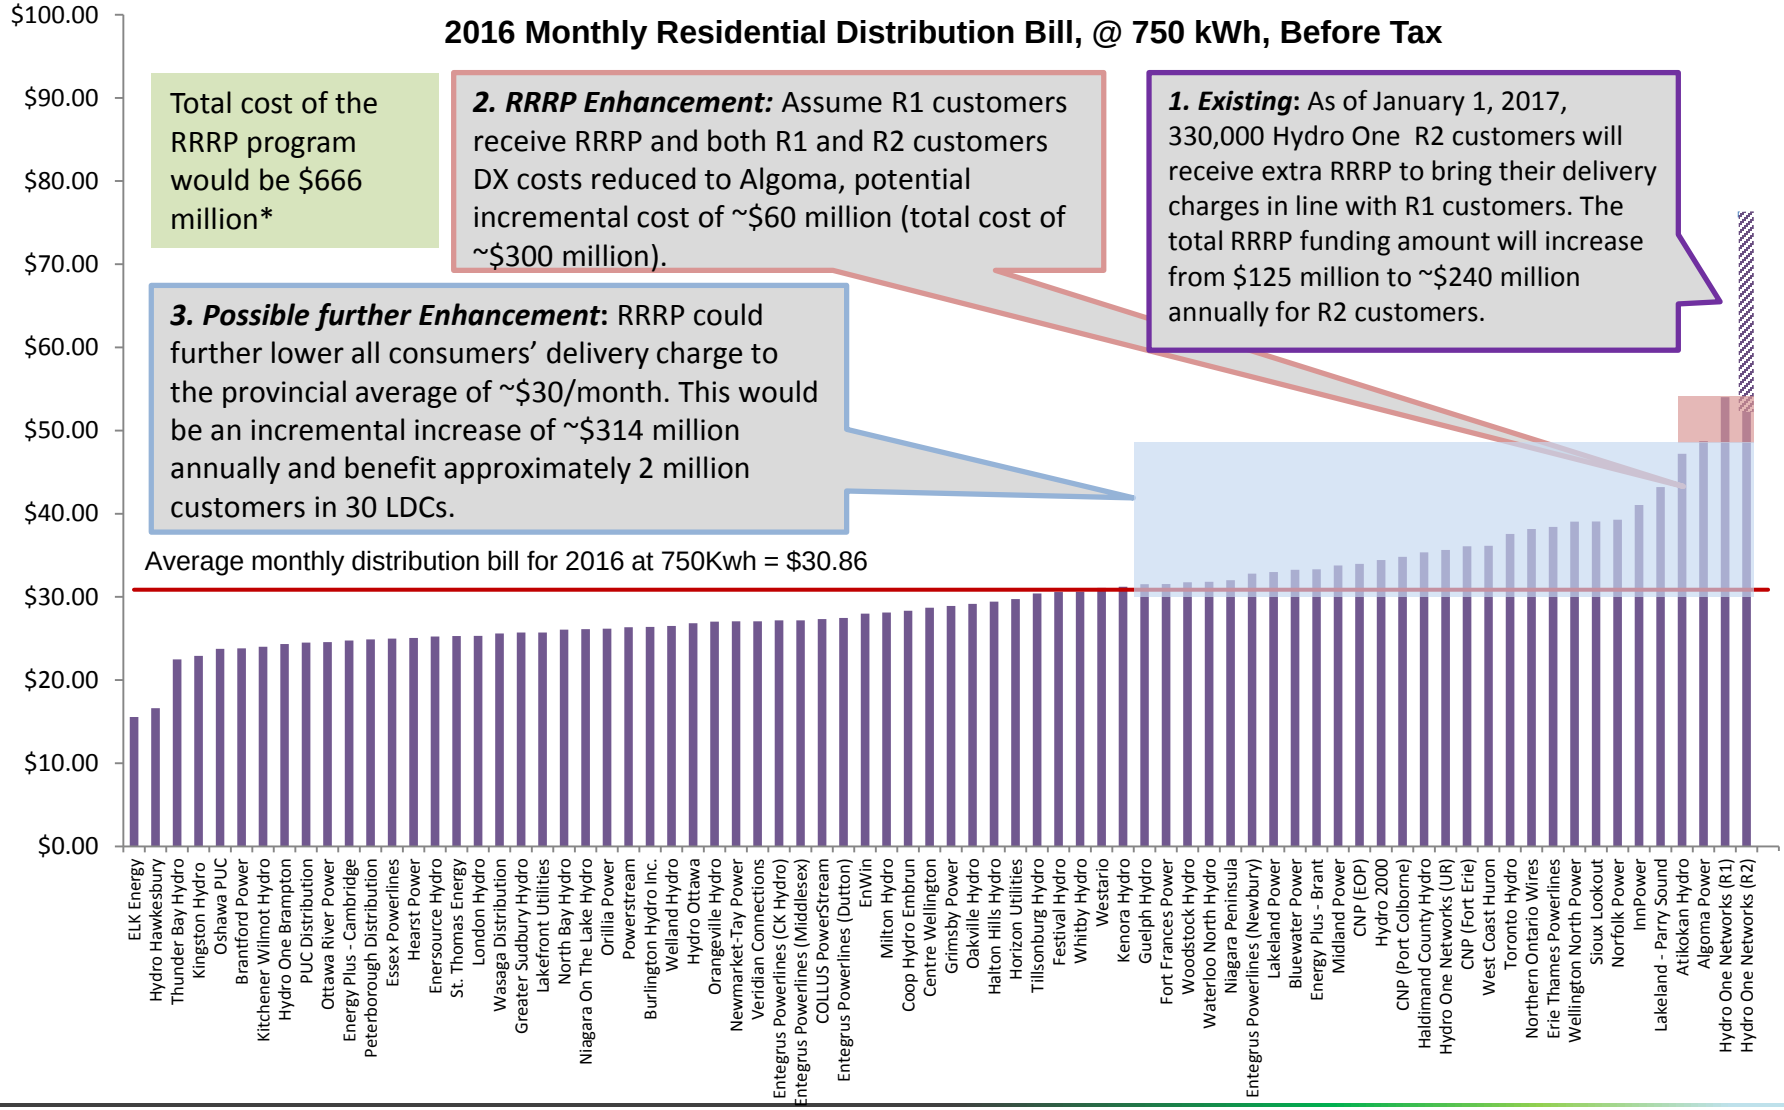
- Although other LDCs do not have medium- and high-density rates, there is a wide range of distribution costs between LDCs. The RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - Could be done on its own or as part of exploring an Ontario-wide uniform "postage stamp" delivery rate.

**Considerations**

- RRRP will be enhanced for R2 customers on January 1, 2017 to have their costs reduced to approximately R1 distribution costs levels. The RRRP could be further enhanced to include R1 customers, and have R2 and R1 customers reduce their costs down to Algoma (see next slide). This would cost $300 million in the first year (and would adjust year over year).
- If there was a desire to reduce costs for all LDCs, a simple average of distribution cost before tax, across all rate zones is $30.86 per month, for a residential customer consuming 750 kWh per month.** Bringing all delivery rates down to this average would cost approximately $500 million for the first year, with escalation in line with average distribution rate increases.
  - This assumes Hydro One R2 consume 1,200 kWh and H1 R1 customers consume 1,000 kWh per month.
- If all customers were brought down to the average costs (see the chart on the next slide for more detail):
  - It is assumed that residential customers with bills less than the provincial average see no change;
  - Majority of the enhanced benefit would go to Hydro One R1 and Toronto Hydro customers; and
  - Mechanism to ensure that LDCs continue to be motivated to achieve efficiencies would need to be designed (see section 4).
- Enhanced RRRP support may be best provided from the tax-base, because if funded from the rate-base, it would increase the costs for all customers who may argue that it is unfair that they are being asked to pay more to subsidize those in other LDCs.
- In conjunction with using the tax-base to reduce delivery charges to the provincial average, the OEB could be asked to explore moving to a province-wide "postage stamp" delivery rate that would be the same across the province to be implemented over time.
  - Could be "winners and losers" as delivery rates less than the average would go up in a postage stamp model;
  - A "postage stamp" model could help incent LDC consolidation.

**Note:** This is based on preliminary estimates and the amount will fluctuate on monthly consumption from customers and LDCs have different customer base with different consumption types.

# 1. Rural or Remote Rate Protection (RRRP) Expansion (cont'd)



*Note: this includes the ~$50M currently supporting Algoma Power and Hydro One Remotes.*

# 2a. Enhance Ontario Electricity Support Program (OESP) Benefit

- The OESP is an income-tested, application based program that lowers the electricity costs of the most vulnerable consumers by providing a rebate directly on their electricity bills. The OESP provides basic benefits to most consumers and enhanced benefits to Indigenous customers and customers with electric heat and medical devices and at launch, it was estimated ~560,000 families could be eligible and some 261,000 applications have been submitted.

- The OESP program benefits could be increased across the board by 50%, which would mean:
  - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
  - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).

- The OESP program could also be further enhanced by working to ensure the program uptake is as close as possible to 100%:
  - Streamlining the application process to make it easier and quicker to get through;
  - Putting in place a more aggressive communications strategy to make sure people are aware of the program;
  - Increasing funding for key partner agencies to work directly with individuals who are applying; and
  - Exploring automatic OESP qualification for those who receive provincial programs (e.g., ODSP).

**Considerations**

- If the OESP was funded by the tax-base, it could also be explored whether the OESP could be better delivered as a provincial program via the tax system. This may help ensure that the program's participation rate is as high as possible.
  - At the time of program design, advice was given that a 40-50% participation rate would be high for an application-based program delivered through electricity bills.
  - The province would need to work with LDCs if the rebate was to appear on electricity bills rather than be delivered via the income tax system (e.g., through the Trillium Benefit).

# 1 & 2a. Fiscal Impacts of RRRP, OESP and First Nation Rate

- Table below shows estimates of program costs up to 2022:

| Year | OESP ($M) | OESP + 50%($M) | RRRP($M) | RRRP Enhancement ($M) | First Nations Delivery Rate($M) | TOTAL RANGE ($M) (from status quo to OESP and RRRP enhancements) |
|---|---|---|---|---|---|---|
| 2017 | $108 | $162 | $292 | $374 | $18 | $418 to $846 |
| 2018 | $150 | $226 | $300 | $384 | $18 | $468 to $928 |
| 2019 | $186 | $279 | $306 | $394 | $18 | $510 to $997 |
| 2020 | $215 | $322 | $315 | $404 | $18 | $548 to $1,059 |
| 2021 | $243 | $365 | $322 | $415 | $18 | $583 to $1,120 |
| 2022 | $272 | $408 | $329 | $426 | $18 | $619 to $1,181 |

1) Ontario Electricity Support Program (OESP)
   - After almost a year in market, close to 30% of potentially eligible customers are signed up.
   - The cost projections above assume the program grows to 100% of eligible consumers by 2022 and remains at that level.
   - The second column forecast also assumes the existing credit amounts increase by 50%.
     - Forecast assumes 10% administration costs
     - Forecast does not account for the approximately 142,000 low-income households that OEB estimated are not eligible because they do not directly receive an electricity bill.

2) Rural and Remote Rate Protection (RRRP)
   - Provides benefits to R2 Hydro One consumers, Algoma, and remote communities.
   - Includes the expanded coverage that will begin on January 1, 2017.
   - Expansion to cap distribution rates for other customers is based at $374M and assumes escalation of 2.6% (historical average dx rate increase). This is a conservative estimate, as Hydro One and Toronto Hydro increases could drive program costs beyond the average increase.

3) First Nation rate reduction (currently under development)
   - On November 14, 2016, OEB presented options to the Ministry on reducing costs for on-reserve First Nation customers.
   - OEB's recommended option to provide 100% delivery rate credit, which is estimated at $18.4 million per year.
     - Other options includes a seasonal fixed credit to account for demand changes over the year ($13 million) or a 50% total bill reduction ($23 million).

# 2b. Expand OESP Eligibility

**Expanded Coverage**

- When OESP was being created, the OEB estimated that are 713,000 low-income households, of which 20% do not receive electricity bills. Thus, only 571,000 would potentially be eligible for OESP.
- If moved to the tax base, the OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity.

**Eligibility Categories**

- OESP has two credits amounts:
    1) Basic credit of $30-50 per month, based on the level of income and the number of residents.
    2) Enhanced credit of $45-75 per month for those with unique electricity needs:
        a) Electric heating,
        b) Indigenous customers, and
        c) Certain electrically intensive medical devices.
- The enhanced credit can be expanded to include additional eligibility categories of customers. For example, a new “Low Density Consumer” category could be introduced that provides Hydro One R2 customers (highest distribution rates) eligible for OESP the enhanced credit.

**Considerations**

- Potential costs for expanded coverage and new eligibility categories depend on updated estimates and changes to program design and delivery.
- There would be value in keeping the OESP as an income-tested program to distinguish it from other initiatives (e.g. RRRP, which is designed to address disparity between rural and urban distribution costs).

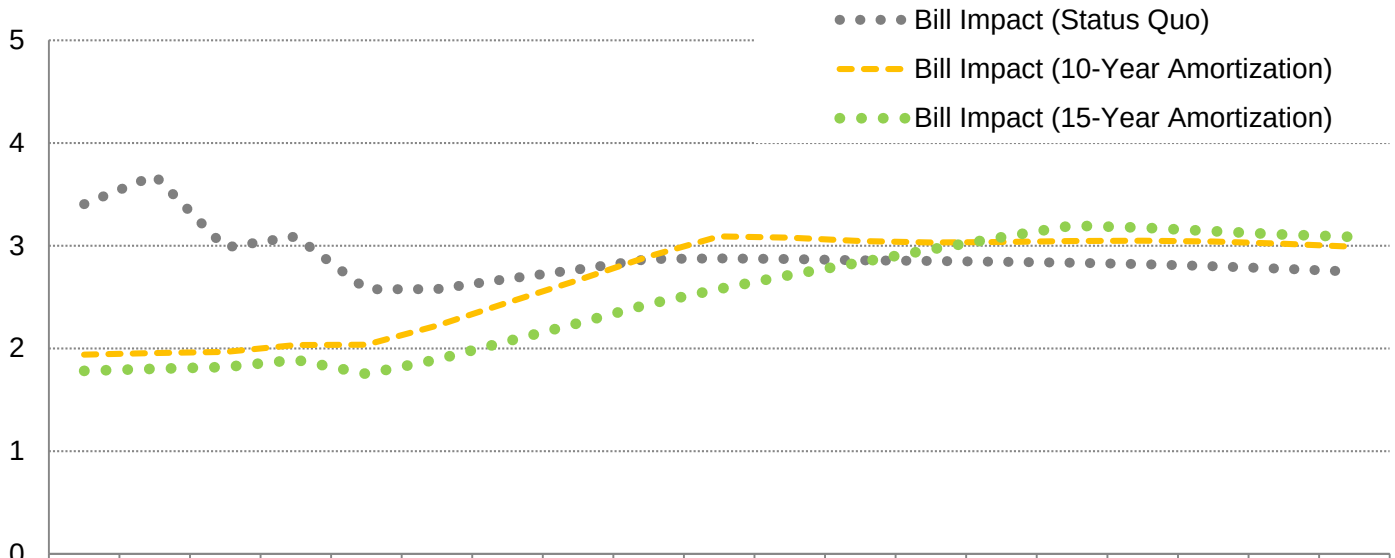
# 3a. Amortize Conservation Program Costs

- ~$3 billion from the electricity ratepayer base will be spent on conservation programs delivered under the Conservation First Framework (CFF) and the Industrial Accelerator Program (IAP) between 2015 and 2020.
- Currently, Conservation and Demand Management (CDM) program costs are recovered from the Global Adjustment (GA) mechanism about one month after expenses are incurred.
- As a potential rate mitigation measure, certain CDM costs could be amortized. This would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs).
  - The time period over which costs could be amortized would be over the lifetime of funded CDM measures.
  - ENERGY is working with IESO to determine the appropriate lifetime period – the graph on the next slide, which illustrates residential bill impacts, presents two cases: **10-year and 15-year measure lifetimes**.
- In both cases, amortizing a portion of conservation spending would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020. Over time the benefit would decrease and turn into a cost (higher electricity rates than would otherwise occur), as interest charges begin to grow. Estimated interest charges are as follows (a 3% interest rate is assumed; increases in interest rates could result in higher overall interest charges):
  - $712 million ($2016) – Amortizing eligible 2017-2035 CDM costs for 10-year period; and
  - $1.3 billion ($2016) – Amortizing eligible 2017-2035 CDM costs for 15-year period .
- Legislative changes would be needed to allow recovery of interest payments from ratepayers, or these costs could be recovered from the Consolidated Revenue Fund (CRF, or taxes).
- An alternative that could be explored would be to pay for CDM costs, or for a portion of these, from the tax-base (*see Appendix for more detail on tax funding option*).

