

2017 Long-Term Energy Plan – Regional Development Options and Electricity Outlooks

Working Draft

July 2017

Agenda for Discussion

1. Update and decision on infrastructure funding for regional economic development priorities.
2. Overview of 2017 Long-Term Energy Plan (2017 LTEP) Outlooks/Forecasts and confirmation of modelling assumptions:
 - A. Fuels; and
 - B. Electricity.
3. Discussion of inputs into the development of the 2017 LTEP Residential Electricity Price Forecast:
 - C. Ontario's Fair Hydro Plan; and
 - D. Options to bend the future cost curve for electricity ratepayers.

1. INFRASTRUCTURE FUNDING OPTIONS FOR REGIONAL ECONOMIC DEVELOPMENT PRIORITIES

Overview

- Through consultations and engagement sessions in support of the development of the Ministry's Long-Term Energy Plan, many communities highlighted that regional differences in electricity infrastructure are hindering economic development. Concerns included:
 - The impact of declining reliability on load customers
 - The impact of connection constraints and the costs of system expansion or enhancement for:
 - load customers looking to increase their load profile or set up new facilities
 - generation customers siting new renewable generation.
- The Ministry of Energy is proposing to seek provincial and federal capital funding for electricity transmission and distribution infrastructure that supports economic development and job creation and develop a program and delivery mechanism.
- The Ministry of Energy is targeting release of the LTEP in late September/early October

Decision Point:

- A decision is required on including language in LTEP 2017 (slide 7). As the language will raise expectations with stakeholders, there should be a reasonable likelihood that funding can be found, otherwise it may be preferable to omit reference in LTEP, but continue to pursue the funding outside of LTEP timelines.

Potential Project Examples

Category	Examples
Reliability upgrades - Enhancements to single-circuit lines which lack redundancy (Approximately 30% of transmission delivery points in Ontario are supplied by single circuit lines, primarily in Northern Ontario) - Upgrades from single-phase to 3-phase power - Power quality improvements including back up generation, ride-through equipment and micro-grids	Greenstone: Constructing a new transmission line to serve the Greenstone area to address reliability of the existing transmission system, enable new resource development opportunities and eliminating the need for mines to develop on-site gas generation. Wahgoshig First Nation: Upgrading from single-phase to 3-phase to enable housing developments, water infrastructure upgrades and commercial projects. Gananoque: Building a second line to Gananoque from Kingston to reduce outages Cochrane: Northland Power is interested in exploring a microgrid project using its former Non-Utility Generator (NUG) to supply businesses in Cochrane Leeds and Grenville: Greenfield Ethanol and Prysmian Cables have previously expressed concerns with outages and the need to expand operations Huntsville: Resolving a power quality issue caused by sensitive electrical equipment, such as those identified by Kimberly Clark in Muskoka
Connection of new load customer Expansions and enhancements of transmission and distribution infrastructure to enable load customers to grow or establish a new connection.	Greater Madawaska: Upgrades to enable growth of the Calabogie Peaks Resort and neighbouring lands. Prescott and Russell: Upgrades to enable Calypso Water Park, St. Albert Cheese and Skotidakis Goat Farm to expand Leamington: Upgrades to enable growth of Agri-business. Napanee: Goodyear previously sought funding for upgrades to enable an expansion Red Lake: Updates to enable new and expanded resource developments
Facilitating connection of renewable generation Enhancements to infrastructure to eliminate connection constraints	Tillsonburg: Upgrades to eliminate transmission constraints to enable to new renewable generation and participating in Oxford County's 100% renewable energy by 2050 goal
Committed bulk transmission system projects underway to reduce costs to ratepayers	East West Tie: Providing a long-term, reliable supply of electricity to meet the growth in demand and changes to the supply mix in Northwest Ontario. Northwest Bulk: Supporting growth and maintain a reliable electricity supply to areas west of Thunder Bay, including the potential for a future line from Dryden to the Manitoba border to accommodate better integration of provincial electricity grids and increase intertie capability with Manitoba. Hawthorne to Merivale Reconductoring: Upgrades to optimize use of Ontario's interties.

