents.

#### **832.07.08                    Management of Excess Materials**

Management of excess materials shall be as specified the Contract Documents.

### **832.08                    QUALITY ASSURANCE**

Prior to use, live cuttings and stakes and plant material as specified in the Contract Documents may be inspected by the Contract Administrator. Any live material that has dried out or is damaged shall be rejected.

### **832.09                    MEASUREMENT FOR PAYMENT**

#### **832.09.01                    Actual Measurement**

##### **832.09.01.01                    Live Stakes**

For measurement purposes a count shall be made of the number of live stakes installed.

##### **832.09.01.02                    Brush Layers Vegetated Rock Soil Lifts**

Measurement of brush layers, vegetated rock and soil lifts shall be by area in square metres following the contours of the ground.

##### **832.09.02                    Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

**832.10 BASIS OF PAYMENT**

**832.10.01**  
**Brush Layers - Item**  
**Live Stakes - Item**  
**Soil Lift - Item**  
**Vegetated Rock - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**832.10.02 Vegetative Cover**

Payment for vegetative cover shall be according to OPSS 803.

**832.10.03 Temporary Erosion and Sediment Control**

Payment for temporary erosion and sediment control shall be according to OPSS 804 and OPSS 805.

## 902.03

### DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Bedding** means granular material to be placed in areas so designated in the Contract Documents.

**Channel** means a natural or artificial watercourse.

**Culvert** means a structure that provides an opening through an embankment and to which roadway loads are distributed through fill or that is designated as a culvert in the Contract Documents.

**Designated Payment Surface** means the original ground surface shown in the Contract Documents, unless a specially designated payment surface is shown either by elevation or by profile. The specially designated payment surface is horizontal in the transverse direction.

For rock excavation the designated payment surface shall be the existing rock surface as established in the field before rock excavation begins, unless another designated payment surface is specified.

**Dewatering System** means as defined in OPSS 517.

**Earth** means all soils except those defined as rock, and excludes stone masonry, concrete and other manufactured materials.

**Foundation** means that portion of the ground below the structure base or footings that supports the structure or that portion of the ground supporting the pile caps.

**Rock** means natural beds or massive fragments, of the hard, stable, cemented part of the earth's crust, igneous, metamorphic, or sedimentary in origin, which may or may not be weathered, and includes boulders having a volume of 1 cubic m or greater.

**Soil** means all loose or moderately cohesive organic or inorganic deposits of the earth's crust such as silt, sand, gravel, or clay or any of their mixtures.

**Structure** means any bridge, tunnel, concrete culvert, retaining wall, dock, guideway, or sign support.

## 902.04

### DESIGN AND SUBMISSION REQUIREMENTS

#### 902.04.01

#### Design Requirements

##### 902.04.01.01

##### Dewatering

Where dewatering is required, the Contractor shall be responsible for the design of the dewatering system for the intended purpose.

#### 902.04.02

#### Submission Requirements

##### 902.04.02.01

##### Preconstruction Survey

Prior to commencing the work, a condition survey of property and structures that may be affected by the work shall be submitted to the Contract Administrator. The survey shall include the locations and conditions of adjacent properties; buildings; underground structures; Utility services; and structures, such as walls abutting the site.

## **902.05 MATERIALS**

### **902.05.01 Granular**

Granular material to be used for backfill, bedding, and frost tapers shall be according to OPSS 1010.

The 19.0 mm clear stone to be used for wall drains shall be according to OPSS 1004.

### **902.05.02 Native Backfill**

Native and imported material shall be approved by the Contract Administrator. All material shall be free from frozen lumps, cinders, ashes, refuse, vegetable or organic matter, rocks and boulders over 150 mm in any dimension, and other deleterious material.

### **902.05.03 Clay Seal**

Clay seal shall be according to OPSS 1205.

### **902.05.04 Geotextile**

Geotextile shall be according to OPSS 1860 and be of the type, class, and filtration opening size (FOS) range specified in the Contract Documents.

## **902.06 EQUIPMENT**

### **902.06.01 Compaction Equipment**

Compaction equipment shall be according to OPSS 501.

## **902.07 CONSTRUCTION**

### **902.07.01 Removals**

Removals shall be according to OPSS 510.

### **902.07.02 Removal of Ice and Snow**

All ice and snow shall be removed from all portions of the work area before any excavation and backfill operations proceed. Frozen materials shall not be incorporated into the work. Material shall not be placed over frozen ground, ice, or snow.

### **902.07.03 Protection Systems**

Protection systems shall be according to OPSS 539.

Protection systems shall be installed:

- a) Where the stability, safety, or function of an existing structure, roadway, railway, or other facility can be impaired by an excavation or temporary slope.
- b) To permit excavation where there is a necessity to retain the sidewalls of an excavation and to permit dewatering by restricting water flow and facilitating safe execution of the work.

#### **902.07.04                      Dewatering Structure Excavation**

Until backfilling has been completed and to permit the placing of concrete in the dry, all work necessary to control the flow of water into the excavation and to prevent disturbance of the founding material shall be carried out.

#### **902.07.05                      Excavation**

##### **902.07.05.01                  General**

Deterioration of the foundation soil or rock, surface water from entering and eroding the face of the excavation, and build up of hydrostatic pressures that may have harmful effects upon the temporary or permanent structures shall be prevented.

##### **902.07.05.02                  Excavation for Foundations**

Excavation for footings, working slabs, and granular pads shall be to the neat lines specified in the Contract Documents.

The bottom of the excavation on which the footing, working slab, or granular pad is to rest shall not be disturbed. In soft conditions, construction of the footing or structural slab shall commence immediately after the final removal of material to the foundation level has been completed.

In the case of concrete culverts of the open footing type, no excavation shall be made between the footings below the level of the stream bed or the top of the footings, whichever elevation is lower, unless authorized in writing by the Contract Administrator.

The elevation of the bottom of the footing, working slab, or granular pad shall not be changed without the approval of the Contract Administrator.

Overexcavated areas shall be restored to their original conditions. Overexcavated areas shall be backfilled with a material suitable for the particular application and approved by the Contract Administrator. Concrete fill shall be used for overexcavation in rock. Where material other than concrete is used, the material shall be compacted to the dry density specified in OPSS 501.

When authorized by the Contract Administrator, additional excavation, as may be required, shall be carried out.

##### **902.07.05.03                  Excavation for Backfill and Frost Tapers**

Excavation for backfill and frost tapers shall be to the neat lines specified in the Contract Documents.

Overexcavated areas shall be restored with material approved by the Contract Administrator. The material shall be compacted to the dry density specified in OPSS 501.

##### **902.07.05.04                  Preservation of Channel**

Where a channel cross-section is altered, it shall be restored to its original condition.

#### **902.07.06                      Backfilling**

##### **902.07.06.01                  General**

Frozen materials shall not be incorporated into the work.

Footings shall be protected against frost action.

Other than the backfill placed to the tops of the footings, no fill shall be placed against an abutment, wingwall, retaining wall, or concrete culvert until the concrete has reached 70% of its design strength.

Backfilling around culverts, arches, rigid frames, and piers shall proceed simultaneously and evenly on both sides of the structure. The differential in surface elevation of the backfill material on each side of the structure and individual component shall not be greater than 500 mm.

All voids around abutments, piers, or other permanent work shall be backfilled to the level of the surrounding ground or to the grade specified in the Contract Documents, whichever is the lower before the general backfilling commences.

When rock fill is to be placed around a structure the structure shall be protected to prevent damage from the rock fill.

The minimum height of fill specified in the Contract Documents shall be placed before traffic or construction equipment shall pass over the culvert.

Granular material shall be placed within the lines and grades specified in the Contract Documents.

Wall drains shall have a 0.05 m<sup>3</sup> pocket of 19 mm minimum size clear stone wrapped in geotextile placed over the opening of the wall drain at the backfilled side of the wall.

#### **902.07.06.02                      Compaction**

Backfill shall be placed according to OPSS 206, except the Modified Layer Compaction Method shall not apply, and compacted according to OPSS 501.

Only hand operated vibratory type compaction equipment shall be used for compaction of fill material within the restricted zone behind all earth retaining structures.

#### **902.07.07                      Clay Seal**

When specified in the Contract Documents, clay seals shall be placed to the dimensions shown.

#### **902.07.08                      Inspection for Dewatering, Excavation and Backfilling**

A Request to Proceed shall be submitted to the Contract Administrator prior to the commencement of dewatering of the excavation for the structure and completion of the excavation for the foundation.

The next operation after the completion of the excavation for the foundation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

A Request to Proceed shall be submitted to the Contract Administrator upon completion of the excavation for backfill and frost tapers and prior to the commencement of backfilling of excavation.

The next operation prior to the commencement of backfilling of excavation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **902.07.09                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **902.09 MEASUREMENT FOR PAYMENT**

### **902.09.01 Actual Measurement**

#### **902.09.01.01 Excavation for Structure**

Measurement of earth or rock excavation for structure shall be by volume in cubic metres.

Measurement of excavation for footings shall be based on the neat horizontal dimensions of the footing to the depth of the bottom of the footing, working slab, or granular pad.

Except as noted below, the quantity of excavation shall include only the quantities below the designated payment surface within the neat lines specified in the Contract Documents.

The above measurement also includes:

- a) Removal of asphalt pavement, except where there is a separate tender item for pavement removal that includes pavement overlapping the area of structure excavation.
- b) The excavation quantities, below the designated payment surface, required for placing granular backfill and granular frost tapers.
- c) For open footing culverts, the excavation quantities as measured below the designated payment surface but between the plan areas of the footings and above the stream bed or the tops of the footings, whichever is higher.

Where the structure excavation overlaps excavation required for other work, the measurement shall be made as specified in the Contract Documents with no deductions for overlap.

The volume of boulders in an excavation shall be calculated from the three maximum rectilinear dimensions. The following provisions shall apply:

- a) Only the amount removed shall be considered for payment.
- b) The volume of the boulders removed shall be deducted from the volume of excavation as calculated above.

The measurement of the total volume of materials considered for payment shall not exceed the calculated volume of excavation within the theoretical lines.

#### **902.09.01.02 Granular Backfill**

Measurement for payment of granular backfill shall be by volume in cubic metres or tonnes as specified in the Contract Documents.

The quantity of granular backfill and granular bedding shall include only those quantities measured below the subgrade and as measured within the theoretical line and grades specified in the Contract Documents.

Where the Contractor has excavated beyond the limits specified in the Contract Documents, the conversion factor of 2 t/m<sup>3</sup> shall be used in measurement of the excess volume when it is replaced with granular on a tonne basis.

The weighing of granular material supplied on a tonnage basis shall be according to the Contract Documents.

## **902.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **902.10 BASIS OF PAYMENT**

### **902.10.01 Earth Excavation for Structure - Item Rock Excavation for Structure - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract Administrator requests excavation for concrete working slabs, granular working pads, or granular bedding, payment shall be at the Contract price for the type of excavation required.

### **902.10.02 Dewatering Structure Excavations - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

### **902.10.03 Granular Backfill to Structure - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material required to do the work.

When the Contract Documents do not include a separate item for granular backfill to structure, the Contract price for the items directly associated with the granular backfill to structure shall be full compensation for all labour, Equipment, and Material required to do the work.

### **902.10.04 Clay Seal - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

### **902.10.05 Overexcavation**

Payment shall not be made for overexcavation that has not been approved by the Contract Administrator or for backfill restoration of such overexcavation.

|---------------|--------------|

This specification covers the requirements for the supply and installation of deep foundation units.

#### **903.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **903.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **903.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following specifications, standards, or publications:

### **Ontario Provincial Standard Specifications, Construction**

### **903.03**

### **DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Anvil** means the component of a diesel hammer that acts as an impact block for the ram

**Bedrock** means a natural solid bed of the hard, stable, cemented part of the earth's crust, igneous, metamorphic, or sedimentary in origin that may or may not be weathered.

**Caisson Pile** means a cast in place deep foundation unit with or without an enclosing liner formed by placing concrete in a bored or excavated hole.

**Cap Block** means a material placed on top of the helmet to cushion the blow of the hammer and to attenuate the peak impact energy without causing excessive loss of the impact energy.

**Casing** means open ended enclosing cylindrical steel tubing or pipe permanently installed in the ground. Casings are structurally required and can be used to stabilize and excavated hole.

**Certificate of Conformance** means a document issued by the Quality Verification Engineer confirming that the specified components of the Work are in general conformance with the requirements of the Contract Documents.

**Deep Foundation Unit** means a structural member, driven or otherwise, installed in the ground to transfer the loads from a structure to soil or rock and derives supporting resistance from the surrounding soil or rock or from the soil or rock strata below its tip or a combination of both.

**Displacement Caisson Pile** means a pile formed in the ground by driving a casing or liner with a concrete plug or an expendable metal plate attached to it and replacing the displaced soil with unreinforced or reinforced concrete.

**Driven Pile** means one of the following pile types: steel H, tube, or sheet piles; wooden pile; or precast reinforced concrete pile that has been installed by means of a pile driver.

**Driving Shoe** means reinforcement attached to the bottom of the pile and designed to protect the pile during driving or to penetrate into a hard stratum.

**Driving to a Set** means driving the pile to the requirement that satisfies pile driving criteria correlated to a required pile resistance.

**Engineer** means a professional engineer licensed by the Professional Engineers Ontario to practice in the Province of Ontario.

**Follower** means a removable extension that transmits the hammer blows to the head of the pile.

**Helmet** means a formed steel cap that fits over the top of a pile head to retain in position a resilient cap block.

**Jetting** means the use of a jet of water at high pressure directed into the ground below the pile tip to assist its penetration

**Liner** means open ended enclosing steel tubing or pipe temporarily installed in the ground to facilitate the construction of caisson piles

**Pile** means a relatively slender structural element that is installed, wholly or partly in the ground by driving, drilling, auguring, jetting, or other means.

**Pile Cap** means a footing or some other structural component used to transfer the load to the piles as well as maintaining them in position.

**Pile Cushion** means a pad of resilient material placed between the helmet and the top of a precast reinforced concrete or wooden pile to minimize damage to the head during driving.

**Pile Group** means the piles supporting a pile cap.

**Pumped Concrete** means a method of transporting concrete through hose or pipe by means of positive and continuous pressure.

**Quality Verification Engineer (QVE)** means an Engineer retained by the Contractor qualified to provide the services specified in the Contract Documents.

**Ram** means the moving or driving part of an air, steam, diesel, or drop pile hammer that delivers an impact blow to an anvil and to the pile.

**Retapping** means verifying that the specified resistance previously attained has been sustained by imparting appropriate hammer energy to the pile and monitoring pile penetration.

**Rock Points** means a specially designed steel tip fitted to piles to enable them to be driven into hard, sound sloped bedrock.

**Sheet Pile** means a pile that is designed to interlock with adjacent piles and form a continuous wall for the purpose of resisting mainly lateral forces and to reduce seepage.

**Slurry** means a drilling fluid, consisting of water mixed with one or more of various solids or polymers, used to maintain the stability of the side walls and bottom of an excavation.

**Tremie** means a hopper with a vertical pipe used for placing concrete under water. The foot of the pipe is always submerged in concrete except during commencement of concreting and the upper level of the concrete in the pipe is always above water level.

#### **903.04 DESIGN AND SUBMISSION REQUIREMENTS**

##### **903.04.01 Design Requirements**

##### **903.04.01.01 Concrete**

The Contractor is responsible for providing plastic concrete with suitable characteristics for installation. The concrete shall be flow able, non-segregating concrete that does not exhibit rapid slump loss.

##### **903.04.02 Submission Requirements**

##### **903.04.02.01 General**

All submissions shall bear the seal and signature of an Engineer experienced in the field of deep foundations.

When welded field splices are used, welding procedures according to the Canadian Welding Bureau shall be submitted to the Contract Administrator.

##### **903.04.02.02 Preconstruction Survey**

A condition survey of property and structures that may be affected by the work shall be submitted to the Contract Administrator prior to commencing the work. The survey shall include the locations and conditions of adjacent properties; buildings; underground structures; Utility services; and structures, such as walls abutting the site.

##### **903.04.02.03 Materials**

##### **903.04.02.03.01 Mill Certificates**

One copy of the mill certificates, indicating that the steel meets the requirements for the appropriate standards for H-piles, tube piles, casings, and sheet piles shall be submitted to the Contract Administrator at the time of delivery.

Where mill test certificates originate from a mill outside Canada or the United States of America, the information on the mill certificates shall be verified by testing by a Canadian laboratory. The laboratory shall be certified by an organization accredited by the Standards Council of Canada to comply with the requirements of ISO/IEC 17025 for the specific tests or type of tests required by the material standard specified on the mill test certificate. The mill test certificates shall be stamped with the name of the Canadian testing laboratory and appropriate wording stating that the material conforms to the specified material requirements. The stamp shall include the appropriate material specification number, the date (i.e., yyyy-mm-dd), and the signature of an authorized officer of the Canadian testing laboratory.

##### **903.04.02.03.02 Concrete**

A suitable, site-specific concrete mix design that meets the requirements of the hardened concrete shall be submitted to the Contract Administrator 14 Days prior to construction, for information purposes only.

##### **903.04.02.03.03 Slurry**

The following shall be submitted to the Contract Administrator 14 Days prior to construction, for information purposes only:

- a) The type, source, and physical and chemical properties of the bentonite or polymer.
- b) The source of water.
- c) Method of mixing slurry.
- d) The water solids ratio and the mass and volumes of the constituent parts, including any chemical admixtures or physical treatment employed to produce slurry with the required physical properties.
- e) Details of procedure to be used for monitoring the quality of the slurry.
- f) A test report showing the properties of the slurry and certifying that the slurry meets the requirements of API RP 13B-1.
- g) Method of disposal of the slurry.

#### **903.04.02.04                      Installation**

##### **903.04.02.04.01                  Driven Piles**

The following shall be submitted to the Contract Administrator as least 14 Days prior to construction, for information purposes only:

- a) A schedule of work identifying time and sequence of activities.
- b) Type of equipment, anvil, helmet, and hammer details, including the hammer energy assumed by the Contractor, stated potential energy (rated energy) of the hammer, operating efficiency, and weight of ram.
- c) Working Drawings of precast concrete piles showing the pile dimensions, concrete strength, tendon arrangement, working stresses and arrangement of steel reinforcement, schedules, elongation calculations, method and sequence of casting, complete specifications and details of the prestressing steel, and lift anchors and lifting point locations.
- d) The method of maintaining the steel reinforcement cages in position, when steel reinforcement cages are used in tube piles.
- e) Procedure for monitoring pile installation.
- f) Details of the method of attaching proprietary driving shoes.
- g) When load testing is specified in the Contract Documents, details of the full-scale test, including site preparation and the details of the load application, components, equipment, testing apparatus, and method of monitoring.
- h) Information pertinent to establishing the resistance of a pile when the wave equation analysis method is used.

##### **903.04.02.04.02                  Caisson Piles**

The following shall be submitted to the Contract Administrator at least 14 Days prior to construction, for information purposes only:

- a) A schedule of work identifying time and sequence of activities.
- b) Detailed procedures for caisson excavation in overburden and rock.

- c) Detailed procedures for casing and liner installation and for the withdrawal of the liner.
- d) Detailed procedures for slurry displacement method of excavation, including disposal of slurry upon completion.
- e) Detailed procedures for tremie concrete, including the size of tremie delivery pipe.
- f) Detailed procedure for placing concrete in the dry.
- g) Method of maintaining the steel reinforcement cages in position in the caisson.
- h) Details of filling the annular void around a casing.
- i) Details of procedure to be used for monitoring installation.
- j) When load testing is specified in the Contract Documents, details of the full-scale test, including site preparation, details of the load application, components, equipment, testing apparatus, and method of monitoring.

#### **903.04.02.04.02.01      Milestone Inspections**

The Quality Verification Engineer shall witness the following interim inspections of the work for caisson piles:

- a) Excavation
- b) Steel reinforcement installation
- c) Placing of concrete

A copy of the written permission to proceed shall be submitted to the Contract Administrator prior to commencement of the next operation.

#### **903.04.02.04.03      Displacement Caisson Piles**

The following shall be submitted to the Contract Administrator as least 14 Days prior to construction, for information purposes only:

- a) A schedule of work identifying time and sequence of activities.
- b) Type of equipment, anvil, helmet, and hammer details, including the hammer energy assumed by the Contractor, stated potential energy (rated energy) of the hammer, operating efficiency, maximum stroke or drop, and weight of the ram.
- c) Details of procedures used for installation of displacement caisson piles, including detailed procedures for liner installation and withdrawal.
- d) Method of maintaining the steel reinforcement cages in position in the pile.
- e) Details of procedure to be used for monitoring pile installation.
- f) When load testing is specified in the Contract Documents, details of the full-scale test, including site preparation, and the details of the load application, components, equipment, testing apparatus, and method of monitoring.

#### **903.04.02.04.04            Steel Reinforcement Cages**

Working Drawings showing the fabrication details of the steel reinforcement cages, including the lifting points and lifting lugs, shall be submitted to the Contract Administrator at least 14 days prior to fabrication, for information purposes only.

#### **903.04.02.05                Qualifications**

Copies of the Canadian Welding Bureau's certification of the Independent Testing Company, the Non-destructive Testing Technician, and the Welding Inspector shall be submitted to the Contract Administrator at least 5 Days prior to the commencement of any non-destructive testing, for information purposes only.

#### **903.04.02.06                Review of Splice Test Results and Permission to Proceed**

Upon completion of the testing of the splices, the Quality Verification Engineer shall review all test results to verify that all the welds were done according to the welding procedures and Contract Documents and issue the Contractor written permission to proceed with the work.

### **903.05                        MATERIALS**

#### **903.05.01                    Wooden Piles**

Wooden piles shall be according to CAN3-056 and shall be clean and peeled. Treated piles shall be pressure treated with creosote according to CAN/CSA-080.

Wooden piles shall be provided with collars sufficiently strong to prevent splitting of the head of the wooden pile during driving.

#### **903.05.02                    Steel Piles**

##### **903.05.02.01                H-Piles**

Steel H-piles shall be according to CAN/CSA G40.20/G40.21, Grade 350 W.

##### **903.05.02.02                Tube Piles**

Steel tube piles shall be according to ASTM A 252, minimum Grade 2.

##### **903.05.02.03                Sheet Piles**

Steel sheet piles shall be according to ASTM A 328M.

#### **903.05.02.04                Straightness Tolerance for Steel Piles, Casings, and Liners**

Steel piles, casings, and liners shall conform to a straightness tolerance of 1.5 mm maximum per metre of length.

Steel sheet piles shall be sufficiently straight to prevent binding in the interlock during driving.

#### **903.05.03                    Driving Shoes and Rock Points**

Rock points and driving shoes shall be as specified in the Contract Documents.

Driving shoes shall transfer the driving stresses to the pile over the full cross-sectional area of the pile.

Where precast concrete piles are driven into dense or hard material, a steel driving shoe cast into the concrete shall be provided.

Where wooden piles are driven into dense material, a steel plate driving shoe shall be provided to prevent damage to the bottom of the pile.

#### **903.05.04                      Casing for Caissons**

Casings shall be according to ASTM A 252, Grade 2. If welded, they shall be welded by the electric arc method according to CSA W59.

The casing wall thickness specified is the minimum that shall be supplied. The wall thickness shall be increased as required to ensure the casing is not damaged during handling and installation.

#### **903.05.05                      Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

#### **903.05.06                      Concrete**

##### **903.05.06.01                  General**

Concrete shall be according to OPSS 1350.

##### **903.05.06.02                  Tube Piles**

Concrete shall have a slump of 150 to 180 mm.

##### **903.05.06.03                  Caisson Piles**

Concrete shall have a slump of 150 to 180 mm. When approved by the Contract Administrator in writing, admixtures may be used. Where the liner is to be withdrawn, sufficient retarder shall be added to prevent arching of concrete during liner withdrawal and to prevent setting of concrete until after the liner is withdrawn.

#### **903.05.07                      Precast Concrete Piles**

The production of precast reinforced concrete piles shall be according to OPSS 904, OPSS 905, and OPSS 909.

Steel reinforcement shall be placed such that direct loading during the ram stroke shall not occur.

Lifting anchors shall be at least 25 mm clear from reinforcement or prestressing steel in the pile.

Concrete in precast reinforced concrete piles shall be according to OPSS 1350 and have a nominal minimum 28-Day compressive strength of 45 MPa.

Concrete for precast reinforced concrete piles shall be cured according to OPSS 904.

Concrete for precast reinforced concrete piles shall be placed in smooth mortar-tight forms that are supported to prevent excessive deformation or settlement during placing or curing.

Unformed surfaces shall be finished smooth.

When removed from the form, the pile shall present true, smooth, even surfaces free from honeycombs and voids. The pile shall be straight so that a line stretched from butt to tip on any face shall not be more than 25 mm from the face of the pile at any point.

Each precast reinforced concrete pile shall have the date of manufacture (i.e., yyyy-mm-dd) inscribed on it.

**903.05.08                      Slurry**

**903.05.08.01                  Solids**

Bentonite and polymers shall be according to API Spec 13A.

**903.05.08.02                  Water**

Water shall be according to OPSS 1302.

**903.05.08.03                  Slurry Composition**

The slurry shall consist of a stable colloidal suspension of pulverized solids or polymers thoroughly mixed with water. The density, viscosity, sand content, and pH of the slurry being used during excavation shall be according to API RP 13B-1.

**903.06                          EQUIPMENT**

**903.06.01                      Hammers**

Hammers shall be capable of installing the piles, casings, and liners to the depth or resistance specified in the Contract Documents, without damage to the portions that are not cut off.

The hammer used to chisel the rock point into the rock shall be capable of delivering a controlled blow in 10% increments ranging in energy from zero to the maximum hammer energy.

For precast reinforced concrete piles, the heaviest hammer practicable shall be employed and the stroke limited so as not to damage the piles. When choosing the size of the hammer, consideration shall be given to whether the pile is to be driven to a resistance or to a given depth.

**903.06.02                      Helmets and Striker Plates**

The head of steel piles shall be protected by a striker plate or a helmet. Helmets shall have adequate and suitable cushioning material. Helmets and striker plates shall distribute the blow of the hammer evenly throughout the cross-section of the pile head.

**903.06.03                      Leads**

Pile driver leads shall be built to afford freedom of movement for the hammer and shall be held in position at the top and bottom by guys, stiff braces, or other approved means to ensure support of the pile, casing, or liner while it is being driven. Swinging leads shall not be permitted.

Batter piles, casings, or liners shall be driven with leads aligned parallel to the axis of the pile, casing, or liner. The leads shall be equipped with a fixed, rigid, adjustable kicker.

**903.06.04                      Followers**

When use of followers are specified in the Contract Documents, followers shall be of type, size, shape, length, and weight as to permit driving the pile, casing, or liner at the location and to the required depth or ultimate resistance specified in the Contract Documents. The follower shall be provided with a socket or hood carefully fitted to the top of the pile, casing, or liner to minimize loss of energy and to prevent damage to the pile, casing, or liner, and shall have sufficient rigidity to prevent "whip" during driving.

When followers are permitted, an identical follower shall be used when the set is being determined.

## **903.07 CONSTRUCTION**

### **903.07.01 Transporting, Storing, and Handling Piles, Casings, Liners, and Reinforcing Steel Reinforcement Cages**

#### **903.07.01.01 General**

Piles, casings, liners, and steel reinforcement shall be transported, stored, and handled in such a manner that damage is prevented and the strength of the components is not affected by deterioration or deformation.

Components shall be lifted and placed using appropriate lifting equipment, temporary bracing, guys, or stiffening devices so that the components are at no time overloaded, unstable, or unsafe.

Material shall be supported to prevent unequal settlement when stacked.

#### **903.07.01.02 Wooden Piles**

Canthooks, dogs, pile pulls, or use of other lifting methods that might damage the integrity of the pressure treated surface shall not be used. Cuts or breaks in the surface of treated piling shall be given three brush coats of hot creosote oil. Bolt holes shall be treated with three applications of hot creosote oil applied with a bolt hole treater.

#### **903.07.01.03 Handling Holes in Steel Piles**

Unless otherwise approved by the Contract Administrator, holes shall only be made in the portion of the pile to be cut off or in the portion of the pile to be encased in concrete.

When other holes are approved to be cut in a pile they shall be covered by splice plates placed on both sides of the section. The thickness and the mechanical properties of the plate material shall be at least equivalent to the pile material.

#### **903.07.01.04 Precast Reinforced Concrete Piles**

Precast concrete piles shall be handled only from the designated lifting points.

When lifting or transporting precast reinforced concrete piles lift anchors, slings, or other approved means shall be used. Care shall be taken when lifting and transporting to avoid any overstressing of the pile or cracking of the concrete.

Precast reinforced concrete piles shall be so handled to avoid breaking or chipping their edges.

Lift anchors shall be removed and the holes filled with a non-shrink grout or epoxy installed according to the manufacturer's recommendations.

#### **903.07.01.05 Caisson Casings and Liners**

Casings and liners shall be handled and stored in such a manner to avoid damage or distortion to them. The casings and liners shall be maintained circular within  $\pm 2\%$  of the casing or liner diameter.

#### **903.07.02 Driven Piles**

**903.07.02.01****Pile Driving Requirements and Restrictions**

Piles shall not be driven until embankment work or excavation work has been completed to the underside of the footing. When driving of the piles is completed, all material between the piles shall be removed to the correct elevation and any holes or voids created shall be filled to the correct elevation with compacted material approved by the Contract Administrator.

Piles shall be installed at the locations specified in the Contract Documents and to the set or depth specified without being damaged. Damage to the pile, casing, or liner during driving shall be prevented by limiting the drop or energy and number of blows of the hammer. The hammer, helmet, cap block, striker plate, and pile shall be coaxial and shall sit squarely upon each other.

A shorter stroke shall be used and proper precaution shall be taken when there is a danger of damaging or over driving the piles, casing, or liners under conditions such as:

- a) In the early stages of driving a long pile where a hard layer near the ground surface has to be penetrated.
- b) Where there is very soft material of a considerable depth and a large penetration is achieved at each hammer blow.
- c) Where it is anticipated the pile shall meet refusal on rock or other impenetrable soil.
- d) When piles are driven onto sloping bedrock.

Damage to adjacent structures, Utilities, and fresh concrete shall be prevented during pile installation. Piles shall not be driven within a radius of 8 m of concrete that has been in place for less than 72 hours. Piles shall not be driven within a radius of 15 m of concrete that has been in place for less than 72 hours without the approval of the Contract Administrator.

The tops of all piles shall be either square to the longitudinal axis of the pile or horizontal as indicated in the Contract Documents.

Piles shall not be forced into their proper position by the use of excessive manipulation. Pile damage due to excessive driving shall be avoided.

**903.07.02.02****Driving Shoes and Rock Points**

Driving shoes and rock points shall be installed in locations specified in the Contract Documents.

Driving shoes shall be welded in accordance with the Contract Documents.

When driving shoes are specified in the Contract Documents, the Titus H bearing pile point or APF Hard Bite, standard model, may be substituted for the driving shoes.

When Oslo points are specified in the Contract Documents, the Titus H bearing pile point or APF, rock injector model, may be substituted for the pile points.

Where proprietary driving shoes are used, they shall be welded or otherwise attached to the driven piles according to the manufacturer's specifications.

**903.07.02.03****Splicing****903.07.02.03.01****General**

Any damaged material shall be cut-off prior to splicing.

#### **903.07.02.03.02          Wooden Piles**

Wooden piles shall not be spliced.

#### **903.07.02.03.03          H-Piles, Tube Piles, and Sheet Piles**

Welding shall be according to CSA W59 and shall be done by a qualified welder employed by a firm certified according to CSA W47.1, Division 1 or Division 2.1.

Steel H-piles and steel tube piles may be spliced providing the pieces being spliced are not less than 3 m long. Splices in marine structures shall be located below the low water level, unless otherwise encased in concrete.

Sheet piles shall not be spliced without approval by the Contract Administrator.

#### **903.07.02.03.04          Precast Reinforced Concrete Piles**

Precast reinforced concrete piles shall only be spliced when specified in the Contract Documents and the splices shall only be made with approved mechanical splicing devices.

#### **903.07.02.04                  Concrete in Steel Tube Piles**

Concrete in steel tube piles shall be placed according to OPSS 904.

#### **903.07.02.05                  Cutting Off Piles**

##### **903.07.02.05.01          General**

Driven piles shall be cut to the elevation as specified in the Contract Documents.

The length of pile supplied shall be sufficient to ensure there is no damaged material below the cut off. Damaged material at the pile head shall be cut off.

Piles shall not be cut off until retapping, redriving, and specified load testing are complete.

##### **903.07.02.05.02          Wooden Piles**

Where wooden piles are broomed, splintered, or otherwise damaged below the cut-off elevation, the pile shall be considered defective and shall be replaced.

#### **903.07.02.06                  Protective Coating for Steel H and Steel Tube Piles**

Exposed steel H and steel tube piles shall have a coal tar epoxy protective coating applied from an elevation 600 mm below the low water level or finished ground surface up to the top of the exposed steel.

The steel surfaces shall be cleaned according to SSPC-SP10 prior to application of a coal tar epoxy system that shall be according to OPSS 911.

#### **903.07.02.07                  Monitoring Driven Piles**

##### **903.07.02.07.01          General**

The driving of piles shall be carefully monitored and controlled and pile driving records produced for each pile. The QVE or an individual under the direct supervision of the QVE shall verify the work.

Piles shall not be overdriven. When driving to a specified ultimate resistance, driving to a set or driving to bedrock, the piles shall be driven to the anticipated tip elevation. The Contract Administrator shall be notified if

the piles do not reach set at the anticipated tip elevation, .

In soils where there is a possibility of piles moving upward due to ground heave, elevations of completed pile tops shall be measured at intervals while nearby piles are being installed. The readings shall be recorded and submitted to the Contract Administrator as the work proceeds.

#### **903.07.02.07.02      Driving to a Specified Elevation**

Piles shall be driven to an elevation specified in the Contract Documents. Driving piles to other elevations shall only be done when approved in writing by the Contract Administrator.

#### **903.07.02.07.03      Driving to a Specified Ultimate Resistance**

##### **903.07.02.07.03.01      General**

The Quality Verification Engineer shall establish the reference set used to determine ultimate resistance and measure and record the set for individual pile acceptance.

The set and rebound measurements shall be obtained by the Quality Verification Engineer. The Quality Verification Engineer shall determine the measured ultimate resistance and verify that the design ultimate resistance has been achieved.

##### **903.07.02.07.03.02      Driving to a Set**

The founding elevation shall be established by driving to a set determined in accordance with the dynamic formula specified in the Contract Documents or by the application of the wave equation analysis procedure that verifies the pile resistance. This set shall be established on the first pile of every ten piles driven in a pile group.

The other piles shall be controlled by the pile penetration rate in blows per millimetre that correlates to the set.

When new conditions, such as change in hammer size, change in pile size, or change in soil material occur, new sets shall be determined.

##### **903.07.02.07.03.03      Driving to Bedrock**

When driving piles to bedrock, the pile shall be adequately seated on bedrock without damaging the pile.

Where rock points are used, the rock points shall penetrate into the rock. Piles driven using rock points shall be driven to ensure adequate seating on the bedrock without damaging the pile.

Driving of piles on sloping bedrock shall be stopped when initial contact is made with the bedrock. The bedrock elevation shall be recorded. Driving shall then continue, commencing with energy of 10% of the maximum energy of the hammer. The pile shall be driven in sets of 20 blows at this energy until no penetration is observed. Twenty additional blows shall be applied, and, if no penetration is observed, the energy shall be increased by an additional 10% and the above procedure repeated.

Driving shall continue with these stepped increases in energy and with the same series of blows as described above, until the pile has been seated on the bedrock.

If unrealistic excessive penetration per blow is observed, driving shall be stopped and this excessive penetration immediately reported to the Contract Administrator.

The Quality Verification Engineer shall determine when the hammer energy can be increased and when the driving is complete for each pile.

#### **903.07.02.07.04 Wave Equation Analysis**

When requested by the Contract Administrator, all equipment, material, and personnel shall be supplied to conduct the wave equation analysis procedure. The Quality Verification Engineer shall review the results of the analysis.

#### **903.07.02.07.05 Hammer Performance**

When requested by the Contract Administrator, the hammer performance using the pile driving analyzer or other approved equivalent shall be verified in the presence of the Contract Administrator. Hammer performance shall be verified to ensure that the actual potential energy (rated energy) is not less than 90% of the stated potential energy. All instrumentation, access, and assistance for the testing and monitoring as directed by the Contract Administrator shall be provided.

#### **903.07.02.07.06 Retapping Tests on Piles**

In each pile group, 10% of the piles rounded up to the next whole number, but no fewer than two piles, shall be retapped no sooner than 24 hours after installation of the individual pile to confirm that the ultimate axial resistance has been sustained.

Retapping of piles driven to bedrock is not required.

#### **903.07.02.07.07 Retapping and Redriving Piles**

When the retapping tests indicate that the ultimate axial resistance has not been achieved on any one pile, all piles in the group shall be retapped.

Where the retapping reveals that the ultimate axial resistance of the piles has not been achieved, the piles that have not achieved the ultimate axial resistance shall be redriven to the specified resistance.

Where piles have risen, the piles shall be redriven to the original depth.

#### **903.07.02.08 Jetting**

Jetting shall be carried out in such a manner that the resistance of the piles already in place and the safety of adjacent structures shall not be impaired. Jetting shall be stopped at least 1 m above the final expected pile-tip elevation and at least 1 m above the tip elevation of any piles previously driven within 2 m of the jet. Where piles are to be end bearing on rock, jetting may be carried to the rock surface.

The driving and jetting of precast reinforced concrete piles shall not be carried out simultaneously.

#### **903.07.03 Caisson Piles**

##### **903.07.03.01 General**

Caissons shall be constructed as specified in the Contract Documents.

The final bearing elevation shall be as specified in the Contract Documents or as determined by the Contract Administrator. When permanent casings are not specified, the caisson shall be constructed in a drilled hole with or without the use of a temporary liner or slurry as determined by the Contractor.

##### **903.07.03.02 Excavation**

###### **903.07.03.02.01 General**

Sidewall stability shall be maintained throughout the excavation and concrete placement operation. Soil

cave-in into the excavation hole shall be prevented.

The bottom of the excavation shall be cleaned before the start of concrete placement.

Excavation methods shall be such that the sides and bottom of the hole are straight and free of loose material that might prevent intimate contact of the concrete with undisturbed soil or bedrock.

Except when founded on sloping rock, the caisson bottom shall be level. On sloping rock, the caisson bottom may be stepped, with each step not greater than  $\frac{1}{4}$  the diameter of the bearing area.

#### **903.07.03.02.02 Casings**

When an auger is used to excavate for a casing, the diameter of the auger shall be no greater than the outside diameter of the casing.

#### **903.07.03.02.03 Liners**

The diameter of the excavation for the installation of liners shall not exceed the diameter of the liner by more than 150 mm.

#### **903.07.03.02.04 Slurry Method**

The level of slurry in the excavation shall be sufficient to prevent the intrusion of water and to maintain a stable wall with no cave-in, sloughing, or basal heave.

Slurry shall be tested as specified in API RP 13B-1. All test equipment required for the tests shall be provided. A slurry sampler capable of obtaining samples at any depth within the caisson hole shall be available at all times.

At least 1 set of tests shall be completed every 4 hours during the slurry operation. Samples shall be taken from the mud tank and from within the caisson at a depth within 300 mm of the bottom.

#### **903.07.03.03 Inspection of the Excavation**

The bottom of excavations shall be visually inspected.

#### **903.07.03.04 Dewatering**

Where dewatering is required, a dewatering scheme shall be employed in such a manner as to prevent any disturbance to the base founding material. The dewatering shall not create subsidence or cause ground loss that may adversely affect the work or adjacent structures.

#### **903.07.03.05 Backfilling Liners Left in Place**

The annular space between a liner permanently left in place and shaft excavation shall be filled with concrete or fluid grout.

#### **903.07.03.06 Steel Reinforcement**

Steel reinforcement steel shall be installed according to OPSS 905. Steel reinforcement cages shall be checked to ensure conformance to the Working Drawings prior to installation and during placement of concrete.

The steel reinforcement cage shall be fabricated in one piece.

Welding of steel reinforcement and use of splices shall not be done unless specified in the Contract

Documents.

The steel reinforcement shall not be displaced or distorted during the construction of the caisson.

### **903.07.03.07 Concrete**

#### **903.07.03.07.01 General**

Concrete shall be placed in the caisson according to OPSS 904 and as specified herein. Concrete shall be placed immediately following interim inspection of the caisson hole by the Quality Verification Engineer.

The reinforcement shall not be displaced or distorted during the construction of the caisson.

Arching of concrete during casing withdrawal shall be prevented.

#### **903.07.03.07.02 Concrete Placed in the Dry**

The concrete may be placed free fall provided the fall is vertically down the centre of the opening and transverse ties, spacers or other objects do not impede the free fall. In the event of interference with the concrete free fall, an elephant trunk or other means shall be used to prevent concrete segregation.

Concrete shall be placed in a continuous operation from the bottom to the top of the caisson or, where columns are cast integral with the caisson, to the elevation of the bottom of the column steel reinforcement cage. The concrete shall be vibrated for the last 1.5 m of the pour.

#### **903.07.03.07.03 Concrete Placed Under Water or Under Slurry**

Tremie or pumped concrete shall be carried out in one continuous operation. The tremie or pumping operation shall be a continuous flow of concrete that prevents the inflow of water or slurry.

Where tremie concrete is to be placed in a caisson under water, the Contractor shall maintain an adequate head of water within the excavations to prevent the inflow of water through the base or walls of the caisson as the concrete is being placed.

Where tremie is placed under slurry, the caisson shall be filled with concrete entirely by tremie and the method of deposition shall not be changed part way up the caisson.

When concrete placement is not started within 6 hours of acceptance of the excavation, the excavation shall be redrilled, cleaned, and the slurry tested before concrete placement commences.

#### **903.07.03.07.04 Withdrawal of Liners**

Arching of concrete during withdrawal of the liner shall be prevented.

During withdrawal, the bottom of the liner shall have a minimum embedment into the concrete being placed and a sufficient head of concrete shall be maintained above the bottom of the liner at all times to prevent intrusion of soil and water into the hole.

During withdrawal, upward or downward movement of the steel reinforcement shall be monitored. Upward or downward movement shall be restricted to 150 mm.

A theoretical concrete level shall be calculated based on the quantity of concrete placed and the caisson dimensions, and this theoretical level shall be compared to the actual level of concrete in the caisson to provide a check for possible separation of shaft concrete during liner withdrawal.

#### **903.07.03.07.05                      Founding Elevation**

The final founding elevation shall be as specified in the Contract Documents or an elevation approved in writing by the Contract Administrator. When casings are not specified in the Contract Documents, the caisson shall be constructed in a drilled hole with or without the use of a liner or slurry as determined by the Contractor.

Except when founded on sloping unweathered bedrock, the caisson bottom shall be level. On sloping unweathered bedrock, the caisson bottom may be stepped, with each step not greater than one quarter the diameter of bearing area.

The bearing area of the caisson pile shall be approved by the Quality Verification Engineer prior to placing concrete.

#### **903.07.04                                  Displacement Caisson Piles**

Work shall be carried out in accordance with the displacement caisson pile suppliers' installation procedures. A permanent liner shall be used when specified in the Contract Documents.

The sequence of installation shall be such as to prevent damage to any recently completed piles.

The pile shall not be founded above or below the specified pile tip elevation without approval in writing from the Contract Administrator.

The QVE or an individual under the direct supervision of the QVE shall verify the installation of displacement caisson piles.

#### **903.07.05                                  Tolerances**

##### **903.07.05.01                              Driven Piles**

- a) Cut-off elevation  $\pm 25$  mm.
- b) Deviation from vertical not more than 1H:50V, except in the case of a pile cap or footing supporting only a single row of piles the deviation shall not be more than 1H:75V in the direction of the span.
- c) The deviation from the specified inclination for battered piles shall not exceed 1H:25V.
- d) The centre of the pile at the junction with the pile cap shall be within 150 mm measured horizontally of that specified except in the case of a pile cap or footing supported on a single row of piles the deviation shall not be more than 75 mm measured horizontally in the direction of the span.

##### **903.07.05.02                              Caissons and Displacement Caisson Piles**

- a) Cut-off elevation  $\pm 25$  mm.
- b) Horizontal location at cut-off not more than 5% of shaft diameter or 75 mm, whichever is less.
- c) Vertical alignment not more than 2% of the caisson length from vertical for vertical caissons, or 2% of the caisson length from the specified inclination for battered caissons.

#### **903.07.06                                  Load Test**

When a load test is specified in the Contract Documents, the testing shall be according to ASTM D 1143M for piles under vertical static load, ASTM D 3689 for piles under tensile load, and ASTM D 3966 for piles under lateral loads. The Quality Verification Engineer shall witness the pile load test. All records and results of the

pile load test attached with the Certificate of Conformance shall be submitted to the Contract Administrator.

All necessary personnel, equipment, and material to make adjustments during the tests shall be provided and at least one skilled worker shall be present for the complete duration of each test. This worker shall have demonstrated experience in load testing of piles.

The following shall be provided for the duration of all testing:

- a) A level dry working area at the test location
- b) An adequate enclosure sufficient to provide complete protection from adverse weather conditions
- c) All temporary work required to obtain access to the site for the personnel, equipment, and materials.

Upon completion of the tests, the site shall be cleared and restored to the satisfaction of the Contract Administrator. Piles that are not part of the finished work shall be cut off 1.2 m below ground level or 0.6 m below stream bed level. Any resulting void shall be backfilled with suitable fill material.

### **903.07.07                      Repair of Welds**

Any section of weld that does not meet the requirements of the Contract Documents shall be removed and rewelded.

### **903.07.08                      Quality Control**

#### **903.07.08.01                      Inspection and Testing of Welds**

##### **903.07.08.01.01                      Qualifications of Companies and Individuals**

An independent testing company with no corporate affiliation with the Contractor shall be employed to carry out the non-destructive testing of welds. The independent testing company shall be certified by the Canadian Welding Bureau to the requirements of CSA W178.1 for bridge structures by radiographic or ultrasonic test methods.

Testing shall be done by a non-destructive testing technician employed by an independent testing company. The non-destructive testing technician shall have documented evidence of training and professional knowledge, skill, and experience in non-destructive testing of structural steel welds and material and have a valid certificate showing qualification to a Level II or III according to CAN/CGSB-48.9712 and the Canadian Welding Bureau for the non-destructive testing specified.

Visual inspections shall be performed by a welding inspector employed by an independent testing company. The welding inspector shall have documented evidence of training, professional knowledge, skill and experience in the visual inspection of structural steel welds and material, and have a valid certificate showing qualification to Level II or III according to CSA W178.2.

##### **903.07.08.01.02                      Visual Inspection of Welds**

A representative sample of not less than 30% of the welds, as determined by the Quality Verification Engineer, shall be visually inspected for conformance to the requirements of CSA W59, the Contract Documents, and the Working Drawings.

##### **903.07.08.01.03                      Non-Destructive Testing of Welds**

Radiographic or ultrasonic testing shall be carried out using procedures according to CSA W59.

Ultrasonic or radiographic testing shall be carried out on the entire length of selected splice welds chosen at

random by the Quality Verification Engineer or the Welding Inspector assigned to carry out visual inspection.

Selection shall be based on the following criteria:

- a) For pile groups other than at integral abutments, 10% of the splice welds, rounded to the next highest number, but no fewer than two.
- b) For pile groups at integral abutments, 10% of the splice welds, rounded to the next highest number, but no fewer than two of when the welds are below 6 m of the pile cut-off elevation.
- c) For pile groups at integral abutments, all splice welds within 6 m of the pile cut-off elevation.

#### **903.07.08.01.04          Repaired Welds**

All welds that have been repaired shall be visually inspected and shall undergo non-destructive testing.

#### **903.07.08.02          Non-Destructive Test Reports and Visual Inspection Reports**

Within 7 Days from completion of the inspection and testing, two copies of all inspection and testing reports shall be submitted to the Contract Administrator, for information purposes only.

#### **903.07.08.03          Certificate of Conformance**

A completed Certificate of Conformance shall be submitted to the Contract Administrator upon completion of the deep foundation work. The Certificate of Conformance shall be sealed and signed by the Quality Verification Engineer and shall state that the deep foundation work has been carried out in general conformance with the Contract Documents and Working Drawings. The Certificate of Conformance shall also certify that the interim milestone inspections have been completed as specified.

When the specified horizontal tolerances are not achieved, the process for "Non-Conforming Work by the Contractor" as specified elsewhere in the Contract Documents shall be followed unless the pile discrepancies are minor and do not require a detailed design evaluation.

For these minor cases, a proposal for an amendment to the Contract Documents stating that the pile discrepancies are minor and do not require detailed design evaluation shall be submitted to the Contract Administrator for acceptance.

The proposal shall be signed by an Engineer and shall be accompanied by a drawing containing the following information:

- a) Specified pile locations;
- b) Actual pile locations; and
- c) Proposed adjustments to the footing and reinforcement.

### **903.09                  MEASUREMENT FOR PAYMENT**

#### **903.09.01              Actual Measurement**

##### **903.09.01.01          H-Piles, Tube Piles, Wooden Piles, and Precast Reinforced Concrete Piles**

Measurement of piles shall be by length in metres of the piling left in place after cut-off.

**903.09.01.02                      Sheet Piles**

Measurement of sheet piles shall be by area in square metres based on the driving lines specified and the length of piling left in place after cut-off.

**903.09.01.03                      Driving Shoes**

For measurement purposes, a count shall be made of the number of drive shoes used.

**903.09.01.04                      Rock Points**

For measurement purposes, a count shall be made of the number of rock points used.

**903.09.01.05                      Caissons and Displacement Caisson Piles**

Measurement of caissons and displacement caisson piles shall be by length in metres of the depth along the centreline between the approved bearing surface at the bottom and the specified elevation at the top.

**903.09.01.06                      Retapping Piles**

For measurement purposes, a count shall made of the number of piles retapped above and beyond the minimum number described in the Retapping Tests on Piles clause.

Piles retapped as part of the minimum number required for the retapping tests described in the Retapping Tests on Piles clause shall not be measured for payment.

**903.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**903.10                                BASIS FOR PAYMENT**

**903.10.01                          Supply Equipment for Installing Driven Piles - Item  
Supply Equipment for Installing Caisson Piles - Item  
Supply Equipment for Installing Displacement Caisson Piles - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material required to do the work.

For payment purposes, 50% of the work under this item is completed when the satisfactory performance of the equipment has been demonstrated to the Contract Administrator by the installation of 1% of piles. The remaining 50% shall be paid on the satisfactory completion of the installation of piles.

When the hammer performance is requested to be verified, such verification shall be completed at no extra cost to the owner when the energy delivered is less than 90% of the stated potential energy (rated energy) specified in the submission.

When the energy is equal to or greater than 90% of the stated potential energy stated in the required submission, the cost verifying the hammer performance shall be administered as a Change in the Work.

**903.10.02                          H-Piles - Item  
Tube Piles - Item  
Precast Concrete Piles - Item  
Wood Piles - Item  
Displacement Caisson Piles - Item**

**Caisson Piles - Item**  
**Driving Shoes - Item**  
**Rock Points - Item**  
**Sheet Piles - Item**  
**Load Test - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Payment for redriving piles shall be at the Contract price for the applicable tender item above.

When the Contractor substitutes driving shoes or Oslo points with Titus H bearing pile points, the cost of such substitutions shall be at no extra cost to the Owner.

**903.10.03                      Retapping Piles - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Retapping the minimum specified number of piles for retapping tests shall include all labour, Equipment, and Material to do the work and shall be included in the Contract price for the appropriate pile tender item.

Where additional retapping is required, payment shall be made based on the ratio of the number of piles retapped in a pile group above the minimum requirement, up to the total number of piles in that pile group, times the tender price for retapping all piles for that pile group.

**Appendix 903-A, April 2016**  
FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

## 904.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Bridge** means a structure that is greater than 3 m in span that provides a roadway, carriageway, or walkway for the passage of vehicles or pedestrians or both across an obstruction or gap or facility.

**Cold Joint** means the interface surface other than at a formed joint that occurs when plastic concrete is placed against concrete that has taken its initial set.

**Cold Weather** means those conditions when the ambient air temperature is at or below 5 °C. It is also considered to exist when the ambient air temperature is at or is likely to fall below 5 °C within 96 hours after completion of concrete placement. Temperature refers to shade temperature.

**Concrete Toe Wall** means a low unreinforced concrete gravity type retaining wall no greater than 2 m in height.

**Construction Joint** means the surface where two successive placements of concrete meet or where new concrete is placed against old concrete across which it is desirable to achieve bond between the two concrete placements and through which steel reinforcement may be continuous.

**Culvert** means a structure that provides an opening through an embankment and in which roadway loads are distributed to the structure through fill or that is designated as a culvert in the Contract Documents.

**Designated Limits** means the dimensions of the component as shown on the Contract Drawings or the limits of the component as revised in the field in writing by the Contract Administrator.

**High Performance Concrete (HPC)** means concrete with a minimum specified 28-Day compressive strength of at least 50 MPa that includes silica fume and may include other supplementary cementing materials and having a specified rapid chloride permeability at 28 to 32 Days of 1,000 coulombs or less.

**Honeycombing** means rough and stony concrete surface with voids where the mortar did not fill the spaces between the coarse aggregate particles.

**Reinforcing Steel Bars** means deformed steel bars made of carbon steel as defined in CAN/CSA G30.18, used for the reinforcement of concrete.

**R Value** means the metric thermal resistance value that is a measurement of the resistance to heat transfer of insulation.

**Segregation** means visible separation of the mortar and coarse aggregate particles in the plastic concrete resulting in concrete that is not uniform in appearance or proportions.

**Stainless Steel Reinforcing Bars** means deformed stainless steel bars as defined in ASTM A 955 used for the reinforcement of concrete.

**Steel Reinforcement** means all types of steel reinforcement for concrete, including reinforcing steel bars, stainless steel reinforcing bars, splice bars, welded steel wire fabric, and prestressing strands and bars.

**Structure** means any bridge, culvert, tunnel, retaining wall, wharf, dock, or guideway, or any part thereof, or other reinforced concrete component designed to carry loads, including high mast pole footings and sign support footings. For the purposes of this specification, a working slab is not considered a structural component.

**Tremie** means a hopper with a vertical pipe extending from the bottom of the hopper to the lowest point of concrete deposit, used to place concrete under water.

## **904.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **904.04.01 Submission Requirements**

#### **904.04.01.01 Request to Place Structural Concrete**

Prior to each placement of concrete operation, a Request to Place Structural Concrete form accompanied with all supporting documentation as specified on the form, shall be submitted to the Contract Administrator.

The placement of concrete shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **904.04.01.02 Bridge Deck Placement Plan**

A work plan shall be submitted to the Contract Administrator a minimum of seven Days prior to commencement of placing concrete in bridge decks, for information purposes. The work plan shall include:

- a) The proposed methods and sequence of placing operations to be used.
- b) Complete details of all equipment to be used during the concrete placement.

**904.04.01.03****Temperature Control Plans**

A temperature control plan shall be submitted to the Contract Administrator a minimum of seven Days prior to commencement of placing any concrete that requires temperature control for review of compliance with the requirements as specified in the Contract Documents.

The plan shall include methods for monitoring and controlling concrete temperature and the temperature difference prior to, during, and after placement for:

- a) Concrete subject to cold weather.
- b) HPC.
- c) Bridge decks.
- d) Large concrete components where the smallest dimension is 1.5 m.

The temperature control plan shall include, as a minimum, the following:

- a) Concrete element for which the plan applies.
- b) Temperature monitoring system, including the locations and depths, number of thermocouples, and frequencies of recordings to be used in each placement.
- c) Method of ensuring concrete temperature and temperature difference are maintained for the duration of the protection period.
- d) Any alterations to work schedule, production, delivery schedule, and time of placement for temperature control purposes.
- e) Any modification to mix design for temperature control purposes.
- f) Any other specific measures to be taken.
- g) Method of withdrawal of protection.

In addition, for concrete subject to cold weather the temperature control plan shall also include the following:

- a) Type of insulation, R value and number of layers, including test data verifying the R value. The submission for cold weather protective measures shall be accompanied by samples of insulation, if requested by the Contract Administrator.
- b) Type and layout of heaters and type and extent of housing.

**904.04.01.04****Curing Compound**

A minimum of seven Days prior to the application of the curing compound, the following shall be submitted to the Contract Administrator, for information purposes:

- a) Literature stating the manufacturers recommended rate of application.
- b) Description of the equipment to be used.
- c) A statement from the manufacturer of the curing compound approving the equipment.

#### **904.04.01.05 Approach Slab Seat Elastomers and Ballast Wall Elastomers**

A copy of the manufacturer's certificate verifying compliance with OPSS 1202 shall be submitted to the Contract Administrator prior to installation of the approach slab seat elastomer or ballast wall elastomer or both.

#### **904.05 MATERIALS**

##### **904.05.01 Concrete**

Concrete shall be according to OPSS 1350.

##### **904.05.02 Portland Cement**

Portland cement shall be according to OPSS 1301.

##### **904.05.03 Sand**

Sand shall be according to OPSS 1002.

##### **904.05.04 Bonding Agents**

Bonding agent shall consist of Portland cement, Type GU, and sand in the ratio of 1:1 by volume and sufficient water to produce a consistency so that it can be applied with a stiff brush to the existing concrete in a thin even coating that shall not run or puddle.

##### **904.05.05 Mortar**

Mortar shall be a 2:1 mixture by volume of sand and Portland cement, Type GU, and shall contain 12% entrained air with water sufficient to make a stiff mix.

##### **904.05.06 Burlap**

The burlap shall be according to AASHTO M182, Class 4, and shall be free from substances that are deleterious to concrete. The burlap shall have no tears or holes.

##### **904.05.07 Water**

Water used for curing and fog misting of concrete, including pre-soaking of burlap, and for making bonding agents and mortar and mixing proprietary patching materials shall be according to OPSS 1302.

##### **904.05.08 Moisture Vapour Barrier**

The material shall be a white opaque polyethylene film according to ASTM C 171, at least 100 µm thick.

##### **904.05.09 Curing Compound**

Curing compound shall be according to OPSS 1315.

#### **904.05.10 Approach Slab Seat Elastomers and Ballast Wall Elastomers**

Elastomers delivered to the site shall exceed the required length to allow for a 600 mm test sample to be taken from the approach slab seat or ballast wall elastomers on each structure.

The elastomer shall be according to the plain bearing requirements of OPSS 1202.

#### **904.05.11                      Insulation Material**

Insulation material shall be mineral wool, glass fibre, plastic foam or other suitable material, having an R value not less than 0.02 m<sup>2</sup> C/W per 1 mm thickness.

Straw insulation shall not be used. Loose or absorbent insulation material shall not be used, unless it is completely contained within waterproof wrapping.

#### **904.06                              EQUIPMENT**

##### **904.06.01                      General**

Equipment made of aluminium material shall not come in contact with the plastic concrete.

##### **904.06.02                      Concrete Pump**

The concrete pump shall be a reciprocating pump equipped to fit a pipeline at least 100 mm in diameter.

##### **904.06.03                      Consolidating Equipment**

Internal vibrators shall be of the high frequency type with 8,000 minimum to 12,000 maximum vibrations per minute when immersed in concrete.

External vibrators shall have a minimum frequency of 3,600 vibrations per minute.

##### **904.06.04                      Mixer for Bonding Agents**

The mixer for the bonding agent shall be a stationary mixer, power driven, and capable of uniformly mixing the materials.

##### **904.06.05                      Bridge Deck Finishing Machine**

The bridge deck finishing machine shall:

- a) Be self-propelled and capable of forward and reverse movement under positive control.
- b) Be fitted with wheels that travel on adjustable screed rails.
- c) Be fitted with a reversing rotating cylinder screed capable of finishing the concrete without subsequent hand finishing.
- d) Be fitted with a reversing screw power auger.
- e) Be capable of externally vibrating the surface of the concrete by means of a plate or roller.
- f) Be fitted with a means to raise all screeds to clear the screeded surface and to accurately reposition them without adjusting the legs.
- g) Have adjustable legs fitted with locking devices.

##### **904.06.06                      Screed Rails**

The rails shall be made of metal and be straight to within 3 mm in a 3 m length. Screed rail chairs shall be adjustable in height, made of metal, and spaced at a maximum of 1.2 m and be placed under all rail joints. Maximum deflection of the screed rails under load shall be 2 mm in a 1.2 m length.

#### **904.06.07 Work Bridges**

Work bridges shall be provided to facilitate surface finishing of unscreeded areas, corrections to surface finish, concrete inspection, and placing of curing materials.

Work bridges shall ride on the screed rails and the top surface of a work bridge shall not be higher than 1.0 m above the finished surface.

#### **904.06.08 Hand Finishing Tools**

Floats shall be made of magnesium or wood. Magnesium bull floats shall be commercially made.

#### **904.06.09 Straight Edges**

Two straight edges commercially made of metal, one 3 m and one 500 mm long shall be used.

#### **904.06.10 Tremie**

The tremie shall be equipped with a foot valve at the bottom of the pipe. The pipe shall have a 300 mm  $\pm$  50 mm inside diameter and shall be long enough to extend to the lowest point of concrete deposit.

#### **904.06.11 Spray Equipment for Curing Compound**

The curing compound shall be applied to the concrete surface by means of motorized spraying equipment approved by the manufacturer of the curing compound. The equipment shall include a mechanical agitator.

#### **904.06.12 Compressor - Air Blasting**

The compressor for air blasting shall have a minimum capacity of 3.5 m<sup>3</sup>/minute. The compressed air shall be free of oil or other contaminants.

### **904.07 CONSTRUCTION**

#### **904.07.01 Formwork and Falsework**

Formwork and falsework shall be according to OPSS 919. Textile form liners shall not be used.

#### **904.07.02 Steel Reinforcement, Mechanical Connectors, and Associated Hardware**

Steel reinforcement, mechanical connectors, and associated hardware shall be according to OPSS 905.

Where the superstructure is continuous over a support, all the deck steel reinforcement shall be placed in the entire deck prior to any concrete is placed. This requirement does not apply to the bottom slab of post-tensioned decks with trapezoidal voids.

#### **904.07.03 Deck Joint Assemblies and Joint Material**

Deck joint assemblies, joint fillers, joint seals, joint sealing compounds, and external waterstops shall be according to OPSS 920.

#### **904.07.04 Preparation for Concrete Placement**

##### **904.07.04.01 General**

All concrete surfaces against which new concrete is to be placed, including formed and sawcut surfaces, shall be clean, solid, and free from loose or unsound fragments, coatings, and any other foreign substances or debris and shall be sufficiently rough to ensure that a full bond is developed with the new concrete. The concrete surface shall be uniformly roughened to a surface profile of  $5 \pm 2$  mm by means of methods such as scabbling, chipping, or bush hammering to expose the aggregates across the entire surface. Roughening is not required for the vertical faces of slope paving or for new concrete substrate with a roughened finish imparted at the time of placement meeting the profile requirement.

##### **904.07.04.02 Abrasive Blast Cleaning**

The following surfaces shall be abrasive blast cleaned according to OPSS 929:

- a) All existing steel reinforcement that shall be incorporated into the rehabilitation of a concrete structure component.
- b) All surfaces of existing structural steel against which new concrete shall be placed for the rehabilitation of a concrete structure component.
- c) All new or existing concrete surfaces against which new concrete shall be placed.

##### **904.07.04.03 Cleaning**

All concrete and structural steel surfaces against which new concrete is to be placed shall be cleaned by power washing no more than 24 hours prior to placing concrete.

##### **904.07.04.04 Pre-Wetting**

All concrete surfaces to receive concrete shall be maintained in a wet condition for a period of one hour prior to placing any new concrete.

Immediately prior to wetting the concrete surface, all dust and loose material shall be removed from the prepared surface by using compressed air.

Prior to placing concrete, excess water shall be removed from the surface using compressed air.

##### **904.07.04.05 Bonding Agent**

A bonding agent shall be used for:

- a) Exposed vertical surfaces of concrete, less than 300 mm in height, against which new concrete is to be placed.
- b) Blockouts in concrete for installation and modification of deck joint assemblies.
- c) Stressing tendon anchorage recesses.

A thin uniform coating of bonding agent shall be brushed onto the prepared surface immediately prior to placing fresh concrete. Bonding agents shall be mixed by means of a mixer. Any bonding agent not used within 30 minutes of mixing shall be discarded. Bonding agent that has dried shall be removed and replaced prior to placing concrete against it.

**904.07.04.06****Element-Specific Preparation**

For concrete in footings; when specified in the Contract Documents that the concrete is to be placed against undisturbed soil or set in rock, any over-excavation shall be filled with concrete of the same strength as the footing concrete.

For parapet and barrier walls and curbs on structures; all anchorages shall be fastened in place accurately and securely prior to proceeding with concrete placement. The railing anchorage inserts shall be fastened in place according to OPSS 908.

For concrete in approach slabs; the approach slab seat elastomer, polystyrene, and joint filler shall be installed and the grade thoroughly wetted down prior to placing the concrete in the approach slab.

For concrete in slope paving; the slope face shall be shaped, excavation completed, granular A placed and compacted according to OPSS 501 and the crushed rock, moisture vapour barrier, wood strips, and joint filler placed as required prior to placing the concrete. Sealant shall be installed as specified in the Contract Documents.

**904.07.05****Placing of Concrete****904.07.05.01****General**

The method of transporting, placing, and consolidating the concrete shall be such as to prevent segregation.

Concrete placing and transporting devices shall not be supported by the steel reinforcement.

Concrete shall be deposited within 1.5 m of its final position. Chutes shall have sufficient slope to deliver concrete of the approved consistency and shall have a maximum length of 15 m.

When concrete is to be dropped more than 1.5 m, fully enclosed vertical drop chutes extending to the point of deposit shall be used. Drop chutes are not required for placing concrete in steel tube piles of 0.6 m diameter or less. Concrete shall be placed at a steady rate such that a monolithic concrete is obtained without the formation of cold joints.

When there is an interruption in placing concrete greater than 20 minutes, the surface of the concrete shall be covered with wet burlap. The Contractor shall notify the Contract Administrator immediately of any interruption resulting in a cold joint and shall submit a proposal for remedial action for approval.

**904.07.05.02****Concrete Placing Restrictions**

The placement of concrete shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

No concrete shall be placed until all curing material and, in cold weather, all cold weather protection material has been delivered to the site.

Barrier and parapet walls on structures shall not be slipformed.

When concrete is to be placed on a surface that has a slope greater than 3%, the placing operation shall begin at the lower end of the slope and progress upwards.

All surfaces against which concrete is to be placed shall be free of standing water, except for tremie concrete. Fresh concrete shall be protected from contact with rain or snow.

The temperature of formwork, steel reinforcement, or any other material on which the concrete is to be placed shall not exceed 30 °C.

Debris shall be removed from the area where concrete is to be placed.

Ice and snow shall be removed from the area where concrete is to be placed. Deicing chemicals shall not be used. Concrete shall not be placed on or against frozen ground. Excavations prepared for concreting and any existing concrete, steel reinforcement, structural steel, forms, or other surfaces against which concrete shall be placed shall be at a minimum temperature of 5 °C for a period of 12 hours prior to commencement of placing concrete.

#### **904.07.05.03 Concrete in Structure and in Deck**

Concrete diaphragms shall be placed monolithically with the deck.

All bridge deck placements 3 m or wider shall be finished using a finishing machine and a work bridge. Where placements are longer than 40 m or wider than 10 m, a second work bridge shall be used. For deck placements narrower than 3 m, the Contractor shall submit a proposal detailing a method of finishing to the Contract Administrator for approval. Small localized areas may be hand finished subject to approval by the Contract Administrator.

Where the superstructure is continuous over a support, the screed rails shall be placed for the entire length of the structure prior to any concrete is placed.

A dry run shall be carried out in the presence of the Contract Administrator to ensure that the specified camber, crown, slab thickness, and concrete cover are achieved. In those areas of the deck where a finishing machine will be used to finish the concrete, the dry run shall be carried out by means of the finishing machine fitted with an attachment suitable for checking the required cover, securely fastened to the finishing machine strike-off with the strike-off set in its lowest position. This operation shall be repeated to cover the entire area to be concreted.

For HPC and silica fume overlay, at the time of the dry run the Contractor shall demonstrate that the performance of the fog misting equipment meets the specified requirements.

Screed rails and the supports for the screed rails shall not be removed until the concrete has hardened sufficiently to withstand the weight of workers and equipment used to remove them without marring the surface of the concrete. Any part of the screed rail supports that remain in the deck shall have 100 mm of concrete cover. Chairs used to support screed rails shall not be welded to structural steel but may be welded to shear connectors.

The holes in the deck resulting from removal of the screed rail supports shall be thoroughly cleaned of all deleterious material and abrasive blast cleaned immediately prior to filling with proprietary patching material. The work of cleaning and filling the holes shall be completed within 96 hours after the end of the deck curing period.

#### **904.07.05.04 Tremie Concrete**

Concrete shall be placed using a tremie or concrete pump. No air or water pockets shall be introduced into the tremie concrete by the placing equipment.

Pipe of a tremie or hose of a concrete pump shall be positioned vertical and shall be long enough to reach the lowest point of concrete deposit. A continuous flow of concrete at a minimum rate of 15 m<sup>3</sup>/h shall be maintained through the pipe or hose. The concrete shall be placed in its final position and to its full depth in a continuous placing operation without interruption. The top under water surface of the concrete shall be kept level during concrete placement. After placement, the concrete shall not be disturbed, puddled, or vibrated. Tremies or concrete pumps shall be located a maximum distance of 5 m apart and a maximum of 2.5 m from forms.

Concrete shall only be placed in water that has a temperature of 2 °C or greater. The velocity of water flow inside the forms shall not be more than 3 m/min.

When placing the tremie pipe or concrete pump hose and at the start of the concreting operation, the pipe or hose shall be sealed at the bottom to prevent ingress of water. Once concrete is flowing through the pipe or hose, the discharge end shall be kept continuously immersed in the freshly placed concrete. If the seal is lost, thereby allowing the pipe or hose to fill with water, the pipe or hose shall be withdrawn, the seal re-established, and the concreting operation restarted. Separate cranes shall be used to deliver the tremie concrete and to move and position the tremie or concrete pump.

Tremie concrete shall not be placed above the existing water level.

When a placement operation is interrupted below water level, the surface laitance shall be removed to expose the coarse aggregate within 36 hours after the interruption and prior to continuation of the operation.

When a placement operation is completed, and work is to continue in the dry, a construction joint shall be prepared by removing surface laitance to expose the coarse aggregate.

Unwatering shall not be permitted until at least 24 hours after the concrete placement is completed.

#### **904.07.06 Consolidation**

Internal or external vibrators or both shall be used to thoroughly consolidate concrete at the point of deposit within 15 minutes of placement.

Each layer of concrete shall be vibrated. Vibrators shall extend into the previous layer to produce a homogenous mixture at the layer interface.

Vibration shall not be used to make the concrete flow or to spread the concrete more than 1.5 m from the point of deposit.

#### **904.07.07 Concrete Finishing**

Finishing of the concrete surface shall be done immediately following placement.

No material shall be applied to the concrete surface or the finishing tools to aid in the finishing.

The surface shall be smooth, free from open texturing, undulations, projections, and ridges and shall be struck off true to grade and cross-section and, except as specified for bridge deck placements, shall be hand finished with a float.

Bridge decks shall be finished according to the Concrete in Structure and in Deck clause. In addition, for bridge decks where the concrete forms the wearing surface, the surface shall be textured. After a tight, uniform surface has been achieved, texturing shall be done with a wire broom or comb having a single row of tines. The required texture shall be transverse grooves that may vary from 1.5 mm width at 15 mm centres to 4.5 mm width at 20 mm centres with a groove depth varying from 3.0 to 4.5 mm. The texture shall extend uniformly to within 150 to 300 mm of the curb.

Bearing seats and expansion joint dams shall receive a wooden float finish. The top surface of sidewalks and curbs shall be given a broomed finish.

Concrete surfaces against which new concrete is to be placed shall be left with a rough surface finish.

**904.07.08 Curing**

**904.07.08.01 General**

Curing shall be applied immediately after finishing the concrete surface. For continuing operations, such as barrier wall or sidewalk, the curing shall be applied within 2 to 4 m of the finishing operation, and for bridge decks, within 2 to 4 m of the pan or screed of the finishing machine.

Any concrete containing silica fume shall be cured according to the HPC curing requirements.

The curing period shall be a minimum of seven Days for concrete subject to cold weather, concrete cured with curing compound, and HPC. For all other concrete, the curing period shall be a minimum of four Days.

When the ambient air temperature is 0 °C or higher at the time of placing, components of structures shall be cured with burlap and water, except as specified in the Curing Formed Surfaces clause. When the ambient air temperature is below 0 °C at the time of placing, components shall be cured with moisture vapour barrier, except for HPC, which shall be moist cured with burlap and water, regardless of ambient air temperature. During cold weather, burlap shall be prevented from freezing.

Curing compound shall only be permitted for non-structural elements such as slope paving and shall not be used when cold weather concreting is in effect.

Where waterproofing is to be applied to a structure deck following curing with burlap and water or moisture vapour barrier, the deck shall be air cured for at least 72 hours prior to the application of waterproofing.

**904.07.08.02 Fog Misting of High Performance Concrete**

Fog misting for high performance concrete shall be provided by means of hand held fogging wands; a fogging system mounted on the finishing machine may be used, in addition to hand held fogging wands.

Fog mist shall be applied from the time HPC is deposited in the deck, approach slab, median, curb, or sidewalk until it is covered with burlap.

Fog mist shall be applied using a misting nozzle in such a way as to maintain a fog mist above the concrete surface to maintain high relative humidity above the concrete and prevent drying of the concrete. No accumulation of water shall be permitted on the concrete surface. Water from fog misting nozzles shall not be worked into the concrete surface or used as a finishing aid.

**904.07.08.03 Curing with Burlap and Water**

Burlap shall be pre-soaked by immersing it in water for a period of at least 24 hours immediately prior to placing. Two layers of burlap shall be applied to the surface of the concrete. Burlap strips shall overlap 150 mm and shall be held in place without marring the surface of the concrete.

The burlap shall be maintained in a continuously wet condition throughout the curing period by means of a soaker hose. The burlap shall be covered with a layer of moisture vapour barrier within 12 hours of placing of the concrete in a manner that shall prevent deformation of the surface of the concrete.

Air flow in the space between the moisture vapour barrier and the burlap shall be prevented.

Water shall not be allowed to drip, flow, or puddle on the concrete surface when placing the burlap or at any time prior to the concrete has achieved final set.

#### **904.07.08.04 Curing with Moisture Vapour Barrier**

Air flow in the space between the moisture vapour barrier and the concrete surface shall be prevented. The moisture vapour barrier strips shall overlap 150 mm and shall be held in place at the edges and laps to prevent displacement without marring the surface of the concrete.

#### **904.07.08.05 Curing with Curing Compound**

Immediately prior to application, the curing compound shall be agitated by mechanical means to provide a homogeneous mixture. It shall be applied to completely cover the surface of the concrete. A second application of curing compound shall be applied within 30 to 60 minutes after the first application. Each application shall be such that the membrane formed is uniform in thickness and colour and free of breaks and pinholes.

The rate of each application shall not be less than the rate specified by the manufacturer of the compound.

#### **904.07.08.05.01 Curing Compound Sampling**

The Contractor shall be responsible for sampling of curing compounds and handling, identification, and delivery of curing compound samples to Regional Quality Assurance Laboratory for Quality Assurance testing. Curing compounds shall be sampled at the site from the spray nozzle during application. Samples shall be taken at a frequency of one sample per Contract or one sample per 1,000 lineal meters, whichever provides the greater number of samples.

#### **904.07.08.06 Curing Formed Surfaces**

Forms for structure barrier wall, parapet wall, and curb on deck shall be removed no later than 24 hours after concrete placement, and the concrete shall be cured according to the Curing with Burlap and Water clause for the remainder of the minimum curing period.

For all concrete other than HPC, when ambient air temperatures are 5 °C or less, forms for concrete barrier wall, parapet wall, and curb on deck may be left in place for the duration of the curing period.

Other formed surfaces shall require no additional curing where the formwork is left in place for the minimum specified curing period. Where the formwork is removed prior to the curing period is completed, formed surfaces shall be cured with burlap and water according to the Curing with Burlap and Water clause for the remainder of the minimum curing period.

#### **904.07.09 Control of Temperature and Temperature Difference**

##### **904.07.09.01 General**

During the curing period, the concrete temperature shall not fall below 10 °C or exceed 70 °C. The temperature difference between the centre of the concrete component at a location where the concrete is expected to reach the highest temperature and the surface shall not exceed 20 °C, for:

- a) All bridge decks.
- b) HPC.
- c) Large concrete components where the smallest dimension is 1.5 m.
- d) Any concrete subject to cold weather.

**904.07.09.02****Monitoring**

The Contractor shall monitor, record, and submit records for the concrete and ambient air temperature for:

- a) All bridge decks.
- b) HPC.
- c) Large concrete components where the smallest dimension is 1.5 m.
- d) Any concrete subject to cold weather.

The Contractor shall supply and install thermocouple wires and associated instrumentation with a combined accuracy of  $\pm 1.5$  °C capable of recording and displaying temperature. The instrumentation shall include data loggers capable of recording at hourly intervals or less and shall allow direct reading of temperature.

The thermocouples for concrete temperature measurement shall be installed as shown in Table 1 prior to placing concrete. Thermocouples for monitoring ambient air temperature shall be installed in the shade close to the surface of the concrete at a minimum frequency of one thermocouple per stage.

Recording of concrete temperatures shall begin at the start of placement. The temperature shall be recorded automatically at intervals no greater than one hour until the end of the monitoring period. The monitoring period shall be seven Days, or longer when necessary, in order to meet the requirements of the Withdrawal of Protection clause. The digital temperature indicators shall be left in place until the end of the monitoring period.

The Contractor shall also physically monitor and verify concrete and ambient air temperature readings every six hours, or more frequently, for the first three Days and every 12 hours for the remainder of the monitoring period. The Contractor shall take necessary action to maintain the temperature within the specified limits.

The Contract Administrator shall be provided access to verify temperature readings. If the datalogger does not have a digital display that allows the Contract Administrator to verify temperature, the Contractor shall provide the Contract Administrator with the necessary instruments to allow the Contract Administrator to verify thermocouple function and readings.

The Contractor shall prepare a record of temperatures for each Day during the temperature monitoring period and at the end of the temperature monitoring period shall prepare complete temperature records, including graphical plot of temperature versus time.

**904.07.09.02.01****Submission of Temperature Records**

Datalogger temperature records and a record of any actions taken to maintain control of temperature and temperature difference shall be forwarded to the Contract Administrator at the end of each Business Day during the temperature monitoring period. At the end of the temperature monitoring period, the Contractor shall submit to the Contract Administrator a complete temperature record.

**904.07.09.03****Concrete Subject to Cold Weather**

For concrete subject to cold weather, a protection system shall be designed for the worst conditions that can be reasonably anticipated from local weather records, forecasts, site conditions, and past experience for the time period during which the protection is required. The conditions shall be monitored and the protection system modified as required.

For cold weather conditions, minimum protection of concrete shall be as shown in Table 2 and shall be maintained for the duration of the curing period. This period may need to be extended in order to meet the requirement of the Withdrawal of Protection clause.

#### **904.07.09.03.01            Housing and Heating**

The design of the protective housing shall take into account the effects of construction activities such as placing concrete, stressing, and grouting. Heating equipment of sufficient capacity to establish and maintain the specified curing conditions shall be used throughout the curing period and for such time thereafter, as is necessary, for the completion of the work. Heating equipment used within the housing shall be vented outside the housing. Heating equipment having an open flame shall not be permitted.

The ambient air temperature adjacent to the concrete or formwork within the housing shall not be permitted to vary by more than 8 °C.

#### **904.07.09.04            Withdrawal of Protection**

For concrete subject to cold weather and for large concrete components where the smallest dimension is 1.5 m, the protection shall be gradually removed or reduced in such a manner that the maximum allowable drop of concrete temperature, as shown in Table 3, for each 24-hour period is not exceeded.

The protection shall not be totally removed, nor shall the concrete be fully exposed to the air until the average concrete temperature is within 10 °C of the ambient air temperature.

#### **904.07.10                Removal of Formwork and Falsework**

The removal of formwork and falsework shall be according to OPSS 919 and as specified in the Contract Documents.

#### **904.07.11                Construction Joints**

Construction joints shall be formed at the locations specified in the Contract Documents.

In addition, construction joints can be formed where control joints are specified in barrier walls and parapet walls. No other construction joints shall be permitted, unless approved in advance by the Contract Administrator.

A straight 20 mm V-groove shall be formed at the exposed face of the concrete at all construction joints. V-grooves shall not be used on bridge deck surfaces, except for the bottom slab of post tensioned box voided slabs.

A bulkhead shall be used to form vertical or inclined construction joints.

#### **904.07.12                Surface Finish**

##### **904.07.12.01            General**

Concrete surfaces shall not be treated with cement slurry or paste.

Within 3 Days following the removal of forms or curing materials, all holes left in the concrete surface with any dimension greater than 15 mm and less than 50 mm shall be filled with mortar or a proprietary patching material. The holes shall be moist at the time of filling. Mortar shall be tamped into place. Proprietary patching materials shall be placed according to the manufacturer's instructions.

Surfaces with cavities with any dimension greater than 50 mm or with honeycombing are considered deficient and shall be repaired. A repair proposal shall be submitted to the Contract Administrator for approval.

#### **904.07.12.02                      Exposed Surfaces**

The appearance of the concrete shall be uniform in colour, pattern, and texture when viewed from a distance of 15 m. Care shall be taken to select material, including proprietary patching materials, to achieve uniformity of colour and appearance.

All projections, such as fins and bulges, and all blemishes, such as stains and rust marks shall be removed.

#### **904.07.12.03                      Surface Tolerance**

Formed and unformed surfaces shall be such that when tested with a 3 m long straight edge placed anywhere in any direction on the surface, there shall be no gap greater than 6 mm between the bottom of the straight edge and the surface of the concrete. When the straight edge is placed across a construction joint, the gap between the straight edge and the surface of the concrete shall not be greater than 3 mm.

All unformed construction joint surfaces against which sidewalks, curbs, medians, and barrier walls are to be placed shall be such that when tested with a 500 mm straight edge placed anywhere in any direction on the surface, there is no gap greater than 20 mm between the bottom of the straight edge and the surface of the concrete.

#### **904.07.12.04                      Contamination of Surface**

Contamination by oil or other deleterious substances shall be prevented. Contaminated concrete in bridge decks or against which new concrete is to be placed shall be removed according to OPSS 928, procedure for Concrete Removal-Partial Depth, Type A, B, and C.

#### **904.07.13                              Alignment of Components**

The position of the inner and outer top edges of structural components shall be set true to the elevations, alignment, and camber as specified in the Contract Documents without visible deviation from one end of the structure to the other. All concrete items or structural components shall be constructed to the specified geometry.

Variations from plumb or a specified slope shall not exceed 1H:400V. Departure from specified alignment shall not exceed  $\pm 25$  mm.

#### **904.07.14                              Testing for Early Strength**

The Contractor may elect to prepare sets of cylinders for early strength determination in addition to the cylinders required for determination of strength at 28 Days.

The Contractor shall be responsible for all aspects of the preparation, storing, and transportation of cylinders for early strength determination. Curing of cylinders for early strength determination shall consist of storing the cylinders in or on the structure as near as possible to the component that they represent. The cylinders shall receive the same protection from the elements on all surfaces as is given to the portions of the structure that they represent. The Contractor shall identify the time of testing for early-break cylinders and provide the Contract Administrator with one Business Day advance notice to arrange testing. The Contractor shall deliver cylinders for early strength determination immediately prior to the time of testing. The Owner shall test a reasonable number of cylinders for early strength determination at the laboratory designated in the Contract Documents.

Early strength determination of concrete in post-tensioned structures shall be carried out on a minimum of four sets of cylinders representative of the concrete placed in the structure. At least one set of cylinders from the start, middle, and end of the deck section being placed shall be cast. All cylinder test results shall reach the minimum stressing strength as specified in the Contract Documents prior to stressing can commence.

#### **904.07.15 Early Loading of Structural Concrete**

Full design loads shall not be applied to the structure until the specified 28-Day compressive strength has been attained. Early loading of a structural component is permitted, unless expressly stated otherwise in the Contract Documents, subject to the following conditions:

- a) Prior to any early loading, the Contractor shall demonstrate that the concrete has reached a compressive strength of 20 MPa by preparing, curing, and transporting early strength cylinders according to the Testing for Early Strength subsection.
- b) Subsequent placement of reinforcement, formwork and falsework on a footing, culvert base slab, or caisson shall not begin until at least 24 hours after concrete placement, provided that concrete in the footing, culvert base slab, and caisson can withstand the forces exerted. Placement of concrete on the footing, culvert base slab, or caisson shall not be carried out until the concrete has reached a compressive strength of 20 MPa.
- c) Subsequent placement of reinforcement, formwork, falsework, and concrete on all other structural components shall not be carried out until the concrete has reached a compressive strength of 20 MPa.
- d) Early loading of concrete is not permitted where cold weather protection is required.
- e) Construction vehicles shall not be permitted on bridge decks until the concrete has reached a compressive strength of 20 MPa and construction vehicles shall not be permitted on the cantilever portion of the bridge deck until the specified 28-Day compressive strength has been achieved. Gross vehicle weight of the construction vehicles shall not exceed 20,000 kg.
- f) Full curing is to be maintained at all times as specified in the Contract Documents.