# 3a. Amortize Conservation Program Costs (cont'd)

## Conservation Residential Bill Impact – Status Quo, 10-Year and 15-Year Amortization

***CDM Bill Impact ($/month)***



| | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 | 2031 | 2032 | 2033 | 2034 | 2035 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bill Impact (Status Quo) | 3.40 | 3.68 | 2.98 | 3.09 | 2.58 | 2.58 | 2.68 | 2.77 | 2.87 | 2.88 | 2.87 | 2.86 | 2.85 | 2.84 | 2.83 | 2.82 | 2.80 | 2.78 | 2.75 |
| Bill Impact (10-Year Amortization) | 1.94 | 1.95 | 1.97 | 2.03 | 2.04 | 2.22 | 2.45 | 2.67 | 2.90 | 3.09 | 3.08 | 3.05 | 3.03 | 3.04 | 3.04 | 3.05 | 3.04 | 3.02 | 2.99 |
| Bill Impact (15-Year Amortization) | 1.78 | 1.80 | 1.82 | 1.89 | 1.75 | 1.89 | 2.07 | 2.25 | 2.43 | 2.58 | 2.71 | 2.84 | 2.96 | 3.08 | 3.20 | 3.18 | 3.14 | 3.11 | 3.09 |

Source: IESO; Ministry of Energy

**Note**: Chart assumes that conservation incentive costs are available for amortization while administration cost are not. Although there is variable from year to year, incentives represent about two-thirds of conservation spending in Ontario. Chart assumes conservation spending continues at a similar rate beyond 2020. Chart assumes a 10 of 15-year borrowing rate of 3.0%.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- Under **Public Sector Accounting Board (PSAB) accounting standards**, used by both the Province and IESO, only certain assets can be amortized: 1) pensions and 2) tangible capital assets. Under PSAB an asset must meet several criteria to be considered a capital asset, including:
  - A tangible capital asset must be tangible and substantive and the Ontario government must have title and operate the asset.
  - A tangible capital asset must bring a tangible benefit to the government or to Ontario.

- CDM costs, on their own, do not meet the criteria of a tangible capital asset because customers would have ownership and control of installed CDM measures, not the Province or IESO.

- **Rate-regulated accounting** was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- If some of Ontario's CDM costs could be amortized, analysis shows that ratepayer impacts would be reduced in the short-term but interest charges on the loan would result in increased overall ratepayer costs in the longer-term.
- Legislative amendments would be needed to allow recovery of loan interest charges from GA.
- ENERGY staff have developed a note to seek an opinion from IESO's external auditor and from the Ontario Provincial Controller (OPC) to determine whether CDM costs could be amortized according to rate-regulated accounting standards.
- ENERGY is working with IESO to seek an opinion on the proposal from IESO's external auditor.
- ENERGY would then send the IESO external auditor's opinion along with ENERGY's explanatory note to the Ontario Provincial Controller (OPC) to seek a formal opinion on whether CDM costs could be amortized according to rate-regulated accounting standards.
- Further legal analysis would also be required to confirm legal viability and possible approaches to implementation.

# 3b. Rate Smoothing of Conservation Program Costs

- "Rate smoothing" could achieve the same rate reduction effect as amortization.
- Instead of taking out a loan to amortize conservation costs, a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Each year, IESO would defer recovery of a portion of annual conservation costs. Financing would also be required, such as from the OFA, to pay the interest on the deferral account. Interest would accrue on the deferred amounts, likely at the same rates as for the amortization option.
- Deferred costs could be recovered over any time period. If a 10 or 15 year-period was chosen, the rate impacts would be the same as in the amortization option.

**Considerations**

- Option would **not** require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open the Ministry to criticism by the Controller and/or Auditor General since the rate impact is the same.
- The Ministry would have more control under this option to change deferred amounts each year, as opposed to the terms set by a loan agreement under the amortization example.
- There is precedence to this approach for nuclear investments, which otherwise would result in volatile increases and decreases for Ontario ratepayers over the investment period. In 2015, the Ministry amended a regulation that requires the Ontario Energy Board (OEB) to set "smoothed" nuclear rates for OPG's Darlington and Pickering nuclear stations over a 20-year period.
  - The regulation allows OPG to defer recovery in rates of a portion of its nuclear revenue during the Darlington refurbishment (expected to be complete in 2026) and recover these deferred costs over the remaining ten years.
  - OPG will establish a "deferral account" to record the deferred amounts each year up to 2026 plus accumulated interest on the balance to reflect OPG's financing costs as a result of rate smoothing. The deferral account is then drawn down on a straight-line basis between 2026 and 2036.
- At minimum, new regulation would be required. However, further analysis is needed to determine the relevant regulation or legislation, to be amended for IESO (e.g., OEB regulation of IESO costs and fees, GA regulation for how IESO recovers its conservation costs from ratepayers).

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure

- Fund investments in specific energy infrastructure projects through the tax-base. **Note:** This could include the provincial portion of funding for the Remote First Nation Connection Project, a fund to support projects that improve adequacy and reliability in areas where new transmission would unlock economic growth and expansion of natural gas service to underserved communities.

**Considerations**

- Tax-base funding would allow for energy infrastructure to be built without impacting electricity and natural gas rates.

*Remote Connection Project:*

- Ontario ratepayers currently support costs of remote electricity service through RRRP on the order of $28 million/year
- Connecting 21 remote communities to the Ontario grid is supported by a positive business case due to diesel cost savings over time. If RRRP is funded through the tax base as proposed above, this project represents an opportunity to reduce impacts from RRRP.
- Direct investment in Ontario's portion of the capital costs of the project through a provincial fund (e.g., Trillium Trust) could also be considered along with mechanisms for cost recovery through transmission rates to refresh the fund as industry benefits from the transmission investment.
- The amount of investment and long-term savings depend on a federal contribution to the project and ENERGY is currently in discussions with Canada with the goal of concluding a cost-sharing agreement by spring 2017.
- A move to tax-based funding may have implications for cost oversight, since the OEB's mandate is to have oversight of ratepayer impacts. Alternative methods to review cost prudence of tax-based funding may be needed.

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (cont'd)

**Considerations (cont'd)**

*Transmission Projects to Enhance Economic Growth:*

- A tax-based fund could target investments in projects that have been identified in IESO regional plans and that would stimulate economic growth but are not proceeding due to cost barriers under the OEB's beneficiary pays principle. Investments could also target areas where the existing system poses challenges for delivering reliable service such as in parts of Northern Ontario with long single circuits.
- Potential opportunities for investment could include a transmission reinforcement in the **Greenstone area**, upgrades south of **Red Lake** and others TBD based on program design.
- This approach would allow a potion of project costs to be socialized to advance key projects without impacting rates or OEB's principles of cost allocation. Scope and scale of fund would be refined through program design.

*Natural Gas Expansion to Underserved Communities:*

- The Government has currently committed to expanding natural gas access to more communities in Ontario (i.e., $200 million Natural Gas Access Loan and $30 million Natural Gas Economic Development Grant).
  - Natural gas is an affordable heating source in Ontario. Its continues to be less expensive than alternative sources such as electric baseboards, heating oil and propane. For example, switching from oil to natural gas can save an average consumer an estimated $1,500 annually.
  - Increasing access to other energy sources such as natural gas, provides Ontarians with more options to meet their needs, reduce their energy costs and improve their quality of life.
  - Expansion of natural gas delivery infrastructure is widely supported in underserved communities (i.e., a recurring theme at ROMA) as a means to provide consumers and businesses in underserved communities with more affordable energy choices, attract new industry to Ontario and benefit agricultural producers.
- A grant program complements the Ontario Energy Board's recent decision enabling greater rate-based expansion to unserved areas, including rural and remote communities.
  - Applying Trillium Trust funding would make it possible to enhance the Grant Program and service more communities.

# 5. Dedicate Departure Tax

- In connection with the IPO, as a result of leaving the PILs regime and entering the corporate tax regime, Hydro One was deemed to dispose of its assets for proceeds equal to its fair market value, triggering a PILs liability of $2.6 billion (Departure Tax).
- This was paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt.
- The Province could explore repurposing some of those funds to the benefit of ratepayers.
- This may reduce the risk that the Ontario Energy Board (OEB) assigns to ratepayers the benefit from an associated tax asset, resulting in lower earnings and decreased share value for Hydro One. This decision is currently before the OEB, as part of Hydro One's Transmission rate application.
- If the Province were to transfer $2.6 billion in economic benefits to the rate base over 10 years suggest the following impacts (assuming 140TWh per year):
  - Residential Ratepayer Impact (if spread over 10 years): up to $1.39 per month on a typical bill; and
  - Industrial Ratepayer Impact (if spread over 10 years): up to $1.86 / MWh

**Considerations**

- Cost savings to ratepayers and associated fiscal impacts would depend on timing and which ratepayers (e.g., Hydro One customers, or all Ontario customers) will benefit from some or all of the $2.6 billion value.
- The departure tax was effectively a true-up for lower PILs payments from Hydro One in previous years – it was not a one-time windfall for the Province. In other words, it ensures that Hydro One paid all its tax obligations under the PILs regime before moving into the normal corporate tax regime.
- The related ~$2.4 billion fiscal benefit to the Province (from the deferred tax benefit) has already been credited to the Trillium Trust to be used to build infrastructure under Moving Ontario Forward.
- Repurposing funds paid to OEFC may have an impact on the defeasance of electricity stranded debt.
- While this is a shift from messaging that value from the broadening of ownership of Hydro One is being used pay down debt and fund transit and transportation, the Province could link to electricity infrastructure investments (e.g., as an offset to infrastructure investments already made in the sector, or to specific initiatives such as conservation).

# 6a. Empower Energy Agencies – IESO / Market Renewal

- Continue to move forward with IESO's Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2021, leading to a reduction of:
  - About $1/month or less than 1% at current retail prices for a typical residential bill; and
  - About $1.30/MWh at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.
- IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.

# 6b. LDC Efficiencies and Rates

- Reducing costs and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills.
  - Currently, LDCs recover costs through the Delivery line of the electricity bill, which is broken into Distribution and Transmission costs. LDCs are responsible for the Distribution costs of the electricity bill which account which account for about 20% of the total bill.
  - Distribution costs vary across the province as LDCs have different service territories and needs (e.g., geography, number of customers, density of customers, life/health of capital assets, etc). See next slide for more detail.
    - For example, comparing 2016 with 2006, distribution rates have increased by about 24.5% (or about 2.2% per year, compounded annually) across the Province, with significant variation between regions and LDCs (-17% to 148%). Overall consumer price inflation in Ontario for the same period increased by about 19% or 1.8% per year.

**Considerations**

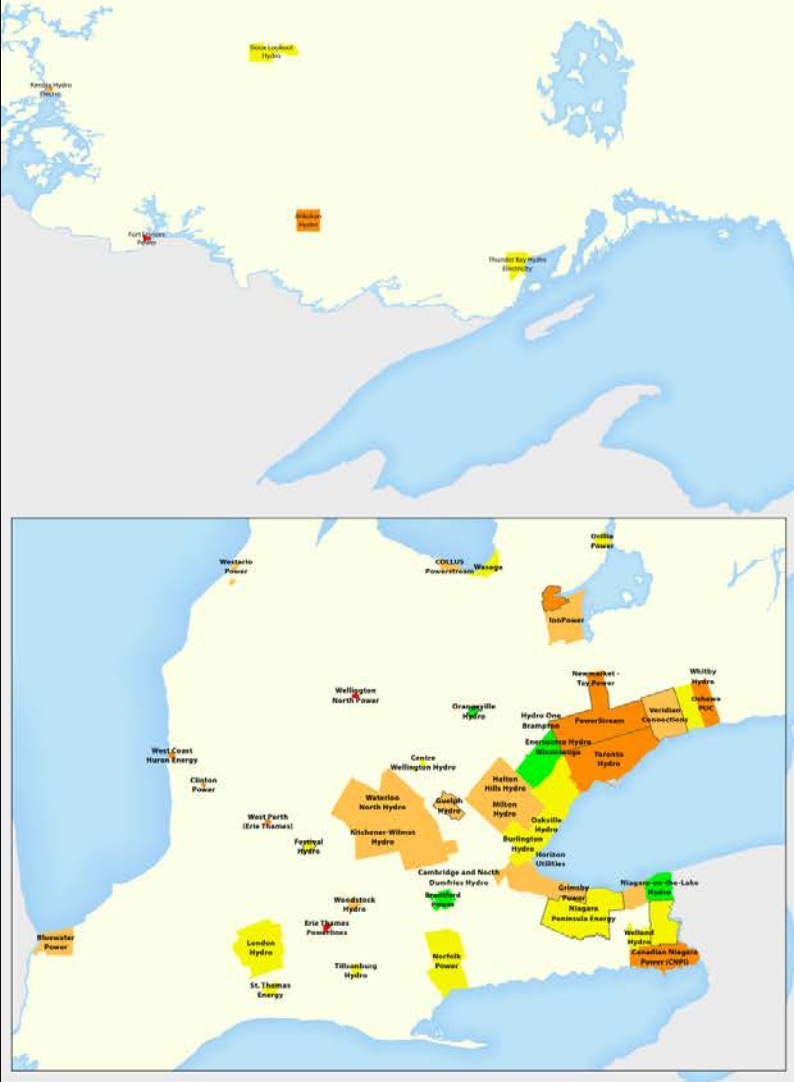
- The Ontario Energy Board (OEB) has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates. Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.

- There maybe opportunities to promote further cost reductions and performance improvements within the distribution sector as there is continued evolution of the regulatory framework in Ontario.
  - Tightening LDC requirements may also indirectly incent other desired policy outcomes, such as LDC consolidation and grid modernization to realize further cost reductions.
  - To further help address the costs associated with the Delivery line of the electricity bill, program such as the RRRP (previous slide) could be expanded to include other customers that may face higher costs.

- ENERGY could help promote or accelerate these efforts by asking the OEB through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and the 2017 Mandate Letter and other agency business planning processes.

- In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. The Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities. The panel recommended legislation to mandate consolidation.
  - Rather than mandating consolidation, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation. Further changes to the tax incentives and/or revisiting legislated consolidation could be considered.

# LDC Distribution Rate Changes (2006 vs 2016)



| Total Dx Rate | 2006 | 2016 | % Rate Change |
|---|---|---|---|
| Hydro One UR (High Density) | $29.13 | $35.65 | 22.4% |
| Hydro One R1 (Medium Density) | $37.73 | $54.02 | 43.2% |
| Hydro One R2 (Low Density) | $44.65 | $76.14 | 70.5% |

## Legend

**LDC Rate Comparison 2006 vs 2016**

**% Total Rate Change ( # of LDCs )**

- -17.3% to 0% ( 5 )
- 0.1% to 15% ( 25 )
- 15.1% to 30% ( 21 )
- 30.1% to 60% ( 16 )
- 60.1% to 89.3% ( 4 )
- Merged LDCs

Below LDCs had either acquired or merged: (# of merged LDCs)

a. Powerstream Inc. ( 5 )
b. Chatham-Kent Hydro Inc. ( 13 )

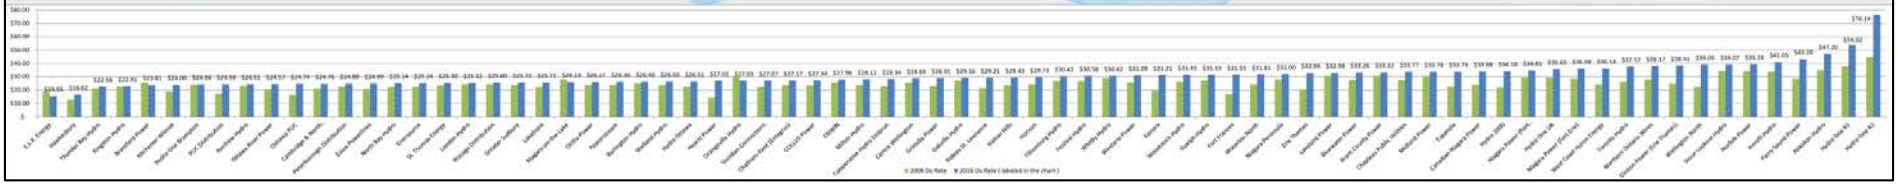
## KEY FINDINGS

- In summary, distribution rates (including rate riders) have increased by about 24.5% across the Province, with significant variation between regions and LDCs (-17% to 148%).
- There is generally no correlation between LDC size or location and distribution rate increase in absolute or percentage terms.
- The current analysis shows no clear relationship between the percentage rate increase and the absolute rate level (that is, high rate increase LDCs may still have among the lowest rates, and low rate increases may have higher rates.
- No clear relationship between amalgamation and rates.
- The analysis does suggest that Hydro One has the highest rates, and some of their customers have seen higher than average rate increases.

## NOTES

- **Rate Calculation:** Monthly residential distribution bill rates, before taxes, are based on consumption of 750 kWh. Distribution charges account for approximately 23% of the average 2016 residential bill.
  All figures calculated by ENERGY staff without input from OEB.
- **Colours:** Colour coding of the map only depicts the change in LDC rate amounts (i.e. LDCs in red don't necessarily have the highest total rates).
- **Mergers:** Rates for customers in merged LDCs have experienced different levels of change. For merged entities, the largest LDC in 2006 was used. An accompanying map focuses on merged entities.
- **Points in Time:** Current analysis compares 2016 and 2006 only. Rates could have had an uneven trajectory, especially considering regulatory decisions such as time limited charges/rebates with temporary impacts.



# 6c. Empower Energy Agencies – OPG / Operational Efficiencies

- Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh).

**Considerations**

- OPG recently submitted its 2017-19 business plan to the Province for concurrence. That plan includes the following:
  - Enterprise total generating cost increasing from $48/MWh in 2016 to an average of $55/MWh over the plan period.
  - An average residential monthly bill increases of $1.05/month annually from 2017-2021.
- Much of this increase is due to the Darlington refurbishment project, which increases costs and reduces OPG's generation over the planning period.
- OPG has also shared its stretch targets for total cost of generation, which average $52/MWh over the 2017-19 plan, a ~$3/MWh reduction (5-6%) relative to its $55/MWh business plan targets.
- The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This is a public document that OEB would likely review and incorporate as part of OPG's current rate application.
- Consistent with regulations under the *Ontario Energy Board Act*, OPG is seeking smoothed rates for nuclear as part of its 2017-2021 rate application.
  - As a result, the benefit to ratepayers of reducing generation costs is uncertain.
  - Given that the application extends beyond the business plan period, and to ensure OPG does not delay costs beyond the planning horizon, the Province may want to provide additional direction for out year expenditures.
- If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.
  - The total cost of $3/MWh based on OPG's forecast production of 74 TWh/yr is about $240 million per year.
- The Province could work with OPG to craft language in the concurrence letter in order to avoid setting unintended precedents for future rate application processes.