Federal Infrastructure Funding

- The 2017 federal budget includes line items that could be used to support electricity infrastructure:

Delivery Mechanism	Total Funding Amount	Ontario Allocation	Criteria
Bilateral Agreements (Negotiated directly with P/Ts)	\$9.2 billion for green infrastructure	TBD [Approx. \$2.5 billion]*	Priority projects, including those that reduce greenhouse gas emissions, help communities prepare for challenges that result from climate change and help build cleaner, better-connected electricity systems.
	\$2 billion for infrastructure projects for rural and northern communities	TBD [Approx. \$500 million]*	A broad range of infrastructure projects including the renewal and replacement of energy systems in northern communities, so that remote communities can reduce their reliance on diesel.
Canada Infrastructure Bank	\$35 billion using loans, loan guarantees and equity investments	TBD	Focus on large, transformative projects such as regional transit plans, transportation networks and electricity grid interconnections.
	– Including \$5 billion for green infrastructure.	TBD	Green infrastructure projects, including those that reduce greenhouse gas emissions, deliver clean air and safe water systems, and promote renewable power.
National Programs	\$220 million to reduce reliance on diesel south of 60 th parallel	TBD	To reduce the reliance of rural and remote communities south of the 60th parallel on diesel fuel, and support the use of more sustainable, renewable power solutions.
	\$4 billion to improve Indigenous communities, including \$2 billion for green infrastructure	TBD	To build and improve housing, water treatment systems, health facilities, and other community infrastructure
	\$2 billion for a Disaster Mitigation and Adaptation Fund	TBD	To support national, provincial and municipal infrastructure required to deal with the effects of a changing climate.

CONFIDENTIAL CABINET DOCUMENT

* Estimate based on the base and per capita funding provided to Ontario 2014 Building Canada Fund Provincial-Territorial Infrastructure Component. Ontario received approximately 28 per cent (\$2.7 billion) of the total P/T allocations of \$9.6 billion.

Provincial Prioritization

- The Ministry of Infrastructure (MOI) is seeking input from other ministries on priorities for federal infrastructure funding.
- Energy is proposing capital funding for electricity transmission and distribution infrastructure that supports economic development on the list of provincial priorities for federal infrastructure funding.
 - Given Ontario's significant investments to reduce GHG emissions in the province's supply mix, funding could help to boost economic development by expanding and enhancing access to clean power through investments in transmission and distribution infrastructure.
- Federal funding would likely require an equivalent provincial contribution.
- MOI has indicated that any new provincial infrastructure funding is likely to be communicated in the 2017 Fall Economic Statement.

2017 LTEP

- LTEP 2017 provides an opportunity to suggest that the government will explore infrastructure funding for transmission and distribution infrastructure.
- As the language will raise expectation with stakeholders, there should be a reasonable likelihood that funding can be found, otherwise it may be preferable to omit reference in LTEP, but continue to pursue the funding outside of LTEP timelines.

LTEP could include the following draft language:

Supporting Regional Economic Development

Electricity transmission and distribution infrastructure is built on a “beneficiary pays” basis. This is done so the cost of any improvement benefitting only certain customers is not borne by all ratepayers. Customers that require an expansion or enhancement of the system must pay the cost themselves of upgrading their connections.

In some cases, however, improved electricity infrastructure provides broader community and regional benefits by supporting, for example, economic development and job creation. There may be specific electricity infrastructure projects that could unlock the economic potential of a region but face barriers due to the “beneficiary pays” approach.

Ontario will explore ways to use federal or provincial infrastructure and economic development funding to support electricity transmission and distribution infrastructure that supports regional economic development. This approach balances the need to support economic development with the protection of ratepayers.

2017 LTEP – Timeline

- The Ministry of Energy is targeting release of the LTEP in Fall 2017.

CONFIDENTIAL CABINET DOCUMENT

2. 2017 LTEP – OUTLOOK AND FORECASTS FOR FUELS AND ELECTRICITY

A. 2017 LTEP – Fuels Outlooks and Forecasts

- Fuels modelling for 2017 LTEP will align with the revised “IESO Base Case” for electricity (i.e., higher electric vehicle uptake from Outlook C/D and updated prices **for** carbon and natural gas).
- From there, two options are proposed:
 1. IESO Base Case + FTR Outlook F (Fuels Only Initiatives)
 - IESO Base Case with FTR Outlook “F” assumptions for adoption of:
 - Natural gas demand-side management (e.g., conservation, building efficiency);
 - Renewable natural gas; and
 - Lower-carbon fuels for transportation (e.g., natural gas, ethanol, biodiesel).
 2. FTR Outlook F
 - FTR Outlook “F” assumptions (i.e., which includes electrification of space and water heating from IESO Outlook D). This approach would affect the LTEP modelling of electricity demand, emissions and price.