#### **904.07.16 Cracks in Formed and Unformed Surfaces**

All concrete shall be inspected to identify and document any cracks including, their location, width, and density. The results of the inspection shall be reported to the Contract Administrator. Cracks shall be inspected and monitored up to the date of Completion of the Work.

Based on criteria as shown in Table 4, the limits of areas requiring repair or replacement and shall be identified and provided to the Contract Administrator along with a proposal for remedial action to be taken. No repairs shall proceed until the proposal has been accepted by the Contract Administrator in writing.

Repairs shall be according to OPSS 932. Where removal is required, the removals and preparation of concrete shall be according to OPSS 928 and OPSS 930.

For bridge decks to be waterproofed, the inspection of the surface to be waterproofed shall be carried out after completion of curing and prior to application of tack coat for waterproofing. Waterproofing of a bridge deck shall not proceed until repairs have been completed and permission to waterproof has been given by the Contract Administrator.

For all other concrete, the inspection shall be carried out in a timely manner, but no later than one month following completion of curing.

#### **904.07.17 Concrete Cover**

All debris and obstructions shall be cleared to provide unhindered access to allow the Contract Administrator to carry out the concrete covermeter survey as specified in the Concrete Cover subsection of the Quality Assurance section. The Contract Administrator shall be notified in writing when the test area is ready for the concrete covermeter survey.

The Contract Administrator shall be allowed a time period of three Business Days to complete the survey, including review of the survey by the Owner. This time period shall commence upon receipt of the Contractor's written notification to carry out the survey. The time period required to complete the concrete survey shall be extended if inclement weather or the ambient air temperatures below 5 °C fall within that time period.

Where the cover does not meet the requirements as specified in the Contract Documents, a proposal for remedial action shall be submitted to the Contract Administrator for approval.

Waterproofing of a bridge deck shall not proceed until the survey has been completed and permission to waterproof has been given by the Contract Administrator.

For all other components, the inspection of the surface shall be carried out in a timely manner, not more than one month after removal of curing.

#### **904.07.18 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **904.08 QUALITY ASSURANCE**

#### **904.08.01 Acceptance**

Acceptance shall be according to OPSS 1350 and this specification, including satisfactory completion of all remedial action associated with surface tolerance, surface finish, concrete cover, alignment, cracks, and any other deficiencies.

#### **904.08.02 Concrete Cover**

The concrete cover shall meet the requirements as specified in the Contract Documents. Concrete cover determination shall be carried out by the Contract Administrator on the front faces of barrier or parapet walls, and the top surface of decks, including medians and sidewalks. The Contract Administrator shall provide the survey report to the Contractor.

#### **904.08.03 Approach Slab Seat and Ballast Wall Elastomers**

The Contract Administrator shall select a random sample of the approach slab seat and ballast wall elastomers, 600 mm in length each, from each structure for testing.

Elastomers that do not meet the requirements as specified in the Contract Documents shall be considered unacceptable and a financial penalty shall be applied.

#### **904.08.04 Curing Compounds**

Curing compounds shall be tested for relative density, non-volatile content, and settlement according to LS-413, LS-414, and LS-416. The individual test results shall be forwarded to the Contractor as they become available.

Curing compound that fails to fall within the specified tolerances for relative density, non-volatile content, or settlement shall be deemed unacceptable and curing compound represented by samples that do not comply with the requirements of this specification shall not be used for curing of concrete.

## **904.09 MEASUREMENT FOR PAYMENT**

### **904.09.01 General**

No deductions from the volume of concrete shall be made for any of the following:

- a) Drainage openings, load reducing devices, embedded timbers, and Utility and prestressing steel ducts, each of which has a cross-sectional area of less than 0.1 m<sup>2</sup>.
- b) Timber, steel, concrete, or concrete filled tubular piles.
- c) Steel reinforcement, miscellaneous hardware, and structural steel.

### **904.09.02 Actual Measurement**

#### **904.09.02.01 Concrete in Culverts Mass Concrete Tremie Concrete Concrete in Footings Concrete in Barrier Wall Footings**

Measurement of concrete shall be by volume in cubic metres.

Measurement shall be made within the designated limits of the work.

Tremie concrete volume may be measured using the concrete delivery tickets, when so designated by the Contract Administrator.

### **904.09.03 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **904.10 BASIS OF PAYMENT**

### **904.10.01 Concrete in Culverts - Item Mass Concrete - Item Tremie Concrete - Item Concrete in Footings - Item Concrete in Barrier Wall Footings - Item Concrete in Structure - Item Concrete in Substructure - Item Concrete in Substructure and Retaining Walls - Item Concrete in Deck - Item Concrete in Barrier Walls - Item Concrete in Parapet Walls - Item Concrete in Approach Slab - Item Concrete in Slope Paving - Item Concrete in Toe Wall - Item Prestressed Concrete Bridge Deck - Item**

**High Performance Concrete in Substructure - Item**  
**High Performance Concrete in Structure - Item**  
**High Performance Concrete in Approach Slab - Item**  
**High Performance Concrete in Deck - Item**  
**High Performance Concrete in Barrier Walls - Item**  
**High Performance Concrete in Parapet Walls - Item**  
**High Performance Concrete in Substructure and Retaining Walls - Item**

Payment at the Contract price for the concrete tender items shall be full compensation for all labour, Equipment, and Material to do the work, subject to payment adjustments as specified in the Contract Documents.

Surface cavities greater than 50 mm and honeycombing shall be repaired at no additional cost to the Owner.

#### **904.10.02                      Formwork and Falsework**

Payment for formwork and falsework shall be included in the work in which it is used.

Where formwork is required for the work under a concrete tender item, it shall be deemed for progress payment purposes that the formwork, together with its supporting falsework, when installed, constitutes 35% of the work to be carried out under the tender item.

Partial payment for construction of the formwork and falsework shall be made on a prorated basis.

#### **904.10.03                      Working Slabs**

When a concrete working slab is required by the Contract Administrator, payment shall be made as a Change in the Work at the unit price of the concrete in the footing to be placed on it.

#### **904.10.04                      Deck Joint Assemblies, Bearings, and Deck Drains**

When the Contract does not contain a separate tender item for deck joint assemblies, bearings, and deck drains, the Contract price for the concrete tender items in which the deck joint assemblies, bearings, and deck drains are incorporated shall include full compensation for all labour, Equipment, and Material to place the deck joint assemblies, bearings, and deck drains.

#### **904.10.05                      Reinforcing Steel Bars, or Stainless Steel Reinforcing Bars**

When the Contract does not contain a separate tender item for reinforcing steel bar or stainless steel reinforcing bar, the Contract price for the concrete tender item in which the steel reinforcement is incorporated shall include full compensation for all labour, Equipment, and Material to place the reinforcing steel bars or stainless steel reinforcing bars.

| <b>Bridge Decks</b>                                                    | All.                                                           | a) Minimum of 3 per stage, or per deck if deck is not placed in stages.<br><br>b) When diaphragm is cast together with a deck, a minimum of 4 per stage. | 3                                          | The beginning, middle, and final portion of the deck placement and in the diaphragm. At locations where the concrete is expected to reach the highest temperature and at the surfaces of concrete. (Note 1) |
| <b>HPC</b>                                                             | Substructure elements: abutments, pier columns, and pier caps. | Minimum of 3 per element or stages thereof.                                                                                                              | 2                                          | At locations where the concrete is expected to reach the highest temperature and at the surface of concrete.                                                                                                |
| <b>Large Concrete Components Where the Smallest Dimension is 1.5 m</b> | Elements with smallest dimension of 1.5 m or more.             | Minimum of 3 per element or stages thereof.                                                                                                              | 2                                          | At locations where the concrete is expected to reach the highest temperature and at the surface of concrete.                                                                                                |

**Notes:**

1. For bridge decks, thermocouples shall be installed in sets of three consisting of one mid-depth thermocouple and two surface thermocouples. The surface thermocouples shall be placed immediately above or the shortest distance from the corresponding mid-depth thermocouple. The surface thermocouples shall be installed beneath the burlap in contact with the surface concrete or imbedded in the concrete within 5 mm of the surface and, for bridge decks, the second surface thermocouple shall be placed inside the bottom form.

**905.01 SCOPE**

This specification covers the requirements for the placement of all steel reinforcement and mechanical connections for concrete structures.

**905.02 REFERENCES**

This specification refers to the following standards, specifications or publications:

**Ontario Provincial Standard Specifications, Construction**

OPSS 909     Prestressed Concrete - Precast Members  
OPSS 910     Stressing Systems for Post-Tensioning

**Ontario Provincial Standard Specifications, Material**

OPSS 1440     Steel Reinforcement for Concrete

**Ontario Ministry of Transportation Publications**

Structural Manual

Laboratory Testing Manual:

LS-434 Method of Test for Mechanical Connectors Used to Splice Steel Reinforcement

LS-448 Method of Test for Determination of Tensile Properties of Welded Wire Reinforcement

### CSA Standards

G30.18-09 (R2019) Carbon Steel Bars for Concrete Reinforcement

S6-19 Canadian Highway Bridge Design Code

W186-M1990 (R2012) Welding of Reinforcing Bars in Reinforced Concrete Construction

### ASTM International

A276 / A276M - 17 Stainless Steel Bars and Shapes

A421 / A421M - 15 Stress - Relieved Steel Wire for Prestressed Concrete

A955 / A955M - 20 Deformed and Plain Stainless Steel Bars for Concrete Reinforcement

## 905.03 DEFINITIONS

For the purpose of this specification the following definitions apply:

**Fabrication** means the cutting, bending, storing, bundling, tagging and delivery of stainless and uncoated reinforcing steel bars.

**Mechanical Connection** means a joining of two reinforcing steel bars, stainless steel reinforcing bars, or post-tensioning tendons by means of a mechanical connector.

**Post-Tensioning** means a method of prestressing in which tendons are stressed after the concrete has reached a predetermined strength.

**Prestressing Steel** means steel strand or bar that exhibits the principal attributes of high tensile strength and ductility because of its composition and method of production.

**Reinforcing Steel Bars** means uncoated deformed steel bars made of carbon steel as defined in CSA G30.18, used for the reinforcement of concrete.

**Slip** means the axial displacement of the reinforcing bars measured relative to the mechanical connector. Displacement is measured at a rebar stress of 5% of specified yield after the mechanical connection has been loaded to a rebar stress of 50% of specified yield and then unloaded to a bar stress of 5% of specified yield.

**Splice Bar** means a reinforcing steel bar or stainless steel reinforcing bar that is further manufactured, other than by solely cutting threads, to be compatible with a specific mechanical connector.

**Stainless Steel Reinforcing Bars** means deformed stainless steel bars as defined in ASTM A955 used for the reinforcement of concrete.

**Steel Reinforcement** means all types of steel reinforcement for concrete including reinforcing steel bars, stainless steel reinforcing bars, splice bars, steel welded wire reinforcement, and prestressing strands and bars.

**Steel Welded Wire Reinforcement** means a wire mesh fabricated by means of resistance welding the crossing joints, available in rolls or flat sheets.

**Strand** means a group of wires laid helically over a central-core wire. A seven-wire strand would consist of six outer wires laid over a single wire core.

**Structure** means any bridge, culvert, tunnel, retaining wall, wharf, dock, or guideway, or any part thereof, or other reinforced concrete component designed to carry loads, including high mast pole footings and sign support footings.

**Swaged** means to apply circumferential pressure to a sleeve surrounding a bar to deform the sleeve sufficiently to achieve bearing between the deformed sleeve and the deformations on the bar.

**Ultimate Tensile Strength** means the breaking load of the material per unit area established by tensile testing.

**Yield Strength** means the stress at which the material exhibits a specified deviation of proportionality of stress and strain.

## **905.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **905.04.01 Submission Requirements**

#### **905.04.01.01 Working Drawings**

##### **905.04.01.01.01 Steel Reinforcement Working Drawings**

Three sets of steel reinforcement Working Drawings shall be submitted to the Contract Administrator for information purposes only at least seven Days prior to the commencement of placing steel reinforcement. An Engineer's seal and signature shall be affixed on the Working Drawings verifying that they are consistent with the Contract Documents. The Working Drawings shall include at least the following: quantity, bar size, grade, mark number, location, and spacing for all steel reinforcement.

When a metric to imperial bar size substitution is made, the placing drawings shall include the quantity, bar size, grade, location, and spacing of both the metric and the substitute imperial bar.

When bar marks are indicated on the Contract Documents and reinforcing bar lists show the same bar marks, Working Drawings are not required.

The fabricator shall not commence fabrication until he has received one set of steel reinforcement Working Drawings sealed and signed by an Engineer. The fabricator shall have a copy of the Working Drawings at the manufacturing plant during fabrication.

A sealed and signed copy of these drawings shall be kept at the site before and during placing of steel reinforcement.

##### **905.04.01.01.02 Steel Reinforcement Schedule**

Three sets of steel reinforcement schedules shall be submitted to the Contract Administrator for information purposes only at least seven Days prior to the commencement of placing steel reinforcement. An Engineer's seal and signature shall be affixed on the steel reinforcement schedule verifying that they are consistent with the Contract Documents. The steel reinforcement schedules shall include at least: quantity, bar size, grade, reinforcing steel bars, stainless steel reinforcing bars, welded wire reinforcement, type if applicable, length, and bending dimensions.

When bar marks are shown on the Working Drawings, they shall be used in the schedule.

Steel reinforcement shall be detailed according to CSA-S6, and the Structural Manual.

The fabricator shall not commence fabrication until he has received one set of the steel reinforcement schedule sealed and signed by an Engineer. The fabricator shall have a copy of the steel reinforcement schedule at the manufacturing plant during fabrication.

A sealed and signed copy of the steel reinforcement schedule shall be kept at the site prior to and during placement of steel reinforcement.

#### **905.04.01.02                      Prestressed Concrete - Precast Members**

Submission of proposals and shop drawings for prestressed concrete-precast members shall be according to OPSS 909.

#### **905.04.01.03                      Prestressed Concrete - Post-Tensioning**

Submissions for post-tensioning shall be according to OPSS 910.

#### **905.04.01.04                      Welding Details**

Three sets of welding details shall be submitted to the Contract Administrator for information purposes only at least seven Days prior to the commencement of steel reinforcement welding. An Engineer's seal and signature shall be affixed on the Working Drawings verifying that they are consistent with the Contract Documents. The welding details shall include materials, procedures, bars to be welded, location, and type of welds, as well as details of tack welds. Details shall be designed to prevent notching effects in the bars.

A sealed and signed copy of the welding details shall be kept at the site prior to and during welding of reinforcing.

#### **905.04.01.05                      Mechanical Connections Details**

Three sets of mechanical connection details shall be submitted to the Contract Administrator for information purposes only at least seven Days prior to the commencement of installation of the connectors. Prior to making a submission, an Engineer's seal and signature shall be affixed on the Working Drawings verifying that they are consistent with the Contract Documents.

The connections details shall contain the following information:

- a) The type or series identification of the connector.
- b) The grade and size of the reinforcement to be joined by the connector.
- c) A copy of the manufacturer's catalogue giving complete data on the connector material and installation procedures.
- d) Location of splices, including type of splice.

### **905.05                                      MATERIALS**

#### **905.05.01                              Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

#### **905.05.02                              Post-Tensioning Materials**

Post-tensioning materials shall be according to OPSS 910.

### **905.05.03 Mechanical Connections Details**

#### **905.05.03.01 Post-Tensioning Tendons**

When tested in an unbonded condition, mechanical connections for post-tensioning tendons shall develop at least 100% of the ultimate tensile strength of the tendons, without exceeding the anticipated set.

The mechanical connection shall withstand without failure, two million cycles of stress through a range of 245 MPa for plain bars and 195 MPa for strands and ribbed bars. The upper limit of the range shall be 70% of the nominal tensile strength.

#### **905.05.03.02 Reinforcing Steel Bars, Stainless Steel Reinforcing Bars**

The mechanical connections shall be qualified by tests made on sample splices according to the Job Control Tests clause.

Mechanical connections for steel reinforcement shall develop, in tension, the greater of 120% of the specified yield strength of the bars or 110% of the mean yield strength of the actual bars used to test the mechanical connection.

The total slip of the reinforcing bars shall not exceed the following measured displacements between gauge points straddling the mechanical connector:

- |                                              |         |
|----------------------------------------------|---------|
| a) For bar sizes up to and including No. 45M | 0.25 mm |
| b) For No. 55M bars                          | 0.75 mm |

Splice bars shall be supplied by the manufacturer of the associated mechanical connector.

Stainless steel splice bars shall be used with stainless steel reinforcing bars and shall be of a type according to OPSS 1440.

### **905.05.04 Mechanical Connectors**

#### **905.05.04.01 Post-Tensioning Tendons**

Mechanical connectors shall be supplied by the manufacturer of the prestressing system.

#### **905.05.04.02 Reinforcing Steel Bars, Stainless Steel Reinforcing Bars**

Mechanical connectors shall be of an approved type and design and may be the form saver type, the filled sleeve type, the swaged sleeve coupler type, the threaded coupler type, the hot rolled thread bar coupler type, or the forged bar coupler type.

Stainless steel mechanical connectors shall be used with stainless steel reinforcing bars and shall be of a type according to OPSS 1440.

#### **905.05.05 Associated Hardware**

Only hardware, including spacers and support devices, approved by the Owner shall be used with steel reinforcement and the hardware shall meet the following requirements:

- a) All supports or support systems shall be capable of withstanding the loads to be placed on them.

- b) Except for tie wire, embedded hardware within 50 mm of exposed surfaces shall be stainless steel, galvanized steel, or of a non-metallic material verified not to react with concrete and approved by the ministry prior to use.
- c) Tie wire shall be 1.2 or 1.6 mm in diameter and shall be annealed ferrous wire except for the tie wire used to tie stainless steel reinforcing bars to stainless steel reinforcing bars, reinforcing steel bars, and shear studs, which shall be Type 316 LN or Type 316L, stainless steel wire.
- d) Bar chairs for supporting steel reinforcement shall be non-metallic.
- e) Concrete chairs shall not be used to support steel reinforcement except in footings and against granular surfaces.

## **905.07 CONSTRUCTION**

### **905.07.01 General**

All steel reinforcement and accessories shall be kept clean of all mud, oil, and other deleterious materials and stored clear of ground contact.

Steel reinforcement shall be placed according to the tolerances shown in Table 1. The tolerances listed include fabrication tolerances.

### **905.07.02 Reinforcing Steel Bars, Stainless Steel Reinforcing Bars, Splice Bars, Stainless Steel Splice Bars and Steel Welded Wire Reinforcing**

#### **905.07.02.01 Storage and Protection of Stainless Steel Reinforcing Bars**

Stainless steel reinforcing bars shall be stored separately from reinforcing steel bars with the bar tags maintained and clearly visible until ready for placement.

#### **905.07.02.02 Placing**

Steel reinforcement shall be accurately placed in the positions as specified in the Contract Documents and held in the correct location during the operations of placing and consolidating concrete.

Bars shall be tied at least at every fourth intersection. The maximum untied length of any bar shall be 1 m.

For slab-on-girder type decks, the top layer of deck reinforcement shall be tied to the shear studs or shear stirrups on each girder at approximately 1.5 m centres.

Spacers for spirals shall be equally spaced around the spiral and shall be so that the specified pitch of the spiral is maintained.

#### **905.07.02.03 Surface Condition**

Steel reinforcement other than stainless steel reinforcing bars with rust, mill scale, or a combination of both shall be acceptable, provided the minimum physical properties including height of deformations and mass of a wire brushed test specimen are not less than the applicable specification requirements. Loose scale shall be removed.

Stainless steel reinforcing bars at the time the concrete is placed shall be free of deposits of iron and non-stainless steels.

#### **905.07.02.04            Cutting**

The cutting of stainless steel reinforcing bars, reinforcing steel bars, welded wire reinforcement, and splice bars by oxyacetylene torch may be carried out only when permitted in writing by the Contract Administrator.

#### **905.07.02.05            Bending**

Field bending of stainless steel reinforcing bars and reinforcing steel bars shall not be permitted, except when specified in the Contract Documents or authorized by the Contract Administrator.

#### **905.07.02.06            Welding**

Welding, including tack welding, shall not be permitted except as specified in the Contract Documents or as shown on the welding details submitted to the Contract Administrator.

The welding of stainless steel reinforcing bars and reinforcing steel bars shall be according to CSA W186 and shall be performed by companies certified by the Canadian Welding Bureau according to CSA W186.

Welding shall not be permitted within 3 m of any prestressing steel. Grounding welding equipment to prestressing steel or sheath shall not be permitted.

Except for splicing of stainless spirals, welding of stainless steel reinforcing bars shall not be permitted.

#### **905.07.02.07            Splicing**

Welded splices shall develop 100% of the tensile strength of the bar.

Splices for stainless steel reinforcing bars and reinforcing steel other than spirals shall be made as specified in the Working Drawings.

End anchorage of column spiral reinforcement shall be provided either by one and one half extra turns of spiral bar at each end of the spiral, one end embedded in the footing and the other end in the component supported above, or by a 90 degree bend around a longitudinal reinforcing bar plus an extension of at least 24 bar diameters into the core of the column.

Splicing of spiral reinforcing bars by means of a non-welded splice shall be made as specified in the Working Drawings. Non-welded splices shall be affected by mechanical connections or anchoring the ends of the spiral bars by means of a 90 degree bend around a longitudinal reinforcing bar with extensions of at least 24 bar diameters into the core of the column.

#### **905.07.02.08            Mechanical Connections**

##### **905.07.02.08.01        General**

Mechanical connections shall only be permitted as specified in the Contract Drawings. Locations of mechanical connections shall be as specified in the Working Drawings.

When a mechanical connector type is specified in the Contract Documents, only the specified mechanical connector type shall be used for that application.

The form saver type of mechanical connector shall only be used at construction joints.

The mechanical connections shall be qualified by tests made on sample splices according to the Job Control Tests clause.

All procedures and equipment for mechanical connections shall be according to the manufacturer's recommendations.

Ends of reinforcing bars to be joined shall be cut nominally square.

Connector sleeves shall have the clear cover as specified for the reinforcing steel in that location.

Stirrups, ties, and other reinforcement shall be adjusted or relocated, if necessary, to provide the required clear cover to the reinforcement.

Threads cut on the ends of the reinforcing steel bars shall match the internal threads in the connector.

#### **905.07.02.08.02      Job Control Tests**

When mechanical connectors are used, sample connections shall be assembled at the work site in the presence of the Contract Administrator. Frequency of sampling and method of sample assembly shall be according to the Quality Assurance section. Sample connections for testing shall be assembled on site in exactly the same manner as the connectors used in the Work. Sample connections fully assembled anywhere other than on site and in the presence of the Contract Administrator shall not be submitted for testing.

Samples for testing shall be submitted at least 10 Days prior to intended start of concrete placement.

#### **905.07.03      Prestressing Steel for Prestressed Concrete**

##### **905.07.03.01      Surface Condition**

All prestressing steel shall be clean and free of all rust, oil, dirt, scale, and pitting. Prestressing steel may have a light oxide coating.

##### **905.07.03.02      Placing**

Prestressing steel shall be accurately placed in the positions as specified in the Contract Documents and held in the correct location during the operations of placing and compacting concrete.

Prestressing steel shall be placed according to the tolerances shown in Table 1.

Mechanical connections in strand or high strength bars shall not be permitted in the Work, unless specified in the Contract Documents.

Mechanical connections shall be installed according to the recommendations of the manufacturer of the prestressing system used.

##### **905.07.03.03      Welding**

Welding of prestressing strand shall not be permitted.

#### **905.07.04      Stressing Systems for Post-Tensioning**

Construction requirements for stressing systems for post-tensioning shall be according to OPSS 910.

#### **905.07.05      Inspection after Installation of Steel Reinforcement and Mechanical Connectors**

A Request to Proceed shall be submitted to the Contract Administrator upon completion of the installation of the steel reinforcement and, if any, mechanical connectors.

The next operation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **905.07.06 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **905.08 QUALITY ASSURANCE**

#### **905.08.01 Sampling**

##### **905.08.01.01 Prestressing Steel**

The Contractor shall notify the Contract Administrator when prestressing steel is available for sampling.

Samples selected by the Contract Administrator shall be properly labeled by the Contractor for submission at least three weeks in advance of anticipated use to the Owner's laboratory or as directed by the Contract Administrator.

Samples of prestressing steel shall be provided as follows:

- a) For strand; one sample, 1.0 m long from each reel.
- b) For anchorages and connectors; samples shall be selected by the Contract Administrator on a random basis.

##### **905.08.01.02 Reinforcing Steel Bars and Stainless Steel Reinforcing Bars**

Reinforcing steel bars and stainless steel reinforcing bars shall be sampled for acceptance on a lot basis. A lot shall consist of reinforcing steel of the same grade, or stainless steel of the same Type and grade, of a single nominal size, and from the same mill and heat.

Three 1.5 m long samples shall be selected on a random basis at the site by the Contract Administrator and shall be accompanied by the mill certificate for that lot.

##### **905.08.01.03 Mechanical Connectors - Sampling for Job Control Test**

Mechanical connectors shall be sampled for acceptance on a lot basis. A lot shall consist of all connectors of one size and type from one supplier. If a lot contains more than 300 connectors, it shall be divided into sublots of a maximum of 300 connectors. Sublots shall be of approximately equal size.

The Contractor shall assemble six sample connections per subplot or six sample connections per lot if there are less than 300 connectors. The reinforcing bars from which the test samples are to be fabricated shall be selected on a random basis at the site by the Contract Administrator. The length of each bar to be joined shall be at least 500 mm. The same materials, position, location, equipment, and procedures as are being used to make connections in the reinforcing bars in the work shall be used when making the sample connections.

The Contractor shall complete Owner Standard Form, PH-CC-812, Field Sample Data Sheet-Mechanical Connectors, for each assembled sample. The Contractor shall submit the samples and the completed forms along with mill test certificates corresponding to the bars used, to the Contract Administrator for delivery to the laboratory designated by the ministry.

#### **905.08.01.04 Steel Welded Wire Reinforcement- Sampling for Tensile Strength**

Welded wire reinforcement shall be sampled for acceptance on a lot basis. A lot shall be 7000 m<sup>2</sup> of welded wire reinforcement or fraction thereof.

A minimum of five samples shall be taken per lot for testing and shall be extracted from the same sheet of mesh. Each specimen shall be a minimum length of 500 mm and shall contain at least one cross-wire in its middle section. The sampling time and location shall be determined by the Contract Administrator.

#### **905.08.02 Testing**

##### **905.08.02.01 Prestressing Steel**

The testing of prestressing steel shall be according to ASTM A421.

##### **905.08.02.02 Reinforcing Steel Bar and Stainless Steel Reinforcing Bar**

The testing of reinforcing steel bar shall be according to CSA G30.18 and the testing of stainless steel reinforcing bar shall be according to ASTM A276 and ASTM A955. Testing shall be carried out at the discretion of the ministry.

##### **905.08.02.03 Mechanical Connections**

###### **905.08.02.03.01 Testing for Torque**

When required by the manufacturers' installation procedure, torque shall be checked on 5% of the splices. Formwork that limits access to connectors for testing purposes shall not be placed until testing has been completed.

###### **905.08.02.03.02 Job Control Test**

Three of the six sample connections for each lot or subplot shall be tested for acceptance and the remaining three samples shall be retained by the testing laboratory for referee testing, if invoked.

The samples shall be tested for slip and tensile strength according to LS-434.

If one or more of the three test samples fails to meet the requirements of this specification for either the slip or tensile strength, the lot or subplot represented by the samples shall be rejected.

Individual test results shall be forwarded to the Contractor, as they become available.

###### **905.08.02.03.03 Job Control Test - Referee Testing**

Referee testing of mechanical connectors may be invoked by the Contractor within five Business Days of receiving the test result.

When referee testing is invoked, the three retained referee samples will be tested by the referee laboratory designated by the ministry. The samples shall be tested for slip and tensile strength according to LS-434.

Referee test results shall be forwarded to the Contractor, as they become available.

If one or more of the referee samples fails to meet the requirements of this specification for either the slip or tensile strength, the Acceptance Testing results are confirmed and shall be the basis of acceptance.

When all three referee samples meet the requirements of this specification for slip and tensile strength, the Acceptance Testing results are not confirmed and the referee test results shall replace the Acceptance Testing results as the basis of acceptance.

**905.08.02.03.04 Referee Testing Cost**

The cost of mechanical connector referee testing shall be as specified in the Contract Documents. When the referee results indicate that the acceptance test results for refereed lot or subplot are not confirmed, the Owner shall bear the cost. When the referee results indicate that the acceptance test results for refereed lot or subplot are confirmed, the Contractor shall be charged the cost of mechanical connector testing.

**905.08.02.04 Steel Welded Wire Reinforcement for Tensile Strength**

Testing of tensile strength of welded wire reinforcement shall be according to LS-448.

The lot of material shall be considered acceptable if the average of the valid test results meet or exceed 4% elongation, the specified yield strength and none of the individual valid test results have less than 3.2% elongation.

A minimum of three valid test results is required for acceptance. If less than three valid test results are obtained then the lot of material shall be resampled and tested until a total of five valid test results are obtained. No valid test results shall be discarded.

Unacceptable lots shall be rejected and replaced.

**905.09 MEASUREMENT FOR PAYMENT**

**905.09.01 Actual Measurement**

**905.09.01.01 Mechanical Connectors  
Stainless Steel Mechanical Connectors**

For measurement purposes, a count shall be made of the number of connectors installed.

**905.09.02 Plan Quantity**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**905.10 BASIS OF PAYMENT**

**905.10.01 Reinforcing Steel Bar - Item  
Stainless Steel Reinforcing Bar - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**905.10.02 Mechanical Connectors – Item  
Stainless Steel Mechanical Connectors – Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

|---------------|--------------|
| <b>906.01</b> | <b>SCOPE</b> |
|---------------|--------------|

This specification covers the construction requirements for the fabrication, delivery, and erection of structural steel for highway bridges.

### 906.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Bearing Contact Area** means two planes that are in contact or have a separation between them not exceeding 0.12 mm.

**Erection Diagrams** means drawings showing the dimensioned layout of the steel structure, from which shop details are made, and that correlate the fabricator's piece markings with the location in the structure.

**Faying Surface** means the mating surface of a member that is in contact with another member to which it is to be joined.

**Flush** means a profile of weld reinforcement in which there is a smooth gradual transition between the base and weld metal involving grinding where necessary. Weld reinforcement not exceeding 1 mm in height may remain on each surface, unless the weld is part of a faying surface when all reinforcement is removed.

**Fracture Critical Member** means a member, including attachments, in a single load path structure that is subject to tensile stress and whose failure could lead to collapse of the structure.

**Inspector** means an individual who is a Canadian Welding Bureau (CWB) certified Level 2 or Level 3 inspector according to the requirements of CSA W178.2 and has documented evidence of professional knowledge, skill, and experience in the inspection of fabrication and erection of steel bridges.

**New Steel** means structural steel that has not previously been used.

**Non-Destructive Testing Technician** means an individual who has documented evidence of training, professional knowledge, skill, and experience in non-destructive testing of structural steel welds and material, and has a valid certificate showing qualification to a Level 2 or 3 according to CGSB 48.9712 for the non-destructive testing specified.

**Primary Tension Member** means a member including attachments that are subject to tension stress.

**Smooth** means a profile of weld reinforcement, in which the surface finish or weld reinforcement has sufficiently smooth gradual transition, involving grinding where necessary. Weld reinforcement not exceeding the following limits, may remain on each surface:

2 mm for plate thickness  $\leq 50$  mm

3 mm for plate thickness  $> 50$  mm

**Snug Tight** means the tightness attained by a few impacts of an impact wrench or the full effort of a person using a spud wrench.

## **906.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **906.04.01 Design Requirements**

#### **906.04.01.01 General**

Design shall be according to CSA-S6 and the Structural Manual.

#### **906.04.01.02 Welding**

Welding design shall be according to CSA W59.

Welding procedures shall be according to CSA W47.1 and CSA W59, except where modified by CSA-S6, Clause A10.1.5.

Symbols for welding and non-destructive testing shall be according to CSA W59.

#### **906.04.02 Submissions**

##### **906.04.02.01 General**

When other authorities are involved in the approval of the design or construction of a highway structure, submissions shall be made at least 35 Days prior to commencement of work and one additional copy of the submission shall be provided for each authority.

The requirements of each authority shall be satisfied prior to commencement of fabrication.

**906.04.02.02****Shop Drawings and Welding Procedures**

Three sets of the shop drawings and welding procedures shall be submitted to the Contract Administrator at least seven Days prior to commencement of fabrication, for information purposes only. Prior to making a submission, an Engineer's seal and signature shall be affixed on the shop drawings and welding procedures verifying that the details and procedures are in conformance with the Contract Documents.

The shop drawings shall include at least the following:

- a) Full detail dimensions and sizes of all component parts of the structure. These dimensions shall make allowance for changes in shape due to weld shrinkage, camber, and any other effects that cause finished dimensions to differ from initial dimensions.
- b) Identification marking of each member for erection.
- c) All necessary specifications and standards for the materials to be used.
- d) Identification of areas requiring special surface treatment.
- e) Identification of fracture-critical and primary tension members and component parts. Attachments having a length of more than 100 mm in the direction of tension and welded to the tension zone of a fracture-critical or primary tension member shall be treated as part of that member.
- f) Bolt installation requirements, including number of fitting up bolts required at each connection and oversize and slotted holes.
- g) Details of all welds, including the identification of any welds which require a surface finish of smooth or flush.
- h) Identification of material and welds requiring non-destructive testing, including the limits of the weld undergoing testing and the frequency and type of testing.
- i) Temporary welds.
- j) Location of shop and field splices.

Fabrication shall not commence until the fabricator has received one set of shop drawings and welding procedures sealed and signed by an Engineer.

A copy of the shop drawings and welding procedures shall be at the fabrication facility during fabrication.

**906.04.02.03****Erection Diagrams and Erection Procedure Drawings and Calculations**

Three sets of the erection diagrams and erection procedure drawings and calculations shall be submitted to the Contract Administrator at least seven Days prior to commencement of erection, for information purposes only. Prior to making a submission, an Engineer's seal and signature shall be affixed on the erection diagrams and erection procedure drawings and calculations verifying that the erection diagrams and erection procedure drawings and calculations are consistent with the Contract Documents.

Erection diagrams and erection procedure drawings shall include at least the following:

- a) Principal dimensions of the bridge.
- b) Identification marking of each member for erection.
- c) Sizes of all members.

- d) Field welding requirements, including identification of welds requiring non-destructive testing.
- e) Size and type of bolts.
- f) Bolt installation requirements, including the number of fitting up bolts required at each connection and identification of oversize and slotted holes.
- g) Bracing during erection of structural steel.
- h) Treatment at faying surfaces for joints designed as slip critical.

Erection shall not commence until one set of erection diagrams and erection procedure drawings and calculations sealed and signed by an Engineer have been received.

A copy of the erection diagrams and the erection procedure drawings and calculations shall be at the site during erection.

#### **906.04.02.04                      Mill Test Certificates**

Prior to the use of any material in fabrication, two copies of the mill test certificates for that material shall be submitted to the Contract Administrator, confirming that the material is according to the Contract Documents.

Copies of the mill test certificates for all material to be used in the fabrication shall be available for review at the fabricating plant during fabrication. The certificates shall show that the material is according to the Contract Documents.

Material used in fabrication shall be directly traceable to the mill test certificate. When material is divided, identification marking shall be transferred to all pieces.

When mill test certificates originate from a mill outside of Canada or the United States of America, the information on the mill test certificate shall be verified by testing at a Canadian laboratory. This laboratory shall be certified by an organization accredited by the Standards Council of Canada to comply with the requirements of ISO/IEC 17025 for the specific tests or type of tests required by the material standard specified on the mill test certificate. The Canadian laboratory's test certificate shall be identified with the name of the laboratory and appropriate wording stating that the material is according to the specified Contract requirements. The certificate shall include the appropriate material specification number, testing date (i.e., yyyy-mm-dd), signature of an authorized officer of the Canadian laboratory, and be traceable to the original mill test certificate. Material coupons to be tested in the Canadian Laboratory for the purpose of verifying mill test certificates originating from a mill outside of Canada or the United States of America shall be taken from the material sample once the material has arrived in Canada.

#### **906.04.02.05                      Test Reports for Fasteners**

Proof that the bolts, nuts, and washers meet the chemical composition, mechanical properties, dimensions, workmanship, and head burst as required by ASTM F3125, ASTM A563, or ASTM F436 shall be submitted to the Contract Administrator. Verification of the acceptability of assemblage of zinc-coated bolts, nuts, and washers delivered to the job site shall also be submitted to the Contract Administrator.

For bolts, nuts, and washers supplied from a manufacturer outside Canada or the United States of America, the above information shall be verified by testing at a Canadian laboratory as outlined in the Mill Test Certificates clause.

**906.04.02.06****Independent Testing Organization and Technician Information**

The name of the independent testing organization and the non-destructive testing technicians, together with proof of certification, shall be submitted to the Contract Administrator a minimum of seven Days prior to the commencement of fabrication, for information purposes only.

**906.04.03****Inspection after Fabrication of the Structural Steel**

A Manufacturer's Certificate of Conformance and a Request to Proceed shall be submitted to the Contract Administrator upon completion of the fabrication of the structural steel and prior to shipping from the plant.

The structural steel shall not be delivered from the plant until the Contract Administrator has received the Manufacturer's Certificate of Conformance, Request to Proceed, and issued a Notice to Proceed.

**906.05****MATERIALS****906.05.01****Steel**

Structural steel shall be new steel and of the grade and category specified in the Contract Documents and shall be according to CSA G40.20/G40.21.

ASTM A588 may be substituted when either of the following steel grades have been specified:

- a) CSA G40.20/G40.21, Grade 350A.
- b) CSA G40.20/G40.21, Grade 350AT, when the Charpy impact energy requirements are verified by the submission of test documentation.

ASTM A709, Grade 345 or Grade 345S may be substituted when either of the following steel grades have been specified:

- a) CSA G40.20/G40.21, Grade 350W.
- b) CSA G40.20/G40.21, Grade 350WT, when the Charpy impact energy requirements are verified by the submission of test documentation.

Substitution of other material for size and grade is not permitted unless approval is received from the Contract Administrator.

Material testing shall confirm that all structural steel to be used in welded fabrication contains less than 0.0008% boron. Boron content shall be reported on the mill test certificate. When verification by testing at a Canadian laboratory is required as outlined in the Mill Test Certificate clause, the boron content shall also be verified and reported.

The steel shall be identified as specified in the Control of Material clause.

**906.05.02****High Strength Bolts, Nuts, and Washers**

High strength bolts shall be according to ASTM F3125, Grade A325M or Grade A490M.

High strength nuts, and hardened washers shall be suitable for use with the types of bolts being specified and shall be according to ASTM A563 and ASTM F436.

The nuts, bolts, and washers shall be supplied and shipped together as an assembly from the same manufacturer.

High strength bolts, nuts, and washers for use with unpainted corrosion-resistant steel shall be Type 3. Bolts, nuts, and washers used with steel specified in the Contract Documents to receive a paint coating or galvanizing shall be Type 1 and shall be galvanized. High strength Grade A490M bolts shall not be galvanized or plated.

#### **906.05.03                      Electrodes**

Welding electrodes, electrode and flux or electrode and gas combinations shall be low hydrogen (level H16 or less) and shall be according to CSA W47.1, CSA W48, and Section 12 of CSA W59.

The weld metal shall meet the Charpy V notch impact energy requirements of CSA-S6, Table 10.15 for fracture-critical members and Table 10.14 for primary tension members.

Weld metal used with corrosion resistant steels shall have similar corrosion resistance and colour to the base metal and shall be according to CSA W59.

#### **906.05.04                      Stud Shear Connectors**

Stud shear connectors shall meet the requirements of ASTM A108 Grades G10100 to G10200. All stud shear connectors shall meet the requirements of CSA W59, Annex H. Only studs of Type B as defined by CSA W59, Annex H, shall be used.

#### **906.05.05                      Pins and Rollers**

Pins and rollers more than 175 mm in diameter shall be forged and annealed or forged and normalized. Pins and rollers 175 mm or less in diameter shall be forged and annealed, forged and normalized, or cold-finished carbon-steel shafting.

#### **906.05.06                      Bearings**

Bearings shall be according to OPSS 1202 or OPSS 1203 or both.

### **906.07                          CONSTRUCTION**

#### **906.07.01                      Fabrication**

##### **906.07.01.01                  General**

The fabrication shall be according to CSA-S6, Clause A10.1.4.

All Atmospheric Corrosion Resistant (ACR) steel components shall be abrasive blast-cleaned according to SSPC-SP6/NACE No. 3 to completely remove mill scale, rust, coating, oxides, corrosion products, oil, grease, dust, dirt, and other foreign matter.

##### **906.07.01.02                  Plate Edges**

Plasma arc cutting of plates up to and including 25 mm in thickness is permitted. Plasma arc cutting of plates thicker than 25 mm shall not be permitted unless approval is received in writing from the Contract Administrator. Plasma arc cutting of plates shall use oxygen as the cutting gas and all edges shall be square and free of dross.

The quality of cut edges and the inspection and repair of planar discontinuities shall be according to CSA W59.

Corners of oxygen cut girder flanges shall be chamfered 1.5 to 2.0 mm by grinding.

#### **906.07.01.03                      Straightening Material**

Material with sharp kinks shall be rejected. Straightening of bends shall only be done using mechanical means or by the application of controlled heating according to CSA W59. Details of the straightening procedure including testing requirements, sealed and signed by an Engineer shall be submitted to the Contract Administrator prior to the straightening, for information purposes only.

Straightening shall only be carried out in the presence of the Owner's inspector. The Contract Administrator shall be given seven Days prior notice to arrange for the inspection.

If necessary, the Contract Administrator shall specify additional testing to be performed by the Contractor. If evidence of damage is discovered, the material shall be rejected, and the cost of testing shall be at the expense of the Contractor.

#### **906.07.01.04                      Cambering**

When rolled sections are heat cambered, the details of the heat cambering procedure, sealed and signed by an Engineer, shall be submitted to the Contract Administrator seven Days prior to cambering, for information purposes only.

Plate girders shall have the required camber cut into the web with suitable allowance for camber loss due to cutting and welding.

Steel box girders fabricated with webs in an upright position shall have the fabricated camber verified by subtracting ordinates for deflections for girder segments from the relaxed camber diagram ordinates.

The use of heat to alter the camber of fracture critical or primary tension members shall be subject to approval by the Contract Administrator prior to the application of heat.

The ends of cambered girders shall be vertical under full dead load.

#### **906.07.01.05                      Horizontally Curved Girders**

##### **906.07.01.05.01                  Heat Curving of Rolled Beams and Welded Girders**

Girders shall be cambered before heat curving.

A detailed procedure for the heat curving operation, sealed and signed by an Engineer, shall be submitted to the Contract Administrator 14 Days prior to heat curving, for information purposes only.

#### **906.07.01.06                      Identification Marking for Erection**

Each member shall carry an erection mark for identification.

Permanent marking shall be affixed in an area not exposed to view in the finished structure.

#### **906.07.01.07                      Welded Construction**

##### **906.07.01.07.01                  General**

All welded construction shall be according to CSA W59 and Clause A10.1.5 of CSA-S6.

All welding shall be carried out by welders having a CSA W47.1 identification card valid for the type of welding to be done and for the duration of the welding work.

The fabrication weld metal requirements, base metal repairs, and repairs of weld in fracture critical and primary tension members shall be according to CSA-S6, Clause 10.23.6.

Any company responsible for welding structures fabricated or erected according to CSA-S6 shall be certified according to CSA W47.1, Division 1 or 2.

#### **906.07.01.07.02          Altering the Sweep of Fracture-Critical and Primary Tension Members**

The use of heat to alter the sweep of fracture critical or primary tension members shall be subject to approval by the Contract Administrator, prior to the application of heat.

#### **906.07.01.07.03          Submissions of Repair Procedures**

Canadian Welding Bureau (CWB) approved welding procedure specifications, data-sheets, and repair procedures for prequalification sealed and signed by an Engineer, shall be submitted for approval to the Contract Administrator 14 Days prior to commencement of work.

#### **906.07.01.07.04          Assembly for Welding**

Assembly for welding shall be according to CSA W59 and the following:

- a) Bearing stiffeners shall be vertical under full dead load.
- b) Intermediate stiffeners shall be either true vertical or perpendicular to the horizontal work lines used to layout the girder.
- c) Bearing stiffeners fitted to bear shall have a minimum bearing contact area of 75% and a maximum separation of 1 mm over the remaining area.
- d) Fitted intermediate stiffeners shall have a minimum bearing contact area of 25% and a maximum separation of 2 mm.

#### **906.07.01.07.05          Temporary Welds**

Temporary welds shall not be used on fracture-critical and primary tension members.

Temporary welds shall not be used on flange material in compression, unless approved by the Contract Administrator.

#### **906.07.01.07.06          Preheat, Interpass Temperature, and Heat Input Control**

When making welding repairs to fracture-critical and primary tension members, the preheat requirements shall be according to CSA-S6, Table 10.16.

#### **906.07.01.07.07          Profile of Welds**

Profile of welds shall be according to CSA W59 and the Structural Manual.

#### **906.07.01.07.08          Corrections**

Welding corrections and repairs to fracture-critical and primary tension members shall be according to CSA-S6, Clause 10.23.6.

Any steel members subjected to shape corrections or straightening shall be allowed to cool in still air.

**906.07.01.07.09 Peening**

Peening, when required, shall be subject to approval by the Contract Administrator.

**906.07.01.07.10 Stress Relief-Heat Treatment**

Stress relief-heat treatment temperatures shall be recorded using thermo-couples or other methods acceptable to the Contract Administrator. A record showing temperature and time data of the heat-treating operation shall be maintained and be made available to the Contract Administrator upon request.

**906.07.01.07.11 Welding Inspection**

**906.07.01.07.11.01 General**

All welding inspection shall be according to CSA W59.

**906.07.01.07.11.02 Identification Cards - Canadian Welding Bureau**

Prior to commencement of welding, the Canadian Welding Bureau's transferable or non-transferable identification cards for each tacker, welder, or welding operator to be employed on the work shall be made available to the Contract Administrator. Such identification cards shall be currently valid and shall indicate the welding processes and the welding positions at which the personnel are qualified to weld.

**906.07.01.07.11.03 Certification of the Independent Testing Organization**

The independent organization undertaking welding testing under the Quality Control subsection shall be certified for testing bridges according to CSA W178.1. The certification shall encompass at least the following methods: radiographic, ultrasonic, and magnetic particle.

**906.07.01.07.11.04 Certification of the Non-Destructive Testing Technician**

The independent organization's non-destructive testing technician undertaking non-destructive testing of welds under the Quality Control subsection shall be certified according to CGSB 48.9712 Level 2 or Level 3 for the methods used.

**906.07.01.07.12 Welding Corrections and Repairs for Fracture-Critical and Primary Tension Members**

**906.07.01.07.12.01 General**

All repair procedures requiring approval shall be submitted to the Contract Administrator at least 14 Days prior to commencement of the work.

Repair procedures shall be according to CSA-S6, Clause 10.23.6.

**906.07.01.07.12.02 Approval for Non-Critical Repairs**

Non-critical repairs are those listed in CSA-S6, Clause 10.23.6.

Repair procedures shall be prepared and submitted to the Contract Administrator. Work on the repair shall not commence until the Contract Administrator has given written approval to proceed.

#### **906.07.01.07.12.03      Approval for Critical Repairs**

Repair procedures that are beyond those described in CSA-S6, Subclause 10.23.6.4 are considered critical and shall be individually approved by the Contract Administrator before repair welding proceeds.

Critical repairs include those listed in CSA-S6, Clause 10.23.6.

#### **906.07.01.07.13      Non-Destructive Testing of Fracture Critical Members**

The fabricator shall maintain documentation of all visual and non-destructive testing for review and verification by the Contract Administrator. Documentation shall be submitted to the Contract Administrator upon completion of the project.

#### **906.07.01.07.14      Repair of Welds**

Any section of weld that does not meet the acceptance standards shall be removed, re-welded, and re-examined.

#### **906.07.01.07.15      Bolted Construction**

##### **906.07.01.07.15.01      General**

Bolted construction shall be according to CSA-S6, Clause A10.1.6.

Once all bolts in a joint are brought to a snug tight condition and all plies in the connection are in firm contact, the nuts and the protruding bolt ends shall be match marked using an indelible paint marker before final tightening to enable the amount of relative rotation to be determined. Match marking does not relieve the bolting inspector's responsibility to ensure the inspection requirements of CSA-S6 are satisfied.

Bolts shall be sufficiently long to exclude threads from the shear plane.

##### **906.07.01.07.15.02      Plasma Arc Cutting of Holes**

Plasma arc cutting of holes shall only be permitted in plates up to and including 20 mm in thickness. Plasma arc cut holes shall be produced by mechanically guided means and the diameter of the holes shall be greater than or equal to the thickness of the plate. When plasma arc cutting of holes is permitted, the cutting gas as well as the shielding gas shall be oxygen and the surface roughness shall not exceed 25 microns (1000 micro-inches) as defined in CSA B95 Occasional gouges not more than 1.5 mm in depth are permitted. Thermally cut holes shall be 2 mm larger than the nominal diameter of the bolt and the taper shall not exceed 0.5 degrees.

##### **906.07.01.07.15.03      Holes Drilled Using Numerically Controlled Machines**

As an alternative to the shop trial assembly requirements of CSA-S6 when numerically controlled machines have prepared the boltholes, a check assembly consisting of the first components of each type of bolthole pattern to be made shall be undertaken to adequately demonstrate the accuracy of the drilling. If the check assembly is satisfactory, further assemblies of like components are not required. If the check assembly is unsatisfactory, the work shall be redone or repaired in a manner acceptable to the Contract Administrator.

##### **906.07.01.07.15.04      Inspection**

Inspection shall be according to CSA-S6 as required.

**906.07.01.07.16            Tolerances**

**906.07.01.07.16.01        Dimensional and Workmanship Tolerances**

Dimensional and workmanship tolerances shall be according to CSA W59 and Clause A10.1.7 of CSA-S6.

**906.07.02                    Delivery**

A delivery schedule shall be provided to the Contract Administrator not less than five Days prior to shipping.

Delivery shall include loading of the members, transportation, unloading, storage at the storage site and temporary works for access.

Structural steel shall be loaded for shipping in such a manner that it can be transported and unloaded at its destination without being excessively stressed, deformed, or otherwise damaged.

Plate girders shall be transported with their webs in a vertical plane. When girders cannot be shipped with their webs in the vertical plane, static and dynamic forces during handling, transportation, and storage shall be determined using a dynamic load allowance of 100%. Computed stresses shall be according to CSA-S6, Clause 10.10 and the maximum cyclic stress range shall not exceed the constant amplitude fatigue threshold for the appropriate fatigue categories specified in CSA-S6, Table 10.4. All the calculations and associated sketches, including reasons why the girders cannot be shipped with the webs in the vertical plane, shall be submitted by the Contractor to the Contract Administrator for approval seven Days prior to shipping. The calculations and sketches shall be sealed and signed by an Engineer.

Structural steel, when stored, shall be stored in a manner to avoid excessive stress deformation or other damage.

Advertising by means of removable signing is permitted on elements only while in transit to the specified site. Any permanent markings on a surface that would be visible after installation shall not be permitted.

**906.07.03                    Erection**

**906.07.03.01                General**

The Contract Administrator shall be notified in writing of the starting erection date at least 14 Days prior to the commencement of field operations.

Erection shall be according to CSA-S6, Clause A10.1.10. Additional permanent material may be provided to ensure that the member capacities are not exceeded during erection, if approved by the Contract Administrator. The additional material shall be shown in the erection diagram.

Repairs to erected material shall only be permitted after the Contract Administrator has approved the repair procedure.

Welding shall not be used to fill misplaced holes.

Hammering that can damage or distort the members is not permitted.

**906.07.03.02                Falsework**

Falsework shall be according to OPSS 919.

### **906.07.03.03 Connections**

Holes made in the field shall be drilled or sub-drilled and reamed.

Any error that prevents the proper assembly and fitting of parts shall be reported and the proposed method of correction shall be submitted to the Contract Administrator. Corrective measures shall not commence until the submitted proposal is accepted.

Bolt heads shall be located on the outside faces of the exterior girders.

Bolt heads in field splices for box girders shall be located on the exterior surfaces.

### **906.07.03.04 Maintaining Alignment and Camber**

The bridge shall be erected to the alignment and elevations specified in the Contract Documents.

### **906.07.03.05 Bearings**

The installation of bearings shall be according to OPSS 922.

### **906.07.03.06 Coatings**

Coating of new structural steel shall be according to OPSS 911.

## **906.07.04 Quality Control**

### **906.07.04.01 General**

Quality control shall be according to CSA-S6, Clause A10.1.8. The acceptance standards of CSA W59 for dynamically loaded structures shall also apply.

In addition to quality control measures instituted by the Contractor, the Contractor shall be responsible for the quality control procedures specified herein.

### **906.07.04.02 Control of Material**

A record for each component shall be kept identifying the material as to heat number, corresponding mill test certificate, and colour coding or other identification markings.

### **906.07.04.03 Visual Inspection**

The Contractor's inspector shall carry out full visual inspection.

### **906.07.04.04 Non-Destructive Testing**

#### **906.07.04.04.01 General**

An independent testing organization shall carry out all non-destructive testing of the welds for bridge structures by using radiographic, ultrasonic, magnetic particle, and liquid penetrant test methods as applicable.

A non-destructive testing technician shall do the testing.

Neither the technician nor the independent testing organization shall be changed without the approval of the Contract Administrator.

#### **906.07.04.04.02 Notification of Testing**

The independent testing organization shall be given at least five Days notice of when the work is ready for testing. Such notice shall include the type and quantity of work to be tested.

#### **906.07.04.04.03 Testing of Welds**

Radiographic, ultrasonic, or magnetic particle testing shall be carried out using procedures according to CSA W59.

The amount and location of welding to be tested shall not be less than:

- a) Visual inspection of all welds.
- b) Radiographic or ultrasonic inspection of groove welds in flanges and webs of built-up girders:
  - i. Flange splices in tension or stress reversal zones: 100% of all welds.
  - ii. Flange splices in compression zones: 100% of the weld of 1 in 4 splices.
  - iii. Web splices for 1/2 the depth from the tension flange: 100% of the weld length for each weld.
  - iv. Web splices for 1/2 the depth from the compression flange: 100% of the weld length of 1 in 4 splices.

If defects are found during testing of compression zones, two additional zones shall be tested for each zone exhibiting defects.

- c) Magnetic particle inspection of web-to-flange fillet welds:
  - i. Submerged-arc welds - 25% of length of each weld.
  - ii. Semi-automatic welds - 50% of length of each weld.
  - iii. Manual welds - 100% of length of each weld.
- d) Magnetic particle inspection of fillet welds in connection plates and stiffeners to which diaphragms or cross bracing are attached:
  - i. For 1/2 the depth from the tension flange: 100% of weld length of each weld.
  - ii. Transverse welds on tension flanges: 100% of weld length of each weld.
- e) Arc strikes shall be lightly ground and checked for cracks by magnetic particle inspection.

Radiographic and ultrasonic testing shall be performed prior to the assembly of the flanges to the webs.

#### **906.07.05 Repair of Welds**

Any section of weld that does not meet the acceptance standards shall be removed, re-welded, and re-examined.

#### **906.07.06 Inspection Reports**

Inspection reports shall be sealed and signed by an Engineer.

Inspection reports shall be made available to the Owner's inspector upon request. Copies of all inspection reports shall be submitted to the Contract Administrator within seven Days of inspection.

#### **906.07.07                      Erected Girder Elevations**

The top of flange elevations and top of splice plate elevations specified in the Contract Documents shall be checked and recorded and shall be submitted to the Contract Administrator within seven Days.

#### **906.07.08                      Inspection after Installation of the Structural Steel**

A Request to Proceed shall be submitted to the Contract Administrator after the installation of the structural steel.

The next operation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **906.07.09                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **906.08                              QUALITY ASSURANCE**

#### **906.08.01                      General**

Visual inspection, non-destructive testing, and sampling shall be done in the fabrication shop and in the field by an Owner's inspector to confirm the material supplied, fabrication, and erection has been done as specified in the Contract Documents.

Electric power, scaffolding, protection from the weather, and free access for inspection and testing of material, to all aspects of the fabrication, delivery, and erection of the structural steel shall be supplied.

### **906.10                              BASIS OF PAYMENT**

#### **906.10.01                      Fabrication of Structural Steel - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

Structural steel that is stored at the fabricator's premises or some other location away from the Working Area shall be paid for when the Contractor obtains a lease from the property owner that names the Owner as the tenant. The Owner shall provide the form of lease for this purpose that specifies payment of \$10.00 for the term of the lease. The Contractor shall retain full responsibility for the members.

#### **906.10.02                      Delivery of Structural Steel - Item Erection of Structural Steel - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

#### **906.10.03                      Shop and Field Inspection and Testing**

The supply of electric power, scaffolding, protection from the weather, and access for material testing and inspection shall be the Contractor's responsibility at no extra cost to the Owner.

#### **906.10.04                      Bearings**

Payment for the supply and installation of bearings shall be according to OPSS 922.

When the Contract does not contain a separate item for bearings and bearings are not paid as part of any concrete tender item according to OPSS 904, the Contract price for the erection of structural steel shall include full compensation for all labour, Equipment, and Material to supply and install the bearings.

## 908.03

### DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Anchorage Assembly** means an assembly of metal plates, rods/bolts, nuts and washers installed with posts to anchor metal railing/inspector guard system into concrete.

**Barrier Wall Railing** means a metal railing that is anchored to the top of a concrete barrier wall and is part of a barrier system that has undergone the barrier appraisal requirements of CSA-S6.

**Bicycle Railing** means an all-metal barrier system mounted on a structure that is designed to meet the bicycle barrier requirements of CSA-S6.

**Combination Railing** means a metal railing that is fastened to concrete barrier designed to meet the combination barrier requirements of CSA-S6.

**Inspector Guard** means metal safety guard anchored to the concrete abutment seat, walls or RSS coping to protect the inspector from a fall during inspection and has been designed to meet the Ontario Building Code requirements.

**Metal Railing** is a generic term used for metal part of parapet wall, barrier wall, pedestrian, bicycle, or combination railing.

**Parapet Wall Railing** means a metal railing that is fastened to the top of a concrete parapet wall and is part of a traffic barrier system that has undergone the barrier appraisal requirements of CSA-S6.

**Pedestrian Railing** means an all-metal railing system mounted on a structure that is designed to meet the pedestrian barrier requirements of CSA-S6.

## 908.04

### DESIGN AND SUBMISSION REQUIREMENTS

#### 908.04.01

#### Submission Requirements

##### 908.04.01.01

##### General

Three sets of Working Drawings shall be submitted to the Contract Administrator, prior to commencement of fabrication of the metal railing and/or inspector guard, for information purposes only. Prior to a submission, an Engineer's seal and signature shall be affixed on the Working Drawings verifying that the drawings are as specified in the Contract Documents.

When multi-discipline engineering work is depicted on the same Working Drawing and a single Engineer is unable to seal and sign the Working Drawing for all aspects of the work, the drawing shall be sealed and signed by as many additional Engineers as necessary.

The manufacturer shall not commence fabrication of the metal railing or the inspector guard until receiving a sealed and signed copy of the Working Drawings. A copy of these drawings shall be retained at the manufacturing plant during the fabrication.

A sealed and signed copy of the metal railing and/or inspector guard Working Drawings shall be at the site prior to and during installation of the metal railing and/or inspector guard.

#### **908.04.01.02                    Inspection after the Fabrication of Metal Railing and Inspector Guard**

A Manufacturer's Certificate of Conformance and a Request to Proceed for each individual shipment shall be submitted to the Contract Administrator upon completion of fabrication of the metal railing and inspector guard and prior to shipping from the plant.

The metal railing and inspector guard for each individual shipment shall not be delivered from the plant until the Contract Administrator has received the Manufacturer's Certificate of Conformance, Request to Proceed, and issued a Notice to Proceed.

#### **908.04.01.03                    Mill Test Certificates**

Mill test certificates shall be submitted according to OPSS 906.

#### **908.04.01.04                    Test Reports for Fasteners and Anchorages**

Test reports demonstrating that the bolts, anchorages, nuts, and washers meet the chemical composition, mechanical properties, dimensions, workmanship, and head burst as specified in the Contract Documents shall be submitted to the Contract Administrator. Verification of the acceptability of assemblage of zinc-coated bolts, anchors, nuts, and washers delivered to the job site shall be submitted to the Contract Administrator.

For bolts, anchors, nuts, and washers supplied from a manufacturer outside of Canada or the United States of America, the above information shall be verified by testing at a Canadian laboratory according to the Mill Test Certificates clause of OPSS 906.

### **908.05                                MATERIALS**

#### **908.05.01                         Metal Railings**

##### **908.05.01.01                    Steel Railing and Steel Posts**

Steel shall be according to CSA G40.20/G40.21.

Rails and posts shall be Grade 350W or 350WT as specified in the Contract Documents.

Steel plate shall be Grade 300W or 350W as specified in the Contract Documents.

Galvanized bolts and nuts shall be according to ASTM A307 or ASTM F3125/F3125M, Grade A325 as specified in the Contract Documents.

Studs shall be according to ASTM A108. Lock nuts shall be according to ASTM A563. Washers shall be according to ASTM F844.

Cast steel posts shall be according to ASTM A27, Grade 65-35.

Paint shall be as specified in the Contract Documents.

##### **908.05.01.02                    Aluminum Railing and Aluminum Posts**

Extruded aluminum tubing shall be 6061-T6 or 6351-T6 alloy according to ASTM B221M.

Aluminum sheet and plate shall be 6061-T6 alloy according to ASTM B209M.

Cast Posts shall be A444.0-T4 heat-treated according to ASTM B108. Extruded posts shall be 6061-T6 or 6351-T6.

**908.05.01.03                      Stainless Steel Fasteners**

Bolts shall be according to ASTM F593, Type 304 or 316 stainless steel with matching nuts according to ASTM F594 and matching washers. Set screws shall be according to ASTM F880M, Type 304 or 316 stainless steel.

**908.05.01.04                      Galvanized Hardware**

L-bolt assemblies shall be according to ASTM A307 and include hex nuts, flat washers, and lock washers. The assemblies shall be galvanized according to ASTM A153/A153M.

**908.05.02                          Inspector Guard**

Steel railing and posts shall be according to ASTM A500 Grade C, or CSA G40.20/G40.21 Grade 300W.

Steel plate shall be Grade 300W as specified in the Contract Documents.

Galvanized bolts and nuts shall be as specified in the Contract Documents.

Lock nuts shall be according to ASTM A563. Washers shall be according to ASTM F844.

Coating shall be as specified in the Contract Documents.

**908.05.03                          Anchorage Assembly**

Anchorage assemblies shall be as specified in the Contract Documents.

The anchorage assembly shall be supplied with the bolts installed in a template.

**908.05.04                          Grout**

Grout shall be non-staining, non-shrink cement based grout or non-staining, non-shrink epoxy based grout, and as specified in the Contract Documents.

**908.05.05                          Hot Dip Galvanizing**

Purity of the zinc and the galvanizing bath composition for hot dip galvanizing of steel railing and Inspector Guard components shall be according to ASTM A123/A123M.

**908.05.06                          Zinc-Rich Touch-Up Paint**

Zinc-rich touch-up paint shall be according to the ministry's DSM.

**908.05.07                          Thermal Sprayed Metal Coatings**

Thermal sprayed metal coatings shall be according to SSPC-CS 23.00 / AWS C2.23M / NACE No.12. The metallizing wire for thermal metal spray coatings shall be an alloy consisting of 85% zinc and 15% aluminum.

**908.05.08                          Zinc-Tin-Copper Solder**

The zinc-tin-copper solder shall be 50% zinc, 49% tin, and 1% copper used with the manufacturer's recommended flux.

**908.07 CONSTRUCTION**

**908.07.01 Fabrication of Metal Railings and Inspector Guard**

**908.07.01.01 General**

The railing system and inspector guard components shall be fabricated as specified in the Working Drawings. Field modification shall only be done when approved by the Contract Administrator.

The fabricator shall be certified according to CSA W47.1, Division 1 or Division 2 for steel railings or CSA W47.2, Division 1 or Division 2 for aluminum railings.

**908.07.01.02 Steel Components**

**908.07.01.02.01 Fabrication**

**908.07.01.02.01.01 General**

Fabrication and welding shall be according to OPSS 906 and CSA W59. All welding inspection shall be according to CSA W59.

All flame cut edges shall be as smooth and regular as those produced by edge planing and shall be free of slag.

**908.07.01.02.02 Surface Preparation for Hot Dip Galvanizing**

The metal railing and inspector guard components shall be cleaned according to OPSS 911 prior to galvanizing.

**908.07.01.02.03 Hot Dip Galvanizing**

Hot dipped galvanizing of steel railing and inspector guard components shall be according to OPSS 911.

**908.07.01.02.04 Zinc and Zinc-Nickel Plating**

Setscrews shall have zinc-nickel plating applied to a thickness of 10 µm. The plating shall show no red rust after 1,000-hour exposure to salt spray according to ASTM B117.

Lock nuts shall be zinc plated according to ASTM B695.

**908.07.01.02.05 Paint Coating of Galvanized Surfaces**

When specified, paint coating of galvanized surfaces shall be according to OPSS 911.

**908.07.01.02.06 Repair of Damage to Galvanized Coating**

When the galvanized surface of a steel railing or inspector guard component is damaged or uncoated, the exposed steel shall be repaired if the cumulative total of the damaged and uncoated areas does not exceed 2% of the total area of each component or 0.02 m<sup>2</sup>, whichever is less. Where the cumulative area exceeds these amounts, the damaged coating shall be stripped and the component re-galvanized according to ASTM A123/A123M.

Damaged and uncoated areas shall be cleaned of all rust and other contaminants and repaired using one of the following methods:

a) Soldering method using zinc-tin-copper solder

The surface preparation and application of flux and zinc-tin-copper solder shall be according to ASTM A780/A780M and the manufacturer's recommendations. The finished thickness of the metal coating in the repaired area shall be a minimum of 90 µm. The repaired surface shall be ground flush with the surrounding galvanized coating.

b) Thermal Metal Spraying

The surface preparation and application of thermal spray metal coating or metallizing shall be done according to SSPC-CS 23.00/AWS C2.23M/NACE No. 12 to provide a minimum thickness of 200 µm, applied in two separate coats.

The metal coating on the repaired areas shall have a minimum adhesion of 2.8 MPa, when tested according to ASTM D4541.

c) Zinc-Rich Touch-Up Paint

This method of repair of galvanized coating is permitted when:

- i. The individual damaged and uncoated area is less than 625 mm<sup>2</sup>, and
- ii. The number of repair spots does not exceed 6 per each 12 m section of galvanized rail bar or inspector guard. The number of repair spots in each galvanized rail post shall be limited to a maximum of 2.

Two coats of one of the approved zinc-rich touch-up paint shall be brush applied after the surface preparation according to ASTM A780/A780M.

**908.07.01.03 Aluminum Components**

**908.07.01.03.01 Fabrication**

**908.07.01.03.01.01 General**

Welding of aluminum shall be permitted only where specified in the Working Drawings.

Fabrication and welding shall be according to CSA W59.2. All welding inspection shall be according to CSA W59.2.

Aluminum railings and posts shall be thoroughly cleaned of all discolorations by approved methods and all marks and scratches shall be removed. The railings, when erected, shall have a clean degreased aluminum surface of uniform appearance and texture.

Railing components shall be joined by riveting, bolting, expanding, or welding as specified in the Working Drawings. Special aluminum alloy fasteners shall only be used with written approval from the Contract Administrator.

When tubular balusters are fastened to the horizontal rails by expanding the tubes, the holes drilled into the rail shall not be more than 1 mm greater than the nominal diameter of the baluster tube. A standard self-feeding tapered roll expander shall be used to expand the balusters to allow for a tight fit in all rails.

Sheet or plate material may be sheared, sawn, or cut with a router; however, sheet or plate materials more than 10 mm thick shall only be sawn or routed. Cut edges shall be true and smooth, free from excessive burrs and ragged edges.

Re-entrant cuts shall only be used when unavoidable and, when they are used, a fillet shall be provided by drilling prior to cutting.

Aluminum alloys shall not be flame cut.

Boltholes in 10 mm or thinner material may be drilled or punched to finished size. In material thicker than 10 mm, the holes shall be drilled to finished size or sub-punched smaller than the nominal diameter of the fastener and reamed to size.

During fit-up, holes shall not be drifted in such a manner as to distort the metal, but holes misaligned less than 2 mm may be reamed to render a reasonable fit.

The shank of bolts shall be long enough to provide full bearing in the connection and, where the shank extends beyond the surface being clamped, washers shall be used under the nuts to ensure proper clamping.

#### **908.07.01.03.02            Contact Surfaces**

Where aluminum would otherwise come in contact with other metal surfaces, the contacting surfaces shall be separated from each other by use of a synthetic rubber or neoprene gasket. The single rail and double rail galvanized steel railings mounted on aluminum casting posts on top of a barrier wall or parapet wall are exempt from these requirements.

Where aluminum would otherwise come in contact with concrete, wood, or masonry, the contact surfaces shall be separated by means of a synthetic rubber or neoprene gasket or the aluminum surface shall be given a heavy coat of alkali-resistant bituminous paint prior to installation. The paint shall be applied as it is received from the manufacturer without the addition of thinner.

#### **908.07.02                    Anchorages**

##### **908.07.02.01                General**

Anchorage assemblies shall be installed as specified in the Contract Documents.

##### **908.07.02.02                Anchorages Installed Before Concrete Placement**

When specified in the Contract Documents, anchorage components shall be installed prior to placing concrete and shall be securely tied to reinforcing steel. Anchorage assemblies shall be positioned with templates and installed securely in the formwork to maintain the position of the anchors during placement of concrete.

##### **908.07.02.03                Anchorages Installed After Concrete Placement**

When specified in the Contract Documents, anchorages shall be installed after concrete placement. Holes shall be core drilled, anchoring grout placed, and anchors properly positioned at locations as specified in the Contract Documents. The placement of the anchoring agent and the anchors shall be according to the manufacturer's recommendations, except as modified in this clause. The holes shall be free of dust and debris immediately prior to placement of the anchoring agent. When the anchoring agent fails to fill the hole after insertion of the anchor, additional anchoring agent shall be immediately added to fill the hole.

When a cement based grout is used as the anchoring agent, the holes shall be pre-dampened for a period of one hour and any free water shall be removed prior to the application of the cement based grout.

When an epoxy grout is specified as the anchoring agent, the inside surface of the holes shall be roughened and dry prior to the application of the epoxy grout.

Where anchors are inserted into horizontal or inclined holes in a vertical face, the anchors shall be maintained in position during the setting of the anchoring agent. Loss of anchoring agent from the holes shall be prevented.

#### **908.07.02.04                    Anchorages Installed in Timber**

Holes for bolts shall be drilled with a bit 1.5 mm larger in diameter than the bolt. The diameter of the recessed holes for the bolt heads shall be no greater than 10 mm larger than the width of the bolt head.

Where oil treatment has been used on the wooden curbing, the cut surfaces of the wood shall be given three coats of creosote oil. Each coat shall be allowed to dry before the next coat is applied.

Repairs to cuts in material treated with water-borne preservatives shall be according to CSA O80 Series.

#### **908.07.03                    Installation of Metal Railings and Inspector Guard**

##### **908.07.03.01                    General**

Metal railing and inspector guard shall be installed according to the Working Drawings.

Metal railing and inspector guard components shall be protected from damage and distortion during hot dip galvanizing, handling, transportation, storage, and installation.

Bedding grout shall not be used. Epoxy grout may be placed under post bases, as necessary, to fill the voids. The epoxy grout shall not have a thickness exceeding 3 mm. The surface preparation, mixing, installation, and curing time for the epoxy grout shall be according to the manufacturer's recommendations.

The work shall include installation of the anchorage assemblies installed after concrete placement or installed in wood.

##### **908.07.03.02                    Alignment**

The metal railing and inspector guard shall be installed to the elevations and alignments as specified in the Contract Documents within a tolerance of  $\pm 6$  mm and with no kinks or other visible breaks in alignment throughout the length of the installation.

#### **908.07.04                    Quality Control**

##### **908.07.04.01                    Inspection After Preparation of the Anchorages**

A Request to Proceed shall be submitted to the Contract Administrator upon preparation of the anchorages and prior to the installation of the metal railing or inspector guard.

The installation of the metal railing or inspector guard shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

##### **908.07.04.02                    Inspection After Installation of the Metal Railing or Inspector Guard**

An inspection after installation shall be performed of the metal railing and/or inspector guard to ensure all the requirements are met as specified in the Working Drawings. The alignment of the metal railing or inspector guard shall remain within the tolerance limits after installation.

#### **908.07.05                    Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**908.08                      QUALITY ASSURANCE**

**908.08.01                  General**

Access shall be provided to the Owner to do inspection, testing, and sampling in the fabricating shop and field if requested to confirm that the materials supplied, the fabrication, and the installation have been completed as specified in the Contract Documents and Working Drawings.

**908.09                      MEASUREMENT FOR PAYMENT**

**908.09.01                  Actual Measurement**

**908.09.01.01              Barrier Wall Railing  
Parapet Wall Railing  
Pedestrian Railing  
Bicycle Railing  
Combination Railing  
Inspector Guard**

Measurement of metal railings and inspector guard shall be by length in metres from end to end of the railing/inspector guard.

**908.09.02                  Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**908.10                      BASIS OF PAYMENT**

**908.10.01                  Barrier Wall Railing - Item  
Parapet Wall Railing - Item  
Pedestrian Railing - Item  
Bicycle Railing - Item  
Combination Railing - Item  
Inspector Guard - Item**

Payment at the Contract price for the above tender items shall be full compensation for labour, Equipment, and Material to do the work.

This specification covers the construction requirements for fabrication, delivery, and installation of precast prestressed concrete girders with steel reinforcement.

#### **909.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **909.01.02 Appendices Significance and Use**

Appendices are not for use in provincial Contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner.

Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their Contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **909.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### 909.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Bed** means the assembly consisting of platform, forms and end blocks in which the girders are cast.

**Bughole** means a small regular or irregular cavity resulting from entrapment of air bubbles in the surface of formed concrete during placement and consolidation.

**Cold Joint** means a joint or discontinuity resulting from a delay in placement of sufficient duration to preclude intermingling and bonding of the concrete.

**Cold Weather** means when the air temperature to which the girder is exposed is at or below 5 °C, or when the air temperature to which the girder is exposed is at or is likely to fall below 5 °C within 96 hours after completion of concrete placement. Temperature refers to shade temperature.

**Design Proposal** means a submission of proposed changes, when engineering design is required.

**Laitance** means a layer of weak and nondurable material on the surface of the concrete containing cement and fines from aggregates, brought by bleeding water to the top surface concrete.

**Lot** means all girders produced during a one-week period (seven consecutive days); or, if more than 4 girders are produced in seven consecutive days, a lot means every 4 girders produced consecutively. Girders of the same lot shall be manufactured by the same supplier, made from the same concrete mix design, for the same ministry Contract, and be of the same cross-section and type of precast concrete girder.

**Girder Type** means a girder differentiated by its cross-section shape such as box girder type (solid or voided), I-girder type (such as Nebraska University (NU) and Canadian Precast Prestressed Concrete Institute (CPCI)), or T-girder type.

**Indoor Precast Concrete Plant** means a building, which is a permanent structure, providing protection from sun, wind, and rain and which is temperature controlled, such that the temperature does not fall below 15 °C or exceed 30 °C.

**Post-Tensioning** means a method of prestressing in which tendons are tensioned after the concrete has reached a predetermined strength.

**Pour Line** means a visible delineation between two placements of concrete where the concrete from each placement is well-bonded to the other.

**Precaster** means the party who produces the girders.

**Prestressed Concrete** means reinforced concrete in which internal stresses have been initially introduced so that subsequent stresses resulting from dead load and superimposed loads are counteracted to a desired degree. This may be accomplished by pretensioning or post-tensioning.

**Pretensioning** means a method of prestressing in which strands are tensioned before the concrete is placed.

**Repair Proposal** means a submission when repairs to the girders are required.

**Strand** means a group of wires laid helically over a central core-wire.

**Sweep** means the lateral deviation from straightness of a girder with respect to its design centre line.

**Tendon** means a high strength steel element consisting of one or more wires, strands or bars; used to impart prestress to the concrete.

## **909.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **909.04.01 Design Requirements**

#### **909.04.01.01 General**

The design shall be according to CAN/CSA S6 and the Structural Manual.

## **909.04.01.02 Permissible Changes from the Contract Drawings**

### **909.04.01.02.01 General**

Changes from the Contract Drawings are permitted and may be implemented by the precaster, without prior approval from the Owner, provided they meet the requirements of this specification.

### **909.04.01.02.02 Prestressing of Girders**

The prestressing strand pattern may be adjusted to suit production requirements provided all changes meet the original design strength without adversely affecting other components of the structure. If the centre of gravity of the strands at the interior hold down closest to mid-span is within  $\pm 10$  mm of the original design, then one or more of the following adjustments shall be permitted provided that both the serviceability and ultimate limit states capacities are not adversely affected:

- a) Provide additional strands with a lower jacking stress provided the total prestress force is within  $\pm 2\%$  of the original design.
- b) Use of imperial strand spacing in lieu of metric, where 25 mm = 1" and 50 mm = 2".
- c) Addition of one hold-down per end is added towards the girder end at the same spacing as the original design.
- d) One less hold-down per end when the hold-down closest to mid-span is deleted.
- e) Increase or decrease the number of strands in each hold-down group.
- f) Increase of vertical strand spacing between hold-down points from 25 mm up to 50 mm.

### **909.04.01.02.03 Reinforcing of Girders**

The stirrup projection may be adjusted from that shown on the original design, based on details such as the predicted camber, provided it meets the deck embedment range indicated elsewhere in the Contract Documents.

Spacing of stirrups around blockouts for diaphragms may be adjusted, provided the minimum spacing requirements of CAN/CSA S6 are satisfied, and up to two stirrups may be added in order to maintain the total reinforcement requirements.

### **909.04.01.02.04 Other Design Details**

Details limited to those below may be adjusted to suit production requirements, provided all changes meet the original design without adversely affecting other components of the structure:

- a) Dowel holes and inserts may be adjusted vertically within  $\pm 75$  mm from the location shown on the original design to avoid any conflict with strands.
- b) Undercut dimensions may be adjusted to accommodate the predicted camber.
- c) Additional pockets and hardware for temporary bracing may be added.
- d) Additional temporary post-tensioning or pre-tensioning for shipping and handling may be added provided they do not adversely affect the girders at any stage.

The production length of the girder may be adjusted to account for elastic shortening.

### **909.04.01.03 Temporary Bracing**

Temporary bracing shall be installed at all substructure locations for I-girders at the time of installation to maintain stability.

Temporary bracing for girders shall be designed according to CAN/CSA S6 using a wind load specific for the location and having a return period of 10 years if the girders are to be permanently connected within the same construction season. If the girders are not to be permanently connected within the same construction season, subject to the Owner's approval, the return period to be used in the design shall be 25 years.

In no case shall temporary bracing be less than the minimum requirements specified in the Contract Documents.

### **909.04.02 Submission Requirements**

#### **909.04.02.01 Working Drawings**

Three sets of fabrication Working Drawings, including supporting documentation, shall be submitted to the Contract Administrator at least 7 Days prior to commencement of fabrication of the girders, for information purposes only. Prior to making a submission, the design Engineer and the design-checking Engineer shall affix their seals and signatures on the Working Drawings verifying that the drawings are consistent with the Contract Documents.

When other authorities are involved in the approval of the design or construction of a highway structure, the fabrication Working Drawings submission shall be at least 5 weeks prior to commencement of the work and one additional copy of the submission shall be provided for each authority. The requirements of each authority and the requirements of the Owner as specified in the Contract Documents shall be satisfied prior to commencement of the work.

The Working Drawings shall include the following information:

- a) Girder details.
- b) Prestressing reinforcing steel size, grade, location, and jacking force as required by the design.
- c) Hold-down locations and forces.
- d) Reinforcing steel schedules.
- e) Lifting point locations.
- f) Details and location of all temporary supports.
- g) Strand release sequence.
- h) Any changes to the Contract Drawings made according to the Permissible Changes from the Contract Drawings clause.
- i) All other applicable details.

The supporting documents shall include the following information:

- j) A letter signed and sealed by an Engineer listing all permitted changes made along with supporting calculations. The letter shall state that the changes have not adversely affected the girder capacities.

- k) Handling and installation procedures, including calculations and lifting point locations.
- l) Details of bracing installed to provide adequate support and stability to the girder during construction.

#### **909.04.02.02 Concrete Mix Design**

The Contractor shall be responsible for the concrete mix design and shall submit the concrete mix design to the Contract Administrator according to the Mix Design clause of OPSS 1350.

#### **909.04.02.03 Concrete Plant Certification**

The certificate verifying compliance of the plant with the certification requirements of the Canadian Standards Association (CSA) or CPCI, under the category Group B, Bridges as either subcategory B4 (Prestressed Deflected Strand Bridge Members) or subcategory B3 (Prestressed Straight Strand Bridge Members), as required for the work, shall be submitted to the Contract Administrator with the concrete mix design submission.

Copies of precast plant certification audit reports of CPCI or CSA, or both as applicable, and related documentation shall be submitted to the Owner upon request.

Documentation verifying certification of the concrete production facility by the Ready Mixed Concrete Association of Ontario shall be submitted when concrete is supplied by a ready-mixed concrete supplier.

#### **909.04.02.04 Control of Concrete Temperature**

One week prior to the commencement of fabricating the girders, a description of the method for monitoring and effectively controlling the temperature of the concrete shall be submitted to the Contract Administrator, for information purposes only. The description shall include the method of controlling the concrete temperature during the curing and protection period.

#### **909.04.02.05 Precast Report**

A precast report shall be submitted to the Contract Administrator for each shipment of girders, prior to shipping the girders. The report shall contain the following information:

- a) List of girders in the shipment, including their ID number, lot number, and description.
- b) The mill certificates for the strands, along with the elongation calculations based on the actual material properties specified in the mill certificate of the strands used in the work.
- c) Record of the jacking force, elongations, and corrections.
- d) Temperature records for formwork and steel at the time of concrete placement.
- e) Temperature control records, including location of thermocouple wires.
- f) Record of inspection of moist curing.
- g) Summary of material test results for plastic concrete: air content, slump, and concrete temperature.
- h) Summary of material test results for hardened concrete: transfer strength, confirmation of the projected 28-Day compressive strength. If test results are not available at the time of shipping, they may be submitted within 4 Business Days following completion of testing.
- i) Summary of all measurements and inspections required by this specification, including the concrete cover, crack measurement summary, tolerances, and surveys for geometric control.

- j) Documentation confirming that all repairable defects have been identified, evaluated, and repaired as detailed in the Repair of Defects and Deficiencies Repairable by Standard Methods clause.
- k) A letter from the Quality Verification Engineer (QVE), giving the Contractor permission to proceed with the work. The letter shall state that the QVE has conducted an interim inspection and verified that the fabrication of girders and required testing have been carried out in general conformance with the sealed and signed Working Drawings, supporting documents, and Contract Documents.
- l) When steam curing is used, test results indicating that time of initial set was determined, unless standard delay periods are used, according to the Steam Curing and Other Application of Heat clause.

#### **909.04.02.06                      Design Proposals**

Five copies of the design proposal shall be submitted to the Contract Administrator for acceptance. The design proposals shall bear the seal and signature of the design Engineer and the design checking Engineer. The Contractor shall not proceed with the proposed changes until the design proposal has been accepted by the Contract Administrator.

The Contract Administrator shall provide a response within 10 Business Days of receiving the proposal.

### **909.05                                      MATERIALS**

#### **909.05.01                                  Bearing Plate**

The bearing plate shall be according to CSA G40.20/G40.21, Grade 300W or greater.

Anchor studs shall be a headed type and be according to CSA W59 and shall be welded to the bearing plates prior to galvanizing.

All surfaces shall be hot dipped galvanized according to ASTM A153 or shall be zinc metallized according to CSA G189.

#### **909.05.02                                  Burlap**

Burlap shall be according to AASHTO M182, Class 4, and shall be free from substances that are deleterious to concrete. The burlap shall have no tears or holes.

#### **909.05.03                                  Concrete**

Concrete materials shall be according to the Materials section of OPSS 1350 with the following additions and amendments:

- a) Compressive strength shall be as specified in the Contract Documents.
- b) The air void system in hardened concrete when tested according to LS-432 shall be:
  - i. Air Content: 3.0% minimum
  - ii. Spacing Factor: 0.200 mm maximum
- c) Rapid chloride permeability of concrete containing silica fume at 28 to 32 Days shall be equal to or less than 1,000 coulombs and rapid chloride permeability of all other concrete at 28 Days shall be equal to or less than 2,500 coulombs.