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate

- OEB continues to move forward with its Regulated Price Plan (RPP) Roadmap:
  - The OEB is undertaking a comprehensive review of the RPP, including exploring the introduction of offering different pricing plan options for customers following the completion of pilot programs in 2018. The plan is expected to be implemented over a 3-5 year period.
- Until new pricing plans are available, the OEB could provide an "opt-in flat rate RPP" structure that could be made available to residential, farm and small business consumers on an interim basis (2-3 years) until a wider range of price plans are available, providing customers with pricing choice.
- Time-of-Use (TOU) pricing could also be introduced for non-RPP Class B consumers to reduce Global Adjustment (GA) volatility and reduce system costs.

| Current TOU | New Flat Rate |
|---|---|
| On: 18.0 ¢/kWh | 11.1 ¢/kWh |
| Mid: 13.2 ¢/kWh | |
| Off: 8.7 ¢/kWh | |

**Considerations**

- Would provide consumers with electricity pricing choice.
- The OEB has indicated that the option would lead to no overall change in system costs. Consumers with higher peak and mid-peak usage patterns would see a decrease in their electricity bills, while those with higher off-peak usage patterns would see an increase.
  - While the current strong supply conditions may allow for such an RPP structure (i.e., peak demand requirements can be easily met), administrative costs could be high (distributors would need to design/implement an opt-in process and associated billing system on an interim basis).

| | Current TOU | New Flat Rate |
|---|---|---|
| 1) Monthly electricity bill- higher peak and mid-peak usage patterns | $172 | $163 |
| 2) Monthly electricity bill- higher off-peak usage patterns | $152 | $163 |

***Note:** 1) assumes a consumer consumption pattern of 45%:30%:25% (Off-peak: Mid-peak: On-peak), while 2) assumes consumer consumption pattern of 80%:10%:10% (Off-peak: Mid-peak: On-peak). Estimates are based on OEB's online electricity bill calculator (for Toronto Hydro- November 2016 rates)

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate (cont'd)

**Considerations**

- The decision to undertake smart meter investments was partly justified on the basis of TOU pricing. If TOU pricing were to be made optional, some stakeholders could question the rationale for smart meter investments.
  - Rationale for offering a flat rate option could focus on providing customers with choice until new pricing plans are rolled out under the RPP roadmap.

- If a flat rate design is introduced, there could be significant consumer opposition to any return to a mandatory TOU.

- After the interim flat rate period, the OEB could offer a wider range of pricing plans to consumers.
  - As part of its RPP review, the OEB will be running pilots with LDCs to assess customer response to alternative time periods and pricing structures.
  - Learnings from these pilots will help inform potential changes to the RPP. Pilots are expected to be in market May 2017 and run for one year.

- Non-RPP Class B electricity consumers currently pay Global Adjustment (GA) on a volumetric basis. Moving them to TOU would provide an incentive to shift consumption to off-peak periods.
  - Consumers, including manufacturers, who are unwilling to shift would face higher costs and likely not be supportive of the changes.
  - The decision to pursue TOU pricing for non-RPP class B consumers will impact proceeds recycling as there is interplay between the two initiatives.

# 7b. Give Consumers More Rate Choices and Greater Transparency – Detailed Global Adjustment

- Provide electricity consumers greater transparency with respect to electricity generation costs by providing more details regarding the Global Adjustment (e.g., adding a line on hydro bills, quarterly energy reports, etc).

**Considerations**

- As electricity bills have increased, many consumers have complained about a lack of transparency on the drivers of electricity costs. In particular, consumers and legislative officers have singled out the GA.

- Providing consumers with additional information on the cost components and amounts recovered through the GA would help consumers understand how the different forms of electricity generation in Ontario contribute to consumers costs.

- Providing additional information to consumers on electricity commodity cost drivers without sufficient context or background could simply lead to increased complaints about particular generating technologies that make up large shares of costs (e.g., nuclear).

- Adding a breakout of the amount of GA on residential electricity bills could lead to further confusion due to the existing breakout of multiple time-of-use buckets.

- Alternatively, the existing quarterly Ontario Energy Report, which provides various energy sector data, could be leveraged to show a breakout of quarterly GA costs by fuel type. A link on electricity bills could point to this information.

# 8. Help Small Business Manage Their Electricity Cost – End DRC Early for Class B Electricity Consumers

- Propose to remove the $0.07/kWh Debt Retirement Charge (DRC) from the bills of commercial/small industrial Class B consumers beginning in 2017, instead of April 1, 2018.
  - **Note:** Class A consumers (e.g., large industrial) would continue to pay DRC until at least April 1, 2018.

**Considerations**

- For a Class B consumer currently paying about $152/MWh, removing the DRC would represent a savings of about 5%.
  - A 50% reduction in the DRC charge would represent a savings of about 2%.

- Alternatively, the reduction of the DRC could be to $0.035/kWh starting in 2017, to provide relief for cap and trade until proceeds recycling is fully operational.

- Residential consumers have had the DRC removed from bills since January 1, 2016. Taking DRC off commercial and small industrial bills would result in equal treatment for these groups of consumers.

- The savings for commercial and small industrial consumers associated with this proposal would drop to zero in April 2018, since this is the current planned date for removing the DRC from non-residential bills.

- Prior to moving forward with this proposal, additional analysis from Legal Services and the MOF would be needed.

# 9. Extend Length of Existing Wind / Solar Contracts

- Wind and solar developments are typically contracted through standard offer procurements on 20 year fixed terms at fixed pricing.
- Many of these projects have already reached commercial operation.
- The province could explore options for IESO to negotiate extensions to existing renewable energy contracts, for example, by 10 years, in return for the proponents agreeing to a lower price in the near term.

**Considerations**

- Projects in commercial operation offer potential for near-term rate reduction whereas projects that have yet to reach commercial operation provide potential to mitigate future rate increases only.
- The attractiveness of this option to contract holders would vary from project to project and would depend on project economics.
- Revised pricing would be subject to negotiation, and associated ratepayer savings would be difficult to forecast accurately.
- The duration of contract renegotiation is difficult to forecast and may not be achievable in the near term.
  - Proponents may have to renegotiate their project financing arrangements, ensure project investors are satisfied with any changes in ROI, and extend land leases.
- Project host communities and Indigenous communities whose traditional territory the projects are sited in may not be interested in these projects extending their operational period ; discussions/consultation may be required in advance of this potential option moving forward.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Should Ontario be successful in negotiating lower prices in the near term, it should be noted that contract holders will be in a strong bargaining position (given their existing fixed-priced contracts), and will likely extract additional value from the negotiations.

- Since the Minister of Energy is not a party, IESO would be required to renegotiate the contracts, which would likely involve a direction or directive to IESO.

- Further analysis is required as to how ENERGY could express its policy intent to have IESO renegotiate the contracts for a reduced rate at a longer term, however it is unlikely that IESO could guarantee the outcome.

- Further analysis is required to ascertain whether there is scope within the existing contracts for IESO to renegotiate their terms in this manner.

- Extending contract terms would also reduce planned flexibility and increase the risk of overpayment as this existing capacity would now be contracted into the 2040s and not the 2030s.

- Extending contract terms may require investments in component replacement and additional operation and maintenance costs that developers would seek to recover under any renegotiated contract.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Ontario has over 4,500 MW of wind in commercial operation, with the vast majority being large scale (>500kW) developments.
  - This includes over 2,700 MW of large FIT 1 and GEIA wind projects representing 47 contracts (average size ~58 MW) and over 1,000 MW of solar projects representing 103 contracts.

- Projects over 500 kW would offer the most savings potential as they represent the majority of installed renewables capacity and are spread across fewer contracts.

- Below are two potential approaches to reducing ratepayer costs in the near term by extending contract terms at reduced prices. An illustrative example of a typical large wind project is used.

- **Example:** 100 MW FIT 1 wind project achieving Commercial Operation in 2014 (i.e., 17 years remaining on initial 20 year contract), assuming a 10 year contract extension negotiated at the LRP I low weighted average wind price of $64.5/MWh;
  - (17 years @ $135/MWh + 10 years @ $64.5/MWh)
  - **Potential Approach 1:** Provide a single new contract price that is the average of the lower extension price and the FIT contract price over the new contract term. The new price would be lower over a longer term.
  - **Illustrative Example:** New contract for 27 years at $129/MWh.
  - New contract price set to allow 10% rate of return over 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract (remaining term extended for 10 additional years) |
|---|---|---|
| Contract Cost (NPV 2017) | $550 million | $582 million |
| Average Monthly Ratepayer Impact Over First 5 Years | $0.03 savings | |
| Average Monthly Ratepayer Impact Over Remaining 22 Years | $0.02 increase | |
| Average Monthly Ratepayer Impact Over Entire 27 Year Contract | $0.01 increase | |

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- **Potential Approach 2:** Offer facilities a revised contract that extends terms and is structured to offer lower pricing in the initial contract years and higher pricing in the later years of the contract.
  - For example, the New contract is $85.9/MWh over the first 5 years and $169/MWh over the remaining 22 years.
    - Price over first 5 years is LRP I weighted average wind price.
    - Price over remaining 22 years is set to allow 10% rate of return over entire 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract | |
|---|---|---|---|
| | | Initial 5 Years | Last 22 Years |
| Contract Cost (NPV 2017) | $550 million | $632 million | |
| Monthly Average Ratepayer Impact Over First 5 Years | $0.09 savings | | |
| Monthly Average Ratepayer Impact Over Remaining 22 Years | $0.07 increase | | |
| Monthly Average Ratepayer Impact Over Entire 27 Year Contract | $0.04 increase | | |

# 10. Tax Relief for Solar and Wind Contracts

- In 2010 and 2011 Ontario procured large scale projects (>500 kW) through the FIT program at standard offer pricing.

- The FIT program was the centerpiece of the GEA which established the economic and social goals of growing the green economy, including establishing a local renewable energy manufacturing base, supporting the development of green energy jobs, and providing incentives for Indigenous participation.

- To help achieve these economic and social goals, the FIT program offered pricing at above competitive procurement rates, and provided Indigenous and Community participation adders, which resulted in economic benefits to all Ontarians, but resulted in additional costs borne by Ontario's electricity ratepayers.

- Ontario could fund the added cost of some or all of these economic and social incentives by shifting their costs from the rate-base to the tax-base.
    1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
    2. The tax base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT.

**Considerations**

- If applied to projects in commercial operation the benefit to the ratepayer would be immediate.
- Comparing FIT pricing to competitive procurement pricing could provide a reasonable representation of energy procurement without the added cost of economic and social incentives.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
   - For example, from 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
   - The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
   - If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
   - The $3.3 billion difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.
   - This represents estimated average ratepayer savings of $1.50/ month relative to OPO forecasts.
   - The same approach could be considered for solar projects however, prior to LRP I in 2016, Ontario had not procured solar capacity competitively and international cost comparisons are challenging given differences in regional development costs.
   - This example does not include the value of participation price adders available for community and indigenous participation.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

2. The tax-base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT 1 solar and wind projects.

   - For example, 17 large FIT 1 wind and solar projects have Indigenous and/or Community participation making them eligible for a price adder in addition to their base contract price.

   - The estimated value of these price adders is approximately $17.1 million (NPV 2017) over the expected remaining term of their contracts.

   - This represents estimated ratepayer savings of approximately $0.01/month relative to OPO forecasts.

| 46 | GEIA | 148.6 | Dec-14 |
| 47 | GEIA | 270 | May-15 |

# Key Outcomes / Next Steps

- The proposed initiatives provide the following opportunities to:
  - Provide a greater focus on vulnerable consumers by funding electricity support programs through the tax-base.
    - Enhance existing and new support programs targeted at the most vulnerable consumers (i.e., OESP and RRRP); and
    - Better harmonize delivery rates across the province.
  - Re-set how energy infrastructure is funded by shifting costs to the tax-base from the rate-base.
  - Provide electricity consumers with greater choices and transparency (e.g., alternative rate plan based on a flat electricity rate, unpacking the Global Adjustment costs, etc);
  - Provide system benefits (e.g., market renewal);
  - Increase cost effectiveness and improve efficiency; and
  - Lower the cost of electricity for all consumers.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require legislative and/or regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

# Appendix

A. Rural or Remote Rate Protection (RRRP) – Overview and Enhancements
B. Fund Conservation Programs Through the Tax-Base
C. Eliminate the Industrial Conservation Initiative (ICI)
D. Cancel Large Renewable Procurement I (LRP I)

# A. RRRP Overview and Enhancements

- The Delivery line of the electricity bill is composed of Distribution and Transmission Costs. While transmission costs are uniform across the province, LDC costs vary by distributor and account for about 20% of the total bill for the electricity customers.
  - See slide X for a map of delivery rate increases between 2006 and 2016.
- The Rural or Remote Rate Protection (RRRP) framework was put in place in 2001 to help offset the higher costs to distribute electricity to Ontario residents who live in rural or remote locations.
- RRRP is available to: residential Hydro One R2 customers (~350,000 customers), Algoma Power customers (~11,600 customers); H1 remote customers (~3,500 customers).
  - To date, R2 customers receive a fixed amount of $125 million a year distributed amongst the customers. Algoma and Remote customers have RRRP calculated by the OEB each year that fluctuates based on average provincial distribution increases.
- Because the amount had been fixed for over a decade, the Province recently increased funding of the RRRP program for Hydro One R2 customers from $125 million to $240 million. This will be effective as of January 1, 2017, and will bring their delivery charges in line with the next highest charges from Hydro One's R1 customer class.

# B. Fund Conservation Programs Through the Tax-Base

- Propose to fund 2017-2020 electricity conservation and demand management program costs* using tax dollars instead of ratepayer dollars.
  - Funds received through the Hydro One Departure Tax could potentially be repurposed towards this.
- Total remaining 2017-2020 electricity conservation program costs are expected to be ~$2.1 billion.
- Post 2020, this option could evolve to funding conservation programs through the Greenhouse Gas Reduction Account.

**Considerations**

- Electricity conservation programs provide a number of benefits to society, however, Ontario's ratepayers have been covering these costs:
  - Avoiding/deferring future energy infrastructure investments, reducing disruption in communities (e.g., avoiding the need to build new natural gas generation);
  - Environmental benefits (e.g., reduced natural gas peaking generation and GHG emissions); and
  - Social and economic benefits (e.g., job creation and assistance managing electricity bills).
- There is precedence for using tax dollars to fund conservation programs.
  - Between 2007 and 2011, Ontario funded the Home Energy Savings retrofit program using tax dollars.
- Funding conservation programs though the tax-base is expected to result in a benefit of $3.40/month for residential electricity consumers in 2017. This could provide immediate short term relief to consumers while other rate mitigation initiatives are developed (e.g., market renewal, LDC efficiencies).

*** Note:** This includes costs towards the Conservation First Framework, Industrial Accelerator Program, Demand Response and the Conservation Fund)

# C. Eliminate the Industrial Conservation Initiative (ICI)

- The cost shift from the Industrial Conservation Initiative (ICI) could be removed from electricity bills by eliminating ICI.
  - The ICI allows large electricity consumers to lower their electricity costs by reducing their demand during peak hours.