A. 2017 LTEP – Fuels Demand Outlook

- The chart below compares fuels demand under the updated IESO Base Case (June 2017), the updated IESO Base Case with FTR Outlook F Fuels Only scenario and the FTR Outlook F.
- Fuels only scenarios from FTR Outlook F reduces demand by 14% relative to IESO Base Case by 2035.
- The FTR Outlook F reduces demand by 19% relative to IESO Base Case by 2035.

A. 2017 LTEP – Fuels Emissions Outlook

- Emissions from Ontario's fuels sector are expected to decline as a result of electrification of vehicles, as well as conservation and alternative fuel-switching.
- Adopting the fuels only scenarios from FTR Outlook F reduces GHG emissions by 19% relative to IESO Base Case by 2035.
- Adopting the FTR Outlook F reduces GHG emissions by 36% relative to IESO Base Case by 2035.

A. 2017 LTEP – Residential Natural Gas Bill Outlook

- The 2017 LTEP could include a forecast of residential natural gas bills to illustrate the upward pressure from higher commodity costs, increasing impact of carbon prices and the higher costs of introducing alternative fuels into the supply mix (e.g., renewable natural gas).
- IESO Base Case (July 2017 carbon pricing and natural gas forecast) with Option 1 (IESO Base Case plus FTR Outlook F Fuels Only scenarios).*

Typical Residential Natural Gas Bill
(with tax, nominal \$ per month)

A. Considerations/Recommendations

- Pending further discussion, the IESO Base Case + FTR Outlook “F” is recommended as it:
 - Accounts for conservation initiatives such as building energy efficiency upgrades through the use of demand-side management;
 - Includes a renewable natural gas component; and
 - Accounts for the adoption of lower-carbon fuels within the transportation sector (which would include such fuels as ethanol, biodiesel, and natural gas, likely in the form of compressed natural gas or liquefied natural gas).

B. 2017 LTEP – Electricity Outlooks and Forecasts

- The Long-Term Energy Plan (LTEP) is the energy sector's roadmap. It includes 20-year outlooks / forecasts, and identifies initiatives to position the energy sector for the future. Past LTEPs have included:
 - Forecast of typical residential electricity bills
 - Electricity Demand Outlook;
 - Electricity Supply Outlook; and
 - Emissions Outlook.
- The introduction of Ontario's Fair Hydro Plan (OFHP) has impacted the residential electricity bill by reducing costs in the near term. Over the long-term the incurred debt will be repaid by electricity consumers.
- ENERGY and its agencies are also considering options to remove costs from the electricity system through efficiencies, other funding sources and supply mix decisions.
- Savings from the IESO's Market Renewal of up to \$5.2 billion over a 10-year period beginning in 2021 have been incorporated into the electricity outlooks. See appendix slide 40 for more detail.

B. 2017 LTEP – Residential Price Forecast

- The 2017 LTEP will include an updated residential electricity bill forecast.
- Previous LTEP residential bill forecasts have followed a trend of being lower than the prior LTEP.
- Current OFHP forecasts remain below the 2013 LTEP curve (using 750 kWh per month) for the duration of the forecast period.

CONFIDENTIAL CABINET DOCUMENT

B. 2017 LTEP – Electricity Demand Outlook

- The following chart compares the demand forecast in 2013 LTEP, IESO's outlook publically released in September (Outlook B), and the new updated outlook for 2017 LTEP.
- The updated outlook was based on Outlook B with increased EV uptake (2.4 million EVs by 2035) and recent sector updates (about 5 TWh higher than Outlook B by 2035).

CONFIDENTIAL CABINET DOCUMENT

B. 2017 LTEP – Electricity Supply Outlook

- 18 GW of supply resources will reach the end of their contact term by 2035. There will be a need for additional resources in the early 2020s.
 - These resources could offer into the electricity and/or capacity market to provide additional supply as required.