- d) Aggregates shall be according to OPSS 1002. The nominal maximum size of coarse aggregate shall be 19.0 mm, except when a smaller nominal size is required in order to meet the requirements of CAN/CSA S6.
- e) Slag aggregate shall not be used.
- f) Superplasticizer may be added to the mix at time of batching for all types of concrete.

When self-consolidating concrete (SCC) is proposed to be used, it shall be subject to Owner approval prior to use. Where accepted for use, SCC shall be according to the Owner's requirements for self-consolidating concrete. A copy of the non-standard Special Provision can be obtained from the Materials Engineering and Research Office, Concrete Section.

#### **909.05.04 Concrete Sealers**

Concrete sealers shall be from the Owner's list of acceptable sealers.

#### **909.05.05 Elastomeric Coating**

Elastomeric coating shall be according to OPSS 1213.

#### **909.05.06 Formwork**

Formwork shall be fabricated steel, except for box girders of non-standard width for which wood forms may be used. All formwork shall be according to OPSS 919 and CAN/CSA A23.4. Forms shall be fabricated to meet the dimensional tolerances and finishes specified in the Contract Documents.

#### **909.05.07 Hardware**

All hardware shall be non-corroding or be galvanized according to ASTM A153.

The hold down device may be black steel; however, the surfaces of the hold down device located within 40 mm of the concrete surface shall be chromate coated over an electrodeposited coating of zinc according to ASTM B 633.

#### **909.05.08 Moisture Vapour Barrier**

The moisture vapour barrier shall be a white opaque polyethylene film according to ASTM C171 and shall not be less than 100 µm thick.

#### **909.05.09 Post-Tensioning Material**

Post-tensioning material, including grout, shall be according to OPSS 910.

#### **909.05.10 Proprietary Patching Materials**

Proprietary patching materials shall be from the Owner's List of Concrete Patching Materials. The list of proprietary patching materials shall be obtained from the Contract Administrator.

#### **909.05.11 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

## **909.05.12 Water**

Water used for curing, fog-misting, and steam curing of concrete, including presoaking of material for moist curing, shall be according to OPSS 1302.

## **909.06 EQUIPMENT**

### **909.06.01 Chipping Hammers**

Chipping hammers shall have a maximum weight of 9.0 kg and a maximum piston stroke of 102 mm. All hammers shall have the manufacturer's name and model number engraved on them by the manufacturer. All information must be legible.

### **909.06.02 Pretensioning and Post-Tensioning**

Pretensioning equipment shall be according to CSA A23.4. Post-tensioning equipment shall be according to OPSS 910.

### **909.06.03 Thermocouples and Dataloggers**

Thermocouples and associated instrumentation shall have an accuracy of  $\pm 1.5$  °C, shall record temperatures at time intervals not exceeding 15 minutes and shall display the temperature.

## **909.07 CONSTRUCTION**

### **909.07.01 General**

The Contract Administrator shall be notified in writing at least 7 Days prior to commencement of fabrication.

Each girder shall be identified with a unique number and the date of casting within 24 hours of stripping forms. The information shall be marked on the girders and shall remain exposed and visible throughout the duration of construction. When the information is stencilled, indelible ink or paint shall be used.

### **909.07.02 Precast Plant Certification**

Girders shall be fabricated by a plant certified by CSA or by CPCI under the category Group B, Bridges, as either subcategory B4 (Prestressed Deflected Strand Bridge Members) or subcategory B3 (Prestressed Straight Strand Bridge Members), as required for the work.

### **909.07.03 Pretensioning**

Strands shall not be tensioned in the deflected position, unless the hold-down device used permits free movement of the strand and the use of the device has been tested by its manufacturer to ensure that the final stress along the full length of the strand is uniform.

#### **909.07.03.01 Strand Splicing**

Strands shall not be spliced within the concrete girder.

#### **909.07.04                      Welding**

Welding of steel hardware, including shear studs, shall be according to CSA W59 and shall be performed by a qualified welder working for a company certified by the Canadian Welding Bureau according to CSA W47.1.

Welding of reinforcing steel bars shall be according to CSA W186 and performed by a qualified welder working for a company certified by the Canadian Welding Bureau according to CSA W186.

Welding within 3 m of the prestressing steel is not permitted unless the prestressing steel is fully encased in concrete that has reached the transfer strength specified in the Contract Documents. Welding equipment shall not use any components of the prestressing system or any component in contact with the prestressing system as an electrical ground.

#### **909.07.05                      Steel Reinforcement**

The placement of steel reinforcement shall be according to OPSS 905, with the exception and/or addition of the placing tolerances listed below:

- a) Vertical position of prestressing strands: + 5/-10 mm
- b) Length of debond on prestressing strands:  $\pm 50$  mm
- c) Projection of positive moment connection reinforcing steel at girder ends:  $\pm 25$  mm
- d) Stirrup spacing:         $\pm 15$  mm when spacing is 100 mm or less  
                                  $\pm 25$  mm when spacing is greater than 100 mm  
                                  $\pm 30$  mm when spacing is 300 mm or greater

Under no circumstances shall reinforcement be inserted into plastic concrete.

#### **909.07.06                      Placing of Sheaths and Anchorages**

When girders are to be post-tensioned, the sheaths and anchorages shall be placed according to OPSS 905 except that the placing tolerances shall be  $\pm 5$  mm at splice points and  $\pm 10$  mm elsewhere.

#### **909.07.07                      Production of Concrete**

Production of concrete shall be according to the General, Temperature Control, Mixing Time and Mixing Rate, and Delivery sub-sections in OPSS 1350.

When there are multiple batches of concrete in a single ready-mix truck, hopper or other container, discharge times shall be measured from the time of introduction of water to cement for the first batch of concrete in the truck. Discharge of all concrete in the truck shall be completed within 1.5 hours, except when the air temperature exceeds 28 °C and the concrete temperature exceeds 25 °C, the discharge shall be completed within 1 hour.

#### **909.07.08                      Placing of Concrete**

##### **909.07.08.01                  General**

The method of transporting, placing, and consolidating the concrete shall be such as to prevent segregation.

Devices for placing and transporting concrete shall not be supported by the steel reinforcement.

Concrete shall be deposited within 0.5 m of the top of the reinforcement and 2.5 m horizontally of its final position.

Concrete shall be placed at a steady rate, such that a monolithic concrete is obtained without the formation of cold joints or pour lines.

When there is an interruption in placing concrete greater than 20 minutes, the top of the formwork shall be covered with wet burlap to maintain 100% relative humidity above the concrete. The Contract Administrator shall be notified of any interruption resulting in a cold joint. A proposal for remedial action shall be submitted to the Contract Administrator for approval by the Owner.

#### **909.07.08.02 Concrete Placing Restrictions**

All surfaces against which concrete is to be placed shall be free of standing water. Fresh concrete shall be protected from contact with rain or snow.

All debris shall be removed from the area where concrete is to be placed.

Ice and snow shall be removed from the area where concrete is to be placed. Deicing chemicals shall not be used. Any surface against which concrete is placed, including any existing concrete, steel reinforcement, structural steel, forms, or other surfaces shall be at a minimum temperature of 5 °C immediately prior to commencement of placing concrete.

The average temperature of the formwork, steel reinforcement or any other material against which concrete is to be placed shall not exceed 30.0°C, with no individual temperature exceeding 35.0 °C, and the maximum difference between the highest and lowest temperature measurement shall not exceed 10.0 °C. Average temperature shall be based on the average of a set of 10 temperature measurements, evenly spaced, along the formwork, steel reinforcement or other material against which concrete is to be placed. For formwork, five temperature measurements shall be made on each side of the formwork.

Temperature measurements shall be taken no more than 10 minutes prior to concrete placement, for each girder. Temperature measurements shall be made with a contact thermometer with an accuracy of  $\pm 1$  °C. Temperature measurements shall be recorded and included in the precast report.

#### **909.07.09 Consolidation**

Internal or external vibrators or both shall be used to thoroughly consolidate concrete, within 15 minutes of placing.

Concrete shall be thoroughly consolidated around all steel reinforcement.

Each layer of concrete shall be vibrated. Vibrators shall extend into the previous layer to produce a homogenous mixture at the layer interface and prevent the formation of pour lines or cold joints.

Vibration shall not be used to make the concrete flow or to spread the concrete more than 1.5 m from the point of deposit.

#### **909.07.10 Concrete Finishing**

The top surface of the girders, against which new concrete is to be placed, shall be intentionally roughened while the concrete is sufficiently plastic so that the depth of the indentations is at least 5 mm and the spacing is not greater than 15 mm.

All concrete surfaces against which new concrete is to be placed shall be clean, sound, and free from any loose particles and laitance.

The following surfaces shall be abrasive blast cleaned according to OPSS 929, prior to shipping the girders:

- a) Top portion of girders containing laitance.
- b) The portion of the sides and end of the girder against which new concrete is to be placed.

#### **909.07.11 Control of Temperature**

##### **909.07.11.01 General**

All necessary actions shall be taken to maintain temperatures within the specified limits. During the moist curing, moisture retention, and protection periods, the following temperature requirements shall be met:

- a) The concrete temperature shall not exceed 70.0 °C.
- b) The concrete temperature shall not fall below 10.0 °C before the concrete has reached 75% of the specified 28-Day compressive strength.
- c) The temperature difference, as measured between thermocouples at the following locations, shall not exceed 20 °C:
  - i) Internal concrete temperature and the corresponding surface concrete temperature.
  - ii) Internal concrete temperatures at different locations within the girder.
- d) The maximum cooling rate of concrete shall not exceed 15.0 °C per hour until the concrete is not more than 20.0 °C above the air temperature. Air temperature is temperature next to the concrete, within the curing enclosure.

##### **909.07.11.02 Temperature Monitoring and Records**

The concrete and air temperatures during the curing period and, if applicable, cold weather protection period shall be monitored and recorded. Thermocouples and dataloggers shall be used to measure and record temperatures for each girder produced.

Thermocouple wires shall be installed prior to placing concrete according to Table 3. Thermocouples for monitoring air temperature shall measure air temperature adjacent to the girder. Thermocouples used to monitor the surface concrete temperature shall be imbedded in the concrete within 5 mm of the surface. Thermocouples to monitor maximum internal temperature shall be placed at the locations where the concrete is expected to reach the highest temperature, according to Table 3.

Recording of concrete and air temperatures shall begin at the start of placement. The temperatures shall be recorded automatically at time intervals not exceeding 15 minutes until the end of the curing period and, if applicable, the end of the cold weather protection period. The dataloggers shall be left in place until the end of the monitoring period.

The Contract Administrator and any other Owner's representatives shall be provided access to verify temperature readings. If the datalogger does not have a digital display that allows the Contract Administrator to verify temperature, the Contractor shall provide the Contract Administrator with the necessary instruments to allow the Contract Administrator to verify thermocouple function and readings.

The temperature monitoring and recording system shall provide unalterable records of temperature during the recording period. Prior to use on the Contract, the temperature monitoring and recording system shall be confirmed, in writing, to be acceptable to the Owner.

A record of temperatures shall be prepared for each Day during the temperature monitoring period.

The record of temperatures, including a graphical plot of temperature versus time, shall be submitted to the Contract Administrator in the precast report. The format of the temperature plot shall be acceptable to the Owner.

## **909.07.12 Curing**

### **909.07.12.01 General**

Moist curing shall continue throughout the duration of the moist curing period. The moist curing period shall be 48 hours followed by a 48-hour moisture retention period, except for concrete containing silica fume which shall have a moist curing period of 7 Days.

Moist curing of exposed surfaces shall be applied within 2 to 4 m of concrete placement, except for girders produced in an indoor precast concrete plant and not containing silica fume; for such girders, exposed surfaces may be covered with moisture vapour barrier between concrete placement and concrete finishing, for the shortest practical time period and in no cases exceeding 40 minutes.

For all girders, after formwork is removed, formed surfaces shall be moist cured for the remainder of the 48-hour moist curing period, and no less than 24 hours.

### **909.07.12.02 Moist Curing**

Moist curing shall be sufficient to keep all surfaces of the precast girder in a continuously wet condition, with no dry areas, by applying one or a combination of the following methods:

- a) Curing with Burlap and Water
- b) Curing with Water Mist
- c) Steam Curing
- d) Immersion

Records of moist curing shall be maintained and submitted according to the Precast Report clause.

Girders whose surfaces have not been kept in a continuously wet condition shall be rejected and replaced; the Contractor may submit a proposal for remediation subject to the approval of the Owner.

### **909.07.12.02.01 Curing with Burlap and Water**

Burlap shall be pre-soaked by immersing it in water for a period of at least 24 hours immediately prior to placing. Two layers of burlap shall be applied to the surface of the concrete. Burlap strips shall overlap 150 mm.

The burlap shall be maintained in a continuously wet condition throughout the curing period by means of a soaker hose. The soaker hose shall be turned on as soon as possible, when running water will not cause damage to the concrete surface. The burlap shall be covered with a layer of moisture vapour barrier within 3 hours of placing of the concrete, in a manner that shall prevent deformation of the surface of the concrete.

Air flow in the space between the burlap and the girder shall be prevented.

Water shall not be allowed to drip, flow or puddle on the concrete surface until the concrete has hardened sufficiently to resist damage.

#### **909.07.12.02.02            Steam Curing and Other Application of Heat**

Application of steam may be used.

The girder shall be heated evenly. Steam, heat or forced air shall not be directed on the concrete, forms or reinforcing steel. There shall be free circulation of steam, heat and forced air around the top, sides, and ends of the girder. Concrete surfaces shall not be exposed to combustion gases during the curing cycle.

There shall be a delay period prior to application of steam or heat above 30 °C, as follows:

- a) Delay period of four hours after completion of concrete placement if the mix does not contain a retarder.
- b) Delay period of six hours after completion of concrete placement if the mix contains a retarder.

A shorter delay period may be used if it has been demonstrated to the satisfaction of the Owner that initial set occurs earlier. Time of initial set shall be demonstrated by testing according to ASTM C403, using the same mix design, mixing equipment, concrete temperature, and ambient temperature as when producing the girders. Time of initial set testing shall be done in the presence of the Contract Administrator or the Owner's representative. Time of initial set testing shall be done before production. Demonstration of the time of initial set according to ASTM C403 may be required up to two times per year, upon request by the Contract Administrator.

#### **909.07.12.03            Moisture Retention**

After completion of the moist curing period, girder surfaces shall be completely covered by moisture vapour barrier to protect girders from moisture loss for a period of 48 hours.

Alternatively, moist curing methods may be continued during this period.

#### **909.07.13            Cold Weather Protection Period**

If cold weather conditions are present at the end of the curing period and moisture retention period, the girders shall be provided with protection from cold weather and moisture loss for an additional 24 hours, prior to exposure to cold weather conditions. Protection shall be extended beyond 24 hours if required to meet the requirements in the Control of Temperature subsection.

#### **909.07.14            Exposure**

During moist curing, moisture retention and cold weather protection periods, the girder may be exposed for a maximum total period of 1 hour per day for the purposes of formwork removal, release of strands at transfer strength, removal from the bed, filling of bug holes, inspection or relocation within the plant, except for indoor precast concrete plants, where the exposure period shall not exceed 2 hours per day.

During the exposure period:

- a) The requirements in the Control of Temperature subsection do not apply.
- b) There shall be no more than 3 consecutive thermocouple measurements of surface temperature below 10 °C, and none below 5 °C, when measured at 15 minute intervals at locations according to Table 3.

On the first day only of the moist curing period, the moist curing requirements do not apply during the 1-hour exposure period, or 2-hour exposure period for indoor plants, except for concrete containing silica fume, where continuous moist curing shall be applied throughout the exposure period.

#### **909.07.15                      Transfer of Prestressing Force**

The prestressing force shall not be transferred to the girders until the transfer strength specified in the Contract Documents has been reached. The prestressing force shall be transferred according to the strand release sequence specified on the Working Drawings.

#### **909.07.16                      Treatment at Ends of Girders**

The prestressing strands at ends of girders that are to be encased in concrete shall be cut off 25 mm beyond the ends of the beams. The prestressing strands at the end of girders that are not to be encased in concrete shall be cut back to recess the cable 25 mm from the end of girder. The recess shall be cleaned, filled with a proprietary patching material, and the ends of the girders coated with elastomeric coating.

#### **909.07.17                      Surface Finish**

##### **909.07.17.01                  General**

Concrete surfaces shall not be treated with cement slurry or paste.

Bugholes with a depth less than or equal to 5 mm and a maximum dimension at the surface of 50 mm do not require repair.

Surface defects and deficiencies with dimensions according to Table 2 are repairable by standard methods according to Table 2.

A repair proposal shall be submitted to the Contract Administrator to repair surface defects and deficiencies with dimensions greater than those listed in Table 2.

##### **909.07.17.02                  Exposed Surfaces**

The appearance of the concrete and repairs shall be uniform in colour, pattern, and texture when viewed from a distance of 15 m. Care shall be taken to select material, including proprietary patching materials, to achieve uniformity of colour and appearance.

All projections, such as fins and bulges, and all blemishes, such as stains and rust marks, shall be removed.

#### **909.07.18                      Sampling and Testing of Plastic Concrete**

Sampling and testing of the plastic concrete for slump, air content, and temperature shall be according to OPSS 1350. The results of these tests shall be recorded. The minimum frequency of testing shall be as follows:

- a) For concrete supplied by an external concrete supplier and delivered by a ready-mix truck, once for each of the first three trucks, until satisfactory control is established, and then once every third truck.
- b) For batches of concrete produced at the precast plant and transported by a ready-mix truck, once for each of the first three trucks, until satisfactory control is established, and then once every third truck
- c) For batches of concrete produced at the precast plant, and not delivered by a truck, once for each of the first five batches of concrete, until satisfactory control is established, and then once every fifth batch.

Satisfactory control is established when three or five consecutive tests of concrete, as specified above, are within the specified requirements, without adjustments. If any adjustments are required or conducted, testing shall continue until three or five consecutive tests, as specified above, meet the requirements with no adjustments. Satisfactory control shall be established each Day.

Testing of plastic concrete shall be carried out as close as possible to the location of discharge of concrete into the formwork.

Sampling and testing of slump, air content, and temperature of plastic concrete, and casting of cylinders for determination of compressive strength shall be carried out by a person holding either of the following certifications:

- a) CCIL Certified Concrete Testing Technician, or
- b) ACI Concrete Field Testing Technician, Grade 1.

The person shall have a valid original card issued by the certifying agency in his or her possession at all times.

#### **909.07.19                      Transfer Strength**

Prior to transfer of the prestressing force, it shall be demonstrated that the transfer strength specified in the Contract Documents has been achieved. The Contractor, when requested by the Owner, shall participate in standard cylinder correlation strength testing programs conducted by the Owner.

#### **909.07.20                      Concrete Cover Measurement**

The Contractor shall carry out, at the precaster's facility, a cover meter survey on all girders until satisfactory control is established. For each type, design and size of girder, satisfactory control shall be established when three consecutive girders of the same design are within the specified tolerances. After satisfactory control has been established, testing shall be carried out on every fifth girder. If testing indicates that cover measurements for a girder do not meet the tolerances specified in Table 1, testing shall resume on each girder until satisfactory control is re-established.

Readings shall be taken at locations 600 mm from both ends, at mid-span, and at intervals not exceeding 5 metres along the length of the girder.

For I-girders, readings shall be taken at each location, as detailed below:

- a) Top of web, both sides.
- b) Bottom of web, both sides.
- c) Mid-height of each side of bottom flange for CPCI-Girders, and on top of each side of bottom flange, 150 mm from the edge of the flange for NU girders.
- d) Underside of girder, located at 150 mm from both edges of flange.

For box girders, readings shall be taken at each location, as detailed below:

- a) Top of web, exterior sides.
- b) Bottom of web, exterior sides.
- c) Underside of girder, located at 400 mm from both edges of flange.

#### **909.07.21 Dimensional Measurements**

The Contractor shall carry out measurements on each girder to determine compliance with tolerance requirements. Girders shall meet the tolerances specified in Table 1.

#### **909.07.22 Access for Quality Assurance**

Electrical power, scaffolding, protection from the weather, and unhindered access for inspection and testing of all fabrication, delivery, and installation of girders shall be provided to the Contract Administrator or Owner's representative.

For the purposes of cover meter and dimensional measurements, all debris and obstructions shall be removed.

#### **909.07.23 Delivery**

The Contract Administrator shall be notified in writing 3 Business Days prior to delivery of the girders.

Delivery shall include transportation and storage of the girders. Transportation and storage of the girders shall be according to CAN/CSA A23.4. The delivery shall include loading of the girders, transportation, unloading, and storage at the storage site.

Girders shall be loaded for shipping in such a manner that they can be transported and unloaded at their destination without being damaged or exposed to stresses for which they were not designed.

Girders shall be handled and transported with their webs in a vertical plane, and the points of support during loading and unloading, lifting, storing, and transporting shall be according to the Working Drawings.

Girders, when stored, shall be stored in such a manner to avoid excessive stress or other damage.

Advertising by means of removable signing shall be permitted on girders only while in transit to the storage site. Any permanent markings on a surface that would be visible after installation shall not be permitted.

#### **909.07.24 Installation**

The Contract Administrator shall be notified in writing of the installation date at least 3 Business Days prior to the commencement of field installation operations. Installation shall be according to the Working Drawings.

The work shall consist of installation and stabilization of the girders during construction. Girders shall be lifted and placed in a manner to ensure they are not overstressed, unstable, or unsafe at any time.

A copy of the Working Drawings shall be kept on the site during installation of the girders.

The installation tolerance of girders shall be  $\pm 15$  mm on the bearing in both the longitudinal and transverse directions.

For box girders placed side-by-side, accumulated tolerance differences shall be distributed equally along the width of the structure. The maximum accumulated increase or decrease in total width of the girders shall not exceed 70 mm with 35 mm maximum on either side.

The forces resulting from the lifting devices acting on the girders shall not be inclined to the vertical at an angle greater than 30 degrees. All lifting devices for girders shall be removed or cut off to maintain the specified cover prior to placement of concrete in the deck.

I-girders and other girders that may experience stability problems during construction shall be braced individually by attaching each end to the substructure, as a minimum, immediately upon installation and according to the Working Drawings.

#### **909.07.25                      Repair of Defects and Deficiencies Repairable by Standard Methods**

Any individual girder having one or more of the defects and deficiencies identified in Table 2 shall be repaired according to the repair method specified. Such repairs do not require proposals or Owner approval. Where more than one of the defects or deficiencies listed in Table 2, excluding bugholes, are located in the same area in the girder, a repair proposal shall be submitted. All causes, preventative actions, and corrective actions, including repair methods and materials used, shall be documented and submitted in the precast report.

#### **909.07.25.01                      Assessment of Repair**

When defects or deficiencies occur, at the discretion of the design Engineer, a visual inspection may be conducted or other measures required, such as cores to be taken to assess the effectiveness of the repairs.

The filling of core holes shall be according to OPSS 1350.

#### **909.07.26                      Certificate of Conformance**

Within 5 Business Days of installing all the girders within a stage, a Certificate of Conformance sealed and signed by a Quality Verification Engineer shall be submitted to the Contract Administrator. The Certificate shall identify the girders and state that the work has been carried out in general conformance with the signed and sealed documents, which include the Working Drawings, supporting documents, and Contract Documents.

#### **909.07.27                      Material Sampling for Acceptance Testing**

##### **909.07.27.01                      Sampling of Steel Reinforcement**

Samples of steel reinforcement shall be provided to the Owner according to OPSS 905 when requested.

If required, samples shall be delivered to:

Head, Concrete Section  
Ontario Ministry of Transportation  
145 Sir William Hearst Avenue, Room 15  
Downsview, Ontario, M3M 0B6

##### **909.07.27.02                      Sampling of Water, Admixtures, and Cementing Materials**

When requested by the Owner, samples of all cementing materials, admixtures, and water shall be obtained and delivered for testing by the Owner. If required, samples of admixtures and water shall be delivered to the Regional Quality Assurance laboratory and samples of cementing materials shall be delivered to:

Head, Concrete Section  
Ontario Ministry of Transportation  
145 Sir William Hearst Avenue, Room 15  
Downsview, Ontario, M3M 0B6

### **909.07.27.03                    Sampling of Hardened Concrete for Acceptance Testing**

#### **909.07.27.03.01                General**

Test specimens shall consist of cylinders cast from plastic concrete for determination of compressive strength and cores removed from completed girders for determination of air void system parameters of hardened concrete and rapid chloride permeability. Test specimens shall be delivered to the designated laboratory for testing by the Owner.

Girders shall be sampled on a lot basis according to Table 4 of this specification.

#### **909.07.27.03.02                Cylinders for 28-Day Compressive Strength Testing**

Sets of cylinders, as defined in Table 4, shall be cast for 28-Day compressive strength testing by the Owner.

All concrete test cylinders shall be cast in new, single-use moulds conforming to the requirements of CSA A23.2-1D and made of plastic, with a lid. The lids shall be chemically and physically compatible with the concrete and shall provide watertight closure for the moulds.

Concrete test cylinders shall be cast, cured, and transported to the designated laboratory according to CSA A23.2-3C with the exception that cylinders shall be cured with the girder prior to delivery to the laboratory. Cylinders shall be delivered to the laboratory for demoulding.

Test information shall be recorded on MTO form PH-CC 322. A copy of the form shall be submitted with each set of the concrete cylinders along with a transmittal form and the Form A of the concrete mix design for the girder.

#### **909.07.27.03.03                Coring**

The number of cores removed from a girder shall be according to Table 4.

Cores shall be removed at the plant or on site when the girder is between 7 to 10 Days of age. Cores shall be removed in the presence of the Contract Administrator or Owner's representative. The girder from which core samples shall be taken shall be randomly selected from the lot by the Contract Administrator.

Coring shall be carried out according to CSA A23.2-14C. Cores shall not contain reinforcement or other embedded material. A covermeter capable of detecting the type(s) of reinforcing materials in the girder shall be used to establish the location of reinforcement and other embedded material prior to coring.

Cores shall be taken from locations selected by the Contract Administrator as follows:

- a) For I-girders, cores shall be from the middle quarter of the girder length, in the upper half of the web, outside of the flange area.
- b) For box girders, cores shall be taken at random locations of the top slab.

The Contract number, lot number, and girder identification number shall be marked legibly on each core with durable ink. Each core shall be placed in a plastic bag, sealed to prevent loss of moisture, fitted with a security tag by the Contract Administrator. Cores shall be transported to the designated laboratory within 24 hours of coring with a transmittal form and the Form A of the concrete mix design for the girder. Cores shall be transported in a manner to avoid damage.

The core holes shall be filled, within 3 Days, according to the Filling of Core Holes subsection of OPSS 1350, with concrete or a proprietary patching material from the Owner's pre-qualified products list.

Concrete used to patch core holes shall have comparable properties to that of the concrete used in the girder.

#### **909.07.28 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **909.08 QUALITY ASSURANCE**

#### **909.08.01 General**

The acceptance of girders shall be according to the requirements of this specification, including satisfactory completion of all repairs, if applicable. Girders not meeting the requirements of the Contract Documents shall be deemed unacceptable and shall not be included in the Work.

Acceptance for compressive strength, air void system parameters, and rapid chloride permeability shall be on a lot basis. Lot size, of the lesser of either 7 consecutive Days' production or 4 consecutively produced girders, shall be confirmed with the Contract Administrator prior to commencing production.

For Contracts requiring high-volume production, the use of a larger lot size may be proposed, up to a maximum of 20 girders per lot produced over no more than 7 consecutive Days, and shall be subject to the approval of the Owner. The established lot size shall remain consistent for the duration of the Contract

#### **909.08.02 Lot Size and Samples for Compressive Strength, Air Void System, and Rapid Chloride Permeability**

Acceptance of 28-Day compressive strength shall be based on testing of cylinders.

Acceptance testing of air void system and rapid chloride permeability shall be performed on cores removed from the girders. Testing of cores for air void system shall commence when the sample is delivered to the designated laboratory.

The sample type and size, and number of samples per lot shall be according to Table 4.

#### **909.08.03 Acceptance of Concrete Compressive Strength**

Compressive strength of cylinders, for acceptance, shall be determined according to LS-426 for concrete with silica fume and high strength concrete, and according to LS-407 for all other concrete.

##### **909.08.03.01 Basis of Acceptance**

28-Day compressive strength of a lot shall be considered acceptable when it meets all of the following:

- a) The average of the set of three cylinder compressive strengths shall be equal to or greater than the specified 28-Day compressive strength.
- b) No individual cylinder test shall be more than 4.0 MPa below the specified 28-Day compressive strength.

Unacceptable lots shall be rejected and replaced.

Test results shall be forwarded to the Contractor as they become available.

**909.08.03.02****Referee Testing of Compressive Strength**

Referee testing of compressive strength may only be invoked by the Contractor within 5 Business Days of receipt of the acceptance test result.

Referee testing of compressive strength shall be carried out on a set of three cores taken by the Contractor from the girder which the acceptance cylinders represent. The Contractor shall remove the cores in the presence of the Contract Administrator. The cores shall be 100 mm in diameter and 220 mm long or full depth, whichever is less. The core extraction shall be according to the Coring subsection of this specification, with the exception that if the girders have not been delivered to the construction site, coring shall take place at the precast plant in the presence of the Contract Administrator. Referee cores shall be obtained and transported to the referee laboratory designated by the Owner within 3 Business Days of invoking referee testing.

The referee laboratory shall be designated by the Owner based on the applicable roster and cores shall be tested according to CSA A 23.2-9C on moisture conditioned cores.

Referee test results shall be forwarded to the Contractor as they become available.

If the difference between the referee test result and the acceptance test result is less than the confirmation value, the acceptance test result is confirmed, and the acceptance test result shall be used in the determination of acceptance of the lot. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed, and the acceptance test result shall be disregarded and the referee test result shall replace the acceptance test result in the acceptance requirements of this specification. The confirmation value for confirming the acceptance test result shall be the greater of 10% of the specified strength or 10% of the strength of the acceptance cores, expressed to one decimal place.

The cost of referee testing of compressive strength shall be according to OPSS 1350.

**909.08.04****Acceptance of Air Void System in Hardened Concrete**

Testing of air void system shall be according to LS-432. One half of the sample shall be tested to determine the acceptability of the lot. The other half of the sample shall be retained by the Owner for audit purposes.

Test results shall be forwarded to the Contractor as they become available.

For a lot to be considered acceptable, the sample shall have a minimum air content of 3.0% and a spacing factor of 0.200 mm or less. Acceptable lots shall be subject to full payment.

Lots with samples with a spacing factor greater than 0.200 mm and less than or equal to 0.250 mm shall be considered unacceptable and shall be repaired according to Table 2.

Lots with samples with a spacing factor more than 0.250 mm or air content less than 3.0 % shall be rejected and replaced.

**909.08.04.01****Referee Testing of Air Void System in Hardened Concrete**

Referee testing of air void system parameters shall be according to OPSS 1350.

**909.08.05****Acceptance of Rapid Chloride Permeability**

Cores shall be tested for rapid chloride permeability according to LS-446. Three 50-mm long test specimens shall be prepared for each core:

- a) One specimen shall be tested immediately after the core is delivered to the laboratory. Results shall be provided to the Contractor for information purposes as they become available.
- b) Two specimens shall be tested between 28 and 32 Days of age to determine acceptance of the lot. The acceptance test result for the lot shall be the average of the two 50-mm long samples tested between 28 and 32 Days of age. The test result shall be used to determine the acceptance of the lot.

Lots with rapid chloride permeability less than 2,500 coulombs are considered acceptable. Lots with a rapid chloride permeability result greater than 2,500 coulombs and less than or equal to 3,500 coulombs shall be considered unacceptable but with the agreement of the Owner may be permitted to remain in the Work with a payment adjustment. The payment adjustment shall be calculated according to the Basis of Payment section.

Lots with rapid chloride permeability results exceeding 3,500 coulombs shall be rejected and replaced.

For concrete lots containing silica fume, rapid chloride permeability less than 1,000 coulombs are considered acceptable. Lots containing silica fume with a rapid chloride permeability result greater than 1,000 coulombs and less than or equal to 2,000 coulombs shall be considered unacceptable but, with the agreement of the Owner, may be permitted to remain in the Work with a payment adjustment. The payment adjustment shall be calculated according to the Basis of Payment section.

Lots containing silica fume with rapid chloride permeability results exceeding 2,000 coulombs shall be rejected and replaced.

Test results shall be forwarded to the Contractor as they become available.

#### **909.08.05.01 Referee Testing of Rapid Chloride Permeability**

Referee testing of rapid chloride permeability may only be invoked by the Contractor within 5 Business Days of receipt of the acceptance test result.

Referee testing for rapid chloride permeability shall be carried out on a new core taken by the Contractor from the same girder from which the acceptance sample was obtained. A core for referee testing shall be removed in the presence of the Contract Administrator, for each disputed lot, at a location no more than 1 meter from the location from which the disputed acceptance core was removed. The core shall be 100 mm in diameter and 220 mm long or full depth, whichever is less. The core extraction shall be according to the Coring subsection of this specification. Referee cores shall be obtained and transported to the referee laboratory designated by the Owner within 3 Business Days of invoking referee testing.

The referee laboratory shall be designated by the Owner based on the applicable roster and cores shall be tested by that laboratory.

Referee test results shall be forwarded to the Contractor as they become available.

When the referee result is greater than the acceptance test result or no more than 200 coulombs below the acceptance test result, the acceptance test result is then confirmed and shall remain valid. When the referee test result for the lot is more than 200 coulombs below the acceptance test result, the acceptance test result is then not confirmed, and the referee test result shall replace the acceptance test result in the acceptance requirements of this specification.

The cost of referee testing of rapid chloride permeability for all concrete shall be according to OPSS 1350 Acceptance of Rapid Chloride Permeability for Silica Fume Overlays and High Performance Concrete.

#### **909.08.06 Acceptance of Water, Admixtures, and Cementing Materials**

Acceptance of water, admixtures and cementing materials shall be according to OPSS 1350.

#### **909.08.07 Acceptance of Concrete Temperature**

Girders that meet the temperature requirements of this specification during production, the curing period, and, if applicable, the cold weather protection period, are considered acceptable. Girders that do not meet one or more of the temperature requirements of this specification are considered unacceptable and shall be rejected and replaced.

Each girder for which the highest temperature has been maintained below 65.0 °C during the moist curing, moisture retention, and protection periods and which meets all other requirements of the Contract Documents shall be eligible for a payment bonus. The bonus shall be \$1,000 for each girder, up to a maximum of \$10,000 in total for all of the girders in a single structure. A girder which is rejectable or fails to fully meet the requirements of the Contract Documents shall not be eligible for a bonus.

#### **909.08.08 Acceptance of Surface Finish**

All girders meeting the surface finish requirements of this specification shall be considered acceptable. A proposal may be submitted by the Contractor for unacceptable surface finish, according to the All Other Defects and Deficiencies section of this specification, subject to the approval of the Owner.

#### **909.08.09 Dimensional Verification and Concrete Cover Measurements**

The Contract Administrator shall carry out measurements to confirm compliance with the requirements of Table 1.

If a girder fails to meet the requirements specified in Table 1,

- a) It shall be rejected and replaced, and
- b) A consultant shall be retained by the Owner, at the Contractor's expense, to verify all other girders are within the tolerances of Table 1.

If a girder fails to meet the dimensional tolerances in Table 1, it shall be rejected and replaced; the Contractor may submit a proposal for remediation or for use of the girder, subject to the approval of the Owner.

#### **909.08.10 Defects and Deficiencies**

##### **909.08.10.01 General**

Defects and deficiencies are classified as follows:

- a) Defects and deficiencies repairable by standard methods.
- b) Defects and deficiencies causing rejection.
- c) All other defects and deficiencies.

##### **909.08.10.02 Defects and Deficiencies Repairable by Standard Methods**

Any individual girder having one or more of the defects and deficiencies listed in Table 2 shall be deemed unacceptable and the girder shall be repaired according to Table 2. When more than one of the defects or

deficiencies listed in Table 2 is located in the same area in the girder, the Contractor shall be required to submit a repair proposal for acceptance according to the All Other Defects and Deficiencies clause.

#### **909.08.10.03 Defects and Deficiencies Causing Rejection**

A girder having any one of the following defects and deficiencies shall be rejected and replaced:

- a) If concrete temperature exceeds 70 °C at any time during the curing period.
- b) For I-girders, if there is honeycombing, voids, cavities, spalls, delaminations, or cracks in the concrete within a bearing surface area defined by the contact area of the bearing plus 30 mm on all sides, except when the bearing area of the girder is fully encased in concrete.
- c) For box girders, if there is honeycombing, voids, cavities, spalls, or delaminations in the concrete within a bearing surface area defined by the contact area of the bearing plus 30 mm on all sides, except when the bearing area of the girder is fully encased in concrete.
- d) If there is a crack in the bottom flange that extends through to the opposite face, unless the entire crack is located at the end of the girder and will be fully encased in concrete.
- e) If breakage of strand wires exceeds the limit permitted in CAN/CSA A23.4.
- f) If the sweep of the girder on site and in position without any intermediate bracing is in excess of 1.5 mm/m length of girder.
- g) If cover does not meet specified requirements except as indicated in the All Other Defects and Deficiencies section of this specification.

#### **909.08.10.04 All Other Defects and Deficiencies**

The Contractor shall submit a proposal for repair or remediation to the Contract Administrator for acceptance, when,

- a) A girder has defects or deficiencies that are not identified as rejectable or included in Table 2 in the list of defects and deficiencies repairable by standard methods; or
- b) More than one of the defects or deficiencies listed in Table 2, except for bugholes, are located in the same area in the girder; or
- c) Three occurrences of the same defect are present in the girder; or
- d) There is the presence of pour lines or cold joints; or
- e) Unacceptable surface finish; or
- f) The compressive strength of the lot is lower than specified, but not lower than 4 MPa below the specified strength; or
- g) Dimensional tolerances of the girder do not meet the requirements of this specification; or
- h) Failure to maintain moist curing has occurred.

The repair proposal, signed and sealed by an Engineer, shall include, as a minimum,

- a) Description of the girder and identification of the defects or deficiencies.

- b) Detailed sketches, width, length, depths, location, and nature and frequency of any defects.
- c) Assessment of any impact of the repaired defects on durability, structural adequacy, and integrity of the girder or on the structure.
- d) A detailed repair plan, including material, method, and equipment to be used.
- e) Verification that the repair plan complies with the applicable standards for the type of work.
- f) All relevant supporting information, including material test results, field measurements and observations, production records, photographs, and structural analysis calculations used for determining that the performance and function originally expected from the girder shall be met.
- g) Causes of the defect and corrective action to be taken to prevent recurrence of the defect in future production, delivery, or installation.

If the repair proposal is deemed acceptable, the girder shall be repaired according to the proposal. The Contractor shall not carry out any repairs without the prior acceptance of the proposal by the Contract Administrator. If the repair proposal is deemed unacceptable, the girders shall be rejected and replaced.

In addition, the repair proposal shall be signed and stamped by an Engineer, including, as a minimum, assessment of any impact on the durability, structural adequacy, and integrity of the girder or on the structure, of either low or high cover, and submitted to the Contract Administrator for acceptance, when,

- a) Low cover at soffit of girders at locations other than bearing cutouts: any cover readings less than 40 mm and greater than 35 mm.
- b) High cover at soffit of girders at locations other than bearing cutouts: any cover readings less than 70 mm and greater than 60 mm.
- c) High cover at all locations other than between bearing cutouts on soffit of girders: any cover readings less than 55 mm and greater than 45 mm.

For low cover at all locations except girder soffits between bearing cutouts, the girder may be sealed for cover readings between -5 mm and -10 mm of the specified cover, according to Table 2 of this specification.

If the Engineer's assessment is deemed acceptable by the Contract Administrator, the girders shall be accepted according to the Engineer's assessment. If deemed unacceptable, the girders shall be rejected and replaced.

## **909.10 BASIS OF PAYMENT**

### **909.10.01 Prestressed Concrete Girders (Type) Fabrication - Item Prestressed Concrete Girders Containing Silica Fume (Type) Fabrication - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Rejected girders shall be replaced at no additional cost to the Owner.

Girders stored at the precaster's premises or at some other location away from the Working Area shall be paid for when the Contractor obtains a lease from the property owner that names the Owner as the

tenant. The Owner shall provide the form of lease for this purpose that specifies a payment of \$10.00 for the term of the lease. The Contractor shall retain full responsibility for the girders.

**909.10.02                      Payment Adjustment for Rapid Chloride Permeability**

The payment adjustment shall be calculated based on individual lots and applied as follows:

$$\text{Payment adjustment} = \text{lot quantity} \times (C-2500)/5$$

Where:

|                    |   |                                                                                    |
|--------------------|---|------------------------------------------------------------------------------------|
| Payment adjustment | = | payment adjustment of a lot (\$)                                                   |
| C                  | = | rapid chloride permeability of a lot (coulombs)                                    |
| Lot quantity       | = | volume of concrete in a lot (m <sup>3</sup> ) (calculated based on plan dimension) |

The payment adjustment for concrete containing silica fume shall be calculated based on individual lots and applied as follows:

$$\text{Payment adjustment} = \text{lot quantity} \times (C-1000)/5$$

Where:

|                    |   |                                                                                    |
|--------------------|---|------------------------------------------------------------------------------------|
| Payment adjustment | = | payment adjustment of a lot (\$)                                                   |
| C                  | = | rapid chloride permeability of a lot (coulombs)                                    |
| Lot quantity       | = | volume of concrete in a lot (m <sup>3</sup> ) (calculated based on plan dimension) |

**909.10.03                      Prestressed Concrete Girders (Type) Delivery - Item**  
**Prestressed Concrete Girders Containing Silica Fume (Type) Delivery**  
**- Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**909.10.04                      Prestressed Concrete Girders (Type) Installation - Item**  
**Prestressed Concrete Girders Containing Silica Fume (Type) Installation**  
**- Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**TABLE 1**  
**Tolerances**

| Item                                                                                | Tolerances                                                                                                                         |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Length:<br>Straight-line measurement taken horizontally at the mid-height of girder | $\pm 1.0$ mm/m; not to exceed $\pm 25$ mm maximum                                                                                  |
| Overall Depth                                                                       | $\pm 8$ mm for depths up to 600 mm<br>$\pm 12$ mm for depths over 600 mm                                                           |

#### **910.01 SCOPE**

This specification covers the construction requirements for internal bonded post-tensioning and grouting of tendons in prestressed concrete. This specification does not cover requirements for post-tensioning in concrete segmental construction nor requirements for post-tensioning with external tendons.

#### **910.02 REFERENCES**

**910.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Anchorage Zone** means the end portion of the post-tensioning element consisting of local zone and general zone.

**Calibration** means the process of determining experimentally the absolute values corresponding to the gradation on a scale subject to error.

**Coupler means** a device for the joining of two post-tensioning tendons or prestressing steel bars by means of a mechanical connector.

**General Zone** means the anchorage zone region of post-tensioned component which extends from anchorage device along the axis of the component according to CSA S6.

**Local zone** means the zone behind the anchorage device where the prestressing force is transferred to the post-tensioned structural component.

**Post-Tensioning** means a method of prestressing in which tendons are tensioned after the concrete has reached a predetermined strength.

**Prestressing Steel** means as defined in OPSS 905.

**Prestressing Steel Bar** means as defined in OPSS 1440.

**Primary Tendon Anchorages** means the anchorage on longitudinal tendons.

**Tendon** means a high-strength steel element used to impart prestress to concrete.

**Tensile Strength** means the breaking load of the tendon per unit area established by tensile testing.

**Vent** means an inlet to permit the injection of grout into the duct or an outlet to provide for the escape of air, grout, and to bleed or drain water.

**Yield Strength** means the stress at which the tendon exhibits a specified deviation of proportionality of stress and strain.

#### **910.04 DESIGN AND SUBMISSION REQUIREMENTS**

##### **910.04.01 Design Requirements**

###### **910.04.01.01 General**

All proposed post-tensioning systems shall meet the design slip requirements specified in the Contract Documents.

###### **910.04.01.02 Design of Anchorage Zone**

Design shall be according to the CSA S6 and the Structural Manual, Division 1. The supplier of the post-tensioning system shall be responsible for the design of the local zone according to CSA S6. Design of the general zone shall be as specified in the Contract Documents.

##### **910.04.02 Submission Requirements**

###### **910.04.02.01 General**

All Working Drawings, post-tensioning details, and calculations shall bear the seal and signature of an Engineer.

All submissions shall be according to the appropriate clause; however, when other authorities are involved in the approval of the design or construction of a Highway structure, submissions shall be made at least 5 weeks prior to commencement of work and one additional copy of the submission shall be provided for each authority.

###### **910.04.02.02 Post-Tensioning Working Drawings**

At least 3 weeks prior to commencement of post-tensioning work, one electronic copy of all Working Drawings in pdf format shall be submitted to the Contract Administrator. The drawings shall include the following:

- a) Design details.
- b) Slip.
- c) Calculation data, including wobble and friction coefficients for the duct material used.
- d) Post-tensioning sequence.

e) Details of the:

- i. Ducts.
- ii. Supports.
- iii. Vents.
- iv. Anchorages.

Details of anchorages for post-tensioning tendons shall be according to the requirements of the manufacturer of post-tensioning system.

#### **910.04.02.03                      Post-tensioning Details**

At least 2 weeks prior to commencement of the post-tensioning operations, one electronic copy in pdf format of the following information shall be submitted to the Contract Administrator:

- a) Elongation calculations that take into account all relevant losses.
- b) The type of jacks.
- c) Friction of jacks.
- d) Jacking pressure.
- e) Method of attaining the required slip (e.g. wedge or nut seating procedure).
- f) Two copies of the prestressing steel manufacturer's stress-strain curves test reports.

#### **910.04.02.04                      Couplers**

##### **910.04.02.04.01                  General**

At least 3 weeks prior to the commencement of the work, a copy of the post-tensioning system manufacturer's catalogue giving complete data on the coupler material, installation procedures, and test reports from the manufacturer certifying that the strength and fatigue requirements have been satisfied shall be submitted to the Contract Administrator.

##### **910.04.02.04.02                  Testing**

Dynamic tests are not required on bonded tendons, unless specified in the Contract Documents.

A dynamic test for bonded tendons shall be performed on a representative anchorage and coupler specimen and the results submitted to the Contract Administrator. The tendon shall withstand, without failure, 500,000 cycles from 60 to 66% of its minimum specified ultimate strength and also 50 cycles from 40 to 80% of its minimum specified ultimate strength. The period of each cycle shall be the change from the lower stress level to the upper stress level and back to the lower. The specimen used for the second dynamic test may be the same one used for the first dynamic test. Systems using multiple strands, wires, or prestressing steel bars may be tested using a test tendon of smaller capacity than the full-sized tendon. The test tendon shall duplicate the behaviour of the full-sized tendon and generally shall not have less than 10% of the capacity of the full-sized tendon.

#### **910.04.02.05                      Prestressing Steel Mill Test Certificates and Stress-Strain Curves for Prestressing Steel**

Submission of mill test certificates and stress strain curves shall be according to Mill Certificates and Stress-Strain Curves for Prestressing Steel subsection in OPSS 1440

One copy of mill test certificates for all material to be used in the fabrication of the prestressing steel shall be available for review at the fabricating plant during fabrication. The mill test certificates shall show that the material is according to the Contract Documents.

Mill test certificates for prestressing steel bars shall demonstrate that tensile testing has been carried out on full-section specimens according to ASTM A370.

Test results shall be provided for relaxation testing of prestressing steel bars for the same heat number as the material supplied for the work. The testing shall be carried out according to the test procedure described in the Material section.

#### **910.04.02.06                      Prestressing Personnel**

At least 12 weeks prior to commencing the post-tensioning operation, experience records shall be submitted to the Contract Administrator for prestressing personnel employed or licensed by the manufacturer of the post-tensioning system as described herein.

#### **910.04.02.07                      Grouting Plan**

At least 4 weeks prior to the work, written procedures for grouting operations shall be submitted to the Contract Administrator. The grouting plan shall include the following:

- a) Pre-packaged grout product name, manufacturer, and quantity to be used in grouting.
- b) Manufacturer's specified limits for efflux time measurement for the fluidity of the grout.
- c) 28-Day compressive strength test results for the grout from the manufacturer within the last 12 months.
- d) Type of grouting equipment including provision for spare parts and details of a backup mixer.
- e) Mixing and pumping procedures.
- f) Direction of grouting and sequence of use of the inlets and outlets.
- g) Procedures for handling blockages, and procedures for possible regrouting.
- h) Temperature control measures for grouting operation.
- i) Details of vacuum-assisted grouting procedures, if applicable.

#### **910.04.02.08                      Corrosion Inhibitor**

At least 3 weeks prior to the commencement of the work, the name of the corrosion inhibitor applied to the prefabricated cables and written approval by the post-tensioning system supplier shall be submitted to the Contract Administrator.

### **910.05                                  MATERIALS**

#### **910.05.01                              Anchorages and Couplers**

##### **910.05.01.01                          General**

When anchorages and couplers for post-tensioning are tested in an unbonded state, they shall develop at least 95% of the ultimate tensile strength of the tendons. After tensioning and the initial slip required to seat the strands has occurred, anchorages shall be capable of sustaining the applied loads without additional slippage, distortion, or other changes that could result in unaccounted loss of prestress.

## **910.05.01.02                    Anchorages**

The manufacturer of the post-tensioning system shall establish the dimensions and details of anchorages within the local zone, which are dependent on the jacking force and the concrete strength at transfer specified in the Contract Documents. Additional steel reinforcement required to resist tensile, bursting, spalling, or longitudinal edge tension forces within the general zone shall be as specified in the Contract Documents.

Primary tendon anchorages of multi-strand tendons shall be multi-plane bearing type. Primary and transverse tendon anchorages shall be provided with end caps that cover the strand ends and wedges according to PTI/ASBI M50.3. Steel and plastic end caps are permitted. The end caps shall have a 3 mm minimum wall thickness and shall have attachments and gaskets that allow the cap to withstand full grouting pressures. End caps shall be vented to ensure that they are completely filled with grout. Steel end caps shall be galvanized according to ASTM A123 or equivalent.

## **910.05.01.03                    Couplers**

Couplers shall be according to the submitted manufacturer's data accepted by the Contract Administrator.

## **910.05.02                        Ducts**

### **910.05.02.01                    General**

Ducts for internal post-tensioning shall be corrugated plastic. The ducts, including joints, shall be watertight, vapour-tight and nonreactive with concrete, tendons, or grout. The ducts and components shall meet the requirements of Post-Tensioning System Tendon Protection Level 2 (PL-2) according to PTI/ASBI M50.3.

Ducts provided for future external post-tensioning shall be made from smooth, and rigid polyethylene.

All ducts shall be provided with suitable devices for the injection and discharge of grout after prestressing. Air vents shall be provided at all high points on the ducts that are continuous over more than one span. Air and drainage vents shall be provided at other locations as specified in the Contract Documents.

Ducts shall be capable of withstanding concrete pressures without excessive deformations and shall not permit the entrance of cement paste during the placement of concrete. The ducts shall have sufficient rigidity to maintain the required profile between points of support.

For single strand of prestressing steel tendons, the inside diameter of the ducts shall be at least 6 mm larger than the nominal diameter of the strand or prestressing steel bar. For multiple strand tendons, the inside cross-sectional area of the duct shall be at least twice the cross-sectional area of the tendon.

### **910.05.02.02                    Plastic Ducts**

Plastic ducts, including their splices, shall be made of polyethylene or polypropylene according to PTI/ASBI M50.3 and shall be vapour-tight and remain so after tendon installation and stressing.

Plastic for the external post tensioning ducts shall be code letter D or E for colour and ultraviolet (UV) stabilizer according to ASTM D3350. The plastic duct shall be manufactured according to ASTM D2239 from virgin material.

The ducts shall be capable of being curved to the specified radius without damage. The duct wall thickness shall not be less than 1 mm for the specified minimum radius of curvature, after a tendon movement of 750 mm under a tendon stress of 80% of the specified strength. For curved ducts, the radial force, as exerted on the duct wall by a single strand, shall not exceed 40 kN/m.

The plastic ducts shall meet the following requirements:

- a) For ducts with an inside diameter of 50 mm or less, a 3 m length supported at the ends shall not deflect under its own weight by more than 75 mm at a temperature of not less than 20 °C.

- b) For ducts with an inside diameter of more than 50 mm, a 6 m length supported at the ends shall not deflect under its own weight by more than 75 mm at a temperature of not less than 20 °C.
- c) The duct shall not deform more than 3 mm under a point load of 445 N applied through a No. 10 reinforcing steel bar located between the corrugation ribs at a temperature of not less than 20 °C.
- d) Material thickness shall be as follows:
  - i. Corrugated, internal duct shall have a minimum of 2.0 mm wall thickness or meet the requirements of FIBBUL 75 Table 8.1.
  - ii. External ducts shall have an external diameter to wall thickness ratio of 17 or less.

#### **910.05.02.03                      Vents and Drains**

Vents and drains shall be a 19 mm minimum diameter flexible tubing material capable of withstanding the applied grouting pressures. Vents shall be temporarily equipped with an airtight shut-off valve to isolate the duct system from the environment.

#### **910.05.03                      Grout**

##### **910.05.03.01                      Pre-Packaged Grout**

The grout used shall be one of the pre-packaged grout products listed in Table 1 and shall meet the requirements of a Class C grout according to PTI M55.1.

The pre-packaged dry grout mixture shall be supplied on skids and covered with polyethylene sheeting. The pre-packaged dry grout mixture shall be stored in a dry condition up to the time of its use and suitably protected against the weather during delivery and storage on site. The pre-packaged dry grout mixtures shall be used within 6 months of packaging and shall be stored on site for a maximum of 1 month.

The dry ingredients of the grout shall be thoroughly mixed and packaged in bags, with a maximum bag size of 30 kg. The bag shall be of sufficient strength and waterproof to withstand handling and to protect the grout from moisture and contamination. The bags shall have the following information printed on the outside: Name of manufacturer, maximum amount of water to be used per bag of dry grout mixture, date packaged, and expiry date.

##### **910.05.03.02                      Grout Properties**

The grout shall have the following physical properties:

- a) The minimum 28-Day compressive strength shall be 55 MPa, when tested according to CSA A3004-2C.
- b) No bleeding or segregation when allowed to stand for 3 hours according to clause 4.4.8.1, wick-induced bleed test of PTI M55.1
- c) The efflux time measurement for the fluidity of the grout shall be within the limits specified by the manufacturer.
- d) The chloride content shall be according to PTI M55.1 when tested according to ASTM C1152

#### **910.05.04                      Hardware**

Only hardware, including spacers and support devices for the ducts, that are capable of withstanding the loads placed on it and that is approved by the Owner shall be used. All embedded hardware within 100 mm of exposed faces shall be coated with an acceptable material or be of an acceptable non-metallic material.

## **910.05.05                      Prestressing Steel**

### **910.05.05.01                  General**

Prestressing steel shall be low alloy prestressing steel bar or uncoated, low relaxation 7-wire strand according to OPSS 1440.

Prestressing steel bar shall be low relaxation and shall meet the requirements of relaxation testing as specified herein when furnished in its final condition after all processing. Relaxation loss shall be less than 3.0% when tested at an initial stress of 70% of minimum specified ultimate tensile strength of the bar for 1000 hours according to ASTM E328 Method A, except a gauged bar is not required if the specimen length is at least 60 bar diameters. Relaxation testing shall be completed at a temperature of 20 °C ± 2 °C. Quenched and tempered bars are not permitted.

### **910.05.05.02                  Corrosion Inhibiting Coating**

A corrosion inhibitor, approved by the post-tensioning system supplier, shall be applied to the prefabricated cables to prevent the pitting of the prestressing steel as described herein. Vapour phase corrosion inhibitors shall not be used.

### **910.05.06                      Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

### **910.05.07                      Water**

Water shall be according to OPSS 1302.

## **910.06                          EQUIPMENT**

### **910.06.01                      Air Compressor**

The air compressor used for air blasting shall have a minimum capacity of 3.5 m<sup>3</sup>/min. The compressed air shall be free of oil according to ASTM D4285.

### **910.06.02                      Grouting Equipment**

The grouting equipment shall consist of a mixer, a separate holding tank, and a pump.

The mixer shall be:

- a) A high-shear mechanical or colloidal type with a speed of 1200 to 2000 rpm.
- b) Equipped with a calibrated measuring device for determining the quantity of mixing water. The total quantity of water used in each batch of grout shall be measured to an accuracy of ± 2%.
- c) Equipped with a visible timing device suitable for controlling the mixing time.
- d) Any pressure measuring devices shall be calibrated within a 6 month period preceding the work. The device shall be accompanied by a certified calibration curve.

The holding tank shall be capable of keeping the mixed grout continuously in motion until it is used. The outlet to the pump shall have a 5 mm screen.

The grout pump shall be capable of grouting to a pressure of at least 1 MPa and shall be equipped with a pressure gauge and a pressure valve set to release at a pressure of 1 MPa, except for vertical tendons with approval from the Contract Administrator. The pressure gauge shall have an accuracy of ± 2%, shall be accompanied by a certified calibration curve and shall be calibrated at least once a year.

The grouting equipment shall be of sufficient capacity to ensure that the grouting of the longest duct can be completed within 30 minutes after mixing. The velocity of grout in the duct shall be between 5 and 12 m/min and the pressure shall be compatible with the length and size of the duct.

The grout hoses and their rated pressure capacity shall be compatible with the pump output and the maximum grouting pressure. All connections from the grout pump to the duct shall be airtight so that air cannot be drawn into the duct.

The configuration of the equipment shall be such that the grout can be recirculated to the holding tank, if stoppage occurs in the grouting.

A backup mixer in good working condition shall be available at the site before commencement of grouting in case of breakdown of the grouting equipment during grouting.

### **910.06.03 Malfunction of Gauges**

Malfunctioning gauges shall be replaced immediately upon discovery of the malfunction.

### **910.06.04 Measuring Devices for Post-tensioning**

Pressure gauges, dynamometers, tension meters, load cells, or other suitable devices shall be used for controlling and measuring the tendon forces and shall be according to the following:

- a) The device shall be capable of measuring the forces to an accuracy of  $\pm 2\%$ .
- b) Each gauge shall be capable of indicating forces directly in Newtons or be accompanied by a conversion chart so that the imperial readings can be converted into Newtons.
- c) The indicating dials of the gauges shall be at least 150 mm in diameter or a digital pressure gauge shall be used.
- d) Each gauge shall be accompanied by a certified calibration curve.
- e) The graduated capacity of the gauge shall be such that the forces to be measured fall within 25 and 75% of the minimum and maximum measurement levels respectively, unless calibration data clearly establishes that the gauge is accurate over a wider range.
- f) Pressure gauge readings shall be taken in a static configuration.
- g) Gauges shall be mounted near eye level and within 2 m of the operator and positioned so readings can be obtained without parallax.
- h) Two gauges shall be used at each jack and pump combination.
- i) The gauges shall be recalibrated any time a gauging system indicates erratic results and at intervals not greater than 6 months.

## **910.07 CONSTRUCTION**

### **910.07.01 Prestressing Personnel**

Personnel employed or licensed by the manufacturer of the post-tensioning system shall carry out the work.

Personnel employed to supervise the work of installation, tensioning and grouting shall:

- a) Have a working knowledge of the post-tensioning system used;

- b) Be capable of evaluating the forces, gauge pressures, elongations, and method by which the post-tensioning system transfers the forces to the structure;
- c) Have a minimum of 5 years experience in carrying out this type of work within the last 10 years or shall have PTI Level 2 Multistrand & Grouted Field Specialist Certification;
- d) Be present during the post-tensioning and grouting; and
- e) Also be present during concreting operations to ensure that the post-tensioning components of the work are not adversely affected.

#### **910.07.02                      Welding**

Shop welding of the prestressing tendons shall only be permitted to facilitate pulling the tendon through the duct. Where the ends of strands are welded together to facilitate pulling the tendon through the duct, the length of the tendon used as an electrical ground or 1 m, whichever is greater, shall be cut off from the welded end prior to stressing. Care shall be exercised at all times to prevent the possibility of heat destroying the tensile properties of the steel. No other welding of post-tensioning tendons and ducts is permitted.

Field welding within 3 m of the post-tensioning steel is not permitted on site. Field welding equipment shall not use any components of the post-tensioning system as an electrical ground.

#### **910.07.03                      Surface Condition of Post-Tensioning System Components and Temporary Corrosion Protection of Prestressing Steel**

All material shall be clean and free of oil, dirt, scale, and pitting. A light rust coating on steel hardware is acceptable.

Prestressing steel shall be free of rust or pitting prior to grouting. Strand condition shall be evaluated according to Figure 11.1 of PTI/ASBI M50.3 and the condition shall be similar to Photo 2 or better. A quality process shall be established to maintain the corrosion inhibitor on the prestressing steel until the time of grouting. Dry hot air, with a maximum relative humidity of 40%, shall be blown into the ducts and sealed to maintain the prestressing steel condition if the time between stressing and grouting is to exceed 14 Days.

#### **910.07.04                      Installation**

##### **910.07.04.01                      Post-Tensioning System**

The post-tensioning system shall meet a protection level of PL-2, according to PTI/ASBI M50.3 and as described herein.

Prestressing steel, ducts, anchorages, couplers, and local steel reinforcement at anchorages shall be placed in the position specified in the Contract Documents and shall be held in the correct location during the operations of placing and consolidating of concrete. The ducts shall be supported and secured at intervals not exceeding 0.6 m and a smooth profile shall be maintained. Flat ducts that are not preloaded with strands, shall be supported and secured at intervals not exceeding 0.6 m. Flat ducts that are preloaded with strands shall be supported and secured at intervals not exceeding 0.5 m. All joints between ducts and other associated hardware shall be protected against the ingress of laitance during concreting and against the entry of any deleterious material before, during, and after placement of concrete. Ducts and anchorages shall be installed at the locations specified in the Contract Documents and within the following tolerances:

- a) Longitudinal sheath  $\pm 15$  mm.
- b) Transverse sheath  $\pm 10$  mm.
- c) Anchorage  $\pm 10$  mm.

Couplers for strand or prestressing steel bar are not permitted in the work unless specified in the Contract Documents. When couplers are specified in the Contract Documents, installation of couplers shall be according to the recommendations of the manufacturer of the post-tensioning system used.

Bearing plates at anchorage components shall be within 2 degrees of their design orientation and trumpets shall be perpendicular to the faces of the bearing plates and securely fastened in place.

Ducts shall be fully sealed against the elements prior to installation of prestressing steel. Duct alignment and transition to anchorage components shall be free of kinks and shall provide smooth continuous transitions between elements. Slitting of ducts to facilitate bending is not permitted. Pushing or pulling of strands through ducts shall be done with methods that will not snag or cut ducts.

Joints in ducts shall be by means of proprietary couplers. Fusion welding of ducts is not permitted. Heat shrink sleeves, if applicable, shall be as per PTI/ASBI M50.3. Proprietary couplers shall be according to the PL-2 leak-tightness requirements of FIBBUL 75. Joint tape is not permitted in lieu of couplers.

Half-shell duct supports shall be used to support the inside radius of curvature for bonded rounded ducts when the radius of curvature is less than 20 m.

Monostrand jacks are only permitted for flat tendons.

MTO form PH-CC-701, Request to Proceed, shall be submitted to the Contract Administrator after the installation of the post-tensioning system is complete and prior to placing the concrete.

The next operation shall not proceed until MTO form PH-CC-702, Notice to Proceed, has been received from the Contract Administrator.

#### **910.07.04.02                      Vents and Drains**

Vents shall be installed as follows:

- a) At the anchorages of the tendon.
- b) At the high points of the duct.
- c) At the lowest point of a tendon having a small radius such as a vertical loop.
- d) At major changes in the cross-section of the duct such as trumpets of couplers and anchorages.
- e) For all tendons other than top slab transverse tendons, place drains at low points of all duct profiles, or as close as practical to the geometric low points of all duct profiles, except where an inlet, outlet, or anchorage that can service as a drain is located at the low point.

Vents at anchorages and high points shall extend at least 500 mm above the highest point on the profile of the duct in which the vent is placed. Duct holes at vent locations shall be of the same size as the inside diameter of the vent tube. Direct inlets, outlets or drains existing on vertical or predominantly vertical surfaces of box girders towards the interior of the box.

Drain tubes shall be routed for positive drainage when required. Vents shall be sealed when not in use for grouting operations.

#### **910.07.04.03                      Placing of Steel Reinforcement**

The placing of steel reinforcement as duct support spirals, tensioning rings, and reinforcing grids at anchorages shall be according to OPSS 905.

#### **910.07.04.04                    Duct Proving**

When strands are installed after concreting, a torpedo shall be passed through the longitudinal ducts to confirm the ducts are free of any obstructions according to PTI/ASBI M50.3.

#### **910.07.05                        Post-Tensioning**

##### **910.07.05.01                    Material Sampling**

The Contract Administrator shall be notified when the post-tensioning steel is available for sampling at least 1 week in advance of stressing.

Prestressing steel samples selected by the Contract Administrator for testing and inspection shall be labelled by the Contractor with the following information:

- a) Manufacturers identification number.
- b) Reel number.
- c) Heat number.
- d) Location of sampled area.

Samples of post-tensioning materials and the dry grout mixture shall be submitted to the Contract Administrator as follows:

- a) For strand, 1 sample 1.0 m long from each reel.
- b) For prestressing steel bar, 1 sample 1.0 m long from each heat number.
- c) For anchorages and couplers, samples shall be selected by the Contract Administrator on a random basis.
- d) For dry grout mixture, representative samples of the packaged material shall be submitted to the Contract Administrator when requested.

##### **910.07.05.02                    Post-tensioning of Prestressing Steel**

Post-tensioning shall not commence until the concrete has reached the strength specified in the Contract Documents.

Post-tensioning shall be carried out according to the Contract Documents.

Jacking pressures shall be read with the gauge in a static configuration and shall remain steady until the jacks are released, otherwise subsequent readings shall be recorded.

After post-tensioning, all openings and vents along the post-tensioning system shall be temporarily plugged or sealed until grouting commences.

MTO form PH-CC-701, Request to Proceed, shall be submitted to the Contract Administrator upon completion of the post-tensioning and prior to cutting of tendons and grouting.

Cutting of tendons and grouting shall not proceed until MTO form PH-CC-702, Notice to Proceed has been received from the Contract Administrator.

**910.07.05.03****Measurement of Tensioning and Variation in the Post-Tensioning Force**

Friction losses in jacks, hoses, and connections shall be determined and recorded. The force in the tendons shall be determined by means of the pressure gauge and shall be continually verified by measuring the tendon elongation. The pressure gauge readings and the elongations shall be recorded at intervals of 25% of the maximum force and shall include the final reading.

The measured elongations of individual tendons, at the specified jacking force and based on the gauge pressures, shall be within - 3 to + 9% of the calculated values. If the actual elongation is outside this tolerance, jacking of that tendon shall stop and the Contractor shall prepare and submit a report rationalizing the observed difference.

The variation from the specified total post-tensioning force over the entire component cross-section, including any broken strands, shall not exceed  $\pm 5\%$ . The distribution of the variation of the total post-tensioning force across the component cross-section shall be subject to the approval of the Contract Administrator.

**910.07.05.04****Maximum Tension**

In no case shall the low relaxation steel be tensioned above 85% of its tensile strength and in no case shall any steel be tensioned above 94% of its yield strength.

**910.07.05.05****Post-Tensioning Records**

Upon completion of all post-tensioning operations, the Contractor shall submit to the Contract Administrator, records of elongation, calibrated jacking pressure readings, slippages, and strand breakages.

**910.07.05.06****Cutting of Tendons**

Care shall be exercised at all times in the cutting of tendons to avoid the possibility of adversely affecting the pre-stressing steel.

Cutting of the tendons shall be by mechanical means.

**910.07.06****Grouting****910.07.06.01****General**

Grouting shall be carried out as soon as possible, but in no case shall any post-tensioning ducts be left un-grouted for more than 7 Days from the date of the Contract Administrator's completed MTO form PH-CC-702, Notice to Proceed, or more than 21 Days from the time of first installation of prestressing within ducts.

The temperature of the concrete and the ducts shall not be less than 5 °C or higher than 30 °C before grouting commences and for at least 72 hours after grouting has been completed.

Grouting shall not proceed when the ambient air temperature is expected to exceed 28 °C or fall below 2 °C at the time of grouting or within the 48 hour period following the grouting operation.

The preparation, mixing and grouting procedures shall follow manufacturer's instructions unless otherwise specified in this specification.

**910.07.06.02****Preparation for Grouting****910.07.06.02.01****General**

Dry, oil free compressed air shall be blown through each duct. Each vent shall be tested in turn to ensure that the ducts, vents, inlets, and outlets are capable of accepting the injection of grout.

All ducts shall be free of all deleterious material that may impair bonding of the grout to the ducts and tendons. The use of steam or flushing with water is not permitted.

#### **910.07.06.02.02          Duct Air Test**

An air test shall be carried out on all ducts prior to grouting according to PTI/ASBI M50.3.

#### **910.07.06.03          Grout Mixing**

Grout mixture showing evidence of dampness, lumps, hardened pieces, or contamination shall not be incorporated in the work.

A standard batch size shall be established and the size of the batch to be used shall be reported to the Contract Administrator prior to commencement of grouting. The standard batch size shall be used throughout the grouting operation.

The time interval between the addition of the water to the dry grout in the mixer and pumping of the grout shall not exceed 30 minutes. Water shall not be added to the grout after initial mixing.

The holding tank shall be kept partially full at all times during the pumping operation to prevent air from being drawn into the duct.

#### **910.07.06.04          Temperature of Grout**

When the ambient air temperature exceeds 15 °C, the grout shall be stored and protected in a shaded area.

The temperature of the grout in the holding tank at the time of injection shall meet the manufacturer's instructions, but shall not exceed 35 °C. Temperature shall be measured hourly.

#### **910.07.06.05          Grouting Procedures**

All grout vents of each duct shall be open when grouting starts. The elevation of the end of the injection vent, at the free end, shall be higher than the high point vents along the duct.

Grouting shall commence as soon as possible after mixing is complete. The grout shall be continuously pumped from the lowest grout inlet without any interruptions. The one-way flow of grout shall be maintained throughout the grouting operation. The pumping pressure at the injection vent shall not exceed 1 MPa.

The method of injection shall ensure that the ducts are completely filled with grout and the tendons or prestressing steel bars encapsulated with grout.

The consistency of grout flowing from a vent shall be examined to determine whether or not the grout is of the same consistency as that being pumped into the injection vent. When the grout is of the same consistency, an additional 5 litres of grout shall be allowed to flow out prior to closing that vent. An additional 20 litres of grout, minimum, shall be pumped out the final outlet until consistency is achieved and no visible signs of air is being ejected. The outlet at the end of the tendon shall not be permanently closed until the wet density consistently meets the established acceptable range.

As grout of original consistency flows from the vents, the vents shall be successively closed as the filling of the duct progresses. When grout of original consistency flows from the ejection vent at the free end, that vent shall be closed. The injection tubes shall be sealed off under pressure when the duct is completely filled with grout. A pressure of approximately 500 kPa shall be maintained for at least 1 minute after sealing. Grout vents shall not be reinjected to burp the ducts.

The grout tubes shall be topped up with grout if subsidence of grout occurs when disconnecting the pump or pressure apparatus so that grout completely fills the ducts and openings. After the grout has hardened, the grout tubes shall be cut off flush with the surface of the deck and any tubes not completely full of grout shall be topped up with grout flush with the surface of the concrete.

After grouting is completed, any residue of grout remaining on concrete surfaces adjacent to the vents shall be removed.

After grouting, loads shall not be applied to or removed from the structure until the grout has reached a minimum compressive strength of 20 MPa. For the purposes of this clause, removal of falsework and formwork shall not constitute a load on the structure.

#### **910.07.07                      Material Sampling and Testing**

##### **910.07.07.01                      Grout Mixture**

##### **910.07.07.01.01                      General**

Field trial batch testing shall be carried out on site using the same equipment, materials, and personnel to be used in grouting production.

Production testing shall be carried out at the time of grouting.

Field sampling and testing shall be performed by a person certified according to the Testing of Plastic Concrete clause of OPSS 1350. Additionally, test cubes for compressive strength testing shall be prepared by personnel from a testing laboratory certified by an organization accredited by the Standards Council of Canada according to CSA A283 for Additional Tests according to CSA A3004-2C.

##### **910.07.07.01.02                      Field Trial Batch Testing**

At least 7 Days prior to the grouting operation, a trial batch shall be carried out to ensure that the grout meets the specified requirements. The Contractor shall notify the Contract Administrator of the date and location of the trial batch at least 7 Days prior.

The trial batch shall consist of the following tests, at minimum:

- a) Pumpability and fluidity test according to clause 4.4.7 of PTI M55.1.
- b) Wick-induced bleed test according to clause 4.4.8.1 of PTI M55.1 or, alternatively, Schupack pressure bleed test according to clause 4.4.8.2 of PTI M55.1.
- c) Chloride ion content according to clause 3.3.4 of PTI M55.1 from a sample of the grout with the same water source to be used for the operation. Testing shall be completed by an independent testing laboratory.

##### **910.07.07.01.03                      Production Testing of Plastic Grout**

Prior to grouting, the fluid grout shall be sampled from the mixer or holding tank of the mixer immediately following completion of mixing in the presence of the Contract Administrator. The sample batch of grout shall be tested for the following:

- a) A pumpability and fluidity test shall be carried out according to clause 4.4.7 of PTI M55.1. The efflux time shall be within 5 seconds of the previously measured trial batch values and not less than 5 seconds in total. Measurements shall be performed immediately after the grout is removed from the mixer and 30 minutes after mixing. After 30 minutes has elapsed since mixing, the grout shall be remixed for 30 seconds before testing again for efflux time. Subsequent fluidity tests shall be carried out at the mixer and the end outlet every 2 hours during grouting operations.

The grout used for the first set of fluidity measurements shall be discarded after testing and shall not be used for the 30 minute measurement. The grout used for the 30 minute measurement shall be left undisturbed in a clean container covered with a lid until the measurement is performed.

- b) One wick-induced bleed test shall be initiated prior to the start of grouting according to clause 4.4.8.1 of PTI M55.1.

- c) A wet density (mud balance) test shall be performed for the initial batch of grout and every 2 hours at the mixer and the outlet to establish batch consistency, according to PTI M55.1. The permitted density range shall be specified by the grout manufacturer. The density at the outlet shall be equal to or greater than the value measured at the mixer. If the density at the outlet is lower, then additional grout shall be pumped until consistency is achieved.

The results of the fluidity, wick-bleed, and wet density tests shall be submitted to the Contract Administrator. Any test result that indicates the grout is not meeting the requirements specified herein shall be immediately reported to the Contract Administrator with proposed corrective measures.

#### **910.07.07.01.04            Sampling for 28-day Compressive Strength Acceptance Testing**

Cubes for determination of the compressive strength of the grout shall be cast and cured according to CSA A3004-C2 for testing of 28-Day compressive strength by the Owner. Two sets of six cubes shall be cast per lot, one set for acceptance testing and one set for referee testing, if invoked. The Contract Administrator shall randomly select the batch from the Day's production from which the acceptance and referee samples are taken.

Stainless steel moulds provided by the Contract Administrator shall be used for preparing cubes for compressive strength tests.

The specimens shall be stored at a temperature between 15 °C and 25 °C and shall not be moved prior to demoulding. The specimens shall be demoulded and transported to the designated laboratory within 24 hours ± 4 hours. The samples shall be transported in a sealed white opaque plastic bag containing at least 250 ml of water and maintained at a temperature between 15 °C and 25 °C.

#### **910.07.07.01.05            Early Compressive Strength Tests**

Prior to early loading, it shall be demonstrated that the grout has attained a compressive strength of 20 MPa. Grout cubes for compressive strength testing shall be prepared, stored, demoulded and tested according to CSA A3004-2C.

The laboratory conducting the early compressive strength tests shall be CSA certified as specified herein.

#### **910.07.07.01.06            Access for Quality Assurance**

Unhindered access for inspection and testing of all the work shall be provided to the Contract Administrator or the Owner's representative. Any debris and obstructions shall be removed to allow access for the purposes of dimensional measurements and/or inspection.

#### **910.07.08                    Post Grout Inspection**

A post-grout inspection shall be carried out 24 hours after grouting by the prestressing personnel. The prestressing personnel shall be according to the Prestressing Personnel subsection. An inspection report shall be submitted to the Contract Administrator within 7 Days of grouting. The report shall describe, with photos, any leaks, cracks, voids or other deficiencies found and shall note locations of deficiencies, if present.

#### **910.07.09                    Inspection after Cutting Tendons and after Grouting**

Placement, stressing, and grouting of the post-tensioning system shall be carried out as specified in the Contract Documents.

A MTO form PH-CC-822, Certificate of Conformance shall be submitted to the Contract Administrator upon completion of cutting tendons and after grouting.

#### **910.07.10                    Management of Excess Material**

Management of excess material shall be as specified in the Contract Documents.

## **910.08 QUALITY ASSURANCE**

### **910.08.01 General**

The acceptance of post-tensioning system shall be according to the requirements of this specification, including satisfactory completion of any repairs. Repairs shall not be carried out without the prior written acceptance by the Contract Administrator.

### **910.08.02 Acceptance of Post-tensioning System**

Acceptance shall be based on:

- a) Acceptable 28-Day Compressive strength of the grout.
- b) The post-tensioning system being free of voids, contamination, or defects.
- c) No damage to prestressing steel, anchorages, ducts, vents, and other system components.
- d) No visible damage to prestressing steel including but not limited to yielding, pitting, nicks, heat damage or excessive corrosion. Any damage to the prestressing steel listed here shall be cause for rejection.
- e) No damaged or blocked ducts or incompletely filled tendons. Any one of the defects/deficiencies listed here shall be rejectable and shall be repaired to the satisfaction of the Contract Administrator.

### **910.08.03 Acceptance 28-Day Compressive Strength of Grout**

#### **910.08.03.01 Lot Size**

A lot shall consist of all the grout from one Day's placement of grout.

#### **910.08.03.02 Acceptance Testing**

One set of six cubes shall be tested for 28-Day compressive strength per lot to determine the acceptance of the lot. The compressive strength of a lot shall be the average of the set of the six cubes.

Compressive strength shall be determined according to CSA A3004-C2.

Compressive strength shall be considered acceptable when the lot strength is greater than or equal to the specified 28-Day compressive strength.

Unacceptable grout shall be subject to removal and replacement.

#### **910.08.03.03 Referee Testing**

##### **910.08.03.03.01 General**

The referee testing process for 28-Day compressive strength of grout is based on duplicate cubes cast at the same time as the acceptance cubes.

Referee testing of compressive strength for a lot may only be invoked by the Contractor within 3 Business Days of receiving the test results for that lot.

The referee laboratory shall be designated by the Owner. Referee test results shall be forwarded to the Contractor as they become available.

If the difference between the referee test result and the acceptance test result is less than or equal to the confirmation value, then the acceptance test result is confirmed, and the acceptance test result shall be used in the determination of acceptance for the grout. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed, and the acceptance test result shall be disregarded, and the referee results shall be used in the determination of acceptance. The confirmation value for confirming the acceptance test result shall be the greater of 10% of the specified strength or 10% of the strength of the acceptance cubes, expressed to one decimal place.

**910.08.03.02 Referee Testing Cost**

The cost of compressive strength referee testing shall be as specified in the Contract Documents.

When the referee result confirms the acceptance test result, the Contractor shall be charged the cost of compressive strength referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

**910.08.04 Acceptance of Prestressing Steel**

Acceptance of prestressing steel shall be according to OPSS 1440.

**910.10 BASIS OF PAYMENT**

**910.10.01 Longitudinal Stressing System - Item  
Transverse Stressing System - Item  
Vertical Stressing System - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Materials to do the work.

SSPC-CS 23.00 / AWS C2.23M/NACE No.12-2016      Application of Thermal Spray Coatings (Metallizing) of Aluminum, Zinc, and Their Alloys and Composites for Corrosion Protection of Steel

### **Others**

Federal Standard 595C Colors, 2017 - Published by U. S. General Services Administration

## **911.03                      DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Coating** means a liquid, liquefiable, or mastic composition that is converted to a solid protective, decorative, or functional adherent film after application as a thin layer.

**Coating System** means a number of coats of metallic or paint coating, or both, separately applied in a predetermined order at suitable intervals to allow for setting, drying, or curing.

**Dry Film Thickness** means the thickness of a coating after it has dried throughout, after all the solvent has evaporated, and the coating has cured.

**Escape** means any visible emission or settlement of dust or debris, including abrasive media, paint chips, and coating material, outside the limits of the enclosure resulting from surface preparation or coating application.

**Faying Surface** means the mating surface of a member that is in contact with the mating surface of another member when joined together.

**Final Surface Preparation** means surface preparation as specified in the Contract Documents.

**Interim Surface Preparation** means an incomplete surface preparation that does not meet the requirements for the final surface preparation.

**Metallic Coating** means hot dip galvanizing or thermal sprayed metal coating.

**Metallizing** means application of thermal sprayed metal coating.

**Paint Coating** means a liquid or mastic composition that upon drying or curing is converted to a solid protective, decorative, or functional adherent film after application as a thin layer.

**Paint Coating System** means a number of coats of paint coating separately applied in a predetermined order at suitable intervals to allow for setting, drying, or curing.

**Power Washing** means the use of low-pressure water to remove contaminants from the surface without damaging the coating. The water pressure shall be within the range of 7 to 10 MPa.

**Railing System** means steel tube rails, steel panels, steel posts, steel caps, steel panel anchorages, and steel splash guards, including all steel connections.

**Recoat Time** means the time recommended by the manufacturer for drying, curing, or setting of paint coating prior to application of subsequent coat.

**Seal Coat** means a paint coating used to seal thermal sprayed metal coating.

**Slip Critical Connection** means a connection where slippage cannot be tolerated, including those subject to fatigue or to frequent load reversal, or where the resultant deflections are unacceptable.

**Spent Material** means the spent abrasive, removed coating material, rust, or other debris or a mixture thereof generated during surface preparation.

**Spot Measurement** means the average of the three gauge readings taken per spot.

**Structural Steel** means the steel components of a structure, including lighting poles, traffic signal poles, bearing assemblies, deck drains, piles, and all other steel appurtenances and connections, excluding railing systems.

**Surface Profile** means the surface contour of a blast or power tool cleaned substrate, when viewed from the edges of the surface.

**Sweep Blasting** means a process of rapid movement of abrasive blast nozzle over a surface to remove deleterious substances and to roughen its surface profile.

## **911.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **911.04.01 Design Requirements**

Design of enclosures and temporary supports shall be according to CSA-S6, Structural Manual, and OPSS 919.

### **911.04.02 Submission Requirements**

#### **911.04.02.01 General**

Except for the material certification for the coating material, five sets of each of the following submissions shall be submitted to the Contract Administrator at least 3 weeks prior to commencement of the coating operations, for information purposes only.

#### **911.04.02.02 Written Notices**

Written notice submissions shall include:

- a) Details of the methods, procedures, and sequence of operations to be employed to complete the work, including Working Drawings and schedules.
- b) Details of surface preparation and coating of areas that are difficult to access. This shall include an identification of all areas that are difficult to access, methods of surface preparation and level of surface preparation achievable if different than specified in the Contract Documents, and method of coating application.
- c) Details of the proposed method for management of excess materials including collection, containment, and disposal of all solid and liquid wastes.

#### **911.04.02.03 Working Drawings**

##### **911.04.02.03.01 Environmental Protection**

When the Contract contains a tender item for environmental protection, the Working Drawings shall include a detailed description of the environmental protection to be employed, including details of the enclosure, erection of the enclosure, and relocation procedure for the enclosure and equipment.

#### **911.04.02.03.02          Restriction on Construction Loads**

##### **911.04.02.03.02.01      General**

Working Drawings shall show the location and magnitude of all applied construction loads.  
The Working Drawings shall:

- a) State that the bridge, including all components that the Contractor requires to support the enclosure system, can safely support all loads, including construction loads according to CSA-S6 and the Structural Manual; and,
- b) Shall bear the seals and signatures of two Engineers who shall also verify the actual field condition of the structure prior to certifying the Working Drawings.

Where the applied construction loads exceed the limits specified in the Construction Load Limits clause, two Engineers shall be retained who shall act as an evaluation Engineer and a design-checking Engineer to carry out a structural evaluation. Such evaluation shall ensure that the bridge can safely support all loads according to CSA-S6 and the Structural Manual, including construction loads imposed on the bridge based on the Contractor's method of construction. A synopsis of the evaluation, including detailed calculations and notes, shall be prepared and, when requested, be made available to the Contract Administrator. The documents shall bear the seals and signatures of both the evaluation Engineer and the design-checking Engineer. Documentation of such evaluation shall be retained for a period of six years after the Contract Administrator has issued a Certificate of Completion.

##### **911.04.02.03.02.02      Construction Load Limits**

- a) Slab on Girder Structures
  - i. 400 kg per support point with a maximum of two support points loaded per girder per span, or
  - ii. The specified uniformly distributed load per linear metre of the girder.
- b) Truss or Arch Structures
  - i. 400 kg per panel point with a maximum of two panel points loaded on a truss or arch, or
  - ii. The specified load per panel point.