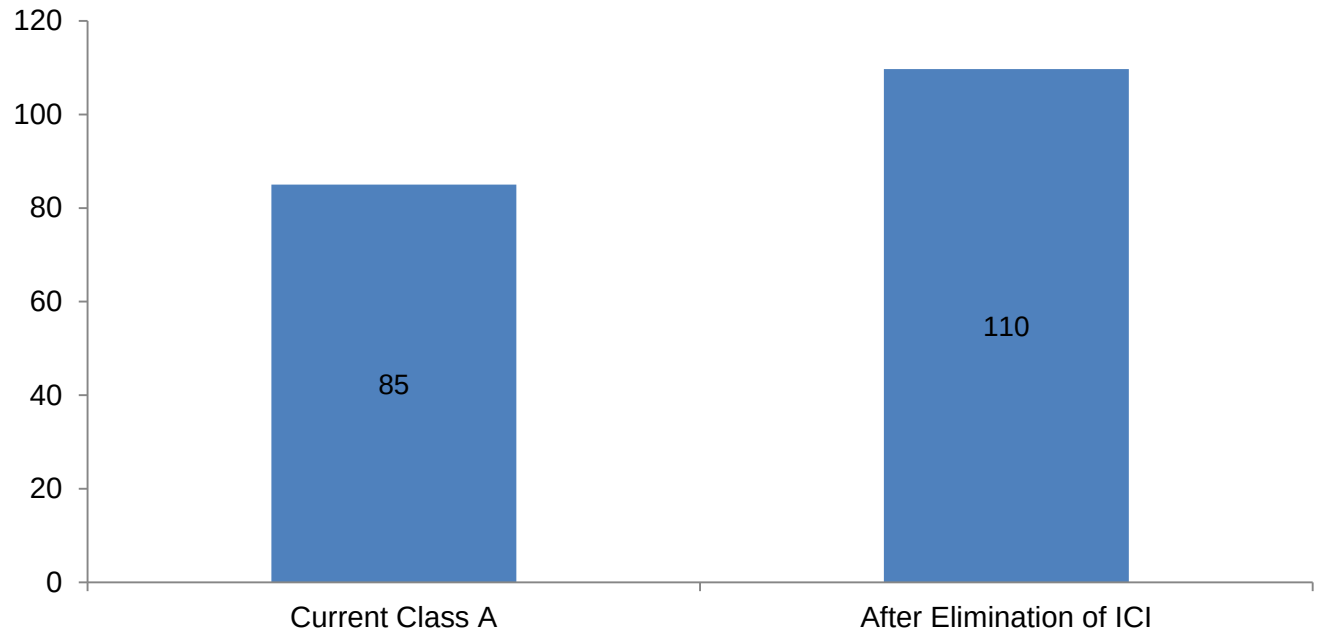
**Considerations**

- Eliminating ICI would result in a benefit of more than $4/month for residential electricity consumers in 2017.
  - However, unless government took action to mitigate the associated cost shift back to industrial consumers, typical industrial prices would increase by about one-third. Such a price increase would pose significant challenges for energy-intensive consumers.
- Industrial stakeholders have indicated that ICI as an integral factor in maintaining competitiveness and retaining industry in the province.
  - Eliminating ICI would limit the “cost shift” onto residential consumers, but it would also lead to a reduction in industrial demand. The large industrial contribution to the fixed costs of running the electricity system would then need to be covered by remaining consumers.
- If ICI is retained, current IESO projections indicate that the cost shift will decrease each year going forward as Global Adjustment (GA) decreases (due to an expected increase in HOEP).
- Alternatively, ICI could be funded through the tax-base at a cost of $900 million annually. There is precedent to use the tax-base for industrial support programs, including the Northern Industrial Electricity Rate Program (NIERP) and the Jobs and Prosperity Fund.

# C. Eliminate the Industrial Conservation Initiative (cont'd)

- ICI currently provides a benefit of about $25/MWh to Class A electricity consumers.

**All-In Electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer.

# D. Cancel/Adjust Renewable Energy Procurements

- The Ministry could consider the following actions to further mitigate future impacts to electricity bills:

| Unallocated/Terminated Capacity | Announced Procurements | Executed Contracts |
|---|---|---|
| A. Do not procure unallocated or terminated capacity | B. Revise FIT 5 target | D. Cancel LRP I contracts |
| | C. Cancel FIT 6 | |

**Overarching Considerations**

- Cost savings associated with reducing or cancelling renewable energy procurements and programs will not reduce current electricity bills, but would result in future cost reductions relative to Ontario Planning Outlook forecasts.
- The IESO estimates implementing options A to C will reduce system costs by approximately $592 million ($2016) between 2019 and 2028, resulting in an average of approximately $0.50/month in savings to a typical residential electricity bill over the same period.
- The microFIT program is winding down end of 2017. Annual microFIT procurement targets have been undersubscribed.
- With a few exceptions (e.g. rollover of unallocated microFIT capacity; addition of terminated microFIT and small FIT capacity to FIT 5), plans for unallocated or terminated capacity are not defined in announcements or existing directions.

*Cancel/Adjust Announced Procurements:*

- Amendments to existing directions to IESO would be required to reduce FIT 5 and cancel FIT 6.
- The FIT 5 procurement is underway with a base target of 150 MW and inclusion of any capacity available from contract terminations under prior small FIT and microFIT procurements. The application window closed on November 25, 2016.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts

*Cancel Existing LRP I Contracts:*

- 16 LRP I contracts (approx. 455 MW) have been executed and projects are under development.
- None have met Key Development Milestones. Total value of LRP I estimated at approx. $1 billion (NPV to 2016).

**Considerations**

- To help inform a decision, IESO or OEB could be asked to evaluate and provide guidance to the Ministry on the system need for LRP I projects and potential ratepayer impacts/benefits.
- 13 of 16 LRP I contracts have Indigenous participation. Cancelling LRP I contracts would remove this economic development opportunity and likely damage relationships between Indigenous communities and the government.
- LRP I Contract includes an “Optional Termination” provision allowing IESO to terminate any contract prior to the “Commercial Operation Date” with 6 months written notice.
- The IESO obligations under the Optional Termination provision depend on whether the project has met all “Key Development Milestones”.
  - As no projects have met their Key Development Milestones, the estimated total cost payable to contract holders is about $8 million.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts (cont'd)

**Legal Analysis**

- Any new directive to cancel LRP I contracts would need to be approved by Cabinet, either as part of an LTEP implementation directive to IESO, or pursuant to the overall power to direct IESO with respect to procurements.
  - An amendment to an existing direction would not require Cabinet approval, however, further analysis is required to determine if direction to cancel LRP I contracts could be considered as amending existing direction.
- ENERGY has previously received advice that there is a high risk that a court would conclude that the Minister has no authority under the *Electricity Act , 1998* to issue a direction requiring IESO to terminate microFIT Conditional Offers and FIT Offer Notices that have already been issued to applicants, because these offers create vested contractual rights. This reasoning would likely apply equally to any direction to IESO to cancel LRP I contracts. Previous advice has also flagged a risk that the Province could be liable for damages in tort for inducing a breach of contract (or other claims).
- The risk and costs associated with potential law suits resulting from the cancellation of contracts requires further analysis. LSB recommends ENERGY seek an opinion from Crown Law Office Civil before proceeding.

Good morning,

Attached are materials for Monday's rate mitigation meeting.

Keley

Original Message

Subject: Rate Mitigation

Hi Steve,

Attached are two decks on rate mitigation. We can use the decks as the basis for discussion at our meeting on Monday. I'll ask Keley to share with the other participants.

# Financing the Global Adjustment

January 13, 2017

*Working Draft for Discussion Purposes Only*

# Purpose

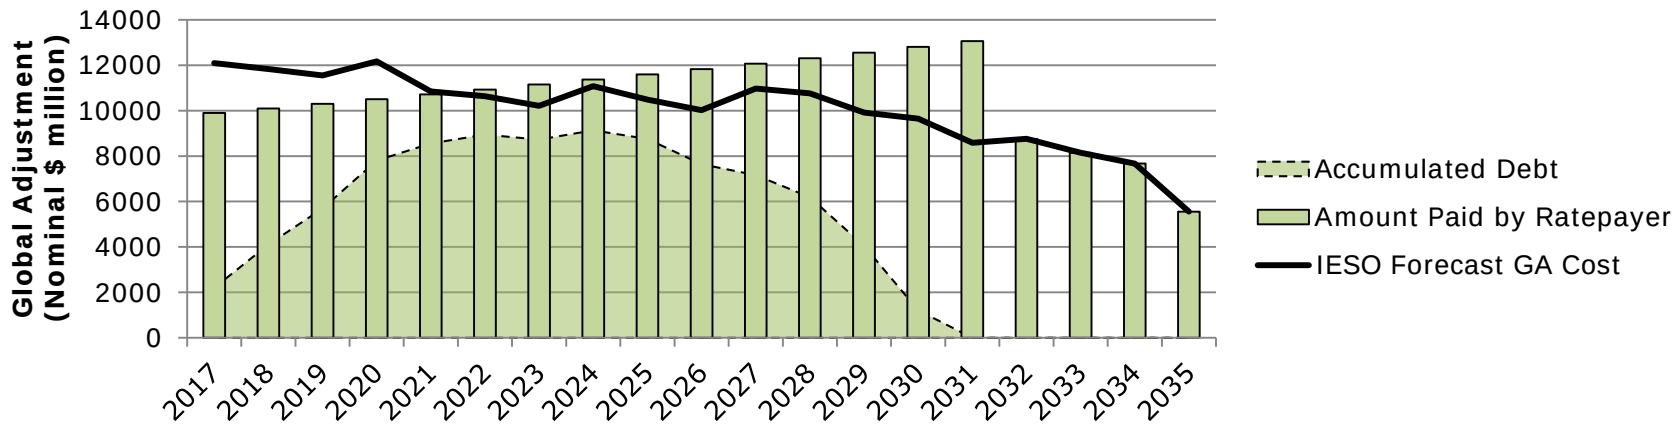
- To analyze the impact of partially financing the cost of the global adjustment (GA) to defer some of the cost to later years.
- The economic, legal and fiscal risks to ratepayers, stakeholders and government are qualitatively discussed.
- The remainder of the presentation quantitatively examines several different scenarios for financing the GA, showing:
  - The impact on residential bills; and
  - The amount of debt incurred.

# Rationale for Financing the GA

- The GA is comprised of costs for regulated and contracted generation, as well as conservation.
- Some contracted generation assets are expected to have a useful life that extends beyond the term of their current financial contracts (typically 20-years).
- Similarly, conservation costs are recovered through the GA on an annual basis while conservation initiatives provide benefits to the electricity system over the course of many years.
- Since the GA only includes costs related to the contractual life of these assets, there may be an opportunity to recognize the longer-term benefit of these assets to the electricity system and “bring forward” that benefit for ratepayers today, while deferring some of the current costs.
- An indicative GA financing proposal is presented that lowers ratepayers costs over the short term by borrowing money but increases costs over the long term when GA costs are forecast to be lower.
- Note that not all generating assets will continue operations at the end of their contract term. Regulatory constraints (i.e., nuclear licences) or low demand conditions (i.e., as experienced with current expiring NUGs) would mean that some generators will shutdown at the expiry of their contract. Future ratepayers would be paying for these assets that are no longer producing power.

# Indicative Proposal to Finance the Global Adjustment

- For the purpose of discussion, it is proposed that the amount of GA paid by ratepayers in each year over the forecast period is set at a fixed amount until the total amount of money borrowed has been completely paid back.
- All scenarios are assumed to begin January 1, 2017, setting the 2017 amount of GA paid by ratepayers at a value lower than the true cost of GA and increasing that amount year-over-year at inflation (assumed to be 2%) until the debt has been paid off.
- In this way, GA costs will be "smoothed" over time by lowering costs in the short term and increasing costs in the long term.
- In some scenarios, the amount of GA paid by ratepayers *above* the expected true cost of GA is capped so as to limit large increases in the cost of electricity in any given year.
- All analysis is based on forecasts from Independent Electricity System Operator's (IESO) Ontario Planning Outlook and assumes a 5% borrowing interest rate.



**Sample financing**: Ratepayers pay less than the cost of GA in early years, borrowing up to $9 billion that is fully paid off in 2031 by charging ratepayers more than the cost of GA in later years.

# Considerations and Risks – Ratepayer

Ratepayer:

- Borrowing money to finance the GA, while lowering costs in the short term, results in a more rapid rise in electricity prices beyond the rate of increase already expected.

- The GA financing proposal involves borrowing large amounts of money over a long period of time (16-30 years, depending on the scenario) to reduce electricity rates. This debt would be highly sensitive to interest rates which could extend repayment timelines or put significant pressure on electricity rates. A long-term interest rate of 5% is assumed for this analysis.

- GA and HOEP provide a natural hedge against each other – when one goes up, the other goes down – keeping total electricity costs relatively stable and predictable. Smoothing only the GA would lead to greater price volatility for consumers.

    - For example, if HOEP is higher than expected (due to higher gas or carbon prices, for example), all-in rates will rise significantly as the natural decrease in GA would not occur given the prescribed GA rate described in the indicative proposal.

- Should Ontario electricity demand be lower than forecasted, the cost of paying off the debt will be spread over a smaller pool of consumption, further increasing future costs for individual ratepayers.

# Considerations and Risks – Fiscal and Stakeholder

Fiscal / Accounting:

- Further analysis is required on whether such changes to the financing of the GA would affect the Province's current accounting treatment for the GA and represent a potential fiscal risk. As such, early engagement with Legal Services Branch and Treasury Board Secretariat is advised.
    - It is unclear whether legislation could determine the manner in which this initiative is accounted for. Further work is required.
- Historically electricity sector financing has been conducted by the Ontario Financing Authority, e.g., managing OEFC's stranded debt and borrowing on behalf of IESO. Further consultation with the OFA will be required to determine the appropriate vehicle for additional borrowing.
- The significant amount of additional Provincial borrowing needed to finance the GA, and associated risks (e.g., interest rates, repayment timelines), could put pressure on the Province's credit rating and overall borrowing capacity. Further analysis is required and would suggest early engagement with the OFA through which money will be borrowed.

Stakeholder:

- The significant deferral of electricity system costs over a long time-horizon and associated interest costs may draw criticism from some stakeholders as creating a new "stranded debt" in the sector. Note: the Debt Retirement Charge was removed from residential bills in 2016 and will be removed for remaining customers in 2018.

# Considerations and Risks – Legal

Legal:

- Legislation would be required to authorize the financing proposal.
  - Amendments to the *Electricity Act, 1998* (EA) could authorize the financing of certain costs within or part of the GA. However, whether any other legislation requires amendment is not known at this time.
  - The GA regime currently provides that “true costs” represent the true costs of making payments to generators or counter parties to contracts, not the incurring of discretionary financing or interest costs.
  - Considerations such as the need to analyze legal risks or the need to address costs retroactively (if the proposal requires a January 1, 2017 start) could add to the legal and drafting complexity;

- Introduction of a bill in the week of February 20th is an aggressive timeline that could require diversion of resources from other initiatives.

# GA Debt Financing Scenarios

1. Status Quo

   - Ratepayers continue paying the full cost of the GA in each year without incurring any debt.

2. Moderate short-term cost reductions with limits

   - The amount of GA paid by ratepayers in 2017 is lowered by $2.5 billion below the true cost of GA and increases at inflation (assumed to be 2%) in each subsequent year until the total amount of money borrowed is paid off.
   - Future GA over-payments above the true cost of GA are capped at $2 billion to limit electricity cost increases in any given year.

3. Maximized short-term cost reductions with limits

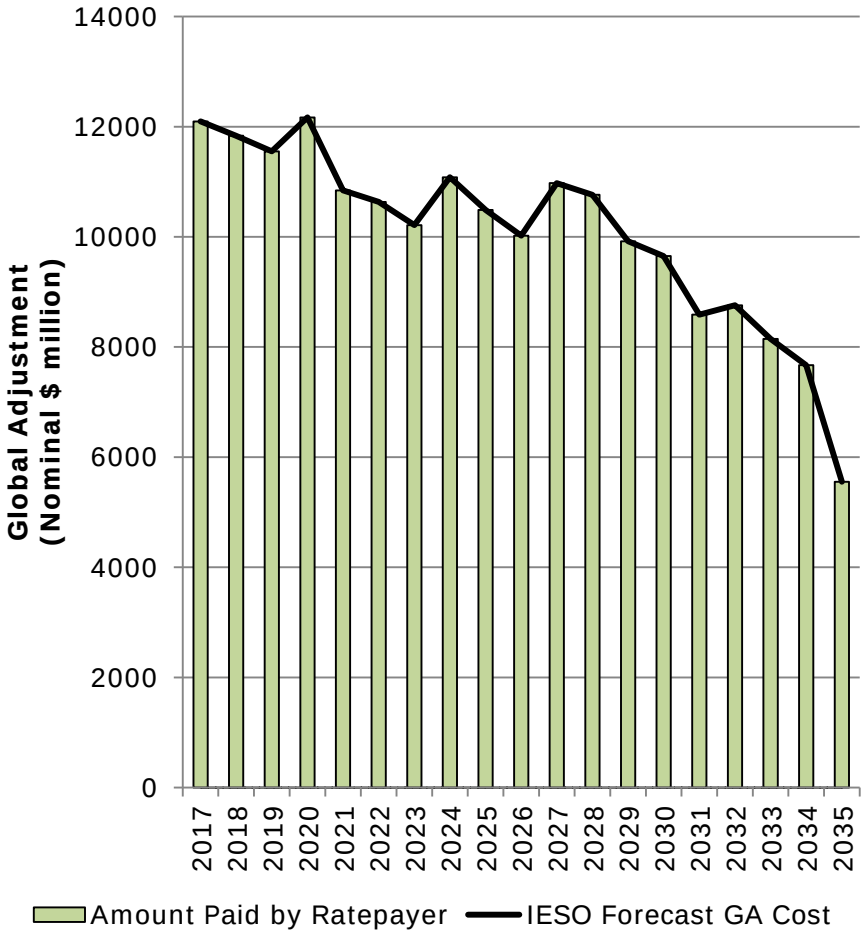
   - This scenario considers the maximum amount by which ratepayer GA costs in 2017 can be reduced such that the total amount of money borrowed is paid off over a 25-30 year financing period.
   - Future GA over-payments above the true cost of GA are capped at $2 billion to limit electricity cost increases in any given year.