CONFIDENTIAL CABINET DOCUMENT

B. 2017 LTEP – Electricity Emissions Outlook

- With the retirement of coal plants, greenhouse gas (GHG) emissions have dropped by over 80% in the past 10 years. Today, Ontario electricity sector GHG emissions represent about 2% of Ontario's overall economy-wide GHG emissions.
- The trend of lower emissions is forecast to continue over the planning outlook.

CONFIDENTIAL CABINET DOCUMENT

3. INPUTS INTO THE DEVELOPMENT OF THE 2017 LTEP RESIDENTIAL ELECTRICITY PRICE FORECAST

2017 LTEP – Residential Electricity Price Forecast

- The 2017 LTEP price forecast needs to show progress at lowering costs relative to the 2013 LTEP.
- The modelling assumptions for 2017 LTEP Residential Electricity Price Forecast include:
 - Benefits from implementing IESO’s Market Renewal which includes a number of initiatives focused on more efficiently meeting demand; and
 - Ontario’s Fair Hydro Plan (OFHP).
- A decision is required on actions to mitigate increases in the residential bill, in the near, medium and long term, including:
 - I. Funding conservation from Greenhouse Gas Reduction Account (GGRA) proceeds;
 - II. Funding options or suspension of existing and/or planned renewable initiatives;
 - III. Finding Greater Efficiencies (e.g., incenting further efficiencies in the distribution sector);
 - IV. Other measures (e.g., adjust the rate of inflation); and
 - V. Enhancing existing measures (e.g., the Ontario Rebate for Electricity Consumers (OREC)).

A. Ontario's Fair Hydro Plan

- The Ontario Fair Hydro Plan Act, 2017 requires the Minister of Energy to calculate the “Fair Allocation Amount” (FAA) for each 6-month period to 2047.
 - The FAA is the accumulated difference between the allocation of clean energy costs and any associated financing costs payable by specified consumers under the OFHPA and the allocation of clean energy costs that would have been payable by those same consumers absent the OFHPA.
- The FAA aligns clean energy costs with clean energy benefits into the future.
- The Minister is required by the Act to provide the FAA to the Ontario Power Generator (OPG) as Financial Services Manager.
 - The FAA is expected to be set out in a letter from the Minister to OPG.
- The FAA is a constraint on the debt that the Financial Services Manager can finance.
- This is an important input in the development of the 2017 LTEP residential price forecast curve (i.e., the forecast cannot be finalized until the OFHP payback period is finalized).
- The FAA is necessary for the development of a Financing Plan by OPG and must precede the rating and sale of the asset (Fall 2017 TBC).

A. Ontario's Fair Hydro Plan – Fair Allocation Amount

- The Fair Allocation Amount (FAA) forecast outlined below includes a period capped at inflation and is consistent with the *Ontario Fair Hydro Plan Act, 2017*. Under current OFHP forecasts, residential electricity rates would increase at an average rate of about 6% between the end of the inflationary cap until the recovery period (i.e., 2021-2027).
- It should be noted that the outlook is subject to a number of sensitivities (e.g. demand, interest and financing costs, technology performance, system costs etc.) which can significantly impact the price forecast.

	2017-May	2017-Jul	2018-May	2019-May	2020-May	2021-Jul	2022-May	2023-May	2024-May	2025-May	2026-May	2027-May	2028-May	2029-May	2030-May	2031-May	2032-May	2033-May	2034-May	2035-May	2036-May	2037-May	2038-May	2039-May	2040-May	2041-May	2042-May	2043-May	2044-May	2045-May	2046-May	2047-May	2048-May

CONFIDENTIAL CABINET DOCUMENT

Note: Based on a preliminary July 2017 forecast; forecast is subject to change. Assumes 30-year financing period and a nominal interest rate of 5% (compounded monthly). Status Quo forecast beyond 2035 is extrapolated.

A. Ontario's Fair Hydro Plan – Fair Allocation Amount (cont'd)

Considerations

- The Fair Allocation Amount (FAA) forecast includes a period capped at inflation and is consistent with the *Ontario Fair Hydro Plan Act, 2017*.
- Under the OFHPA, the recovery of debt created by the deferral of electricity charges must reasonably align with the fair allocation of clean energy costs.
- Under the FAA, the typical residential electricity bill increases by 6.5% after the end of the cap period, followed by annual increases of about 6% annually until the recovery period.
- Smoothing post the inflationary cap period would provide a larger medium-term benefit to Regulated Price Plan (RPP) eligible consumers when compared to the FAA curve. However, smoothing results in increases above the FAA for the period 2026 to 2047.
 - Further smoothing at an annual 5% increase after inflation cap ends provides puts additional pressure on the incurred debt and represents a funding gap of \$0.7 billion over the same time period when compared to the FAA forecast.