#### **911.04.02.04                  Paint Coating Product Data Sheets**

Product data sheet submissions shall include the manufacturer's product data sheets showing the following:

- a) Recommended maximum dry film thickness.
- b) The mixing and thinning directions.
- c) The recommended spray nozzles and pressures.
- d) The recommended temperature range and acceptable humidity levels for application.
- e) The minimum acceptable recoat time period for temperatures in the intervals of 5 °C from 0 to 30 °C.

**911.04.02.05                      Material Certification**

**911.04.02.05.01                      Coating Manufacturer's Certification**

Prior to commencement of the coating application, the Contract Administrator shall be supplied with written certification from the coating manufacturer stating that all materials supplied are as specified in the Contract Documents and the manufacturer's current product data sheets.

**911.04.02.05.02                      Certification of Abrasive Media**

Prior to abrasive blasting, the Contract Administrator shall be supplied with written certification from a laboratory certified by an organization accredited by the Standards Council of Canada stating that the abrasive media meets the material requirements specified in this specification.

**911.05                                      MATERIALS**

**911.05.01                                      Abrasive Media**

**911.05.01.01                                      General**

Abrasive media shall have a conductivity not exceeding 1,000 micro Siemens ( $\mu\text{S}$ )/cm, when tested according to ASTM D4940.

Except for abrasive blast cleaning of galvanized surfaces, the abrasive media shall have a hardness of 6 or greater on the Mohs scale. There shall be no presence of oil.

The testing for hardness and presence of oil shall be according to SSPC-AB 1.

The maximum moisture shall be 0.5% by weight, when tested according to ASTM C566.

**911.05.01.02                                      Paint Coating on Galvanized Surfaces**

The abrasive media used for surface preparation of galvanized surfaces prior to receiving paint coating shall be of such hardness that the galvanized coating is not damaged.

**911.05.01.03                                      Thermal Sprayed Metal Coatings**

Abrasive media used for the surface preparation for thermal spray metal coating application shall be sufficiently hard and sharp to produce an angular surface profile on to the steel substrate such that the subsequent metal coating shall meet the bond strength requirements specified. Shot or other abrasives producing a rounded or peened profile shall not be used.

**911.05.02                                      Compressed Air**

Compressed air used during all work operations shall be clean, dry, and free from oil residues, when tested according to ASTM D4285.

**911.05.03                                      Metal Coatings**

**911.05.03.01                                      Hot Dip Galvanizing**

Purity of the zinc and the galvanizing bath composition for hot dip galvanizing of structural steel shall be according to ASTM A123/A123M.

Material for repair of galvanized surfaces shall be either zinc-tin-copper solder for repair by soldering or metallizing wire for repair by metallizing.

In addition to the above materials, the use of the following paint coatings is permitted for repair of galvanized surfaces on new structural steel sign support structures and sectional steel high mast lighting poles:

- a) For the repair of overhead trusses by paint coating, all three coats of the epoxy zinc/epoxy/polyurethane system shall be included on the ministry's DSM. The colour of the finish coat shall be equivalent to 17178 aluminum according to Federal Standard 595C colors.
- b) For the repair of sign support columns and sectional steel high mast lighting poles that are specified to receive a subsequent paint coating, epoxy zinc primer shall be included on the ministry's DSM.

#### **911.05.03.02 Thermal Sprayed Metal Coatings**

Thermal sprayed metal coatings shall be according to SSPC-CS 23.00/AWS C2.23M/NACE No.12. The metallizing wire shall be an alloy consisting of 85% zinc and 15% aluminum that is according to the requirements of ASTM B833.

#### **911.05.03.03 Zinc-Tin-Copper Solder**

The zinc-tin-copper solder shall be 50% zinc, 49% tin, and 1% copper used with the manufacturer's recommended flux.

#### **911.05.04 Paint Coatings**

##### **911.05.04.01 General**

Paint coating shall be according to OPSS 1704 and as specified in the Contract Documents.

Only paint coatings contained in the original containers sealed by the manufacturer shall be used.

##### **911.05.04.02 Paint Coating Systems for Coating Galvanized Surfaces**

Where specified in the Contract Documents, one of the approved paint systems for coating galvanized surfaces from the ministry's DSM shall be applied to hot dipped galvanized components that require subsequent paint coating.

The colour of the finish coat shall be equivalent to 16307 grey according to Federal Standard 595C, unless otherwise specified in the Contract Documents.

##### **911.05.04.03 Rapid Deployment Coating Systems for Structural Steel**

Where specified in the Contract Documents, one of the approved paint systems for rapid deployment coating systems from the ministry's DSM shall be applied to structural steel.

##### **911.05.04.04 Seal Coat**

The seal coat shall be as specified in the Contract Documents.

## **911.06 EQUIPMENT**

### **911.06.01 Scaffolds**

The coated areas of the structure, coming into contact with rollers, clamps, and other parts of the scaffolding and access facilities shall be protected using rubber or other material to prevent damage to the coating.

### **911.06.02 Spray Pot**

The agitators in the spray pot shall extend to within 25 mm of the bottom of the pot to ensure proper mixing of paint components prior to spray application.

## **911.07 CONSTRUCTION**

### **911.07.01 General**

The extent of work, cleaning requirements, surface preparation, environmental protection requirements, and type of coating system shall be as specified in the Contract Documents.

Where there is a conflict between the manufacturer's recommendations and the Contract Documents, the more stringent requirements shall apply as determined by the Contract Administrator.

All components coated off-site shall be protected from handling or shipping damage by using padded slings, separators, and tie downs or other similar devices. Loading procedures shall be designed to protect coated surfaces from any possible damage to the coating.

Components of structural steel sign support structures and sectional steel high mast lighting poles that are to be hot dip galvanized shall be according to the Contract Drawings. Components of structural steel sign support structures and sectional steel high mast lighting poles that are to be hot dip galvanized and subsequently paint coated shall be according to the Contract Drawings.

The Contract Administrator shall be granted access to the galvanizing and painting shops where components are being cleaned and coated, during all hours of work.

Galvanized steel components, when stored, shall be stored in a manner to avoid wet storage stain. Components shall be stored above ground on skids or other supports. Careful consideration shall be given to how galvanized steel components are stacked and bundled to ensure adequate air flow.

### **911.07.02 Operational Constraints**

A MTO form PH-CC-701, Request to Proceed, shall be submitted to the Contract Administrator when the surface preparation and each subsequent phase of work of coating application are completed and ready for inspection.

Subsequent work shall not commence until the Contract Administrator has completed the inspection of the work completed and issued a MTO form PH-CC-702, Notice to Proceed.

Welding, cutting, or drilling of existing structural steel shall not be permitted unless approved by the Contract Administrator.

All structural rehabilitation work shall be completed prior to commencing the coating operations.

Surfaces adjacent to areas to be cleaned and coated shall be protected from damage during surface preparation and coating application.

When there is partially completed coating work at seasonal shutdown, the following operations shall be carried out immediately prior to commencement of coating application in the next construction season:

- a) Areas that have been coated but have not received the finish coat shall be power washed using potable water and allowed to dry thoroughly.
- b) Partially completed coating exhibiting rust or rust stains shall be removed, and the surface shall be cleaned to the original surface preparation standard as specified in the Contract Documents and re-coated with the specified coating system or an alternative coating system acceptable to the Contract Administrator.

## **911.07.03                      Surface Preparation and Surface Profile**

### **911.07.03.01                      General**

Fins, slivers, burred, or sharp edges weld spatter; or slag shall be removed by power grinding prior to the surface preparation and coating application. Edges of all structural steel specified to be cleaned and coated shall be ground to a smooth radius of at least 3 mm by hand or power tools prior to abrasive blast cleaning.

Final surface preparation for coating application shall only be carried out when the temperature, moisture, and humidity satisfy the criteria specified in SSPC-PA 1 for coating application.

The temperature, moisture, and humidity limitations do not apply to interim surface preparation. The Contract Administrator shall be notified of interim surface preparation work prior to commencement of the work.

### **911.07.03.02                      New Structural Steel**

New structural steel specified to be cleaned and paint coated shall be abrasive blast cleaned to the requirements of SSPC-SP 10/NACE No. 2. The abrasive blast cleaning shall provide a surface profile height of a minimum of 40 µm and a maximum of 75 µm.

### **911.07.03.03                      Existing Structural Steel**

Existing structural steel that has been specified to be cleaned and paint coated in the Contract Documents, shall be abrasive blast cleaned to the requirements of SSPC-SP 10/NACE No. 2. The abrasive blast cleaning shall provide a surface profile height of a minimum 40 µm and a maximum of 90 µm for paint coating application.

### **911.07.03.04                      Existing Steel Railing Systems**

The steel components in the handrail panels shall be cleaned to the requirements of SSPC-SP 8. The steel components in the posts, caps, and panel anchorages on steel posts shall be abrasive blast cleaned to the requirements of SSPC-SP 5/NACE No.1. The abrasive blast cleaning shall provide a surface profile height of a minimum of 50 µm and a maximum of 100 µm for thermal sprayed metal coating application.

The steel panel anchorages on the concrete posts shall be abrasive blast cleaned to the requirements of SSPC-SP 10/NACE No.2.

### **911.07.03.05                      Paint Coating on Galvanized Surfaces**

Galvanized surfaces to be paint coated shall be prepared according to ASTM D6386.

Thick edges due to excess liquid zinc run-off during the galvanizing process; high spots; and rough edges, such as metal drip line, shall be removed by clean hand or power tools to ensure smooth surface. The excess zinc shall be removed until it is flush with the surrounding area. Any oil or grease on the surface shall be removed by solvent cleaning according to SSPC-SP 1. Surface preparation shall be performed by sweep blasting to roughen the surface using an abrasive of such hardness that the galvanized coating is not damaged.

After sweep blasting and prior to the application of the paint coating, the galvanized surface shall be examined and repaired, as required. The dry film thickness of the zinc coating after sweep blasting shall be according to ASTM A123/A123M.

#### **911.07.03.06 Thermal Sprayed Metal Coating**

Structural steel surfaces specified to receive a thermal sprayed metal coating shall be abrasive blast cleaned to the requirements of SSPC-SP 5/NACE No.1. The abrasive blast cleaning shall provide a surface profile height of a minimum of 50 µm and a maximum of 100 µm.

#### **911.07.03.07 Hot Dip Galvanizing**

Existing structural steel specified to be hot dip galvanized shall be first abrasive blast cleaned to SSPC SP 6/NACE No.3 to remove the existing paint coatings and rust and then the components shall be cleaned to the requirements of SSPC-SP 8 prior to being galvanized.

New structural steel shall be cleaned to the requirements of SSPC-SP 8 prior to galvanizing.

The length of time that all steel components are immersed in the pickling solution shall be kept to an absolute minimum to achieve the specified surface preparation condition prior to hot dip galvanizing. The galvanizer shall employ proper pickling and galvanizing procedures as precautionary measures to safeguard against embrittlement, as specified in ASTM A143/A143M.

#### **911.07.03.08 Faying Surfaces**

Faying surfaces of existing and new structural steel components to be connected by bolts shall be cleaned to the surface preparation standard required for the coating system specified.

Faying surfaces of slip critical connections designed to receive Class A or Class B coatings shall have the same blast cleaning as was used in the tests to determine the mean slip coefficient.

#### **911.07.03.09 Surface Preparation of Areas Difficult to Access**

Surface preparation of areas specified in the Contract Documents as difficult to access shall be carried out to the extent practical from the access opening as detailed on the Contractor's submission for methods, procedures, and sequence of work. The surface preparation standard for these areas shall be based on reasonable effort demonstrated in the field acceptable to the Contract Administrator.

#### **911.07.04 Application of Coating**

##### **911.07.04.01 General**

The Contract Administrator shall be notified 48 hours in advance of mixing and applying a paint coating or coating system.

New atmospheric corrosion resistant steel shall be coated with a low Volatile Organic Compound (VOC) epoxy zinc/epoxy/polyurethane system. All other steel shall be cleaned and coated with the coating system as specified in the Contract Documents.

All new A325 bolts and accompanying nuts and washers used with steel specified in the Contract Documents to receive a paint coating or galvanizing shall be Type 1 and shall be galvanized.

Prepared surfaces shall have no dust prior to the application of coating.

Paint coating shall be smooth, continuous, and free of runs and sags. No pinholes or holidays of the paint coating on galvanized components shall be allowed.

#### **911.07.04.02                      Paint Coating Systems**

##### **911.07.04.02.01                  General**

All paint coating systems shall be stored, thinned, handled, mixed, and applied according to SSPC-PA 1 and the recommendations on the manufacturer's product data sheets.

When there is a drop in temperature after the coating has been applied, the recoat time period shall be according to the manufacturer's product data sheets for the lower temperature.

All rivets, bolts, nuts, washers, and pitted areas shall be stripe coated with the primer and with the top coat material by brush, in addition to spray application. Stripe coating with the primer shall be carried out after the spray application of the primer. For projects where the inorganic zinc primer is specified, an epoxy-zinc primer from the same manufacturer shall be used for stripe coating. Stripe coating with the top coat material shall be carried out prior to the spray application of the finish coat. Stripe coating shall be according to SSPC-PA 11.

Bearing shoe plates or bevelled plates or both at girder locations where coating of the girders has been specified in the Contract documents shall also be coated using the specified coating system.

For each coat of paint, the initial pass of the spray gun shall be directed at the outside edges of the steelwork prior to completely coating all surfaces.

All runs and sags shall be brushed out as the application progresses.

Application related failures in coatings, as described in the Coating Failures chapter of the SSPC Painting Manual Volume 1, shall be corrected prior to the application of a subsequent coat and, in the case of the top coat, after the application of the top coat.

Where excessive coating thickness produces "mud cracking" in zinc rich coating materials, the coating shall be scraped back and sanded to a soundly bonded coating and the area recoated to the required thickness.

All dry spray shall be removed by sanding and the coating reapplied as specified in the Contract Documents.

##### **911.07.04.02.02                  New Structural Steel**

All new structural steel including diaphragms, excluding surfaces in contact with concrete and the faying surfaces of bolted joints, shall be coated to the extent as specified in the Contract Documents.

The maximum time between final surface preparation and prime coat application inside the shop shall be 24 hours. Structural steel subjected to outdoor exposure after final surface preparation shall be prime coated within 10 hours.

All coats of the specified paint coating system shall be shop applied.

Prior to assembly, surfaces not in contact with other steel surfaces, but that are inaccessible after assembly shall have all coats applied.

Surfaces inaccessible for coating after erection shall be coated prior to erection.

At least 100 mm of bare metal and 100 mm of each coat of the new system shall be left exposed for lapping of subsequent coats, where the continuous application of paint or final surface preparation is interrupted in a section.

#### **911.07.04.02.03      Existing Structural Steel**

Except for metallizing and hot dip galvanizing, the maximum time between final surface preparation and the prime coat application shall be 10 hours.

When work operations require bolt connections of structural steel components, faying surfaces of existing structural steel shall have only the prime coat applied, prior to assembly.

When tying into existing coatings, that portion of the existing coating within 300 mm of the edge of the new coating shall be power washed using potable water to remove all contaminants. The edges of the existing coating shall be feathered into areas cleaned to bare steel so that at least 4 mm of each coat of the existing coating is exposed.

#### **911.07.04.02.04      Paint Coating on Galvanized Surfaces**

All coats of the paint system shall be shop applied.

When surface preparation is done indoors and the galvanized steel component remains indoors at all times until coating is completed, the maximum time allowable between surface preparation by sweep blasting and prime coat application shall be 24 hours provided that the relative humidity within the shop is maintained at 50% or below 50% for the entire 24-hour period. If the prepared galvanized steel component is exposed outdoors or if it is kept indoors and the relative humidity is above 50%, the maximum time between final surface preparation by sweep blasting and prime coat application shall be 4 hours.

#### **911.07.04.02.05      Faying Surfaces**

##### **911.07.04.02.05.01      General**

Faying surfaces of bolted connections shall have only the prime coat applied.

Exterior surfaces of the bolted connections within a distance of 25 mm around the edge of the bolt holes and against which the bolt head or washer is going to be bearing shall receive only the prime coat. Any exposed areas of primer not covered by the bolt head or washer after the installation of the bolts shall be touched up with the second and third coats of the specified coating system.

Faying surfaces left exposed to UV radiation for extended periods of time may begin to chalk. All necessary precautions shall be taken to prevent chalking if bolted connections will not be assembled within 3 months. If chalking is present at the time of assembly, it shall be removed by washing the surface with an appropriate cleaner and rinsing with potable water, or as recommended by the coating manufacturer.

##### **911.07.04.02.05.02      Slip Critical Connections**

Faying surfaces of slip critical connections designed to receive Class A or Class B coatings shall have the same coating application as was used in the tests to determine the mean slip coefficient. Slip critical connections shall not be assembled before the coating has cured for the minimum time that was used in the qualifying tests and identified in the coating manufacturer's written instructions.

At slip critical connections on paint coated components, the surface within the bolt pattern, and for a distance of 50 mm beyond the splice plates shall receive only the prime coat of paint, prior to assembly.

Prime coated surfaces that are exposed after assembly shall receive the second and third coats of the paint system after cleaning of the surfaces according to manufacturer's recommendations.

Faying surfaces of galvanized components of slip critical connections shall be hot dip galvanized according to the requirements of ASTM A123/A123M. Power or hand wire brushing is not permitted. These faying surfaces shall not be subsequently paint coated.

#### **911.07.04.02.06          Dry Film Thickness**

Dry film thickness shall be as listed on the ministry's DSM. If not listed on the ministry's DSM, dry film thickness shall be according to the following:

- a) An epoxy-zinc, water-based acrylic, water-based acrylic coating system shall consist of three coats with dry film thickness according to Table 1.
- b) An epoxy-zinc, epoxy, polyurethane coating system shall consist of three coats with dry film thickness according to Table 2.
- c) An inorganic-zinc, water-based acrylic, water-based acrylic coating system shall consist of three coats with dry film thickness according to Table 3.
- d) An inorganic-zinc, epoxy, polyurethane coating system shall consist of three coats with dry film thickness according to Table 4.
- e) Three-coat moisture-cured polyurethane (MCU) coating system with zinc-rich primer shall consist of three coats with dry film thickness according to Table 5.
- f) A coal tar epoxy coating system shall consist of two coats with dry film thickness according to Table 6.
- g) High build epoxy prime coat, aliphatic polyurethane topcoat coating system for coating galvanized surfaces shall consist of two coats with dry film thickness according to Table 7.
- h) Modified aluminum epoxy mastic prime coat, aliphatic polyurethane topcoat coating system for coating galvanized surfaces shall consist of two coats with dry film thickness according to Table 7.

#### **911.07.04.02.07          Repair of Paint Coatings on New and Existing Structural Steel**

Damaged areas of paint coated surfaces shall be prepared to the original surface preparation standard specified and by feathering the edges of sound coatings. For damaged areas of less than 100 cm<sup>2</sup>, power tool cleaning according to SSPC SP 11 may be used for surface preparation. The prepared surfaces shall be recoated with the originally applied materials, except for inorganic zinc primer, which shall be recoated with an epoxy zinc primer from the same manufacturer. The dry film thickness of all the three coats in the repair area shall be as specified for the initial application.

#### **911.07.04.02.08          Repair of Paint Coatings on Galvanized Surfaces**

Painted galvanized surfaces where the paint coating has been damaged shall be carefully prepared by hand or power tool cleaning and the edges, including at the interface of the uncoated areas of the faying surfaces, shall be feathered. The prepared surfaces shall be recoated with the specified materials according to the manufacturer's product data sheets.

In areas where the galvanized coating beneath the paint coating is also damaged, the repair of paint coating shall be performed upon completion of the repair of galvanized coating.

### **911.07.04.03 Metal Coatings**

#### **911.07.04.03.01 Hot Dip Galvanizing**

At least 72 hours prior to the commencement of galvanizing, the Contract Administrator shall be given written notice of the intent to hot dip galvanize including a schedule for hot dip galvanizing of various components. Hot dip galvanizing done without this prior notification may be rejected.

Galvanized surfaces that are to receive a subsequent paint coating shall be identified when delivered to the hot dip galvanizer. These surfaces shall be air cooled. Passivation treatment or water quenching shall not be permitted.

Hot dip galvanizing shall be according to ASTM A123/A123M. Hot dip galvanizing of structural bolts and steel hardware that are to be centrifuged or otherwise handled to remove excess zinc shall be according to ASTM A153/A153M.

Girders, diaphragms, and all other structural steel components shall be handled in such a manner to ensure that the components do not get warped or distorted during or immediately after hot dip galvanizing. The lifting system during handling of girders shall consist of a spreader beam providing support to the girder being galvanized at spacing not greater than 6 m.

Web of girders shall be kept vertical during the galvanizing process and supports at spacing not greater than 6 m shall be provided for placing of the components during cooling after galvanizing.

Two copies of the galvanizer's coating thickness readings shall be submitted to the Contract Administrator after galvanizing and prior to the installation of the component in the structure.

#### **911.07.04.03.02 Thermal Sprayed Metal Coatings**

A written notice shall be submitted to the Contract Administrator 48 hours in advance of surface preparation and thermal metal spray coating application.

The application of thermal sprayed metal coating shall be according to SSPC-CS 23.00/AWS C2.23M/NACE No.12 to provide a minimum of 200 µm coating thickness. Coating thickness shall not exceed 400 µm. Thermal sprayed metal coating shall have a minimum of 4.8 MPa bond strength to the steel substrate when tested according to ASTM D4541 using either Type III or Type V self-alignment tester.

Immediately prior to metallizing, all prepared surfaces shall be cleaned by vacuuming to remove dust, debris, and other surface contaminants. At least one layer of thermal sprayed metal coating shall be applied within 4 hours of blast cleaning or before flash rusting occurs, whichever is sooner. This layer shall cover the peaks of the surface profile. Prior to applying additional sprayed metal to the specified thickness, the first layer of coating shall be visually inspected to verify that the coating surface has not become contaminated. Any contamination between coats shall be removed according to the manufacturer's instructions before any additional material is applied. The coating shall be sprayed to obtain the specified thickness, as soon as possible.

Before starting the work, a 300 x 300 mm steel sample plate similar in composition and thickness to the steel to be coated shall be submitted to the Contract Administrator. This plate shall be cleaned and sprayed on site according to the Contract Documents. The metal coating on the sample plate shall be checked by the Contract Administrator for compliance with the Contract Documents. This plate, when accepted by the Contract Administrator, shall be used as the visual standard to determine the acceptability of the thermal spray metal coating for the entire work.

All thermal metal spray applicators shall demonstrate proficiency in applying the thermal sprayed metal coating on a test patch to the satisfaction of the Contract Administrator prior to commencing full-scale application. The first 600 mm square block pattern application shall be used for this evaluation by the Contract Administrator.

The equipment shall be operated according to the manufacturer's latest written instructions, including air pressure, gun distance to work surface, and gun angle relative to the work surface.

Thermal metal spraying shall be done in a block pattern, typically 600 mm square. The sprayed metal shall overlap 50% on each pass to ensure uniform coverage. The required coating thickness shall be obtained in multiple layers. Each layer shall be applied at right angles to the previous layer. The semi-molten or molten particles of metallizing wire shall be firmly adhered to the substrate; free from lumps, chips, blisters, or loosely adhering particles; and have a fine-sprayed texture.

#### **911.07.04.03.03            Seal Coating of Thermal Sprayed Metal Coatings**

All thermal sprayed metal coated surfaces shall be seal coated within 6 hours after application of thermal sprayed metal coating according to SSPC-PA 1.

Contamination on thermal sprayed metal coated surfaces, including dust and moisture, shall be removed to the satisfaction of the Contract Administrator prior to the application of the seal coat. The seal coat materials shall be mixed and applied according to the manufacturer's instructions. Thinning shall not be done, unless approved in writing by the manufacturer and by the Contract Administrator.

The minimum dry film thickness shall be 100 µm.

#### **911.07.04.03.04            Repair of Hot Dip Galvanizing**

The Contract Administrator shall be notified 24 hours in advance of their intention to carry out the repair of damaged coatings.

Damaged and uncoated areas in galvanized coating shall be repaired, only if the cumulative total of the damaged and uncoated areas does not exceed 2% of the total area of a fabricated assembly or 0.02 m<sup>2</sup>, whichever is smaller. If the cumulative total of the damaged or uncoated area exceeds the above, then the damaged coating shall be stripped and the component re-dipped in a galvanizing bath according to ASTM A123/A123M.

Damaged and uncoated areas shall be cleaned of all rust and other contaminants and repaired using one of the following methods:

##### **a) Soldering Method Using Zinc-Tin-Copper Solder**

The surface preparation of damaged and uncoated areas and the application of the flux and zinc-tin-copper solder shall be according to ASTM A780 and the manufacturer's recommendations. The finished thickness of the metal coating in the repaired area shall be a minimum of 90 µm. The repaired surface shall be ground flush with the surrounding galvanized coating.

For components that are to be subsequently paint coated, repair by soldering shall be performed prior to surface preparation for paint coating application.

##### **b) Thermal Metal Spraying**

The surface preparation and application of thermal spray metal coating shall be done according to SSPC-CS 23.00/AWS C2.23M/NACE No.12 to provide a cumulative thickness of 200-400 µm, applied in two separate coats.

The metal coating on the repaired areas shall have a minimum of 2.8 MPa adhesion when tested according to ASTM D4541 using either Type III or Type V self alignment tester.

When metallizing is to be used for repair of damaged galvanized coating of structural components that are to be subsequently painted, it shall be performed immediately after the surface preparation of the repair area to the specified surface preparation standards and sweep blasting of the entire component, prior to the application of the prime coat of the paint coating system. The prime coat of the paint coating system shall be applied within 6 hours of repair by metallizing.

c) Epoxy Zinc/Epoxy/Polyurethane Paint System

This method of repair of metal coating is permitted on sign support structures and sectional steel high mast lighting poles when:

- a) The individual damaged and uncoated area with exposed steel is less than 625 mm<sup>2</sup>;
- b) The dry film thickness of the galvanized coating of a structural member in localized areas does not meet the specification requirements but exceeds 60 µm; and
- c) The number of repair spots does not exceed 6 per galvanized overhead truss or a column or a section of sectional steel high mast lighting pole.

All three coats given for the system listed on the ministry's DSM shall be used for repair of galvanized coating defects on overhead trusses.

Only the epoxy zinc primer listed on the ministry's DSM shall be used for repair of galvanized coating defects in sign support columns and sectional steel high mast lighting poles. Defects shall then be top coated with the same paint coating system used for top coating of the structural component.

Surface preparation of the damaged or uncoated areas shall be by hand or power tool cleaning using clean equipment, scraping of the edges of galvanized coating to remove loose edges, feathering of the edges of intact coatings, and abrading of surface followed by solvent cleaning according to SSPC-SP 1. Where coating damage has exposed the base metal and the width is larger than 6 mm, the damaged area shall be cleaned according to SSPC-SP 11 prior to the application of the epoxy zinc primer.

All paint coating materials shall be brush applied according to manufacturer's product data sheets.

When paint coated galvanized surfaces are damaged, the paint coating on and around the galvanized surfaces that are to be repaired shall be removed by sanding to a sufficient distance from the repair area to prevent heat damage to the paint during metal coating repair process, followed by repair of damaged metal coating. The specified paint coating system shall then be applied over the repaired area according to manufacturer's product data sheets.

**911.07.04.03.05      Repair of Thermal Sprayed Metal Coatings and Seal Coat**

The Contract Administrator shall be notified 24 hours in advance of the intention to carry out the repair of damaged coatings.

Damaged metal coating and uncoated areas of structural steel surfaces shall be cleaned of all rust and other contaminants and repaired by thermal metal spraying according to SSPC-CS 23.00/AWS C2.23M/NACE No.12 to provide a minimum of 200 µm cumulative thickness, applied in two separate coats. The surfaces shall be brought to the original surface preparation standard specified prior to thermal metal spraying.

For repair of seal coated metallized surfaces, the seal coating on and around the metallized surfaces that are to be repaired shall be removed by sanding to a sufficient distance from the repair area to prevent damage to seal coating during the metal coating repair process. The repaired area shall then be coated with the specified seal coating system according to the Seal Coating of Thermal Sprayed Metal Coatings clause.

#### **911.07.04.04 Coating of Areas Difficult to Access**

Coating of areas specified in the Contract Documents as difficult to access shall be done from the access opening, as detailed in the Contractor's submission for methods, procedures, and sequence of work. Quality of the coating application for these areas shall be based on a reasonable effort demonstrated in the field acceptable to the Contract Administrator.

#### **911.07.04.05 Existing Steel Railing Systems**

Steel handrail panels shall be removed from the structure, delivered to the galvanizer, cleaned, prepared, galvanized, delivered to the site, and reinstalled.

Steel posts, steel post caps, and steel panel anchors shall be metallized after removal of and prior to reinstallation of the handrail panels.

The structural steel in the steel panel anchorages on concrete posts shall be coated with the low VOC epoxy-zinc/epoxy/polyurethane system.

#### **911.07.05 Field Sampling and Testing of Coating Materials**

##### **911.07.05.01 Paint Coating Materials**

Field samples of 250 ml of each batch of each component of all paint coating materials used shall be obtained for testing. Complete Owner Standard Form, PH-CC-430, Structural Coating Sample Data, for each component sample. Submit the samples and the completed forms to the Contract Administrator for delivery to the laboratory designated by the ministry.

For multicomponent paint coat, there shall be enough samples of each paint component so that different batches could be combined to form the complete coat for testing.

The coating supplier shall be consulted for the sampling procedure prior to obtaining samples of moisture sensitive materials. Solvent shall not be added to the field samples.

##### **911.07.05.02 Metallic Coating Materials**

When the application of thermal sprayed metal coating is specified in the Contract Documents, a 1.0 m long metallizing wire from the same batch used in the work shall be submitted to the Contract Administrator.

#### **911.07.06 Access for Inspection**

Access for inspection to all portions of the work shall be provided and maintained.

## **911.07.07                      Quality Control**

Ongoing quality control of the cleaning and coating application operations, including measurements of temperature, humidity, dew point, surface profile, and coating thickness shall be performed. Quality control measurements shall also include monitoring of the air change and the existence of negative pressure within the enclosure for projects that require surface preparation by abrasive blast cleaning or other high dust generating methods. The existence of negative pressure within the enclosure by instrument measurements or by visual assessment shall be demonstrated as often as requested by the Contract Administrator. Written documentation of measurements taken, including dry film thickness (DFT) measurements taken using Type 2 constant pressure probe magnetic gauges, shall be provided to the Contract Administrator on a weekly basis, minimally, or more often as requested by the Contract Administrator. Dry film thickness readings for quality control shall be measured according to ASTM D7091 using a Type 2 magnetic gauge.

The magnetic gauge shall be calibrated according to the procedures in SSPC-PA 2. To facilitate the calibration procedure, a 75 x 75 mm area of the prepared steel at a location selected by the Contract Administrator shall be masked off. After all tests are completed, this area shall be coated as specified in the Contract Documents. As an alternative to calibrating the Type 2 magnetic gauge on the prepared surface, an uncoated 300 x 300 mm reference plate sample of steel of similar composition; thickness,  $\pm$  10%; and surface preparation for gauge calibration may be provided.

## **911.07.08                      Environmental Protection During Surface Preparation and Coating of Structural Steel and Steel Railing Systems**

### **911.07.08.01                      General**

During the work of surface preparation and coating of structural steel and steel railing systems, the total cumulative time of random escapes to the environment shall not exceed 15 minutes over an 8 hour work shift. For shorter or longer work shifts, the allowable cumulative time of escape shall be prorated by proportioning, based on the duration of the work shift to 8 hours.

Operation shall cease immediately in the event that the random escapes exceed the specified limits or any escape extends beyond the right-of-way.

Operation shall not resume until remedial action and cleanup has been completed.

### **911.07.08.02                      Application of Coating Material Without Spray Equipment**

When coating material is applied without spray equipment, an enclosure is not required, provided escape of coating material is prevented. A method of containment shall be provided to protect the surrounding areas from unwanted spills and drips of paint coating materials.

### **911.07.08.03                      Application of Coating Material with Spray Equipment**

When coating material is applied with spray equipment, a full enclosure that prevents the escape of coating material shall be installed and maintained.

### **911.07.08.04                      Low Dust Generating Surface Preparation**

Partial enclosures may be used to prevent escape of material, including substrate material, paint chips, and localized dust, from low dust generating surface preparation methods such as cleaning with hand or power tools.

## **911.07.08.05 Abrasive Blasting or Other High Dust Generating Surface Preparation**

### **911.07.08.05.01 General**

Except as specified below for the vacuum abrasive blasting and filtration or similar vacuum and filtration systems, a full enclosure with a negative pressure system shall be installed and maintained around all surface preparation activities when abrasive blasting is carried out.

### **911.07.08.05.02 Vacuum Abrasive Blasting**

At work areas where vacuum abrasive blasting is used, a full enclosure with negative pressure system is not required, provided the vacuum blasting equipment can satisfy the random escape limits stipulated in this specification. A partial enclosure with ground covers and skimmers on waterways shall be installed as a minimum to prevent incidental escape.

## **911.07.08.06 Enclosures**

### **911.07.08.06.01 General**

Enclosures shall be installed, operated, and maintained to limit the random escape of material.

When openings or tears occur in the enclosure, surface preparation operations shall cease until repairs have been made.

The enclosures shall be removed from the right-of-way at the completion of the work.

Work platforms and the ground surface, where work is being conducted from the ground, shall be covered with tarps with overlapping sealed edges or other means to protect the ground from contamination and to permit recovery of the spent material.

Deck drains shall be fully sealed when the deck surface forms the floor of the enclosure. Where the enclosure extends below the deck, deck drains shall be temporarily extended or redirected to avoid road run off discharging into the enclosure.

There shall be no escape of dust or materials while dismantling or moving the enclosure. Walls, floors, and joints of the enclosure shall be cleaned by vacuuming prior to moving or dismantling it. All dust and material not previously accessible or found in cracks and joints during dismantling shall be immediately vacuumed.

### **911.07.08.06.02 Partial Enclosures**

Partial enclosures shall be installed to prevent the escape of all materials, including localized dust.

A partial enclosure is not an appropriate containment system for high dust generating surface preparation operations such as abrasive blast cleaning. Partial enclosures may consist of vertical and floor tarps, provided the tarps are overlapped and securely fixed together at the seams.

### **911.07.08.06.03 Full Enclosure**

Full enclosures shall be impervious to dust and wind and prevent the escape of all materials, including dust. A full enclosure on its own is not an appropriate containment system for high dust generating surface preparation operations such as abrasive blast cleaning. Full enclosures shall be free of any openings and shall have joints, seams, and overlaps fully sealed.

#### **911.07.08.06.04 Full Enclosure with Negative Pressure**

A full enclosure with negative pressure shall consist of the full enclosure, as described in the Full Enclosures clause, equipped with a mechanical ventilation system capable of effecting complete air change for the enclosure in less than one minute. The mechanical ventilation system shall be in operation during abrasive blast cleaning, clean up activities, and surface blow down or other high dust generating surface preparation operations to ensure effective removal of dust and other materials from the air inside the enclosure.

#### **911.07.08.07 Dust Collector**

Air evacuated from an enclosure shall be conveyed in fully sealed conduits to a dust collector appropriately sized for the material and airflow. There shall be no escape of materials from conduits and dust collectors.

#### **911.07.08.08 Recycling Equipment**

When spent abrasive material is recycled, there shall be no escape of dust or material during the mobilization, operation, clean-up, or demobilization of abrasive recyclers, conduits, dust collectors, and associated equipment. The collectors and filters should arrive on site undamaged, empty, and free of all dust and debris.

#### **911.07.08.09 Handling and Storage of Spent Material**

Spent materials and dust in the immediate vicinity of the area where structural steel is to be coated shall be removed prior to paint coat application. Spent materials from an enclosure shall be collected daily. Spent material from recycling equipment and dust collectors shall be collected on a regular basis to maintain the effective performance of the equipment. All spent material shall be stored in rigid containers with tight sealing lids. The containers shall be made of steel, rigid plastic, or similar material and shall be in sound condition. The containers shall keep the material dry at all times and prevent its escape. There shall be no escape of material during transfers to and from containers, enclosures, recycling equipment, or dust collectors.

Measures shall be taken to prevent vandalism of stored spent material.

#### **911.07.08.10 Containment around Equipment and Materials**

If any equipment or materials is parked or stored on the bridge deck, approaches, or adjacent surfaces, the surfaces under such equipment shall be covered with tarps to contain any spills or leaks from the equipment or operations involving the equipment.

Tarps shall be sufficiently overlapped, impervious to water, and free of holes and openings.

All spills accumulated on the tarps shall be prevented from escaping onto the surrounding surface and be cleaned up immediately.

#### **911.07.08.11 Remedial Work**

Remedial work related to the environmental protection shall be carried out to rectify work that does not meet the requirements as specified in the Contract Documents. A remedial work scheme shall be submitted to the Contract Administrator and work shall not proceed until written permission to do so is received from the Contract Administrator.

#### **911.07.09 Management of Excess Materials**

Management of excess materials shall be as specified in the Contract Documents.

## **911.08 QUALITY ASSURANCE**

### **911.08.01 Inspection**

Each phase of the work shall be inspected by the Contract Administrator and approved before work is to commence on to the next phase.

### **911.08.02 Surface Preparation**

Acceptability of the surface preparation by the Contract Administrator shall be based on the applicable SSPC surface preparation specifications and pictorial standards given in SSPC-VIS 1 and SSPC-VIS 3.

### **911.08.03 Measurement of Surface Profile**

Surface profile measurements shall be made by the Contract Administrator on a random basis using a surface profile gauge according to ASTM D4417, Method B or a spring micrometer and an extra coarse pressure sensitive replica tape according to ASTM D4417, Method C.

### **911.08.04 Testing for Cleanliness**

The work shall be randomly tested by the Contract Administrator for cleanliness to determine contamination of surfaces by the presence of visible dust, oils, grease, or other foreign matter.

### **911.08.05 Measurement of Temperature, Humidity, and Dew Point**

Random testing of ambient and surface temperature, relative humidity, and dew point by the Contract Administrator shall be done by means of a thermometer, surface thermometer, or recording hygro-thermograph and digital or sling psychrometer with recognized psychometric tables.

### **911.08.06 Measurement of Coating Thickness**

Measurement of the coating thickness shall be made by the Contract Administrator. The dry film thickness shall be measured according to ASTM D7091 using a Type 2 magnetic gauge.

Determination of the acceptability of the dry film thickness of each coat shall be made according to SSPC-PA 2, Coating Thickness Restriction Level 3

The specified maximum dry film thickness used to determine acceptability of coating thickness according to SSPC-PA 2 shall be the manufacturer's recommended maximum, as shown in the submitted product data sheets.

The Contractor shall be present when the Owner's magnetic gauges are being calibrated by the Contract Administrator.

#### **911.08.06.01 Measurement of Coating Thickness on New Structural Steel Sign Support Structures and Sectional Steel High Mast Lighting Poles**

The dry film thickness shall be measured by Type 2 constant probe magnetic gauges according to ASTM D7091 and SSPC-PA 2, except that 5 separate spot measurements at representative locations of each galvanized sign support columns or legs and each sectional steel high mast lighting pole, as determined by the Contract Administrator, shall be taken after the application of individual coats of the paint coating system.

The Contractor shall note defects on sectional steel high mast lighting poles prior to installation. All defects shall be repaired according to the Repair of Paint Coatings on Galvanized Surfaces and Repair of Hot Dip Galvanizing clauses as applicable. The coating of sectional steel high mast lighting poles is subject to inspection by the Contract Administrator.

#### **911.08.07                      Testing Adhesion of Paint Coatings**

Paint coatings may be tested for adhesion at the discretion of the Contract Administrator.

#### **911.08.08                      Testing Adhesion of Thermal Sprayed Metal Coatings**

During thermal metal spraying, the Contract Administrator shall perform random adhesion tests according to ASTM D4541 using either Type III or Type V self alignment tester. The minimum acceptable adhesion strength shall be 4.8 MPa. All non-conforming areas and areas damaged by the test shall be re-blasted and re-sprayed to conform to the requirements as specified in the Contract Documents.

Adhesion measurements on repaired areas may be made on a random basis according to the above method.

#### **911.08.09                      Testing of Coating Materials**

Field samples shall be delivered within one week from the date of sampling for testing to:

Head, Concrete Section  
Ontario Ministry of Transportation  
95 Arrow Road  
Toronto, Ontario, M9M 2L4

The submitted field samples of paint coatings shall be tested according to OPSS 1704 and as specified in the Contract Documents. Samples of metallic coating materials shall be tested as specified in the Contract Documents.

#### **911.08.10                      Frequency of Tests and Inspection**

Except as specified above, the frequency of tests shall vary as conditions require.

#### **911.08.11                      Performance Warranty for Coating of Existing Structural Steel**

When the area of existing structural steel to be cleaned and coated is more than 200 m<sup>2</sup>, the coating system shall be unconditionally warranted for a period of 24 months from the date of the Contract Completion Certificate that it has been applied as specified in the Contract Documents, and will be free from defects, as specified below.

The coating system shall be considered defective if any of the following conditions exist:

- a) Visible corrosion products, except at locations defined in the Contract Documents as difficult to access, blistering, bubbling, checking, cracking, wrinkling, delaminations, dry spray, pinholes, sagging, flaking, mud cracking, peeling, scaling, or undercutting.
- b) Coating applied over dirt, debris, blasting debris, corrosion products not removed during surface preparation, or steel projections.
- c) Incomplete coating.
- d) Damage to the coating caused by the Contractor's operations or excessive blast dust on the finish coat.

In the 2 months immediately preceding the last month of the warranty period, the Owner shall inspect the coatings for the defects listed above. The Contractor shall be given a minimum of 72 hours' notice prior to the inspection and may be present during this inspection. The Owner at their expense shall arrange for traffic control and access for the inspection.

All defective areas identified by the inspection shall be repaired as specified in the Contract Documents. All repair work shall be completed within 8 weeks of the Contractor receiving notification of the results of the inspection, unless prevented by seasonal shutdown, in which case the repairs shall be completed in the first 5 weeks of the following construction season.

## **911.10 BASIS OF PAYMENT**

### **911.10.01 Coating Existing Structural Steel - Item Coating New Structural Steel - Item Coating Steel Railing System - Item Environmental Protection During Coating of Structural Steel and Steel Railing Systems - Item Coating New Structural Steel Sign Support Structures - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Remedial work on environmental protection shall be completed by the Contractor at no additional cost to the Owner.

## **911.10.02 Progress Payments**

### **911.10.02.01 Coating Items**

Progress payments for the coating items shall be made on the following basis:

#### **a) Coating Existing and New Structural Steel**

##### **i. Paint Coatings:**

|                                    |                                                  |
|------------------------------------|--------------------------------------------------|
| Surface preparation and prime coat | 80% for 2 coat systems<br>70% for 3 coat systems |
| 2 <sup>nd</sup> coat               | 15% for 2 coat systems<br>10% for 3 coat systems |

##### **ii. Hot Dip Galvanizing and Hot Dip Galvanizing with Paint Coatings:**

|                                                 |                                                                                                 |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Surface preparation and hot dip galvanizing     | 90% for hot dip galvanizing only application<br>55% for hot dip galvanizing with paint coatings |
| Sweep blasting and all coats of paint coating   | 35%                                                                                             |
| Cleanup and final coating repair after erection | 10%                                                                                             |

iii. Thermal Sprayed Metal Coating with Seal Coat:

Surface preparation, metallizing, and seal coat 90%

Cleanup and final coating repair 10%

b) Coating Steel Railing System:

Dismantling, delivery to galvanizer,  
surface preparation, galvanizing, and  
coating of posts and anchors 80%

Delivery to site and erection 15%

Cleanup and final coating repair after erection 5%

**911.10.02.02 Environmental Protection Items**

Progress payments for environmental protection shall be made on the same percentage basis as the coating items for which the environmental protection is required.

### **912.01 SCOPE**

This specification covers the material and construction requirements of single and adjacent side-by-side (multi-cell) precast concrete box culverts with spans greater than 3.0 m, and associated precast concrete appurtenances, in open cut, for both new culverts and replacement of existing culverts. This specification includes requirements for excavation, bedding, backfilling, and cover material.

|                  | * [Part of A23.1-19/A23.2-19 – Concrete Materials and Methods of Concrete Construction/Methods of Test and Standard Practices for Concrete] |

For the purpose of this specification, the following definitions apply:

**Backfill** means earth, rock, or granular material used as fill within the excavation placed beyond the limits of bedding and cover below the subgrade elevation, including frost tapers.

**Bedding** means the material used to support the bottom of the culvert.

**Bughole** means a small regular or irregular cavity resulting from entrapment of air bubbles in the surface of formed concrete during placement or consolidation.

**Cold Joint** means a joint or discontinuity resulting from a delay in placement of sufficient duration to preclude intermingling and bonding of the concrete.

**Cold Weather** means when the air temperature to which the element is exposed is at or below 5 °C, or when the air temperature to which the element is exposed is at or is likely to fall below 5 °C within 96 hours after completion of concrete placement. Temperature refers to shade temperature.

**Culvert** means a structure with a span greater than 3.0 m that is typically embedded in fill, and is used to convey water, pedestrians, vehicles, cyclists, or animals.

**Concrete Appurtenances** means head walls, cut-off walls, aprons, collars and any other concrete fixtures associated with the culvert, excluding concrete bedding or concrete structures covered elsewhere in the Contract Documents.

**Distribution Slab** means a reinforced concrete slab on top of the culvert that may be specified when the earth cover is less than 600mm to improve load distribution on a culvert.

**Element** means an individual precast concrete culvert unit.

**Excavation, Earth and Rock** means the excavation of material classified as earth and rock according to OPSS 902.

**Granular Cover** means the material placed as a protective layer above the culvert to prevent damage to the culvert.

**Honeycombing** means rough and stony concrete surface with voids where the mortar did not fill the spaces between the coarse aggregate particles.

**Indoor Precast Concrete Plant** means a building, which is a permanent structure, providing protection from sun, wind, and rain and which is temperature controlled, such that the temperature does not fall below 15 °C or exceed 30 °C.

**Length** of the culvert means the distance measured between the ends of the assembled elements, measured along the longitudinal axis.

**Lot** consists of all elements of the same span and concrete mix design, produced over seven consecutive Days.

**Native Material** means the original material removed to form an excavation and which is acceptable to the Contract Administrator for return to the same or other excavation as backfill beyond the structure.

**Pour Line** means a visible delineation between two placements of concrete where the concrete from each placement is well-bonded to the other.

**Protection Slab** means a concrete slab that may be placed on the top of the culvert in an area exposed to chlorides. See also Distribution Slab.

**Segregation** means visible separation of the mortar and coarse aggregate particles in the plastic concrete resulting in concrete that is not uniform in appearance or proportions.

**Soil** means all loose or moderately cohesive organic or inorganic deposits of the earth's crust such as silt, sand, gravel, or clay or any of their mixtures.

**Span** means the horizontal distance measured perpendicular to the inside faces of the walls of the culvert.

## **912.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **912.04.01 Design Requirements**

The design shall be according to CSA S6, the Structural Manual, and as specified in the Contract Documents.

Culverts shall be waterproofed as specified in the Contract Documents.

### **912.04.02 Submission Requirements**

#### **912.04.02.01 Working Drawings**

Three sets of Working Drawings, including supporting documentation, shall be submitted to the Contract Administrator at least seven Days prior to commencement of fabrication of the elements, for information purposes. The Working Drawings shall be:

- a) signed and sealed by an Engineer, where Working Drawings show the same reinforcement sizes, spacing, and layouts from Contract Drawings, or,
- b) signed and sealed by a design Engineer and a design-checking Engineer, where Working Drawings have been modified from Contract Drawings.

When other authorities are involved in the approval of the design or construction of the culvert, the submission of Working Drawings shall be made at least 35 Days prior to commencement of fabrication of the elements and one additional copy of the submission shall be provided for each authority. The requirements of each authority and the requirements of the Owner as specified in the Contract Documents shall be satisfied prior to commencement of the Work.

The Working Drawings shall include as a minimum the following information:

- a) Element details.
- b) Steel reinforcement details.
- c) Lifting point locations.
- d) Details and location of any temporary supports.
- e) Stripping strength and requirements for handling of components immediately after stripping.
- f) Design calculations, of any components not specified on, or altered from, the Contract Drawings.
- g) Waterproofing details, provided by Owner.

- h) Connection details.
- i) Details for invert, obvert, depth of embedment and substrate materials.
- j) Details for inlet and outlet control structures and any associated retaining structures.
- k) Details of any openings required in the walls or slabs for connection of storm drainage.
- l) Details of any features required to facilitate fish passage, up-welling or any other environmental requirements.
- m) Any other applicable details.

The supporting documents shall include, as a minimum, the following information:

- a) Handling and installation procedures including calculations.
- b) Details of any bracing required to provide stability to the elements during transportation and construction.

#### **912.04.02.02 Concrete Mix Designs**

The concrete mix shall be designed to provide adequate strength and durability for the intended use and to meet the requirements as specified in the Contract Documents. The concrete mix design shall be submitted according to the Mix Design clause of OPSS 1350.

#### **912.04.02.03 Precast Plant Certification Submissions**

The certificate, verifying the precast plant is certified according to the Precast Plant Certification clause, shall be submitted with the concrete mix design submission.

Copies of precast plant certification audit reports of Canadian Precast Concrete Quality Assurance Program (CPCQA), Canadian Standards Association (CSA), or both as applicable, and related documentation, shall be submitted to the Owner upon request.

If concrete is supplied by a ready-mix concrete supplier, a currently valid Certificate of Ready Mixed Concrete Production Facilities as issued by the Ready Mixed Concrete Association of Ontario (RMCAO), shall be submitted with the concrete mix design submission.

For multi-year contracts, for all plants supplying the work, documentation verifying that the precast plant, and ready-mix plant(s) if used, continue to hold valid certification shall be submitted annually.

#### **912.04.02.04 Control of Concrete Temperature**

Seven Days prior to the commencement of fabrication of the elements, a description of the method for monitoring and effectively controlling the temperature of the concrete shall be submitted to the Contract Administrator, for information purposes. The description shall include the method of controlling and recording the concrete temperature during the curing and protection period.

#### **912.04.02.05 Notification of Placement**

The Contract Administrator shall be notified in writing at least seven Days prior to commencement of fabrication. Any changes in the fabrication schedule shall be provided to the Contract Administrator in writing.

**912.04.02.06****Mill Certificates**

Mill certificates shall be submitted according to OPSS 1440. The mill certificates shall be submitted as part of the precast report.

**912.04.02.07****Manufacturer's Certificate of Conformance and Precast Report**

A manufacturer's Certificate of Conformance and precast report shall be submitted to the Contract Administrator for each shipment of elements at least five Business Days prior to shipping the elements from the precast plant.

The precast report shall contain the following information:

- a) List of elements including their identification number, lot number and description.
- b) Mill certificates for the steel reinforcement used in the elements.
- c) Summary of all measurements and inspections carried out prior to concrete placement to verify compliance with the Contract Documents including reinforcement placement, and other pre-pour checks.
- d) Temperature records for formwork and steel at the time of concrete placement.
- e) Temperature records for the concrete, including location of thermocouple wires, and graphical plots verifying that the requirements for maximum and minimum temperature, maximum allowable temperature difference, and maximum cooling rate, have been met. The format of the temperature plots shall be acceptable to the Owner.
- f) Record of inspection of moist curing.
- g) Summary of material test results for plastic concrete: air content, slump and concrete temperature.
- h) Summary of material test results for hardened concrete: stripping strength, confirmation of the projected 28-Day compressive strength. If test results are not available at the time of shipping, they may be submitted within four Business Days following completion of testing.
- i) Summary of all measurements and inspections required by this specification, including the concrete cover over steel reinforcement, crack measurement summary, and dimensional verification.
- j) Documentation, including colour photographs (labelled and dated), confirming that any defects repairable by standard methods have been identified, evaluated, and repaired as detailed in the Repair of Defects and Deficiencies Repairable by Standard Methods clause.
- k) When steam curing is used, test results showing that time of initial set was determined, unless standard delay periods are used, according to the Steam Curing and Other Application of Heat clause of OPSS 909.

A Request to Proceed shall be submitted to the Contract Administrator before each shipment of elements to the site.

The elements shall not be delivered to the site until the Contract Administrator has received the manufacturer's Certificate of Conformance, the precast report, and Request to Proceed, and the Contractor has received a Notice to Proceed.

**912.05 MATERIALS**

**912.05.01 Backfill**

**912.05.01.01 Backfill to Structure**

Backfill to the structure shall be one of the following, or as specified in the Contract Documents:

- a) Granular A, according to OPSS 1010.
- b) Granular B, Type I or II, with 100% passing the 26.5 mm sieve, according to OPSS 1010.

The 19.0 mm clear stone for wall drains shall be according to OPSS 1004.

**912.05.01.02 Backfill Beyond Structure**

Backfill beyond the structure shall be one of the following, or as specified in the Contract Documents:

- a) Granular A, according to OPSS 1010.
- b) Granular B, Type I or II, with 100% passing the 26.5 mm sieve, according to OPSS 1010.
- c) Native material.

**912.05.02 Bedding**

Bedding shall be as specified in the Contract Documents. The nominal maximum aggregate size for bedding shall not exceed 26.5 mm in diameter, unless the bedding layer has a thickness of 150 mm or greater, in which case the nominal maximum aggregate size shall not exceed 37.5 mm in diameter.

**912.05.03 Burlap**

Burlap shall be according to OPSS 1306.

**912.05.04 Clay Seal**

Clay seal, if required, shall be according to OPSS 1205.

**912.05.05 Concrete**

Concrete materials for precast components shall be according to the Materials section of OPSS 1350 with the following additions and amendments:

- a) Compressive strength shall be as specified in the Contract Documents.
- b) The air void system spacing factor, when tested according to LS-432, shall be 0.200 mm maximum.
- c) The nominal maximum size of coarse aggregate shall be 19.0 mm, except when a smaller nominal size is required in order to meet the requirements of CSA S6.
- d) Air-cooled blast furnace slag shall not be used as aggregate.

Concrete for cast-in-place concrete appurtenances, protection slabs and distribution slabs shall be according to OPSS 1350. Compressive strength for cast-in-place concrete appurtenances, protection slabs and distribution slabs shall be as specified in the Contract Documents.

#### **912.05.06 Concrete Sealers**

Concrete sealers, if required, shall be from the Owner's list of acceptable sealers. The list shall be obtained from the Contract Administrator.

#### **912.05.07 Formwork**

All formwork shall be according to OPSS 919 and CSA A23.4. Formwork shall be fabricated to meet the dimensional tolerances and finishes as specified in the Contract Documents. Textile form liners shall not be used.

#### **912.05.08 Geotextile**

Geotextiles shall be according to OPSS 1860 and shall be of the type, class and filtration opening size (FOS) specified in the Contract Documents.

#### **912.05.09 Granular Cover**

Granular cover shall be one of the following, or as specified in the Contract Documents:

- a) Granular A, according to OPSS 1010.
- b) Granular B, Type I or II, with 100% passing the 26.5 mm sieve, according to OPSS 1010.

#### **912.05.10 Hardware**

Hardware shall be made of stainless steel according to OPSS 1440 or be galvanized according to ASTM A153, except that galvanized hardware located within 50 mm of the concrete surface shall be chromate coated over an electro-deposited coating of zinc according to ASTM B633.

#### **912.05.11 Moisture Vapour Barrier**

The moisture vapour barrier shall be white opaque polyethylene film according to ASTM C171 and shall not be less than 100 µm thick.

#### **912.05.12 Native Material**

Native and imported material shall be approved by the Contract Administrator. All material shall be free from frozen lumps, cinders, ashes, refuse, vegetable or organic matter, rocks and boulders over 150 mm in any dimension, and other deleterious material.

#### **912.05.13 Preformed Joint Seal**

Preformed joint seals shall be used for sealing the joint between elements. Preformed joint seals shall be butyl rubber according to ASTM C990.

#### **912.05.14 Proprietary Patching Materials**

Proprietary patching materials shall be from the Owner's List of Acceptable Concrete Patching Materials. The list of proprietary patching materials shall be obtained from the Contract Administrator.

### **912.05.15 Steel Reinforcement**

Steel reinforcement shall be according to OPSS 1440.

### **912.05.16 Water**

Water used for curing, including steam curing and pre-soaking of burlap, and water used in proprietary patching materials shall be according to OPSS 1302.

## **912.06 EQUIPMENT**

### **912.06.01 General**

Equipment made of aluminum, including tools, shall not come in contact with the plastic concrete.

### **912.06.02 Temperature Monitoring and Recording System**

The temperature monitoring and recording system shall provide unalterable records of temperature during the recording period. Prior to use on the Contract, the temperature monitoring and recording system shall be confirmed by the Owner, in writing, to be acceptable.

Thermocouples and associated instrumentation shall have an accuracy of  $\pm 1.5$  °C and shall record temperatures at time intervals not exceeding 15 minutes and shall digitally display the temperature.

### **912.06.03 Chipping Hammers**

Chipping hammers shall have a maximum weight of 9.0 kg and a maximum piston stroke of 102 mm. All hammers shall have the manufacturer's name and model number legibly engraved on them by the manufacturer.

## **912.07 CONSTRUCTION**

### **912.07.01 Production of Precast Concrete Culverts**

#### **912.07.01.01 Precast Plant Certification**

Precast culverts shall be fabricated by a plant certified according to one of the following:

- a) Canadian Precast Concrete Quality Assurance (CPCQA) Certification Program, Group B, Precast Bridge Products (B1 minimum), or
- b) Canadian Standards Association (CSA) Pre-cast Concrete Products Certification Program, Group B, Bridge Products (B1 minimum).

If concrete is supplied by a ready-mix concrete plant, the concrete production facility shall be certified by the Ready Mixed Concrete Association of Ontario (RMCAO).

#### **912.07.01.02 Markings**

As a minimum, the following information shall be embossed using numbers and letters 30 mm wide, 35 mm high and 5 mm deep on an upper top haunch of each element in the following order, readily visible for inspection:

- a) Prequalification stamp in accordance with the published requirements of the CPCQA or CSA Certification Program.
- b) Name or trademark of the manufacturer.
- c) Identification of plant if manufacturer has more than one plant.
- d) Date of manufacture (yyyy-mm-dd).
- e) Unique Number.
- f) Specification designation.
- g) MTO Site Number on end pieces.

In addition, the word "top" shall be lettered with waterproof paint on the top surface. This requirement shall be waived if the manufacturer installs lifting devices in the top slab only.

#### **912.07.01.03 Steel Reinforcement, Mechanical Connectors, and Associated Hardware**

##### **912.07.01.03.01 Placement of Reinforcement**

The placement of steel reinforcement shall be according to OPSS 905.

Under no circumstances shall reinforcement be inserted into plastic concrete.

##### **912.07.01.03.02 Welding**

Welding of steel hardware shall be according to CSA W59 and shall be performed by a welder qualified by the Canadian Welding Bureau (CWB) working for a company certified in accordance with CSA W47.1, Division 1 or 2.

Welding of reinforcing steel bars shall be according to OPSS 905. The reinforcing steel welding shall be performed by a welder qualified by the CWB working for a company certified in accordance with CSA W186.

##### **912.07.01.04 Production of Concrete**

Production of concrete shall be according to the General, Temperature Control, Mixing Time and Mixing Rate, and Delivery subsections of OPSS 1350.

When there are multiple batches of concrete in a single ready-mix truck, hopper or other container, discharge times shall be measured from the time of introduction of water to cement for the first batch of concrete in the truck, hopper or other container. Discharge of all concrete in the truck, hopper or other container shall be completed within 1.5 hours, except when the air temperature exceeds 28 °C and the concrete temperature exceeds 25 °C, the discharge shall be completed within 1 hour.

##### **912.07.01.05 Sampling and Testing of Plastic Concrete**

Sampling and testing of the plastic concrete for slump, air content, and temperature shall be according to OPSS 1350. The results of these tests shall be recorded. The minimum frequency of testing shall be as follows:

- a) For concrete supplied by an external concrete supplier and delivered by a ready-mix truck, once for each of the first three trucks, until satisfactory control is established, and then once every third truck.

- b) For batches of concrete produced at the precast plant and transported by a ready-mix truck, once for each of the first three trucks, until satisfactory control is established, and then once every third truck.
- c) For batches of concrete produced at the precast plant, and not delivered by a truck, once for each of the first five batches of concrete, until satisfactory control is established, and then once every fifth batch.
- d) For batches of concrete produced at a precast plant with an integrated mixing and delivery system (e.g. Autocor), once for every second batch for the first six batches, until satisfactory control is established, and then once every 7 m<sup>3</sup> of concrete.

Satisfactory control is established when three or five consecutive tests of concrete, as specified above, are within the specified requirements, without adjustments. If any adjustments are required or conducted, testing shall continue until three or five consecutive tests, as specified above, meet the requirements with no adjustments. Satisfactory control shall be established each Day or when there is a break in production longer than 1.5 hours.

Testing of plastic concrete shall be carried out as close as possible to the location of discharge of concrete into the formwork.

Sampling and testing of slump, air content and temperature of plastic concrete shall be carried out by a technician holding either of the following certifications:

- a) CCIL Certified Field Testing Technician; or
- b) ACI Concrete Field Testing Technician - Grade 1.

This technician shall have a valid, original card issued by the certifying agency in his or her possession at all times.

#### **912.07.01.06 Verification Cylinders for 28-Day Compressive Strength Testing**

One set of three 100 mm diameter x 200 mm long cylinders shall be cast per lot for 28-Day compressive strength testing by the Owner. Cylinders shall be cast by a certified technician. Cylinders shall be cast with an element selected randomly from the lot by the Contract Administrator.

All concrete test cylinders shall be cast in new, single-use moulds conforming to the requirements of CSA A23.2-1D and made of plastic, with a lid. The lids shall be chemically and physically compatible with the concrete and shall provide watertight closure for the moulds.

Concrete test cylinders shall be cast, cured, and transported to the designated laboratory according to CSA A23.2-3C with the exception that cylinders shall be cured with the element with which they were made, prior to delivery to the laboratory. Cylinders shall be delivered to the laboratory for demoulding.

Test information shall be recorded on MTO form PH-CC 322. A copy of the form shall be submitted with each set of the concrete cylinders along with a transmittal form and PH-CC-433A (Form A) of the concrete mix design for the culvert. No referee cylinders are required for this testing.

Cylinder test results will be used by the ministry to verify compliance with the requirements of CSA S6.

#### **912.07.01.07 Placing of Concrete**

##### **912.07.01.07.01 General**

The method of transporting, placing, and consolidating the concrete shall be such as to prevent segregation.

Concrete placing and transporting devices shall not be supported by the steel reinforcement.

Concrete shall be deposited within 0.5 m of the top of the reinforcement and 2.5 m horizontally of its final position.

Concrete shall be placed at a steady rate such that a monolithic concrete is obtained without the formation of cold joints or pour lines.

When there is an interruption in placing concrete greater than 20 minutes, the top of the formwork shall be covered with wet burlap to maintain 100% relative humidity above the concrete. The Contract Administrator shall be notified of any interruption resulting in a cold joint.

#### **912.07.01.07.02 Concrete Placing Restrictions**

All surfaces against which concrete is to be placed shall be free of standing water. Fresh concrete shall be protected from contact with rain or snow. Deicing chemicals shall not be used.

All debris shall be removed from the area where concrete is to be placed.

Any surface against where concrete is placed, including existing concrete, steel reinforcement, structural steel, forms, or other surfaces, shall be at a minimum temperature of 5 °C immediately prior to commencement of placing concrete.

The temperature of the formwork, steel reinforcement or any other material against which concrete is to be placed shall not exceed 30 °C.

Temperature measurements shall be taken no more than 10 minutes prior to concrete placement, for each element. Temperature measurements shall be made with a contact thermometer with an accuracy of  $\pm 0.5$  °C.

#### **912.07.01.07.03 Consolidation**

Internal or external vibrators or both shall be used to thoroughly consolidate the concrete, as it is placed. Concrete shall be thoroughly consolidated around all steel reinforcement.

Each layer of concrete shall be vibrated. Vibrators shall extend into the previous layer to produce a homogenous mixture at the layer interface and prevent the formation of pour lines or cold joints.

Vibration shall not be used to make the concrete flow or to spread the concrete more than 1.5 m from the point of deposit.

The requirements of this clause do not apply to self-consolidating concrete (SCC), where accepted for use by the Owner.

#### **912.07.01.07.04 Concrete Finishing**

Finishing of the concrete surface shall be done immediately following placement. No material shall be applied to the concrete surface or the finishing tools to aid in the finishing.

Except as indicated below, finished surfaces shall be smooth, free from open texturing, undulations, projections, and ridges. The concrete shall be struck off to the required dimensions and cross-section and shall be hand finished with a float.

Concrete surfaces against which new concrete is to be placed shall be:

- a) Left with a rough surface finish (so that the depth of the indentations is at least 5 mm and the spacing is not greater than 15 mm), except for concrete surfaces against which protection slabs or distribution slabs shall be placed, and
- b) Abrasive blast cleaned according to OPSS 929, prior to placing any additional concrete.

The requirement to hand finish the concrete with a float does not apply to SCC, where accepted for use by the Owner.

## **912.07.01.08 Control of Temperature**

### **912.07.01.08.01 General**

For all concrete, all necessary actions shall be taken to maintain temperatures within the specified limits. During production, moist curing and the cold weather protection period, the following temperature requirements shall be met:

- a) The concrete temperature shall not exceed 60 °C, except if the concrete has a maximum thickness greater than 500 mm, then the concrete temperature shall not exceed 65 °C.
- b) The concrete temperature shall not fall below 10 °C before the end of moist curing.
- c) The concrete temperature shall not fall below 0 °C before the end of the cold weather protection period.
- d) The temperature difference, as measured between thermocouples at the following locations, shall not exceed 20 °C:
  - i. Internal concrete temperature and the corresponding surface concrete temperatures.
  - ii. Internal concrete temperatures at different locations within the element.
- e) The maximum cooling rate of concrete shall not exceed 15.0 °C per hour until the concrete is not more than 20.0 °C above the air temperature. Air temperature is temperature next to the concrete, within the curing enclosure.

### **912.07.01.08.02 Temperature Monitoring and Records**

The concrete and air temperatures during the curing period and, if applicable, the cold weather protection period shall be monitored and recorded. The concrete temperature shall be measured and recorded for each element.

Thermocouples shall be placed in the following locations at a minimum:

- a) Ambient air temperature adjacent to the concrete.
- b) The expected point of maximum internal temperature, located centrally within the concrete at the maximum section thickness, typically a haunch.
- c) Corresponding surface concrete temperature, with the thermocouple imbedded in the concrete within 5 mm of the surface, at the maximum section thickness.
- d) Centrally at mid-span and mid-depth of the longest span, typically the top or bottom of the element.

A set of a) to d) thermocouples shall be placed in each element at mid-length.

For culverts with a span greater than 6 m, an additional set of b) and c) thermocouples shall be imbedded in each element in another location of maximum section thickness so that temperatures are monitored in both halves of the span.

Recording of concrete and air temperatures shall begin at the start of concrete placement. The temperature shall be recorded automatically at time intervals not exceeding 15 minutes until the end of the curing period and, if applicable, the end of the cold weather protection period. The temperature monitoring system shall be left in place until the end of the monitoring period.

When requested, the Contract Administrator and any other Owner's representatives shall be provided access to verify temperature readings and thermocouple function.

Temperature records shall be submitted for the duration of the temperature monitoring period.

Temperature records, including a graphical plot of temperature versus time, shall be submitted to the Contract Administrator in the precast report.

#### **912.07.01.09                      Curing**

##### **912.07.01.09.01                  General**

Concrete shall be moist cured for four Days except for concrete containing silica fume which shall be moist cured for seven Days. Curing in cold weather conditions shall be according to the Cold Weather Protection Period section of this specification.

Moist curing of exposed surfaces shall commence immediately after concrete finishing, except for culverts produced in an indoor precast concrete plant and not containing silica fume; for such culverts, exposed surfaces may be covered with moisture vapour barrier between concrete placement and concrete finishing, for the shortest practical time period and in no cases exceeding 40 minutes.

##### **912.07.01.09.02                  Moist Curing**

Moist curing shall be sufficient to keep all surfaces of the concrete in a continuously wet condition, with no dry areas, by applying one or a combination of the following methods:

- a) Curing according to the Curing with Burlap and Water clause.
- b) Curing by means of continuous water application, e.g. mist.
- c) Curing according to the Steam Curing and Other Application of Heat clause.
- d) Curing by means of immersion in water.

Records of moist curing shall be maintained and submitted according to the requirements of this specification.

The records shall provide verification that curing is in accordance with this specification. As a minimum, records of moist curing shall include the identification of the person checking the moist curing system, the time that it was verified and photo documentation of the curing chamber in operation during the curing period as follows:

- a) Photographs shall be taken every 8 hours for the first 24 hours of the curing period.
- b) Photographs shall be taken every 24 hours as a minimum for the remainder of the curing period.
- c) Each photo shall include a date and time stamp of when the photo was taken.

Elements whose surfaces have not been kept in a continuously wet condition shall be deemed rejectable.

Formwork shall be removed within four Days of concrete placement and the concrete shall be moist cured for the remainder of the minimum curing period and no less than 24 hours.

Concrete may be exposed to ambient conditions, during the moist curing period, according to the Exposure clause of this specification.

#### **912.07.01.09.03      Curing with Burlap and Water**

Curing with burlap and water shall be done according to the Curing with Burlap and Water clause of OPSS 909 with the addition of the following:

- a) Burlap shall be held in place without marring the surface of the concrete.

#### **912.07.01.09.04      Steam Curing and Other Application of Heat**

Steam curing and application of heat, if used, shall be according to the requirements of the Steam Curing and Other Application of Heat section of OPSS 909.

#### **912.07.01.10      Exposure**

During moist curing and cold weather protection periods, the element may be exposed for a maximum total period of one hour per day for the purposes of formwork removal, inspection or relocation within the plant, except for indoor precast concrete plants, where the exposure period shall not exceed two hours per day.

During the exposure period:

- a) The requirements in the Control of Temperature clause do not apply.
- b) There shall be no more than three consecutive thermocouple measurements of surface temperature below 10.0 °C, and none below 5.0 °C, when measured at 15 minute intervals at locations according to the Temperature Monitoring and Records clause.

On the day formwork is removed, the moist curing may be suspended during the 1-hour exposure period, or 2-hour exposure period for indoor plants, except for concrete containing silica fume. For concrete containing silica fume, continuous moist curing shall be applied throughout the exposure period.

#### **912.07.01.11      Cold Weather Protection Period**

If cold weather conditions are present at the end of the curing period, the elements shall be provided with protection from cold weather and moisture loss for an additional 24 hours, prior to exposure to cold weather conditions. Protection shall be extended if required to meet the requirements in the Control of Temperature clause.

#### **912.07.01.12      Stripping Strength**

For each element, it shall be demonstrated that the stripping strength as specified in the Working Drawings has been achieved prior to stripping the formwork. The Contractor, when requested by the Owner, shall participate in standard cylinder correlation strength testing programs conducted by the Owner.

### **912.07.01.13 Concrete Cover**

The Contractor shall carry out, at the precasting facility, a covermeter survey on all elements until satisfactory control is established. For each design and size of element, satisfactory control shall be established when three consecutive elements of the same design are within the specified tolerances. After satisfactory control has been established, testing shall be carried out on every fifth element. If testing indicates that cover measurements for an element do not meet the tolerances specified in Table 1, testing shall resume on each element until satisfactory control is re-established.

Concrete cover readings shall be taken evenly spaced across the surface of the concrete at grid points, along the longitudinal and transverse axes, at a spacing of 1 to 3 m, providing a minimum of 20 measurement points per element.

### **912.07.01.14 Dimensional Tolerances**

The Contractor shall carry out measurements on each element prior to shipping and on each culvert, after installation, to determine compliance with tolerance requirements. Elements and culverts shall meet the tolerances specified in the Contract Documents and Table 1 of this specification.

For dimensional tolerances not specified, the maximum allowable dimensional variation shall be 1:800 or  $\pm 5$  mm, whichever is greater.

### **912.07.01.15 Surface Finish**

#### **912.07.01.15.01 General**

Concrete surfaces shall not be treated with cement slurry or paste.

Surface defects and deficiencies with dimensions according to Table 2 are repairable by standard methods according to Table 2.

A repair proposal shall be submitted to the Contract Administrator to repair surface defects and deficiencies not listed in Table 2.

#### **912.07.01.15.02 Exposed Surfaces**

The appearance of the concrete and repairs shall be uniform in colour, pattern, and texture when viewed from a distance of 15 m. Material, including all patching materials, shall be selected to achieve uniformity of colour and appearance.

All projections, such as fins and bulges, and all blemishes, such as stains, shall be removed.

#### **912.07.01.15.03 Surface Tolerance**

Formed and unformed surfaces shall be such that when tested with a 3 m long straight edge placed anywhere in any direction on the surface, there shall be no gap greater than 6 mm between the bottom of the straight edge and the surface of the concrete.

### **912.07.02 Installation**

#### **912.07.02.01 Foundations – General**

The culvert shall be placed on competent in situ soil or compacted backfill, or as specified in the Contract Documents.

When unsuitable material is encountered during excavation for the culvert foundation, the unsuitable material shall be removed to competent stratum and replaced to the foundation grade with compacted granular material, as specified in the Contract Documents.

The final founding elevations shall be as specified in the Contract Documents or an elevation approved in writing by the Contract Administrator.

**912.07.02.01.01            Support Systems**

Support systems shall be according to OPSS 404.

**912.07.02.01.02            Temporary Protection Systems**

Temporary protection systems shall be according to OPSS 539.

**912.07.02.01.03            Excavation**

The excavation for the installation of the culvert shall be according to OPSS 902, including frost tapers and culvert end treatments.

Swamp excavation shall be according to OPSS 209.

**912.07.02.01.04            Dewatering**

Dewatering shall be according to OPSS 517.

**912.07.02.01.05            Bedding**

Bedding shall be placed as specified in the Contract Documents and compacted according to OPSS 501. Bedding shall ensure uniform support under the full width and length of the culvert.

The bedding shall be placed in uniform lifts not exceeding 200 mm in thickness. Bedding shall not be placed on frozen material.

Bedding and subgrade material shall be protected from disturbance during construction.

**912.07.02.01.06            Levelling Course**

When a leveling course is specified, it shall consist of a 75 mm minimum thickness of fine aggregate. Fine aggregate for levelling courses shall be according to OPSS 1002.

**912.07.02.02                Delivery**

The Contract Administrator shall be notified in writing a minimum of three Business Days prior to delivery of the elements.

Delivery shall include transportation, loading and unloading, and storage of the elements. Transportation and storage of the elements shall be according to CSA A23.4.

Elements shall be loaded for shipping in such a manner that they can be transported and unloaded at their destination without being damaged or exposed to stresses for which they were not designed. Elements, when stored, shall be stored in such a manner to avoid damage or excessive stress.

Storage includes, but is not limited to, storage while awaiting delivery in temporary locations or, at the job site. Lifting, storing, and transporting shall be as specified in the Working Drawings.

Advertising by means of removable signing shall be permitted on elements only while in transit to the site. Any permanent markings on a surface that would be visible after installation shall not be permitted.

#### **912.07.02.03                    Installation of Precast Concrete Culvert**

The Contract Administrator shall be notified in writing of the installation date a minimum of three Business Days prior to the commencement of installation. Installation shall be according to CSA A23.4 and as specified in the Contract Documents.

The Work shall consist of installation and stabilization of the elements. Elements shall be lifted and placed in a manner to ensure they are not overstressed, unstable, or unsafe at any time.

After installation of the elements, concrete patching material, from the Ministry's list of acceptable patching materials, shall be used to provide required concrete cover over lifting devices.

A copy of the Working Drawings shall be kept on the site during installation of the elements.

The Contractor shall inspect the elements for defects before installation.

#### **912.07.02.04                    Cast-in-Place Concrete Appurtenances, Protection Slabs and Distribution Slabs**

Cast-in-place concrete appurtenances, protection slabs and distribution slabs shall be according to OPSS 904. Reinforcing steel shall be placed according to OPSS 905.

When a protection slab or distribution slab is required, it shall be as specified Contract Documents. The protection slab or distribution slab shall be placed without any damage to or movement of the culvert.

#### **912.07.02.05                    Joints Between Elements**

##### **912.07.02.05.01                General**

All joints between elements of the culvert shall be constructed and treated to prevent leakage and infiltration.

All elements shall be provided with bell and spigot ends. The ends shall be of such design that when the elements are laid together they will make a continuous culvert with a smooth interior free of irregularities in the flow line. The gap at the joints shall not exceed the maximum value provided in Table 1. The gap between adjacent side-by-side (multi-cell) box culverts shall be 60 mm, with a tolerance specified in Table 1. Joint treatment shall be as shown in the Contract Documents.

##### **912.07.02.05.02                Preformed Seals**

Preformed seals shall be placed according to the manufacturer's recommendations.

##### **912.07.02.06                    Alignment**

The position of the inner and outer top edges of elements shall be set true to the elevations and alignment as specified in the Contract Documents. Culverts shall be constructed to the specified geometry, plumbness, and alignment and shall not exceed the tolerances outlined in Table 1.

#### **912.07.02.07                    Inspection After the Installation of the Culvert and Prior to Waterproofing**

After installation of all elements of a culvert within a construction stage, and prior to waterproofing, a Request to Proceed shall be submitted to the Contract Administrator. The next operation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **912.07.02.08                      Waterproofing of the Culvert**

Waterproofing of the culvert shall be as specified in the Contract Documents.

#### **912.07.02.09                      Geotextile at Joints**

After completion of waterproofing, including placement of protection board, the joints shall be covered with a minimum 600 mm wide geotextile, unless otherwise specified, to prevent influx of material from the backfill or native soil or both. The 600 mm wide strip of geotextile shall be placed to form a continuous barrier centered on the exterior of all buried joints, including on top of areas of the joint that are waterproofed.

The geotextile and the seam requirements at the joints shall be according to OPSS 1860.

Geotextile shall be free of folds, tears, and wrinkles. The geotextile shall be joined so that the material laps a minimum of 500 mm, and shall be pinned together.

#### **912.07.02.10                      Inspection After the Waterproofing of the Culvert and Prior to Backfilling**

After waterproofing of all elements of a culvert within a construction stage, and prior to backfilling, a Request to Proceed shall be submitted to the Contract Administrator. The next operation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **912.07.02.11                      Backfilling**

Backfilling shall be according to OPSS 902. Backfill shall be placed without any damage to or movement of the elements.

#### **912.07.02.12                      Granular Cover**

Cover shall be placed in layers not exceeding 200 mm in thickness, loose measurement, and each layer shall be compacted according to OPSS 501. The cover material shall be placed without any damage to or movement of the culvert.

#### **912.07.02.13                      Clay Seals**

When a clay seal is specified in the Contract Documents, the clay seal shall be placed to the dimensions specified in the Contract Documents and compacted to a minimum of 95% of the maximum dry density (MDD). The MDD shall be determined according to LS-706, carried out on a single representative sample. Field density and field moisture determinations shall be made according to ASTM D6938.

#### **912.07.03                          Repair of Defects and Deficiencies Repairable by Standard Methods**

##### **912.07.03.01                      General**

All concrete shall be routinely inspected for any defects and deficiencies up to the date of Completion of the work. Defects and deficiencies shall be identified and documented including their location, size, and frequency.

Areas requiring repair or replacement shall be based on the criteria shown in Table 2. The limits of repair and replacement for each area shall be identified.

Any element having one or more of the defects and deficiencies identified in Table 2 shall be repaired according to the repair method specified. Such repairs do not require proposals or Owner approval prior to repair.

Where more than one of the defects or deficiencies listed in Table 2, excluding bugholes, is located in the same area in the element, a repair proposal shall be submitted to the Contract Administrator. The repair proposal shall be according to the Quality Assurance section.

All causes, preventative actions, and corrective actions, including repair methods and materials used, shall be documented and submitted in the precast report.

#### **912.07.03.02                      Assessment of Repair**

At the discretion of the Owner, additional visual inspection or other investigative measures, including the removal of cores, may be required to assess the effectiveness of the repair. The filling of core holes shall be according to the Filling of Core Holes subsection in OPSS 1350.

#### **912.07.04                      Material Sampling for Acceptance Testing**

##### **912.07.04.01                      Sampling of Steel Reinforcement**

Samples of steel reinforcement shall be provided to the Owner according to OPSS 905.

##### **912.07.04.02                      Sampling of Water, Admixtures, and Cementing Materials**

Samples of all water, admixtures, and cementing materials shall be provided to the Owner for testing, according to OPSS 1350.

##### **912.07.04.03                      Sampling of Hardened Concrete for Acceptance Testing**

###### **912.07.04.03.01                      General**

Hardened concrete shall be sampled on a lot basis according to the Coring clause and Lot Size subsection of this specification. Test specimens shall consist of cores removed from the hardened concrete for testing by the Owner of compressive strength, air void system parameters and rapid chloride permeability.

###### **912.07.04.03.02                      Notification**

A list of elements and their identification numbers shall be submitted to the Contract Administrator within 24 hours of the completion of a lot, to facilitate selection by the Contract Administrator of elements for acceptance testing.

###### **912.07.04.03.03                      Coring**

One set of cores shall be obtained from each lot for quality assurance testing. Locations of core removal shall be randomly selected from each lot by the Contract Administrator. A set of cores shall consist of five cores, 100 mm in diameter and 220 mm in length. If the element is less than 220 mm thick, the full depth of the element shall be cored.

Cores shall be removed when the concrete is between 7 to 10 Days of age, and prior to application of waterproofing membrane. Cores shall be removed in the presence of the Contract Administrator or Owner's representative. No core shall be taken within 250 mm of any joint or edge or within a distance 500 mm from another core. No core shall be taken through the waterproofing system. All cores of the same set shall be removed at a location no more than 3 m from the location of the first core for that set. Cores shall be removed from the sides or haunch of the elements.

Coring shall be carried out according to CSA A23.2-14C. Cores shall not contain reinforcement or other embedded material. A covermeter capable of detecting the type(s) of reinforcing materials in the element shall be used to establish the location of reinforcement and other embedded material prior to coring.

The contract number, lot number, and element identification number shall be marked legibly on each core with durable ink. Each core shall be placed in a plastic bag, sealed to prevent loss of moisture, and fitted with a security tag by the Contract Administrator. All acceptance cores shall immediately be given to the Contract Administrator, with the transmittal form and PH-CC-433A (Form A) of the concrete mix design, for transportation to the designated laboratory.

The core holes shall be filled, within three Days, according to the Filling of Core Holes subsection of OPSS 1350.

#### **912.07.05                      Access for Quality Assurance**

Unhindered access for inspection and testing of all the work shall be provided to the Contract Administrator or Owner's representative.

Any debris and obstructions shall be removed to allow access for the purposes of covermeter and dimensional measurements or inspection.

#### **912.07.06                      Management of Excess Materials**

Management of excess material shall be as specified in the Contract Documents.

### **912.08                              QUALITY ASSURANCE**

#### **912.08.01                      General**

The acceptance of culverts shall be according to the requirements of this specification, including satisfactory completion any repairs.

Acceptance of compressive strength, air void system parameters, and rapid chloride permeability shall be on a lot basis.

Lots not meeting the requirements of the Contract Documents shall be deemed rejectable.

#### **912.08.02                      Lot Size**

The Contract Administrator shall determine the limits of each lot prior to commencing production, based on the lot size definition, and shall confirm the specific elements to be included in each lot prior to commencing production of that lot.

#### **912.08.03                      Acceptance of Compressive Strength of Concrete in Place**

Testing of compressive strength shall be according to LS-410.

Three cores shall be tested to determine the acceptability of compressive strength of the lot. The 28-Day concrete compressive strength of a lot shall be considered acceptable when:

- a) The average of the three individual compressive strength cores is equal to or greater than the specified strength, and
- b) No individual core result is more than 10% below the specified 28-Day compressive strength.

Unacceptable lots shall be deemed rejectable, but may, at the discretion of the Owner, be permitted to stay in the work. When the Owner permits the work to remain in place, it shall be subject to a payment adjustment

calculated according to the Basis of Payment section.  
Test results shall be forwarded to the Contractor as they become available.

#### **912.08.03.01 Referee Testing of Compressive Strength of Concrete In Place**

Referee testing of compressive strength may only be invoked by the Contractor within five Business Days of receipt of the acceptance test result.

Referee testing of compressive strength shall be carried out on a set of three cores taken, within three Business Days of invoking referee testing, by the Contractor from the same element which the acceptance cores were taken, in accordance with the Coring clause. Referee cores shall immediately be given to the Contract Administrator for transportation to the designated laboratory.

The referee laboratory shall be designated by the Owner based on the applicable roster and cores shall be tested according to LS-410.

Referee test results shall be forwarded to the Contractor as they become available.

The confirmation value for confirming the acceptance test result shall be the greater of 10% of the specified strength or 10% of the strength of the acceptance cores, expressed to one decimal place.

If the difference between the referee test result and the acceptance test result is less than the confirmation value, the acceptance test result is confirmed, and the acceptance test result shall be used in the determination of acceptance of the lot. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed, and the acceptance test result shall be disregarded.

The cost of referee testing of compressive strength shall be according to OPSS 1350.