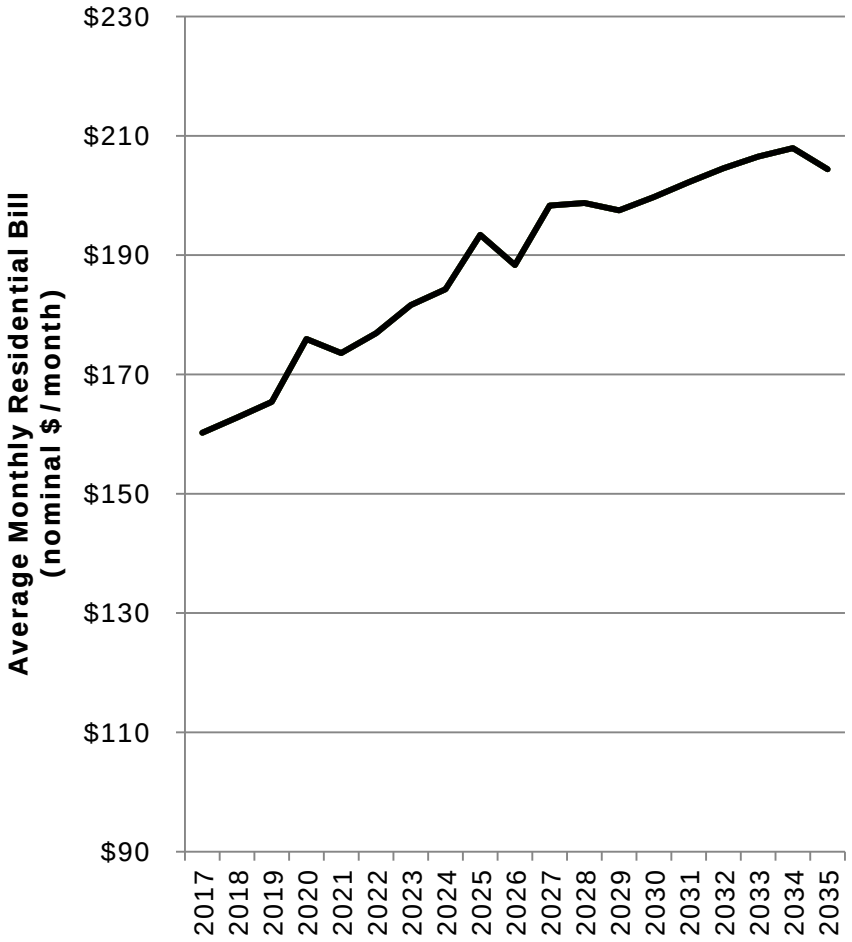
4. Maximized short-term cost reductions, no limits

   - This scenario considers the maximum amount by which ratepayer GA costs in 2017 can be reduced such that the total amount of money borrowed is paid off over a 25-30 year financing period.
   - No limit is placed on the amount charged to ratepayers above the true cost of GA.

# 1. Status Quo – Global and Residential Impacts

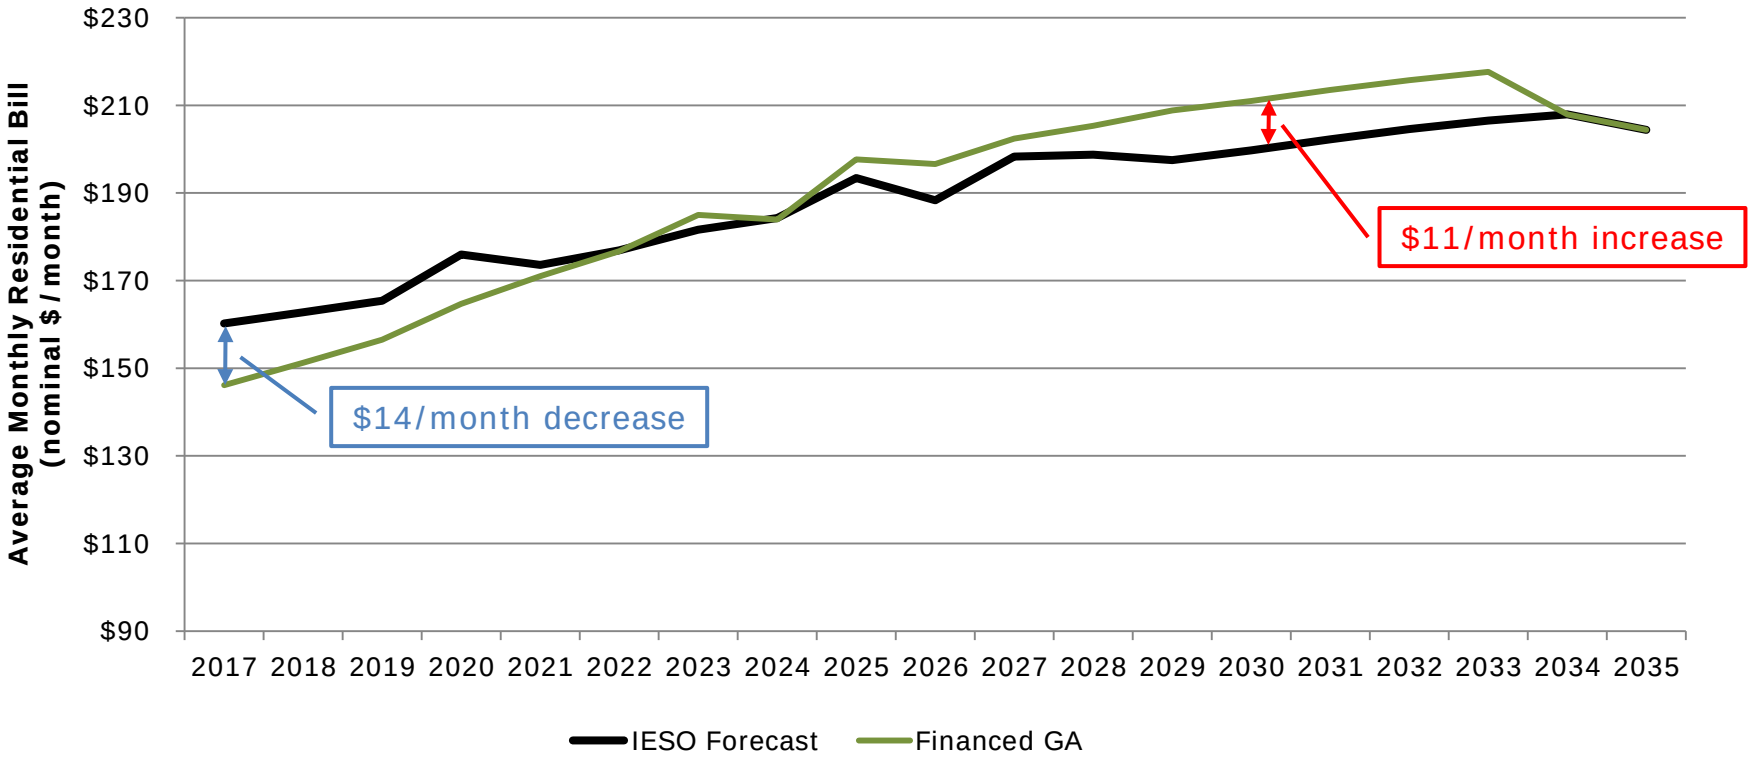
- Ratepayers continue paying the true cost of GA.





# 2. Moderate Short-term Cost Reduction with limits – Residential Impacts

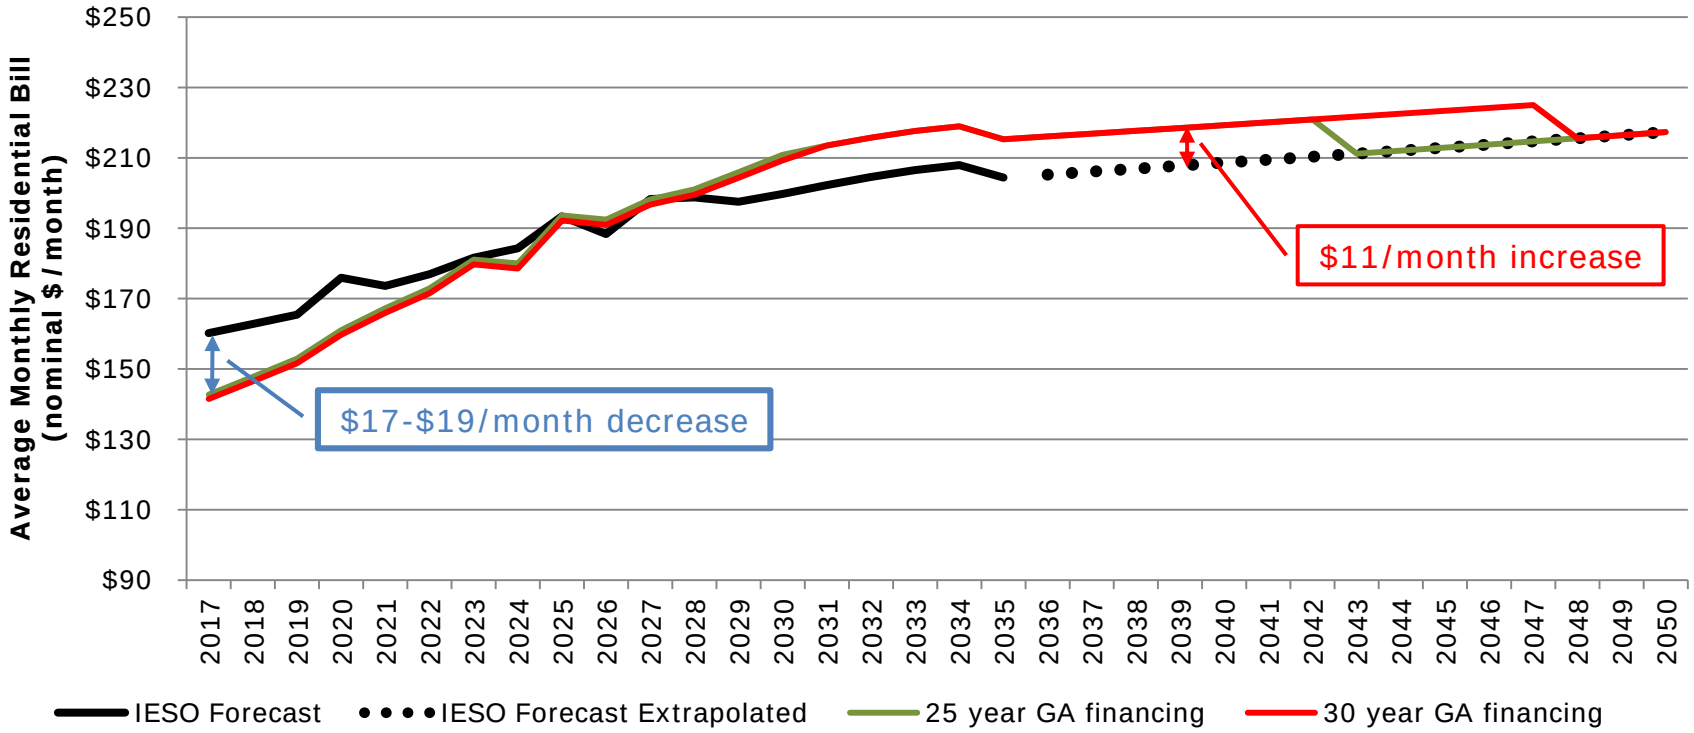
- In this scenario, the starting GA payment from all ratepayers in 2017 is lowered by $2.5 billion below the true cost of GA and is increased at inflation in subsequent years – subject to a cap of no more than $2 billion above the true cost of GA in any given year – until the borrowed money is repaid.



- By **borrowing up to $10.7 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $14/month** at the cost of **a long-term increase over 12 years of up to $11/month** above the true cost of electricity production.

# 3. Maximized Short-term Cost Reduction with limits – Residential Impacts

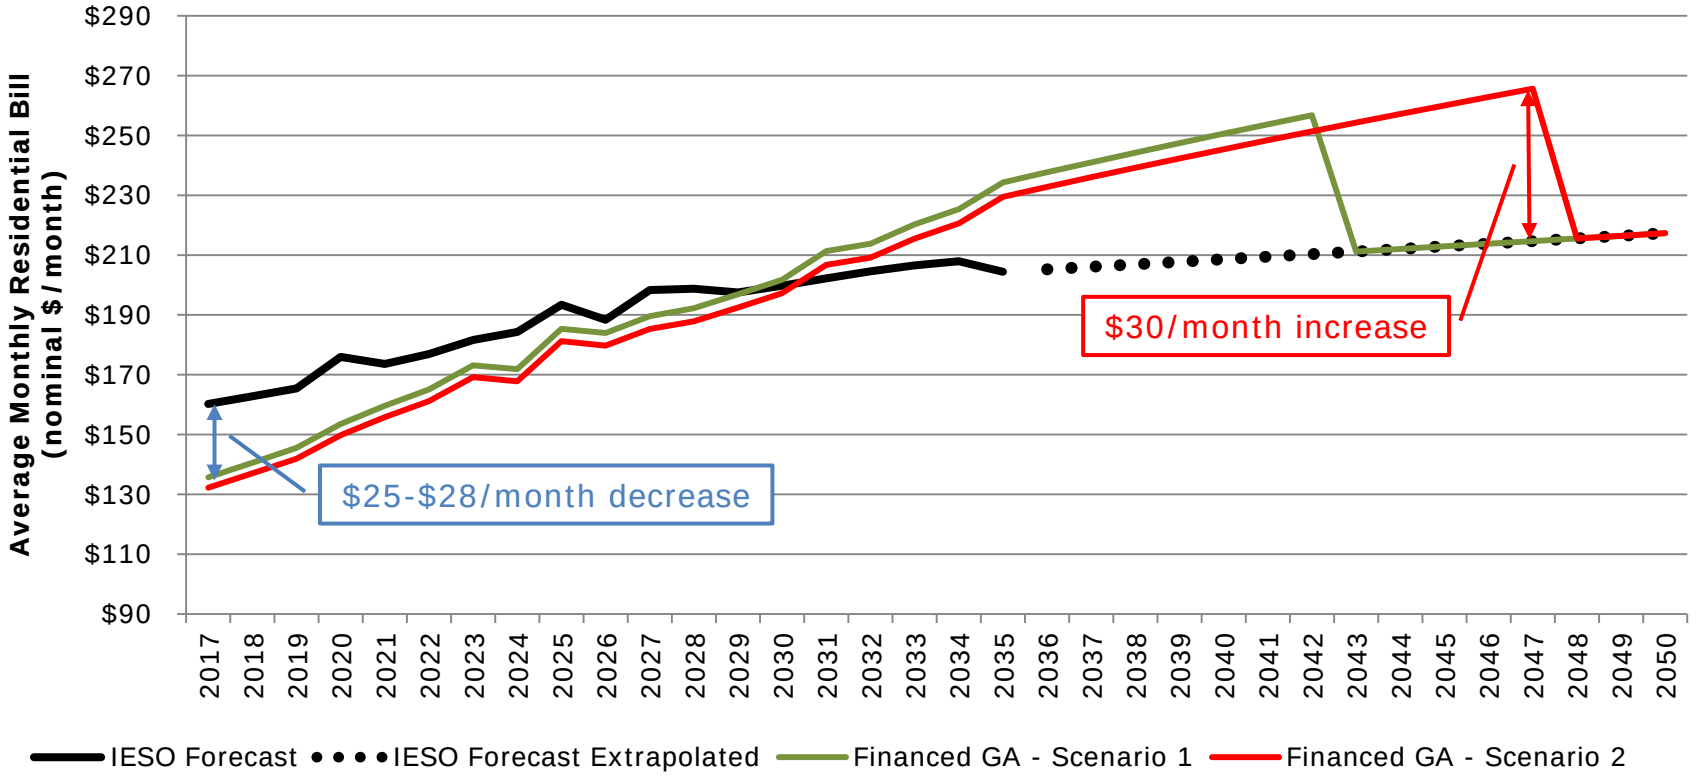
- In this scenario, the starting GA payment from all ratepayers in 2017 is lowered as much as possible and is increased at inflation in subsequent years – subject to a cap of no more than $2 billion above the true cost of GA in any given year – such that the borrowed money is paid back in 25 years (green line) and 30 years (red line) respectively.



- By **borrowing up to $23 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $17-$19/month** at the cost of **a long-term increase over 17-22 years of up to $11/month** above the true cost of electricity production.

# 4. Maximized Short-term Cost Reduction, no limits – Residential Impacts

- In this scenario, the starting GA payment from all ratepayers in 2017 is lowered as much as possible and is increased at inflation in subsequent years such that the borrowed money is paid back in 25 years (green line) and 30 years (red line) respectively. No limit is placed on the ratepayer GA over-payments in later years.



- By **borrowing up to $66 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $25-$28/month** at the cost of **a long-term increase over 12-17 years of up to $25-$30/month** above the true cost of electricity production.

Ontario

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector – Update

## Working Draft

December 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure (i.e., $35 billion+ investment in cleaner generation and $15.5 billion investment in Hydro One transmission and distribution systems).

- Ontario has taken a number of actions to lower electricity cost for all consumers by:
  - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).
  - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., competitive LRP, no new NUG contracting).

- Following the 2016 Throne Speech, actions were announced to further reduce electricity costs by:
  - Providing an 8% rebate ($11/month savings), updating RRRP ($45/month savings), expanding ICI (up to one-third savings for participants), suspending the LRP II and the EFWSOP (up to $3.8 billion in cost savings) and recycling proceeds to industrial/ commercial consumers.