Fiscal Year Impact of the Funding Gap	17-18	18-19	19-20	20-21	21-22	22-23	23-24	24-25	25-26	26-27	27-28	28-29	29-30	30-31

CONFIDENTIAL CABINET DOCUMENT

B. Bending the Future Cost Curve for Electricity Ratepayers

- The 2017 LTEP is an opportunity to profile several initiatives to bend the future cost curve for OFHP-eligible and ineligible ratepayers that could include:
 - I. Funding conservation from Greenhouse Gas Reduction Account (GGRA) proceeds;
 - II. Funding options or suspension of existing and/or planned renewable initiatives;
 - III. Finding Greater Efficiencies (e.g., incenting further efficiencies in the distribution sector);
 - IV. Other measures (e.g., adjust the inflationary cap); and
 - V. Enhancing Existing Measures (e.g., the Ontario Rebate for Electricity Consumers (OREC)).
- The above initiatives reduce the rate increases during recovery period for OFHP-eligible electricity consumers, while simultaneously providing longer term persistent benefits to all ratepayers.
 - Options I-III above benefit all electricity consumers ~~because it decreases total GA. including those currently ineligible for most existing price mitigation programs (e.g., Class B consumers)~~ Consumers that pay disproportionately more GA than other consumers (i.e., Class B) would see a greater reduction than consumers that pay lower GA (i.e., Class A). For example, under current forecasts, every \$100 million removed from GA reduces Class B rates by about \$0.76/MWh.
- Bending the future cost curve ~~could is likely to~~ be achieved through a combination of these initiatives. A summary of each is provided in the following slides.
- Both the fuels and electricity systems are adaptable and provide the opportunity to be leveraged to support the province's economy-wide greenhouse gas (GHG) emissions reduction targets.
 - In order to achieve Ontario's economy-wide GHG targets, increased electrification and additional investment beyond what is envisioned in the 2017 LTEP would be necessary. The Ministry and IESO continue to consider the costs related to these investments (e.g., displacement of some conventional fuels with less carbon-intense alternatives, new emissions-free generating capacity, etc.) and further analysis is pending.

CONFIDENTIAL CABINET DOCUMENT

I. Shifting Costs – Funding Conservation from GGRA Proceeds

- Removing conservation costs from the Global Adjustment (GA) starting in 2018 reduces accumulated debt associated with OFHP by \$3.2 billion from 2021 to 2029 under the scenario that directly returns to the FAA curve after the capped period.

With Conservation	2017-May	2017-Jul	2018-May	2019-May	2020-May	2021-Jul	2022-May	2023-May	2024-May	2025-May	2026-May	2027-May	2028-May	2029-May	2030-May	2031-May	2032-May	2033-May	2034-May	2035-May	2036-May	2037-May	2038-May	2039-May	2040-May	2041-May	2042-May	2043-May	2044-May	2045-May	2046-May	2047-May	2048-May

CONFIDENTIAL CABINET DOCUMENT

Note: Based on a preliminary July 2017 forecast; forecast is subject to change. Assumes 30-year financing period and a nominal interest rate of 5% (compounded monthly). Status Quo forecast beyond 2035 is extrapolated.

I. Shifting Costs – Funding Conservation from GGRA Proceeds (cont'd)

Considerations

- The Ministry could take steps to further reduce the cost curve by transferring the cost of electricity conservation and demand management (CDM) programs, either in whole or in part, from rates to the Greenhouse Gas Reduction Account (GGRA):
 - The Conservation First Framework (CFF) and Industrial Accelerator Program (IAP) are in place until December 31, 2020;
 - Timing aligns with when electricity bills are forecasted to increase (beginning 2021) and is coincident with the next Cap and Trade compliance period;
 - A natural point of change to the governing policy and framework; and
- Removing conservation costs from the Global Adjustment (GA) could achieve ratepayer cost reductions starting in 2027:
 - While less debt and interest is accrued in early years, the OFHP holds bills low until 2027.
- Initiatives funded through GGRA must undergo annual approval by the Minister of the Environment and Climate Change, are subject to fluctuations in the revenue amounts collected through Cap and Trade audits, and will compete with other GHG reduction initiatives.
- GA funding could be used as a backstop for CDM programs if GGRA funding was not available in a given year.
- Conservation must be considered in the context of supply/demand planning. Therefore, it is recommended that the Ministry and its agencies maintain oversight of conservation programs even if funded by GGRA.