#### **912.08.04 Acceptance of Air Void System in Hardened Concrete**

Testing of air void system shall be according to LS-432. One half of a core shall be tested to determine the acceptability of the lot. The other half of the core shall be retained by the Owner for audit purposes.

Test results shall be forwarded to the Contractor as they become available.

For the lot to be considered acceptable, the sample shall have a minimum air content of 3.0% and a spacing factor of 0.200 mm or less. Acceptable lots shall be subject to full payment.

Lots with a sample with a spacing factor greater than 0.200 mm and less than or equal to 0.250 mm are unacceptable. If the Owner permits the work to remain in place, lots with a spacing factor greater than 0.200 mm and less than or equal to 0.250 mm shall be subject to a payment adjustment calculated according to the Basis of Payment section.

Lots with a sample with a spacing factor more than 0.250 mm or air content less than 3.0% shall be deemed rejectable.

#### **912.08.04.01 Referee Testing of Air Void System in Hardened Concrete**

Referee testing of air void system parameters shall be according to OPSS 1350.

The cost of air void system referee testing shall be according to OPSS 1350.

**912.08.05                      Acceptance of Rapid Chloride Permeability**

**912.08.05.01                General**

Acceptance of rapid chloride permeability shall be based on the result of the core representing the lot, tested according to LS-433 at 28-32 Days of age.

Two samples 50 mm long shall be cut from the core, tested, and the results averaged to determine the acceptance of the lot.

Test results shall be forwarded to the Contractor as they become available.

**912.08.05.02                Concrete Without Silica Fume**

Lots with rapid chloride permeability less than or equal to 2,500 coulombs are considered acceptable. Acceptable lots shall be subject to full payment.

Lots with a rapid chloride permeability result greater than 2,500 coulombs are unacceptable. If the Owner permits the work to remain in place, lots with an average value of rapid chloride permeability exceeding 2,500 coulombs and less than 3,500 coulombs shall be subject to a payment adjustment calculated according to the Basis of Payment section.

Lots with rapid chloride permeability results exceeding 3,500 coulombs shall be deemed rejectable.

**912.08.05.03                Concrete Containing Silica Fume**

Lots with rapid chloride permeability less than or equal to 1,000 coulombs are considered acceptable. Acceptable lots shall be subject to full payment.

Lots with a rapid chloride permeability result greater than 1,000 coulombs are unacceptable. If the Owner permits the work to remain in place, lots with an average value of rapid chloride permeability exceeding 1,000 coulombs and less than 2,000 coulombs shall be subject to a payment adjustment calculated according to the Basis of Payment section.

Lots with rapid chloride permeability results exceeding 2,000 coulombs shall be deemed rejectable.

**912.08.05.04                Referee Testing of Rapid Chloride Permeability**

**912.08.05.04.01            General**

Referee testing of rapid chloride permeability may only be invoked by the Contractor within five Business Days of receipt of the acceptance test result.

Referee testing shall be carried out on a core taken, within three Business Days of invoking referee testing, by the Contractor from the same element which the acceptance core was taken, in accordance with the Coring clause. The referee core shall immediately be given to the Contract Administrator for transportation to the designated laboratory.

Referee testing shall be done on two-50 mm samples obtained from the core representing the lot for which referee testing was invoked, and the results shall be averaged to obtain the test result for the lot.

Cores shall be tested according to LS-433.

The referee laboratory shall be designated by the Owner based on the applicable roster and cores shall be tested by that laboratory.

Referee test results shall be forwarded to the Contractor as they become available.

The cost of referee testing of rapid chloride permeability for all concrete shall be according to the Referee Testing Cost clause in the Acceptance of Rapid Chloride Permeability subsection in OPSS 1350.

#### **912.08.05.04.02 Concrete Without Silica Fume**

When the referee result is greater than the acceptance test result or no more than 500 coulombs below the acceptance test result, the acceptance test result is then confirmed and shall remain valid. When the referee test result for the lot is more than 500 coulombs below the acceptance test result, the acceptance test result is then not confirmed, and the referee test result shall be used for determining acceptability of the lot.

#### **912.08.05.04.03 Concrete Containing Silica Fume**

When the referee result is greater than the acceptance test result or no more than 300 coulombs below the acceptance test result, the acceptance test result is then confirmed and shall remain valid. When the referee test result for the lot is more than 300 coulombs below the acceptance test result, the acceptance test result is then not confirmed, and the referee test result shall be used for determining acceptability of the lot.

#### **912.08.05.04.04 Cost of Referee Testing for Rapid Chloride Permeability**

The cost of rapid chloride permeability referee testing shall be as specified in the Contract Documents.

When the referee result confirms the acceptance test result, the Contractor shall be charged the cost of rapid chloride permeability referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

#### **912.08.06 Acceptance of Water, Admixtures, and Cementing Materials**

Acceptance of water, admixtures and cementing materials shall be according to OPSS 1350.

#### **912.08.07 Acceptance of Concrete Temperature**

Elements that meet the temperature requirements of this specification during production, the curing period, and, if applicable, the cold weather protection period, shall be considered acceptable. Elements that do not meet one or more of the temperature requirements of this specification are deemed rejectable.

#### **912.08.08 Acceptance of Surface Finish**

All elements meeting the surface finish requirements of this specification shall be considered acceptable. For elements that do not meet the surface finish requirements of this specification, a proposal for repair or remediation may be submitted by the Contractor, according to the All Other Defects and Deficiencies clause.

#### **912.08.09 Dimensional Verification and Concrete Cover Measurements**

The Contract Administrator shall carry out measurements on interior and exterior surfaces on at least one element per lot, prior to any waterproofing or backfilling operations, to confirm compliance with the requirements of Table 1. The Contract Administrator shall be notified in writing when the test area is ready for the concrete covermeter survey and dimensional verification.

If an element fails to meet the dimensional or cover tolerances specified in Table 1,

- a) It shall be deemed rejectable and,

- b) A consultant shall be retained by the Owner, at the Contractor's expense, to verify that all the other elements in the lot are within the tolerances of Table 1.

#### **912.08.10 Dowels**

When dowels are specified in the Contract Documents, they shall be according to the visual acceptance criteria and pull testing criteria requirements as specified in the Contract Documents.

#### **912.08.11 Defects and Deficiencies**

##### **912.08.11.01 Defects and Deficiencies Repairable by Standard Methods**

Any individual element having one or more of the defects and deficiencies listed in Table 2 shall be deemed unacceptable and shall be repaired according to Table 2.

##### **912.08.11.02 Defects and Deficiencies Causing Rejection**

An element having one or more of the following defects and deficiencies shall be deemed rejectable:

- a) If concrete temperature of an element less than 500 mm in thickness exceeds 60 °C, or if the concrete has a maximum thickness greater than 500 mm and the concrete temperature exceeds 65 °C, at any time during the curing period.
- b) If concrete temperature of an element falls below 10 °C during the moist curing period or 0 °C during the cold weather protection period.
- c) If an element has honeycombing, voids, cavities, spalls, delaminations, or cracks, in the concrete that exceed the conditions described in Table 2.
- d) If an element has a crack that is greater than 1.0 mm in width or if there is a crack of any width that extends through to the opposite face of the element.
- e) If an element contains a cold joint.

##### **912.08.11.03 All Other Defects and Deficiencies**

A repair proposal for repair or remediation signed and sealed by an Engineer may be submitted to the Contract Administrator for acceptance when,

- a) Failure to maintain moist curing has occurred; or
- b) An element has defects or deficiencies that are not identified as rejectable or included in Table 2 in the list of defects and deficiencies repairable by standard methods; or
- c) More than one of the defects or deficiencies listed in Table 2, except for bugholes, are located in the same area in the element; or
- d) Three occurrences of the same defect are present in the element; or
- e) Surface finish is unacceptable; or
- f) Dimensional tolerances of the element or culvert do not meet the requirements of this specification.

#### **912.08.11.03.01          Repair Proposal**

The repair proposal shall include as a minimum:

- a) Identification of the culvert or element and description of the defects or deficiencies.
- b) High resolution photographs and detailed sketches showing the width, length, depth, location, nature and frequency of any defects.
- c) An assessment of any impact of the repaired defect(s) on durability, structural adequacy and integrity of the element or on the culvert.
- d) A detailed repair plan including materials, method, and equipment to be used.
- e) Verification that the repair plan complies with the applicable Standards for the type of work.
- f) All relevant supporting information, including material test results, field measurements and observations, production records, photographs, and structural analysis calculations, used for determining that the performance and function originally expected from the element or culvert shall be met.
- g) Cause(s) of the defect and corrective action to be taken to prevent recurrence of the defect in future production, delivery, or installation.

If the repair proposal is deemed acceptable by the Owner, the culvert or element shall be repaired according to the proposal. Repairs shall not be carried out without the prior written acceptance of the proposal by the Contract Administrator. If the repair proposal is not acceptable to the Owner, the element or culvert shall be replaced.

#### **912.08.11.04          Assessment of Repairs**

The Contract Administrator shall inspect the repaired work. This inspection may include covermeter surveys, coring, and any other testing deemed necessary to assess the effectiveness and acceptability of the repair.

### **912.09                      MEASUREMENT FOR PAYMENT**

#### **912.09.01                  Actual Measurement**

##### **912.09.01.01              Precast Concrete Box Culvert, Fabrication**

Measurement for the fabrication of precast concrete culverts shall be by the horizontal length in metres along the centerline of the invert of the culvert.

##### **912.09.01.02              Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clause under Actual Measurement.

### **912.10                      BASIS OF PAYMENT**

- 912.10.01                  Precast Concrete Box Culvert, Fabrication (Span  $\geq 3.0$  to  $< 4.0$  m) - Item**
- Precast Concrete Box Culvert, Fabrication (Span  $\geq 4.0$  to  $< 5.0$  m) - Item**
- Precast Concrete Box Culvert, Fabrication (Span  $\geq 5.0$  to  $\leq 6.1$  m) - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

Elements deemed rejectable shall be replaced at no additional cost to the owner.

#### **912.10.01.01 Payment Adjustment for Compressive Strength of Concrete in Place**

Payment adjustment for an unacceptable lot represented by cores shall be calculated according to the following:

$$\text{Payment Adjustment} = \text{lot quantity/tender quantity} \times \text{Price} \times ((100 - P)/100)$$

Where:

Payment Adjustment = payment reduction for a lot (\$)  
 Lot quantity = volume of concrete in a lot (m<sup>3</sup>) (calculated based on plan dimension)  
 Tender quantity = volume of concrete in tender (m<sup>3</sup>) (calculated based on plan dimension)  
 Price = Contract price for the Fabrication tender item  
 P = pay factor for the lot according to the table below:

| Average of the three individual compressive strength cores, as percentage of specified strength | Lowest of the three individual compressive strength cores, as percentage of specified strength | Pay Factor (P) |
|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|----------------|
| ≥ 90%                                                                                           | ≥ 80%                                                                                          | 100            |
| < 90% but ≥ 85%                                                                                 | ≥ 80%                                                                                          | 95             |
| < 85% but ≥ 80%                                                                                 | ≥ 75%                                                                                          | 85             |
| < 80%                                                                                           | Not Applicable                                                                                 | Reject         |

#### **912.10.01.02 Payment Adjustment for Air Void System in Hardened Concrete**

Payment adjustment for an unacceptable lot represented by cores shall be calculated according to the following:

$$\text{Payment Adjustment} = \text{lot quantity/tender quantity} \times \text{Price} \times ((100 - P)/100)$$

Where:

Payment Adjustment = payment reduction for a lot (\$)  
 Lot quantity = volume of concrete in a lot (m<sup>3</sup>) (calculated based on plan dimension)  
 Tender quantity = volume of concrete in tender (m<sup>3</sup>) (calculated based on plan dimension)  
 Price = Contract price for the Fabrication tender item  
 P = pay factor for the lot according to the table below:

| Spacing Factor, mm  | Pay Factor (P) |
|---------------------|----------------|
| > 0.200 but ≤ 0.220 | 90             |
| > 0.220 but ≤ 0.240 | 80             |
| > 0.240 but ≤ 0.250 | 70             |

### **912.10.01.03                      Payment Adjustment for Rapid Chloride Permeability**

The payment adjustment shall be calculated based on individual lots and applied as follows:

$$\text{Payment adjustment} = \text{lot quantity} \times (C-2500)/5$$

Where:

|                    |                                                                                      |
|--------------------|--------------------------------------------------------------------------------------|
| Payment adjustment | = payment reduction for a lot (\$)                                                   |
| C                  | = rapid chloride permeability of a lot (coulombs)                                    |
| Lot quantity       | = volume of concrete in a lot (m <sup>3</sup> ) (calculated based on plan dimension) |

The payment adjustment for concrete containing silica fume shall be calculated based on individual lots and applied as follows:

$$\text{Payment adjustment} = \text{lot quantity} \times (C-1000)/5$$

Where:

|                    |                                                                                      |
|--------------------|--------------------------------------------------------------------------------------|
| Payment adjustment | = payment reduction for a lot (\$)                                                   |
| C                  | = rapid chloride permeability of a lot (coulombs)                                    |
| Lot quantity       | = volume of concrete in a lot (m <sup>3</sup> ) (calculated based on plan dimension) |

### **912.10.02                      Precast Concrete Box Culvert, Delivery and Install (Span ≥ 3.0 to < 4.0 m) - Item Precast Concrete Box Culvert, Delivery and Install (Span ≥ 4.0 to < 5.0 m) - Item Precast Concrete Box Culvert, Delivery and Install (Span ≥ 5.0 to ≤ 6.1 m) - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

### **912.10.03                      Excavation for Culverts**

Payment for earth and rock excavation shall be at the Contract price for the tender items "Earth Excavation for Structure" and "Rock Excavation for Structure", according to OPSS 902.

### **912.10.04                      Swamp Excavation**

Payment for swamp excavation shall be at the Contract price for the tender item Earth Excavation, Grading, according to OPSS 206.

Payment shall not be made for the removal of materials that slide or slough inside the excavation limits.

### **912.10.05                      Granular**

Granular material used for bedding, backfill, cover, and frost tapers shall be paid for under the appropriate granular items specified in the Contract Documents.

Payment will not be made for granular used to fill any area excavated beyond the lines specified in the Contract Documents.

### **912.10.06                      Concrete in Cast-in-Place Appurtenances, Protection Slabs and Distribution Slabs**

Payment shall be at the Contract price for the tender item "Concrete in Culverts", according to OPSS 904.

**912.10.07                      Steel Reinforcement in Cast-in-Place Concrete Appurtenances, Protection Slabs and Distribution Slabs**

Payment shall be at the Contract price for the tender items "Reinforcing Steel Bar", "Stainless Steel Reinforcing Bar", "Mechanical Connectors" and "Stainless Steel Mechanical Connectors" according to OPSS 905.

**912.10.08                      Clay Seal - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**TABLE 1**  
**Tolerances**

| Item                                                                                                                                                                                                                                                                                                                       | Tolerances                                                                                                                                            |

#### **913.01 SCOPE**

This specification covers the requirements for the installation of electrical and communication materials to be embedded in structures.

#### **913.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

##### **Ontario Provincial Standard Specifications, Construction**

|          |                                            |

| OPSS 603 | Installation of Ducts                      |
| OPSS 616 | Footings and Pads for Electrical Equipment |

## **CSA Standards**

|                            |                                   |
|----------------------------|-----------------------------------|
| C22.2 No. 40-M1989 (R2009) | Cutout, Junction, and Pull Boxes  |
| C22.2 No. 85-14            | Rigid PVC Boxes and Fittings      |
| C22.2 No. 211.2-06 (R2011) | Rigid PVC (Unplasticized) Conduit |
| C22.2 No. 227.1-06 (R2011) | Electrical Nonmetallic Tubing     |

### **913.05 MATERIALS**

#### **913.05.01 Junction Boxes and Fittings**

Junction boxes and fittings shall be according to CSA C22.2 No. 85.

#### **913.05.02 Rigid Ducts**

Rigid ducts to be embedded shall be according to OPSS 603, Table 1.

Ducts less than 60 mm diameter shall be rigid PVC and according to CSA C22.2 No. 211.2. The associated cleaner and solvent cement shall be according to the duct manufacturer's recommendations.

#### **913.05.03 Flexible Ducts and Fittings**

Flexible ducts and fittings shall be according to CAN/CSA C22.2 No. 227.1.

#### **913.05.04 Fish Line**

Fish line shall be nylon or polypropylene materials with a minimum test strength of 400 N.

#### **913.05.05 Anchorage Assemblies and Hardware**

Anchorage assemblies and hardware shall be according to OPSS 616.

##### **913.05.05.01 Anchor Assembly Struts**

Anchor assembly struts shall be according to OPSS 616.

##### **913.05.05.02 Studs, Nuts, and Washers**

Studs, nuts, and washers shall be according to OPSS 616.

##### **913.05.05.03 Ferrules**

Ferrules shall be according to OPSS 616.

### **913.07 CONSTRUCTION**

#### **913.07.01 Embedded Work in Structure**

All components shall be installed at locations specified in the Contract Documents. Components shall be secured and supported in place so that shifting or deflection of the components does not occur during the placing of concrete or under other such loads as may be encountered during construction.

#### **913.07.01.01 Junction Boxes**

Junction boxes shall be installed so that the outside faces of the covers are flush with the finished surface of the concrete, except for barrier walls. Junction boxes shall be recessed 50 mm in barrier walls and have grounded galvanized steel treaded covers according to CSA C22.2 No. 40 and the Contract Documents.

Junction boxes shall be drilled to accept conduit fittings as specified in the Contract Documents. Ducts and conduit fittings shall be connected to junction boxes using appropriate solvent cement.

#### **913.07.01.02 Ducts**

Ducts shall be installed using CSA approved fittings, couplings, and accessories for the type of duct used. Adapter couplings shall be installed between ducts of dissimilar materials. Expansion and deflection fitting assemblies or wobble joints shall be installed at structural expansion joints.

Expansion and deflection coupling joints shall be according to the Contract Documents and manufacturer's specifications. Duct to couplings and fittings connections shall be made with a cleaner and solvent cement suitable for the type of duct installed.

Ducts ending at vertical concrete faces shall be terminated with fittings as specified in the Contract Documents.

Ducts shall be free of debris, water, breakage, and distortion and verified by pulling a mandrel through the ducts.

All open ends in ducts shall be plugged with plastic plugs.

#### **913.07.01.03 Fish Line**

A fish line shall be installed in all duct systems. A 1.5 m length of fish line shall be left coiled in each junction box and at each duct termination at a concrete face by bringing the fish line out of the duct beside the plastic plug.

#### **913.07.01.04 Anchorage Assemblies**

Anchorage assemblies shall be installed according to OPSS 616.

#### **913.07.02 Embedded Work in Structure for Other than Owner**

The work for embedded work in structure for other than the Owner shall be according to subsection Embedded Work in Structure and as specified in the Contract Documents.

When material supplied by others to the Contractor is specified in the Contract Documents, the Contractor shall notify the Contract Administrator in writing of the need for the material a minimum of 30 Days in advance of the date when the material is required.

### **913.10 BASIS OF PAYMENT**

#### **913.10.01 Embedded Work in Structure - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

**CONSTRUCTION SPECIFICATION FOR  
WATERPROOFING BRIDGE DECKS  
WITH HOT APPLIED ASPHALT MEMBRANE**

**914.01 SCOPE**

This specification covers the requirements for waterproofing of new and existing concrete bridge decks with hot applied asphalt membrane.

**914.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **914.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **914.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standards Specifications, Material**

|           |                                                       |

### **Ontario Ministry of Transportation Publications**

MTO Field Guide, for the Acceptance of Hot Mix and Bridge Deck Waterproofing

### **Canadian General Standards Board (CGSB)**

37-GP-9MA (1983) Primer, Asphalt, Unfilled for Asphalt Roofing, Damproofing and Waterproofing

### **ASTM International**

D 4285-83 (2012) Test Method for Indicating Oil or Water in Compressed Air

## **914.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Deck** means the upper concrete surface of a structure to which waterproofing membrane shall be applied.

**Protection Board** means a durable panel specifically designed to provide an interface protection barrier between the asphalt and the waterproofing membrane.

**Random Location** means a location determined by the Contract Administrator based on random numbers or, if protection boards are used, it means the exposed corner of a protection board closest to that location.

## **914.05 MATERIALS**

### **914.05.01 Waterproofing Membrane**

The waterproofing membrane shall be hot applied rubberized asphalt according to OPSS 1213 and shall be supplied to the job site in cakes in the manufacturer's sealed and labelled containers ready for melting and application.

### **914.05.02 Waterproofing Membrane Reinforcement**

Waterproofing membrane reinforcement shall be spun bonded sheet structure composed of 100% continuous filament polyester fibres bonded together at their crossover points and shall be acceptable to the Owner. The membrane shall be supplied in minimum widths of 450 mm. The material shall be unaffected by the heat generated by the waterproofing membrane and the hot mix.

### **914.05.03 Hot-Poured Rubberized Asphalt Joint Sealing Compound**

The hot-poured rubberized asphalt joint sealing compound shall be according to OPSS 1212.

### **914.05.04 Protection Board**

Protection board shall be according to OPSS 1215.

### **914.05.05 Tack Coat**

The tack coat used in conjunction with the waterproofing membrane shall be primer cut back with a product recommended by the tack coat manufacturer. The primer shall be according to CGSB-37-GP-9MA

## **914.06 EQUIPMENT**

### **914.06.01 Heating and Mixing Kettle for Waterproofing Membrane and Hot-Poured Rubberized Asphalt Joint Sealing Compound**

Heating and mixing kettles shall be used for the waterproofing membrane and the hot-poured rubberized asphalt joint sealing compound.

The kettles shall be of the double boiler oil heat transfer type with a built-in agitator and equipped with 2 functional permanently installed dial type thermometers with an accuracy of  $\pm 2$  °C to measure the temperature of the melted compound and the oil. Heating shall be controlled by a thermostat to maintain the temperature of the product used within the range required by the manufacturer.

### **914.06.02 Thermometer**

A separate calibrated thermometer with an accuracy of  $\pm 2$  °C for verification of the material temperature shall be available on the job site.

### **914.06.03                      Air Compressor**

The compressor shall provide oil and water free compressed air. The compressed air shall be tested according to ASTM D 4285.

## **914.07                              CONSTRUCTION**

### **914.07.01                      General**

#### **914.07.01.01                  Bridge Deck Waterproofing**

Bridge deck waterproofing shall consist of:

- a) Deck surface preparation.
- b) Application of the tack coat.
- c) Application of the waterproofing membrane.
- d) Application of the waterproofing membrane reinforcement.
- e) Application of the protection board.
- f) Forming and filling of grooves where there are no separate tender items for this work.
- g) If applicable, repair of rejectable or marginal lots.

#### **914.07.01.02                  Traffic Restrictions**

After abrasive blast cleaning operations have commenced, traffic shall not be allowed on the abrasive blast cleaned area until after the hot mix binder course has been placed and cooled to ambient temperature.

The traffic restrictions apply to all traffic other than the construction equipment directly associated with the waterproofing operations and the paving operations that follow.

#### **914.07.01.03                  Procedure**

Waterproofing operations shall only be carried out when the air and concrete surface temperature are 5 °C or higher.

Waterproofing membrane reinforcement and protection board shall be stored at the manufacturer's recommended temperature range.

The waterproofing operations shall be performed sequentially with no delay between operations other than delays that may be required by this specification.

Drainage holes through the deck shall not be plugged or covered by either waterproofing membrane or protection boards.

#### **914.07.01.04                  Notice of Commencement of Waterproofing Operations**

At least 48 hours prior to the commencement of any waterproofing operations, the Contract Administrator shall be informed, in writing, of the date and time the Contractor intends to commence the work.

Waterproofing shall not commence until permission is given by the Contract Administrator.

**914.07.01.05                      Existing Asphalt Covered Decks**

When an asphalt riding surface is to be stripped from the existing concrete structure deck, at least 7 Days prior to the commencement of the asphalt stripping operation, the Contract Administrator shall be informed, in writing, of the date and time the Contractor intends to commence the work.

**914.07.01.06                      Applicators**

Waterproofing membrane applicators shall be from the Owner's list of applicators approved by the waterproofing membrane manufacturer.

**914.07.02                          Deck Surface Preparation**

**914.07.02.01                      Treatment of Grout Tubes on Deck Surfaces**

The grout tubes shall be cut flush with the deck surface prior to sand blasting and shall be recut flush with the concrete surface if sandblasting results in the tube projecting from above the concrete. A 450 x 450 mm piece of membrane reinforcement, centred on the tube, shall be installed as specified herein.

**914.07.02.02                      New Concrete Bridge Decks and Concrete Deck Overlays**

The surface of the concrete shall be completely treated by abrasive blast cleaning to expose sound, laitance-free concrete. Curing compound used on the concrete surface shall be completely removed. All dirt and debris shall be removed from the bridge deck. Immediately prior to the application of the tack coat, the concrete surface shall be cleaned with a jet of oil-free compressed air to remove all dust and other foreign material.

**914.07.02.03                      Existing Deck Surface Preparation**

All areas of the concrete deck that have a textured surface, not including sawcut grooves, shall be bush hammered, ground down, or scabbled to reduce the depth of texture to 2 mm or less prior to the abrasive blast cleaning operation for waterproofing.

Prior to waterproofing, all existing waterproofing material shall be removed and all concrete surfaces prepared according to the New Concrete Bridge Decks and Concrete Deck Overlays clause.

**914.07.02.04                      Modification of Deck Joint Assemblies of Existing Bridge Decks**

Modifications to the expansion joint assemblies involving welding or other means of attachment to existing armouring shall be carried out prior to waterproofing.

**914.07.02.05                      Modification of Deck Drains**

Modification of deck drains shall be as specified in the Contract Documents. The modifications shall be made prior to waterproofing the deck.

### **914.07.03 Tack Coating**

A tack coat shall be applied wherever waterproofing membrane is to be applied. The tack coat shall terminate in the chase or, where there is no chase, be extended up the face of the curbs, barrier walls, expansion joints, and deck drains to the level of the top of the proposed hot mix base course. The tack coat material shall be uniformly applied at a rate of  $0.25 \text{ l/m}^2$  or as required by the manufacturer using equipment approved by the manufacturer of the tack coat material. The tack coat shall be applied when the concrete is surface dry and clean. Waterproofing equipment shall not be permitted upon the tack coat until it has fully cured.

Drying of the concrete surface shall not be expedited by use of a torch or any other means.

### **914.07.04 Application of Waterproofing Membrane**

Cakes of asphalt waterproofing membrane shall be melted on the job site and shall be continuously agitated in the mechanically agitated heating and mixing kettle. The contents shall be continuously agitated until the material can be drawn free flowing and lump free from the mixing kettle at a temperature within the range recommended by the manufacturer.

Areas of the deck with sawcut grooves shall be filled with a scratch coat of waterproofing after the tack coat has cured. The waterproofing membrane shall be applied immediately after application of the scratch coat.

Waterproofing membrane shall not be applied until the tack coat has cured completely. The tack coat shall also be free of any surface moisture and dirt and it shall not be dried by torch or any other means. The waterproofing membrane shall be applied within the temperature range recommended by the manufacturer to form a uniform film having a thickness of  $5 \pm 1 \text{ mm}$ . The application of the waterproofing membrane shall be continuous. If discontinuities cannot be avoided, the waterproofing membrane shall be lapped a minimum of 150 mm.

The waterproofing membrane shall terminate in the chase or, where there is no chase, be extended up the face of curbs, barrier or parapet walls, expansion joints, and deck drains to the level of the top of the proposed hot mix base course.

### **914.07.05 Membrane Reinforcement**

The membrane reinforcement shall be placed directly over the waterproofing membrane and pressed in while it is still tacky. The membrane reinforcement shall terminate in the chase or, where there is no chase, be extended up the face of the curbs, barrier walls, expansion joints, and deck drains to the level of the top of the proposed hot mix base course. The membrane reinforcement shall then be covered with an additional layer of waterproofing membrane.

### **914.07.06 Application of Protection Board**

Protection boards shall be laid on the waterproofing membrane while the surface is still tacky and shall be laid transverse to the centreline of the deck. Material shall not be applied to the waterproofing membrane surface to remove the tackiness prior to installation of the protection board. The protection boards shall be placed with all edges overlapping  $12 \pm 6 \text{ mm}$ . The protection board edge shall be within 6 mm of all curbs, vertical faces of drains, and vertical faces of expansion joints. Protection boards shall be placed so that the joints lap in the direction of traffic flow and be staggered a minimum of 150 mm.

Binder course pavement shall be placed within 7 Days of waterproofing.

**914.07.07****Form and Fill Grooves**

Where hot mix asphaltic concrete is carried directly over expansion and fixed joints and where specified in the Contract Documents, a 20 mm wide and 20 mm deep rectangular groove shall be formed. This groove shall be made either by dry sawing or routing, with vertical sides, and be located directly over the joint for the full length of the joint.

Immediately prior to placing the hot-poured asphaltic sealing compound, the groove shall be dry and clean of any dust or debris using oil-free compressed air.

Cakes of joint sealing compound shall be melted on the job site and shall be continuously agitated in the mechanically agitated heating and mixing kettle. The contents shall be continuously agitated until the material can be drawn free flowing and lump free from the mixing kettle at a temperature within the range recommended by the manufacturer.

Joint sealing compound shall be poured using hand pouring pots, mechanical methods, or any other method that gives satisfactory results.

Shields shall be provided to prevent the compound from being spilled on the concrete curb, barrier or parapet walls, expansion joints, deck drains, and on the newly placed hot mix asphalt.

Sufficient joint sealing compound shall be poured into the groove so that upon completion of the work the surface of the compound is flush with the surface of the pavement. If the compound subsides to a level below the surface of the pavement, a second pouring shall be done. When more than one pouring is required to fill the groove, succeeding pours shall be made immediately.

Damage to the joint sealing compound caused by the Contractor's operation shall be repaired.

Traffic shall not be permitted over the joint sealing compound until the compound has cooled to ambient temperature.

**914.07.08****Sampling for Quality Assurance****914.07.08.01****Material Samples**

Representative samples of the following shall be taken for quality assurance testing by the Owner:

- a) For each lot, as defined in the Quality Assurance section of this specification, a 4 litre sample of waterproofing membrane from the heating and mixing kettle, at the time directed by the Contract Administrator.
- b) For each Contract, a 1 litre sample of tack coat.
- c) For each Contract, a 300 x 300 mm piece of waterproofing membrane reinforcement.
- d) For each Contract, a 300 x 300 mm piece of protection board.
- e) For each Contract, a 1 litre sample of joint sealing compound.

The time of sampling shall be determined using the Field Guide for the Acceptance of Hot Mix and Bridge Deck Waterproofing.

The Contract Administrator shall be allowed to examine the sample containers prior to sampling to ensure they are clean and free of debris.

#### **914.07.08.02                      Delivery of Samples**

Samples of the waterproofing membrane, waterproofing membrane reinforcement, joint sealing compound, tack coat, and the protection board shall be delivered within 5 Business Days of the application date to:

Head, Concrete Section  
Ontario Ministry of Transportation  
Room 15, Building C  
1201 Wilson Avenue  
Downsview, Ontario, M3M 1J8

#### **914.07.09                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **914.08                      QUALITY ASSURANCE**

#### **914.08.01                      Lot Size**

A lot size shall be a single bridge deck or part of a bridge deck with a surface area of 800 m<sup>2</sup> or less. Decks larger than 800 m<sup>2</sup> shall be divided into the least number of equal size lots of 800 m<sup>2</sup> or less. Decks separated into segments for staged construction shall be treated as separate lots. The Contract Administrator shall determine the limits of each lot.

For measurement of membrane thickness only, a lot shall be divided into 10 equal sublots. The sampling location within the subplot shall be determined by the Contract Administrator.

#### **914.08.02                      Acceptance of Waterproofing Membrane Reinforcement, Joint Sealing Compound, and Tack Coat**

Waterproofing membrane reinforcement, joint sealing compound, and tack coat shall be evaluated by the Owner for compliance with the requirements of this specification.

#### **914.08.03                      Acceptance of Waterproofing Membrane Thickness**

##### **914.08.03.01                      General**

The Contract Administrator shall determine the acceptability of the waterproofing membrane thickness by measurement on a lot-by-lot basis.

##### **914.08.03.02                      Testing of Waterproofing Membrane Thickness**

Measurements shall be made according to the Field Guide For the Acceptance of Hot Mix and Bridge Deck Waterproofing and shall be taken after each lot has been completed, including the placement of protection board.

##### **914.08.03.03                      Waterproofing Membrane Thickness Acceptance Determination**

The decision to accept the waterproofing membrane thickness shall be based on the mean and standard deviation of each lot.

If the lot mean is less than 4.0 mm or greater than 6.0 mm, the entire lot is rejectable and the Contractor shall remove and replace the lot according to the Treatment of Rejectable Lots clause.

If the lot mean is greater than or equal to 4.0 mm and less than or equal to 6.0 mm, the mean and the standard deviation shall be rounded to the closest 0.1 mm and 0.05 mm, respectively, and shall then be applied to Table 1 to determine if the lot is in the acceptable, marginal, or rejectable range. If the lot is within the marginal range as shown in Table 1, the Contractor may repair the lot as outlined below or request that the Owner accept the lot as is with a payment adjustment as outlined in the Payment Adjustment Due to Membrane Thickness Deficiency clause. If the lot is within the rejectable range as shown in Table 1, the Contractor shall remove and replace the lot according to the Treatment of Rejectable Lots clause.

Where the membrane thickness is greater than 6.0 mm, the Contractor may submit a proposal in writing for an alternative to removal and replacement for rejectable waterproofing membrane thickness for the Owner's consideration.

#### **914.08.03.04 Referee Testing of Waterproofing Membrane Thickness for Marginal or Rejectable Lots**

The Contractor may request retesting, prior to paving and within 2 Business Days of being advised of test results, if any or all of the 10 subplot test values are challenged. If this occurs, 10 new thickness measurements shall be taken within the lot by the Contract Administrator in the presence of the Contractor. The new test values shall then be used to determine acceptance. Acceptance shall be based on the criteria specified in the Membrane Thickness Acceptance Determination clause and shall be binding on both parties.

If the referee testing results in either a marginal or a rejectable lot, the Contractor shall bear the cost of the referee testing. If the referee testing results in the material passing thickness testing criteria and resulting in an acceptable lot, the referee testing charge shall be paid by the Owner.

#### **914.08.04 Acceptance of Waterproofing Membrane Quality**

##### **914.08.04.01 General**

Acceptance of the waterproofing membrane quality shall be on a lot-by-lot basis.

##### **914.08.04.02 Sampling and Testing of Waterproofing Membrane Quality**

The sample delivered to the Owner shall be split at the laboratory into 2 equal parts; one part shall be tested for acceptance and the other shall be retained for referee testing.

##### **914.08.04.03 Waterproofing Membrane Quality Acceptance Determination**

A lot shall be acceptable if it meets the requirements as shown in Table 2 when tested in accordance with OPSS 1213 and this specification. Marginal lots shall be subject to a payment adjustment according to this specification.

A lot is rejectable if any of the following criteria are met:

- a) The total number of adjustment points (PT), as shown in Table 2 is greater than 20.
- b) Any test result for a sample is in the rejection value range, as shown in Table 2.

A lot shall be considered marginal and subject to a payment adjustment as outlined in the Payment Adjustment Due to Membrane Quality Deficiency clause if the total number of adjustment points (PT) resulting from Table 2 is greater than zero and less than or equal to 20.

Rejectable lots shall be removed and replaced according to the Treatment of Rejectable Lots clause.

**914.08.04.04****Referee Testing of Waterproofing Membrane Quality**

The Contractor may request, in writing, retesting of any sample that results in payment adjustment or rejection of a lot; however, the request shall be made within 5 Business Days of receiving notification of payment adjustment or rejection of the lot. The results of the referee test shall be used for acceptance determination and shall be binding on both parties. If the referee testing results in either a payment adjustment or rejection of the lot, the Contractor shall bear the cost of the referee testing. If the referee testing results in the material passing all test criteria, the referee testing charge shall be paid by the Owner.

**914.08.05****Acceptance of Protection Board**

Protection board shall be acceptable if it meets the requirements of OPSS 1215 and this specification.

The Contract Administrator shall determine acceptability of protection board thickness on a lot-by-lot basis. A lot size shall be the total number protection boards required to cover the area defined in the Lot Size clause.

One protection board per lot shall be randomly selected by the Contract Administrator and the thickness shall be measured according to the Field Guide for the Acceptance of Hot Mix and Bridge Deck Waterproofing. Protection board thickness measurement shall be done on site prior to the commencement of the waterproofing operation.

Lots where the measured protection board thickness is less than 3.2 mm or greater than 4.0 mm shall be rejectable.

Rejectable protection board shall not be placed in the work. Rejectable protection board that has been placed in the work shall be removed and replaced, along with the waterproofing membrane according to the Treatment of Rejectable Lots clause.

**914.08.06****Treatment of Rejectable Lots**

Removal of membrane material shall include removal of the full membrane thickness to neat lines and removal of overlying pavement, as applicable. Deck surface preparation, placement of a new tack coat, membrane material, and membrane reinforcement over the removal area shall be completed according to this specification. New membrane material shall be lapped according to the Application of Waterproofing Membrane clause.

Any protection boards that are removed during the repairs and referee testing shall be replaced with new ones.

Lots that have been repaired or replaced shall be subject to Quality Assurance acceptance requirements of this section.

The Contractor shall be responsible for all costs associated with removing and replacing rejectable lots.

**914.09****MEASUREMENT FOR PAYMENT****914.09.01****Actual Measurement****914.09.01.01****Membrane Reinforcement**

Measurement of membrane reinforcement shall be by length in metres. Allowance shall not be made in the measurement for the turn-up at vertical faces or for any overlap.

**914.09.01.02                      Form and Fill Grooves**

Measurement of forming and filling grooves shall be by length in metres.

**914.09.01.03                      Modification of Deck Drains**

For measurement purposes, a count shall be made of the number of deck drains modified, regardless of type and size.

**914.09.01.04                      Deck Surface Preparation**

Measurement of deck surface preparation shall be by area in square metres.

**914.09.02                          Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**914.10                                BASIS OF PAYMENT**

**914.10.01                          Bridge Deck Waterproofing - Item  
Membrane Reinforcement - Item  
Form and Fill Grooves - Item  
Deck Surface Preparation - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract does not contain separate tender items for the work required by this specification, payment at the Contract price for the tender item Bridge Deck Waterproofing shall be full compensation for all labour, Equipment, and Material to do the work.

When repairs or remedial work to the concrete deck is required prior to abrasive blast cleaning and the work is not specified in the Contract Documents, payment for the cost of such work shall be administered as Extra Work.

Repairs to damaged grooves shall be made at the Contractor's expense at no additional cost to the Owner.

**914.10.01.01                      Payment Adjustment Due to Membrane Thickness Deficiency**

When a lot is within the acceptable range as shown in Table 1, a thickness adjustment factor of 1.00 shall be applied to the Contract price for the lot.

When a lot is within the marginal range as shown in Table 1 and the Contractor requests that the Owner accept the lot as is, the thickness adjustment factor as shown in Table 1 shall be applied. Where a lot with mean thickness greater than 6.0 mm has been deemed acceptable and the Contractor requests that the Owner accept the lot as is, a payment adjustment factor of 0.60 shall be applied due to membrane thickness deficiency.

**914.10.01.02                      Payment Adjustment Due to Membrane Quality Deficiency**

Quality adjustment factors are calculated as follows:

If any individual test result is inside the rejection value range, the lot is rejectable.

If the sample test results are in the marginal range for one or more tests, the adjustment points as shown in Table 2 for each borderline test result shall be totalled. If the total exceeds 20, the lot is rejectable. If the total is less than or equal to 20, the Contract Administrator shall assign a payment adjustment factor which shall be 100 minus the total of all the adjustment points (PT) and the result divided by 100.

If the sample test results meet all specification limits as shown in Table 2, the Contract Administrator shall assign a payment adjustment factor of 1.00.

#### **914.10.01.03                      Calculation for Total Adjustment Payment**

The total adjusted payment for the lot shall be based on the thickness and on the quality for the waterproofing membrane and is calculated as follows:

The Contract price for the lot shall be multiplied by the thickness adjustment factor and the results shall then be multiplied by the quality adjustment factor.

#### **914.10.02                      Modification of Deck Drains - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

### **915.01 SCOPE**

This specification covers the requirements for the design and construction of the tri-chord, cantilever tri-chord, cantilever, variable message, pole mounted variable message, monotube overhead, bridge mounted, and roadside breakaway and non-breakaway sign support structures, including their footings.

### **915.02 REFERENCES**

### 915.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Bridge Mounted Sign Support Structure** means a static sign support structure attached to the side of a bridge.

**Cantilever Sign Support Structure** means an overhead sign support structure consisting of horizontal members mounted to one side, both sides, or centre mounted, to a single vertical leg.

**Cantilever Tri-Chord Sign Support Structure** means a static sign support structure consisting of a galvanized steel overhead truss constructed in the form of a three-chord system mounted to a single vertical leg.

**Column** means the vertical member of a roadside sign support structure that has the base section of the member buried below grade and the upper section connected to a sign or sign support.

**Leg** means the vertical member of an overhead sign support structure that connects to the sign support footing.

**Overhead Monotube Sign Support Structure** means an overhead sign support structure consisting of two vertical single steel tubing legs spanned by a single steel tubing member.

**Overhead Sign Support Structure** means a structure for supporting signs over a roadway.

**Pole Mounted Variable Message Sign Support Structure** means an overhead sign support structure consisting of a variable message board centre mounted to a single vertical galvanized steel pole.

**Roadside Sign Support Structure** means a timber or steel, breakaway or non-breakaway, sign support structure, consisting of two or more columns on the side of the roadway.

**Sign and Sign Board** means a traffic control device mounted on a fixed support that conveys a specific message by means of symbols and/or words, and is officially installed for the purpose of regulating, warning, informing, and guiding traffic.

**Sign Support Structure** means an overhead sign support structure or a roadside sign support structure.

**Sweep** means the deviation from straightness of a member or any portion of a member with respect to its minor axis.

**Tri-Chord Sign Support Structure** means a static sign support structure consisting of a galvanized steel overhead truss constructed in the form of a three-chord system and having two tubular legs.

**Variable Message Sign Support Structure** means an overhead sign support structure with two steel legs, consisting of a pair of trussed members, and an aluminum truss spanning the roadway.

**Variable Message Sign (VMS)** means a Variable Message Sign that includes display elements, sign case, VMS controller, controller enclosure and all other mechanisms and equipment required to enable placement of the VMS on the support structure.

## **915.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **915.04.01 Design Requirements**

Sign support structure design shall be according to the Sign Support Manual, Structural Manual, CSA S6, AASHTO LRFDLTS-1, and the requirements of this specification. In addition, aluminum components shall also be designed according to CSA S157.

The catwalk grating shall be designed for a live load of 5 kPa.

Welding design shall be according to CSA W59.2 for aluminum and CSA W59 for steel.

### **915.04.02 Submission Requirements**

#### **915.04.02.01 General**

When other authorities are involved in the approval of the design or construction of a highway structure, the submission shall be made at least 5 weeks prior to commencement of work.

#### **915.04.02.02 Working Drawings for Sign Support Structures**

Working Drawings shall be submitted to the Contract Administrator at least 7 Days prior to commencement of fabrication of overhead sign support structures, for information purposes only.

Working Drawings shall be according to the Contract Documents. An Engineer's seal and signature shall be affixed on the Working Drawings verifying that they are consistent with the requirements of the Contract Documents.

The fabricator shall have a sealed and signed copy of the Working Drawings at the manufacturing facility during fabrication. Working Drawings shall include at least the following information:

- a) Fabrication details.
- b) Specifications of the material to be used.
- c) Design, assembly, and detail drawings including welding procedures according to CSA W59.2 for aluminum and CSA W59 for steel.
- d) Fastener torquing values and methods.
- e) For variable message sign support structures, structural details including the catwalk, aluminum skin, and attachment of the VMS to the sign support structure.
- f) Coating requirements.

#### **915.04.02.03 Mill Test Certificates**

Mill test certificates shall be according to OPSS 906.

#### **915.04.02.04                      Verification of Fasteners**

Verification that bolts, nuts, and washers meet the chemical composition, mechanical properties, dimensions, workmanship, and head burst as required by the appropriate ASTM specification specified in the Contract Documents shall be submitted to the Contract Administrator.

#### **915.04.02.05                      Delivery Schedule for Overhead Sign Support Structures**

The delivery schedule of overhead sign support structures and their components to the galvanizing or painting facility or both, and to the site, shall be provided to the Contract Administrator not less than 7 Days before shipping begins.

#### **915.04.02.06                      Rock Excavation Plan**

If rock is present within the depth of the footing as specified in the Contract Documents a proposed method of rock excavation shall be submitted to the Contract Administrator at least 14 Days prior to the commencement of excavation, for information purposes only.

#### **915.04.02.07                      Erection Procedures for Overhead Sign Support Structures**

Erection procedures shall be submitted to the Contract Administrator at least 7 Days prior to the commencement of overhead sign support structure erection, for information purposes only.

Erection procedures shall be according to the Contract Documents. An Engineer's seal and signature shall be affixed on the erection procedures verifying that they are consistent with the requirements of the Contract Documents.

A copy of the erection procedures shall be at the site during erection. The erection procedures shall include at least the following:

- a) Proposed method and sequence of erection.
- b) Weight and lifting points of the members.
- c) Locations and lifting capacities of the cranes to be used to lift the members.
- d) Details of temporary bracing and temporary supports used during construction, including time and sequence of removal.
- e) Calculations.
- f) Fastener torquing values and methods.
- g) Method of maintaining the columns and anchorages vertical and in the specified location in the footings until the concrete has set.
- h) Erection tolerance between the end diagonal and the corbel for the tri-chord sign support structure truss.

#### **915.04.02.08                      Inspection Company and Inspector Information**

The names of the inspection company, inspectors, and non-destructive testing technicians, together with proof of certification, shall be submitted to the Contract Administrator a minimum of 7 Days prior to commencement of fabrication of overhead sign support structures, for information purposes only.

**915.04.02.09 Signboards**

**915.04.02.09.01 Sign Ordering**

A list of required signboards and tabs shall be submitted to the Contract Administrator a minimum of 12 weeks prior to the date of installation and shall contain the quantity, sign details, and the date for pick-up.

**915.04.02.09.02 Sign Confirmation and Inspection**

Confirmation in writing shall be provided to the Contract Administrator within 5 Business Days stating that all the supplied signs were received according to the list of required signboards and tabs. The Owner shall be responsible for the cost of replacing any incorrect signs identified prior to the confirmation. Once the confirmation has been received the Owner shall not be responsible for the cost of replacing any damaged, missing, and incorrect signs.

**915.05 MATERIALS**

**915.05.01 General**

All material used shall be appropriate for its end use and shall be compatible with the sign structure metal.

**915.05.02 Aluminum**

Extruded aluminum tubing shall be 6061-T6 alloy according to ASTM B221M.

Aluminum sheet and plate shall be 6061-T6 alloy according to ASTM B209.

Dissimilar metal shall not come in contact with aluminum.

**915.05.03 Anchorage Assembly**

Bolts, studs, struts, and coils shall be as specified in the Contract Documents. The anchorage assembly shall be hot dip galvanized according to the Coating clause. The anchorage assembly shall be supplied with the fasteners installed in a rigid template.

**915.05.04 Clamps**

Clamps shall be as specified in the Contract Documents.

**915.05.05 Coatings**

Paint and metallic coatings shall be as specified in the Contract Documents and according to OPSS 911.

**915.05.06 Concrete**

Concrete shall be according to OPSS 1350. Compressive strength shall be as specified in the Contract Documents.

**915.05.07 Electrical**

Ducts and fittings for electrical work shall be as specified in the Contract Documents and according to OPSS 603.

Electrical grounding posts at handholes shall be according to OPSS 609.

#### **915.05.08 Fasteners**

Stainless steel fasteners shall be alloy 304 or 316 according to ASTM F593.

Lock nuts shall be nylon insert type.

Galvanized steel fasteners shall be according to ASTM A307 or ASTM F3125, grade A325 or grade A325M, Type 1 as specified in the Contract Documents.

High strength nuts, and hardened washers shall be suitable for use with the types of bolts being specified and shall be according to ASTM A563 and ASTM F436.

The nuts, bolts, and washers shall be supplied and shipped together as an assembly from the same manufacturer.

#### **915.05.09 Granular Backfill**

Granular backfill shall be as specified in the Contract Documents and according to OPSS 1010.

#### **915.05.10 Primer and Locking Compound**

The thread-locking compound shall be a removable medium strength, single component anaerobic thread locking material that allows disassembly with hand tools. The primer shall be as recommended by the manufacturer of the thread-locking compound.

#### **915.05.11 Reinforcing Steel**

Reinforcing steel shall be according to OPSS 1440 and as specified in the Contract Documents.

#### **915.05.12 Steel**

Steel shall be according to CSA G40.20/G40.21, ASTM A500, OPSS 906, and as specified in the Contract Documents.

#### **915.05.13 Wood**

Wood shall be grade No. 1 Coast Douglas Fir, or grade No. 1 Jack Pine - Beam and Stringer grade, or Post and Timber grade categories as specified in the Contract Documents and shall be according to OPSS 1601.

Wood shall be pressure preservative treated according to OPSS 1601.

### **915.07 CONSTRUCTION**

#### **915.07.01 Fabrication**

##### **915.07.01.01 Aluminum Sign Support Structures**

##### **915.07.01.01.01 General**

The aluminum fabrication shall be according to CSA W59.2.

Cutting shall be done by shearing, sawing, milling, or plasma arc. Flame cutting of components is not permitted. In straightening out parts, only plastic or rubber hammers shall be used. All sharp edges and burrs shall be removed. Components cracked or ruptured at any time shall be replaced and not be used in the work.

#### **915.07.01.01.02          Welding**

All welding shall be according to CSA W59.2.

The company performing the welding shall be certified according to CSA W47.2, Division 1 or Division 2.

All welding shall be carried out by welders having a CSA W47.2 identification card valid for the type of welding to be done and for the duration of the welding work. Prior to commencement of welding, the identification cards for each tack welder, welder, or welding operator to be employed on the work shall be made available to the Contract Administrator. Identification cards shall be currently valid and shall indicate the welding processes and the welding positions for which the personnel are qualified to weld.

Welding jigs and fixtures shall be used to hold the connector assemblies in position during fabrication.

All areas to be welded shall be free of grease and cleaned with grease free aluminum or stainless steel brushes. All welds shall be according to CSA W59.2 and made using an inert-gas shielded arc process. All welds shall be cleaned of soot.

Components to be joined by fillet welding shall have a separation no greater than 1.5 mm.

Unless specified on the Working Drawings or otherwise approved in writing by the Contract Administrator, field welding shall not be permitted. When field welding is permitted, it shall be done by a welder certified for all position welding according to CSA W47.2.

#### **915.07.01.02          Steel Sign Support Structures**

##### **915.07.01.02.01          General**

The steel fabrication shall be according to the Working Drawings and OPSS 906, except as specified in this specification.

Circular structural tubing shall have no more than one longitudinal weld. Octagonal legs shall have no more than two longitudinal welds. Longitudinal welds in legs shall be full penetration and done using an automatic welding process. Longitudinal welds in legs shall be in a plane through the centroid of the section that is parallel to the signboard.

If an octagonal cross section is used for the legs, it shall be produced by mechanically bending the material. The centroid of the octagonal section shall be coincident with the specified circular shape.

##### **915.07.01.02.02          Welding**

Welding shall be according to CSA W59. All accessible welds, except fillet welds, shall be ground smooth.

##### **915.07.01.02.03          Steel Monotube Overhead Sign Support Structures**

The members shall be octagonal in cross-section and when tapered, the taper shall be uniform. Legs shall have one or two longitudinal automated electrically welded joints along their full length.

Circumferential welds shall be full penetration welds and shall be ground flush on the exterior face. The maximum permitted number of circumferential welded joints in a member length, as measured between the connections shall be as follows:

- a) Up to and including 9 m - one weld.
- b) Greater than 9 m - two welds.

Circumferential welds shall not be located less than 2.7 m from a bolted connection and all welding shall be carried out prior to galvanizing.

Sweep, in millimetres, shall not exceed:

$$\text{Sweep} \leq (\text{Total Length of Member in Metres} / 15) \times 10.4 \text{ mm}$$

All welding at flange plates shall develop the full strength of the adjacent shaft section.

The column base plates shall be flush with the bottom of the columns. The base plates shall be positioned perpendicular to the centreline of the columns. The flange plates shall be positioned to provide the specified camber of the horizontal member after erection. After fabrication, the faces of the base plates and flange plates shall be true and free from distortion.

A waterproof removable galvanized steel top cap shall be furnished with each leg. The caps shall blend with the general column design to present a neat overall appearance. Each cap shall be rigidly secured to the column by a hexagonal head stainless steel set screw. The flange plates, handholes, access nipples for wiring, grounding lugs, and mounting brackets shall be accurately positioned on the members. The wiring apertures shall provide a smooth cable entrance into the members.

#### **915.07.01.02.04          Coating**

All steel components of steel sign support structures, including the anchorage assembly, shall be hot dip galvanized according to OPSS 911.

Legs of sign supports, shall be subsequently coated with an approved paint system according to OPSS 911.

#### **915.07.01.03          Mechanical Access for Electrical Work**

Legs adjacent to the power source shall be fabricated with handhole frames complete with covers and gaskets. The strength of the leg at the section through the handhole shall not be less than the original section. When specified in the Contract Documents, grounding lugs, fuse clips, and access nipples for wiring shall be installed during shop fabrication.

#### **915.07.01.04          Identification of Overhead Sign Support Structures**

Each sign support structure shall have a site identification marking located approximately 1 m above the footing showing the following information:

- a) Site identification number.
- b) Manufacturer's name or trademark.
- c) Date of manufacture.
- d) Maximum sign area.
- e) Design wind pressure.

The marking shall be on a corrosion resistant plate securely attached by means of stainless steel band clamps. The plate shall be attached on the right leg viewed in the direction of traffic. The maximum size of plate shall be 150 x 150 mm.

The site identification number, maximum sign area, and design wind pressure for each sign support structure shall be as specified in the Contract Documents.

## **915.07.02 Shipment of Sign Support Structures and Their Components**

### **915.07.02.01 General**

Each sign support structure shall be shipped, complete with hardware, suitably packaged to ensure that all components are delivered together with tags attached noting the site identification number. The fuse connector clip and grounding post shall be assembled inside the leg before shipment.

### **915.07.02.02 Transporting, Unloading, Storing, and Handling Components**

The components shall only be handled at the lifting points shown in the Working Drawings using non-metallic lifting slings.

The components that are to receive a paint coating after galvanizing shall be identified when delivered to the galvanizing plant.

All work necessary to ensure safe loading, delivery, unloading, and storage of components at the specified site shall be performed. Components shall be loaded for shipping in a manner that they can be transported and unloaded at its destination without being overstressed or damaged. When stored, components shall be stockpiled to avoid permanent deformation or damage.

Advertising by means of removable signing is permitted on elements only while in transit to the specified site. Painting of advertisements directly on elements is not permitted.

### **915.07.02.03 Storage of Signboard Chord Clamps**

When the Contract Documents do not include the installation of the signboard for each overhead sign structure, the chord clamps required for fastening the sign shall be placed in burlap bags with tags. The tags shall be marked with the size of clamps and the identification number of the sign structure on which they are to be used. Chord clamps prepared in this manner shall be delivered to the Owner for storage as specified in the Contract Documents.

## **915.07.03 Footings for Overhead Sign Support Structures**

### **915.07.03.01 General**

The footings shall be constructed plumb to within 1H:100V.

The tolerance for the location of the centre of the constructed footing shall be 75 mm from the location specified in the Contract Documents.

### **915.07.03.02 Excavation**

The excavation shall be to the lines and grades specified in the Contract Documents and according to OPSS 902.

Cylindrical shaft footings for overhead sign support structures shall be constructed as caisson piles according to OPSS 903.

When the following conditions are encountered the excavation shall be stopped, observations shall be recorded, and the Contract Administrator shall be notified immediately:

- a) Different subsurface conditions and/or unexpected conditions such as obstructions within the foundations; or
- b) Unexpected rock is encountered at a depth less than the full depth of the footing; or
- c) Soil with unexpectedly lower strengths that compromise the bearing capacity.

#### **915.07.03.03                      Formwork**

Formwork shall be according to OPSS 919.

The footing shall be formed to a minimum of 150 mm below finish grade. Formwork shall be removed to a minimum depth of 150 mm below finished grade prior to placing granular backfill.

#### **915.07.03.04                      Reinforcing Steel**

Reinforcing steel shall be placed according to OPSS 905.

#### **915.07.03.05                      Anchorage Assembly**

The anchorage assembly shall be installed level to the tolerances as specified in the Contract Documents. The tolerance for the location of the centre of the anchorage assembly shall be 50 mm from the centre of the footing. Anchorage assemblies shall be securely tied to the reinforcing steel and provided with supports to maintain its position during the placing of concrete. The anchorage assembly shall not be welded to the reinforcing cage and shall remain plumb to within 1H:200V. The anchorage assembly setting templates shall remain in place until after the curing period of the concrete.

The centre to centre tolerance of the anchorage assemblies for the following structure types shall be:

|                                           |                    |
|-------------------------------------------|--------------------|
| Tri-chord sign support structure:         | - 25 mm to + 50 mm |
| Variable message sign support structure:  | ± 25 mm            |
| Monotube overhead sign support structure: | ± 25 mm            |

Bedding grout shall not be used under the base plates of tri-chord, cantilever tri-chord, cantilever, pole mounted variable message, and monotube overhead sign support structures.

#### **915.07.03.06                      Electrical Ducts and Fittings**

All work for electrical ducts and fittings shall be according to OPSS 603.

When rigid duct sleeves in footings are specified in the Contract Documents, they shall be located to suit incoming duct or cable systems and shall be securely tied to steel reinforcement, prior to placing concrete.

All rigid duct sleeves shall be cut off cleanly above the footing ensuring a minimum projection of 150 mm above the base plates. Rigid duct sleeves shall be temporarily plugged or sealed until the ducts or cable systems are installed.

#### **915.07.03.07                      Concrete**

##### **915.07.03.07.01                  General**

Concrete shall be according to OPSS 904, with the following additions:

- a) All loosed, softened, and deleterious material within the foundation shall be removed prior to concreting.
- b) The foundation shall be inspected by the Contract Administrator prior to concreting.

- c) Concrete shall be placed against undisturbed soil and the top of the footing shall be float finished level within  $\pm 10$  mm of the elevation specified in the Contract Documents.
- d) When white-pigmented membrane is used as a curing compound on an adjacent concrete barrier, a minimum of one coat of the curing compound shall be applied to the concrete footing after completion of the curing with burlap and water of the footing, for colour uniformity. Additional curing compound shall be applied, as necessary, to ensure colour uniformity. The curing compound shall only be used on the exposed surfaces of the footings. No curing compound shall be applied to construction joints.

#### **915.07.03.07.02          Early Loading of Sign Support Structure Concrete**

Early erection of the sign support structure shall be according to the Early Loading of Structural Concrete subsection of OPSS 904 with the following exception:

- a) Prior to any early loading, it shall be demonstrated that the concrete has reached a compressive strength of 25 MPa by preparing, curing, and transporting early strength cylinders according to the Testing for Early Strength subsection of OPSS 904.

#### **915.07.03.08          Inspection after Construction of the Footings**

An Owner standard form PH-CC-701, Request to Proceed, shall be submitted to the Contract Administrator upon completion of the construction of the footing, and prior to the installation of the overhead sign support structure.

The installation of overhead sign support structure shall not proceed until an Owner standard form PH-CC-702, Notice to Proceed, has been received from the Contract Administrator.

#### **915.07.04          Erection of Overhead Sign Support Structures**

##### **915.07.04.01          General**

The Contract Administrator shall be notified in writing a minimum of 7 Days prior to the commencement of field operations and erection work.

Components shall be erected using appropriate lifting equipment, temporary bracing, guys, and stiffening devices so that the components are at no time overstressed, unstable, unsafe, or damaged.

The fully assembled truss of the variable message sign support structure shall be erected in one lift.

Legs of structures with rigid corners shall not be forced into position on to the anchorage bolts.

A primer and locking compound shall be applied to the anchor bolts during erection of the overhead sign structure.

##### **915.07.04.02          Legs**

Legs of structures shall be erected plumb to within a tolerance of 1H:200V.

##### **915.07.04.03          Field Cutting**

Field cutting of material is not permitted.

##### **915.07.04.04          Attachments to Sign Support Structures**

Attachments to the sign support structure shall only be made with clamps. Welding shall not be used for any attachment to the sign support structure.

#### **915.07.04.05 Field Splices**

Bolted field splices shall be as specified in the Contract Documents, have full contact bearing when assembled and shall not have a separation exceeding 0.5 mm for at least 75% of the entire contact area. The separation of any remaining portion shall not exceed 1 mm.

#### **915.07.04.06 Fastener Torquing**

Fasteners shall be torqued as specified in the Contract Documents.

#### **915.07.05 Breakaway and Non-Breakaway Roadside Sign Support Structures**

##### **915.07.05.01 General**

##### **915.07.05.01.01 Excavation**

The excavation for the footings of the steel columns and the installation of the wood columns shall be augered in undisturbed soil to the dimensions and at the locations specified in the Contract Documents. The elevation of the bottom of the excavation shall be as specified in the Contract Documents or as determined by the Contract Administrator. Sidewall stability shall be maintained throughout the excavation and concrete placement for steel columns, and installation of wood columns. The formation of cavities in the wall and the flow of soil or water into the excavation shall be prevented. All loose material shall be removed from the bottom of the excavation.

The MTO form PH-CC-701, Request to Proceed, shall be submitted to the Contract Administrator upon completion of the excavation. The work shall not proceed until the Contract Administrator has inspected the excavation and issued the MTO form PH-CC-702, Notice to Proceed.

When the following conditions are encountered the excavation shall be stopped, observations shall be recorded, and the Contract Administrator shall be notified immediately:

- a) Different subsurface conditions and/or unexpected conditions such as obstructions within the foundations; or,
- b) Unexpected rock is encountered at a depth less than the full depth of the footing; or,
- c) Soil with unexpectedly lower strengths that comprise the bearing capacity.

##### **915.07.05.01.02 Tolerances**

Centreline of the columns and column stubs shall be within 50 mm of the centreline of the as-built footing.

Centre to centre spacing of columns, column stubs, or column assemblies shall be  $\pm 50$  mm.

Height of signboard attachment holes shall be  $\pm 10$  mm.

#### **915.07.05.02 Steel Roadside Sign Support Structures**

##### **915.07.05.02.01 Footings**

Concrete shall be according to OPSS 904. Concrete for footings shall be placed against undisturbed soil.

The top of the footing shall be shaped to a dome with the top of the dome a minimum of 25 mm above the surrounding ground.

Minimum edge distance of the column components from the edge of concrete footing shall be 75 mm.

#### **915.07.05.02.02          Column Erection**

The columns shall be maintained vertical to within a tolerance of 1H:200V and oriented within the tolerances as specified in the Contract Documents until the concrete has set.

For the transverse alignment of the columns, the column components shall be installed so that the faces in contact with the cross-arms shall line up and be coplanar. The cross-arms and sign panels shall not be distorted.

The assembled elements constituting the column shall be straight and concentric with a maximum offset from the vertical axis of 5 mm at any joint.

Shims shall not be used in the assembly of the columns and joints, except at the column stub to lower column connection.

#### **915.07.05.02.01          Breakaway Type Columns**

The top surface of the friction plate on the column stub shall be installed level at the elevation specified in the Contract Documents and maintained in this position during the placing and setting of the concrete. The contact areas of the friction plate, fuse plate, and column flange shall be; smooth; clean; and free of galvanized beads, runs, and other imperfections that may impair the sliding action.

#### **915.07.05.03          Wood Roadside Sign Support Structures**

##### **915.07.05.03.01          Footings**

The columns shall be maintained vertical to within a tolerance of 1H:200V and within the tolerances as specified in the Contract Documents until the backfill has been completed.

Granular backfill shall be compacted according to OPSS 501. The top layer shall extend 100 mm above the surrounding ground and shall be sloped away from the column to provide water run off.

The backfill operation shall be completed prior to the attachment of the signs.

##### **915.07.05.03.02          Field Installation**

Field erection and cut surface treatment shall be according to OPSS 907.

The pressed steel shear plates shall be installed in grooves according to manufacturer's recommendations.

The splice surfaces shall be flat and perpendicular to the centreline of the post to ensure full plate contact and shall be used as templates for drilling the holes.

#### **915.07.06          Site Trimming Around Footings**

The area surrounding the footing shall be trimmed and finished as specified in the Contract Documents.

#### **915.07.07          Bridge Mounted Sign Support Structures**

When the location of attachment on a structure is not specified in the Contract Documents, the attachment to the structure shall be located to minimize the fatigue affects on the support structure as determined by the Contract Administrator.

The Contract Administrator shall be notified in writing a minimum of 7 Days prior to the commencement of field operations and erection work.

Components shall be erected using appropriate lifting equipment, temporary bracing, guys, and stiffening devices so that the components are at no time overstressed, unstable, unsafe, or damaged.

Installation of anchors shall be according to the Contract Documents.

#### **915.07.08 Attachment of New Signboards**

##### **915.07.08.01 General**

The signboards shall be installed at the locations as specified in the Contract Documents using fasteners appropriate for the application.

All new signboards and tabs to be installed on all new sign support structures will be supplied by the Owner.

Tabs placed on signboards shall be installed with self-tapping screws, #3 Tek screws, with a minimum distance between screws of 300 mm.

##### **915.07.08.02 Sign Pick-Up**

All ordered signboards and tabs shall be picked up at the location provided in the "Schedule of Materials to be Supplied by the Owner" within 10 Business Days of receiving notice from the Contract Administrator that the signs are ready for pick-up.

#### **915.07.09 Quality Control**

##### **915.07.09.01 General**

The quality control of all fabrication processes shall be according to OPSS 906, except as modified in this specification.

Visual inspection and non-destructive testing of steel components shall be according to CSA W59 and as specified in this specification. The acceptance standards of CSA W59 for dynamically loaded structures shall apply.

Visual inspection and non-destructive testing of aluminum components shall be according to CSA W59.2 and as specified in this specification. The acceptance standards of CSA W59.2 for dynamically loaded structures shall apply.

##### **915.07.09.02 Certification of Testing Company, Inspectors and Technicians**

An inspector performing the visual inspection shall be certified according to CSA W178.2. Certification shall be to either CWB Level 2 or CWB Level 3.

A testing company shall be employed by the Contractor to do the non-destructive testing of welds and shall be an independent testing organization that is certified by the Canadian Welding Bureau to the requirements of CSA W178.1 for testing of industrial structures. Certification shall include all non-destructive testing methods required to fulfill the inspection and testing requirements of this specification.

Non-destructive testing shall be done by a technician certified in accordance with CGSB 48.9712. Certification shall be to either CGSB Level 2 or CGSB Level 3 for the method used.

The technician and the testing company shall not be changed without the prior approval of the Contract Administrator.

#### **915.07.09.03                    Inspection and Testing Reports**

A copy of all inspection and testing reports shall be submitted to the Contract Administrator within 7 Days after inspection.

Inspection reports shall bear the seal and signature of an Engineer.

#### **915.07.09.04                    Material Certification**

Prior to fabrication, the materials used shall be certified to be according to the requirements specified in the Material section.

#### **915.07.09.05                    Inspection of Welds**

Upon completion of fabrication, all welds in the structure shall be visually inspected and the following welds and connections shall be tested to confirm the acceptability of the fabrication:

- a) The following steel connections shall be tested by magnetic particle testing:
  - i. All column to base plate, stiffeners to column, and stiffeners to base plate for the cantilever, tri-chord, cantilever tri-chord, variable message, pole mounted variable message, and overhead monotube sign support structures.
  - ii. All arm to leg connection plates, stiffeners to arm connection plate, and stiffeners to leg connection plate for cantilever and cantilever tri-chord sign support structures.
- b) The following welds shall be tested using ultrasonic testing methods:
  - i. All longitudinal groove welds in the first 2 m of the leg measured from the base plate of the tri-chord, pole mounted variable message, and overhead monotube sign support structures.
  - ii. All longitudinal groove welds along the full length of the legs of cantilever tri-chord and cantilever sign support structures.
  - iii. All circumferential welds.
  - iv. All full penetration groove welds at the eight inclined chord / horizontal aluminum chord node locations of the end panels of variable message sign support structures.

#### **915.07.09.06                    Inspection of Galvanizing**

Upon completion of the galvanizing of tri-chord, cantilever tri-chord, and cantilever sign support structures; the truss portion of the structure shall be visually inspected to confirm that the elements have not been damaged due to the galvanization process.

A written inspection and testing report shall be prepared.

#### **915.07.09.07                    Inspection of Coating**

Coating inspection shall be according to OPSS 911.

A written inspection report of the observations shall be prepared.

#### **915.07.09.08                    Inspection after the Fabrication and Coating of the Overhead Sign Support Structure**

A Manufacturer's Certificate of Conformance and an Owner standard form PH-CC-701, Request to Proceed, shall be submitted to the Contract Administrator upon completion of the fabrication and coating of the overhead sign support structure.

The overhead sign support structure shall not be shipped from the plant until the Contract Administrator has issued an Owner standard form PH-CC-702, Notice to Proceed.

#### **915.07.09.09                    Inspection of Erected Sign Structure**

##### **915.07.09.09.01            General**

An inspector shall be provided and in attendance to observe the erection operation and to report on compatibility of anchor layout and holes in the base plate and the general alignment, fit up, and bolting.

Bolted construction shall be according to the Bolted Construction General clause in OPSS 906.

The inspector shall visually inspect all components for dents, cracks, ruptures, and loose or improperly fitted clamps and fasteners, including tensioning of fasteners, as well as the presence of all drain and vent holes as specified in the Contract Documents.

A written inspection report of the observations shall be prepared.

##### **915.07.09.09.02            Inspection of Tri-Chord and Cantilever Tri-Chord**

An inspector shall confirm that the tolerance is as specified in the Contract Documents between the first diagonal and the corbel is maintained in the tri-chord sign support structure.

#### **915.07.10                    Repair of Sign Support Structures**

##### **915.07.10.01                General**

Repair of sign support structures shall only apply to rehabilitation and refurbishment of existing sign support structures.

##### **915.07.10.02                Steel**

Salvaged steel components may be used as specified in the Contract Documents. A written certification bearing the seal and signature of an Engineer shall be submitted to the Contract Administrator certifying that salvaged components are defect free and are according to the Contract Documents.

##### **915.07.10.03                Aluminum**

Cracked or ruptured welds may be repaired. Distorted, cracked, or ruptured members or components shall be replaced subject to approval by the Contract Administrator as specified in the Contract Documents. Salvaged members shall not be used.

##### **915.07.10.04                Inspection of Repairs**

An inspection of the repairs and replaced components shall be completed as specified in the Quality Control subsection.

##### **915.07.11                    As-Built Drawings**

For overhead sign support structures, as-built drawings shall be prepared and submitted to the Contract Administrator in a reproducible format prior to Contract Completion and shall include the following information:

- a) All work incorporated in the completed structure that required the submission of Working Drawings.
- b) All changes that have been made from the original Contract Documents.

The as-built drawings shall bear the seal and signature of an Engineer.

**915.07.12 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**915.08 QUALITY ASSURANCE**

**915.08.01 General**

The Owner, at its discretion, may choose to do inspection, testing, and sampling in the fabricating shop and field to confirm that the materials supplied, the fabrication of sign support structures, and the erection of sign support structures have been completed as specified in the Contract Documents.

The Contractor shall provide a free and safe access, and protection from the weather for inspection and testing of materials and structural components, during all aspects of the fabrication, delivery, and erection of the sign support structures, at no additional cost to the Owner.

**915.09 MEASUREMENT FOR PAYMENT**

**915.09.01 Actual Measurement**

**915.09.01.01 Sign Support Footings**

For measurement purposes, a count shall be made of the number of sign support footings installed.

**915.09.01.02 Sign Support Structures**

For measurement purposes, a count shall be made of the number of sign support structures installed.

**915.09.01.03 Attachment of New Signboards**

For measurement purposes, a count shall be made of the number of signboards and tabs installed.

**915.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**915.10 BASIS OF PAYMENT**

- 915.10.01**
- Concrete in Ground Mounted Static Sign Support Footings, Tri-Chord and Cantilever - Item**
  - Concrete in Median Mounted Static Sign Support Footings Tri-Chord and Cantilever - Item**
  - Cantilever Tri-Chord Static Sign Support Structures, Class - Item**
  - Concrete in Ground Mounted Variable Message Sign Support Footings - Item**
  - Concrete in Median Mounted Variable Message Sign Support Footings - Item**
  - Concrete in Steel Monotube Overhead Sign Support Footings - Item**
  - Concrete in Steel Column Breakaway Sign Support Footings - Item**
  - Concrete in Steel Column Non-Breakaway Sign Support Footings - Item**
  - Tri-Chord Static Sign Support Structures, Span in Metres - Item**
  - Cantilever Static Sign Support Structures, Class - Item**

**Pole Mounted Variable Message Sign Support Structures - Item**  
**Steel Monotube Overhead Sign Support Structures, Span in Metres - Item**  
**Variable Message Sign Support Structures, Span in Metres - Item**  
**Steel Column Breakaway Sign Support Structures - Item**  
**Steel Column Non-Breakaway Sign Support Structures - Item**  
**Wood Column Breakaway Sign Support Structures - Item**  
**Wood Column Non-Breakaway Sign Support Structures - Item**  
**Aluminum Bridge Mounted Sign Support Structures - Item**  
**Repair of Existing Structure - Item**  
**Attachment of New Signboards - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

For payment purposes, the fabrication and delivery of the sign support structures to the work site shall constitute 60% of the work of the tender item.

Replacement of aluminum components that were cracked, ruptured, or damaged during fabrication or erection shall be at no additional cost to the Owner.

### **918.01 SCOPE**

This specification covers the requirements for the design, supply, construction, maintenance, and removal of modular bridge structures used for temporary installations, including ramps, bank seats, decking, sidewalks, and railings.

#### **918.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **918.01.02 Appendices Significance and Use**

Appendices are not for use in provincial Contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **918.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### 918.03

### DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Bank Seats** means mud sills, timber matting and other components to support the base plates and ramps.

**Modular Bridge** means a superstructure comprised of commercially available standard proprietary prefabricated components that can be assembled and disassembled on site.

**Temporary Installation** means an installation that maintains traffic at a construction site for a length of time not exceeding three years.

### 918.04

### DESIGN AND SUBMISSION REQUIREMENTS

#### 918.04.01

#### Design Requirements

The modular bridge structure shall be designed according to the Contract Documents, CAN/CSA S6 and the Structural Manual except that:

- a) The following requirements of the CAN/CSA S6 are not mandatory:
  - i. Traffic lane widths, side clearance, and sidewalks.
  - ii. Deck crossfall and drain outlets.
  - iii. Limitation of maximum deflection.
  - iv. Designing floor beam and diaphragms for jacking.
  - v. Provision of a protective coating.
  - vi. Fatigue.
  - vii. Accessibility for inspection and coating, the avoidance of pockets, and the provision of drain holes in pockets and their filling with waterproofing.
  - viii. Camber.
  - ix. Provision of two bolts at the end of bracing members.
  - x. Nuts with safety pins or snap rings may be used instead of hexagonal recessed nuts or hexagonal solid nuts with washers.
- b) In addition to the requirements of CAN/CSA S6, a minimum of three girders or two pairs of trusses shall be used to form the main load carrying system of the bridge.

#### 918.04.02

#### Submission Requirements

##### 918.04.02.01

##### Working Drawings, Procedures & Certifications

The following documents, bearing the seal and signature of a design Engineer and a design-checking Engineer, shall be submitted to the Contract Administrator at least 7 Days prior to commencement of the installation of the modular bridge, for information purposes only:

- a) Working Drawings of the modular bridge.
- b) Launching, installation and removal procedures.
- c) A letter and design calculations certifying that the modular bridge has been designed according to the Contract Documents.

- d) Where modular bridge components are fabricated outside of Canada, a letter shall be submitted certifying that the materials used, and the fabrication of the modular bridge components are according to the Contract Documents.
- e) Where the load carrying capacity of the modular bridge or any of its components has been established by testing, the load test reports provided by the manufacturer of the modular bridge shall be submitted confirming the bridge satisfies the requirements of the Evaluation Section of CAN/CSA S6, using a Reliability Index ( $\beta$ ) not less than 3.75.

Where previously used components are utilized in the modular bridge, a letter signed and sealed by an Engineer shall be submitted certifying that all used components are in good structural condition and free from any damage or defects that could adversely affect their load carrying capacity and performance.

When other authorities are involved in the approval of the design or construction of the modular bridge, submissions shall be made at least 5 weeks prior to commencement of work and one additional copy of the submission shall be provided for each authority.

The requirements of each authority shall be satisfied prior to commencement of the work.

#### **918.04.02.02                      Notice of Installation**

A written notice shall be submitted to the Contract Administrator at least 7 Days prior to the installation of the modular bridge superstructure.

### **918.05                              MATERIALS**

#### **918.05.01                      General**

All materials and components shall be according to the Working Drawings.

#### **918.05.02                      Modular Bridge Components**

All modular bridge steel components shall be fabricated according to the requirements of OPSS 906.

The use of modular bridge components that have been used previously is permitted provided they are free from damages or defects that could adversely affect their load carrying capacity and performance.

#### **918.05.03                      Hardware**

The hardware used in the assembly and installation of the modular bridge shall be according to the modular bridge manufacturer's requirements.

#### **918.05.04                      Structural Steel**

Any structural steel components that are not part of the modular bridge shall be designed and constructed according to OPSS 906.

#### **918.05.05                      Wood**

Wood shall be according to OPSS 1601. Preservative treatment of wood is not required. Fasteners and hardware for wood construction shall be according to OPSS 907.

**918.05.06 Railings**

Railings shall be according to OPSS 908 or an equivalent modular bridge manufacturer railing system.

**918.07 CONSTRUCTION**

**918.07.01 General**

Documentation indicating that the modular bridge Superintendent who shall be in charge of the installation of the modular bridge has had experience and has successfully performed these duties on at least 3 similar bridges shall be submitted to the Contract Administrator at least 7 Days prior to installation of the modular bridge.

**918.07.02 Construction of Bank Seats**

Fill under bank seats shall be compacted according to OPSS 501 to a minimum of 95% of the maximum dry density.

**918.07.03 Installation and Removal of Modular Bridge**

The modular bridge, including bank seats, shall be assembled, installed, and removed according to the Working Drawings, procedures and Contract Documents.

**918.07.04 Certificate of Conformance**

Upon the completion of construction of the modular bridge, a Certificate of Conformance bearing the seal and signature of a Quality Verification Engineer shall be submitted to the Contract Administrator. The certificate shall state that the modular bridge has been constructed in general conformance with the Working Drawings, procedures and Contract Documents.

**918.07.05 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**918.07.06 Modular Bridge Maintenance**

For the duration of the Contract, excluding seasonal shutdown, the modular bridge, including bearings, bank seats, ramps, decking, sidewalks, railing, approaches, and substructure elements shall be inspected, and have any deficiencies corrected, to ensure its structural integrity, safety and performance are not compromised.

**918.10 BASIS OF PAYMENT**

**918.10.01 Temporary Modular Bridge - Item**

Payment at the Contract price for the above item shall be full compensation for all labour, Equipment, and Material to do the work.

For payment purposes, the construction of the modular bridge shall constitute 50% of the work of the tender item.

## 920.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Armouring Angle** means the expansion joint angle at the gap.

**Bearing** means a structural device that transmits load while permitting translation or rotation or both.

**Blockout** means a cavity created to permit the installation of deck joint assemblies.

**Elastomer** means a compound containing virgin polychloroprene (neoprene).

**Joint Seal** means ethyl vinyl acetate foam.

**Joint Sealing Compound** means a hot applied material, which is not preformed, used to seal a joint.

**Nosing Angle** means the angle that forms the outside edges of the blockout.

**Preformed Seal** means an extruded elastomer that, when retained in recesses in the deck joint assembly, prevents the passage of water and other materials.

**Product Drawings** means drawings prepared by the manufacturer that have been approved by the Owner for use with the product.

**Trial Installation** means an installation designated by the Owner for the purpose of proving the performance of a particular joint system.

**Upturn** means an upward vertical change in direction of the seal at the gutter lines.

## **920.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **920.04.01 Submission Requirements**

#### **920.04.01.01 Notice of Manufacturer**

Within 30 Days of the Contract award, the name and address of the manufacturer of the deck joint assembly shall be submitted in writing to the Contract Administrator.

#### **920.04.01.02 Deck Joint Assembly Working Drawings**

##### **920.04.01.02.01 General**

Prior to commencement of fabrication of the deck joint assembly, one hardcopy set and one electronic PDF copy of deck joint assembly Working Drawings, shall be submitted to the Contract Administrator for information purposes. An Engineer shall affix their seal and signature on the Working Drawings verifying that the drawings are consistent with the Contract Documents and product drawings.

A sealed and signed copy of these drawings shall be kept at the manufacturing plant during the joint assembly fabrication and at the site prior to and during installation of the deck joint assembly.

##### **920.04.01.02.02 Modular Expansion Joints**

In addition to the general requirements for modular expansion joints, the deck joint assembly Working Drawings shall also bear the seal and signature of a design-checking Engineer. The deck joint assembly manufacturer shall submit the approved product drawings along with the Working Drawings.

The product drawings shall specify all material properties, dimensions, connection attachments, injection hose system, splices, fasteners and accessories, and the individual alphanumeric identification numbers. The product drawings for modular joints shall bear the seal and signature of an Engineer.

##### **920.04.01.02.03 Drawing Content**

The deck joint assembly Working Drawings shall clearly indicate the following:

- a) Material properties.
- b) Dimensions, including total joint length, skew angles, crossfalls (measured along skew angle), and overall lengths between all breakpoints.
- c) Connection attachments.
- d) Injection hose system components and name of approved injection company.
- e) Shop, field, and stage construction splices when applicable.
- f) Fasteners and accessories.
- g) Installation details.
- h) Individual alphanumeric identification number for each stage of installation.
- i) Handling procedures including lifting points.
- j) Manufacturer's installation procedure

- k) Turn-of-nut procedure specified in the Contract Documents for achieving the required bolt pretension.
- l) For modular joints, the stiffness of the mechanism shall be shown on the Working Drawings.

#### **920.04.01.02.04 Deck Joint Assembly Modification**

In addition to the requirements of the previous clause, the deck joint assembly Working Drawings shall show all connection details between the new and the existing deck joint assemblies and all other modifications.

#### **920.04.01.03 Field Dimensions**

Prior to the commencement of fabrication of the deck joint assembly, a drawing showing the actual joint dimensions at the existing deck joint assembly locations shall be submitted to the Contract Administrator.

#### **920.04.01.04 Cold Weather Protection for Epoxy Injection**

Seven Days prior to the commencement of epoxy injection of the deck joint assembly in cold weather, a description of the method to be used to control the concrete temperature shall be submitted to the Contract Administrator. The submission shall be accompanied by samples of insulation when requested by the Contract Administrator. The description shall contain the following information:

- a) Weather conditions for which the description applies.
- b) Type of insulation, metric R value, and number of layers to be used.
- c) Description of housing and heating.
- d) Method of protection employed to effectively maintain the concrete temperature above 5 °C in the expansion joint blockout during the injection and continuously for a period of 48 hours after epoxy injection.

#### **920.04.01.05 Inspection After the Fabrication of Expansion Joints**

A Manufacturer's Certificate of Conformance and a Request to Proceed shall be submitted to the Contract Administrator upon completion of the fabrication of the expansion joint and prior to shipping from the plant.

The expansion joint shall not be delivered from the plant until the Contract Administrator has received the Manufacturer's Certificate of Conformance, Request to Proceed, and issued a Notice to Proceed.

#### **920.04.01.06 Concrete Mix Design**

A mix design shall be submitted according to OPSS 1350 for concrete in deck joint assemblies.

### **920.05 MATERIALS**

#### **920.05.01 Anti-seize Compound**

Anti-seize compound shall be according to OPSS 1210.

## **920.05.02 Concrete**

Concrete in which the deck joint assemblies are embedded shall be according to the Materials section of OPSS 1350, except that for sliding plate and modular deck joint assemblies the nominal maximum size of coarse aggregate for concrete shall be 13.2 mm.

## **920.05.03 Deck Joint Assemblies**

Deck joint assemblies shall be according to OPSS 1210.

## **920.05.04 Granular A**

Granular A shall be according to OPSS 1010.

## **920.05.05 Joint Fillers**

Joint fillers shall be according to OPSS 1308.

## **920.05.06 Joint Sealing Compounds**

Joint sealing compounds shall be according to OPSS 1212.

## **920.05.07 Lubricant**

The lubricant shall be water soluble, non-adhesive, and non-staining. Lubricants used between the steel components and preformed seals shall not be deleterious to the joint materials or the surrounding concrete.

## **920.05.08 Preformed Seals**

Preformed seals shall be according to OPSS 1210. Preformed seals shall have a manufacture date less than two years at the time of installation.