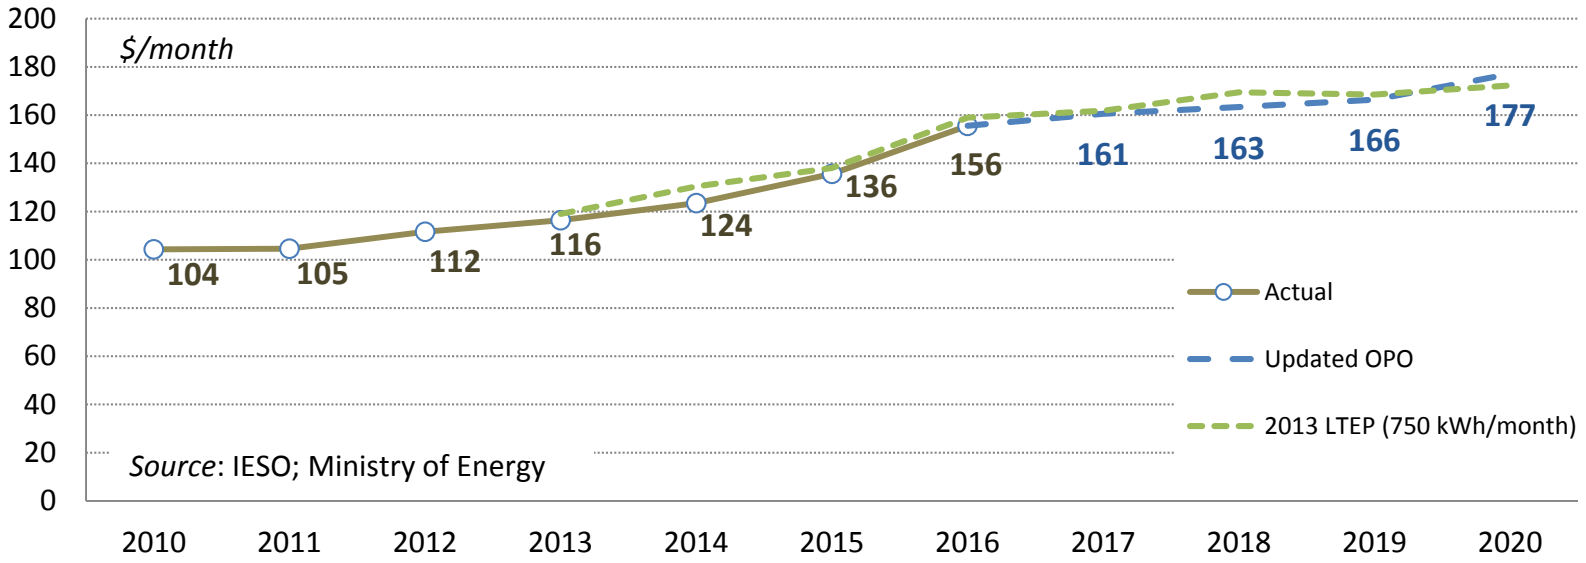
- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

# Electricity Prices – Residential

- Residential consumers electricity prices continue to be a concern for many Ontarians, particularly those that rely on electric heat.
  - **Note:** The typical residential bill is currently below the 2013 Long-Term Energy Plan (2013 LTEP) forecast.

**Typical Residential Electricity Bills**
*Historical and Forecast*



**Note**: The 2013 LTEP forecast for residential bills was based on 800 kWh/month without RRRP or electric heating; the above has been rebased to 750 kWh/month for comparison purposes. Typical residential are based on Toronto Hydro. The updated OPO forecast above includes the 8% rebate to offset the provincial portion of HST, ICI expansion and RRRP expansion.

# Broad Policy Themes / Rationale

- Support the continued reduction in the differential across distribution rates (as charged by Local Distribution Companies) across the Province through the potential enhancement of Rural or Remote Electricity Rate Protection, (RRRP). In order to not increase regulatory costs to customers as a result, this program can be moved to the tax-base.
- Provide a greater focus and support on lower income Ontarians by funding the Ontario Electricity Support Program (OESP) through the tax-base, as well as enhancing the support available through the program.
- Amortize electricity conservation and demand management (DM) programs over 15-years to provide lower costs for electricity consumers.
  - Alternatively, pay for conservation/DM programs through the tax-base and transition costs to the new "green bank entity" over time. Costs would be shifted in recognition of the burden borne by ratepayers in phasing out coal generation.
- Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding, such as remote electrification, large transmission projects, new or expanded interties and expansion of natural gas to underserved areas (i.e., rural and remote communities), etc.
- Empower energy agencies to increase cost effectiveness and improve efficiency by having – IESO modernize Ontario's electricity market through electricity market renewal initiatives, the OEB identify opportunities for future LDC cost reductions/efficiencies and work with OPG to find further efficiencies in operations and pass on savings to ratepayers.
- Give consumers more choice by allowing households to "opt into" an alternative rate plan, based on a flat electricity rate, as an interim measure as the Ontario Energy Board (OEB) develops more pricing options over time. Also give consumer greater transparency with respect to electricity costs by providing more details regarding the Global Adjustment (GA).
- Help small business manage their electricity costs and provide relief for cap and trade until proceeds recycling is fully operational by ending the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers, a benefit of $7/MWh.

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

| *$/750kWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |

**Source:** Ministry of Finance, Energy
**Note:** *Assumes RRRP enhancement to reduce distribution rates to $30 for LDCs and **Assumes increase OESP credit by 50%.
Not included in chart is additional $18M/year to fund potential First Nations rate program through the Tax-Base.

# Existing Rate Mitigation Programs – Overview

- There are a number of existing programs funded by electricity ratepayers that help mitigate electricity bills for some customers, each of which has a unique policy rationale.

- Programs such as the as the Rural or Remote Rate Protection (RRRP) program are targeted at all customers who face the highest delivery costs in the province, while others such as the Ontario Electricity Support Program (OESP), are income tested and targeted at the most vulnerable energy consumers.
  - These program are not mutually exclusive and a customer could receive both the RRRP and the OESP.
  - There are other programs that are still under development such as options for a First Nations Rate currently being developed by the OEB as per the request of the Minister of Energy. These options are aimed to alleviate high delivery costs for on-reserve indigenous consumers.

- There are opportunities to enhance each of these programs. However, if enhancements are funded through the electricity rate-base, while they would lower costs for eligible consumers, they would raise costs for all other ratepayers.

- Given that these programs focus on promoting equity between different areas of the province (RRRP) or on social equity (OESP), they could be funded by the tax-base rather than the rate-base. This would allow their goals to be achieved and enhanced without increasing electricity rates. The following slides explore options to enhance each program using the tax-base.
  - These enhancements would also work in conjunction with the Ontario Energy Board's focus on reducing LDC costs outlined in option 6b.

# 1. Rural or Remote Rate Protection (RRRP) Expansion

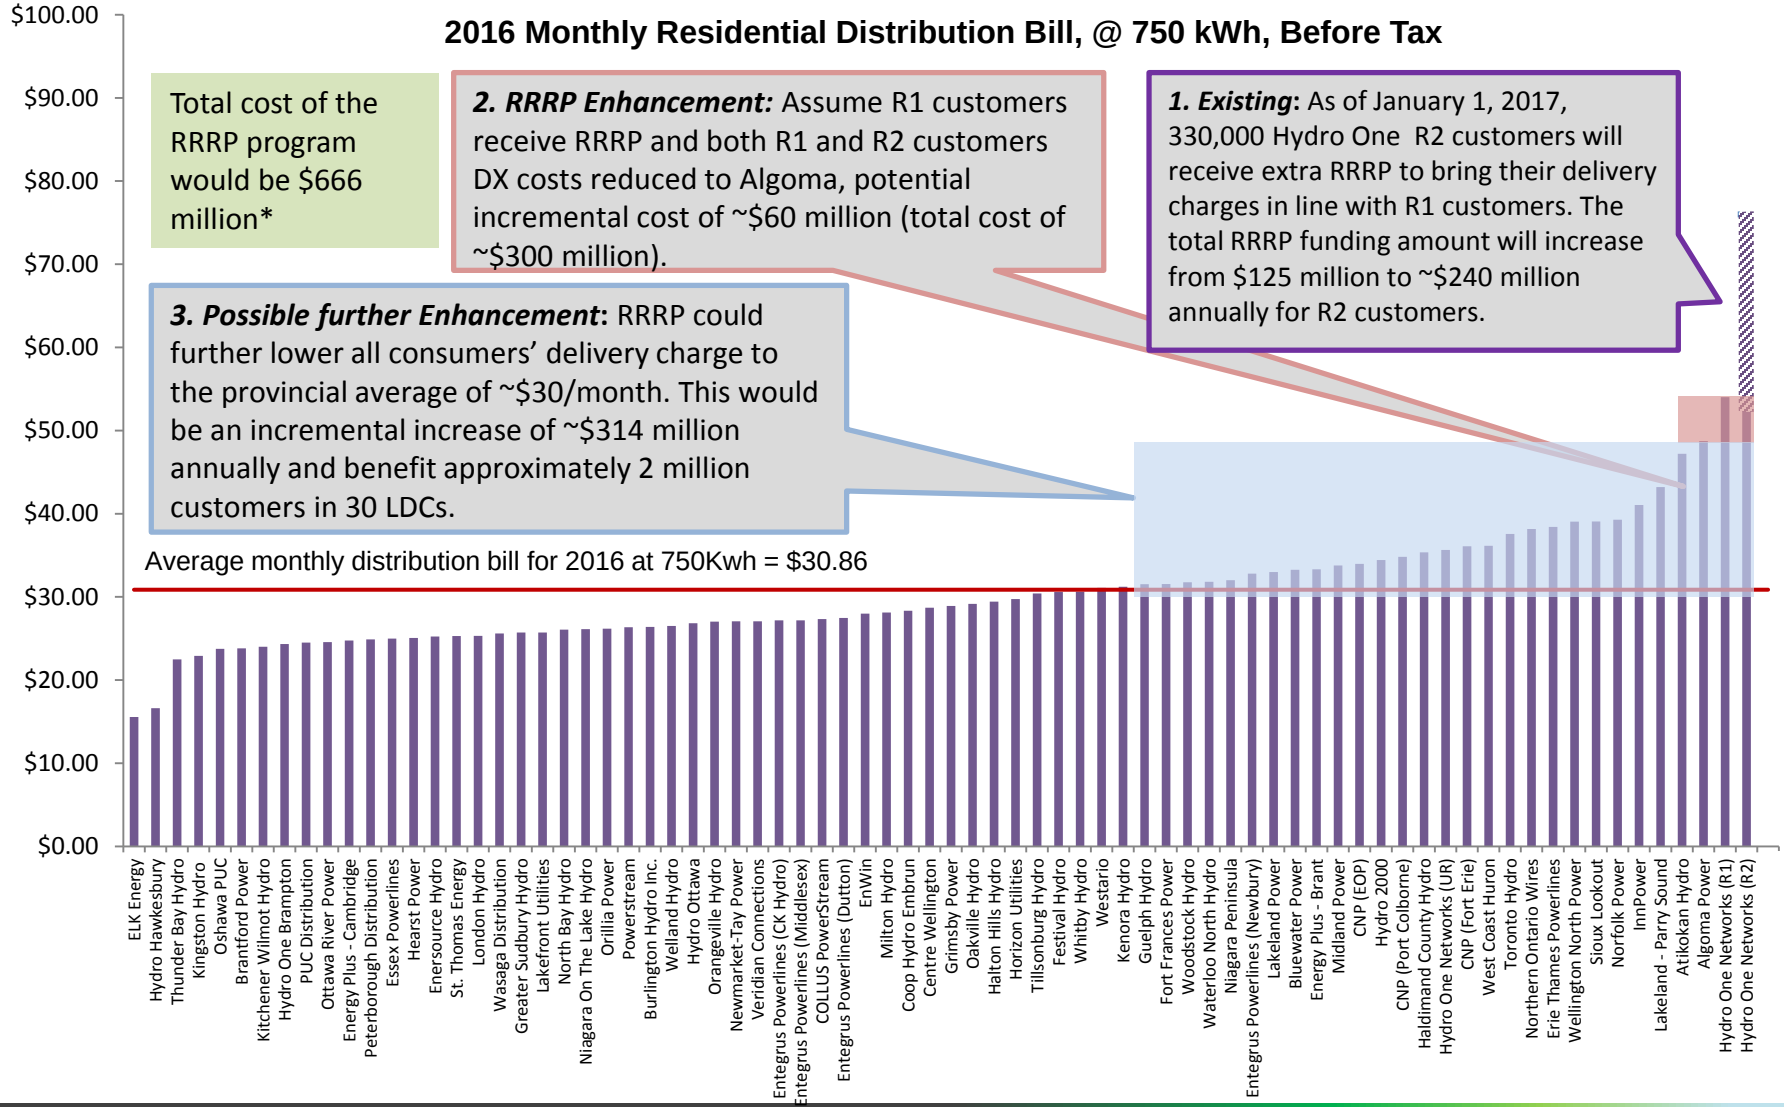
- The Rural or Remote Rate Protection (RRRP) program supports the most costly-to-serve distribution customers in Ontario. It is not income tested and most of the support goes to Hydro One's R2 (low density) rate class and remote communities.
  - Costs to these Hydro One customers are higher than average because of their relatively low density. The OEB mandates that they pay the full cost of service and in recent rate filings has asked Hydro One to ensure this through cost allocation studies.
  - To mitigate these costs, the RRRP was recently enhanced to help lower the bills of Hydro One's R2 customers to around those of its R1 (medium density) customers.
- Although other LDCs do not have medium- and high-density rates, there is a wide range of distribution costs between LDCs. The RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - Could be done on its own or as part of exploring an Ontario-wide uniform "postage stamp" delivery rate.

**Considerations**

- RRRP will be enhanced for R2 customers on January 1, 2017 to have their costs reduced to approximately R1 distribution costs levels. The RRRP could be further enhanced to include R1 customers, and have R2 and R1 customers reduce their costs down to Algoma (see next slide). This would cost $300 million in the first year (and would adjust year over year).
- If there was a desire to reduce costs for all LDCs, a simple average of distribution cost before tax, across all rate zones is $30.86 per month, for a residential customer consuming 750 kWh per month.** Bringing all delivery rates down to this average would cost approximately $500 million for the first year, with escalation in line with average distribution rate increases.
  - This assumes Hydro One R2 consume 1,200 kWh and H1 R1 customers consume 1,000 kWh per month.
- If all customers were brought down to the average costs (see the chart on the next slide for more detail):
  - It is assumed that residential customers with bills less than the provincial average see no change;
  - Majority of the enhanced benefit would go to Hydro One R1 and Toronto Hydro customers; and
  - Mechanism to ensure that LDCs continue to be motivated to achieve efficiencies would need to be designed (see section 4).
- Enhanced RRRP support may be best provided from the tax-base, because if funded from the rate-base, it would increase the costs for all customers who may argue that it is unfair that they are being asked to pay more to subsidize those in other LDCs.
- In conjunction with using the tax-base to reduce delivery charges to the provincial average, the OEB could be asked to explore moving to a province-wide "postage stamp" delivery rate that would be the same across the province to be implemented over time.
  - Could be "winners and losers" as delivery rates less than the average would go up in a postage stamp model;
  - A "postage stamp" model could help incent LDC consolidation.

**Note:** This is based on preliminary estimates and the amount will fluctuate on monthly consumption from customers and LDCs have different customer base with different consumption types.

# 1. Rural or Remote Rate Protection (RRRP) Expansion (cont'd)



*Note: this includes the ~$50M currently supporting Algoma Power and Hydro One Remotes.*

# 2a. Enhance Ontario Electricity Support Program (OESP) Benefit

- The OESP is an income-tested, application based program that lowers the electricity costs of the most vulnerable consumers by providing a rebate directly on their electricity bills. The OESP provides basic benefits to most consumers and enhanced benefits to Indigenous customers and customers with electric heat and medical devices and at launch, it was estimated ~560,000 families could be eligible and some 261,000 applications have been submitted.

- The OESP program benefits could be increased across the board by 50%, which would mean:
  - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
  - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).

- The OESP program could also be further enhanced by working to ensure the program uptake is as close as possible to 100%:
  - Streamlining the application process to make it easier and quicker to get through;
  - Putting in place a more aggressive communications strategy to make sure people are aware of the program;
  - Increasing funding for key partner agencies to work directly with individuals who are applying; and
  - Exploring automatic OESP qualification for those who receive provincial programs (e.g., ODSP).

**Considerations**

- If the OESP was funded by the tax-base, it could also be explored whether the OESP could be better delivered as a provincial program via the tax system. This may help ensure that the program's participation rate is as high as possible.
  - At the time of program design, advice was given that a 40-50% participation rate would be high for an application-based program delivered through electricity bills.
  - The province would need to work with LDCs if the rebate was to appear on electricity bills rather than be delivered via the income tax system (e.g., through the Trillium Benefit).

# 1 & 2a. Fiscal Impacts of RRRP, OESP and First Nation Rate

- Table below shows estimates of program costs up to 2022:

| Year | OESP ($M) | OESP + 50%($M) | RRRP($M) | RRRP Enhancement ($M) | First Nations Delivery Rate($M) | TOTAL RANGE ($M) (from status quo to OESP and RRRP enhancements) |
|---|---|---|---|---|---|---|
| 2017 | $108 | $162 | $292 | $374 | $18 | $418 to $846 |
| 2018 | $150 | $226 | $300 | $384 | $18 | $468 to $928 |
| 2019 | $186 | $279 | $306 | $394 | $18 | $510 to $997 |
| 2020 | $215 | $322 | $315 | $404 | $18 | $548 to $1,059 |
| 2021 | $243 | $365 | $322 | $415 | $18 | $583 to $1,120 |
| 2022 | $272 | $408 | $329 | $426 | $18 | $619 to $1,181 |

1) Ontario Electricity Support Program (OESP)
   - After almost a year in market, close to 30% of potentially eligible customers are signed up.
   - The cost projections above assume the program grows to 100% of eligible consumers by 2022 and remains at that level.
   - The second column forecast also assumes the existing credit amounts increase by 50%.
     - Forecast assumes 10% administration costs
     - Forecast does not account for the approximately 142,000 low-income households that OEB estimated are not eligible because they do not directly receive an electricity bill.