II. Supply Mix Funding Options or Suspension

- There are several supply mix and funding options to reduce system costs that achieve similar outcomes:
 - Suspending current and/or planned renewable initiatives; or
 - Funding current and/or planned renewable costs from a different source (e.g., GGRA, federal funding).

Considerations

- Similar funding systems are in place already in Canada. Alberta funds its renewable generating resources with funds generated through its carbon tax.
- Shifting the funding of a percentage (10%) of renewable costs from the Global Adjustment (GA) to the GGRA starting in 2017 would result in cumulative savings of \$7.4 billion, a portion of which would accrue to OFHP consumers (analysis ongoing).
 - The required GGRA funding would be variable due to changes in renewable capacity and generation, and well as variability in the wholesale electricity price.
 - Funding renewables would reduce available GGRA funding for other programs and initiatives.
 - There would be additional administrative burden to shift, manage and track a subset of total renewable costs.
- Not proceeding with MicroFIT 2017 and FIT 5, and exiting LRP1 contracts would result in cumulative savings of over \$1.5 billion.
 - LRP 1 contracts have already been issued. Contract amendments or terminations without the consent of developers could result in legal proceedings against IESO and the Province.
- Similar to seeking federal funding for transmission infrastructure, the 2017 LTEP could represent an opportunity to seek federal funding for renewable generation.

II. Supply Mix Funding Options or Suspension – Shifting the Cost of Renewables

- Scenario modelled removes costs associated with exiting LRP 1 and planned FIT programs starting from 2018.

	2017-May	2017-Jul	2018-May	2019-May	2020-May	2021-Jul	2022-May	2023-May	2024-May	2025-May	2026-May	2027-May	2028-May	2029-May	2030-May	2031-May	2032-May	2033-May	2034-May	2035-May	2036-May	2037-May	2038-May	2039-May	2040-May	2041-May	2042-May	2043-May	2044-May	2045-May	2046-May	2047-May	2048-May

CONFIDENTIAL CABINET DOCUMENT

Note: Based on a preliminary July 2017 forecast; forecast is subject to change. Assumes 30-year financing period and a nominal interest rate of 5% (compounded monthly). Status Quo forecast beyond 2035 is extrapolated.

{ # }

II. Supply Mix Funding Options or Suspension – Shifting the Cost of Renewables

Considerations

- Exiting LRP 1 and FIT programs from 2018 reduces total accumulated OFHP debt as shown in the summary provided above.

CONFIDENTIAL CABINET DOCUMENT

Note: Based on a preliminary July 2017 forecast; forecast is subject to change. Assumes 30-year financing period and a nominal interest rate of 5% (compounded monthly). Status Quo forecast beyond 2035 is extrapolated.

{ # }

III. Finding Greater Efficiencies – Distribution Sector Savings

- Ontario's distribution sector represents \$3.6 billion in annual costs, and typically makes up ~20% of the average residential electricity bill.
- The 2012 Ontario Distribution Sector Review Panel (ODSRP) Report proposed that there was opportunity for \$1.7 billion in savings over 10 years through capital planning optimization and operations, maintenance and administrative (OM&A) reductions as a result of LDC consolidation.
- While the ODSRP recommended legislating LDC consolidation, the majority of the savings they identified were in OM&A costs. These cost reductions could be targeted through other regulatory mechanisms, with a stretch savings target of about \$135 million, to be sustained year over year. Under OFHP smoothing at 6.3%, this would reduce the funding gap by \$0.7 billion and under OFHP smoothing at 5%, it would reduce it by \$1.1 billion.