## **920.05.09 Water**

Water used for curing shall be according to OPSS 1302.

## **920.05.10 Waterstops**

Waterstops shall be according to OPSS 1204.

## **920.07 CONSTRUCTION**

### **920.07.01 Operational Constraints**

During construction, joints shall be protected from chloride ingress during winter weather, extending from November 1 to April 15, by the installation of a temporary joint seal meeting the requirements of this specification.

### **920.07.02 Installation of Deck Joint Assemblies**

#### **920.07.02.01 General**

Concrete work shall be according to OPSS 904, except as specified herein.

The plastic concrete shall be sampled and tested for slump, plastic air content and temperature according to the Materials Sampling and Testing section of OPSS 1350.

Deck joint assemblies shall be installed according to the deck joint assembly Working Drawings. When a deck joint assembly requires an expansion joint drainage system, it shall be installed as specified in the Contract Documents.

Any damage to the galvanic corrosion protection coating system, including surface areas of field welds, shall be repaired with two coats of brush applied zinc-rich touch-up coating applied according to the coating manufacturer's recommendations.

The threaded portion of the bolts and the underside of bolt heads shall be liberally coated with anti-seize compound immediately prior to installation.

The bolts that have been fully tensioned and require removal after final installation shall not be reused to fasten the clamping bars.

For modular expansion joint installations, the manufacturer's representative shall be present on site during the installation to ensure proper installation. The representative shall review the modular joint after it is placed and prior to concreting.

#### **920.07.02.01 Traffic Restrictions**

Traffic, including construction traffic, shall not be permitted on any part of each stage of the deck joint assembly until all of the following conditions are met:

- a) Concrete has attained a minimum compressive strength of 25 MPa. Early strength determination of concrete compressive strength shall be according to OPSS 904.
- b) Epoxy injection has been completed.
- c) Epoxy has cured for a minimum of 24 hours.
- d) For cold weather, epoxy has cured for 48 hours after epoxy injection or the curing time as specified in the manufacturer's data sheet, whichever is longer.
- e) For Type A joints, the clamping bars have been installed.

#### **920.07.02.02 Protection**

The deck joint assembly shall be lifted by nylon slings placed at the lifting points indicated on the deck joint assembly Working Drawings.

During storage, the deck joint assembly shall be protected from dirt and deleterious materials and stored so that distortion cannot occur. The deck joint assembly shall be supported on wood blocking spaced a maximum of 2 m apart.

Preformed seals storage and handling requirements shall be according to the manufacturer's recommendations.

### **920.07.02.03                      Splicing**

The location and number of field and stage construction splices and method of splicing of metal components shall be as detailed on the deck joint assembly Working Drawings. For new construction, where the length of the expansion joint is greater than 15 m and a splice is required, a splice shall be located at a lane demarcation line near the centreline of the structure.

Field splicing of modular joints shall not be permitted.

The preformed seal shall be continuous with no splices.

### **920.07.02.04                      Welding**

Field welding of structural steel shall be according to CSA W59 by a company certified to CSA W47.1, Division 1 or 2. Any welding of reinforcing steel shall meet CSA W186 requirements.

### **920.07.02.05                      Drilling and Preparation of Holes**

The edge of drilled holes shall not be permitted within 70 mm of a concrete edge.

### **920.07.02.06                      Placing**

#### **920.07.02.06.01                  General Requirements**

The deck joint assemblies shall be placed as specified in the Contract Documents.

The deck shall be waterproofed according to OPSS 914.

Concrete faces of the blockout shall be abrasive blast cleaned according to OPSS 929. Any existing reinforcing steel to be retained as part of a rehabilitation shall also be abrasive blast cleaned according to OPSS 929.

Immediately prior to placing concrete, top setting devices shall be adjusted to give the setting width as specified in the Working Drawings.

Setting devices shall be tightened and the deck joint assembly secured at the correct width, line and grade by welding the loop anchors and stud anchors to the steel reinforcement at a spacing of approximately 500 mm on centre. Any welding of reinforcing steel shall meet CSA W186 requirements.

Concrete shall be placed in the blockout, no later than 48 hours after the blockout surfaces have been abrasive blast cleaned. All concrete surfaces to receive concrete shall be maintained in a wet condition for a period of one hour prior to placing any new concrete. Immediately prior to wetting the concrete surface, all dust and loose material shall be removed from the prepared surface by using compressed air. Prior to placing concrete, excess water shall be removed from the surface using compressed air.

Concrete shall be placed and consolidated to minimize voids under the deck joint assembly and shall be hand-finished with a wooden float. All steel surfaces that are going to be in contact with the preformed seal shall be protected during concrete placement.

Exposed faces of the structural steel shapes shall be cleaned to remove any concrete and deleterious material.

The setting devices shall be flame cut at the gap between two to four hours after concrete placement. The setting device boltholes for all nosing angles, as well as for the armouring angles, of the joints shall be drilled to a depth of 20 mm, air blast cleaned, and filled with epoxy. All dust, debris, water, and any other foreign materials must be removed from boltholes immediately prior to filling it with epoxy.

#### **920.07.02.06.02 Joint Installation After Asphalt Paving**

When specified in the Contract Documents, concrete shall be removed to prepare the blockout. Where new barrier or parapet walls are to be constructed, bulkheads shall be used to form blockouts. Steel reinforcement shall be placed in the blockout, as specified in the Contract Documents.

Prior to filling the blockout, the expansion joint gap shall be plugged to support the material placed in the blockout. The method used to plug the gap shall accommodate the anticipated movement of the structure and retain the blockout material until the joint is to be placed. Granular A shall be used to fill the blockout and then be compacted to 100% of the maximum dry density according to OPSS 501. Granular A shall be placed as follows:

- a) When only construction vehicles and equipment are going to use the bridge and cross over the blockout prior to asphalt paving, the Granular A shall be placed from the top of the plug up to a height that is level with the top of the adjacent concrete.
- b) When traffic is to be maintained on the bridge and cross over the blockout prior to asphalt paving, the Granular A shall be capped with 50 mm of cold mix or hot mix asphalt placed level with the top of the adjacent concrete. The top surface of the asphalt shall be maintained smooth and level with adjacent concrete and shall not ravel.

Prior to asphalt paving, the limits of the blockout shall be accurately marked and the markings shall be visible after paving so that the joint limits may be accurately identified.

The paving operation shall be continuous over the area from 20 m beyond the approach slab, across the bridge to 20 m beyond the end of approach slab of the opposite end. The asphalt pavement at the limits of blockout shall be sawcut full depth and the asphalt above the blockout shall be removed.

The saw-cut asphalt edges shall be adequately protected for the full depth of asphalt. Wood angles with a minimum thickness of 19 mm shall be considered a minimum requirement.

All the material used to fill the blockout and to plug the expansion gap, including any supports or bracing, shall be removed to the depth of the bearing seat. Asphalt residue shall be cleaned from the steel reinforcement.

Reinforcing steel in the blockout shall be checked to ensure that it is not damaged. Damaged reinforcing steel shall be removed from the blockout and replaced with new reinforcing steel.

The deck joint assembly shall be placed in the blockout 3 mm below the elevation of asphalt pavement and in the position specified in the deck joint assembly Working Drawings.

After installation of the deck joint assemblies, a 20 mm wide groove shall be saw cut for the full depth of asphalt adjacent to each steel-nosing angle. If the previously saw cut face is undamaged and within 5 mm of the specified location, the groove may be formed. The grooves shall be cleaned, dried, and filled with hot poured rubberized joint sealing compound according to OPSS 914.

#### **920.07.02.06.03 Joint Installation Prior to Asphalt Paving**

Concrete shall be removed to prepare the blockout, as required. The blockout shall be formed to the lines and grades specified in the Contract Documents. Where new barrier or parapet walls are to be constructed, bulkheads shall be used to form blockouts. The dimensions of the blockout in the barrier or parapet wall shall not be greater than those of the blockout in the deck and ballast wall, except for the modular joints in structures. Steel reinforcement shall be placed as specified in the Contract Documents.

The top of formwork shall be set such that the top of the deck joint assembly is placed at the proposed top-of-asphalt elevations.

The joint assembly shall be placed in the blockout at the correct elevation and location.

Waterproofing membrane shall extend 50 mm up the vertical face of the nosing angle of the deck joint assembly.

The final top of asphalt elevation immediately adjacent to the deck joint assemblies shall be 5 mm higher than the assembly, and shall taper to 0 mm over a distance of 1.0 m.

#### **920.07.02.07 Concrete Curing**

Curing of concrete for Type A and C deck joint assemblies shall be according to OPSS 904.

Curing of concrete for sliding plate and modular deck joint assemblies shall be according to OPSS 904 with the exception that the moist curing period shall be seven Days.

#### **920.07.02.08 Epoxy Injection**

##### **920.07.02.08.01 General**

Epoxy shall be injected into the injection hose system once concrete in the expansion joint blockouts has reached a minimum compressive strength of 25 MPa and curing of concrete has been completed. Early strength determination of concrete compressive strength shall be according to OPSS 904.

The epoxy shall be kept at a temperature of  $20\text{ }^{\circ}\text{C} \pm 5\text{ }^{\circ}\text{C}$  prior to its use.

The concrete surfaces shall be clean and dry prior to epoxy injection.

##### **920.07.02.08.02 Injection Method**

Only the supplier of the expansion joint system or an agent approved by the supplier shall inject the epoxy used in the injection hose system.

Epoxy shall be mixed and pressure injected according to the manufacturer's specifications.

Injection shall start at the injection fitting at one end of a 2 m section of hose to initially fill the hose and continue until the epoxy discharges from the other injection fitting of the same section. Injection shall then alternate at both fittings of the same section until the epoxy emanates from the voids in the concrete or at the interface between the steel angles and concrete or both. The injection fittings shall then be plugged.

If the epoxy injection pressure is held at 50 kPa for at least 60 seconds without having epoxy discharge from the other injection fitting, the section shall be considered sufficiently injected.

The above procedure shall be repeated in each section of hose until the full length of the expansion joint system has been filled with epoxy. The top surface of the blockout shall be thoroughly cleaned to remove any excess epoxy prior to hardening.

After the epoxy has set, all adapters and injection fittings shall be removed and the ends of each hose shall be filled with epoxy.

The deck joint assembly shall be checked for voids remaining under the angles. Holes shall be drilled in angles where voids are detected and voids and boltholes shall be filled with epoxy.

### **920.07.02.08.03 Cold Weather Epoxy Injection Requirements**

Epoxy injection shall not be performed without protection when the ambient air temperature at the time of injection is below 10 °C or is likely to fall below 5 °C within 24 hours immediately following the epoxy injection.

When the epoxy injection is to be performed under cold weather conditions, the temperature of the concrete in the expansion joint blockout shall be a minimum of 10 °C prior to the commencement of the injection. The temperature shall be maintained at a minimum of 10 °C for a period of 24 hours after injection or the curing time as specified in the manufacturer's data sheet.

### **920.07.03 Modification of Deck Joint Assemblies**

The requirements of the Installation of Deck Joint Assemblies subsection shall apply.

Where a new joint assembly is to be welded to existing hardware, the surface of the existing hardware that is going to be in contact with the new joint assembly shall be abrasive blast cleaned according to OPSS 929.

### **920.07.04 Repair of Existing Deck Joints**

Repair of existing deck joint assemblies shall be according to the Installation of Deck Joint Assemblies and the Modification of Deck Joint Assemblies subsections and as specified in the Contract Documents.

When required, repairs to existing concrete within the blockout shall be as directed by the Contract Administrator. Concrete removal and repairs shall be according to OPSS 928 and OPSS 930.

### **920.07.05 Field Installation of Preformed Seals and Bolted Components**

Preformed seals shall be installed with lubricant in one continuous piece.

Prior to installation of the preformed seal, all steel surfaces in contact with the preformed seal shall be cleaned and the gap completely clear for its full length and width to the depth of the bearing seat. The preformed seal and bolted components shall be installed according to the deck joint assembly Working Drawings. Adhesives and sealants shall not be used.

### **920.07.06 Placing Joint Fillers**

Joint fillers shall be firmly fixed in position before any concrete is placed so that their final position in the concrete remains as shown in the Contract Documents and are true to line and grade.

### **920.07.07 Placing Joint Sealing Compounds**

#### **920.07.07.01 Preparation of Joint**

Concrete at all joints shall be sound, clean, dry, and free of all dust, debris, and deleterious material.

#### **920.07.07.02 Placing Hot Poured Rubberized Asphalt Joint Sealing Compounds**

Hot poured rubberized asphalt joint sealing compound shall be installed according to OPSS 914 except that the temperature of the air and the materials that is going to be in contact with the sealing compound shall be 2 °C or greater at the time of installation.

## **920.07.08 Trial Installations**

Only deck joint assemblies pre-approved for trial installation by the Owner shall be used. The installation procedures shall be according to the manufacturer's detailed instructions, the Contract Documents, and this specification.

## **920.07.09 Corrective Work**

All defects or deficiencies identified in the Acceptance of Deck Joint Assembly subsection shall be repaired according to the requirements of this specification and to the satisfaction of the Contract Administrator.

## **920.07.10 Sampling for Quality Assurance Testing**

### **920.07.10.01 Preformed Seal**

Preformed seal samples shall be taken from the extra length of preformed seal supplied for each joint delivered to the Working Area.

The extra 1 m length of preformed seal shall be cut and supplied according to OPSS 1210, in the presence of the Contract Administrator. The sample must be stamped with the name of the manufacturer, product identification, the lot and the date of manufacture.

From time of sampling and through shipping, the seal shall be stored at a temperature between 10 and 50 °C and shall not be exposed to ultraviolet rays. The seal shall be placed in an opaque container or bag in the presence of the Contract Administrator and sealed and labeled immediately. The label shall have the fabrication company name, seal type, Contract number, lot, and location clearly marked.

The seal shall be delivered by the Contract Administrator to:

Head, Concrete Section  
145 Sir William Hearst Avenue, Room 15  
Downsview, Ontario, M3M 0B6

### **920.07.10.02 Concrete Compressive Strength, Air Void System and Rapid Chloride Permeability**

Cylinders shall be cast, cured and transported for compressive strength, air void system and rapid chloride permeability. Testing shall be performed by the Owner according to the Materials Sampling and Testing section of OPSS 1350 with the following exceptions and additions:

- a) A lot shall be all the concrete placed in the expansion joints in one bridge in one day.
- b) One set of three 100 mm diameter x 200 mm long cylinders shall be cast for acceptance testing of 28-day compressive strength for each lot. Every time a set of acceptance cylinders is cast, a second set of cylinders shall be cast for referee testing purposes.
- c) One 100 mm diameter x 200 mm long cylinder shall be cast for evaluation of air void system parameters for each lot.
- d) One 100 mm diameter x 200 mm long cylinder shall be cast for acceptance testing of rapid chloride permeability for each lot. Every time an acceptance cylinder is cast, a second cylinder shall be cast for referee testing purposes.

#### **920.07.11 Expansion Joint Water Test Preparation**

After the epoxy has set and before acceptance, the joint shall be water tested. The Contract Administrator shall evaluate the expansion joint water test. The joint shall be tested over its entire length where there are no upturns. Where there are upturns, the joint shall be tested between the gutter lines. The water shall be continuously ponded for a minimum of one hour, maintaining a minimum depth of 25 mm along the tested length and a minimum depth of 100 mm above the deck joint assembly at the gutter lines. For superelevated decks, only the lower gutter line requires the testing at a depth of 100 mm. The width shall extend 50 mm beyond the concrete dams on both sides of the deck joint assembly. When the staging of traffic is required, the joint shall be tested in overlapping sections.

The air, concrete, and deck joint assembly temperature shall be 2 °C or higher at time of testing. The water test and any related corrective work shall be completed prior to any seasonal shutdowns. Where this is not feasible, a proposal detailing an alternative solution shall be submitted to the Contractor Administrator for approval.

For expansion joints installed at the ends of approach slabs, the expansion joint water test shall not be required.

#### **920.07.12 Inspection After Installation of the Expansion Joints**

A Request to Proceed shall be submitted to the Contract Administrator after the installation of the expansion joint.

The next operation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **920.07.13 Management of Excess Materials**

Management of excess material shall be according to the Contract Documents.

### **920.08 QUALITY ASSURANCE**

#### **920.08.01 Acceptance of the Preformed Seal**

Each preformed seal sample shall be tested according to Table 1 of OPSS 1210 by the Owner. Preformed seals shall be acceptable if the sample tested meets the requirements of OPSS 1210. Unacceptable preformed seals shall be removed and replaced at no additional cost to the Owner. Preformed seals with a date of manufacture of more than two years earlier than the date of sampling shall not be accepted.

A defective seal constitutes grounds for rejection of other seals from the same lot identified by the marking on the seal, within the same Contract.

##### **920.08.01.01 Referee testing**

A written request may be made for referee testing of any sample within five Business Days of receiving notification of rejection of the seal. The results of the referee test shall be used for acceptance determination and shall be binding on both parties. If the referee testing results in rejection of the seal, the Contractor shall bear the cost of the referee testing. If the referee testing results in the material passing all test criteria, the referee testing charge shall be paid by the Owner.

#### **920.08.02 Acceptance of Concrete Compressive Strength**

Compressive strength shall be determined according to LS-407.

The compressive strength result of a lot shall be the average of the set of three acceptance cylinders representing the lot, rounded to one decimal place.

The individual test results shall be forwarded to the Contractor, as they become available.

Concrete compressive strength for the lot shall be considered acceptable when it meets all of the following:

- a) The average compressive strength tests shall be equal to or greater than the specified strength.
- b) No individual strength test shall be more than 4.0 MPa below the specified strength.

Unacceptable lots shall be removed and replaced.

#### **920.08.02.01 Referee Testing**

Referee testing and referee testing cost for concrete compressive strength shall be according to OPSS 1350.

#### **920.08.03 Acceptance of Air Void System in Hardened Concrete**

Acceptance of air void system, including referee testing, shall be according to OPSS 1350 with the following exceptions:

- a) The lot size shall be according to this specification.
- b) One cylinder is tested per lot rather than cores. All references to cores in the Acceptance of Air Void System in Hardened Concrete of OPSS 1350 are replaced by cylinder.

#### **920.08.04 Acceptance of Rapid Chloride Permeability**

Acceptance of rapid chloride permeability, including referee testing, shall be according to OPSS 1350 with the following exceptions:

- a) The lot size shall be according to this specification.
- b) One cylinder is tested per lot rather than cores. All references to cores in the Acceptance of Rapid Chloride Permeability of OPSS 1350 are replaced by cylinder.

#### **920.08.05 Acceptance of Expansion Joint Water Test**

The deck joint assembly shall be acceptable if there is no leakage of water. Leakage of water through the deck joint assembly during this test, including the interface between the preformed seal and the seal retainers, concrete to steel interfaces, and the concrete construction joints, shall constitute failure of the deck joint assembly.

If such failure occurs, the deck joint assembly is to be repaired or replaced and the water test repeated. The method of repair shall be submitted in writing to the Contract Administrator for review prior to commencement of repair work.

#### **920.08.06 Acceptance of Deck Joint Assembly**

On completion of the deck joint assembly installation, the assembly shall be free of the following defects or deficiencies:

- a) Defective preformed seals.

- b) Cracks wider than 0.3 mm and voids in concrete end dams.
- c) Defective coating.
- d) Seal not completely held in retainer.
- e) Turn-of-nut procedure for bolt installation not followed.
- f) Defective, loose, or missing structural components and welds.
- g) A line parallel to the centreline of the structure joining the tops of all steel components of the deck joint assembly that deviates from a line parallel to the pavement profile between nosing angles by more than 3 mm, at any location along the length of the expansion joint.
- h) For modular joints, at any location along the length of the deck joint assembly, the relative difference in the opening between the steel retainers exceeds the narrowest width by 6 mm. This dimension shall be measured at the level of the road surface, perpendicular to the centreline of the expansion joint, and at the inner faces of the retainers.
- i) Any portion of the deck joint assembly is extending above the finished road surface.

For expansion joints installed at the ends of approach slabs, joints will be accepted based on visual acceptance by the Contract Administrator to verify seal integrity and retention.

## **920.10 BASIS OF PAYMENT**

### **920.10.01 Deck Joint Assemblies, Installation - Item Deck Joint Assemblies, Modification - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

### **920.10.02 Repair of Existing Deck Joints - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When the repairs are not specified in the Contract Documents, payment for the cost of repairing existing deck joints and of repairing concrete prior to the installation of deck joint assemblies or preformed seals in existing structures shall be administered as a Change in the Work.

### **920.10.03 Repairs of Defects and Deficiencies**

Repair of defects or deficiencies identified during the inspection for acceptance of deck joint assemblies shall be completed with no additional cost to the Owner.

### **920.10.04 Preformed Seals, Joint Fillers, and Joint Sealing Compounds**

Payment for the tender items in which preformed seals, joint fillers, and joint sealing compounds are placed shall include full compensation for all labour, Equipment, and Material to do the work of placing these materials.

### **921.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Jacking Design Engineer** means the Engineer retained by the Contractor who performs the design of the jacking system and related work.

**Jacking Design Checking Engineer** means the Engineer retained by the Contractor who performs the design check of the jacking design Engineer's work.

**Jacking System** means all components required to perform the lifting and temporary support of the bridge superstructure. This includes but is not limited to; jacks, hydraulic hoses and fluid, valves, sensors, jacking systems, shims, temporary support systems, and all related appurtenances.

**Survey** means precise and detailed measurements and elevations taken, recorded, documented and certified by an Ontario Land Surveyor or an Engineer.

### **921.04 DESIGN AND SUBMISSION REQUIREMENTS**

#### **921.04.01 Design Requirements**

##### **921.04.01.01 General**

A detailed jacking system shall be designed and provided to do the work by a jacking design Engineer and checked by a jacking design checking Engineer, unless a detailed jacking system is provided in the Contract Documents. The jacking design Engineer and jacking design checking Engineer shall have knowledge in the design of bridge jacking systems, and proven experience in recent projects of similar complexity. Both Engineers shall be capable of certifying that the provided jacking equipment and jacking methodologies will facilitate the jacking and lowering of the bridge shall be according to the Contract Documents.

When specific requirements for the jacking system are provided in the Contract Documents, they shall be incorporated into the design of the jacking system.

When jacking locations are provided in the Contract Documents, they shall be incorporated into the design of the Contractor's proposed jacking system and shall not be changed.

Where the replacement of bearings is specified in the Contract Documents, the design shall consider the possible difference in bearings size between the new and the original and ensure that the placement of the temporary supports does not interfere with the proper placing of bearings.

The design shall account for the structural work and condition of the structure at the time of jacking, and the stages that may interfere with temporary supports or jacking locations. It shall consider any deterioration and/or removals prior to and during the duration of the jacking and remedial work. The design of temporary supports shall account for articulation of the superstructure including thermal movements, as well as any potential slip in supports. Jack and support locations shall account for conflicts between structural work and temporary works designed by the contractor.

The amount of pre-loading to be applied to the jacks prior to the start of displacement controlled jacking shall be specified. The pre-loading amount shall be no less than 15% of the specified jacking load and shall be sufficient to account for decompression of bearings, gaps between shims (if used) and any other geometric imperfections in the proposed jacking system.

Temporary supports, including shims and blocking, used to support the jacks shall be designed for no less than 150% of the jacking loads specified on the Contract Drawings.

#### **921.04.01.02                    Jacking Corbels**

The design of temporary jacking corbels anchored into substructure elements shall consider the non-uniform distribution of load between anchors when the system is not pre-tensioned and relies on tension or the combined bearing and shear resistance of the anchors.

#### **921.04.01.02                    Temporary Supports**

Temporary Supports shall be designed according to OPSS 919 and the requirements of this specification.

#### **921.04.02                        Submission Requirements**

#### **921.04.02.01                   Jacking Drawings and Calculations**

Three sets of the jacking drawings and calculations and a digital PDF format copy shall be submitted to the Contract Administrator seven Days prior to the commencement of the jacking operations, for information purposes only. Submissions shall bear the seals and signatures of the jacking design Engineer and the jacking design checking Engineer.

The jacking drawings and calculations shall include the following:

- a) Jacking methodology and sequence.
- b) Location, number, type and capacity of the jacks to be used.
- c) Description of the control system, complete with all design, schematics and equipment to be used.
- d) Location and material to be used for temporary blocking and shimming.
- e) Proposed pre-loading to be applied to jacks.
- f) Schematic showing the configuration of all jacks, stop valves, gauges, manifolds and hydraulic pumps.
- g) Calibration certificates for all jacks, gauges, and lifting/lowering controller, issued within 12 months from when the equipment is to be used.
- h) Full details of the temporary support system including forces to be transmitted and method of transferring the loads to the substructure or founding strata, including considerations for thermal expansion and contraction.
- i) Restrictions on traffic and construction traffic.

A copy of the signed and sealed jacking drawings shall be kept at the site during jacking setup and operations.

## **921.04.02.02                      Revised Submissions**

When jacking design considerations or field conditions necessitate amendments to the jacking drawings, revised jacking drawings shall be submitted according to the Jacking Drawings and Calculations clause.

## **921.05                                      MATERIALS**

### **921.05.01                              General**

Temporary supports shall be structural steel or concrete according to OPSS 919.

When jacks with locking collars are used as temporary supports, they shall be unmodified and as supplied by the manufacturer.

### **921.05.02                              Mechanical and/or Adhesive Anchors**

Mechanical and/or adhesive anchors shall be suitable for dynamic loads and shall be installed according to the manufacturer's recommendations.

### **921.05.03                              Grout**

Grout used for the jacking system that will remain as part of the permanent structure shall be cement based, non-shrink, non-staining, and shall be supplied from a source named on the ministry's DSM. Grout shall have a minimum 7-day compressive strength of 35 MPa.

## **921.06                                      EQUIPMENT**

### **921.06.01                              Synchronized Jacking System**

A synchronized jacking system shall consist of either a Programmable Logic Controller (PLC) controlled system or a volumetric controlled system. The system shall be capable of adjusting pressures and hydraulic volumes in order to achieve a uniform lift and/or lowering to a tolerance of less than or equal to 1.5 mm from the leading to lagging cylinders.

#### **921.06.01.01                          Programmable Logic Controlled Jacking System**

A PLC controlled system shall include a central unit which continuously monitors the relative and absolute position of each individual jacking point.

#### **921.06.01.02                          Volumetric Controlled Jacking System**

A volumetric controlled jacking system shall be fully calibrated and designed to precisely deliver the same volume of hydraulic oil to each individual jack at the same time. The same make and model of jacks shall be used at all locations.

### **921.06.02                              Displacement Sensors**

The synchronized jacking system shall display real-time data for each jack location showing vertical displacement and hydraulic pressure for monitoring purposes during the jacking operation. The data shall be automatically recorded at one second intervals during active lifting and lowering operations in a data log file for the entire duration of the jacking/lowering operation(s) and only shall cease after the bridge is firmly on the temporary supports or permanent bearings. The data interval may be increased to 10 seconds when the bridge is resting on the pressurized hydraulic component of the system, and not being actively lifted or lowered.

Digital displacement sensors or linear transducers shall be installed at all locations where a jack is placed. Multiple jacks may be represented by a single displacement sensor when all of the following conditions are met:

- a) All jack centrelines are within 1000 mm of each other.
- b) Each jack in the group is in contact with the same structural element.
- c) The structural element is continuous between all jacks within a group, and not separated by any structural discontinuities or abrupt changes in stiffness (such as a bolted connection).
- d) All jacks within a group receive an equal pressure for programmable logic controlled jacking systems, or the same amount of hydraulic fluid for volumetric controlled jacking systems.

Digital displacement sensors or linear transducers shall be accurate to 0.1 mm to monitor displacements. The displacement sensors can be either integrated into the jacking system or independently monitored such that displacement sensors, stroke sensors or calibrated volumetric control system is capable of achieving the relative lift/lowering tolerances specified in the Contract Documents. For jacks supported on temporary fixtures (such as jacking corbels), independent displacement sensors shall be used, and measurements shall be made relative to a fixed location on the adjacent bearing seat.

A data log file shall be submitted to the Contract Administrator within seven days of any jacking operation in Microsoft Excel format (or approved equivalent). Data log file format is to be in a table with individual columns representing each displacement sensor reading in millimetres, hydraulic pressure applied to the jack (or group of jacks), and applied force at each jack (or group of jacks). Data for applied force may be provided using applied pressure to each jack and the area of the jack's piston. Individual rows shall represent the time in Hr:Min:Sec format.

## **921.07 CONSTRUCTION**

### **921.07.01 Pre-Condition Surveys**

Prior to the start of any work related to the jacking operation, field measurements shall be taken of all components of the existing structure that might impact the installation of the jacking system. The jacking design Engineer and the jacking design checking Engineer shall determine whether any adjustments to the jacking system based on the field measurements. When adjustments to the jacking drawings and calculations are required, the jacking drawings and calculations shall be resubmitted to the Contract Administrator along with a request for approval.

Measurements of the underside of deck or girders at bearing locations prior to jacking the structure shall be made taken relative to an adjacent fixed point on the substructure which will not move during construction. This shall include a minimum of one local fixed marking on the abutment or pier immediately adjacent to each lift point and bearing location. This marking must be located such that it will not be moved or compromised by the Work. Measurements to the underside of each girder and lifting point shall be made relative to the corresponding fixed marking, which shall be recorded accurate to 1 mm.

Measurements shall be submitted to the Contract Administrator prior to jacking.

#### **921.07.01.01 Detailed Survey**

A detailed, geodetic survey of the deck top is not required prior to jacking, unless specified in the Contract Documents.

## **921.07.02                      Structural Steel**

All structural steel fabrication, delivery and erection shall be according to OPSS 906.

## **921.07.03                      Formwork and Falsework**

All formwork and falsework shall be according to OPSS 919.

## **921.07.04                      Installation of Bearings**

When jacking is required for the installation, replacement or adjustment of bearings, the requirements shall be according to OPSS 922.

## **921.07.05                      Jacking**

### **921.07.05.01                  General**

All end components of the bridge deck, such as expansion joints and railing systems, shall be free to move vertically prior to jacking. Bolts securing the handrail posts to the parapet walls, if present, shall be loosened to permit jacking without damaging the handrails.

Upon completion of the fabrication and installation of the components of the temporary works and prior to jacking, the jacking design Engineer or jacking design checking Engineer shall conduct an inspection to verify that the fabrication and installation of the temporary works has been carried out according to the jacking drawings.

Traffic shall not be permitted on or below the bridge during the jacking operation, unless specified in the Contract Documents.

### **921.07.05.02                  Jacking Points and Loads**

Jacks shall only be placed at the jacking points specified in the Contract Documents. Jacks with a rated capacity of no less than 150% of the jacking loads specified on the Contract Drawings shall be used.

At no point shall the applied jacking loads exceed 200% of the jacking loads specified on the Contract Drawings.

### **921.07.05.03                  Inspection Prior to the Commencement of the Jacking Operation**

A Certificate of Conformance shall be submitted to the Contract Administrator prior to commencing each jacking operation.

### **921.07.05.04                  Jacking Operations**

The Contract Administrator shall be informed in writing at least three Days prior to the commencement of the jacking operations.

The lifting or lowering of the entire width of the structure shall be carried out in one uniform and synchronized operation using a synchronized jacking system. At no time during the lifting or lowering of the structure, except during pre-loading of the system, shall the elevation difference between any displacement sensor exceed 1.5 mm.

Jacking operations shall be carried out under the direct supervision of the jacking design Engineer or the jacking design checking Engineer. Prior to the commencement of jacking operations, the accuracy of all transducer read-outs, relative to manual measurements shall be demonstrated to the Contract Administrator.

The lift and/or lowering at each jacking point shall be monitored continuously during the jacking operation from a centralized location by remote sensors or calibrated jacking system. The maximum lift for all jacking points shall be as specified in the Contract Documents. The minimum lift shall be 3 mm above the bearings once decompressed.

#### **921.07.05.05 Temporary Supports**

The bridge superstructure shall not be supported on pressurized hydraulic jacks for a period longer than permitted on the jacking drawings and shall never exceed 12 hours.

When the required lift for all jacking points has been achieved and the bearings have been released, temporary supports (such as blocking and shimming) shall be placed to support the bridge. The jacks shall then be lowered in one synchronized operation while maintaining the maximum allowable difference between any two jacking points of 1.5 mm.

The jacking loads shall be transferred to temporary supports prior to bearing removal, bearing seat reconstruction, or other related bearing replacement work.

Temporary supports shall be located at the jacking points or as specified in the Contract Documents.

The superstructure shall not be left on temporary supports for more than 30 Days or as specified in the Contract Documents.

#### **921.07.05.05.01 Post-Jacking Survey**

Immediately after the structure has been placed on temporary supports and prior to the bearing seats being reconstructed (if applicable), the underside of the superstructure that will be in contact with the new bearings shall be surveyed. The survey shall include the four corners in contact with the bearings and at least one point in the middle of the bearing area. Data from the survey shall be forwarded to the Contract Administrator to determine if adjustments to the design are required.

#### **921.07.05.06 Lowering of the Superstructure**

Where jacking of the superstructure is accompanied by rehabilitation of bearing seats, the superstructure may be jacked again for the removal of the temporary supports only after the concrete in the bearing seats has reached 75% of its design strength. The jacks shall then be lowered in one synchronized operation, while maintaining the maximum allowable difference between any two jacking points of 1.5 mm, and the superstructure shall be placed onto the bearings.

#### **921.07.05.06.01 Bearing Contact**

The bearings shall have uniform and full contact at top and bottom. The requirements for bearing full contact shall be according to OPSS 922. The jacking system shall remain in place until full contact of bearings is achieved.

#### **921.07.05.07 Reinstatement of Structure and Components**

The bridge deck and girders shall be reinstated to the original elevations unless new elevations are specified in the Contract Documents or as otherwise directed by the Contract Administrator.

When bearings are replaced, a final continuous and smooth riding surface across all joints, approaches, and adjacent spans shall be provided with a tolerance of 3 mm across each joint. The Contract Administrator shall be notified when existing conditions, information in the Contract Documents, or specific components will affect the ability to meet this requirement for further clarification or instruction.

Anchor holes shall be filled with non-shrink grout finished flush with the surrounding concrete. No metal components of the jacking system shall be embedded permanently in concrete with less than 40 mm of cover.

All expansion joint and handrail components removed or loosened to facilitate jacking shall be reinstated.

#### **921.07.06                      Inspection After Completion of the Jacking Operation**

A Certificate of Conformance shall be submitted to the Contract Administrator upon completion of each jacking operation.

#### **921.07.07                      Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **921.10                              BASIS OF PAYMENT**

#### **921.10.01                      Jacking of Superstructure - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment and Materials to do the work.

## **CONSTRUCTION SPECIFICATION FOR INSTALLATION OF BEARINGS**

---

### MTO Forms:

PH-CC-701 Request to Proceed  
PH-CC-702 Notice to Proceed

## 922.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Anchor** means a device employed to secure a bearing to the structure or to restrict movement of the structure or both.

**Bearing** means a structural device that transmits load while permitting translation or rotation or both.

**Superstructure** means all parts of a bridge above the bearings.

## 922.04 DESIGN AND SUBMISSION REQUIREMENTS

### 922.04.01 Design Requirements

#### 922.04.01.01 Jacking

When jacking is not specified in the Contract Documents, design requirements shall be in accordance with OPSS 921 with the following additional requirements:

- a) Detailed calculation of all anticipated jacking and temporary support loads, and member resistances, shall be performed in accordance with CSA S6.
- b) The calculated jacking and temporary support loads shall reflect the actual loads that will be present on the bridge during jacking and temporary support, including all anticipated construction dead and live loads.
- c) Jacking loads shall be calculated for the jacking operation at serviceability limit states, and when the bridge is on temporary supports at ultimate limit states.

### 922.04.02 Submission Requirements

#### 922.04.02.01 Layout and Installation Drawings

##### 922.04.02.01.01 General

At least seven Days prior to commencement of bearing installation, one hardcopy and one electronic PDF copy of bearing layout and installation Working Drawings shall be submitted to the Contract Administrator for information purposes only. An Engineer's seal and signature shall be affixed on the bearing layout and installation Working Drawings verifying that they are consistent with the Contract Documents.

A copy of the bearing layout and installation Working Drawings shall be kept on site prior to and during the installation of the bearings.

#### **922.04.02.01.02            Elastomeric Bearings**

The layout and installation Working Drawings for elastomeric bearings shall clearly indicate the following:

- a) Bearing layout and orientation.
- b) Dimensions and details of the bearings.
- c) Details of the top or bottom plate, or both, including anchorages or dowels or both.
- d) Installation details.
- e) Load resistance at serviceability and ultimate limit states, including maximum compressive permanent and total loads.
- f) Individual alphanumeric identification of each bearing and lot identification.

#### **922.04.02.01.03            Rotational and Sliding Surface Bearings**

The layout and installation Working Drawings for rotational and sliding surface bearings shall clearly indicate the following:

- a) Bearing layout and orientation.
- b) Top and bottom plate details, including anchorages.
- c) Installation details.
- d) Method of attachment of bearings to the top and bottom plates.
- e) Bearing identification letter and numbers.

#### **922.04.02.02                Jacking**

When jacking is not specified in the Contract Documents, submission requirements shall be in accordance with OPSS 921 with the following additional requirements:

- a) Submissions shall be made at least seven Days in advance of the planned jacking operation for approval.
- b) The jacking drawings shall clearly show the anticipated loads during the jacking operation at serviceability limit states, and while the bridge is on temporary supports at ultimate limit states.
- c) Dimensioned locations of all jacking points shall be clearly shown in an elevation view across the entire substructure, and in a section view of each substructure location cut from elevation at a minimum.
- d) Jacking loads shall be clearly shown for each individual jacking point and shall represent the actual loads anticipated at each location.
- e) The maximum allowable lift shall be specified on the jacking drawing.

## **922.05 MATERIALS**

### **922.05.01 Bearings**

Bearings shall be according to OPSS 1202 or OPSS 1203 and as specified in the Contract Documents.

### **922.05.02 Grout**

Grout for installation of rotational and sliding surface bearings or anchors shall be cement based, non-shrink, non-staining, and shall be supplied from a source named on the ministry's DSM. Grout shall have a minimum 7-Day compressive strength of 35 MPa.

## **922.07 CONSTRUCTION**

### **922.07.01 General**

The bearings shall be protected from damage, distortion, excessive heat, and deleterious matter during the handling, transportation, storage, and installation.

The bearings shall not be disassembled without the permission of the bearing supplier. The bearing supplier's representative shall be present during disassembly and reassembly.

Upon completion of the structure, the top and bottom surfaces of the bearings shall be in full contact with the structure.

Where pintles are specified in the Contract Documents, they shall engage the steel plate of the bearings through the entire thickness of that plate.

When elastomeric bearings are replaced on an existing structure, the top and bottom of the bearings shall be in full contact with the structure. Work required to achieve full contact shall be as specified in the Contract Documents. If the work as specified in the Contract Documents does not achieve full contact of the bearings, the Contract Administrator shall be notified and the work shall proceed only when directed.

### **922.07.02 Bearing Seats**

The bearing seats shall be finished to an elevation as specified in the Contract Documents and shall be finished level or as specified in the Contract Documents.

For elastomeric bearings, the finish of the concrete surface shall be smooth and not vary greater than 1 mm along a straightedge placed in any direction across an area that extends at least 25 mm beyond the outside limits of the bearing. For other types of bearings, deviation along the straightedge shall not vary greater than 3 mm.

Any concrete surface area prepared by grinding shall not allow water to pond in the area. For elastomeric bearings, the bearing seat areas prepared by grinding shall have a finish equivalent to a trowel finish. All surface areas shall be inspected and deemed acceptable by the Contract Administrator prior to installation of bearings.

### **922.07.03 Installation of Anchors**

The diameter, length, and material of the anchor and the diameter and depth of the anchor hole shall be as specified in the Contract Documents.

Holes for anchors shall be formed into abutments and pier caps prior to casting concrete. Coring for installation of bearing anchors is not permitted, unless specified elsewhere in the Contract Documents. If sleeves are used as forms, they shall be removed prior to installation of anchors.

When coring of the bearing seats to receive anchors is specified in the Contract Documents, coring shall be done without damaging or cutting the steel reinforcement by using either a concrete covermeter or a concrete scanner (such as a ground penetrating radar unit) to locate the steel reinforcement in advance. Where permitted, coring shall not commence earlier than three weeks prior to bearing installation.

The holes shall be protected against entry of moisture and shall be completely filled with grout, when the anchors are installed.

#### **922.07.04                      Grouting**

Where the anchors for rotational and sliding surface bearings require core drilling or preformed holes, the bearings shall be bedded over their entire area on grout that does not contain any voids. The use of permanent shims to achieve the theoretical elevation at the top of the bearing shall not be allowed.

Grouting operations shall be according to the manufacturer's recommendations, with the following exceptions:

- a) The temperature of the air, concrete, and bearings shall not be less than 10 °C at the time of grouting and shall be maintained at not less than 10 °C for a minimum of 96 hours after grout is placed.
- b) The thickness of the grout bedding for rotational and sliding surface bearings shall be 12 mm ± 3 mm.

The substrate shall be roughened by bushhammering, cleaned, and prewetted prior to grouting. Transfer of superstructure load to the bearings shall not be allowed until the grout has reached a minimum strength of 30 MPa.

The grout material shall be mixed, handled, and cured according to the manufacturer's instructions.

Grout is not permitted in contact with elastomeric bearings.

#### **922.07.05                      Alignment and Elevation Tolerances**

Bearings shall be set level to within a 500H:1V slope in any direction. The top of the bearing shall be set at the theoretical elevation specified in the Contract Documents, within the following tolerances:

|                                          |               |
|------------------------------------------|---------------|
| Concrete deck and precast I-type girders | ± 5 mm        |
| Steel plate girders                      | 0 to + 3.0 mm |
| Steel and precast concrete box girders   | 0 to + 2.0 mm |

The longitudinal and transverse centrelines of the bearings shall be installed within ± 10 mm of the position specified in the Contract Documents. The centreline of the bearing along the direction of movement shall be parallel to the direction of movement of the bridge at that bearing location within 0.02 radians of the value specified in the Contract Documents.

## **922.07.06 Temporary Attachments**

Temporary clamping devices shall be used to maintain correct orientation and setting and to prevent movement or separation of the bearing components during the handling, transportation, and installation. The clamping devices shall not be used for lifting or suspending the bearings. Clamping devices shall be removed after each bearing is in its final position, with all permanent connections made, and after all grout and concrete in contact with the bearing have been placed.

## **922.07.07 Jacking**

Jacking shall be in accordance with OPSS 921.

### **922.07.07.01 General**

All jacking and temporary support components shall have sufficient strength and stability for the entire duration that they are in use. All jacking surfaces shall be level.

Repairs shall be performed to the existing structure prior to jacking if necessary, so that jacking and temporary support bearing surfaces are sound and competent. Concrete shall reach a minimum strength of 75% of the specified 28-day compressive strength prior to loading.

Jacks may be fitted with appropriate locking collars to function as temporary supports.

### **922.07.07.02 Adjusting or Resetting Bearings**

When jacking is required in order to adjust or reset the bearings, the structure shall be jacked the minimum amount required to allow the bearings to be adjusted.

For girder type bridges, all girders at each abutment or pier shall be jacked simultaneously if the amount of total lift required to adjust or reset the bearings exceeds 3.0 mm and a concrete deck is present.

Each girder may be individually jacked to adjust or reset the bearings if:

- a) The total lift required is less than or equal to 3.0 mm and a concrete deck is present; or,
- b) The total lift required is less than or equal to 5.0 mm and a concrete deck is not present.

The total lift amount shall include the amount to decompress the bearings plus the additional amount to lift the girders enough to do the bearing adjustment or reset.

For all other bridge types, the entire superstructure shall be uniformly lifted across the entire width of the abutment or pier.

## **922.07.08 Positive Attachment of Elastomeric Bearing Strips**

Where positive attachment is specified for elastomeric bearing strips on ballast walls, wing walls, elastomer shall be attached with stainless steel concrete nails spaced at 400 mm or epoxy adhesive.

## **922.07.09 Sampling for Quality Assurance Testing**

### **922.07.09.01 Sampling of Bearings**

After the bearings have been fabricated, the Contract Administrator shall be notified in writing of the identification and availability of the bearings.

When continuous strip bearings have been specified for precast boxes placed side-by-side, each strip bearing shall be supplied at least 600 mm longer than required. A sample, 600 mm in length, shall be cut in the field from one end of each strip bearing and supplied for testing.

Elastomeric bearings beyond the number of bearings specified for installation shall be supplied as specified in the Contract Documents. Lot size shall be as specified elsewhere in the Contract Documents.

All bearings shall be available for sampling either at the project site or at a location acceptable to the Contract Administrator. Sample bearings for testing purposes shall be randomly selected by the Contract Administrator from the lot. When there is more than one lot containing bearings with the same dimensions, the Contract Administrator shall group the bearings based on sequential dates of manufacture. The Contract Administrator shall advise in writing which bearings have been selected for testing from each lot, and the identification of all other bearings within the lot.

Elastomeric bearings sampled for testing, and a copy of the bearing layout and installation Working Drawings according to OPSS 1202, shall be delivered to:

Head, Concrete Section  
145 Sir William Hearst Avenue, Room 15  
Downsview, Ontario, M3M 0B6

Bearings weighing more than 30 kg shall be delivered on a wooden pallet which can be lifted by a forklift.

#### **922.07.09.02                      Sampling of Approach Slab Bearings and Ballast Wall Bearings**

Elastomers delivered to the site shall exceed the required length to allow for a 1 m labelled test sample to be taken from the approach slab or ballast wall elastomers on each structure.

Elastomers shall be delivered, along with a transmittal form to:

Head, Concrete Section  
145 Sir William Hearst Avenue, Room 15  
Downsview, Ontario, M3M 0B6

#### **922.07.09.03                      Grout Sampling**

One set of three compressive strength cubes shall be cast for each day of production of grout. Casting of cubes shall be according to CSA A3004-C2. For early strength testing, additional cubes shall be cast. Cubes for compressive strength testing shall be delivered, with a transmittal form, to the Regional Quality Assurance Laboratory.

#### **922.07.10                          Inspection after Installation of the Bearings**

Inspection after installation of the bearings shall be according to the Contract Documents.

#### **920.07.13                          Management of Excess Materials**

Management of excess material shall be according to the Contract Documents.

### **922.08                              QUALITY ASSURANCE**

#### **922.08.01                          Acceptance of Bearings**

Acceptance of bearings shall be on a lot basis. The number, type, and size of elastomeric bearing samples to be selected for destructive testing shall be as specified in the Contract Documents.

The acceptance of bearings shall be according to the requirements of this section. If the bearing tested does not meet the requirements of this section, all bearings from the lot are unacceptable and shall not be included in the Work. Unacceptable bearings that have been included in the Work shall be removed and replaced at no additional cost to the Owner. Repairs to elastomeric bearings are not permitted.

Bearings supplied as replacements for rejected bearings shall be sampled, tested, and accepted on the same basis as the original bearings.

An allowance of 60 days shall be made for the Owner's testing program from the time of submission of elastomeric bearings and Working Drawings, according to this specification.

#### **922.08.02                      Acceptance of Approach Slab Bearings and Ballast Wall Bearings**

Acceptance of bearings shall be on a lot basis. For testing of approach slab bearing and ballast wall bearing elastomers, a lot shall be all the bearings on a structure.

The acceptance of bearings shall be according to the requirements of OPSS 1202. For each lot, one 1 m sample of elastomer shall be tested according to OPSS 1202. If the bearing tested does not meet the requirements of this specification, all bearings from the lot shall be considered unacceptable but with the agreement of the Owner may be permitted to remain in the Work with a payment adjustment. The payment adjustment shall be calculated based on individual lots and applied according to the Basis of Payment section of this specification.

#### **922.08.03                      Acceptance of Grout Compressive Strength**

One set of three cubes shall be tested for 7-Day compressive strength according to CSA A3004-C2. Grout shall be acceptable if the average 7-Day compressive strength of the set of three cubes is greater than or equal to 35 MPa. Unacceptable grout shall be removed and replaced at no additional cost to the Owner.

### **922.09                      MEASUREMENT FOR PAYMENT**

#### **922.09.01                      Bearings – Elastomeric, Laminated Bearings – Rotational**

For measurement purposes, a count shall be made of the number of the bearings installed.

### **922.10                      BASIS OF PAYMENT**

#### **922.10.01                      Bearings – Elastomeric, Plain – Item Bearings – Elastomeric, Laminated - Item Bearings – Rotational - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the Work.

Payment at the Contract price shall include full compensation for any additional bearings supplied for destructive testing.

For structural rehabilitation, when repairs to the existing bearing seat or soffit above the bearing areas is required prior to the installation of the new bearings to ensure full contact is achieved, and if the work is not specified in the Contract Documents, payment for such work shall be administered as a Change in the Work.

**922.10.02                      Payment Adjustment for Bearings**

**922.10.02.01                  Elastomeric Bearings with Steel Laminates**

When the elastomer cover to each of the embedded steel plates in the test sample is within the tolerances of the specifications, a payment adjustment factor of 1.00 shall be applied to the Contract price for the bearings location represented by the sample. Bearings that do not meet tolerances are rejectable and shall be removed and replaced at no additional cost to the Owner.

When the elastomer cover to any or all of the embedded steel plates in the test sample is within the payment adjustment range shown in Table 1 and/or Table 2, and a request is made that the Owner accept the bearings in the lot represented by the sample as is, the cover payment adjustment factor equal to 0.5, shall apply to the lot. In the case where both Table 1 and Table 2 indicate a cover payment adjustment factor of 0.5, the payment adjustment factor of 0.5 applies.

When multiple test samples are represented by the tender item, the payment adjustment shall apply to the total plan area of laminated elastomeric bearings represented by the sample, divided by the total plan area of all laminated elastomeric bearings represented by the tender item.

When the average top or bottom elastomer cover to the embedded steel plates in the test sample exceeds the tolerance specified in the Contract Documents and exceeds 70% of the average effective elastomer thickness of internal layers, or when the average thickness of individual layers of elastomer exceeds the tolerance specified in the Contract Documents, a request may be made that the Owner accept the bearings if they meet the design requirements. The bearing supplier shall update the bearing design on the shop drawings for the as-built configuration and shall evaluate the bearing for the design loads based on the as-built geometry.

**922.10.02.02                  Approach Slab and Ballast Wall Bearings**

The payment adjustment for each unacceptable lot of approach slab and ballast wall bearings shall be minus \$5,000.

**TABLE 1**  
**Payment Adjustment Factors for Elastomer Cover to Embedded Steel Plates – Low Cover**  
**at Top and Bottom and Low Cover at Sides**

|                               |            | Minimum Top and Bottom Cover, mm |                                                                                                                       |                                                                                                                       |
|-------------------------------|------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|                               |            | < 3.0                            | 3.0 to 3.5                                                                                                            | > 3.5                                                                                                                 |

|--------------|-------------------|
| <b>928-A</b> | <b>Commentary</b> |
|--------------|-------------------|

### **928.01 SCOPE**

This specification covers the requirements for the removal of concrete from existing structures, except by means of pressurized water, hydrodemolition, in order to facilitate structure rehabilitation.

#### **928.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **928.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **928.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

### **Ontario Provincial Standard Specifications, Construction**

OPSS 905      Steel Reinforcement for Concrete

### **CSA Standards**

CAN/CSA S6-06      Canadian Highway Bridge Design Code

## **928.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Certificate of Conformance** means a document issued by the Quality Verification Engineer confirming that the specified components of the Work are in general conformance with the requirements of the Contract Documents.

**Concrete Crusher** means a piece of equipment fitted with a hydraulic attachment, such as a scissor type jaw, used for the removal of concrete.

**Concrete Removal - Full Depth** means concrete removals that typically apply to full or partial length removals of entire thickness of curbs, sidewalks, medians, wingwalls, concrete barrier walls and parapet walls, ballast walls, and approach slabs. This also applies to localized removals extending the full thickness of slab decks and culverts.

**Concrete Removal - Partial Depth, Type A** means concrete removals that typically apply to the top surface of decks, including removals over round voids in post tensioned structures; sidewalks; curbs; and culvert and tunnel floor slabs and the top and inside faces of concrete barrier and parapet walls.

**Concrete Removal - Partial Depth, Type B** means concrete removals that typically apply to deck soffit and fascia of bridge decks, soffit of the top slab of culverts and tunnels, girders, diaphragms, and outside face of concrete barrier walls and parapet walls.

**Concrete Removal - Partial Depth, Type C** means concrete removals other than the ones specified for Concrete Removal - Partial Depth, Type A and Type B, and typically apply to abutments, wingwalls, pier columns and caps, bearing seats, retaining walls, and vertical walls of culverts and tunnels.

**Concrete Removal Sequence** means a specified order of concrete removals within a stage to ensure structural adequacy, stability, and integrity throughout construction.

**Concrete Removal - Structural Component** means concrete removals that typically apply to full or partial length removals of entire thickness of decks, girders, diaphragms, pier columns, and pier caps that have an impact on the structural adequacy, stability, and integrity of a structure.

**Engineer** means a professional engineer licensed by the Professional Engineers Ontario to practice in the Province of Ontario.

**Layer - Reinforcing Steel** means two or more reinforcing bars placed in a plane parallel to a concrete face.

**Mat - Reinforcing Steel** means two layers of reinforcing steel, in different directions, tied together.

**Quality Verification Engineer (QVE)** means an Engineer retained by the Contractor qualified to provide the services specified in the Contract Documents.

**Rehabilitation** means any modification, alteration, or improvement to a structure or its components that is designed to correct defects or deficiencies.

**Reinforcing Steel** means deformed steel bars used in the reinforcing of concrete and includes splice bars.

**Scarifying** means the removal of concrete from the top surface of a structure, to a specified depth achieved by the milling action of cutting teeth fitted to a rotating head.

**Steel Reinforcement** means a general term that includes reinforcing steel bars, splice bars, welded steel wire fabric, and prestressing tendons.

**Structure** means any bridge, culvert, tunnel, retaining wall, wharf, dock, guideway, or any part thereof or other reinforced concrete component designed to carry loads, including high mast pole footings and sign support footings.

## **928.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **928.04.01 General**

The Contractor shall meet all design and submission requirements from other authorities, as specified in the Contract Documents. The requirements of these authorities and the Owner shall be satisfied before commencement of concrete removals.

## **928.04.02 Design Requirements**

The structural design and evaluation shall be carried out according to CAN/CSA S6.

The design assumptions for structural design and evaluation shall accurately represent the condition of the structure during construction, including the effect of concrete removals on load distribution and member resistance, support location and restraints, construction loads and construction staging, and shall be based on the existing structure drawings.

The weights of construction equipment shall be based on the manufacturer's specifications. The minimum dynamic load allowance for rig-mounted breakers and concrete crushers shall be 0.4. The load factors for construction live loads shall be the same as for highway live loads.

## **928.04.03 Submission Requirements**

### **928.04.03.01 Access to Work Areas, Platforms, and Scaffolding**

When access to work areas, work platforms, and scaffolding are to be provided, the Contractor shall submit to the Contract Administrator detailed drawings, for information purposes, prior to the installation.

### **928.04.03.02 Working Drawings**

The Contractor shall submit 3 sets of Working Drawings to the Contract Administrator at least 7 Days prior to the commencement of the concrete removals, for concrete removal, complete deck and concrete removal, structural component, for information purposes only. The Contractor shall have a copy of the Working Drawings on site at all times while the work is being carried out.

All Working Drawings shall contain the following:

- a) Layout and description of concrete removal sequences and temporary supports.
- b) Clearances at existing and proposed structures.
- c) The locations, loadings, and detailed descriptions of heavy equipment and vehicles to be supported on existing structures.
- d) Seal and signature of the design Engineer and design check Engineer employed or retained by the Contractor, and a statement certifying that based on the existing drawings of the structure that the serviceability limit state and ultimate limit state requirements of CAN/CSA S6 are satisfied when any one or more of the following are proposed by the Contractor:
  - i. Existing structures supporting rig-mounted breakers, concrete crushers, cranes, any other heavy equipment, and vehicles that would induce higher load effects than normal traffic on a structure.
  - ii. Removal sequence different from the one specified in the Contract Documents or when the Contract Documents do not specify a removal sequence.
- e) Identify stages of work that require interim inspection by the Quality Verification Engineer (QVE) for the safe execution of concrete removal, such as:
  - i. Installation of temporary support.
  - ii. Installation of temporary protection for traffic, pedestrians, and property.
  - iii. Structural strengthening or modification.
  - iv. Removal of existing dead load or earth pressure, or both.

### **928.04.03.03 Concrete Removal Equipment**

The Contractor shall submit identification of equipment and the manufacturer's published specifications for all concrete removal equipment to be used to the Contract Administrator, at least 7 Days prior to the commencement of the concrete removal operation.

### **928.04.03.04 Saw Cutting Details**

When it is intended to cut full thickness through a concrete component by the use of sawing equipment, the Contractor shall submit saw cutting details to the Contract Administrator, at least 7 Days prior to the intended commencement of the saw cutting operation. The details shall include the following:

- a) Depth and location of sawcuts.
- b) Method used to prevent any contact with components that are to remain in place.
- c) Method of collecting and managing the effluent from the saw cutting operation.

### **928.04.03.05 Traffic and Pedestrian Protection**

Unless otherwise specified in the Contract Documents, the Contractor shall submit a description of the traffic and pedestrian protection plan to the Contract Administrator, at least 7 Days prior to the commencement of the concrete removal operations.

## **928.06 EQUIPMENT**

### **928.06.01 Air Hammers**

Air hammers shall be hand-held and meet the following requirements:

- a) Chipping hammers shall have a maximum weight of 9.0 kg prior to any handle modification and a maximum piston stroke of 102 mm.
- b) Jack hammers shall have a maximum weight of 14.0 kg.
- c) All hammers shall have the manufacturer's name and part or model number engraved on them by the manufacturer. All information must be clearly legible.

The manufacturer's published specifications shall be the sole basis for determining weight and piston stroke.

### **928.06.02 Rig-Mounted Breakers**

Rig-mounted breakers using pneumatically driven equipment shall only be fitted with amoil point and produce a maximum energy of 1,000 Joules per blow as per manufacturer's specification.

### **928.06.03 Sawing Equipment**

The sawing equipment shall be capable of sawing the concrete along the lines and to the depths specified in the Contract Documents.

### **928.06.04 Scarifiers**

Equipment used for scarifying shall be capable of removing a minimum of 6 mm of concrete from the top surface of the structure in one pass.

The maximum weight of a scarifier used on bridge decks shall not exceed 26 tonnes.

**928.06.05                      Straight Edges**

Two commercially made metal straight edges, 1.5 m and 3 m in length, shall be supplied.

**928.07                              CONSTRUCTION**

**928.07.01                      General**

Concrete shall be removed to the depth and demarcated boundaries as specified in the Contract Documents or as directed by the Contract Administrator.

Upon completion of the concrete removals in the demarcated areas, the Contractor shall notify the Contract Administrator for inspection of the removal areas. Additional areas of concrete removal identified by the Contract Administrator shall be removed as directed by the Contract Administrator.

**928.07.02                      Access to Work Area, Work Platform, and Scaffolding**

Adequate access shall be provided to the work area, work platform, and scaffolding as required, for the following:

- a) Concrete surveys by the Contract Administrator.
- b) Inspection of work and measurement of the quantities by the Contract Administrator.
- c) Quality Assurance and acceptance inspections by the Owner.
- d) Performance of the Contractor's work, including concrete removals.

**928.07.03                      Concrete Surveys**

**928.07.03.01                      General**

The Contractor shall schedule operations so as to ensure there is no interference with the concrete surveys.

**928.07.03.02                      Covermeter Survey**

The Contractor shall allow the Contract Administrator to carry out a bridge deck covermeter survey for all asphalt-covered decks when concrete removals from the top surface of the deck are specified in the Contract Documents.

The Contractor shall notify the Contract Administrator 24 hours prior to the commencement of the scarifying operation.

The covermeter survey shall be carried out as follows:

- a) When the deck is specified to be patched, complete the survey after the waterproofing is completely removed from the top surface of the deck.
- b) When an overlay is specified in the Contract Documents, complete the survey after the first pass of the scarifying equipment.

### **928.07.03.03 Concrete Removal Surveys**

#### **928.07.03.03.01 General**

The Contractor shall submit a written notification to the Contract Administrator to carry out all applicable concrete removal surveys. The notification shall state that the Contractor has completed the work specified in the Work Requirements clause for the concrete removal surveys specified and has installed all accesses to the work area, including work platforms and scaffolding required by the Contract Administrator to carry out the surveys.

When the location and extent of removals are not completely defined in the Contract Documents, the Contract Administrator shall carry out one or both of the following concrete removal surveys as part of determining and demarcating the actual location and extent of removals:

a) Visual and Delamination Survey

A visual and delamination survey shall be carried out for all concrete removals.

When a structure has an existing overlay that is not to be completely removed, the Contract Administrator shall carry out the delamination survey twice. The first survey shall be carried out on the top surface of the entire overlay. The second survey shall be carried out on the top surface of the original deck within the removal area, after the existing overlay has been removed.

When a structure has an existing overlay that is to be completely removed, the Contract Administrator shall carry out the delamination survey after the overlay is completely removed.

b) Corrosion Potential Survey (Half-Cell)

A corrosion potential survey shall be carried out on all surfaces when concrete is to be removed based on corrosion potential criteria when specified in the Contract Documents.

When full depth removals are specified in the Contract Documents, the concrete removal surveys on the top of the deck and soffit shall be completed to determine and demarcate the full depth concrete removal areas.

Concrete removals shall not proceed until all the applicable concrete surveys have been completed, reviewed, and written permission to proceed has been given by the Contract Administrator.

#### **928.07.03.03.02 Work Requirements**

Prior to the concrete removal surveys, the Contractor shall carry out all applicable work as follows:

- a) Scarifying - Complete the scarifying operations.
- b) Refacing with Uniform Concrete Removal - Complete the uniform removal of concrete.
- c) Removal of Waterproofing, Asphalt, and Coatings - All existing waterproofing membrane, asphalt, and coatings shall be removed in such a way to prevent damage to the existing concrete surface.
- d) Concrete Removal by Corrosion Potential - The Contract Administrator shall select two widely separated locations for each portion of the structure when the reinforcing steel is continuous. The reinforcing steel within these locations shall be exposed for a length of 150 mm and a clearance of 25 mm all around the bar.

Immediately prior to the commencement of the concrete removal surveys, all equipment shall be removed and all debris and standing water cleared from the surfaces to be surveyed.

### **928.07.03.03 Time Requirements**

The time required by the Contract Administrator to complete the concrete removal surveys, including review of the surveys by the Owner, shall be as specified in Table 1 and shall commence upon receipt of the Contractor's written notification to carry out the concrete removal surveys. When the area of a structure exceeds the maximum area surveyed for the time period shown, the time period specified in Table 1 shall be extended on the basis of prorating the area, rounded up to the nearest Business Day.

The maximum time period required to complete the concrete surveys does not include any days of inclement weather or days when the air temperature is below 5 °C.

### **928.07.04 Scarifying**

#### **928.07.04.01 General**

The portion of the structure to be scarified and the depth of scarifying shall be according to the Contract Documents.

Prior to scarifying, all sand and debris shall be removed from the top surface of the structure to be scarified. The maximum depth of scarifying in any one pass of the scarifying equipment shall be 10 mm. After the scarifying operation, areas of the structure not scarified to the specified depth shall be re-scarified until the specified depth is achieved.

When the specified depth of scarifying is greater than 10 mm, the Contractor shall allow the Contract Administrator a 24-hour period to complete the covermeter survey prior to commencing the second pass of the scarifying.

The portion of the curb face, barrier or parapet wall, and all existing concrete surfaces that have not been scarified against which new concrete is to be placed shall be uniformly roughened by means of scabbling, chipping hammer, or bushhammering. A surface profile of 5 mm ± 2 mm shall be achieved by exposing the aggregates across the entire surface.

All material resulting from the scarifying operation shall be removed from the deck immediately after each pass of the scarifying equipment.

#### **928.07.04.02 Protection of Reinforcing Steel**

The Contractor shall immediately notify the Contract Administrator of any exposed reinforcing steel visible on the concrete surface prior to and at any time during the scarifying operation. Operations shall be adjusted to avoid contacting the reinforcing steel with the scarifying equipment.

The Contract Administrator shall demarcate an area around any exposed reinforcing steel. The concrete shall be removed from within the demarcated area to the depth specified for the adjacent scarifying area using chipping hammers or as directed by the Contract Administrator.

Exposed reinforcing steel shall not be cut, removed, or damaged.

#### **928.07.05 Reinforcing Steel in Concrete Removal Areas**

When the cutting, bending, and removal of reinforcing steel is specified in the Contract Documents, the work shall be done as part of concrete removals. The cutting and bending of reinforcing steel shall be according to OPSS 905.

When the area of concrete removal with exposed reinforcing steel exceeds 2 m<sup>2</sup>, the reinforcing steel shall be retied at every second intersection point and shall be supported to maintain the steel mat in its original location. Supports shall be placed as required and tied securely to the reinforcing steel according to OPSS 905.

## **928.07.06                      Equipment Restrictions**

### **928.07.06.01                  General**

Only equipment specified shall be permitted for the removal of concrete.

Construction equipment shall be permitted on the structure provided that all of the following conditions are met:

- a) Contamination by oil or other deleterious substances shall be prevented. Contaminated concrete shall be removed according to the procedures specified in the Concrete Removal - Partial Depth Type A, B, and C clause.
- b) Vehicles, runways, and equipment other than hand held equipment shall not be supported by reinforcing steel.
- c) Heavy vehicles such as ready mix concrete trucks or dump trucks shall not be permitted on any portion of the deck, within a span, once concrete removals within the deck have commenced in that span.

### **928.07.06.02                  Concrete Removal - Partial Depth Types A, B, and C**

Only chipping hammers shall be used for all partial depth concrete removals.

### **928.07.06.03                  Concrete Removal - Complete Deck, Deck Joint Assemblies, Full Depth, and Structural Component**

#### **928.07.06.03.01              Sawing Equipment**

The use of sawing equipment, except for perimeter treatments of concrete removal areas shall not be permitted for the removal of concrete:

- a) Within the lap length of reinforcing steel to remain in place.
- b) Within 100 mm from the edges and faces of structural steel members and concrete components to remain in place.

Prior to making sawcuts in a concrete deck close to the areas of existing structural steel members and other components that are to remain, the concrete surface shall be delineated by a qualified surveyor to locate the underlying edges and the faces of structural steel members and other components so not to damage the structural steel members and other components while saw cutting the concrete as specified.

#### **928.07.06.03.02              Chipping Hammers**

The use of chipping hammers shall be permitted in all areas of concrete removal.

### **928.07.06.03.03          Jack Hammers**

The use of jack hammers shall not be permitted for the removal of concrete:

- a) For partial depth removals.
- b) Within 100 mm from concrete to remain in place.
- c) Within 25 mm of any reinforcing steel to remain in place.
- d) Within 100 mm from the edges and faces of structural steel members to remain in place.

### **928.07.06.03.04          Rig-Mounted Breakers**

The use of rig-mounted breakers shall not be permitted for the removal of concrete:

- a) In concrete barrier and parapet walls, and deck slabs supported by concrete girders, unless the girders are to be removed.
- b) In concrete barrier and parapet walls supported by steel beams, unless the deck slab is to be removed.
- c) Within the deck joint assembly.
- d) Located within a distance from concrete to remain in place equal to the sum of 600 mm and the specified lap length of reinforcing steel to remain in place.
- e) Within 600 mm from the edge and faces of structural steel members including shear studs to remain in place.

### **928.07.06.03.05          Concrete Crusher**

The use of a concrete crusher shall not be permitted for the removal of concrete:

- a) Within 2 m of concrete to remain in place.
- b) Within 1 m of reinforcing steel to remain in place.
- c) Within 300 mm from the edge and faces of structural steel members, including shear studs to remain in place.

### **928.07.07                  Concrete Removal**

#### **928.07.07.01              General**

Concrete removal shall not be permitted within 1 m of newly placed concrete until the newly placed concrete has attained a compressive strength of 20 MPa.

Concrete shall be removed in such a manner to prevent damage to the concrete to remain in place and debonding of reinforcing steel beyond the demarcated removal area. Reinforcing steel, prestressing tendons, shear connectors, structural steel, Utilities, and all other components that are to remain in place shall not be damaged or loosened. Concrete debris shall be removed from the concrete removal area on an ongoing basis.

## **928.07.07.02 Concrete Removal - Partial Depth Types A, B, and C**

### **928.07.07.02.01 Perimeter Treatment of Concrete Removal Areas**

The perimeter treatment of a partial depth concrete removal area shall be prepared according to the rehabilitation method to be used as follows:

- a) Concrete Overlay or Refacing - The perimeter of the removal area shall have a 1H:1V sloped face for the full depth of the removal area. The perimeter shall not be sawcut.
- b) Shotcrete - Prior to carrying out concrete removal operations, the perimeter of the removal area shall be sawn to a depth of 10 mm or to the depth of the reinforcing steel, whichever is less. The perimeter of the removal area shall have a face perpendicular to the original concrete surface for the specified depth of the removal area.
- c) Concrete Patches - Prior to carrying out concrete removal operations, the perimeter of the removal area shall be sawn to a depth of 25 mm or to the depth of the reinforcing steel, whichever is less. The perimeter of the removal area shall have a face perpendicular to the original concrete surface for the specified depth of the removal area.

### **928.07.07.02.02 Depth of Concrete Removal Areas**

For existing concrete overlays to be patched, concrete shall be removed to the top surface of the original deck in the demarcated areas to allow the Contract Administrator to conduct a second delamination survey.

Concrete removal shall extend below the reinforcing steel within the boundaries demarcated by the Contract Administrator in the following areas:

- a) The entire area of spalls and delaminations.
- b) The areas of concrete components when corrosion potential of the reinforcing steel is more negative than minus 0.35 volts, as determined by the corrosion potential survey.
- c) All areas of exposed reinforcing steel.

Concrete in these areas shall be removed to a uniform depth of 25 mm behind the first layer of reinforcing steel.

Concrete surrounding the second layer of reinforcing steel shall also be removed locally to provide a minimum clearance of 25 mm all around the reinforcing steel.

Concrete removal beyond the second layer of reinforcing steel shall be carried out only when directed by the Contract Administrator.

For all other concrete removals demarcated by the Contract Administrator, including scaling and honeycombing, concrete shall be removed as follows:

- a) To sound concrete, when an overlay or refacing is specified in the Contract Documents.
- b) To sound concrete for a uniform depth of at least 50 mm, when an overlay or refacing is not specified in the Contract Documents.

### **928.07.07.03 Concrete Removal - Complete Deck, Full Depth, and Structural Component**

Prior to carrying out concrete removals, the perimeter of the demarcated removal area shall be sawn to a depth of 25 mm or to the depth of the reinforcing steel, whichever is less, except for localized full depth repairs in the deck.

Prior to carrying out the concrete removals for localized full depth repairs in the deck, the perimeter of the removal area on the top surface of the deck shall be sawn to a depth of 25 mm or to the depth of the reinforcing steel, whichever is less. After concrete removals from the top of the deck are completed, the perimeter of the removal area along the soffit shall be squared off by saw cutting to a depth of 25 mm or to the depth of the reinforcing steel, whichever is less. The concrete removals shall be completed from the soffit using chipping hammers.

### **928.07.07.04 Concrete Removal - Deck Joint Assemblies**

The existing deck joint assemblies including joint filler materials and surrounding concrete shall be removed according to the requirements of this specification and the Contract Documents.

### **928.07.08 Remedial Work**

The Contract Administrator shall be notified immediately in writing if any of the following work related defects are present along with an explanation of the cause and extent of the defect:

- a) Damage to concrete beyond demarcated removal areas.
- b) Damage to concrete not specified for removal and damage to reinforcing steel to remain in place.
- c) Damage to structural steel and other components that are to remain in place.
- d) Contaminated concrete.
- e) Work that does not conform to the requirements of the Contract Documents.

All work related defects shall be repaired. A proposal for the remedial work to correct defects shall be submitted to the Contract Administrator for review. The Contractor shall not proceed with repairs until approval of the proposal has been received.

Repairs shall be made to the approval of the Contract Administrator.

### **928.07.09 Certificate of Conformance**

A Certificate of Conformance shall be submitted by the Contractor upon completion of the designated concrete removal for each structural component and complete deck. The certificate shall be sealed, signed, and dated by the Quality Verification Engineer. The certificate shall state that the Work has been carried out in general conformance with the Working Drawings and the Contract Documents.

### **928.07.10 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **928.08 QUALITY ASSURANCE**

### **928.08.01 General**

After the concrete removals are completed in the areas designated for removal, the work shall be inspected by the Contract Administrator to:

- a) determine and demarcate any additional removals within and along the perimeter of the demarcated areas.
- b) verify that the concrete has been removed to the depth and dimensions specified in the Contract Documents or as approved by the Contract Administrator.
- c) identify any work related defects in the work.

All work related defects and deficiencies shall be corrected as outlined in the Remedial Work subsection.

### **928.08.02 Acceptance**

The following work related defects are unacceptable and shall be subject to remedial work:

- a) Damage to concrete beyond demarcated removal areas.
- b) Damage to concrete not specified for removal and damage to reinforcing steel to remain in place.
- c) Damage to structural steel and other components.
- d) Contaminated concrete.
- e) Work that does not conform to the requirements of the Contract Documents.

## **928.09 MEASUREMENT FOR PAYMENT**

### **928.09.01 Actual Measurement**

#### **928.09.01.01 Scarifying**

Measurement of scarifying shall be by area in square metres of the structure surface area to be scarified.

Measurement shall not be made of the roughened portions of curb faces, concrete barrier and parapet walls or of areas that require a second scarifying due to the Contractor's method of operation.

The total area shall be calculated to the nearest 0.1 m<sup>2</sup>.

#### **928.09.01.02 Concrete Removal - Partial Depth Types A, B, and C**

##### **928.09.01.02.01 General**

Measurement of partial depth concrete removal shall be by area or volume as specified in the Contract Documents.

##### **928.09.01.02.02 By Area**

Measurement shall be of the area of concrete removed in square metres.

The total area shall be calculated to the nearest 0.1 m<sup>2</sup>.

### **928.09.01.02.03            By Volume**

Measurement for payment shall be of the volume of concrete removed for the depth specified or to the depth approved by the Contract Administrator.

Material removed locally 25 mm around the second layer of reinforcing steel shall not be measured. However, if the Contract Documents specify a uniform removal below the second layer of reinforcing steel, measurement for payment shall be of the volume of concrete removed to the specified depth.

After concrete removal is completed, verification of concrete removal depths shall be completed by the Contract Administrator on a grid system that best describes the profile at the particular area.

Measurement shall be taken by placing a straight edge across the removal area and measuring the distance from the straight edge to the top of the remaining concrete surface, as follows:

- a) A minimum of three measurements for each removal area less than or equal to 1.0 m<sup>2</sup>.
- b) A minimum of ten measurements for every square metre for each removal area greater than 1.0 m<sup>2</sup>.

The depths for each removal area shall be measured and averaged to the nearest millimetre.

The total volume shall be calculated to the nearest 0.1 m<sup>3</sup>.

### **928.09.01.03            Concrete Removal - Full Depth**

Measurement of the full depth concrete removal shall be by volume in cubic metres. Alternatively, full depth concrete removal may be a lump sum item.

The total volume shall be calculated to the nearest 0.1 m<sup>3</sup>.

## **928.10                    BASIS OF PAYMENT**

### **928.10.01               Scarifying - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

When exposed reinforcing steel necessitates concrete being removed from within the demarcated areas to the depth specified for the adjacent scarifying using chipping hammers, such work shall be paid as Extra Work.

### **928.10.02               Access to Work Area, Work Platform, and Scaffolding - Item** **Concrete Removal - Complete Deck - Item** **Concrete Removal - Deck Joint Assemblies - Item** **Concrete Removal - Full Depth - Item** **Concrete Removal - Partial Depth Type A - Item** **Concrete Removal - Partial Depth Type B - Item** **Concrete Removal - Partial Depth Type C - Item** **Concrete Removal - Structural Component - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

When the Contract does not contain a separate tender item for access to the work area, work platform and scaffolding, the Contract price for the concrete removal items shall include full compensation for all labour, Equipment, and Material to provide access to work area, work platform, and scaffolding.

Payment for the appropriate tender item Concrete Removal - Partial Depth Type A, Concrete Removal - Partial Depth Type B, or Concrete Removal - Partial Depth Type C or any combination of the three shall include full compensation for all labour, Equipment, and Material to remove concrete locally around the second layer of reinforcing steel to provide a minimum 25 mm clearance around the reinforcing steel.

When the replacement of corrosion damaged reinforcing steel is required, such work shall be paid as Extra Work.

Work related defects repaired as remedial work shall be completed at no extra cost to the Owner.

**TABLE 1**  
**Time Requirements for Concrete Removal Surveys**

| <b>Concrete Component</b>                                                      | <b>Maximum Area Surveyed<br/>Per Time Period<br/>m<sup>2</sup></b> | <b>Time Period<br/>Business Days</b> |
|--------------------------------------------------------------------------------|--------------------------------------------------------------------|--------------------------------------|
| Bridge deck surface, including sidewalks, concrete barrier, and parapet walls. | 3,000                                                              | 3                                    |
| Bridge deck soffit, including fascias.                                         | 1,500                                                              | 3                                    |
| Abutments, wingwalls, and retaining walls.                                     | 1,000                                                              | 2                                    |
| Piers                                                                          | 500                                                                | 2                                    |
| Culverts                                                                       | 500                                                                | 2                                    |

**Appendix 928-A, April 2012**  
**FOR USE WHILE DESIGNING MUNICIPAL CONTRACTS**

**Note:** This is a non-mandatory Commentary Appendix intended to provide information to a designer, during the design stage of a contract, on the use of the OPS specification in a municipal contract. This appendix does not form part of the standard specification. Actions and considerations discussed in this appendix are for information purposes only and do not supersede an Owner's design decisions and methodology.

**929.01 SCOPE**

This specification covers the requirements for abrasive blast cleaning of concrete surfaces and reinforcing steel.

**929.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

**ASTM International**

D 4285-83 (R2006) Standard Test Method for Indicating Oil or Water in Compressed Air

## **The Society for Protective Coatings (SSPC)**

VIS 1-2002 Guide and Reference Photographs for Steel Surfaces Prepared by Dry Abrasive Blast Cleaning

## **Joint Publications of the Society for Protective Coatings (SSPC) and National Association of Corrosion Engineers (NACE)**

SSPC-SP 6/NACE No. 3-2007 Commercial Blast Cleaning

### **929.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Abrasive** means a solid substance capable of grinding or wearing down.

**Fiber Reinforced Polymer (FRP) Reinforcement** means a structural reinforcing bar made from glass fibers or carbon fibers held in a polymeric resin matrix binder. FRP includes dowels, reinforcing bars and grids.

**Layer, Reinforcing Steel** means two or more reinforcing bars placed in a plane parallel to a concrete face.

**Mat, Reinforcing Steel** means transverse and longitudinal layers of reinforcing steel tied together.

**Structure** means any bridge, culvert, tunnel, retaining wall, wharf, dock, guideway or any part thereof, or other reinforced concrete component designed to carry loads, including high mast pole footings and sign support footings.

### **929.06 EQUIPMENT**

#### **929.06.01 Air Compressor**

The air compressor for abrasive blast cleaning shall be capable of delivering material at a pressure of 620 kPa. The air pressure shall be measured in the delivery system at a distance not greater than 3 m from the nozzle end.

The compressed air shall be clean, dry, and free of oil residue when tested according to ASTM D 4285.

Nozzles used for abrasive blast cleaning shall have a minimum diameter of 8 mm and the size shall be indicated on the nozzle.

Hoses used for abrasive blast cleaning shall have an internal diameter not less than 40 mm.

### **929.07 CONSTRUCTION**

#### **929.07.01 General**

Abrasive blast cleaning shall only be permitted when the concrete and reinforcing steel are surface dry.

Areas and components not designated for abrasive blast cleaning shall be protected from adjacent abrasive blast cleaning operations.

All new epoxy coated reinforcing steel and any FRP reinforcement in the vicinity of the abrasive blast cleaning operations shall be protected from damage.

Adequate access to the work area shall be provided to facilitate the work and for any inspection or measurement required by the Contract Administrator.

#### **929.07.02                      Abrasive Blast Cleaning of Reinforcing Steel**

Abrasive blast cleaning of existing reinforcing steel applies to both epoxy coated and uncoated reinforcing steel.

All existing epoxy coated reinforcing steel within a concrete removal area shall be abrasive blast cleaned to remove the epoxy coating. Reinstatement of the epoxy coating on the existing reinforcing steel is not required.

The full circumference of the existing exposed reinforcing steel shall be abrasive blast cleaned to a commercial blast cleaned finish according to SSPC-SP 6/NACE No. 3, and the blast cleaned steel surfaces shall be according to the applicable visual standards specified in SSPC-VIS 1.

When silica sand is used as the abrasive material, the subsequent placement of concrete or shotcrete shall be done within 72 hours or the reinforcing steel shall be reblasted. When other types of abrasive materials are used, the subsequent placement of concrete or shotcrete shall be done within 36 hours or the reinforcing steel shall be reblasted.

#### **929.07.03                      Abrasive Blast Cleaning of Structural Steel in Contact with Concrete**

All surfaces of existing structural steel against which new concrete is to be placed for the rehabilitation of a concrete structure component shall be abrasive blast cleaned to a commercial blast cleaned finish according to SSPC-SP6/NACE No. 3, and the blast cleaned steel surfaces shall be according to the applicable visual standards specified in SSPC-VIS 1.

The abrasive blast cleaning of structural steel shall be done immediately prior to placing coated reinforcing steel or FRP reinforcement.

Enclosure shall be provided during abrasive blast cleaning of structural steel to prevent escape of dust from the immediate work area into the natural environment, live traffic, waterways, and beyond the right-of-way.

#### **929.07.04                      Abrasive Blast Cleaning of Concrete Surfaces**

##### **929.07.04.01                  General**

All new and existing concrete surfaces against which new concrete is to be placed shall be abrasive blast cleaned.

The abrasive blast cleaning shall be of an extent to expose and clean the coarse aggregate and remove all dirt, laitance, and hardened concrete slurry. Any oil or grease on the surface of the concrete shall be removed using hand tools.

The abrasive blast cleaning of concrete surfaces shall be carried out not more than 48 hours prior to the placement of concrete against them.

Immediately after abrasive blast cleaning is completed, the surface shall be checked by the Contract Administrator for fractured concrete or loose aggregate. This material shall be removed using hand tools.

## **929.07.04.02 Concrete Surfaces for Overlays**

Abrasive blast cleaning shall proceed by delineating an area of the deck not exceeding 10 m<sup>2</sup> and completing abrasive blast cleaning within the delineated area prior to proceeding to the adjacent areas of the deck surface.

When the concrete overlay is to be placed over cathodic protection anode mesh, the abrasive blast cleaning shall be completed prior to installing the mesh in that area.

Except when anode mesh is used, areas of concrete that are abrasive blast cleaned for the subsequent treatment of concrete overlay, shall have the overlay applied within 36 hours or shall be reblasted.

## **929.07.05 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

## **929.08 QUALITY ASSURANCE**

### **928.08.01 General**

After abrasive blast cleaning is completed, the abrasive blast cleaned concrete surfaces, reinforcing steel, and structural steel shall be examined by the Contract Administrator to verify that the requirements of this specification have been met.

## **929.09 MEASUREMENT FOR PAYMENT**

### **929.09.01 Actual Measurement**

#### **929.09.01.01 Abrasive Blast Cleaning of Reinforcing Steel**

Measurement for payment shall be of the area of concrete removed in square metres where reinforcing steel bars are exposed. When the removal exposes more than one mat of reinforcing steel, the measured area shall be for each mat of exposed bars that are to remain in place. There shall be no measurement for abrasive blast cleaning of reinforcing steel in volume of concrete that was not designated for concrete removal by the Contract Administrator.

When only one reinforcing steel bar is exposed in the area of concrete removal, the area shall be calculated based on the width of 200 mm by the length of the exposed reinforcing steel bar.

The total area shall be calculated to the nearest 0.1 m<sup>2</sup>.

### **929.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

## **929.10 BASIS OF PAYMENT**

### **929.10.01 Abrasive Blast Cleaning for Overlays - Item Abrasive Blast Cleaning of Reinforcing Steel - Item Abrasive Blast Cleaning of Structural Steel in Contact with Concrete - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour,

Equipment, and Material to do the Work.

Abrasive blast cleaning of reinforcing steel applies to abrasive blast cleaning of existing reinforcing steel that is either epoxy coated or uncoated reinforcing steel.

When the Contract does not contain a separate tender item for providing access to the work, the Contract price for the abrasive blast cleaning items requiring the access shall include full compensation for all labour, Equipment, and Material to provide such access.

|              |                   |
|--------------|-------------------|
| <b>930-A</b> | <b>Commentary</b> |
|--------------|-------------------|

**930.01 SCOPE**

This specification covers the requirements for concrete structure rehabilitation, including; concrete patches, concrete refacing, normal concrete overlays, and silica fume concrete overlays.

**930.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **930.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **930.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## 930.03

### DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Concrete Patches, Formed Surfaces** means concrete patches where at least one face of the patch requires formwork.