2) Rural and Remote Rate Protection (RRRP)
   - Provides benefits to R2 Hydro One consumers, Algoma, and remote communities.
   - Includes the expanded coverage that will begin on January 1, 2017.
   - Expansion to cap distribution rates for other customers is based at $374M and assumes escalation of 2.6% (historical average dx rate increase). This is a conservative estimate, as Hydro One and Toronto Hydro increases could drive program costs beyond the average increase.

3) First Nation rate reduction (currently under development)
   - On November 14, 2016, OEB presented options to the Ministry on reducing costs for on-reserve First Nation customers.
   - OEB's recommended option to provide 100% delivery rate credit, which is estimated at $18.4 million per year.
     - Other options includes a seasonal fixed credit to account for demand changes over the year ($13 million) or a 50% total bill reduction ($23 million).

# 2b. Expand OESP Eligibility

**Expanded Coverage**

- When OESP was being created, the OEB estimated that are 713,000 low-income households, of which 20% do not receive electricity bills. Thus, only 571,000 would potentially be eligible for OESP.
- If moved to the tax base, the OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity.

**Eligibility Categories**

- OESP has two credits amounts:
    1) Basic credit of $30-50 per month, based on the level of income and the number of residents.
    2) Enhanced credit of $45-75 per month for those with unique electricity needs:
        a) Electric heating,
        b) Indigenous customers, and
        c) Certain electrically intensive medical devices.
- The enhanced credit can be expanded to include additional eligibility categories of customers. For example, a new “Low Density Consumer” category could be introduced that provides Hydro One R2 customers (highest distribution rates) eligible for OESP the enhanced credit.

**Considerations**

- Potential costs for expanded coverage and new eligibility categories depend on updated estimates and changes to program design and delivery.
- There would be value in keeping the OESP as an income-tested program to distinguish it from other initiatives (e.g. RRRP, which is designed to address disparity between rural and urban distribution costs).

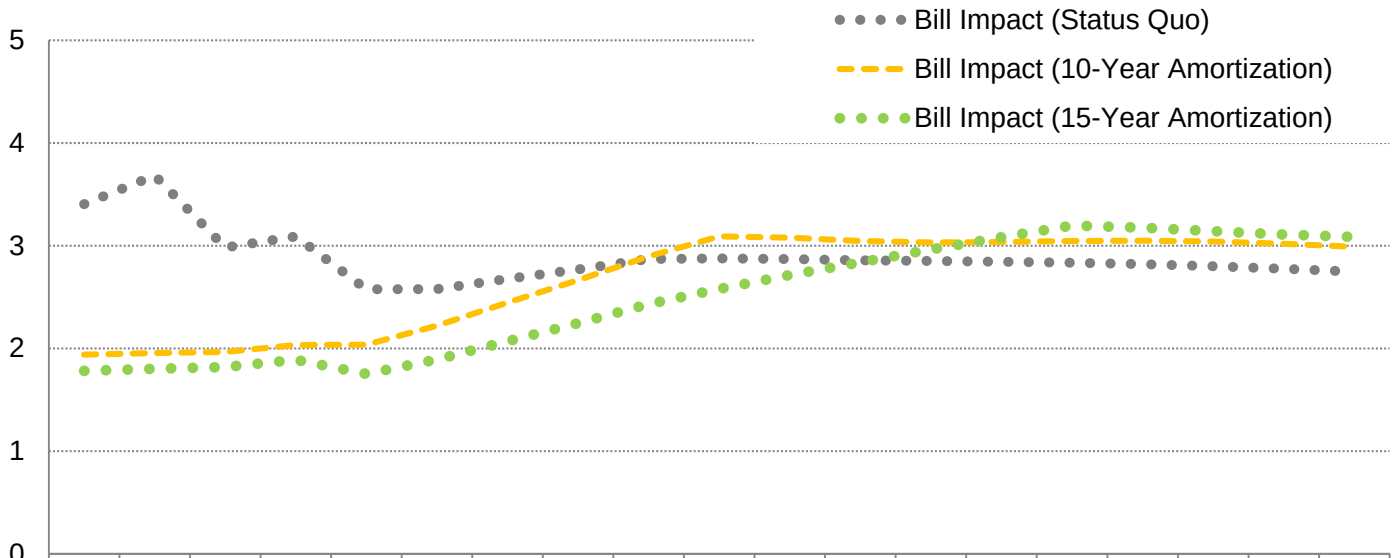
# 3a. Amortize Conservation Program Costs

- ~$3 billion from the electricity ratepayer base will be spent on conservation programs delivered under the Conservation First Framework (CFF) and the Industrial Accelerator Program (IAP) between 2015 and 2020.
- Currently, Conservation and Demand Management (CDM) program costs are recovered from the Global Adjustment (GA) mechanism about one month after expenses are incurred.
- As a potential rate mitigation measure, certain CDM costs could be amortized. This would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs).
  - The time period over which costs could be amortized would be over the lifetime of funded CDM measures.
  - ENERGY is working with IESO to determine the appropriate lifetime period – the graph on the next slide, which illustrates residential bill impacts, presents two cases: **10-year and 15-year measure lifetimes**.
- In both cases, amortizing a portion of conservation spending would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020. Over time the benefit would decrease and turn into a cost (higher electricity rates than would otherwise occur), as interest charges begin to grow. Estimated interest charges are as follows (a 3% interest rate is assumed; increases in interest rates could result in higher overall interest charges):
  - $712 million ($2016) – Amortizing eligible 2017-2035 CDM costs for 10-year period; and
  - $1.3 billion ($2016) – Amortizing eligible 2017-2035 CDM costs for 15-year period .
- Legislative changes would be needed to allow recovery of interest payments from ratepayers, or these costs could be recovered from the Consolidated Revenue Fund (CRF, or taxes).
- An alternative that could be explored would be to pay for CDM costs, or for a portion of these, from the tax-base (*see Appendix for more detail on tax funding option*).

# 3a. Amortize Conservation Program Costs (cont'd)

## Conservation Residential Bill Impact – Status Quo, 10-Year and 15-Year Amortization

***CDM Bill Impact ($/month)***



| | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 | 2031 | 2032 | 2033 | 2034 | 2035 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bill Impact (Status Quo) | 3.40 | 3.68 | 2.98 | 3.09 | 2.58 | 2.58 | 2.68 | 2.77 | 2.87 | 2.88 | 2.87 | 2.86 | 2.85 | 2.84 | 2.83 | 2.82 | 2.80 | 2.78 | 2.75 |
| Bill Impact (10-Year Amortization) | 1.94 | 1.95 | 1.97 | 2.03 | 2.04 | 2.22 | 2.45 | 2.67 | 2.90 | 3.09 | 3.08 | 3.05 | 3.03 | 3.04 | 3.04 | 3.05 | 3.04 | 3.02 | 2.99 |
| Bill Impact (15-Year Amortization) | 1.78 | 1.80 | 1.82 | 1.89 | 1.75 | 1.89 | 2.07 | 2.25 | 2.43 | 2.58 | 2.71 | 2.84 | 2.96 | 3.08 | 3.20 | 3.18 | 3.14 | 3.11 | 3.09 |

Source: IESO; Ministry of Energy

**Note**: Chart assumes that conservation incentive costs are available for amortization while administration cost are not. Although there is variable from year to year, incentives represent about two-thirds of conservation spending in Ontario. Chart assumes conservation spending continues at a similar rate beyond 2020. Chart assumes a 10 of 15-year borrowing rate of 3.0%.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- Under **Public Sector Accounting Board (PSAB) accounting standards**, used by both the Province and IESO, only certain assets can be amortized: 1) pensions and 2) tangible capital assets. Under PSAB an asset must meet several criteria to be considered a capital asset, including:
  - A tangible capital asset must be tangible and substantive and the Ontario government must have title and operate the asset.
  - A tangible capital asset must bring a tangible benefit to the government or to Ontario.

- CDM costs, on their own, do not meet the criteria of a tangible capital asset because customers would have ownership and control of installed CDM measures, not the Province or IESO.

- **Rate-regulated accounting** was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- If some of Ontario's CDM costs could be amortized, analysis shows that ratepayer impacts would be reduced in the short-term but interest charges on the loan would result in increased overall ratepayer costs in the longer-term.
- Legislative amendments would be needed to allow recovery of loan interest charges from GA.
- ENERGY staff have developed a note to seek an opinion from IESO's external auditor and from the Ontario Provincial Controller (OPC) to determine whether CDM costs could be amortized according to rate-regulated accounting standards.
- ENERGY is working with IESO to seek an opinion on the proposal from IESO's external auditor.
- ENERGY would then send the IESO external auditor's opinion along with ENERGY's explanatory note to the Ontario Provincial Controller (OPC) to seek a formal opinion on whether CDM costs could be amortized according to rate-regulated accounting standards.
- Further legal analysis would also be required to confirm legal viability and possible approaches to implementation.

# 3b. Rate Smoothing of Conservation Program Costs

- "Rate smoothing" could achieve the same rate reduction effect as amortization.
- Instead of taking out a loan to amortize conservation costs, a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Each year, IESO would defer recovery of a portion of annual conservation costs. Financing would also be required, such as from the OFA, to pay the interest on the deferral account. Interest would accrue on the deferred amounts, likely at the same rates as for the amortization option.
- Deferred costs could be recovered over any time period. If a 10 or 15 year-period was chosen, the rate impacts would be the same as in the amortization option.

**Considerations**

- Option would **not** require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open the Ministry to criticism by the Controller and/or Auditor General since the rate impact is the same.
- The Ministry would have more control under this option to change deferred amounts each year, as opposed to the terms set by a loan agreement under the amortization example.
- There is precedence to this approach for nuclear investments, which otherwise would result in volatile increases and decreases for Ontario ratepayers over the investment period. In 2015, the Ministry amended a regulation that requires the Ontario Energy Board (OEB) to set "smoothed" nuclear rates for OPG's Darlington and Pickering nuclear stations over a 20-year period.
  - The regulation allows OPG to defer recovery in rates of a portion of its nuclear revenue during the Darlington refurbishment (expected to be complete in 2026) and recover these deferred costs over the remaining ten years.
  - OPG will establish a "deferral account" to record the deferred amounts each year up to 2026 plus accumulated interest on the balance to reflect OPG's financing costs as a result of rate smoothing. The deferral account is then drawn down on a straight-line basis between 2026 and 2036.
- At minimum, new regulation would be required. However, further analysis is needed to determine the relevant regulation or legislation, to be amended for IESO (e.g., OEB regulation of IESO costs and fees, GA regulation for how IESO recovers its conservation costs from ratepayers).

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure

- Fund investments in specific energy infrastructure projects through the tax-base. **Note:** This could include the provincial portion of funding for the Remote First Nation Connection Project, a fund to support projects that improve adequacy and reliability in areas where new transmission would unlock economic growth and expansion of natural gas service to underserved communities.

**Considerations**

- Tax-base funding would allow for energy infrastructure to be built without impacting electricity and natural gas rates.

*Remote Connection Project:*

- Ontario ratepayers currently support costs of remote electricity service through RRRP on the order of $28 million/year
- Connecting 21 remote communities to the Ontario grid is supported by a positive business case due to diesel cost savings over time. If RRRP is funded through the tax base as proposed above, this project represents an opportunity to reduce impacts from RRRP.
- Direct investment in Ontario's portion of the capital costs of the project through a provincial fund (e.g., Trillium Trust) could also be considered along with mechanisms for cost recovery through transmission rates to refresh the fund as industry benefits from the transmission investment.
- The amount of investment and long-term savings depend on a federal contribution to the project and ENERGY is currently in discussions with Canada with the goal of concluding a cost-sharing agreement by spring 2017.
- A move to tax-based funding may have implications for cost oversight, since the OEB's mandate is to have oversight of ratepayer impacts. Alternative methods to review cost prudence of tax-based funding may be needed.

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (cont'd)

**Considerations (cont'd)**

*Transmission Projects to Enhance Economic Growth:*

- A tax-based fund could target investments in projects that have been identified in IESO regional plans and that would stimulate economic growth but are not proceeding due to cost barriers under the OEB's beneficiary pays principle. Investments could also target areas where the existing system poses challenges for delivering reliable service such as in parts of Northern Ontario with long single circuits.
- Potential opportunities for investment could include a transmission reinforcement in the **Greenstone area**, upgrades south of **Red Lake** and others TBD based on program design.
- This approach would allow a potion of project costs to be socialized to advance key projects without impacting rates or OEB's principles of cost allocation. Scope and scale of fund would be refined through program design.

*Natural Gas Expansion to Underserved Communities:*

- The Government has currently committed to expanding natural gas access to more communities in Ontario (i.e., $200 million Natural Gas Access Loan and $30 million Natural Gas Economic Development Grant).
  - Natural gas is an affordable heating source in Ontario. Its continues to be less expensive than alternative sources such as electric baseboards, heating oil and propane. For example, switching from oil to natural gas can save an average consumer an estimated $1,500 annually.
  - Increasing access to other energy sources such as natural gas, provides Ontarians with more options to meet their needs, reduce their energy costs and improve their quality of life.
  - Expansion of natural gas delivery infrastructure is widely supported in underserved communities (i.e., a recurring theme at ROMA) as a means to provide consumers and businesses in underserved communities with more affordable energy choices, attract new industry to Ontario and benefit agricultural producers.
- A grant program complements the Ontario Energy Board's recent decision enabling greater rate-based expansion to unserved areas, including rural and remote communities.
  - Applying Trillium Trust funding would make it possible to enhance the Grant Program and service more communities.

# 5. Dedicate Departure Tax

- In connection with the IPO, as a result of leaving the PILs regime and entering the corporate tax regime, Hydro One was deemed to dispose of its assets for proceeds equal to its fair market value, triggering a PILs liability of $2.6 billion (Departure Tax).
- This was paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt.
- The Province could explore repurposing some of those funds to the benefit of ratepayers.
- This may reduce the risk that the Ontario Energy Board (OEB) assigns to ratepayers the benefit from an associated tax asset, resulting in lower earnings and decreased share value for Hydro One. This decision is currently before the OEB, as part of Hydro One's Transmission rate application.
- If the Province were to transfer $2.6 billion in economic benefits to the rate base over 10 years suggest the following impacts (assuming 140TWh per year):
  - Residential Ratepayer Impact (if spread over 10 years): up to $1.39 per month on a typical bill; and
  - Industrial Ratepayer Impact (if spread over 10 years): up to $1.86 / MWh

**Considerations**

- Cost savings to ratepayers and associated fiscal impacts would depend on timing and which ratepayers (e.g., Hydro One customers, or all Ontario customers) will benefit from some or all of the $2.6 billion value.
- The departure tax was effectively a true-up for lower PILs payments from Hydro One in previous years – it was not a one-time windfall for the Province. In other words, it ensures that Hydro One paid all its tax obligations under the PILs regime before moving into the normal corporate tax regime.
- The related ~$2.4 billion fiscal benefit to the Province (from the deferred tax benefit) has already been credited to the Trillium Trust to be used to build infrastructure under Moving Ontario Forward.
- Repurposing funds paid to OEFC may have an impact on the defeasance of electricity stranded debt.
- While this is a shift from messaging that value from the broadening of ownership of Hydro One is being used pay down debt and fund transit and transportation, the Province could link to electricity infrastructure investments (e.g., as an offset to infrastructure investments already made in the sector, or to specific initiatives such as conservation).

# 6a. Empower Energy Agencies – IESO / Market Renewal

- Continue to move forward with IESO's Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2021, leading to a reduction of:
  - About $1/month or less than 1% at current retail prices for a typical residential bill; and
  - About $1.30/MWh at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.
- IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.

# 6b. LDC Efficiencies and Rates

- Reducing costs and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills.
  - Currently, LDCs recover costs through the Delivery line of the electricity bill, which is broken into Distribution and Transmission costs. LDCs are responsible for the Distribution costs of the electricity bill which account which account for about 20% of the total bill.
  - Distribution costs vary across the province as LDCs have different service territories and needs (e.g., geography, number of customers, density of customers, life/health of capital assets, etc). See next slide for more detail.
    - For example, comparing 2016 with 2006, distribution rates have increased by about 24.5% (or about 2.2% per year, compounded annually) across the Province, with significant variation between regions and LDCs (-17% to 148%). Overall consumer price inflation in Ontario for the same period increased by about 19% or 1.8% per year.