Considerations

- Through LTEP, the Ministry will request the Ontario Energy Board (OEB) via the LTEP implementation directive to use its authority to create more effective tools to harvest more efficiencies and savings in the distribution sector. Examples of potential mechanisms include:
 - Financial penalties for LDCs who do not meet performance expectations.
 - Requiring LDCs to partner and share back office services.
 - Modernizing regulatory compliance processes to reduce costs.
- The Ministry will also ask the OEB to reevaluate its performance mechanisms to ensure that high-cost LDCs are becoming more efficient through the years and ensure clear metrics are in place to allow for proper evaluations of the low performing LDCs (e.g. further strengthen the scorecard that is already in place by the OEB that evaluates LDCs on various metrics and make it publicly available).
- Analysis is on going to develop a proportional estimate for a typical Toronto Hydro customer

IV. Other Measures – Review Inflationary Cap

- Under Ontario's Fair Hydro Plan (OFHP), typical residential bills would increase at the "rate of inflation" for four years.
- Increasing this cap would have the effect of reducing the incurred debt and smoothing the step change in rates when they return to the Fair Allocation Amount (FAA).
- OFHP modelling previously based on 3% "rate of inflation".

	2017-May	2017-Jul	2018-May	2019-May	2020-May	2021-Jul	2022-May	2023-May	2024-May	2025-May	2026-May	2027-May	2028-May	2029-May	2030-May	2031-May	2032-May	2033-May	2034-May	2035-May	2036-May	2037-May	2038-May	2039-May	2040-May	2041-May	2042-May	2043-May	2044-May	2045-May	2046-May	2047-May	2048-May
Average residential bill	136	121	124	126	129	133	142	150	159	167	174	178	183	188	195	193	198	199	197	196	196	195	195	195	195	195	194	194	194	194	194	194	173

CONFIDENTIAL CABINET DOCUMENT

Note: Based on a preliminary July 2017 forecast; forecast is subject to change. Assumes 30-year financing period and a nominal interest rate of 5% (compounded monthly). Status Quo forecast beyond 2035 is extrapolated.

IV. Other Measures – Review Inflationary Cap (cont'd)

Considerations

- The four-year inflationary cap has been publicly communicated.
- Inflationary increases are specified in O.Reg. 195/17 to be applied by the Ontario Energy Board (OEB) when setting Regulated Price Plan (RPP) rates. This regulation would need to be amended to alter or extend the increase cap.
- A ~~2.53.0%~~ increase during the inflationary cap period reduces the incurred debt by \$~~1.69.4~~ billion from 2018-2021.

CONFIDENTIAL CABINET DOCUMENT

IV. Other Measures – Review Inflationary Cap (cont'd)

Considerations

- Raising the "inflationary" increases during the cap period reduces total accumulated OFHP debt as shown in the summary provided above.

CONFIDENTIAL CABINET DOCUMENT

Note: Based on a preliminary July 2017 forecast; forecast is subject to change. Assumes 30-year financing period and a nominal interest rate of 5% (compounded monthly). Status Quo forecast beyond 2035 is extrapolated.

V. Enhancing Existing Measures – OREC

- Enhancing the Ontario Rebate for Electricity Consumers (OREC) would reduce consumer bills by shifting costs to the tax base.
- Rate relief could be provided through on-bill rebates and ‘shaped’ to align with the post-inflation cap annual funding gap.

Considerations

- There will be a fiscal impact on the province resulting from increasing OREC funding.
- ~~The fiscal impact is front end loaded and could reach \$2 billion per year.~~
- Should smoothing be provided to OFHP eligible consumers, increasing OREC funding could be combined with other initiatives to meet the funding gap between the FAA forecast and required funding.
- Potential impacts on OFHP accounting are still being analyzed.

Infrastructure Funding Options – Program Design Considerations

- An overview of program design considerations is included in the chart below. Program design and delivery is highly dependent on the source of funding, which may include specific targeted priorities.