**Concrete Patches, Unformed Surfaces** means concrete patches located in the top surface of decks, sidewalks, and curbs where no formwork is required.

**Concrete Refacing** means concrete refacing where at least one of the surfaces of a component is entirely overlaid with concrete. Concrete refacing typically applies to pier columns, pier caps, abutments, vertical walls of culverts and tunnels, concrete barrier, and parapet walls.

**Form and Pump Placement Method** means a method of placing concrete by pumping directly into formwork through injection ports.

**Hot Weather** means those conditions when the air temperature is at or above 28 °C. It is also considered to exist when the air temperature is at or is likely to rise above 28 °C within 24 hours after concrete placement. Temperature refers to shade temperature.

**Injection Port** means a mechanical device with a manual shut-off that is attached to the formwork and connected to the discharge line of a pump to facilitate delivery of concrete directly into the formwork.

**Rehabilitation** means any modification, alteration, or improvement to a structure or its components that is designed to correct defects or deficiencies.

**Self-Consolidating Concrete (SCC)** means a highly flowable yet stable concrete that can spread readily into place, fill the formwork, and encapsulate the reinforcement without any mechanical consolidation or vibration and without undergoing segregation or excessive bleeding. It may be designed for high strength and durability in addition to flow characteristics.

**Segregation** means visible separation of the mortar and coarse aggregate particles in the plastic concrete resulting in concrete that is not uniform in appearance or proportions.

**Silica Fume Concrete** means concrete which includes silica fume and may in addition include other supplementary cementing materials having specified rapid chloride permeability at 28 to 32 Days of 1,000 coulombs or less.

**Structure** means any bridge, culvert, tunnel, retaining wall, wharf, dock, guideway, or any part thereof or other reinforced concrete component designed to carry loads, including high mast pole footings and sign support footings.

## **930.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **930.04.01 Design Requirements**

#### **930.04.01.01 Formwork and Falsework**

Design submission shall be according to OPSS 919 with the following additional requirements:

- a) Working Drawings for soffit repairs shall be designed and sealed by an Engineer.
- b) Formwork and falsework for soffit repairs subjected to live traffic vibrations on the deck shall be designed for an additional dynamic load allowance of 50% the weight of plastic concrete being supported.

Timber formwork and falsework for soffit repairs shall be designed using permanent load duration factors and shall accommodate additional pressure due to pumping of repair concrete.

#### **930.04.02 Submission Requirements**

##### **930.04.02.01 Notification of Placement of Concrete**

Prior to each placing operation, form PH-CC-736, accompanied by all supporting documentation as indicated on the form shall be submitted to the Contract Administrator.

##### **930.04.02.02 Cold Weather Protection**

###### **930.04.02.02.01 General**

A description of the methods to be used to control the concrete temperature and temperature difference in cold weather shall be submitted to the Contract Administrator 3 Days prior to the commencement of concrete production. Cold weather is considered to exist when the air temperature is at or below 10 °C. It is also considered to exist when the air temperature is at or is likely to fall below 10 °C within 96 hours after concrete placement. Temperature refers to shade temperature. The submission shall be according to the Temperature Control Plans clause of OPSS 904.

###### **930.04.02.02.02 Temperature Records**

Datalogger temperature records and a record of any actions taken to maintain control of temperature and temperature difference shall be submitted to the Contract Administrator at the end of each Business Day during the temperature monitoring period. At the end of the temperature monitoring period, a complete temperature record shall be submitted to the Contract Administrator.

##### **930.04.02.03 Concrete Mix Design**

Concrete mix design submissions shall be according to OPSS 1350, with the additional requirement that test data for linear shrinkage shall be required and submitted within 40 Days of the mix design submission.

#### **930.04.02.04 Hot Weather Concreting**

A description of the methods to be used to control the concrete temperature shall be submitted to the Contract Administrator 3 Days prior to the commencement of concrete production in hot weather.

#### **930.04.02.05 Placement Methods**

When the form and pump placement method is specified in the Contract Documents or self-consolidating concrete is used, 4 copies of the details of the placement method shall be submitted to the Contract Administrator at least 3 Days prior to commencement of the work. The details shall include methodology and equipment to be used and shall bear the seal and signature of an Engineer.

#### **930.04.02.06 Formwork and Falsework**

Working Drawings for soffit repairs shall be submitted to the Contract Administrator 3 Days prior to the commencement of formwork and falsework installation, for information purposes only.

### **930.05 MATERIALS**

#### **930.05.01 General**

The following materials shall be according to OPSS 904:

- a) Burlap.
- b) Insulation material.
- c) Moisture vapour barrier.

If a bonding agent is used, it shall be compatible with the repair material.

#### **930.05.02 Anchors**

Anchors for the attachment of the welded steel wire fabric to the concrete surface shall be galvanized according to ASTM A 153 and be of adequate length and strength to resist a pull-out force of 1.0 kN.

#### **930.05.03 Concrete**

The concrete shall be according to OPSS 1350 with the following modifications:

- a) The minimum specified 28-Day compressive strength shall be 30 MPa, except for silica fume overlays which shall be 40 MPa.
- b) Coarse aggregates for overlays shall consist of a minimum of 60% crushed particles when tested according to MTO LS-607 and shall have 1.00% by mass maximum passing the 75 µm sieve when tested according to MTO LS-601. Coarse aggregate for overlays that form the bridge deck riding surface shall be composed of at least 80% siliceous rocks and minerals.
- c) Linear shrinkage test data for each mix design shall be submitted for information purposes. Testing shall be carried out in accordance with LS 435 and specimens may be cast at the ready mixed plant or at the site. Laboratory testing shall be carried out by a laboratory who has participated in an MTO correlation program for linear shrinkage.

- d) For concrete patches where the longest dimension, width or length, of individual patches is less than 400 mm, a proposal may be submitted to the Contract Administrator for approval to use a proprietary patching material. The patching material shall be mixed, handled, and cured according to the manufacturer's instructions.
- e) SCC will be considered on an individual project basis for patches and refacing subject to the Contract Administrator's approval. If permitted for use, SCC shall be according to the ministry's current specification for SCC. A copy of the specification can be obtained from the Ministry's Material Engineering and Research Office, 1201 Wilson Avenue, Downsview, M3M 1J8.

#### **930.05.04                      Drainage Tubes**

Rigid polyvinyl chloride (PVC) drainage tubes shall be according to CSA C22.2 No. 211.2. Galvanized steel drainage tubes shall be according to ASTM A53/A53M and galvanizing shall be according to ASTM A 123.

#### **930.05.05                      Forms**

Forms shall be according to OPSS 919, with the exception that all forms shall be medium density overlay plywood.

#### **930.05.06                      Proprietary Patching Materials**

Proprietary patching materials shall be from the ministry's list of concrete patching materials.

#### **930.05.07                      Tie Wire**

Tie wire shall be according to OPSS 905.

#### **930.05.08                      Welded Steel Wire Fabric**

Welded steel wire fabric shall be welded galvanized steel and shall be according to CSA G30.5. Galvanizing shall be according to ASTM A 123.

#### **930.05.09                      Water**

Water used for curing, fog-misting of concrete, pre-soaking of burlap, and bonding agent shall be according to OPSS 1302.

### **930.06                              EQUIPMENT**

#### **930.06.01                      General**

The following equipment shall be according to OPSS 904:

- a) Bridge deck finishing machine, screed rails, screed rail chairs, and work bridges used for overlays.
- b) Consolidating equipment.
- c) Hand finishing tools.
- d) Straight edges.

#### **930.06.02                      Buggies**

Buggies used for transporting and placing the concrete may be hand operated or motorized. Motorized concrete buggies shall have a capacity no greater than 0.5 m<sup>3</sup>.

#### **930.06.03                      Compressor - Air Blasting**

The compressed air shall be clean, dry, and free from oil residue and other contaminants when tested according to ASTM D 4285.

#### **930.06.04                      Fog Misting Equipment**

Fog misting equipment shall be provided for the curing of the silica fume concrete overlays. Hand held fogging wands shall be used.

A fogging system mounted on the finishing machine may also be used, provided it does not result in dripping or accumulation of water on the concrete surface.

#### **930.06.05                      Form and Pump Placement Method Equipment**

When the form and pump placement method is specified in the Contract Documents, the pump shall be a positive displacement type pump and shall be capable of delivering adequate volumes of concrete to maintain a continuous placement.

#### **930.06.06                      Sawing Equipment - Overlays**

The sawing equipment shall be self-propelled and capable of sawing the concrete overlay full depth in one pass.

### **930.07                              CONSTRUCTION**

#### **930.07.01                      General**

Typical locations and areas of repair are as shown on the Contract Drawings; however, the actual locations and extent of repair shall be as determined during the layout of the repair areas according to OPSS 928 and as directed by the Contract Administrator.

#### **930.07.02                      Operational Constraints**

The Contract Administrator shall be notified of the intent to place the overlay, concrete patches, or concrete refacing 1 Business Day prior to the commencement of the placing operation. The work shall not proceed until the concrete surface preparation has been completed and form PH-CC-736 has been received and signed by the Contract Administrator.

Construction equipment shall be permitted on the bridge deck or other concrete components, provided that:

- a) Contamination by oil or other deleterious substances is prevented.
- b) Equipment vehicles and runways are not supported by steel reinforcement.
- c) Only the finishing machine and buggies used to place concrete are allowed on the abrasive blast cleaned portions of the deck or other concrete components. No other vehicles or equipment, including concrete ready mix trucks shall be permitted.

- d) Heavy vehicles such as concrete ready mix trucks or dump trucks shall not be permitted on any portion of the deck, within a span, once concrete removals within the deck have commenced in that span.

No construction vehicles, equipment, or traffic, with the exception of sawcutting equipment shall be permitted on the finished surface of the overlay, patches, and on deck surface directly over soffit patches or refacing until the curing and cold weather protection period has been completed and a minimum compressive strength of 25 MPa has been attained.

Prior to seasonal shutdown, operations shall be scheduled in such a manner to ensure that overlays, concrete patches, and concrete refacing are completed in all areas where concrete removal has commenced. No steel reinforcement shall be left exposed during seasonal shutdown.

**930.07.03                      Normal Concrete Overlay  
                                         Silica Fume Concrete Overlay**

**930.07.03.01                  Minimum Thickness of Overlay**

The thickness of the overlay shall be according to the requirements of the Contract Drawings with no areas less than 45 mm in thickness.

**930.07.03.02                  Surface Preparation**

All concrete surfaces against which new concrete is to be placed shall be clean, sound and free from loose or unsound fragments, coatings and any other foreign substances or debris, and shall be sufficiently rough to ensure that a full bond is developed with the new concrete.

A bonding agent may be used. The Contract Administrator shall be notified in writing whether a bonding agent is to be used and, if so, the bonding agent shall be identified.

The portion of curb face, barrier wall or parapet wall, and all existing concrete surfaces which have not been scarified, against which new concrete is to be placed, shall be uniformly roughened by means of scabbling, chipping, or bush hammering. A surface profile of  $5 \pm 2$  mm shall be achieved by exposing the aggregates across the entire surface.

All concrete surfaces and steel reinforcement to receive the overlay shall be abrasive blast cleaned according to OPSS 929.

Immediately prior to pre-wetting the concrete surface, all dust and loose material shall be removed from the prepared surface by using compressed air, except where anode mesh is to be used.

When anode mesh is required, the concrete surface shall be pressure washed with water using a pressure not less than 10 MPa with the anode mesh in place. The pressure washing shall take place immediately prior to pre-wetting. All debris resulting from drilling of anchor holes and other accumulated dirt adhering to the anode or concrete surfaces shall be removed.

All concrete surfaces to receive an overlay shall be pre-wetted and continuously maintained in a wet condition for a minimum period of 6 hours immediately prior to the application of the concrete overlay or bonding agent when used. Excess water shall be removed from the surface using compressed air immediately prior to the application of the bonding agent or concrete overlay.

**930.07.03.03                  Placing of Screed Rails**

Supports for the screed rails shall be installed outside the area to be overlaid or waterproofed. The screed rails shall be continued beyond the deck, at each end, to a length that will enable the finishing machine to be driven beyond the end of deck.

**930.07.03.04****Dry Run**

A dry run shall be made to verify that the minimum thickness of the overlay can be achieved, in the presence of the Contract Administrator, prior to each placing operation.

The Contract Administrator shall be notified at least 1 Business Day in advance of a dry run. When the dry run indicates that an unsatisfactory thickness will result, the screed rails shall be adjusted in order to obtain the minimum thickness and the dry run repeated in the area of screed rail adjustment.

For silica fume concrete overlays, the ability to successfully fog mist shall be demonstrated to the Contract Administrator at the time of the dry run. The same equipment and process shall be used to fog mist the overlay.

**930.07.03.05****Placing of Concrete**

The placing of concrete shall be according to OPSS 904 with the following modifications:

- a) Concrete shall not be placed when the ambient air temperature or existing concrete surface temperature is below 10 °C or likely to fall below 10 °C, or is above 30 °C or likely to rise above 30 °C throughout the duration of the concrete placing operation.

Prior to placing new concrete, it shall be demonstrated to the Contract Administrator that the substrate temperatures meet the Contract requirements, by measuring and recording the substrate temperatures using a contact thermometer or infrared thermometer.

- b) Concrete shall not be placed adjacent to any new concrete less than 48 hours old. If the ambient air temperature falls below 10 °C within the first 48 hours after placement of concrete, the 48 hour time requirement shall be extended to 96 hours.

In addition, for staged overlay construction, concrete shall not be placed adjacent to any new concrete having a compressive strength less than 20 MPa.

- c) All concrete overlay 3 m or wider shall be placed with bridge deck finishing equipment.
- d) Any concrete or bonding agent deposited in areas other than the intended point of discharge shall be removed immediately.
- e) Unless otherwise specified in the Contract Documents, concrete for partial depth removal areas shall be placed at the same time as the overlay. Concrete for full depth removal areas shall be placed prior to placing the overlay and left with a rough surface finish.
- f) Cold joints shall not be permitted.

**930.07.03.06****Construction Joints**

Construction joints shall be permitted only where shown in the Contract Drawings or in the case of unexpected interruptions during the placing operation, as directed by the Contract Administrator.

All construction joints shall be formed using bulkheads. The height of the bulkhead shall match the thickness of the overlay.

The edge and face created by the bulkhead shall be a clean vertical face free from any defects such as honeycombing or spalls. If the construction joint formed by the bulkhead is deemed unacceptable by the Contract Administrator, a new construction joint shall be created by sawcutting back to a limit where the quality of concrete is acceptable to the Contract Administrator.

#### **930.07.03.07                      Surface Finish**

The surface finish shall be according to OPSS 904.

#### **930.07.03.08                      Surface Tolerance**

The surface tolerance shall be according to OPSS 904.

#### **930.07.03.09                      Surface Texture**

Where the surface of the overlay forms the driving surface of the bridge deck, the surface shall be given a texture with a wire broom or comb having a single row of tines. The required texture shall be transverse grooves which may vary from 1.5 mm width at 15 mm centres to 4.5 mm width at 20 mm centres with a groove depth varying from 3.0 mm to 4.5 mm. The texture shall extend uniformly to within 300 mm of the curb or barrier wall or parapet wall.

#### **930.07.03.10                      Curing**

Normal concrete overlay shall be cured according to the requirements for Curing with Burlap and Water clause of OPSS 904 for a minimum curing period of 4 Days, except that for concrete subjected anytime to cold weather during the first 96 hours after concrete placement, the curing period shall be extended to 7 Days.

Silica fume concrete overlay shall be cured according to the requirements for high performance concrete (HPC) of OPSS 904 for a minimum curing period of 7 Days.

Where waterproofing is to be applied to an overlay following curing with burlap and water, the overlay shall be air dried for at least 72 hours prior to the application of waterproofing.

#### **930.07.04                      Concrete Patches, Formed Surface Concrete Patches, Unformed Surface Concrete Patches, Form and Pump Concrete Refacing Concrete Refacing, Form and Pump**

##### **930.07.04.01                      Surface Preparation**

All concrete surfaces against which new concrete is to be placed shall be clean, sound and free from loose or unsound fragments, coatings, and any other foreign substances or debris and shall be sufficiently rough to ensure that a full bond is developed with the new concrete.

A bonding agent may be used. The Contract Administrator shall be notified in writing whether a bonding agent is to be used and, if so, the bonding agent shall be identified.

All existing concrete surfaces against which new concrete is to be placed shall be uniformly roughened by means of scabbling, chipping, or bush hammering. A surface profile of  $5 \pm 2$  mm shall be achieved by exposing the aggregates across the entire surface.

All concrete surfaces and steel reinforcement to receive new concrete shall be abrasive blast cleaned according to OPSS 929.

Immediately prior to pre-wetting the concrete surface, all dust and loose material shall be removed from the prepared surface of the repair area by using compressed air.

The surface of the existing concrete shall be pre-wetted and continuously maintained in a wet condition for a period of 6 hours immediately prior to placing any new concrete. Prior to placing concrete, excess water shall be removed from the surface using compressed air.

**930.07.04.02****Placement of Welded Steel Wire Fabric**

When welded steel wire fabric is specified in the Contract Documents, it shall not be installed until after the concrete surface and exposed steel reinforcement in the repair area have been abrasive blast cleaned. The welded steel wire fabric shall not be abrasive blast cleaned at any time.

Where there is no exposed steel reinforcement, the wire fabric shall be fastened to the concrete with anchors placed no further than 600 mm apart, in a grid pattern.

Where steel reinforcement is exposed, the wire fabric shall be securely fastened to the steel reinforcement by tie wires placed no further than 600 mm apart, in a grid pattern. When the exposed steel reinforcement is not capable of providing rigid support for the wire fabric, anchors shall be used to support the wire fabric.

The wire fabric shall be installed flat, tight, and at the locations shown in the Contract Drawings using spacers and anchors. The edges of adjoining wire fabric shall overlap by two-wire spacing plus 100 mm. The wire fabric shall be kept clean of any contamination that could reduce the bond of the repair material to the wire surface.

**930.07.04.03****Installation of Anchors and Dowels**

Holes for anchors and dowels shall be drilled into the concrete at the location and spacing as specified in the Contract Documents. They shall be installed in such a way as to not cause delamination or other damage to the surrounding concrete. Each anchor used to fasten the welded steel wire fabric into the concrete shall be installed to resist a pull out force of at least 1.0 kN at either sides of the concrete interface.

**930.07.04.04****Formwork and Falsework**

The erection and removal of formwork and falsework shall be according to OPSS 919 and it shall be designed to retain the concrete and withstand the placement pressures. The formwork shall be placed to provide the specified cover to steel reinforcement or welded steel wire fabric, or both, as specified in the Contract Documents. When this results in over-building of the existing concrete surface, a 1H:1V slope shall be provided to meet the existing surface at the edges of the repair area. The perimeter of the formwork shall be sealed to be grout-tight. Vent holes shall be installed at the highest locations.

**930.07.04.05****Placing of Concrete**

The placing of concrete shall be according to OPSS 904 with the following modifications:

- a) Concrete shall not be placed when the ambient air temperature or existing concrete surface temperature is below 10 °C or likely to fall below 10 °C or is above 30 °C or likely to rise above 30 °C throughout the duration of the concrete placing operation.

Prior to placing new concrete, it shall be demonstrated to the Contract Administrator that the substrate temperatures meet the Contract requirements by measuring and recording the substrate temperatures using a contact thermometer or infrared thermometer.

- b) Concrete shall not be placed adjacent to any new concrete less than 48 hours old. If the ambient air temperature falls below 10 °C within the first 48 hours after placement of concrete, the 48 hour time requirement shall be extended to 96 hours.
- c) For form and pump method, the port arrangement and pumping procedures shall be designed to ensure that requirements of this specification are met.
- d) Cold joints shall not be permitted.

#### **930.07.04.06 Construction Joints**

Construction joints in concrete shall be permitted at the locations shown on the Contract Drawings and shall be according to OPSS 904. Any additional construction joints required to suit the construction operation and to meet the specified crack control criteria shall be subject to approval by the Contract Administrator.

#### **930.07.04.07 Surface Finish**

The surface finish shall be according to OPSS 904.

#### **930.07.04.08 Surface Tolerance**

The surface tolerance shall be according to OPSS 904.

#### **930.07.04.09 Curing**

##### **930.07.04.09.01 General**

Normal concrete shall be cured for a minimum period of 4 Days, except that for concrete subjected anytime to cold weather during the first 96 hours after concrete placement the curing period shall be extended to 7 Days.

##### **930.07.04.09.02 Unformed Surfaces**

Concrete shall be cured for the full duration of the curing period according to the Curing with Burlap and Water clause in OPSS 904. The burlap and the moisture vapour barrier shall then be removed and the concrete permitted to air dry for not less than 72 hours prior to any application of tack coat for waterproofing, where applicable.

##### **930.07.04.09.03 Formed Surfaces**

###### **930.07.04.09.03.01 General**

All exposed concrete surfaces of formed components shall be cured as specified in the Unformed Surfaces clause.

###### **930.07.04.09.03.02 Concrete Patches, Formed Surface Concrete Patches, Form and Pump**

Curing shall be according to the following:

- a) If the formwork is left in place for the duration of the curing period, no additional curing shall be required.
- b) Where the formwork is to be removed within the specified curing period, curing shall be applied as specified in the Unformed Surfaces clause, curing shall be applied immediately after removal of the formwork and remain in place until the end of the curing period. Under no circumstance shall the concrete be left uncured for more than 2 hours during the removal of formwork.

###### **930.07.04.09.03.03 Concrete Refacing Concrete Refacing, Form and Pump**

Burlap and water shall be applied immediately to the top of all exposed concrete surfaces, within 2 to 4 m of the finishing operation. The burlap shall be soaked for 24 hours prior to placing and shall be kept continuously wet by means of an operating soaker hose placed along the top of the component being refaced. The soaker hose shall be placed immediately after the concrete has set and its operation shall not cause fines to be washed out.

Forms for all surfaces, except soffit for structural components, shall be removed within 16 to 24 hours of concrete placement, unless the Contractor is unable to remove the forms due to structural concerns. All concrete surfaces shall be immediately covered with wet burlap and moisture vapour barrier for the remainder of the minimum curing period according to the requirements of Curing with Burlap and Water clause in OPSS 904. Under no circumstance shall the concrete be left uncured for more than 2 hours during the removal of the formwork.

Forms for soffit of structural components including decks, pier caps, beams, and arch ribs shall not be removed until the full curing time has elapsed.

## **930.07.05 Cold Weather Protection**

### **930.07.05.01 General**

Concrete shall be protected during cold weather. The protection system shall be designed for the worst conditions that can be reasonably anticipated from local weather records, forecasts, site conditions, and past experience for the time period during which the protection is required.

Regardless of ambient air temperature, overlays shall be moist cured with burlap and water at all times. During cold weather, burlap shall be prevented from freezing.

### **930.07.05.02 Control of Temperature and Temperature Difference**

During cold weather, the temperature of the concrete shall be monitored and controlled according to the Control of Temperature and Temperature Difference subsection in OPSS 904, with the following exceptions:

- a) Thermocouple wires shall be embedded near the concrete surface in a minimum of 4 locations for each Day of concrete placement, as directed by the Contract Administrator. Thermocouples for monitoring ambient air temperature shall be installed in the shade close to the surface of the concrete at a minimum frequency of 1 thermocouple for each Day of placement.
- b) For cold weather conditions, protection of concrete shall, at a minimum, be as shown in Table 1. Protective measures shall be increased based on consideration of the specific type of rehabilitation in order to comply with the specified temperature constraints, as required.
- c) The cold weather protection shall be gradually removed or reduced in such a manner that the maximum allowable drop of concrete temperature for each 24 hour period as shown in Table 1 is not exceeded. The protection shall not be totally removed nor shall the concrete be fully exposed to the air until the average concrete temperature is within 10 °C of the air temperature.

## **930.07.06 Material Sampling and Testing**

### **930.07.06.01 Plastic Concrete Testing**

The sampling and testing of the plastic concrete for slump, air content, and temperature shall be according to OPSS 1350 with the exception that the minimum frequency of testing shall be one test from each load of concrete. Results shall be recorded and shall be submitted to the Contract Administrator, upon request.

### **930.07.06.02 Early Strength Determination**

Where early loading of concrete is proposed or anticipated, sets of cylinders for testing for early strength determination shall be prepared according to OPSS 904.

**930.07.06.03                      Samples for Compressive Strength, Air Void System Parameters and Rapid Chloride Permeability - Acceptance Testing**

The Contractor shall be responsible for sampling and transportation of samples for acceptance testing of compressive strength, air void system, and rapid chloride permeability by the Owner according to OPSS 1350.

**930.07.06.03.01                      Samples for Acceptance Testing Where Rehabilitation Involves the Use of Anode Mesh Cathodic Protection**

Cylinders for acceptance testing of compressive strength shall be according to OPSS 1350.

Where anode mesh is used, cores shall not be required and cylinders shall be cast for determination of air void system and rapid chloride permeability. One cylinder shall be made for determination of air void system parameters to represent each 300 m<sup>2</sup> of surface area of overlay and for each 100 m<sup>2</sup> of surface area of patches and refacing placed.

For silica fume overlays, two additional cylinders shall be made for determination of rapid chloride permeability to represent each 300 m<sup>2</sup> of surface area of overlay placed. One cylinder shall be used for acceptance testing and the remaining cylinder shall be retained for referee testing.

The cylinders shall be 100 mm diameter x 200 mm long and shall be made, field cured, and transported according to the Test Cylinders clause in OPSS 1350.

**930.07.06.04                      Tensile Bond Strength**

The following shall be marked to facilitate the selection of testing locations and avoid damage to the embedded materials due to coring:

- a) For rehabilitation involving use of anode mesh cathodic protection in overlay, the locations of anode distribution bars, wiring, and embedded hardware.
- b) For rehabilitation involving use of glass fiber reinforced polymer (GFRP) reinforcing, the reinforcing bar locations.

Application of tack coat, where applicable, shall not be carried out until the testing of tensile bond strength is completed.

**930.07.06.05                      Filling of Core Holes**

Filling of core holes shall be according to OPSS 1350.

**930.07.07                      Remedial Work**

Remedial work shall be carried out as shown in Table 2.

Treatment for deck with waterproofing and paving shall not begin until the specified curing period and the air drying period has elapsed. For all other exposed components, the treatment shall not begin until a minimum period of 28 Days has elapsed after placement of concrete.

Repair of cracks shall be according to OPSS 932. Alternatively, a proposal for repair may be submitted to the Contract Administrator for review to show that the repair method and material shall be able to restore the structural integrity of the concrete across the cracks. The inspection and monitoring of cracks shall continue up to the date of waterproofing or completion of the Work, whichever is later.

The application of tack coat for waterproofing shall not proceed until all defects have been addressed and remedial work accepted by the Contract Administrator.

**930.07.08                      Modification of Deck Drains**

Modification of deck drains shall be made prior to waterproofing the deck.

**930.07.09                      Drainage Tubes in Deck**

Installation of drainage tubes shall be made prior to waterproofing the deck.

**930.07.10                      Management of Excess Materials**

Management of excess material shall be according to the Contract Documents.

**930.08                              QUALITY ASSURANCE**

**930.08.01                      Testing - Tensile Bond Strength**

The Contract Administrator shall use a covermeter to locate steel reinforcement prior to testing in order to avoid coring through the steel and shall perform the sampling and testing of cores from overlays, concrete patches, and concrete refacing to determine tensile bond strength.

A lot shall consist of the total quantity of concrete patches, concrete refacing, or overlay for each item, except for the following where tensile bond shall not be measured:

- a) When the total measured area of concrete patches on a structure is less than 20 m<sup>2</sup>.
- b) When the total area of concrete refacing on a structure is less than 20 m<sup>2</sup>.
- c) In circular columns with spiral reinforcement.

Each lot shall be divided into sublots as follows:

- a) Sublots for overlays shall be approximately equal in size and not greater than 300 m<sup>2</sup>. Separate sublots are required for each overlay placement.
- b) Sublots for concrete patches shall not be combined with areas of concrete refacing for determining sublots. Sublots shall be approximately equal in size and not greater than 100 m<sup>2</sup>. Work on different structures shall not be combined in the same subplot.
- c) Soffit repairs shall be a separate subplot and a subplot shall not be greater than 100 m<sup>2</sup>.

The tensile bond strength testing shall be carried out on 3 in-situ cores taken within 1 m of each other for each subplot. The core locations shall be randomly selected by the Contract Administrator. Additional testing shall not be permitted.

The cores shall be obtained by the Contract Administrator according to CSA A23.2-14C. Cores shall be 100 mm in diameter and extend into the parent concrete to the depth as specified in LS-430. The testing shall be according to LS-430 and shall be carried out when the concrete is 7 to 10 Days of age. The equipment used to measure the tensile bond strength shall be equipped with a maximum load indicator.

If a core comes loose during coring operation, another core shall be obtained within 300 mm of the original core location.

If failure occurs in the epoxy adhesive and the specified strength of 1.0 MPa has not been reached, the test shall be repeated within 300 mm of the original core location. If a failure occurs fully within the parent concrete, this shall be considered a valid result, unless the Contractor has been directed to leave unsound concrete in place. Retesting is not required when the specified strength of 1.0 MPa has been achieved

Individual test results shall be forwarded to the Contractor, as they become available.

### **930.08.02 Inspection After Curing**

The Contract Administrator shall inspect the Work to determine if the completed work contains any of the following defects:

- a) Areas of debonding.
- b) Honeycombed areas, spalls, and cold joints.
- c) Cracks requiring remedial work as shown in Table 2.

### **930.08.03 Acceptance**

#### **930.08.03.01 Concrete Compressive Strength, Air Void System in Hardened Concrete or Rapid Chloride Permeability for Silica Fume Overlays**

Acceptance, referee testing and referee testing cost of concrete compressive strength, air void system in hardened concrete, and rapid chloride permeability for silica fume overlays shall be according to OPSS 1350.

#### **930.08.03.02 Tensile Bond Strength**

For a subplot to be acceptable, the average tensile bond strength of the subplot shall be a minimum of 1.0 MPa. Sublots with average tensile bond strength less than 1.0 MPa and more than or equal to 0.8 MPa shall be accepted with payment reduction. The payment reduction factor ( $Pr_i$ ) for the tensile bond strength testing for each subplot shall be calculated based on the following equation:

$$Pr_i = 1.25 (1 - B)$$

Where:

B = The average tensile bond strength (MPa) for each subplot. For the purpose of calculating the payment reduction factor, a value of 1.0 MPa shall be used for B when the average tensile bond strength is greater than 1.0 MPa.

i = Sublot number

The payment reduction,  $Pr$ , for the lot is calculated by one of the following equations:

For the concrete patches, concrete refacing, place concrete overlay, and place silica fume concrete overlay items, the following equation shall be used:

$$Pr = \text{Tender Unit Price} \times [(Pr_1 \times LQ_1) + (Pr_2 \times LQ_2) \dots (Pr_n \times LQ_n)]$$

Where:

$Pr_i$  = The payment reduction for subplot i

$LQ_i$  = Quantity for subplot i ( $m^3$ )

n = The total number of sublots

For the finish and cure concrete overlay and finish and cure silica fume concrete overlay items, the following equation shall be used:

$$Pr = \frac{\text{Lump Sum} \times [(Pr_1 \times SA_1) + (Pr_2 \times SA_2) \dots (Pr_n \times SA_n)]}{SA_T}$$

Where:

Pri = The payment reduction for subplot i

SA<sub>i</sub> = Surface area for subplot i (m<sup>2</sup>)

SA<sub>T</sub> = Total surface area of the lot (m<sup>2</sup>)

n = The total number of sublots

For the purpose of calculating the payment reduction for concrete overlays, the Pr shall be applied to both place concrete overlay and finish and cure concrete overlay items.

For the purpose of calculating the payment reduction for silica fume concrete overlays, the Pr shall be applied to both place silica fume concrete overlay and finish and cure silica fume concrete overlays items.

#### **930.08.03.03 Acceptance at the Completion of Work**

The Contract Administrator shall reject all or a portion of the subplot based on:

- a) The presence of debonding, honeycombed areas, spalls and cold joints.
- b) Cracks as shown in Table 2.
- c) Average tensile bond strength less than 0.8 MPa.
- d) Any work that does not meet the requirements of this specification and the acceptance requirements of OPSS 1350.
- e) Unsatisfactory completion of remedial work associated with surface tolerance, surface finish, cracks, or any other deficiencies.

#### **930.08.03.04 Performance During General Warranty Period**

In addition to the acceptance requirements stated herein, concrete in the structure shall meet the requirements as shown in Table 2 during and up to the end of the general warranty period.

### **930.09 MEASUREMENT FOR PAYMENT**

#### **930.09.01 General**

For all types of overlays, there shall be no measurement for the following:

- a) Concrete produced in excess of that required for the placing operation.
- b) Quantity of bonding agent.

For construction joints in overlay that do not meet the requirements specified in this specification and is deemed unacceptable by the Contract Administrator, the portion of overlay removed shall be deducted from the volume indicated on the delivery ticket.

No measurement shall be made for areas of new overlays, concrete patches, and concrete refacing that were removed according to the requirements of the Remedial Work subsection.

**930.09.02                      Actual Measurement**

**930.09.02.01                  Place Concrete Overlay  
Place Silica Fume Concrete Overlay**

Measurement shall be by the volume of concrete placed, including concrete placed in partial depth removals, in cubic metres by delivery ticket. Deductions shall be made for the following:

- a) Concrete produced in excess of that required for the placing operation.
- b) The portion of the overlay that is sawcut back and removed at the construction joint.
- c) The portion of concrete removals not approved by the Contract Administrator.

The total volume shall be calculated to the nearest cubic metre.

**930.09.02.02                  Concrete Patches, Formed Surface  
Concrete Patches, Unformed Surface  
Concrete Patches, Form and Pump  
Concrete Refacing  
Concrete Refacing, Form and Pump**

**930.09.02.02.01              By Volume**

Measurement shall be by the volume of concrete placed in cubic metres.

The volumes shall be calculated by multiplying each area to be patched by the average depth. Depths shall be taken on a grid system to best describe the profile at the particular area. The Contract Administrator, in the presence of the Contractor, shall take a minimum of 3 measurements for each removal area or 10 for every m<sup>2</sup>, after concrete removal is completed by placing a straight edge across the removal area and measuring the depth from the straight edge to the concrete.

The depths shall be measured and averaged to the nearest millimetre.

No measurement shall be made for concrete required to fill localized areas behind the second layer of steel reinforcement.

The total volume shall be calculated to the nearest 0.1 m<sup>3</sup>.

**930.09.02.03                  Modification of Deck Drains**

For measurement purposes, a count shall be made of the number of deck drains modified.

**930.09.02.04                  Drainage Tubes in Deck**

For measurement purposes, a count shall be made of the number of drainage tubes placed.

**930.09.03                      Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**930.10****BASIS OF PAYMENT****930.10.01**

**Modification of Deck Drains - Item**  
**Drainage Tubes in Deck - Item**  
**Place Concrete Overlay - Item**  
**Place Silica Fume Concrete Overlay - Item**  
**Finish and Cure Concrete Overlay - Item**  
**Finish and Cure Silica Fume Concrete Overlay - Item**  
**Concrete Patches, Formed Surface - Item**  
**Concrete Patches, Unformed Surface - Item**  
**Concrete Patches, Form and Pump - Item**  
**Concrete Refacing - Item**  
**Concrete Refacing, Form and Pump - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work, subject to payment adjustments as specified in the Contract Documents. Payment at the Contract price for the above tender items shall also include abrasive blast cleaning of the concrete surface for concrete patches and concrete refacing. Payment for abrasive blast cleaning of steel reinforcement and the concrete surface to receive an overlay shall be administered according to OPSS 929.

When the Contract does not contain a separate tender item for providing access to the work, the Contract price for the concrete patching and concrete refacing items shall include full compensation for all labour, Equipment, and Material to do the work, including provision of access.

No payment shall be made for normal concrete, silica fume concrete or self-consolidating concrete or both required to patch, reface, or overlay areas of concrete removal where the removal was not approved by the Contract Administrator.

| <b>Concrete Surface Scaling</b>                                                                                                                                              | Visual inspection and assessment of severity of-scaling according to Figures 1 to 6.                                                                                                                                                                                    | At the end of the warranty period, there shall be no medium or severe scaling and total area of light scaling shall be no more than 5% of the component.                                                | Areas of medium and severe scaling shall be removed and replaced full depth. For light scaling greater than 5% of the component, the Contractor shall submit a repair proposal for approval by the ministry.                                                                                       |
| <b>Concrete Delamination or Debonding</b>                                                                                                                                    | As described in the Structure Rehabilitation Manual.                                                                                                                                                                                                                    | Delaminated or debonded areas shall not be present.                                                                                                                                                     | Remove and replace.                                                                                                                                                                                                                                                                                |
| <b>Cracks</b>                                                                                                                                                                | Visual inspection and measurement by means of crack comparator.<br><br>Width of crack is measured at the widest point of the crack, not average width of crack.<br><br>Cracks in overlays and patches to be waterproofed shall be measured after the air drying period. | For overlays and patches to be waterproofed and paved, width of cracks shall be less than 0.50 mm and linear measurement of cracks greater than 0.50 mm within 1 m <sup>2</sup> shall be less than 2 m. | Repair cracks greater than 0.50 mm in width according to OPSS 932, unless the linear measurement of cracks greater than or equal to 0.50 mm per m <sup>2</sup> exceeds 2 m. If the linear measurement of cracks greater than 0.50 mm in width exceeds 2 m per m <sup>2</sup> , remove and replace. |
|                                                                                                                                                                              |                                                                                                                                                                                                                                                                         | For exposed overlays, refacing and patches, width of cracks shall be less than 0.30 mm and linear measurement of cracks greater than 0.30 mm within 1 m <sup>2</sup> shall be less than 2 m.            | Repair cracks greater than 0.30 mm in width according to OPSS 932, unless the linear measurement of cracks greater than or equal to 0.30 mm per m <sup>2</sup> exceeds 2 m. If the linear measurement of cracks greater than 0.30 mm in width exceeds 2 m per m <sup>2</sup> , remove and replace. |
| <b>Spalls, Exposed Reinforcement, Honey-Combing, and Other Observed Unanticipated Defects and Deterioration</b>                                                              | Visual inspection.                                                                                                                                                                                                                                                      | Spalls, exposed reinforcement, honey-combing, or other observed defects and deterioration shall not be present at the end of the warranty period.                                                       | Remove and replace.                                                                                                                                                                                                                                                                                |
| <p>Note:</p> <p>A. Where the area failing to meet the performance requirement is a large proportion of the repair area, the entire repair shall be removed and replaced.</p> |                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                    |

## 931.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Cold Weather** means those conditions when the air temperature is less than or equal to 10°C. It is also considered to exist when the air temperature is at or is likely to be less than 10°C within 96 hours after concrete placement. Temperature refers to shade temperature.

**Dry Mix Shotcrete** means the dry materials are prebagged and mixed and placed into a stream of compressed air. Material is carried by the compressed air through a delivery hose to the nozzle where water is added. Water is added to the mixture as it is jetted from the nozzle.

**Hot Weather** means those conditions when the air temperature is greater than or equal to 28°C. It is also considered to exist when the air temperature is at or is likely to be greater than 28°C within 24 hours after concrete placement. Temperature refers to shade temperature.

**Nozzleman** means the qualified worker on the shotcrete crew who has obtained ministry approval for Shotcrete Nozzleman Certification who manipulates the nozzle, controls consistency and controls final disposition of the material.

**Rehabilitation** means any modification, alteration, or improvement to a structure or its components that is designed to correct defects or deficiencies.

**Structure** means any bridge, structural culvert, tunnel, retaining wall, wharf, dock, guide way or any part thereof or other reinforced concrete component designed to carry loads.

**Saturated Surface Dry** means concrete is fully saturated without free standing water.

**Wet Mix Shotcrete** means shotcrete in which all of the materials, including water, are mixed before introduction into the delivery hose. Compressed air is introduced to the material flow at the nozzle.

## **931.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **931.04.01 Submission Requirements**

#### **931.04.01.01 Mix Design for Dry Mix Shotcrete**

A minimum of seven Days prior to the application of shotcrete, the mix design including sources of all materials and the name of the supplier for the pre-bagged dry mix shotcrete shall be submitted to the Contract Administrator.

In addition, the following information shall be submitted with the mix design:

- a) A certificate from the cement supplier stating that the cement is certified to be free from early stiffening tendencies.
- b) Performance test data from the manufacturer of the prebagged material, where testing was carried out by a laboratory independent of the manufacturer, or test data from another MTO Contract, verifying that the pre-bagged material is capable of meeting the requirements of this specification.

The certificate and supporting test data shall be current within 12 months at the time the mix design is submitted to the Contract Administrator.

#### **931.04.01.02 Mix Design for Wet Mix Shotcrete**

The wet mix shotcrete shall be designed to meet the requirements of this specification. The mix design shall be submitted according to the Mix Design clause of OPSS 1350.

Documentation verifying certification of the concrete production facility by the Ready Mixed Concrete Association of Ontario (RMCAO) shall be submitted with the completed MTO form PH-CC-433A (Form A).

#### **931.04.01.03 Shotcrete Equipment**

A minimum of seven Days prior to the application of shotcrete, the following information shall be submitted to the Contract Administrator:

- a) Equipment type and capacity
- b) Nozzle type and size
- c) Continuous feed predampener details, if the dry mix process is used

#### **931.04.01.04                      Nozzleman**

A minimum of seven Days prior to the commencement of the shotcreting operation, the names of the nozzle men and proof of their qualification with photo identification shall be submitted to the Contract Administrator.

#### **931.04.01.05                      Cold Weather Protection**

In cold weather, a temperature control plan shall be submitted to the Contract Administrator a minimum of seven Days prior to the application of shotcrete. The submission shall be according to the Temperature Control Plans clause of OPSS 904.

When requested by the Contract Administrator, samples of insulation materials shall also be submitted.

#### **931.04.01.06                      Hot Weather Shotcreting**

In hot weather, a plan describing the methods to be used to control the shotcrete temperature shall be submitted to the Contract Administrator a minimum of seven Days prior to the application of shotcrete.

#### **931.04.01.07                      Curing**

A minimum of seven Days prior to the application of shotcrete, a description of the methods to be used for fog-misting and curing the shotcrete, including equipment and procedures to be used, shall be submitted to the Contract Administrator.

### **931.05                                  MATERIALS**

#### **931.05.01                              Admixtures**

Admixtures shall be according to OPSS 1303.

#### **931.05.02                              Aggregates**

Aggregates shall be according to OPSS 1002.

#### **931.05.03                              Anchors**

Anchors for the attachment of the welded steel wire reinforcement to the concrete surface shall be galvanized according to ASTM A153 and shall be of adequate length and strength to resist a pull-out force of 1.0 kN. When stainless welded steel wire reinforcement is used, anchors and tie wires shall be made of the same type of stainless steel.

#### **931.05.04                              Burlap**

Burlap shall be according to OPSS 1306.

#### **931.05.05                              Cementing Material**

Cementing materials shall be according to OPSS 1301 and CSA A3001.

#### **931.05.06                              Curing Compound**

Curing compound shall be according to OPSS 1315.

**931.05.07 Formwork**

Formwork shall be according to OPSS 919.

**931.05.08 Proprietary Patching Materials**

Proprietary patching materials shall be from the Owner's prequalified product list. The list of proprietary patching materials shall be obtained from the Contract Administrator.

**931.05.09 Shotcrete****931.05.09.01 General**

Shotcrete shall have a minimum 28-day compressive strength of 35 MPa and maximum rapid chloride permeability less than or equal to 1000 coulombs, when tested at the age of 28-32 Days. The shotcrete mix shall contain 8% silica fume by mass of total cementing materials. Fibres shall not be used in the shotcrete.

Dry mix shotcrete shall be used, unless otherwise specified in the Contract Documents.

**931.05.09.02 Additional Requirements for Dry Mix Shotcrete**

For dry mix shotcrete, the shotcrete mix shall be supplied pre-bagged and unopened. Each bag shall be stamped with the following:

- a) name of the manufacturer
- b) mix identification
- c) manufacturer's batch number
- d) date of packaging

The pre-bagged mix shall contain cementing materials and aggregates. The bags shall be maintained in a dry condition up to the time of use and shall be stored within a temperature range of 10°C to 30°C. Material from bags that contain lumps of hydrated shotcrete or appear to be frozen or otherwise damaged shall not be used in the work. The pre-bagged mix shall be used within the six months of date of packaging.

**931.05.09.03 Additional Requirements for Wet Mix Shotcrete**

Silica fume shall be added to the concrete mix in the form of a blended cement containing silica fume.

**931.05.10 Tie Wire**

Tie wire shall be according to OPSS 905.

**931.05.11 Water**

Water used for production, fog-misting, curing and pre-soaking of burlap shall be according to OPSS 1302.

**931.05.12 Welded Steel Wire Reinforcement**

The welded steel wire reinforcement shall be welded galvanized or stainless steel according to OPSS 1440. Dimensions shall be 51 mm x 51 mm, W 5.5 x W 5.5. Galvanized steel wire shall be according to ASTM A1064. Stainless steel wire reinforcement shall be in according to ASTM A1022.

## **931.06 EQUIPMENT**

### **931.06.01 Compressor - Air Blasting**

The compressor for air blasting shall have a minimum capacity of 3.5 m<sup>3</sup>/min. The compressed air shall be free from oil and other contaminants according to ASTM D4285.

### **931.06.02 Fog Misting Equipment**

Fog misting equipment for the curing of shotcrete shall be according to OPSS 904.

### **931.06.03 Hand Finishing Equipment**

Where hand finishing is required, only magnesium, wood or sponge rubber floats shall be used.

### **931.06.04 Mixers**

#### **931.06.04.01 Dry Mix Process**

A continuous feed predampener shall be used, except for shotcrete which contains an accelerator. The predampening equipment shall be capable of bringing the dry bagged material to a consistent and suitable moisture content and shall operate at sufficient capacity to allow work to proceed without delays.

The delivery equipment shall be capable of discharging the mixture into the delivery hose at a rate sufficient to ensure a continuous smooth stream of uniformly mixed shotcrete mixture being delivered to the nozzle, at the velocity required to ensure maximum consolidation and full encapsulation of the reinforcement.

The discharge nozzle shall be equipped with a manually operated water injection system, for directing an even distribution of liquid through the mixture, with uniform appearance and consistency of shotcrete throughout to ensure that the water is thoroughly mixed with the other materials.

#### **931.06.04.02 Wet Mix Process**

Truck mixers shall be according to the Delivery Equipment subsection of OPSS 1350. The shotcrete delivery equipment shall be capable of delivering the pre-mixed materials accurately, uniformly and continuously through the delivery hose, at the velocity required to ensure maximum consolidation and full encapsulation of the reinforcement.

### **931.06.05 Straight Edge**

The straight edge shall be 1.0 m long, commercially made and metal.

## **931.07 CONSTRUCTION**

### **931.07.01 General**

Locations and extent of repair shall be as determined during the layout of repair areas according to OPSS 928 and as directed by the Contract Administrator.

### **931.07.02 Operational Constraints**

The Contract Administrator shall be notified of the intent to apply shotcrete three Business Days prior to the commencement of the shotcreting operation.

A Request to Proceed shall be submitted to the Contract Administrator at the completion of the surface preparation operation and prior to the commencement of the application of shotcrete.

The application of shotcrete shall not proceed until a Noticed to Proceed has been received from the Contract Administrator.

Prior to the application of shotcrete, protection for traffic from overspray and any rebound shall be in place.

No shotcrete shall be placed until all curing materials have been delivered to the site, and, in cold weather, all cold weather protection materials have been delivered to the site.

Shotcreting shall not be carried out when the air temperature or existing concrete surface temperature is less than 10°C or is likely to be less than 10°C, or is greater than 30°C or likely to be greater than 30°C throughout the duration of the shotcreting operation unless protection is provided in accordance with the Contractor's submitted plan.

Prior to shotcreting, the Contractor shall demonstrate to the Contract Administrator that the substrate temperatures meet the Contract requirements by measuring the substrate temperatures using a contact thermometer, and recording them.

Shotcrete shall not be placed against frozen surfaces. All surfaces against which shotcrete is to be placed shall be free of standing water. Shotcrete shall be protected from contact with rain or snow.

The air in contact with the repaired surfaces shall be maintained at temperatures greater than 10°C for a minimum of 96 hours after the application of shotcrete. Unvented heaters shall not be used.

Shotcreting operations shall be suspended during weather conditions that may adversely affect the quality of the work. This includes but is not limited to wind causing segregation of ingredients, rain or snow.

Prior to seasonal shutdown, operations shall be scheduled in such a manner as to ensure that the shotcreting operations are completed in all areas where concrete removal has commenced. No reinforcing steel shall be left exposed during seasonal shutdown.

### **931.07.03                      Surface Preparation**

All concrete surfaces against which shotcrete is to be placed shall be clean, solid and free from loose or unsound fragments, coatings and any other foreign substances or debris, and shall be sufficiently rough to ensure that a full bond is developed with the new shotcrete.

All existing concrete surfaces to be covered by shotcrete shall be uniformly roughened by means of scabbling, chipping or bush hammering. A surface profile of  $5 \pm 2$  mm shall be achieved by exposing the aggregates across the entire surface.

All concrete surfaces, including areas 50 mm beyond the perimeter of the removal area, and existing reinforcing steel to receive shotcrete shall be abrasive blast cleaned according to OPSS 929 prior to installation of welded galvanized steel wire reinforcement or stainless steel wire reinforcement.

Abrasive blast cleaned areas shall have shotcrete applied within 36 hours of abrasive blasting or shall be reblasted. In areas requiring reblasting, the welded galvanized steel wire reinforcement shall be removed prior to abrasive blast cleaning and shall be reinstalled after cleaning. When stainless steel wire reinforcement is used, it may be left in place during abrasive blast cleaning.

Following abrasive blast cleaning and immediately prior to pre-wetting the concrete surface, all dust and loose material shall be removed from the prepared surface of the repair area by using compressed air.

The concrete surface to receive shotcrete shall be maintained in a continuously wet condition for a period of at least two hours prior to the application of the shotcrete. Immediately prior to the placement of shotcrete, the concrete surface to receive shotcrete shall be brought to a saturated surface dry condition, with excess water removed from the surface using compressed air.

#### **931.07.04                      Placement of Welded Steel Wire Reinforcement**

When welded steel wire reinforcement is specified in the Contract Documents, it shall not be installed until after the concrete surface and exposed reinforcing steel in the repair area has been abrasive blast cleaned. Welded steel wire reinforcement shall not be used in repair areas on which a cathodic protection system is to be installed.

The welded steel wire reinforcement shall be installed flat, tight and in the locations shown in the Contract Documents and in all repair areas greater than 0.1 m<sup>2</sup> that have a minimum dimension of 200 mm, using spacers and anchors or fastening to exposed reinforcing steel. The wire reinforcement shall be securely fastened to the exposed reinforcing steel by ties placed no greater than 300 mm apart, in a grid pattern.

When the exposed reinforcing steel is not capable of providing rigid support for the welded steel wire reinforcement or when the spacing of the reinforcement is greater than 300 mm, anchors shall be used to support the welded steel wire reinforcement. Anchors shall be placed no greater than 300 mm apart in a grid pattern. The clearance between the reinforcement and the existing concrete shall be greater than or equal to 20 mm. The edges of adjoining welded steel wire reinforcement sheets shall be overlapped by one wire spacing plus 50 mm.

The welded steel wire reinforcement shall be kept clean of any substance that may reduce the bond of the shotcrete to the wire surface.

#### **931.07.05                      MTO Nozzleman Certification Program**

Shotcreting shall be carried out by a nozzleman who has successfully participated in the MTO Shotcrete Nozzleman Certification Program that is valid for the current construction season. Notwithstanding this prequalification, the nozzleman shall be replaced when in the opinion of the Contract Administrator; acceptable quality of work is not achieved or is not maintained.

#### **931.07.06                      Mixing and Delivery of Wet Mix Shotcrete**

Wet mix shotcrete shall be mixed and delivered according to the Mixing Time and Mixing Rate, and Delivery subsections of OPSS 1350.

#### **931.07.07                      Placing**

Prior to the application of shotcrete, all structural components and appurtenances not receiving shotcrete shall be protected from the shotcreting operation. Repair areas being prepared to receive shotcrete shall also be protected from contamination, rebound, overspray or anything that would inhibit the bond of the shotcrete.

Where practical, shotcrete shall be placed without the use of formwork. When the requirements of this specification cannot otherwise be met, formwork may be used and shall be according to OPSS 919. Formwork, where used, shall be adequately braced against excessive vibration and constructed to permit the escape of air and rebound material during the shotcreting operation.

During the application of shotcrete, a steady continuous flow of shotcrete shall be maintained.

For dry mix shotcrete, any predampened mixture which is not utilized within 30 minutes, shall be rejected and shall not be incorporated into the work. When wet mix shotcrete is transported to the site by means of agitating or mixing equipment, discharge of the concrete shall be completed within 1.5 hours after introduction of the mixing water to the cement and aggregates, except when the air temperature is greater than 28°C and the concrete temperature is greater than 25°C, the concrete shall be discharged within one hour after the introduction of the mixing water. Use of retarders does not change the specified concrete discharge time.

The total required depth of shotcrete shall be placed within the same Day.

Shotcrete shall be applied such that there is no sagging or separation of the material in place.

All rebound and overspray material shall be removed from the repair area as the work proceeds. Rebound, overspray or waste material shall not be worked back into the shotcrete or salvaged and re-used. The concrete surface surrounding the repair area shall be cleaned immediately after the application of shotcrete using suitable hand tools.

When shotcrete in a repair area cannot be applied in a single operation or delays are experienced, moist curing by means of continuous fog mist shall be applied immediately according to the Curing Subsection. If the previous layer has hardened, the surface of the shotcrete shall be thoroughly cleaned of any laitance, loose material, overspray or other material that may compromise the bond of subsequent layers by wire brushing and wetted prior to application of an additional layer of shotcrete.

The shotcrete shall be placed level with the original concrete surface to provide a minimum of greater than or equal to 50 mm cover to the welded steel wire reinforcement or reinforcing steel unless otherwise specified in the Contract Drawings. Areas where the minimum cover requirements cannot be achieved shall be identified to the Contract Administrator.

At the end of the shotcreting operation, the shotcrete shall be terminated at a 1:1 slope. Before placing an adjacent section, this sloped portion shall be thoroughly cleaned by wire brushing or abrasive blasting to remove any laitance and then wetted.

#### **931.07.08                      Finishing**

Unless otherwise specified in the Contract Documents, when the final layer of shotcrete has attained its initial set, the surface of the shotcrete shall be finished with hand finishing equipment.

When tested with a 1.0 m long straight edge, the maximum gap between the straight edge and any point on the surface shall be 6 mm.

#### **931.07.09                      Curing**

Shotcrete shall be moist cured for a minimum period of four Days followed by three Days of curing with curing compound. Curing for at least the first 24 hours of the curing period shall be by fog mist.

Application of fog mist shall begin immediately after application of the final layer of shotcrete or, where hand finishing is specified, immediately after finishing of the shotcrete.

For the remainder of the moist curing period, for vertical applications, moist curing shall be by means of fog mist or wet burlap and for overhead applications the moist curing shall be by means of fog mist.

When wet burlap is used, the burlap shall be placed in a manner that will ensure that it is in full contact with the surface of the shotcrete for the full duration of the curing period. Curing with burlap and water shall be according to OPSS 904.

Immediately after removal of moist curing, the shotcrete surface shall be coated with a curing compound according to OPSS 904. Once the curing period is complete, curing compound shall be removed completely. The method of removal shall be by abrasive blast cleaning and it shall not result in any damage to the shotcrete surface. The removal process shall meet all environmental constraints as specified in the Contract Documents.

## **931.07.10 Cold Weather Protection**

### **931.07.10.01 General**

Shotcrete shall be protected during cold weather using the method submitted to and accepted by the Contract Administrator. Shotcrete work cannot commence until the Contract Administrator has reviewed and accepted the method submitted.

### **931.07.10.02 Control of Temperature**

During cold weather, for a minimum period of seven Days following the shotcrete operation, the temperature of the shotcrete shall be monitored and controlled to ensure that the temperature is not less than 10°C. Measures shall be taken to ensure that the shotcrete temperature remains within the acceptable limits.

During cold weather, thermocouples, wires and unalterable digital temperature indicators with an accuracy of  $\pm 1.5^{\circ}\text{C}$  shall be supplied to monitor the ambient air temperature and shotcrete temperature. The digital temperature indicators shall be left in place or provided upon request to the Contract Administrator to facilitate additional readings for verification purposes. A set of two thermocouples shall be embedded at a minimum of two locations for each day of shotcreting, as directed by the Contract Administrator. At each location one thermocouple shall be embedded at approximately the centre of the shotcrete application, and the second shall be placed within 10 mm of the surface of the shotcrete.

For cold weather conditions, protection of concrete shall be according to Table 1, as a minimum.

### **931.07.10.03 Cold Weather Temperature Records**

Recording of ambient air temperature and shotcrete temperature shall begin at the start of placement. The ambient air and shotcrete temperature shall be recorded automatically at intervals no greater than one hour until the end of the monitoring period. The monitoring period shall be seven Days. Shotcrete and ambient air temperature readings shall be monitored and verified every 6 hours, or more frequently, for the first three Days and every 12 hours for the remainder of the monitoring period. The Contractor shall take necessary action to maintain the temperature within the specified limits.

The Contract Administrator shall be provided with the necessary access to the location and equipment to verify temperature readings.

Temperature records shall be forwarded to the Contract Administrator at the end of each day. At the end of the cold weather protection period, a complete temperature record consisting of a summary of the recorded temperatures and a graphical plot of temperature versus time shall be submitted to the Contract Administrator.

## **931.07.11 Sampling for Acceptance Testing of 28-Day Compressive Strength and Rapid Chloride Permeability**

### **931.07.11.01 General**

Core samples for acceptance testing of 28-Day compressive strength and rapid chloride permeability shall be removed from the shotcrete repairs at locations randomly selected by the Contract Administrator. Core samples shall be obtained for acceptance testing in the presence of the Contract Administrator.

The lot size, subplot size and number of cores per subplot shall be according to the Quality Assurance section.

#### **931.07.11.02                   Coring**

Coring shall be carried out according to CSA A23.2-14C when the concrete is between 7 to 10 Days of age. Cores for compressive strength testing shall be 75 mm in diameter and a minimum of 100 mm long. Cores for rapid chloride permeability shall be 100 mm in diameter and a minimum of 75 mm long.

To avoid cutting reinforcing steel, all reinforcing steel in the area shall be located, using a covermeter, prior to taking any cores. Cores for compressive strength testing may contain welded steel wire reinforcement but shall not contain reinforcing steel. Cores for rapid chloride permeability testing shall not contain welded steel wire reinforcement or reinforcing steel.

The Contract number, lot number, subplot number, exact location of each individual core, date of shotcrete placement, and date of extraction shall be marked legibly on each core with durable ink immediately after removal.

Cores shall be placed in a plastic bag, sealed to prevent loss of moisture and provided to the Contract Administrator along with Form A of the concrete mix design and the form on which the field data for the cores is recorded, for testing by the Owner.

The filling of core holes shall be according to OPSS 1350.

#### **931.07.12                   Cracks**

The Contractor shall inspect all concrete to identify and document any cracks including, their location, width, and density. The results of the inspection shall be reported to the Contract Administrator.

Based on criteria in the Field Inspection of Completed Work subsection, the Contractor shall identify areas requiring repair or replacement and shall identify the limits of such repair or replacement. This information shall be provided to the Contract Administrator along with a proposal for remedial action to be taken. No repairs shall proceed until the proposal has been accepted by the Contract Administrator in writing. Repair of cracks shall be according to OPSS 932 and shall be completed after the curing period has elapsed.

#### **931.07.13                   Management of Excess Materials**

Management of excess material shall be according to the Contract Documents.

### **931.08                   QUALITY ASSURANCE**

#### **931.08.01                   Acceptance of Shotcrete**

Shotcrete shall be acceptable if all of the requirements of this specification are met, including:

- a) Tensile bond strength
- b) 28-Day compressive strength
- c) Rapid chloride permeability, and
- d) There are no defects detected by inspection according to the Field Inspection subsection.

Unacceptable lots or sublots shall be deemed rejectable.

The replacement shotcrete for lots or sublots shall be evaluated for acceptance on the same basis as the original lots or sublots.

## **931.08.02 Field Inspection**

### **931.08.02.01 Field Inspection Prior To and During Application**

The Contract Administrator will inspect the plastic shotcrete during the application process and will reject all or a portion of the work based on the presence of one or more of the defects identified below:

- a) Failure to achieve specified surface profile
- b) Inadequate abrasive blast cleaning or failure to remove all dust and loose material prior to pre-wetting
- c) Failure to meet 36 hour window between abrasive blast cleaning and application of shotcrete
- d) Failure to adequately prewet or achieve a saturated surface dry condition of the concrete substrate prior to application of the shotcrete
- e) Failure to properly control and remove build-up of shotcrete overspray and rebound
- f) Incomplete consolidation around reinforcing steel, mesh and anchors
- g) Excessive shotcrete rebound
- h) Incorporation of sand lenses, excessive voids, delaminations, sags and sloughing
- i) Failure to apply shotcrete to the required line, grade and tolerance

If plastic shotcrete is rejected by the Contract Administrator, the work shall stop and all necessary measures to correct deficiencies shall be taken while the shotcrete is in the plastic state.

### **931.08.02.02 Field Inspection of Completed Work**

The Contract Administrator will inspect the completed work and will reject all or a portion of the work based on the presence of one or more of the defects identified below:

- a) Debonding or hollow-sounding areas
- b) Porous or rebound material visible in cores or in the field
- c) Areas which have sagged visible in cores or in the field
- d) Cracks with a width greater than 0.3 mm where the linear measurement of the crack is 2 m or greater per square meter area

Cracks greater than or equal to 0.3 mm in width shall be repaired according to this specification, if the linear measurement of the crack per square metre is less than 2 m.

**931.08.03                      Acceptance of Tensile Bond Strength, 28-Day Compressive Strength, and Rapid Chloride Permeability**

**931.08.03.01                      Lot Size**

A lot shall consist of the total quantity of shotcrete in the Contract Documents. Each lot will be divided into sublots of approximately equal size and no greater than 100 m<sup>2</sup>. Separate sublots are required for vertical and overhead repairs. Separate sublots are required for individual structures.

The Contract Administrator will determine the subplot size after discussion with the Contractor and prior to the commencement of the shotcreting operation.

Testing for tensile bond strength, 28-Day compressive strength and rapid chloride permeability will not be required on a structure when the total measured vertical area of shotcrete on a structure is less than 20 m<sup>2</sup> or, total measured horizontal area of shotcrete on a structure is less than 20 m<sup>2</sup> or, for shotcrete on circular columns with spiral reinforcement.

**931.08.03.02                      Acceptance of Tensile Bond Strength**

**931.08.03.02.01                      Basis of Acceptance of Tensile Bond Strength**

The tensile bond strength of a subplot shall be considered acceptable when it meets all of the following:

- a) The average of the three tensile bond strength tests shall be greater than or equal to 1.0 MPa
- b) Each individual tensile bond strength test shall be equal to or greater than 0.6 MPa

Sublots with an average tensile bond greater than or equal to 0.8 MPa and less than 1.0 MPa shall be considered unacceptable but, with the agreement of the Owner, may be permitted to remain in the Work with a payment adjustment. The payment adjustment shall be calculated and applied according to the Basis of Payment section.

Sublots with an average tensile bond strength less than 0.8 MPa or an individual tensile bond strength less than 0.6 MPa shall be rejected.

**931.08.03.02.02                      Acceptance Testing of Tensile Bond Strength**

Tensile bond strength shall be tested by the Owner according to LS-430 when the concrete is 7 to 10 Days of age. Tensile bond strength testing shall be carried out on three in-situ cores taken within 1 m of each other for each subplot. The core locations shall be randomly selected by the Contract Administrator. If a core comes loose during coring operation, another core shall be obtained within 300 mm of the original core location.

Individual test results shall be forwarded to the Contractor, as they become available.

**931.08.03.03                      Acceptance of 28-Day Compressive Strength**

**931.08.03.03.01                      Acceptance Testing of 28-Day Compressive Strength**

For each subplot, one set of three cores shall be taken to determine the 28-Day compressive strength. The 28-day compressive strength shall be determined according to CSA A 23.2-14C on moisture conditioned cores.

The 28-Day compressive strength of a subplot shall be considered acceptable when it meets the following requirements:

- a) The average of the three 28-Day compressive strength tests shall be greater than or equal to 35 MPa.
- b) No individual compressive strength test shall be less than 4.0 MPa below the specified strength.

Sublots with an average compressive strength greater than or equal to 31 MPa and less than 35 MPa shall be considered unacceptable but, with the agreement of the Owner, may be permitted to remain in the Work with a payment adjustment. The payment adjustment shall be calculated and applied according to the Basis of Payment section. Sublots with a compressive strength test less than 31 MPa shall be removed and replaced.

#### **931.08.03.03.02 Referee Testing of 28-Day Compressive Strength**

Referee testing for a subplot may only be invoked by the Contractor within five Business Days of receiving the test results for that subplot.

Referee testing shall be carried out according to the test method specified in the Acceptance Testing of 28-Day Compressive Strength subsection.

The referee laboratory shall be designated by the Owner based on the applicable roster. Referee test results shall be forwarded to the Contractor as they become available.

Referee testing of 28-day compressive strength for a subplot shall be done on a new set of three cores removed by the Contractor within 24 hours of invoking the referee testing. Cores for referee testing for each disputed subplot shall be taken in the presence of the Contract Administrator at a location no more than 1 m from the location that each of the disputed acceptance cores were removed. The core size, and core extraction shall be according to the Coring clause.

If the difference between the referee test result and the acceptance test result is less than or equal to the confirmation value, then the acceptance test result is confirmed, and the acceptance test result shall be used in the determination of acceptance and payment for the concrete. If the difference between the referee test result and the acceptance test result is greater than the confirmation value, the acceptance test result is not confirmed, and the acceptance test result shall be disregarded and not used in the determination of acceptance and payment.

The confirmation value for confirming the acceptance test result shall be the greater of 10% of the specified strength or 10% of the strength of the acceptance cores, expressed to one decimal place.

When acceptance results are eliminated from the analysis as a result of the referee process, the concrete shall be assessed based on the available strength results for the subplot.

The cost of referee testing shall be as specified in the Contract Documents. When the referee result confirms the acceptance test results, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

#### **931.08.03.04 Acceptance of Rapid Chloride Permeability**

##### **931.08.03.04.01 Acceptance Testing of Rapid Chloride Permeability**

For each subplot, two cores shall be taken for acceptance testing of rapid chloride permeability. Cores taken for rapid chloride permeability shall be tested according to LS-433. Acceptance testing shall be carried out at 28 to 32 days. One 50 mm long sample shall be cut from each core representing the subplot and tested to determine the acceptance of the subplot. The results from the two cores representing the subplot shall be averaged to determine the acceptability of the concrete within the subplot.

Sublots with rapid chloride permeability less than or equal to 1000 coulombs are considered acceptable. Sublots with a rapid chloride permeability greater than 1000 coulombs and less than or equal 2000 coulombs shall be considered unacceptable but, with the agreement of the Owner, may be permitted to remain in the Work with a payment adjustment. The payment adjustment shall be calculated and applied according to the Basis of Payment section. Sublots with rapid chloride permeability results greater than 2000 coulombs shall be rejected.

#### **931.08.03.04.02 Referee Testing of Rapid Chloride Permeability**

Referee testing for a subplot may only be invoked by the Contractor within five Business Days of receiving the test results for that subplot.

Referee testing for a subplot shall be done on a new set of two cores removed by the Contractor within 24 hours of invoking the referee testing. Cores for referee testing for each disputed subplot shall be taken in the presence of the Contract Administrator at a location no more than 1 m from the location that each of the disputed acceptance cores were removed. The core size and core extraction shall be according to the Coring subsection.

The cores shall be tested according to LS-433.

Referee test results shall be forwarded to the Contractor as they become available.

When the referee result is greater than the acceptance test result or no more than 300 coulombs below the acceptance test result, the acceptance test result is then confirmed and shall remain valid.

When the referee test result for the subplot is more than 300 coulombs below the acceptance test result, the acceptance test result is then not confirmed and the referee test result shall replace the acceptance test result in the acceptance requirements of this specification.

The cost of referee testing shall be as specified in the Contract Documents. When the referee result confirms the acceptance test results, the Contractor shall be charged the cost of referee testing. When the referee result does not confirm the acceptance test result, the Owner shall bear the cost.

### **931.09 MEASUREMENT FOR PAYMENT**

#### **931.09.01 Actual Measurement**

##### **931.09.01.01 Silica Fume Shotcrete**

Measurement of silica fume shotcrete shall be by the volume in cubic metres of the concrete removed according to OPSS 928 except that, when the existing cover to the reinforcing steel is less than 50 mm, the depth used in calculating the volume shall be adjusted by adding the difference between the 50 mm required and the existing cover.

No measurement will be made for areas of shotcrete that were removed according to the Remedial Work subsection.

No measurement will be made for shotcrete required to patch areas of concrete removal where the removal was not approved by the Contract Administrator.

## **931.10 BASIS OF PAYMENT**

### **931.10.01 Silica Fume Shotcrete - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment and Material to do the work, including abrasive blast cleaning of the concrete surfaces.

Payment for the work of abrasive blast cleaning of reinforcing steel will be administered under OPSS 929.

When the Contract does not contain a separate tender item for providing access to the work, the Contract price for the shotcrete items requiring the access shall include full compensation for all labour, equipment and materials to do the work.

Where the work does not conform to the quality requirements specified for compressive strength, tensile bond or rapid chloride permeability, a payment adjustment for each subplot will be made.

#### **931.10.01.01 Payment Adjustment**

The payment reduction factor ( $Pr_i$ ) for each subplot will be calculated by the following equation:

$$Pr_i = 1.0 - \left( (0.525 - 0.015S) + \left( \frac{(C - 1000)}{15000} \right) + (0.30 - 0.30B) \right)$$

Where:

S = The average 28-day compressive strength (MPa) for each subplot. (For the purpose of calculating the payment adjustment for shotcrete, a value of 35 MPa shall be used for "S" when the average compressive strength is greater than or equal to 35 MPa.)

B = The average tensile bond strength (MPa) for each subplot. (For the purpose of calculating the payment adjustment, a value of 1.0 MPa shall be used for "B" when the average tensile bond strength is equal to or greater than 1.0 MPa.)

C = The average rapid chloride permeability (coulombs) for each subplot. (For the purpose of calculating the payment reduction for shotcrete, a value of 1000 coulombs shall be used for "C" when the average chloride permeability is less than or equal to 1000 coulombs.)

The payment reduction factor for the lot ( $Pr$ ) is calculated by the equation:

$$Pr = \frac{(Pr_1 \times LQ_1) + (Pr_2 \times LQ_2) \cdots (Pr_n \times LQ_n)}{(LQ_1 + LQ_2 \cdots LQ_n)}$$

Where:

$Pr_i$  = Payment reduction factor for subplot i.

$LQ_i$  = Quantity of subplot i (m<sup>3</sup>)

n = The total number of sublots.

The total payment adjustment ( $Pa$ ) for the lot is calculated by the equation:

$Pa = \text{Quantity} \times \text{Tender Unit Price} \times Pr$

**932.01 SCOPE**

This specification covers the requirements for the pressure injection, routing, and sealing of cracks in concrete for the purpose of structural rehabilitation and water seepage control.

**932.02 REFERENCES**

This specification refers to the following standards, specifications, or publications:

### 932.03

#### DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Active Crack** means a crack in concrete with plane surfaces that are in a state of movement relative to each other.

**Crack Depth** means the distance that the crack extends from the injection surface into the concrete to the point where the crack is 0.10 mm wide.

**Effective Injection Pressure** means the fluid grout pressure at point of entry at the injection port. This shall be calculated as gauge pressure minus head losses in injection system.

**Flushing** means removing debris from the crack section by means of air or a liquid under pressure.

**Gauge Pressure** means the actual fluid grout pressure reading on the pump gauge.

**Injection Port** means a mechanical device that is firmly connected into the crack section for the purpose of providing access into a crack for the grouting material.

**Passive Crack** means a concrete crack in concrete with plane surfaces that are not moving relative to each other.

**Payment Adjustment Factor** means a multiplier applied to the unit Contract price to determine the actual unit payment price.

**Plural Component Pump** means a grout pump that separately delivers the grout material components separately to a common static mixer.

**Pot Life** means the period of time after mixing during which a bonding system or mixture containing it retains sufficient workability for proper use.

**Refusal Criteria** means zero flow of grout at the proposed effective pressure for a duration of five minutes.

**Regulated Operating Pressure** means the maximum pressure, measured at the pump discharge, that the pump is capable of producing.

### 932.04

#### DESIGN AND SUBMISSION REQUIREMENTS

#### 932.04.01

##### Submissions

##### 932.04.01.01

##### Crack Repair Work Plan

A copy of the crack repair work plan shall be submitted to the Contract Administrator at least seven Days prior to the commencement of the work.

The crack repair work plan shall bear the seal and signature of an Engineer and include at least the following information.

- a) A description of the method of repair, including the following minimum information:
  - i. Summary of material and method selection for each crack repair type.
  - ii. Proposed effective injection pressure.
  - iii. Surface finishing.
  - iv. Location, size, spacing and type of injection ports.
  - v. Surface treatment of the concrete prior to surface sealing.
  - vi. Method of storing and handling grouts, cleaning solvents, and waste materials.
- b) A list of the materials to be used for surface sealing and repair, including the following minimum information:
  - i. Material specifications.
  - ii. Product data sheets with test data.
  - iii. Material safety data sheets.
  - iv. Pot life of the components to be used based on a sample size of 200 ml at 5 °C and 20 °C.
  - v. ASTM Type, Grade and Class (applicable for epoxy-resin based bonding systems)
- c) A list of the equipment and accessories to be used including the following minimum information:
  - i. The operating pressure of each component.
  - ii. The type of injection port and means of closure.

## **932.05 MATERIALS**

### **932.05.01 Grout**

#### **932.05.01.01 General**

Material used for crack injection shall be polyurethane resins for active cracks and epoxy resins for passive cracks.

Polyurethane and epoxy grout shall prevent the penetration of water and shall fill at least 80% of the depth of the crack using the proposed equipment and method of repair at the ambient and substrate temperatures existing at the time of grouting.

Polyurethane and epoxy grout shall have sufficient pot life to ensure it remains workable throughout the duration of its application and is compatible with the procedures outlined in the submitted crack repair work plan.

#### **932.05.01.02 Epoxy Resin**

Epoxy resin shall be according to ASTM C881, Type IV, Grade I, Class B and C.

#### **932.05.01.03 Polyurethane Resin**

Polyurethane resin shall be 100% solids, hydrophobic and be suitable for the range of temperatures at the time of repair.

### **932.05.02 Joint Sealing Compounds**

#### **932.05.02.01 Hot-Poured Rubberized Joint Sealing Compound**

The hot-poured rubberized joint sealing compound shall be according to OPSS 1212.

### **932.05.02.02 Cold-Applied Joint Sealing Compound**

Cold-applied joint sealing compound shall be according to ASTM C920, Type S or M, Grade NS, Class 25, Use T and M. Type M sealant shall be used where the depth of a chase is greater than 15 mm or the manufacturer's recommended depth for Type S sealant, whichever is less. Where the cold sealing compound is visible after completion of the work a grey colour material shall be used.

### **932.05.03 Water**

Water shall be according to OPSS 1302.

## **932.06 EQUIPMENT**

### **932.06.01 Gauges**

In addition to the calibrated gauges required for use with the pumps and with the injection hose, additional gauges shall be available on site to replace those that malfunction.

Certificates of calibration from an organization accredited by the Standards Council of Canada shall be supplied for each gauge certifying that the gauges are capable of measuring the pressure within a tolerance of  $\pm 5$  kPa.

### **932.06.02 Pumps**

Equipment used for pressure injection shall be suitable for the intended use and compatible with the grout.

Pumps shall be positive displacement type and shall be capable of delivering a minimum of two litres of grout per minute.

Pumps shall be capable of developing a maximum regulated operating pressure at least equal to twice the effective pressure.

Pumps shall be equipped with a calibrated gauge and shall be capable of accurately maintaining an effective operating pressure of 50 kPa or less.

Plural component pumps shall be used when multicomponent solution grouts are used.

Hand cartridge pumps shall not be used unless the volume of crack repair is less than one litre of resin for 100 m<sup>2</sup> of gross repair area.

### **932.06.03 Mixers**

#### **932.06.03.01 Static In-Line Mixers**

Static in-line mixers shall produce a homogeneous grout and shall be sized to accommodate the minimum and maximum anticipated flow rates.

Static mixers shall have the manufacturer's plate attached showing the following mixer information:

- a) Size.
- b) Type.
- c) Maximum operating pressure.

#### **932.06.03.02            Agitating Mixer**

Agitating mixers shall have a power driven paddle mixing head and produce a homogeneous component. The speed of the mixers shall be variable to a maximum of 500 rpm.

#### **932.06.04                Injection Hoses**

Injection hoses shall have a rated working pressure equal to or greater than the maximum pump operating pressure and shall be equipped with a calibrated gauge at the injection port end.

#### **932.06.05                Injection Ports**

Injection ports shall be removable or non-metallic insert type units. The pressure capacity of the injection ports shall be at least equal to the maximum operating pressure of the pump. All injection ports shall be equipped with a shut-off valve or other mechanical means of closure under pressure.

#### **932.06.06                Air Compressor**

Compressed air shall be free from oil and water when tested according to ASTM D4285.

#### **932.06.07                Drills**

Drilling of the injection holes shall be performed using a rotary percussion or rotary diamond type drill. Percussion drilling equipment shall not be used for drilling holes greater than 26 mm diameter and holes within 150 mm of any edge of concrete.

Only holes less than or equal to 26 mm in diameter shall be drilled within 50 mm of any free edge of concrete.

#### **932.06.08                Routing Equipment**

Routing equipment shall be any of the following:

- a) Concrete router.
- b) Hand-held grinding wheel or a multi-bladed cut-off saw equipped with abrasive or diamond blades.
- c) Multi-bladed floor saw cutting equipment equipped with diamond blades.

### **932.07                    CONSTRUCTION**

#### **932.07.01                General**

Installation of all accessories and material shall be according to the manufacturer's recommendations and as specified in the submitted work plan.

Work shall only proceed when the temperature of the concrete is greater than or equal to 5 °C.

#### **932.07.02                Access**

Access shall be provided to facilitate:

- a) Performance of work.
- b) Inspection and measurement of the work by the Contract Administrator.

### **932.07.03                      Crack Identification**

Prior to commencement of the work, the cracks requiring repair, as identified by the Contract Administrator, shall be numbered, physically marked as to their extent and measured in the presence of the Contract Administrator.

This information shall be recorded and a copy submitted to the Contract Administrator.

### **932.07.04                      Crack Injection**

#### **932.07.04.01                  Drilling for Injection Ports**

Holes for injection ports shall be drilled:

- a) Perpendicular to the concrete surface and located directly on top of the crack.
- b) On each side of the crack at a 45-degree angle to the surface of the concrete.
- c) Per the manufacturer's recommendations.

The spacing of the injection ports shall not exceed 200 mm. The size and depth of the injection holes shall be according to the manufacturer's recommendations. Injection ports shall be inserted into the holes and sealed.

Prior to installation of the injection ports each hole shall be individually cleaned of all deleterious material by an air-water blast to completely remove all drill cuttings from the hole.

#### **932.07.04.02                  Cleaning and Flushing**

After the injection ports have been inserted, cracks shall be flushed with an air-water mixture or an alternating water and air flush to remove all deleterious material prior to the injection of grout. The flushing material shall be injected through the injection port and continued until it exudes from the adjacent injection port and the crack is thoroughly cleaned. This flushing shall proceed from one end of the crack to the other.

A final flush shall be made with air only to remove all of the free water.

#### **932.07.04.03                  Surface Preparation and Sealing**

Surface opening of the cracks shall be sealed prior to injection.

The surface of the concrete shall be mechanically cleaned for a distance of 25 mm each side of the crack sections to prepare a clean substrate for bonding of the surface sealing compound. The surface preparation and sealing shall be as recommended by the manufacturer of the surface sealing material.

The surface sealing material shall completely confine the injection grout to the crack section with only the injection ports providing access. The surface sealing material shall withstand the maximum injection pressure without developing leakage along the crack section.

Surface sealing of passive cracks shall not commence until at least one hour after the final air flush.

#### **932.07.04.04 Injection of Grout**

##### **932.07.04.04.01 General**

Grout shall be pressure injected. Injection of grout shall proceed from the injection port at the lowest elevation of the crack and continue upwards along the crack on an injection port to injection port basis without interruption to the other end of the crack. The injection nozzle shall not be moved to the adjacent injection port until grout is showing at the next higher adjacent injection port or refusal criteria is met.

While under pressure, each injection port shall be sealed immediately after completion of injection of grout.

When a maximum operating pressure greater than 3 MPa is required to inject the grout, the injection operation shall cease until the Contractor determines why this operating pressure is required.

##### **932.07.04.04.02 Monitoring**

The volume of grout used within each five metres of crack length shall be recorded. The pump gauge pressure shall be recorded every 10 minutes. The volume of grout and pump pressure shall be related to the crack location.

The records shall indicate crack location and number, injection port spacing, operating pressure and confirmation of grout showing or refusal. A copy of the recorded information shall be submitted to the Contract Administrator at the end of each Day.

##### **932.07.04.04.03 Effective Injection Pressure**

When calculating the effective pressure, the head losses shall be determined prior to commencement of injection.

Head losses shall be determined in the presence of the Contract Administrator by performing a pressure flow test, through the equipment, for each equipment configuration used.

##### **932.07.04.04.04 Ratio Test**

Plural component injection equipment proportioning shall be verified in the presence of the Contract Administrator by measuring the volume output of material in the pressure lines at least once for each two hours of operation.

When deviation from the manufacturer's specified proportioning ratio exceeds 5%, immediate adjustment or replacement of the equipment is required.

##### **932.07.04.04.05 Pot Life Determination**

Prior to commencing the grouting operation, a sample shall be taken from the material containers on site and manually proportioned to the specified component ratio in the presence of the Contract Administrator. The total sample size shall be 200 ml, and the same size container shall be used for each sample taken.

The temperature of the material at the time of mixing and the pot life of the mixed material shall be recorded.

The proportions of materials and pot life shall conform to those specified in the original submissions.

An additional sample shall be taken from the end of the injection hose and a further pot life determination performed.

During grouting material samples shall be taken on a frequency of at least one per hour of operation and the pot life recorded.

Deviation from the proportions and pot life specified shall result in immediate discontinuance of use of the material.

All records shall be submitted to the Contract Administrator at the end of each working day.

#### **932.07.04.05                      Surface Finishing**

Surface finishing shall not proceed until the curing period, as specified by the material supplier, has elapsed. Surface finishing shall consist of removal of the injection ports and the surface sealant flush with the original concrete surface. Core holes and holes left after the removal of injection ports shall be filled with a cement-based non-shrink grout after the surface sealant has been removed.

Where the crack is not completely filled to the injection surface, the crack shall be filled with a compatible material acceptable to the Contract Administrator. The material shall be applied according to the manufacturer's recommendations.

#### **932.07.04.06                      Coring**

A 50 mm diameter test core shall be taken for each completed ten-metre increment of injected crack at locations specified by the Contract Administrator until satisfactory control is established. The ten-metre increment is the length of a continuous crack or a cumulative measurement of cracks of lesser length. The depth of the test core shall be the full depth of the crack but not greater than 500 mm.

Prior to establishing satisfactory control, test cores shall be taken within two hours after injection, at locations specified by the Contract Administrator.

Satisfactory control is established when three consecutive test cores meet acceptance criteria without payment adjustments as defined in the Acceptance and Rejection clause. If payment adjustments are required, test cores shall continue to be extracted for each completed ten-metre increment of injected crack until three consecutive cores are accepted without payment adjustment.

After satisfactory control has been established, test cores shall be taken for each Day or each completed 50 m increment, whichever is more. If a test core indicates payment adjustments or when there are changes in the material or procedure, testing shall resume on ten-metre increments of injected crack until satisfactory control is re-established.

Reinforcement and other embedded material shall be avoided while coring, and the Contractor shall use a covermeter capable of detecting the type(s) of reinforcement and embedded material in the element prior to coring.

All cores shall be taken in the presence of the Contract Administrator and shall be submitted to the Contract Administrator after coring. Similar coring shall be done to check remedial work.

#### **932.07.04.07                      Filling of Core Holes**

Filling of core holes shall be according to OPSS 1350.

#### **932.07.05                          Routing and Sealing Cracks**

Cracks shall be routed to create a chase and then filled with a sealant.

The depth to width ratio of the chase shall be 1H:1V with the crack located within the middle third of the chase. The width of the chase shall be 15 mm ± 5 mm.

The chase shall be abrasive blast cleaned according to OPSS 929. Abrasive blast cleaned areas shall have the subsequent treatment applied within 36 hours or shall be reblasted.

Immediately prior to placing the bond breaker, the chase shall be blasted with compressed air to remove all dust, dirt, and loose material.