Focus Areas	<u>Reliability upgrades</u>: Enhancements to single-circuit lines which lack redundancy, power quality improvements including back up generation, ride-through equipment and micro-grids, and upgrades from single-phase to 3-phase power <u>Connection of new load customers</u>: Expansions and enhancements of transmission and distribution infrastructure to enable load customers to grow or establish a new connection. A fund could also target only location-constrained loads, such as mines, which are often located in remote areas without access to existing infrastructure. <u>Facilitating connection of renewable generation</u>: Enhancements to infrastructure to eliminate connection constraints to advance clean energy projects.
Eligibility Criteria	Projects could be evaluated based on criteria such as: – Number of jobs created – Amount of private sector investment – Supported by or aligned with regional and/or community energy plans and regional growth plans – Ownership by or partnership with Indigenous communities – Alignment with environmental objectives (i.e. reducing natural gas behind the meter generation or diesel back up)
Scale	Depending on the amount of funding available, the program could target a few large, high impact projects, many smaller projects or include streams targeting projects of different size and impact. – For comparison purposes, the proposed 230 kV line in Greenstone is estimated at approximately \$200 million, with a potential benefit to present and future companies. Resolving a power quality issue caused by sensitive electrical equipment, such as those identified by Kimberly Clark in Muskoka could be in the \$0.5 million range, though the benefit would be only to one company.
Federal/Provincial Contribution	Provincial and federal governments could contribute a percentage of overall project cost while still requiring capital investment from the benefiting customer(s). Depending on the nature of the infrastructure, the fund could be rebalanced by payments from customers who benefit from the infrastructure later.
Regional and Indigenous Representation	The program could target projects province-wide or include dedicated regional streams and/or a dedicated stream for Indigenous communities.

Infrastructure Funding Options – Program Delivery Considerations

- Program delivery considerations include the delivery model, application process and governance.
- Delivery considerations are highly dependent on the source of funding, which may include specific delivery mechanisms.

Delivery Model	The Ministry could deliver the program or capitalize on existing economic development programs with a new electricity infrastructure stream. Existing programs supported by MEDG and MNM, such as the Northern Ontario Heritage Fund’s Strategic Economic Infrastructure Fund or the Ontario Economic Development Funds could be leveraged to deliver the program. Existing programs contribute in the range of \$1-10 million per project, depending on the number of jobs created.
Application Process	Depending on the nature and amount of the funding, the program could include a single “one time” application window, or rolling applications over a number of years.
Governance/ Oversight	Depending on the delivery model, financial oversight of committed funds will need to be considered. Capitalizing on existing delivery mechanisms would eliminate the need to create new oversight procedures.

Bending the Cost Curve for Electricity Ratepayers

- The government has indicated publicly that the upcoming 2017 LTEP will continue the trend of taking costs out of the electricity system and making it more affordable for ratepayers.
- Ontario has taken a number of actions to lower electricity costs for all consumers by:
 - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., Green Energy Investment Agreement (GEIA) renegotiation, decreasing Feed-In Tariff (FIT) prices, competitive Large Renewable Procurement (LRP));
 - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., no NUG contract extensions and demand response);
 - Suspending the LRP II and the Energy from Waste Standard Offer Program (EFWSOP) – up to \$3.8 billion in cost savings; and
 - Limiting FIT5 procurement target to 150 MW and suspending future FIT procurements – an average annual savings of \$15 million.
- ENERGY and its agencies are also considering options to remove costs from the electricity system through efficiencies, other funding sources and supply mix decisions.

Improving Processes – IESO's Market Renewal

- IESO's Market Renewal includes a number of initiatives focused on more efficiently meeting demand over the near and longer terms. Market Renewal includes the following:
 - Introduce a Day-Ahead Market based on a Single Schedule Market to provide greater certainty to market participants and lower the cost of producing electricity.
 - Reduce the cost of scheduling and dispatching resources to meet demand as it changes from hour to hour and minute to minute through Enhanced Real-Time Unit Commitment.
 - More efficiently manage unexpected short-term changes on the system by enabling More Frequent Intertie Scheduling.
 - Improve the way Ontario procures resources to meet our longer-term supply needs by implementing an Incremental Capacity Auction.

Considerations

- An independent third party report estimates that benefits from IESO's Market Renewal could reach up to \$5.2 billion over a ten-year period beginning in 2021. Note: IESO has incorporated some of this saving into its current Outlook for electricity system costs and residential bills (i.e., Through reduced capacity payments for generators once their contracts expire).
- In addition to the up to \$5.2 billion in estimated benefits, non-quantified benefits are likely to deliver additional value, for example:
 - Inefficiencies in the current market design need to be managed using extensive time and resources including expensive external legal expertise and consultants.
- In other jurisdictions that went through similar changes, actual efficiencies realized have been greater than those expected often because of the non-quantifiable benefits.
 - For example, Southwest Power Pool, a system operator covering 14 U.S. states, realized \$1 billion in savings over a two year period compared to an expected saving of \$400 million.