A bond breaker compatible with the joint sealing compound and concrete shall be placed at the bottom of the chase.

Joint sealing compound shall be placed in the chase flush with the adjacent concrete surface unless it is subjected to vehicular traffic, in which case, it shall be recessed  $2\text{ mm} \pm 1\text{ mm}$ .

Hot-poured rubberized joint sealing compounds shall only be used on horizontal surfaces. Cold-applied joint sealing compounds shall only be used on vertical surfaces or on horizontal surfaces that are not to be waterproofed. Cold-applied joint sealing compound shall be installed according to the manufacturer's recommendations. Hot-poured rubberized joint sealing compound shall be installed according to OPSS 920.

#### **932.07.06 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

### **932.08 QUALITY ASSURANCE**

#### **932.08.01 General**

When the repair operation is complete, the Contract Administrator shall inspect the work to determine if the completed work contains defects.

#### **932.08.02 Crack Injection**

The 50 mm diameter test cores shall be examined for the percentage of the crack depth filled.

#### **932.08.03 Ratio Test**

The proportioning ratio of the injection material shall not deviate more than 5% from the manufacturer's specified proportioning ratio stated in the work plan.

#### **932.08.04 Pot Life**

The proportion of material and pot life shall not deviate from that specified by the manufacturer in the work plan.

#### **932.08.05 Acceptance or Rejection**

The Contract Administrator shall accept or reject material on the basis of the ratio testing and pot life determination results.

Crack injection shall be accepted or rejected on the basis of the percentage of crack depth filled as determined by evaluating the test core taken in each increment.

Rejection of the increment length of crack represented by the test core shall be applied during the entire grouting operation.

Where 90% or more of the crack depth is filled in the test core, the increment of crack length represented by the core shall be accepted.

Where 80 to 89% of the crack depth is filled in the test core, the work shall be accepted and a payment adjustment shall be applied to increment length of crack represented by that core.

Where less than 80% of the crack depth is filled in the test core, the ten-metre increment of crack length represented by the core shall be rejectable. An immediate review and adjustment of the method of injection shall be completed. The method of repair shall be submitted to the Contract Administrator prior to the commencement of the work. The increments represented by the failed test cores shall be repaired such that at least 80% of the crack depth is filled at no addition cost to the Owner.

**932.09 MEASUREMENT FOR PAYMENT**

**932.09.01 Actual Measurement**

**932.09.01.01 Crack Injection**

Measurement of crack injection shall be by length in metres of the accepted injected cracks. The total length shall be the sum of individual increments represented by the accepted test cores taken within each increment. Cracks filled to less than 80% of the crack depth shall not be measured for payment.

**932.09.01.02 Routing and Sealing**

Measurement of routing and sealing shall be by length in metres.

**932.10 BASIS OF PAYMENT**

**932.10.01 Crack Injection - Item**

Payment at the Contract price for the above tender item shall be full compensation for all labour, Equipment, and Material to do the work.

There shall be 100% payment of the Contract price where 90% or more of the crack depth is filled. There shall be no payment where less than 80% of the crack depth is filled.

There shall be a payment adjustment of the unit Contract price for each increment of crack filled to between 80% and 89% of the crack depth.

$$Pa = [100 - (89 - D) \times 2] \div 100$$

Where: Pa = payment adjustment factor  
D = percentage of the crack depth filled, rounded to the nearest 0.1%.

and:  $89 \geq D \geq 80$

**932.10.02 Routing and Sealing-Hot-Poured Rubberized Joint Sealing Compound-Item  
Routing and Sealing-Cold-Applied Joint Sealing Compound - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

This specification covers the requirements for the installation of cathodic protection system using anode mesh.

#### **935.01.01 Specification Significance and Use**

This specification is written as a provincial-oriented specification. Provincial-oriented specifications are developed to reflect the administration, testing, and payment policies, procedures, and practices of the Ontario Ministry of Transportation.

Use of this specification or any other specification shall be according to the Contract Documents.

## **935.01.02 Appendices Significance and Use**

Appendices are not for use in provincial contracts as they are developed for municipal use, and then, only when invoked by the Owner.

Appendices are developed for the Owner's use only.

Inclusion of an appendix as part of the Contract Documents is solely at the discretion of the Owner. Appendices are not a mandatory part of this specification and only become part of the Contract Documents as the Owner invokes them.

Invoking a particular appendix does not obligate an Owner to use all available appendices. Only invoked appendices form part of the Contract Documents.

The decision to use any appendix is determined by an Owner after considering their contract requirements and their administrative, payment, and testing procedures, policies, and practices. Depending on these considerations, an Owner may not wish to invoke some or any of the available appendices.

## **935.02 REFERENCES**

When the Contract Documents indicate that provincial-oriented specifications are to be used and there is a provincial-oriented specification of the same number as those listed below, references within this specification to an OPSS shall be deemed to mean OPSS.PROV, unless use of a municipal-oriented specification is specified in the Contract Documents. When there is not a corresponding provincial-oriented specification, the references below shall be considered to be to the OPSS listed, unless use of a municipal-oriented specification is specified in the Contract Documents.

This specification refers to the following standards, specifications, or publications:

## **Others**

Ontario Traffic Signal Control Equipment Specifications (OTSCES)  
NACE - National Association of Corrosion Engineers  
Ontario Electrical Safety Code

## **935.03 DEFINITIONS**

For the purpose of this specification, the following definitions apply:

**Cathode Connection** means a cable connection of the following two types made to reinforcing bars:

- a) CS: a current carrying cathode connection that is connected to the negative terminal of the rectifier.
- b) CM: a non-current carrying cathode connection that is used to monitor the potential of the reinforcing steel with respect to a reference cell.

**Corrosion Specialist** means an individual having all of the following qualifications:

- a) A minimum of 5 years experience in cathodic protection of reinforced concrete structures.
- b) Is a NACE accredited cathodic protection specialist.
- c) Is an Engineer.

**Distribution Bar** means a component of the anode that distributes current from the power feed point.

**Instant-Off** means the potential reading taken immediately after the current flowing to the system has been interrupted.

**Subzone** means the division of a concrete component into areas where the anode in an area is not continuous with the anode in the adjacent area.

**Zone** means an area of a concrete component energized by one rectifier unit consisting of one or more subzones.

## **935.04 DESIGN AND SUBMISSION REQUIREMENTS**

### **935.04.01 Submission Requirements**

#### **935.04.01.01 Working Drawings**

At least 8 weeks prior to commencement of production of the cathodic protection assembly, 4 copies of the Working Drawings for the components listed below shall be submitted to the Contract Administrator, for information purposes only. Prior to submission, an Engineer's seal and signature shall be affixed on the Working Drawings verifying that the drawings are consistent with the requirements of the Contract Documents.

- a) The cathodic protection equipment assembly.

- b) The cathodic protection terminal block assembly.
- c) The cathodic protection remote monitoring and control unit.
- d) The cathodic protection rectifier.
- e) The wireless modem antenna.

The Working Drawings shall include the information specified in OPSS 2301.

The Working Drawings shall contain at least the following information:

- a) Dimensioned layout drawings including sections, block diagrams, and details to show enclosure, equipment layout, and mounting arrangement.
- b) Wiring diagram, including field location and function labels.
- c) Detailed bill of materials including sources.

#### **935.04.01.02                      Technical Documentation**

Four copies of the following documents for each rectifier and for the RMU containing at least the following information shall be submitted to the Contract Administrator:

- a) Operation and maintenance manual.
- b) Complete schematic diagrams and parts lists.
- c) Drawings showing external and internal physical dimensions of the unit.
- d) Manufacturer's data sheets and engineering technical data for all electronic, electrical components, and mechanical parts of the unit.
- e) Detailed information and test procedures for trouble-shooting.
- f) Performance reports including the 180 hour burn-in test for the rectifier and RMU documenting all of the required tests for the rectifier and for the RMU.

Two copies of the RMU software shall be submitted to the Owner.

#### **935.04.01.03                      Notification of Production**

The Contract Administrator shall be given at least one week prior notice of the date of commencement of fabrication and the date of completion of fabrication of the following components:

- a) The cathodic protection rectifier.
- b) The cathodic protection remote monitoring and control unit.

#### **935.04.01.04                      Notification of Suppliers**

The names of the suppliers of the cathodic protection control and monitoring equipment shall be submitted to the Contract Administrator, upon request.

#### **935.04.01.05                    Spacer Grid**

The product data sheet of the glass fibre reinforced polymer bars (GFRP) spacer grid shall be submitted to the Contract Administrator prior to installation.

#### **935.04.01.06                    Anode Mesh and Distribution Bars**

At least one week prior to the commencement of the installation of the distribution bars and the anode mesh, the following samples fabricated with the equipment and procedures to be used in the work together with the power setting used in welding the samples shall be submitted to the Contract Administrator:

- a) Two 300 mm lengths of distribution bar overlapped and welded at 4 locations at 12 mm intervals.
- b) Anode mesh welded at the diamond junctions to two 500 mm lengths of distribution bars.

#### **935.04.01.07                    Corrosion Specialist**

At least one week prior to commencement of work on the structure, the name and qualifications of the corrosion specialist shall be submitted to the Contract Administrator.

#### **935.04.01.08                    Test Results**

Within 3 Business Days of the completion of the tests required, the results of all tests that are specified to be recorded shall be submitted in writing to the Contract Administrator.

Each test result shall be identified by the corresponding test location.

### **935.05                                MATERIALS**

#### **935.05.01                        General**

All electrical materials, equipment, components, or completed assemblies of components shall be approved according to the Ontario Electrical Safety Code.

#### **935.05.02                        Concrete Pad for Cathodic Protection**

Concrete pad for cathodic protection shall be according to OPSS 616.

#### **935.05.03                        Cathodic Protection System**

Cathodic protection system and its associated materials shall be supplied according to OPSS 2301.

#### **935.05.04                        Concrete for Blockout**

Concrete used to fill blockouts for installation of cables in curbs, sidewalks, and barrier walls shall have a 28-Day strength of 30 MPa according to OPSS 1350. Nominal maximum size of aggregate shall be 9.5 mm.

#### **935.05.05                        Water**

Water shall be according to OPSS 1302.

**935.05.06                      Non-Shrink Grout**

Non-shrink grout shall be supplied from a source named on the ministry's DSM.

**935.05.07                      Spacer Grid**

The spacer grid shall be according to OPSS 2301.

**935.06                              EQUIPMENT**

**935.06.01                      AC Resistance Meter**

The AC resistance meter shall be capable of measuring from 0.1 to 10,000 ohms, with an accuracy of  $\pm 1$  % of full scale, and shall be insensitive to AC and DC ground currents.

**935.06.02                      Multimeter**

The multimeter shall have an input impedance of not less than 10 megohms when operated at a full scale of 100 mV DC.

The meter shall have an accuracy of  $\pm 2.5$  % of the reading in DC volts with a resolution of 0.1 mV.

**935.06.03                      Clamp-On Ammeter**

The clamp-on ammeter shall be capable of measuring DC current ranging from 1 to 4,000 mA.

The ammeter shall measure DC current with an accuracy of  $\pm 2.0\%$  and a resolution of 1 mA.

**935.06.04                      Air Compressor - Air Blasting**

The air compressor for air blasting shall have a minimum capacity of 3.5 m<sup>3</sup>/min. The compressed air shall be free of oil according to ASTM D 4285-83 and be forced through a nozzle at a minimum pressure of 300 kPa.

**935.06.05                      Pressure Wash Equipment**

The pressure wash equipment shall produce a minimum pressure at the nozzle of 1.4 MPa.

**935.06.06                      Holiday Detector**

The holiday detector shall have pulse type output voltages adjustable to produce from 300 to 3,000 volts. The device shall be equipped with a 300 mm wide conductive steel or copper brush to scan the concrete surface and shall produce a loud audible signal when metals that are electrically connected to the reinforcement are detected.

**935.06.07                      Concrete Cover Meter**

The cover meter shall have a digital read out for measurement of cover and an audio signal indicating detection of reinforcing steel bars in concrete with cover up to 150 mm. The accuracy of the meter shall be  $\pm 5\%$  of full scale.

**935.06.08                      Resistance Welder**

The resistance welder shall be as recommended by the anode system manufacturer.

**935.07 CONSTRUCTION**

**935.07.01 General**

**935.07.01.01 Sequence of Work**

The cathodic protection work shall not commence until the repairs in the areas to receive cathodic protection have been completed fully or in sections and accepted by the Contract Administrator.

**935.07.01.02 Access**

The Contract Administrator shall have full access to the place of manufacture of the cathodic protection control and monitoring equipment.

**935.07.01.03 Electrical**

All electrical work shall be as specified in the Contract Documents.

All resistance measurements shall be made with an AC resistance meter, except when measuring resistance between two cathode connections.

**935.07.01.04 Concrete Removal in Recesses and Cable Slots**

The recesses for the embedded components and cable slots shall be sawcut prior to concrete removal. Concrete removal shall be according to OPSS 928.

**935.07.01.05 Abrasive Blast Cleaning**

Abrasive blast cleaning shall be according to OPSS 929.

**935.07.01.06 Concrete Placement**

Concrete shall be placed according to OPSS 904.

**935.07.01.07 Curing**

Curing of concrete and non-shrink grout shall be according to OPSS 904 utilizing the wet burlap method.

**935.07.02 Cathode Connections**

**935.07.02.01 Installation**

**935.07.02.01.01 Scheduling**

Cathode connections to the reinforcing steel shall be made after removal of concrete and abrasive blast cleaning in the removal areas.

**935.07.02.01.02 Layout**

The cathode CS and CM cables shall be connected to the reinforcing steel at the locations as specified in the Contract Documents. Alternative locations for cathode CS and CM connections shall be specified by the Contract Administrator, if required.

Adjustment up to 1 m shall be allowed for the cathode CS connections. The cathode CM connections shall be located between 600 mm and 1 m of the respective reference cells.

At the cathode connection positions specified, the location of the reinforcing steel bars shall be determined by means of a cover meter.

#### **935.07.02.01.03            Preparation of Reinforcement and Recess**

Concrete shall be removed to expose a 150 mm length of reinforcing bar.

The reinforcing steel and the concrete surface of the recess shall be abrasive blast cleaned and cleaned of all deleterious material by means of air blasting.

The reinforcing bar shall be ground locally to expose bare metal prior to making the thermite weld connection.

#### **935.07.02.01.04            Connection of Reinforcing Steel**

The connection shall be made centred on the ground portion of the reinforcing steel as specified in the Contract Documents. The bare portion of the cathode cable shall be protected by a copper sleeve and shall be connected by thermite welding to the reinforcing bar. Mechanical connections shall not be used.

When the weld has cooled, slag shall be removed and a 5 mm thick layer of silicone sealant shall be applied to the entire weld area of the bar and to all exposed copper cable. After setting of the silicone seal, all debris shall be removed from the recess and the surface of the recess shall be dampened. All free water shall be removed from the recess and the recess shall be filled with non-shrink grout according to the manufacturer's recommendations.

#### **935.07.02.01.05            Cable Installation**

Cable slots shall be created by saw cutting. Cable slots, each 6 mm wide by 10 mm deep, shall be sawn between the cathode connection locations and the junction box for the installation of cathode connection cables as specified in the Contract Documents. The edges of the slot shall be rounded where the slot meets the recess. Each slot shall contain only one cable.

When multiple cables converge in to one cable slot, the cable slot shall be adjusted to 9 mm wide by 23 mm deep and sawn from the point where all the cables converge at the install area to the corresponding junction box. Each cable shall share the common saw slot running to the junction box.

Immediately prior to placing material, the recesses shall be abrasive blast cleaned and all deleterious material contained inside the recesses and slots shall be removed by means of air blasting.

The cable shall be continuously contained in the slot between the cathode connection and the junction box and held in place with non-metallic plugs spaced at 600 mm on centres to prevent migration of the cable towards the surface.

Cables that will be unconnected at the junction box location for more than one week shall have a heat shrink end boot installed until the permanent connection is made.

Cable slots shall be backfilled with non-conductive low viscosity epoxy to the level of the original concrete surface according to the manufacturer's recommendations. Care shall be exercised to ensure that the slots are completely filled with epoxy and there is no excess epoxy spilled over the adjacent concrete surface along the slots.

#### **935.07.02.01.06            Testing During Installation**

Prior to filling cathode recesses, the mechanical soundness of each completed cathode connection shall be verified and the DC resistance and voltage between the ends of cables from cathode connections shall be measured and recorded.

The resistance between any two cathode connection cables in a single zone shall be less than 1.0 ohm and voltage shall be less than 1 mV. If the resistance is greater than 1.0 ohm, or voltage is greater than 1 mV, each individual cathode connection cable shall be checked and remedial work shall be performed as follows:

- a) When the resistance between the end of the cable and the reinforcing bar to which it is connected is greater than 1.0 ohm or the voltage is greater than 1 mV, the cable shall be cut and reattached to the same reinforcing bar at least 150 mm away from the previous connection.
- b) When the resistance between the end of the cable and the reinforcing bar to which it is connected is less than 1.0 ohm and voltage is less than 1 mV, additional cathode connections shall be installed at locations determined by the Contract Administrator.

Resistance and voltage measurements between pairs of cathode connection cables shall be repeated and recorded following remedial work.

When mechanical soundness of the cathode connections and continuity of reinforcing steel have been verified, patching of cathode cavities may proceed. After patches are placed, the resistance and voltage between pairs of cathode connection cables shall be measured and recorded to check the connections prior to placing anode.

The results of all tests shall be certified by the corrosion specialist and the certified test results shall be submitted to the Contract Administrator.

### **935.07.03                      Reference Cells - Graphite and Silver-Silver Chloride**

#### **935.07.03.01                      Installation**

##### **935.07.03.01.01                      Scheduling**

The recesses for reference cells and cable slots shall be saw cut prior to concrete removal.

Reference cells shall be installed after removal of concrete and abrasive blast cleaning in the removal areas.

##### **935.07.03.01.02                      Layout**

The reference cells shall be placed at the locations as specified in the Contract Documents.

At the reference cell positions as specified in the Contract documents, the location of the reinforcing steel bars shall be determined by means of a cover meter.

A recess, 200 mm wide by 400 mm long, to accommodate the reference cell shall be cut into the concrete within 10 to 25 mm from a reinforcing steel bar with the longitudinal axis of the cell parallel to the reinforcing steel bar. The Contract Administrator may specify a smaller size recess, if necessary.

When reinforcing steel interferes with the placement of a cell, the recess shall be extended to permit installing the cell without cutting the reinforcing steel or a new recess shall be cut.

Reference cells shall not be positioned in a patched area or within 600 mm of a patched area.

To comply with the above requirements the cell may be moved a maximum of 1 m from the location as specified in the Contract Drawings.

The Contract Administrator shall specify alternative locations when the above conditions cannot be satisfied or when required.

**935.07.03.01.03****Preparation of Recess and Cell Placement**

The depth of the recess shall permit the reference cell to be installed with the adjacent reinforcing steel bar at the mid height of the cell. When 10 mm of cover is not provided to the top of the cell under the above conditions, the recess shall be deepened to provide the 10 mm of cover.

Reference cells installed adjacent to ducts containing post-tensioning steel shall be installed at the depth as specified in the Contract Documents or as directed by the Contract Administrator.

The concrete surface in the recess shall be abrasive blast cleaned and all deleterious material removed by means of air blasting.

The surfaces of the recess shall be dampened, all free water removed, and coated with non-shrink grout. The reference cell shall be placed tight against the side of the recess closest to the reinforcing steel; however, contact between the cell and the exposed reinforcing steel shall not be permitted. The recess, including cavities induced by saw cutting shall be filled with non-shrink grout according to the manufacturer's recommendations to the level of the original concrete surface.

**935.07.03.01.04****Cable Installation**

Cable slots shall be created by saw cutting. Cable slots, each 6 mm wide by 10 mm deep, shall be sawn between the reference cell recess and the junction box for the installation of the reference cell cables as specified in the Contract Documents. The edges of the slot shall be rounded where the slot meets the recess. Each slot shall contain only one cable.

When multiple cables converge in to one cable slot, the cable slot shall be adjusted to 9 mm wide by 23 mm deep and sawn from the point where all the cables converge at the install area to the corresponding junction box. Each cable will share the common saw slot running to the junction box.

Immediately prior to placing material, the recesses shall be abrasive blast cleaned and all deleterious material contained inside the recesses and slots shall be removed by means of air blasting.

The cable shall be continuously contained in the slot between the reference cell recess and the junction box and held in place with non-metallic plugs spaced at 600 mm on centres to prevent migration of the cable towards the surface.

Each cable left unconnected at the junction box location for more than 1 Day shall have a heat shrink end boot installed on it. The heat shrink end boot shall not be removed until the cable is permanently connected.

Cable slots shall be backfilled with non-conductive low viscosity epoxy to the level of the original concrete surface according to the manufacturer's recommendations. Care shall be exercised to ensure that the slots are completely filled with epoxy and there is no excess epoxy spilled over the adjacent concrete surface along the slots.

**935.07.03.01.05****Testing During Installation**

Upon completion of cell installation, the voltage and resistance between the reference cell and the cathode CM connection shall be measured and recorded.

If the AC resistance between the graphite cell and the cathode connection is less than 10 ohms or more than 1,000 ohms or if the voltage reading is unstable, the cell shall be removed and replaced. The voltage and resistance measurements shall be repeated and recorded.

The results of all tests shall be certified by the corrosion specialist and the certified test results shall be submitted to the Contract Administrator.

**935.07.04****Rigid Ducts and Junction Boxes, Surface Mounted**

The duct, fittings, and junction boxes shall be installed in neat straight lines. Rigid ducts shall be installed vertically and either horizontally or parallel to structural surfaces using offset bends or fittings where changes in alignment are necessary. When holes are specified to permit installation through concrete components, they shall be core drilled.

Expansion joints shall be installed according to the manufacturer's recommendations with at least one expansion joint between any two adjacent junction boxes. Conduit straps and junction boxes shall be fastened to the concrete surface by drilling and inserting stainless steel anchors and bolts.

Conduit straps shall be located at a maximum of 1.5 m centres and shall be one trade size larger than the conduit supported.

Ducts and junction boxes shall be installed after concrete repairs have been completed.

**935.07.05****Rigid Ducts and Junction Boxes, Embedded in Concrete**

The installation of rigid PVC junction boxes and rigid duct embedded in concrete shall be according to OPSS 913.

When cables are to be routed through the curb to a junction box mounted on the outside face of a deck, concrete shall be removed at the curb locations to the width and depth as specified in the Contract Documents. All sharp edges of concrete shall be rounded off. A hole shall be drilled to provide access to the junction box or to provide a deck entry hole where specified in the Contract Documents. A non-conductive duct shall be installed and grouted in place with non-shrink grout.

After the installation of the cables, the duct embedded in the curb shall be sealed with a silicone plug to a depth of 50 mm.

The cavities in the curb, barrier wall, or sidewalk shall be filled with concrete to the original surface according to OPSS 930.

**935.07.06****Rigid Ducts, Direct Buried**

The installation of rigid ducts direct buried shall be according to OPSS 603.

**935.07.07****Extra Low Voltage Cables**

The installation of the extra low voltage cables shall be according to OPSS 604.

The run of extra low voltage cable from the initial splice in the junction box to the cathodic protection cabinet shall be of one continuous length. Heat shrink identification sleeves shall be placed over the free end of each cable at the cathodic protection cabinet and at the end of each cable from the structure in the junction boxes with the number of the component as specified in the Contract Documents.

All splices, with the exception of anode distribution bars, shall be made in the junction boxes with compression connectors. Each splice shall be soldered after installation. Both ends of the connector shall be soldered to the cable.

All splices for reference cells and cathode CM cables shall be sealed and insulated with heat shrink tubing. The splices for the cathode CS cables shall be sealed and insulated with a motor splice kit.

Cable that will be unconnected at the junction box location for more than one week shall have a heat shrink end boot installed until the permanent connection is made.

## **935.07.08 Installation of Cathodic Protection Equipment Assembly**

### **935.07.08.01 Concrete Pad and Ground Electrode**

The concrete pad shall be constructed according to OPSS 616, except that the anchor bolts shall be drilled in place.

The installation of the ground wires and ground electrode shall be according to OPSS 609.

### **935.07.08.02 Installation of Cabinet**

The pedestal and cabinet shall be installed squarely and symmetrically on the concrete pad with a neoprene gasket installed on the bottom channel of the enclosure and the bottom of the pedestal.

Holes for mounting bolts shall be drilled, as required, and anchor bolts installed.

### **935.07.08.03 Grounding**

The ground bar installed on the inside and bottom part of the cabinet shall be connected to the system ground as specified in the Contract Documents.

### **935.07.08.04 Connection of Incoming Cables**

The AC power supply shall be connected to the AC power distribution assembly. Each cable from the structure shall be connected to the proper terminal on the terminal block assembly conforming to the colour code and labelling.

Upon completion of wiring and connection, all incoming cables shall be bundled and held in place with nylon cable ties. Cables and connectors shall not be subject to stress during or after installation.

## **935.07.09 Anode Mesh and Distribution Bars**

### **935.07.09.01 Handling and Storing**

The anode mesh and distribution bars shall be handled and stored in such a manner to avoid breakage or shape distortion due to stretching. The anode mesh and distribution bar shall be kept clean and dry prior to installation.

### **935.07.09.02 Installation**

#### **935.07.09.02.01 Scheduling**

The anode mesh and distribution bars shall be installed after all concrete patching and abrasive blast cleaning of the concrete surface has been carried out and prior to placement of the concrete overlay.

#### **935.07.09.02.02 Layout**

The anode mesh and distribution bars shall be installed on the concrete surfaces as specified in the Contract Documents. Alternative arrangement of anode mesh rows may be considered where it may be practical to use odd shapes of anode mesh, subject to the approval of the Contract Administrator.

#### **935.07.09.02.03 Isolation**

The anode mesh and distribution bars shall be electrically isolated from the reinforcing steel and from any metallic components on the surface of the structure prior to proceeding with the work. Only non-metallic fasteners shall be used.

When a deck has been scarified, a concrete cover survey on a 1.5 x 1.5 m grid shall be done after scarifying and prior to the installation of the anode mesh. The results of the survey shall be recorded and submitted to the Contract Administrator.

A spacer grid shall be placed between the anode mesh and distribution bars and the concrete in areas where cover to the reinforcing steel is less than 15 mm or with exposed reinforcing steel. The spacer grid GFRP bars shall be tied together with plastic ties thereby holding the grid together and secured to prevent bars from floating during the overlay pour. Non- conductive fasteners similar to those used to anchor the titanium mesh shall be used to secure the bars to the deck. The titanium mesh in the secured areas shall be placed on top of the GFRP grid and tied by plastic ties to the grid.

Exposed rebars shall not be protected with a coating of grout or epoxy as a means of isolation.

Immediately prior to installation of the anode mesh, all concrete surfaces shall be inspected for exposed metal such as tie-wire, tie-rods, bolts, and other metallic components. All exposed metal and metal within 5 mm of the concrete surface, which is continuous with the reinforcing steel, shall be identified by visual means and by means of a holiday detector and the metal shall be insulated by coating with two coats of epoxy or shall be removed as directed by the Contract Administrator. When epoxy is used, only the metal shall be coated.

#### **935.07.09.02.04            Anode Mesh Placement**

Adjacent rolls of anode mesh within the same zone shall be in contact with a minimum overlap of 100 mm.

When two or more zones or subzones are specified, the separation between anode mesh in adjacent zones or subzones shall be  $150 \pm 25$  mm.

Anode mesh shall be cut, where necessary, to provide a separation of  $150 \pm 25$  mm between the anode mesh and metal features mounted on or protruding from concrete surface.

At splices and at joints where irregularly shaped sections are added, the anode mesh shall be overlapped a minimum of 75 mm and both sections of the anode mesh shall be welded to the distribution bar.

The anode mesh shall be either offset a maximum of 75 mm from a concrete corner or shall be wrapped tightly around the corner.

The edge of anode mesh shall be offset  $150 \pm 25$ mm from the curb face throughout the length of the deck.

The location of embedded cables shall be determined and marked on the concrete prior to drilling for fasteners.

The anode mesh shall be held in place by non-conductive fasteners inserted in drilled holes. There shall be at least three fasteners installed across the full width of each roll of the anode mesh such that two anchors are placed 50 to 75 mm from the anode mesh edge with a third anchor in the centre. The maximum distance between two adjacent anchors along the length and width of the anode mesh shall not exceed 600 mm.

When the anode mesh is elevated as a result of the GFRP spacer grid, the mesh shall be secured to the GFRP bars by plastic ties.

Overlapping anode mesh may be attached with a common fastener.

The anode mesh shall be installed as close to the concrete surface as practical with a maximum offset from the surface of 3 mm.

Bulges shall be pressed down and additional fasteners shall be installed to maintain the specified clearance.

The anode mesh shall not be tensioned to such an extent that the anode mesh pattern is distorted. Edges of anode mesh cut to avoid contact with objects on the concrete surface shall be fastened at no more than 300 mm intervals.

All debris and dirt resulting from drilling holes for fasteners and others work associated with the installation of the anode mesh shall be removed from the concrete surface by air blasting at a minimum frequency of once per Day.

Under no circumstances shall the anode mesh be subjected to abrasive blast cleaning.

#### **935.07.09.02.05          Distribution Bar Placement**

Distribution bars shall be installed in straight lines as specified in the Contract Documents. The locations shall line up with junction box locations to facilitate connection within the box.

Where specified, distribution bars may be extended by overlapping approximately 200 mm and resistance welding every 12 mm.

The anode mesh shall be resistance welded to the distribution bars at every third diamond intersection point for a spacing of approximately 228 mm.

The welding procedures used shall be according to the anode mesh manufacturer's recommendations and shall be those used in making the samples for submission.

The distribution bars shall be protected by the application of heat-shrinkable tubing:

- a) in conduit connecting to junction box.
- b) where passing through curb.
- c) where traversing concrete cracks greater than 1 mm.
- d) where specified in the Contract Documents or by Contract Administrator.

The distribution bars shall enter the junction box through the conduit as specified in the Contract Documents. The two distribution bars shall be jumpered by a short stub of distribution bar resistance welded to them in the junction box.

The distribution bars shall be connected to the anode bus cables in the junction box by means of a bolted connector as specified in the Contract Documents. The threads of the bolt shall be coated with a locking compound. The connection and any exposed distribution bars shall be sealed and insulated with heat shrink tubing and heat shrink tape.

#### **935.07.09.02.06          Concrete Surface Preparation after Anode Installation**

Immediately after installation of the anode mesh and distribution bars, all debris resulting from the drilling of anchor holes and other accumulated dirt shall be removed from the concrete surface by air blasting.

The surface of the concrete with anode mesh and distribution bars in place shall be pre-wetted with water prior to application of the concrete overlay.

#### **935.07.09.02.07            Protection during Placement of Concrete Overlay**

During placement of concrete overlay, the anode mesh and distribution bars shall be protected against potential damage caused by construction equipment and workers by means of 20 mm thick plywood sheeting. The plywood sheets shall be removed as the placement of the overlay progresses.

#### **935.07.09.02.08            Junction Box Entry**

When wiring is to be routed to junction boxes embedded in new barrier walls or sidewalks, a blackout shall be created to permit installation of conduit and wiring.

After installation of the cables, the conduit in the curb shall be sealed with a silicone plug to a depth of 50 mm.

The cavities in the curb, barrier wall, or sidewalks shall be filled with concrete to the original surface according to OPSS 930. Alternatively, the cavity may be filled with non-shrink grout.

#### **935.07.09.03                Testing**

##### **935.07.09.03.01            Pre-Installation**

Prior to installing anode mesh and distribution bars, the quality of the weld between the anode mesh and current distribution bar shall be pull tested by preparing a sample weld and pulling the anode mesh from the distribution bar using pliers. If metal is pulled from one substrate, the weld is acceptable. If the anode mesh strand or strip breaks or is burned through, the weld power setting is too high. If the weld breaks, the power setting is too low. A similar test shall be carried out to determine the quality of the weld when two distribution bars are welded together. The weld power setting shall be adjusted to obtain satisfactory welds.

One week prior to the commencement of the installation of the distribution bars and the anode mesh, the following samples fabricated with the equipment and procedures to be used in the work together with the power setting used in welding the samples shall be submitted to the Contract Administrator:

- a) Two 300 mm lengths of distribution bars overlapped and welded at four locations at 12 mm intervals.
- b) Anode mesh weld at the diamond junctions to two 500 mm lengths of distribution bars.

##### **935.07.09.03.02            During Installation**

##### **935.07.09.03.02.01        Weld between Anode Mesh and Distribution Bars**

During installation of the anode mesh and distribution bars, random pull tests shall be performed on the weld connecting as follows to verify the adequacy of the welds:

- a) The anode mesh to the distribution bar.
- b) The distribution bar to the distributor bar.

##### **935.07.09.03.02.02        Short Circuits**

Tests for short circuits shall be carried out by the corrosion specialist or a NACE accredited cathodic protection or corrosion technologist under the direct supervision of the corrosion specialist.

Tests for short circuits between the anode mesh, distribution bars, the reinforcing steel, and all metallic appurtenances shall be done during installation of the anode mesh and continuously monitored during application of the concrete overlay.

Short circuits shall be removed and the area retested prior to proceeding with the concrete overlay.

When the area of potential short circuits is equal to or less than 150 x 150 mm, the anode mesh shall be cut clear of the exposed reinforcing steel or in areas where the cover to the reinforcing steel is less than 15 mm. When the area of potential shorts circuits is greater than 150 x 150 mm, the anode mesh shall be separated from the concrete surface using a GFRP spacer grid.

The location and extent of the areas requiring treatment and the treatment undertaken to eliminate the short circuit shall be recorded and submitted to the Contract Administrator.

Prior to installation of the waterproofing on the concrete overlay and at each stage, a test shall be done to confirm that there are no short circuits by temporarily applying a direct current using a portable DC power supply sufficient to produce and applied current density of 10 mA/m<sup>2</sup>. When the occurrence of a short circuit is detected, the short circuit shall be located and removed.

The results of all tests shall be certified by the corrosion specialist and the certified test results shall be submitted to the Contract Administrator.

#### **935.07.09.04                      Trial Operating Period - Acceptance Testing**

##### **935.07.09.04.01                  General**

Prior to the acceptance of the Work, it shall be demonstrated that all components of the cathodic protection system, including the rectifier and RMU, are in proper working order. Short circuits are not permitted between the anode mesh and its hardware and the reinforcing steel or any other metallic components of the structure in contact with the reinforcing steel, such as drainage pipe or expansion joints.

Field readings taken during the trial operating period shall be taken by a NACE accredited cathodic protection or corrosion technologist under the direct supervision of the corrosion specialist.

The system shall be energized for a period of 72 hours at a power level that applies an average current density of 2 mA/m<sup>2</sup> on all cathodically protected areas of the structure. If AC power is not available at the site at the time of the trial operating period, power shall be provided to the rectifier and remote monitoring by means of a portable generator.

Field testing of the installed cathodic protection system shall only be conducted with the Contract Administrator and a representative of the Owner in attendance.

The Contract Administrator shall be informed 4 Business Days in advance of the planned trial operating period.

When measuring the potential of reference cells, the negative lead of the multimeter shall be connected to the reference cell lead wire and the positive lead to the cathode CM wire. The polarity sign of the reading shall be recorded.

Testing shall be done when the air temperature is at least 5 °C.

The results of all tests shall be certified by the corrosion specialist and the certified test results shall be submitted to the Contract Administrator.

A training session for the demonstration of the use of the RMU software including downloading of site data shall be carried out at the ministry's Bridge Office in St. Catharines.

#### **935.07.09.04.02      Testing Prior to Energizing the System**

##### **935.07.09.04.02.01      Embedded Components**

Immediately prior to energizing the system, the following measurements shall be manually recorded on site at the cathodic protection cabinet with a portable multimeter and AC resistance meter:

- a) Reference cell potential, in mV, relative to cathode CM cable.
- b) Voltage between each anode or anode bus and cathode CS cable, in volts.
- c) Resistance, AC, between each reference cell and cathode CM cable, in ohms.
- d) Resistance, AC, between each anode or anode bus and cathode CS cable, in ohms.
- e) Resistance, DC, between CM and CS cathode connections, in ohms.
- f) Voltage between CM and CS cathode connections, in mV.

To meet the requirements of this specification, the readings obtained shall be according to requirements as shown in Table 1.

##### **935.07.09.04.02.02      Rectifier**

It shall be demonstrated in the presence of the Contract Administrator that the rectifier assemblies will function properly throughout the full operating range of the output current and voltage according to OPSS 2301. The rectifier assemblies shall not be connected to the cathodic protection system at the time the testing is conducted.

##### **935.07.09.04.02.03      Remote Monitoring and Control Unit**

It shall be demonstrated in the presence of the Contract Administrator that the operation of the RMU meets the requirements according to OPSS 2301.

#### **935.07.09.04.03      Testing after Energizing the System**

After the system is energized, the following readings shall be manually recorded on site at the cathodic protection cabinet for a period of 72 hours using a portable multimeter and clamp-on ammeter.

- a) Total current and voltage for each rectifier.
- b) Current flow to each area of the system, zones or subzones or both, or anode bus, as applicable.
- c) Reference cell potentials, on and instant-off.

Manual readings shall be verified with portable computer on site connected to the RMU and at a computer located at a remote location.

The manual readings and the RMU readings from the portable computer on site shall be taken on an hourly basis during the work hours and the readings obtained from the remote location computer shall be taken on an hourly basis.

All the measurements obtained by the RMU shall be the same as the readings obtained manually on site. The RMU shall be calibrated using gains and offsets, as required.

The results of all tests shall be certified by the corrosion specialist and the certified test results shall be submitted to the Contract Administrator.

Immediately after the 72-hour readings are made, the system shall be switched off and allowed to depolarize for a period of 4 hours. At the end of the 4-hour depolarization period, reference cell potentials shall be recorded and the differences between instant-off readings at 72 hours and the 76-hour depolarized readings shall be calculated. Voltage between anodes and cathode shall also be recorded.

The performance of the system shall be monitored during the trial operating period and appropriate actions shall be taken to repair any defects detected. The trial operating period shall be repeated as many times as required to prove proper functioning of the system.

Within 7 Days of the completion of the trial operating period, an acceptance testing commissioning report shall be submitted to the Contract Administrator recording:

- a) The dates and times of the periods of trial operation.
- b) Names of individuals collecting and recording data.
- c) Testing equipment used, manufacturer and model number, including power source, if applicable.
- d) All readings noted above, labelled as to appropriate zone, subzone, or bus, as applicable.
- e) All remedial action taken.

The acceptance testing commissioning report shall bear the seal and signature of the corrosion specialist and certify that:

- a) The rectifier and remote monitoring unit are functional.
- b) The wiring of the system is according to the Contract Drawings, and the labelling and identification of wire terminations is correct in the control panel.
- c) All areas, zones and subzones, or buses, as applicable, of the system were functional and received current flow during the trial operating period.
- d) There are no short circuits between anodes and cathodes.
- e) There are no short circuits between reference cells and cathode.
- f) The accuracy of all meters and proper circuit polarity has been verified using a multimeter.

#### **935.07.10 Remedial Work**

Work not meeting the acceptance testing requirements shall be repaired or replaced. Proposals for correcting deficiencies shall be submitted to the Contract Administrator for approval prior to commencement of the remedial work.

#### **935.07.11 Management of Excess Material**

Management of excess material shall be according to the Contract Documents.

**935.08 QUALITY ASSURANCE**

**935.08.01 Anode Mesh**

A manual pull test will be randomly conducted on the weld connecting the anode mesh to the distribution bar to check the weld quality.

**935.08.02 Control and Monitoring Equipment**

The Contractor, through the agreement to purchase control and monitoring equipment, shall ensure the ministry's representative be permitted access to the place of assembly of the cathodic protection equipment assembly while work on the unit is being performed for the purpose of inspecting the work and examining plant records, certificates, materials being used, process of fabrication, and to request further tests, as required.

**935.08.03 Acceptance and Rejection**

Work not meeting the requirements of this specification shall be subject to rejection.

**935.09 MEASUREMENT FOR PAYMENT**

**935.09.01 Actual Measurement**

**935.09.01.01 Cathode Connections  
Reference Cells  
Cathodic Protection Cabinets  
Concrete Pad for Cathodic Protection**

For measurement purposes, a count shall be made of each of the above items installed.

**935.09.01.02 Anode Mesh**

Measurement of anode mesh shall be by area in square metres for the full surface of the concrete being treated with no deduction for minor surface areas not covered, such as at corners, cutouts and the like, nor any addition for surface areas requiring overlapping mesh.

**935.09.02 Plan Quantity Measurement**

When measurement is by Plan Quantity, such measurement shall be based on the units shown in the clauses under Actual Measurement.

**935.10**

**BASIS OF PAYMENT**

**935.10.01**

**Cathode Connections - Item**  
**Reference Cells - Item**  
**Cathodic Protection Cabinets - Item**  
**Concrete Pads for Cathodic Protection - Item**  
**Anode Mesh - Item**  
**Extra Low Voltage Cables for Cathodic Protection - Item**  
**Cathodic Protection Rectifiers - Item**  
**Cathodic Protection Remote Monitoring and Control Units - Item**  
**Rigid Ducts and Junction Boxes for Cathodic Protection - Item**  
**Acceptance Testing for Cathodic Protection - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

**TABLE 1**  
**Resistance and Voltage Requirements**

| <b>Component</b>                        | <b>Resistance<br/>Ohms</b>                | <b>Voltage</b> |
|-----------------------------------------|-------------------------------------------|----------------|
| Reference Cell - Graphite               | 10 - 1000 (AC)                            | Stable         |
| Reference Cell - Silver-Silver Chloride | As per manufacturer's<br>recommendations. | Stable         |
| Cathode Connection                      | < 2 (DC)                                  | < 1 mV         |
| Anode                                   | < 3 (AC)                                  | Stable         |

Recommendations for Prestressed Rock and Soil Anchors

## 942.03 DEFINITIONS

For the purpose of this specification, the following definitions apply:

**Alignment Load** means a nominal minimum load applied to an anchor during testing to keep the testing equipment positioned correctly.

**Anchor** means a system used to transfer tensile loads to soil or rock that includes the prestressing steel, anchorage, corrosion protection, sheathings, spacers, centralizers, and grout.

**Anchorage** means the combined system of anchor head, bearing plate, trumpet, and anchorage corrosion protection that is used to transmit the prestressing force from the prestressing steel to the surface of the ground or the supported structure.

**Anchor Head** means the device by which the prestressing force is permanently transmitted from the prestressing steel to the bearing plate.

**Apparent Free Stressing Length** means the length of tendon or bar that is apparently not bonded to the surrounding ground or grout, as calculated from the elastic movement measured during the load test.

**Bond Length** means the length of the tendon that is bonded to the primary grout and capable of transmitting the applied tensile load to the surrounding soil or rock.

**Centralizer** means a device to support and position the tendon and sleeves in the drill hole throughout the bond length of the tendon so that a minimum grout cover is achieved.

**Coupler** means the method by which the prestressing force can be transmitted from one partial length of prestressing tendon to another.

**Design Load** means the anticipated final maximum effective load in the anchor after allowance for time-dependent losses or gains. The design load includes appropriate load factors to ensure that the overall structure has adequate capacity for its intended use.

**Free Stressing Length** means the designed length of the tendon that is not bonded to the surrounding ground or grout during stressing.

**Lift-Off** means checking the load in the tendon at any specified time with the use of a hydraulic jack at the moment of lifting of the anchor head off the bearing plate.

**Lock-Off Load** means the prestressing force in an anchor immediately after transferring the load from the jack to the stressing anchorage.

**Log Time Cycle** means one rotation of a log cycle of a semilogarithmic plot for the purpose of recording the measurement of movement and time.

**Permanent Anchor** means a prestressed anchor intended for permanent use.

**Performance Test** means cyclic and incremental loading and unloading of an anchor, while recording the total movement of the pulling head in each cycle at each increment, including the residual movement at alignment load.

**Post-Grouting** means regrouting an anchor after the primary grout has set.

**Pre-Production Test Anchor** means an anchor installed and then loaded to verify the design parameters, prior to the installation of the production anchors.

**Prestressing Steel** means strands, a group of strands combined to form a tendon, or a high strength steel bar.

**Primary Grout** means Portland cement based grout that is injected into the anchor hole prior to or after the installation of the anchor tendon to provide for the force transfer to the surrounding ground along the bond length of the tendon.

**Production Anchor** means an anchor installed and loaded that forms part of the final foundation support system.

**Production Test Anchor** means an anchor installed and then loaded to verify the design parameters, prior to the installation of the production anchors.

**Proof Test** means incremental loading of an anchor and recording the total movement of the anchor at each increment.

**Residual Movement** means the non-recoverable movement of the pulling head measured at alignment load.

**Temporary Anchor** means a prestressed anchor intended for temporary use.

**Test Load (TL)** means the maximum load that the anchor is subjected during testing.

**Total Movement** means the total movement of the pulling head measured at maximum load in each cycle.

#### **942.04 DESIGN AND SUBMISSION REQUIREMENTS**

##### **942.04.01 Design Requirements**

###### **942.04.01.01 General**

Except for Owner designed anchors, the Contractor shall be responsible for the detailed design of the anchor, including the determination of the applied loads, design assumptions, and installation procedures. The Contractor shall also be responsible for the design of the anchor testing equipment and reaction system.

The anchors shall be designed to safely withstand the applied loads specified in the Pre-Production Test Anchor clause and fulfill the acceptance criteria specified in the Production Anchor clause and perform satisfactorily at the design load through the required service life.

The design assumptions shall accurately represent the subsurface conditions prevalent at the site.

Temporary anchors in a corrosive environment shall be designed as permanent anchors.

Except as specified in this specification, the anchors shall be designed according to the design recommendation of the Recommendations for Prestressed Rock and Soil Anchors publication.

##### **942.04.02 Submission Requirements**

###### **942.04.02.01 Working Drawings**

Five sets of Working Drawings shall be submitted to the Contract Administrator at least 21 Days prior to the commencement of the work of prestressed rock and soil anchors, for information purposes only. Prior to making a submission, the seals and signatures of a design Engineer and a design-checking Engineer shall be affixed on the Working Drawings verifying that the drawings are consistent with the Contract Documents.

Where multi-discipline engineering work is depicted on the same Working Drawing and the design or design-checking Engineer or both are unable to seal and sign the Working Drawing for all aspects of the work, the drawing shall be sealed and signed by as many additional design and design-checking Engineers as necessary.

Information to be shown on the Working Drawings shall describe and illustrate the complete details of the anchor system, anchor testing equipment, and reaction system for the production anchors and, when specified in the Contract Documents, pre-production test anchors. This information shall include as a minimum:

###### **a) Plans, Elevations, and Sections**

- i. Anchor spacing.
- ii. Orientation.
- iii. Minimum total anchor length.
- iv. Free stressing length.
- v. Design load.
- vi. A unique identification number for each anchor.
- vii. Anchor components and details.

b) Installation

- i. Construction methods.
- ii. Work restrictions.
- iii. Schedule.
- iv. Sequence and coordination of work.
- v. Monitoring.
- vi. Type and number of tests
- vii. Evaluation of test results.

c) Materials

- i. Physical properties of monobar and multistrand anchors.
- ii. Primary grout materials and mix proportions.
- iii. Post grouting materials and mix proportions.
- iv. Free stressing length materials and mix proportions.
- v. Corrosion protection material physical and mechanical properties.

d) Anchor Hole Construction

- i. Method of constructing the anchor holes and maintaining the stability of the holes during the anchor installation. The drilling equipment and materials including drill bit or auger diameter and lengths, casing diameter and lengths, and slurry material used to facilitate the construction of the anchor hole. The method of verifying the hole length shall also be identified.
- ii. Details for assembling the anchor in the anchor hole.
- iii. Method of placing and centring the anchor tendons, including the method used to maintain them in the centre of the hole over the design bond length.
- iv. Bond zone primary grout placement. Grout mixing procedure and the method of installation, including grout pressures. The method to determine the surface of the hardened bond length grout shall be identified.
- v. Bond zone post grout placement. Grout mixing procedure and the method of installation, including grout pressures.
- vi. Free stressing zone grout placement. Grout mixing procedure and the method of installation, including grout pressures.
- vii. Waterproofing of holes drilled in rock for permanent anchors. Details of water tightness tests, including setup, water pressure, method of applying pressure, details of consolidation, grouting, redrilling, and retesting.

e) Stressing Information

- i. Anchor stressing schedule that includes the working loads and test loads.
- ii. Anchor stressing equipment, and the method for testing the stressing of pre-production and production test anchors and production anchors. Details of the reaction system used to support the applied loads.
- iii. Equipment, including the calibration records of the gauges and jacks, and procedure to monitor the applied loads and movements during anchor testing.
- iv. Details of the reference system and equipment to monitor the movement.

f) All design assumptions, loads, parameters, and bond stresses used for pre-production and production test anchors and production anchors.

g) Testing records when testing has been done to determine bond stress.

h) Details of destressing and removal of temporary anchors.

#### **942.04.02.02                      Slurry**

At least 14 Days prior to commencement of the work, the following information for the slurry shall be submitted to the Contract Administrator, for information purposes only:

- a) The type, source, and physical and chemical properties of the bentonite or polymer.
- b) The source of water.
- c) Method of mixing slurry.
- d) The water solids ratio and the mass and volumes of the constituent parts, including any chemical admixtures or physical treatment employed to produce slurry with the required physical properties.
- e) Details of procedure to be used for monitoring the quality of the slurry.
- f) A test report showing the properties of the slurry and certifying that the slurry meets the requirements of API 13A.
- g) Method of disposal of the slurry.

#### **942.04.02.03                      Couplers**

At least 14 Days prior to commencement of the work, a copy of the following shall be submitted to the Contract Administrator:

- a) Manufacturer's catalogue giving the complete data on the coupler material and installation procedures.
- b) Test reports from the manufacturer certifying strength and fatigue requirements.

#### **942.04.02.04                      Prestressing Steel**

##### **942.04.02.04.01                  Mill Certificates**

One copy of the mill test certificates, indicating that the steel meets the requirements of the Contract Documents, shall be submitted to the Contract Administrator at the time the prestressing steel is delivered to the job site.

Identification on the anchor tendon shall allow tracing of the prestressing steel to its heat or reel number.

Where mill test certificates originate from a mill outside Canada or the United States of America the Contractor shall have the information on the mill certificate verified by testing by a Canadian testing laboratory. The laboratory shall be accredited by the Standards Council of Canada as complying with the requirements of ISO/IEC 17025 for the specific tests or type of tests required by the material standard specified on the mill test certificate. The mill test certificates shall be stamped with the name of the Canadian testing laboratory and appropriate wording stating that the material is according to the Contract Documents. The stamp shall include the appropriate material specification number, testing date (i.e., yyyy-mm-dd), and signature of an authorized officer of the testing laboratory.

One copy of the stress-strain curves that are representative of the lots to be used shall be submitted to the Contract Administrator together with the mill certificates specified detailed in OPSS 1440.

#### **942.04.02.04.02            Prestressing Steel Bond Capacity**

If not available from the prestressing steel manufacturer, a prestressing strand bond capacity test shall be conducted on the strand according to Appendix A of the Recommendations for Prestressed Rock and Soil Anchors publication. The test information shall be submitted to the Contract Administrator prior to commencement of work.

#### **942.05                        MATERIALS**

##### **942.05.01                   Permanent Anchors**

##### **942.05.01.01               General**

Tendons shall be manufactured from steel bars or strand either in single or multiple element tendons.

The permanent anchors shall be Dywidag Threadbar Anchors, BBR Cona Multi-Strand Anchors, VSL Multi-Strand Anchors, or other approved equivalent anchors.

##### **942.05.01.02               Anchorages**

The components of the anchorage shall be capable of developing at least 100% of the guaranteed minimum ultimate capacity of the tendon or bar.

The anchor head shall be wedges for prestressing strands and anchor nuts for prestressing bars. The wedges shall be designed to uniformly engage the strand with no notch or pinching effects.

The bearing plate shall be fabricated from steel according to CSA G40.20/G40.21.

The trumpet shall be fabricated from steel pipe according to ASTM A53 or tubing according to ASTM A500. The trumpet shall have a minimum wall thickness of 3 mm for diameters up to and including 100 mm and 5 mm for larger diameters. The joint between the trumpet and the bearing plate and the joint between the trumpet and sheath shall be watertight. The trumpet shall overlap the free stressing length corrosion protection by at least 100 mm. The trumpet shall be long enough to accommodate movements of the structure and the tendon during stressing and testing.

The anchorage covers shall completely encapsulate the anchor head with a watertight seal between the cover and the bearing plate.

##### **942.05.01.03               Prestressing Steel**

Prestressing steel shall be according to ASTM A416 and ASTM A722.

Bars shall be high-tensile strength bars grade 1,030 MPa, 1,100 MPa, or 1,230 MPa.

Strand shall be seven-wire, uncoated, stress relieved and low relaxation strand grade 1,720 MPa, 1,760 MPa, or 1,860 MPa.

The strand and bar shall meet the bond capacity test specified in the Prestressing Steel Bond Capacity subsection.

##### **942.05.01.04               Couplers**

Couplers for bars shall be as specified by the supplier of the anchor and shall develop at least 100% of the guaranteed minimum ultimate strength of the tendon. Strand tendons shall not be coupled.

**942.05.01.05                      Cement**

Cement shall be according to OPSS 1301 and shall be certified free of false set.

**942.05.01.06                      Water**

Water shall be according to OPSS 1302.

**942.05.01.07                      Sheathing**

Plastic sheathing shall be high density polyethylene according to ASTM D1248, Type III, or polyvinyl chloride (PVC) according to ASTM D1784, Class 13464-B or equal. The plastic sheathing shall be such that a bond of 5 MPa is developed when grout with a compressive strength of 30 MPa is used.

Hot melt extruded plastic tubing made from polyethylene according to ASTM D3350 and ASTM D1248 shall have an average minimum wall thickness of 1.5 mm. Hot melt extruded plastic tubing from polypropylene according to ASTM D4101 shall have an average minimum wall thickness of 1.5 mm. Steel tubing or pipe shall have an average minimum wall thickness of 5.0 mm.

The materials for the sheathing accessories such as end caps, grouting caps, grout tubes, and sealing caps shall have properties equal to the plastic sheathing.

**942.05.01.08                      Heat Shrinkable Sleeves**

Heat shrinkable sleeves shall be fabricated from a radiation cross-linked polyolefin tube internally coated with an adhesive sealant.

**942.05.01.09                      Grout Tubes**

Grout tubes shall have an adequate inside diameter to enable the grout to be pumped to the bottom of the drill hole. They shall be able to withstand 1 MPa pressure.

Post-grout tubes shall be strong enough to withstand the post-grouting pressure.

**942.05.01.10                      Bond Breaker**

The bond breaker shall be fabricated from plastic tube or pipe made from medium to high density polyethylene according to ASTM D1248 or from polyvinyl chloride according to ASTM D1784, Class 13464-B or equivalent, with a minimum wall thickness of 1 mm.

**942.05.01.11                      Centralizers and Spacers**

Centralizers and spacers shall be steel or plastic.

**942.05.01.12                      Grout**

The grout cube for high early strength grout shall be at least 20 MPa at 7 Days and 30 MPa at 28 Days. The type of cement used shall be suitable for the required use of the grout. Accelerators shall not be used. The grout shall bleed less than 2% when allowed to stand for one hour.

**942.05.01.13                      Corrosion Inhibiting Compound**

The corrosion inhibiting compound placed in either the free stressing length or the anchorage area shall be an organic compound, grease, or wax with appropriate polar moisture displacing and self-healing properties and corrosion inhibiting additives. The compound shall permanently stay viscous and be chemically stable and non-reactive with the prestressing steel, sheathing material, and anchor grout.

#### **942.05.01.14 Corrosion Protection**

The anchor shall be provided with Class I, encapsulated tendon, double corrosion protection according to the Recommendation for Prestressed Rock and Soil Anchors publication.

The tendon shall be fully encased within a corrugated PVC sheathing that is, in turn, encased within a smooth PVC sheathing over the length of the free stressing zone and protected with grout having the 7- and 28-Day compressive strengths.

#### **942.05.02 Temporary Anchors**

The material for temporary anchors shall be the same as specified for the permanent anchors except the double protection system is not required.

#### **942.05.03 Pre-Production Test Anchors**

The material for the pre-production test anchors shall be the same as specified for the production anchor being evaluated.

#### **942.05.04 Bentonite Cement Slurry**

Bentonite and polymers shall meet the requirements of API 13A.

The bentonite cement slurry shall consist of a stable mixture of cement and a colloidal suspension of pulverized solids or polymers thoroughly mixed with water. The density, viscosity, sand content, and pH of the slurry while being used during excavation shall be according to API RP13B-1.

#### **942.05.05 Concrete**

Concrete shall be according to OPSS 1350 with a nominal 28-Day compressive strength of 30 MPa.

The slump shall be 150 to 180 mm.

### **942.06 EQUIPMENT**

#### **942.06.01 General**

All equipment for the installation of the anchor, anchor stressing, anchor testing, and monitoring of the anchor test shall be suitable for the intended purposes and capable of working on the site under the prevailing access and clearance conditions.

The equipment used shall not cause damage to the anchor tendon, corrosion protection, or retained structural members.

The equipment used shall be in according to those listed in the required submissions.

#### **942.06.02 Grouting Equipment**

Mixers and pumps shall be of an adequate capacity and hoses shall be sized to allow continuous grouting of an individual anchor within one hour. A colloidal mixer with a gauge to measure the water shall be used.

### **942.06.03 Temporary Anchor Concrete Placement Equipment**

Continuous flight augers shall be used for the placement of concrete for temporary anchors up to a maximum ratio of hole diameter to length of 1:35. Open hole concrete placement shall be limited to a minimum hole diameter of 600 mm and a maximum ratio of hole diameter to length of 1:15.

### **942.06.04 Anchor Testing Equipment**

The rated capacity of the equipment shall not be exceeded when stressing the tendon to the maximum specified test load. The pump shall be capable of applying each load increment in less than 60 seconds.

The equipment shall permit the tendon to be stressed in increments so that the load in the tendon can be increased or decreased according to the test specifications and to allow the anchor to be lift-off tested to confirm the lock-off load.

Dial gauges shall have at least a 75 mm travel. Longer gauge stems or sufficient gauge blocks shall be provided to allow for greater travel where required. Gauges shall have precision of at least 0.02 mm.

Dial gauges shall permit the measurement of total tendon movement to the nearest 0.02 mm at every load increment. The gauge shall have sufficient travel to record the total anchor movement at test load without the need to reset at an interim point.

Jacks used for stressing tendons shall have a minimum ram extension of 150 mm.

Stressing equipment shall be calibrated within an accuracy of  $\pm 2\%$  immediately prior to use.

Current calibration curves bearing the seal and signature of an Engineer shall be provided for all gauges and jacks.

## **942.07 CONSTRUCTION**

### **942.07.01 General**

The Contractor shall be responsible for the material, fabrication, installation, testing, and monitoring of pre-production and production test anchors and production anchors.

In addition, for non-Owner designed anchors, the Contractor shall be responsible for the preparation of a soils report, the determination of design parameters, and the design of the anchors.

The anchor system shall be according to this specification and the Working Drawings.

Concrete placement according to the Concrete clause of the Caisson Piles subsection of OPSS 903 may be used for temporary anchors inclined a minimum of 30 degrees below the horizontal and having a minimum hole diameter of 450 mm.

### **942.07.02 Structural Steel**

Structural steel components shall be fabricated according to OPSS 906.

### **942.07.03 Anchor Fabrication**

Anchors shall be either shop or field fabricated according to the Working Drawings and schedules by personnel trained and qualified for this work.

Prestressing steel shall be cut with an abrasive saw or, when approved by the prestressing steel supplier, an oxyacetylene torch may be used.

All of the bond length shall be free of dirt, manufacturers' lubricants, corrosion-inhibiting coatings, or other deleterious substances that may significantly affect the grout-to-tendon bond or the service life of the anchor.

When encapsulated anchors are pregouted, they shall be done on an inclined, rigid frame or bed by injecting the grout from the low end of the tendon.

Joints in the protection system shall be made watertight by use of an epoxy bonding agent.

#### **942.07.04                      Storage and Handling**

Upon delivery, the fabricated anchors and the prestressing steel for fabrication of the tendons and all hardware shall be stored and handled in a manner that avoids mechanical damage, corrosion, and contamination with dirt or deleterious substances.

Handling of the tendons shall not cause mechanical damage or contamination to the prestressing steel, the corrosion protection, or the epoxy coating.

Rope or nylon slings shall be used.

Cement and additives for grout shall be stored under cover and protected against moisture.

Lifting of any pregouted tendons shall not cause excessive bending that may debond the prestressing steel from the surrounding grout.

#### **942.07.05                      Corrosion Protection**

##### **942.07.05.01                  Anchorage Protection**

The corrosion protection of the tendon in the vicinity of the anchorage shall ensure proper protection.

All stressing anchorages permanently exposed to the atmosphere or that has a concrete cover less than 50 mm shall be covered with a corrosion inhibiting compound-filled or grout-filled cover.

On strand tendons, the trumpet shall be long enough to enable the tendon to make a transition from the diameter of the tendon along the free stressing length to the diameter of the tendon at the wedge plate without damaging the encapsulation.

The trumpet shall be completely filled with a corrosion inhibiting compound or grout. Compounds may be placed any time during construction. Grout shall be placed after the anchor has been tested and stressed to the lock-off load.

Corrosion inhibiting compound-filled trumpets shall have a permanent seal between the trumpet and the free stressing length corrosion protection.

Trumpets filled with grout shall have either a temporary seal between the trumpet and the free stressing length corrosion protection or the trumpet shall fit tightly over the free stressing length corrosion protection for a minimum of 0.3 m.

##### **942.07.05.02                  Free Stressing Length Protection**

The tendon shall be fully encased within a corrugated PVC sheathing that is in turn encased within a smooth PVC sheathing over the length of the free stressing zone and protected with grout.

Corrosion protection of the free stressing length shall be provided by a sheath filled with a corrosion inhibiting compound or grout or a heat shrinkable tube internally coated with a mastic compound. The corrosion inhibiting compound shall completely coat the tendon elements, fill the void between them and the sheath, and fill the interstices between the wires of 7-wire strands. Provisions shall be made to retain the compound within the sheath.

The corrosion protective sheath surrounding the free stressing length of the tendon shall be long enough to extend into the trumpet but shall not come into contact with the stressing anchorage during testing.

For pregrouted encapsulations, a separate bond breaker shall be provided to prevent the tendon from bonding to the grout surrounding the free stressing length.

Fusion bonded epoxy may be used to provide an additional layer of protection to the prestressing steel.

#### **942.07.05.03 Free Stressing Length and Bond Length Transition**

The transition between the corrosion protection for the bonded and free stressing lengths shall be designed and fabricated to ensure continuous protection from corrosion.

The corrosion protection surrounding the free stressing length of the tendon shall not contact the bearing plate or anchor head.

#### **942.07.05.04 Coupler Protection**

On encapsulated bar tendons, the coupler and any exposed bar section next to it shall be covered with a corrosion proof compound or wax impregnated cloth tape. The coupler area shall be covered by a smooth plastic tube overlapping the adjacent sheathed tendon by at least 25 mm. The two joints shall be sealed each by a coated heat shrink sleeve of at least 150 mm length or approved equivalent. The corrosion proof compound shall completely fill the space inside the cover tube.

#### **942.07.06 Construction of Anchor Holes**

##### **942.07.06.01 General**

The anchor holes shall be constructed to the diameter, orientation, and length specified in the Contract Documents and detailed on the Working Drawings. A drilling method that establishes a stable anchor hole within the tolerances specified in the Contract Documents shall be used.

The sides and end of the completed anchor holes shall be maintained in a stable condition.

The anchor hole entry shall be located within 300 mm of its plan location. The deviation of the anchor hole entry angle from its inclination as specified the Contract Documents shall be no greater than  $\pm 3$  degrees.

Open anchor holes and drilled casings shall be cleaned upon completion of drilling.

Anchor holes open for longer than eight hours shall be recleaned prior to insertion of the tendon and primary grouting.

The following information shall be recorded for each anchor hole and submitted to the Contract Administrator:

- a) Identification number.
- b) Anchor hole diameter.
- c) Anchor hole length.
- d) Drilling procedure.

- e) Soil, rock, and ground water conditions encountered.
- f) Time required to drill the anchor hole.
- g) Problems encountered.

#### **942.07.06.02                      Waterproofing Anchor Holes**

Waterproofing of anchor holes shall be done when specified in the Contract Documents and according to the Working Drawings, procedures, and equipment.

If during the water tightness test, the leakage from an anchor hole over a ten-minute period exceeds 9.5 L, the anchor hole shall be consolidation grouted, redrilled, and retested.

Redrilling shall be done when the grout strength is considerably less than the strength of the surrounding rock.

#### **942.07.07                      Anchor Installation**

The anchors shall be installed as specified in this specification and detailed on the Working Drawings.

Care shall be taken to ensure the sheathing, corrosion protection, and grout tubes are not damaged during installation of the anchors.

Damaged anchors that cannot be repaired to the satisfaction of the Contract Administrator shall be replaced.

Method of repair shall be submitted to the Contract Administrator for approval.

The prestressing steel in the tendon bond length shall be protected with a grout filled corrugated plastic encapsulation. Centralizers shall be used to ensure a grout cover of at least 12 mm over the encapsulation.

The centralizers shall be maintained in position during installation.

The centralizer shall support the tendon in the drill hole and position the tendon so a minimum grout cover of 12 mm is achieved. Centralizers used inside a sheath shall provide a nominal grout cover of 5 mm over the prestressing steel. All centralizers shall be designed to permit grout to flow freely around the tendon and up the drill hole.

The Contractor shall determine the number of centralizers required; however, one unit shall be placed within 1 m of the bottom of the hole and another at the bond length and free stressing length interface. The centralizers shall not interfere with the placement of grout.

Spacers shall be used in multiple element tendons to separate the strands or bars individually or into small groups.

#### **942.07.07.01                      Inspection during Anchor Installation**

The Contractor's Engineer shall inspect the following Work:

- a) Construction of anchor holes.
- b) Anchor installation.
- c) Primary grouting.
- d) Post grouting.
- e) Placement of slurry in free stressing length.

- f) Anchorage installation.

#### **942.07.08 Primary Grouting of Anchors**

The grout shall be placed as specified in this specification and as detailed on the Working Drawings.

The grout shall entirely fill the annular space between the anchor and the borehole wall in the bond length.

Anchors shall be grouted as soon as practical after installation. The stressing tails of prestressing steel strands shall be aligned prior to initial set of the grout.

After grouting, the anchor shall remain undisturbed until the grout has reached the strength specified in the Contract Documents.

The following information shall be recorded for each anchor and submitted to the Contract Administrator:

- a) Identification number.
- b) Type of grout.
- c) Grout pressure.
- d) Volume of grout used.
- e) Location of the top of the bond length grout.

#### **942.07.09 Post-Grouting of Bond Length**

When specified in the Contract Documents, post-grouting of the bond length shall be done according to the submitted procedures and equipment.

The information required to be recorded for primary grouting shall be recorded for post grouting.

Ground movement shall be monitored and, if excess movement is observed, the grouting shall be terminated and the situation reported to the Contract Administrator.

The Contract Administrator shall be notified prior to the commencement of post-grouting of both permanent and temporary anchors.

#### **942.07.10 Placing of the Cement Bentonite Slurry in the Free-Stressing Length**

The method of placing the cement bentonite slurry shall be as specified in this specification and as detailed on the Working Drawings.

The cement bentonite slurry for the free stressing length shall completely fill the annular space between the prestressing steel and the borehole wall and shall prevent any transfer of the anchor load to the free stressing zone.

#### **942.07.11 Installation of Anchorage**

The anchor bearing plate and the anchor head or nut shall be installed perpendicular to the tendon within  $\pm 3$  degrees and centred on the bearing plate, without bending or kinking of the prestressing steel elements. Wedge holes and wedges shall be free of rust, grout, and dirt. Special care shall be exercised to obtain the continuity of corrosion protection in the vicinity of the anchorage as described in the Corrosion Protection subsection. The stressing tail shall be cleaned and protected from damage until final testing and lock-off.

The tendon stressing tail shall be cut to its final length according to the tendon manufacturer's recommendations after the anchor is accepted by the Contract Administrator.

Anchorage permanently exposed to the atmosphere shall be covered with a corrosion inhibiting compound filled or grout filled cover

## **942.07.12                      Testing**

### **942.07.12.01                      General**

Testing shall be carried out as detailed on the Working Drawings and as specified in this specification.

The maximum anchor load shall not exceed 80% of the guaranteed minimum ultimate strength of the tendon.

Stressing shall not commence until the grout has reached its 28-Day strength.

The Contractor's Engineer shall inspect the pre-production and production anchor testing.

### **942.07.12.02                      Reaction System**

The reaction system shall be installed as detailed on the Working Drawings.

### **942.07.12.03                      Reference System and Testing Equipment**

The layout of the reference systems and testing equipment required for testing shall be as detailed on the Working Drawings and as specified in this specification.

All reference beams shall be independently supported with the support firmly embedded in the ground at a distance of not less than 2.5 m from the anchor. Reference beams and their supports shall be sufficiently rigid to support instrumentation and to prevent movement relative to the test anchor as a result of stressing or other construction activity during testing.

Dial gauges shall bear on the pulling head of the jack and their stems shall be co-axial with the tendon direction.

The jacks shall be secured with chains to provide adequate protection to personnel in the event of breakage of the anchor or stressing system.

### **942.07.12.04                      Reference System Enclosures**

Suitable enclosures shall be constructed to provide complete protection for personnel, equipment, and instruments from variations in the weather conditions and disturbances during the test program.

These provisions shall meet the approval of the Contract Administrator and include the following specific requirements:

- a) The test enclosures shall be weatherproof and adequately lighted and have consistent and controllable heat in order to eliminate temperature variations.
- b) The test enclosure shall be provided with a level dry floor.
- c) A field office equipped with tables, chairs, heating, and lighting shall be provided adjacent to the test anchors.

## **942.07.12.05 Pre-Production Test Anchors**

### **942.07.12.05.01 General**

Pre-production tests shall be conducted to determine the bond stress when:

- a) A bond stress is not specified in the Contract Documents.
- b) A higher bond stress than specified in the Contract Documents is used in the design.
- c) To establish the adequacy of other components of the anchor in advance of the production anchors.

For Contractor designed anchors, at least one pre-production test anchor shall be installed and tested in each significantly different ground condition.

For Owner designed anchors, the number of pre-production test anchors shall be as specified in the Contract Documents. The test anchor shall be constructed using the materials, methods, and procedures specified in this specification and as detailed on the Working Drawings.

Pre-production test anchors shall not be incorporated into the permanent or temporary work unless approved by the Contract Administrator.

### **942.07.12.05.02 Pre-Production Test Procedures and Measurements**

The pre-production anchor test shall be carried out generally in accordance with the prevailing requirements of ASTM D1143 superseded where applicable by the procedure specified in this specification.

When the pre-production test anchor is to be incorporated into the work, the load in the anchor shall be adjusted to lock-off load in the final cycle.

The pre-production test shall be conducted by cyclically and incrementally loading and unloading the anchor according to the schedule below or until the anchor fails.

AL, 0.25 DL, AL  
AL, 0.25 DL, 0.50 DL, AL,  
AL, 0.25 DL, 0.50 DL, 0.75 DL, AL  
AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, AL,  
AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.25 DL, AL,  
AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.25 DL, 1.50 DL, AL  
AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.25 DL, 1.50 DL, 1.75 DL, AL,  
AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.25 DL, 1.50 DL, 1.75 DL, 2.00 DL\*, AL  
AL, 0.00 DL

Where:

AL = alignment load  
DL = design load of anchor

\* At 2.00 DL, the load shall be maintained for 24 hours.

Each load shall be maintained for a minimum of 15 minutes or until the rate of displacement is not greater than 0.25 mm per hour.

Vertical and horizontal movement of the reaction system and tendon elongation shall be recorded with respect to an independent fixed reference point. A record of the test enclosure temperature is also required.

During the load hold periods, the anchor load shall not be allowed to deviate from the test pressure by more than 0.35 MPa.

When required, repumping back to test load shall be done to compensate for small movements, hydraulic oil seepage, and changes in temperature of the hydraulic oil.

The load shall always be returned to the specified test load prior to taking the movement reading at the specified interval. The test load shall not be exceeded during the period of observation.

#### **942.07.12.05.03          Removal of Pre-Production Test Anchors**

The test anchors not approved to be incorporated into the work shall be removed flush with the surrounding ground and the test site restored to its pretest conditions.

The test anchorages shall not be removed until the Contract Administrator has given permission in writing to remove them.

#### **942.07.12.05.04          Request to Proceed and Notice to Proceed**

A Request to Proceed with production anchors shall be submitted to the Contract Administrator following the pre-production anchor stressing

The next operation shall not proceed until a Notice to Proceed has been received from the Contract Administrator.

#### **942.07.12.06          Production Anchors**

##### **942.07.12.06.01          General**

Every temporary and permanent anchor shall be tested according to the Proof Test - Permanent Anchors or Proof Test - Temporary Anchors clause, as appropriate.

##### **942.07.12.06.02          Proof Test - Permanent Anchors**

The following proof test shall be applied to the anchorages:

After preloading the anchor to 1.5 DL for 30 minutes, the proof test shall be conducted by incrementally loading and unloading the anchor according to the following schedule or until the anchorage fails, as determined by the Contract Administrator. The acceptance criteria apply to only the peak loading.

Loads shall be applied as follows:

0.25 DL, 1.00 DL, 1.50 DL, 1.00 DL, 0.25 DL

Where:

DL = specified working load of anchorage

At 1.50 DL, the load shall be maintained for a minimum of 30 minutes. Measurement shall be recorded according to the following time increment schedule.

0 min, 1 min, 2 min, 3 min, 6 min, 9 min, 12 min, 15 min, 18 min, 30 min.

If the acceptance criteria as specified herein are met, the anchorage shall be prestressed to 1.50 DL, then shall be locked-off at the transfer load of 1.10 DL.

If the acceptance criteria as specified herein are not met in the 30-minute period the test shall be extended as required, with readings at 30-minute increments, up to 180 minutes.

If the acceptance criteria as specified herein are not met, the provisions of the Unacceptable Stressing Results clause shall apply.

### **942.07.12.06.03            Proof Test - Temporary Anchors**

The proof test shall be conducted by incrementally loading the anchor according to the following schedule:

AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.20 DL, 1.33 DL, AL, and adjust to lock-off load

Where:

AL = alignment load

DL = specified working load of anchorage

At the test load of 1.33 DL, the load shall remain constant for 10 minutes and the total movement shall be recorded at 1, 2, 3, 4, 5, 6, and 10 minutes. If the difference between the total movements at 1 minute and 10 minutes exceeds 1 mm, the test load shall be maintained for an additional 50 minutes, and the movements readings shall be recorded at 20, 30, 40, 50, and 60 minutes. The anchor shall be returned to AL after holding the load at test load for 50 minutes and the residual movement recorded.

The hydraulic pressure during the load hold period shall not deviate by more than 0.35 MPa and the load shall be returned to the test load prior to taking the movement reading. The total movements at each load increment shall be recorded.

### **942.07.12.06.04            Lock-Off Procedure**

After testing has been completed, the load in the tendon shall be such that, after seating losses (wedge seating), the specified lock-off load has been applied to the anchor tendon.

The magnitude of the lock-off load shall be 1.10 DL or as specified by the Contract Administrator and shall not exceed 70% of the ultimate load of the tendon or bar ( $F_{pu}$ ).

The wedges shall be seated at a minimum load of 50% of  $F_{pu}$ . If the lock-off load is less than 50%, shims shall be used under the wedge plate and the wedges seated at 50% of  $F_{pu}$ . The shims shall then be removed to reduce the load in the tendon to the desired lock-off load. Bar tendons may be locked off at any load less than 70% of  $F_{pu}$ .

### **942.07.12.06.05            Lift-Off Tests**

A minimum of three lift-off tests shall be conducted at each site. The location of the anchor to be tested shall be as determined by the Contractor. The lift-off test shall not be performed until 48 hours has elapsed after transferring the lock-off load. The method of testing shall be as detailed on the Working Drawings.

The lift-off test shall be performed after transferring the load to the anchor and prior to removing the jack from its location. The lift-off load shall be determined by re-applying the load to the tendon or bar to lift off the wedge plate or anchor nut without unseating the wedges or turning the anchor nut.

### **942.07.12.07                Acceptance Criteria**

An anchor shall be considered acceptable when all three of the following acceptance test criteria are satisfied:

- a) The total creep movement at test load during the last log time cycle is less than 1.5 mm.
- b) The apparent free stressing length based on the elastic movement at the test load is not less than 80% of the designed free stressing length.
- c) The load measured during the lift-off test is within 10% of the designed lock-off load.

#### **942.07.12.08 Unacceptable Stressing Results**

For the anchorages that do not meet the acceptance criteria for the performance test or the proof test, the Contractor shall submit one of the following alternatives as a proposal to the Contract Administrator for approval:

- a) Abandon the deficient anchor and install a new anchor.
- b) Lock-off the anchors at no more than 50% of the accepted test load sustained during test or as determined by the Contract Administrator and install an additional anchor to compensate for the deficiency.
- c) Post grout the anchor at a grouting pressure not exceeding 3.6 MPa or as recommended by the Contract Administrator and then conduct a proof test and apply the acceptance criteria to the test results. The post grouting shall be terminated immediately if any distress on the ground surface is observed during grouting.
- d) Readjust the transfer load to 1.10 DL for an anchor that does not meet the lift-off criteria and repeat the test after a minimum of 48 hours. If the anchor does not meet the lift-off test criteria after completing this procedure, it shall be considered unacceptable.

#### **942.07.13 Quality Control**

##### **942.07.13.01 General**

In addition to the quality control procedures initiated by the Contractor, the following work shall also be done.

##### **942.07.13.02 Quality of Grout Mixture**

###### **942.07.13.02.01 General**

The Contractor shall be responsible for testing of bleeding, preparation and initial storage of grout cubes for determination of compressive strength, and delivery of the grout cubes to a testing laboratory designated by the Owner.

The Contractor shall employ staff from a testing company certified according to CSA A283, Certification for Additional Tests 1B, by an organization accredited by the Standards Council of Canada to carry out testing for bleeding, making, and curing of grout cubes and early strength determination.

Grout cubes for compressive strength test and testing of bleeding shall be made on a level, vibration free surface.

###### **942.07.13.02.02 Testing for Bleeding**

The testing for bleeding of the grout shall be according to CSA A23.2-1B.

Prior to the grouting operation, in the presence of the Contract Administrator, a trial batch shall be mixed and the grout tested for bleeding to ensure that the grout meets the requirements of this specification. The trial batch of grout shall not be used in the actual grouting operation.

During the grouting operation, bleeding measurements shall be performed on the grout sampled at the mixer. The measurements shall be performed at least once a day and as requested by the Contract Administrator.

The bleeding test results shall be submitted to the Contract Administrator in writing. The test results that indicate the grout is not meeting the requirements of the Contract Documents shall be reported immediately to the Contract Administrator and the grouting operation halted until the cause of the problem is identified and corrected.

### **942.07.13.02.03            Making, Curing, and Transportation of Cubes for Compressive Strength Tests**

Grout cubes shall be prepared as follows on site from the grout pumped into the anchor body:

- a) One set of grout cubes, consisting of three cubes, shall be made each day the grouting operations are carried out.
- b) The grout cubes shall be prepared according to CSA A23.2-1B and stored at a temperature between 15 and 25 °C and shall not be moved prior to demoulding.
- c) The grout cubes shall be demoulded and transported to the laboratory designated by the Owner within 24 hours.
- d) The grout cubes shall be transported in a sealed white opaque plastic bag containing at least 250 mL of water and maintained at a temperature between 15 and 25 °C.

### **942.07.13.02.04            Early Strength Determination**

The Contractor shall prepare and test additional grout cubes to determine when the grout has attained a strength of 20 MPa.

The laboratory conducting the test shall be certified as specified in this specification.

### **942.07.13.03            Inspection after Anchor Installation**

The Contractor's Engineer shall inspect and verify that the materials have been supplied and installed according to the Contract Documents.

A Certificate of Conformance shall be submitted to the Contract Administrator upon completion of the anchor installation.

The Certificate of Conformance shall be submitted to the Contract Administrator upon completion of the stressing operations.

### **942.07.14            As-Built Drawings**

As-built drawings shall be submitted to the Contract Administrator in a reproducible format prior to final acceptance of work.

The as-built drawings shall be dated and bear the seal and signature of the Contractor's Engineer.

### **942.07.15            Management of Excess Materials**

Management of excess material shall be as specified in the Contract Documents.

## **942.09            MEASUREMENT FOR PAYMENT**

### **942.09.01            Actual Measurement**

#### **942.09.01.01            Pre-Production Test Anchors and Production Anchors**

Measurement of pre-production test anchors and production anchors shall be by length in metres along the actual length of the anchor from the anchor plate to the tip.

**942.09.01.02                    Post-Grouting of Bond Length**

Measurement of post-grouting of bond length shall be by mass in kilograms of mixed grout used.

**942.10                            BASIS OF PAYMENT**

**942.10.01                    Pre-Production Test Anchors - Item  
                                  Production Anchor - Item  
                                  Post-Grouting of Bond Length - Item**

Payment at the Contract price for the above tender items shall be full compensation for all labour, Equipment, and Material to do the work.

## REVISION INFORMATION SHEET

### ONTARIO PROVINCIAL STANDARDS FOR ROADS AND PUBLIC WORKS

#### VOLUME 5 PROVINCIAL-ORIENTED MTO GENERAL CONDITIONS OF CONTRACT AND GENERAL AND CONSTRUCTION SPECIFICATIONS

MANUAL REVISION No. 27

APRIL 2023

#### UPDATING ONTARIO PROVINCIAL STANDARDS FOR YOUR USE

Each roads and public works owner (Owner) is responsible for determining implementation dates and directions for use of Ontario Provincial Standards; therefore, manual holders are cautioned about immediately discarding superseded and cancelled standards.

#### ACCESSING AND OBTAINING ONTARIO PROVINCIAL STANDARDS

Individual OPS standards, revision packages, and complete manuals are available for download, free of charge, in PDF format, from the [MTO Technical Publications](https://www.mto.gov.on.ca/technicalpublications/) website.

#### WAITING TO HEAR FROM YOU

Further news and information about the Ontario Provincial Standards organization can be obtained from the OPS website at [www.ops.on.ca](https://www.ops.on.ca).

Questions should be directed by email to [Ontario.Prov.Standards@ontario.ca](mailto:Ontario.Prov.Standards@ontario.ca)

If you have a suggestion to revise a standard or you have a standard that works in your ministry, municipality, or area, send it to the OPS Administration, for review and possible inclusion into the Ontario Provincial Standards.

**THIS MANUAL IS REVISED AS FOLLOWS:**

**Index Pages Volume 5**

Remove the entire index and replace with the revised index.

## SUMMARY OF REVISIONS

### OPSS.PROV 772 Chain-Link Fence

---

#### Construction Specification for Chain-Link Fence

- Section 772.02 References: updated.
- Section 772.03 Definitions: “or roll-formed” added to “Corner Post”, “Fence Post” and “Top Rail” definitions, “Fence Fabric” definition added.
- Section 772.04 Design and Submission Requirements: added.
- Subsection 772.05.02 Concrete: reference to OPSS 1350 added.
- Subsection 772.07.02 Proprietary Systems: added. Subsequent numbering adjusted in specification.
- Subsection 772.07.03 Chain-Link Fence: subsection title added. Subsequent numbering adjusted in specification.
- Clause 772.07.03.02.01 General: 2<sup>nd</sup> sentence in the 3<sup>rd</sup> paragraph is moved to 1<sup>st</sup> sentence in the 2<sup>nd</sup> paragraph of 772.07.03.04 Top Rails, Top Wires, and Bottom Wires.
- Clause 772.07.03.02.02 Post on Concrete Barrier: 2<sup>nd</sup> paragraph 3<sup>rd</sup> sentence rewritten.
- Clause 772.07.03.02.02 Footings: 1<sup>st</sup> paragraph 2<sup>nd</sup> sentence added, 3<sup>rd</sup> paragraph added.
- Clause 772.07.03.04 Top Rails, Top Wires, and Bottom Wires: 2<sup>nd</sup> paragraph 1<sup>st</sup> sentence moved from 772.07.03.02.01 General and 3<sup>rd</sup> sentence added.
- Clause 772.07.04.01 General: General title added. Subsequent numbering adjusted in specification.
- Subsection 772.08.04 Concrete: added.

### OPSS.PROV 803 Vegetative Cover

---

#### Construction Specification for Vegetative Cover

- Subsection 803.04.01 Submission Requirements: 3<sup>rd</sup> paragraph added.
- Section 803.05: arranged alphabetical.
- Clause 803.05.03.04: modified.
- Section 803.06: arranged alphabetical.
- Clause 803.07.02.02: 3<sup>rd</sup> paragraph added.
- Tables: arranged numerical order of appearance in specification.
- Table 3 Permanent Seed Mixes and Seed Certificate Analysis Values: addition of seed mix selections.
- Table 4 Annual Nurse Crop Seed Sowing Times: added.