**Considerations**

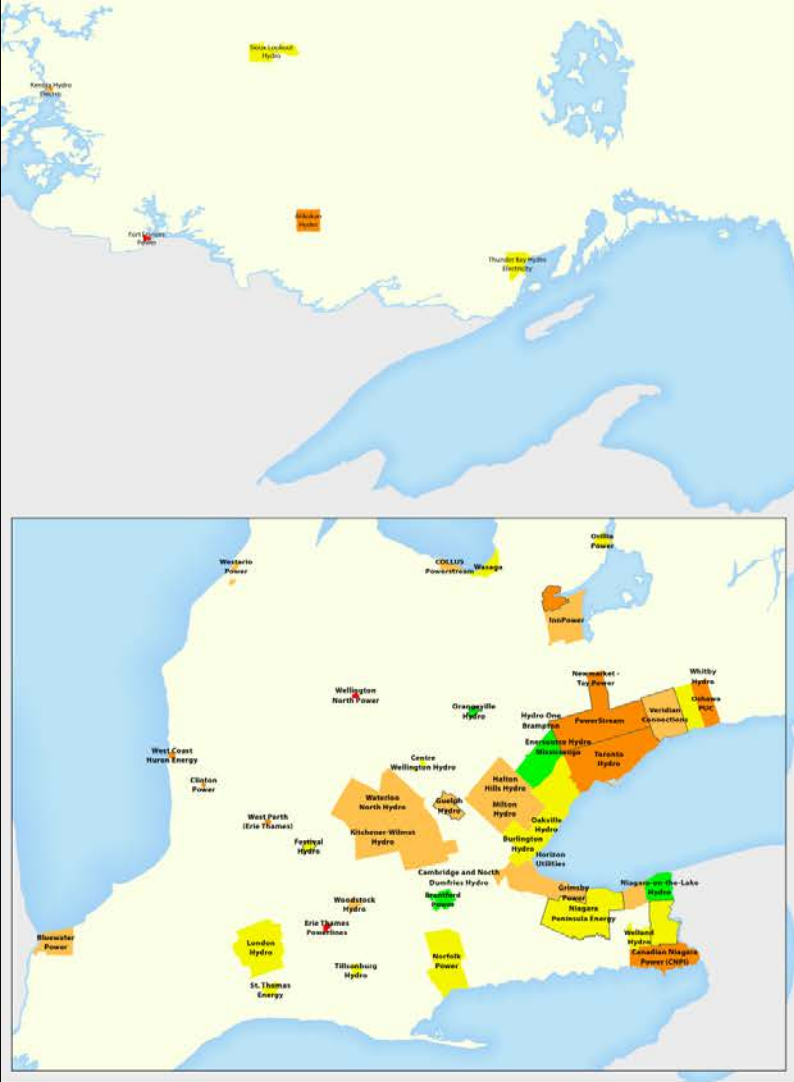
- The Ontario Energy Board (OEB) has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates. Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.

- There maybe opportunities to promote further cost reductions and performance improvements within the distribution sector as there is continued evolution of the regulatory framework in Ontario.
  - Tightening LDC requirements may also indirectly incent other desired policy outcomes, such as LDC consolidation and grid modernization to realize further cost reductions.
  - To further help address the costs associated with the Delivery line of the electricity bill, program such as the RRRP (previous slide) could be expanded to include other customers that may face higher costs.

- ENERGY could help promote or accelerate these efforts by asking the OEB through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and the 2017 Mandate Letter and other agency business planning processes.

- In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. The Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities. The panel recommended legislation to mandate consolidation.
  - Rather than mandating consolidation, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation. Further changes to the tax incentives and/or revisiting legislated consolidation could be considered.

# LDC Distribution Rate Changes (2006 vs 2016)



| Total Dx Rate | 2006 | 2016 | % Rate Change |
|---|---|---|---|
| Hydro One UR (High Density) | $29.13 | $35.65 | 22.4% |
| Hydro One R1 (Medium Density) | $37.73 | $54.02 | 43.2% |
| Hydro One R2 (Low Density) | $44.65 | $76.14 | 70.5% |

## Legend

**LDC Rate Comparison 2006 vs 2016**

**% Total Rate Change ( # of LDCs )**

- -17.3% to 0% ( 5 )
- 0.1% to 15% ( 25 )
- 15.1% to 30% ( 21 )
- 30.1% to 60% ( 16 )
- 60.1% to 89.3% ( 4 )
- Merged LDCs

Below LDCs had either acquired or merged: (# of merged LDCs)

a. Powerstream Inc. ( 5 )
b. Chatham-Kent Hydro Inc. ( 13 )
c. Veridian Connections Inc. ( 4 )

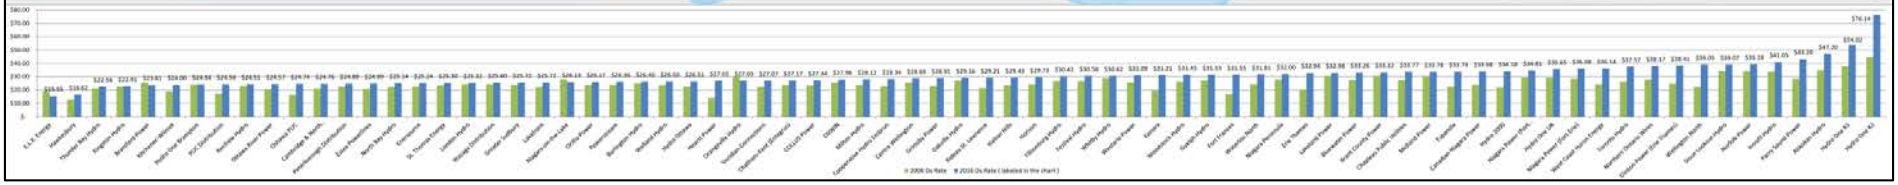
*Published December 2016*

## KEY FINDINGS

- In summary, distribution rates (including rate riders) have increased by about 24.5% across the Province, with significant variation between regions and LDCs (-17% to 148%).
- There is generally no correlation between LDC size or location and distribution rate increase in absolute or percentage terms.
- The current analysis shows no clear relationship between the percentage rate increase and the absolute rate level (that is, high rate increase LDCs may still have among the lowest rates, and low rate increases may have higher rates.
- No clear relationship between amalgamation and rates.
- The analysis does suggest that Hydro One has the highest rates, and some of their customers have seen higher than average rate increases.

## NOTES

- **Rate Calculation:** Monthly residential distribution bill rates, before taxes, are based on consumption of 750 kWh. Distribution charges account for approximately 23% of the average 2016 residential bill.
  All figures calculated by ENERGY staff without input from OEB.
- **Colours:** Colour coding of the map only depicts the change in LDC rate amounts (i.e. LDCs in red don't necessarily have the highest total rates).
- **Mergers:** Rates for customers in merged LDCs have experienced different levels of change. For merged entities, the largest LDC in 2006 was used. An accompanying map focuses on merged entities.
- **Points in Time:** Current analysis compares 2016 and 2006 only. Rates could have had an uneven trajectory, especially considering regulatory decisions such as time limited charges/rebates with temporary impacts.



# 6c. Empower Energy Agencies – OPG / Operational Efficiencies

- Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh).

**Considerations**

- OPG recently submitted its 2017-19 business plan to the Province for concurrence. That plan includes the following:
  - Enterprise total generating cost increasing from $48/MWh in 2016 to an average of $55/MWh over the plan period.
  - An average residential monthly bill increases of $1.05/month annually from 2017-2021.
- Much of this increase is due to the Darlington refurbishment project, which increases costs and reduces OPG's generation over the planning period.
- OPG has also shared its stretch targets for total cost of generation, which average $52/MWh over the 2017-19 plan, a ~$3/MWh reduction (5-6%) relative to its $55/MWh business plan targets.
- The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This is a public document that OEB would likely review and incorporate as part of OPG's current rate application.
- Consistent with regulations under the *Ontario Energy Board Act*, OPG is seeking smoothed rates for nuclear as part of its 2017-2021 rate application.
  - As a result, the benefit to ratepayers of reducing generation costs is uncertain.
  - Given that the application extends beyond the business plan period, and to ensure OPG does not delay costs beyond the planning horizon, the Province may want to provide additional direction for out year expenditures.
- If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.
  - The total cost of $3/MWh based on OPG's forecast production of 74 TWh/yr is about $240 million per year.
- The Province could work with OPG to craft language in the concurrence letter in order to avoid setting unintended precedents for future rate application processes.

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate

- OEB continues to move forward with its Regulated Price Plan (RPP) Roadmap:
  - The OEB is undertaking a comprehensive review of the RPP, including exploring the introduction of offering different pricing plan options for customers following the completion of pilot programs in 2018. The plan is expected to be implemented over a 3-5 year period.
- Until new pricing plans are available, the OEB could provide an "opt-in flat rate RPP" structure that could be made available to residential, farm and small business consumers on an interim basis (2-3 years) until a wider range of price plans are available, providing customers with pricing choice.
- Time-of-Use (TOU) pricing could also be introduced for non-RPP Class B consumers to reduce Global Adjustment (GA) volatility and reduce system costs.

| Current TOU | New Flat Rate |
|---|---|
| On: 18.0 ¢/kWh | 11.1 ¢/kWh |
| Mid: 13.2 ¢/kWh | |
| Off: 8.7 ¢/kWh | |

**Considerations**

- Would provide consumers with electricity pricing choice.
- The OEB has indicated that the option would lead to no overall change in system costs. Consumers with higher peak and mid-peak usage patterns would see a decrease in their electricity bills, while those with higher off-peak usage patterns would see an increase.
  - While the current strong supply conditions may allow for such an RPP structure (i.e., peak demand requirements can be easily met), administrative costs could be high (distributors would need to design/implement an opt-in process and associated billing system on an interim basis).

| | Current TOU | New Flat Rate |
|---|---|---|
| 1) Monthly electricity bill- higher peak and mid-peak usage patterns | $172 | $163 |
| 2) Monthly electricity bill- higher off-peak usage patterns | $152 | $163 |

***Note:** 1) assumes a consumer consumption pattern of 45%:30%:25% (Off-peak: Mid-peak: On-peak), while 2) assumes consumer consumption pattern of 80%:10%:10% (Off-peak: Mid-peak: On-peak). Estimates are based on OEB's online electricity bill calculator (for Toronto Hydro- November 2016 rates)

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate (cont'd)

**Considerations**

- The decision to undertake smart meter investments was partly justified on the basis of TOU pricing. If TOU pricing were to be made optional, some stakeholders could question the rationale for smart meter investments.
  - Rationale for offering a flat rate option could focus on providing customers with choice until new pricing plans are rolled out under the RPP roadmap.

- If a flat rate design is introduced, there could be significant consumer opposition to any return to a mandatory TOU.

- After the interim flat rate period, the OEB could offer a wider range of pricing plans to consumers.
  - As part of its RPP review, the OEB will be running pilots with LDCs to assess customer response to alternative time periods and pricing structures.
  - Learnings from these pilots will help inform potential changes to the RPP. Pilots are expected to be in market May 2017 and run for one year.

- Non-RPP Class B electricity consumers currently pay Global Adjustment (GA) on a volumetric basis. Moving them to TOU would provide an incentive to shift consumption to off-peak periods.
  - Consumers, including manufacturers, who are unwilling to shift would face higher costs and likely not be supportive of the changes.
  - The decision to pursue TOU pricing for non-RPP class B consumers will impact proceeds recycling as there is interplay between the two initiatives.

# 7b. Give Consumers More Rate Choices and Greater Transparency – Detailed Global Adjustment

- Provide electricity consumers greater transparency with respect to electricity generation costs by providing more details regarding the Global Adjustment (e.g., adding a line on hydro bills, quarterly energy reports, etc).

**Considerations**

- As electricity bills have increased, many consumers have complained about a lack of transparency on the drivers of electricity costs. In particular, consumers and legislative officers have singled out the GA.

- Providing consumers with additional information on the cost components and amounts recovered through the GA would help consumers understand how the different forms of electricity generation in Ontario contribute to consumers costs.

- Providing additional information to consumers on electricity commodity cost drivers without sufficient context or background could simply lead to increased complaints about particular generating technologies that make up large shares of costs (e.g., nuclear).

- Adding a breakout of the amount of GA on residential electricity bills could lead to further confusion due to the existing breakout of multiple time-of-use buckets.

- Alternatively, the existing quarterly Ontario Energy Report, which provides various energy sector data, could be leveraged to show a breakout of quarterly GA costs by fuel type. A link on electricity bills could point to this information.

# 8. Help Small Business Manage Their Electricity Cost – End DRC Early for Class B Electricity Consumers

- Propose to remove the $0.07/kWh Debt Retirement Charge (DRC) from the bills of commercial/small industrial Class B consumers beginning in 2017, instead of April 1, 2018.
  - **Note:** Class A consumers (e.g., large industrial) would continue to pay DRC until at least April 1, 2018.

**Considerations**

- For a Class B consumer currently paying about $152/MWh, removing the DRC would represent a savings of about 5%.
  - A 50% reduction in the DRC charge would represent a savings of about 2%.

- Alternatively, the reduction of the DRC could be to $0.035/kWh starting in 2017, to provide relief for cap and trade until proceeds recycling is fully operational.

- Residential consumers have had the DRC removed from bills since January 1, 2016. Taking DRC off commercial and small industrial bills would result in equal treatment for these groups of consumers.

- The savings for commercial and small industrial consumers associated with this proposal would drop to zero in April 2018, since this is the current planned date for removing the DRC from non-residential bills.

- Prior to moving forward with this proposal, additional analysis from Legal Services and the MOF would be needed.

# 9. Extend Length of Existing Wind / Solar Contracts

- Wind and solar developments are typically contracted through standard offer procurements on 20 year fixed terms at fixed pricing.
- Many of these projects have already reached commercial operation.
- The province could explore options for IESO to negotiate extensions to existing renewable energy contracts, for example, by 10 years, in return for the proponents agreeing to a lower price in the near term.

**Considerations**

- Projects in commercial operation offer potential for near-term rate reduction whereas projects that have yet to reach commercial operation provide potential to mitigate future rate increases only.
- The attractiveness of this option to contract holders would vary from project to project and would depend on project economics.
- Revised pricing would be subject to negotiation, and associated ratepayer savings would be difficult to forecast accurately.
- The duration of contract renegotiation is difficult to forecast and may not be achievable in the near term.
  - Proponents may have to renegotiate their project financing arrangements, ensure project investors are satisfied with any changes in ROI, and extend land leases.
- Project host communities and Indigenous communities whose traditional territory the projects are sited in may not be interested in these projects extending their operational period ; discussions/consultation may be required in advance of this potential option moving forward.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Should Ontario be successful in negotiating lower prices in the near term, it should be noted that contract holders will be in a strong bargaining position (given their existing fixed-priced contracts), and will likely extract additional value from the negotiations.

- Since the Minister of Energy is not a party, IESO would be required to renegotiate the contracts, which would likely involve a direction or directive to IESO.

- Further analysis is required as to how ENERGY could express its policy intent to have IESO renegotiate the contracts for a reduced rate at a longer term, however it is unlikely that IESO could guarantee the outcome.

- Further analysis is required to ascertain whether there is scope within the existing contracts for IESO to renegotiate their terms in this manner.

- Extending contract terms would also reduce planned flexibility and increase the risk of overpayment as this existing capacity would now be contracted into the 2040s and not the 2030s.

- Extending contract terms may require investments in component replacement and additional operation and maintenance costs that developers would seek to recover under any renegotiated contract.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Ontario has over 4,500 MW of wind in commercial operation, with the vast majority being large scale (>500kW) developments.
  - This includes over 2,700 MW of large FIT 1 and GEIA wind projects representing 47 contracts (average size ~58 MW) and over 1,000 MW of solar projects representing 103 contracts.

- Projects over 500 kW would offer the most savings potential as they represent the majority of installed renewables capacity and are spread across fewer contracts.

- Below are two potential approaches to reducing ratepayer costs in the near term by extending contract terms at reduced prices. An illustrative example of a typical large wind project is used.

- **Example:** 100 MW FIT 1 wind project achieving Commercial Operation in 2014 (i.e., 17 years remaining on initial 20 year contract), assuming a 10 year contract extension negotiated at the LRP I low weighted average wind price of $64.5/MWh;
  - (17 years @ $135/MWh + 10 years @ $64.5/MWh)
  - **Potential Approach 1:** Provide a single new contract price that is the average of the lower extension price and the FIT contract price over the new contract term. The new price would be lower over a longer term.
  - **Illustrative Example:** New contract for 27 years at $129/MWh.
  - New contract price set to allow 10% rate of return over 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract (remaining term extended for 10 additional years) |
|---|---|---|
| Contract Cost (NPV 2017) | $550 million | $582 million |
| Average Monthly Ratepayer Impact Over First 5 Years | $0.03 savings | |
| Average Monthly Ratepayer Impact Over Remaining 22 Years | $0.02 increase | |
| Average Monthly Ratepayer Impact Over Entire 27 Year Contract | $0.01 increase | |

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- **Potential Approach 2:** Offer facilities a revised contract that extends terms and is structured to offer lower pricing in the initial contract years and higher pricing in the later years of the contract.
  - For example, the New contract is $85.9/MWh over the first 5 years and $169/MWh over the remaining 22 years.
    - Price over first 5 years is LRP I weighted average wind price.
    - Price over remaining 22 years is set to allow 10% rate of return over entire 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract | |
|---|---|---|---|
| | | Initial 5 Years | Last 22 Years |
| Contract Cost (NPV 2017) | $550 million | $632 million | |
| Monthly Average Ratepayer Impact Over First 5 Years | $0.09 savings | | |
| Monthly Average Ratepayer Impact Over Remaining 22 Years | $0.07 increase | | |
| Monthly Average Ratepayer Impact Over Entire 27 Year Contract | $0.04 increase | | |

# 10. Tax Relief for Solar and Wind Contracts

- In 2010 and 2011 Ontario procured large scale projects (>500 kW) through the FIT program at standard offer pricing.

- The FIT program was the centerpiece of the GEA which established the economic and social goals of growing the green economy, including establishing a local renewable energy manufacturing base, supporting the development of green energy jobs, and providing incentives for Indigenous participation.

- To help achieve these economic and social goals, the FIT program offered pricing at above competitive procurement rates, and provided Indigenous and Community participation adders, which resulted in economic benefits to all Ontarians, but resulted in additional costs borne by Ontario's electricity ratepayers.

- Ontario could fund the added cost of some or all of these economic and social incentives by shifting their costs from the rate-base to the tax-base.
    1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
    2. The tax base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT.

**Considerations**

- If applied to projects in commercial operation the benefit to the ratepayer would be immediate.
- Comparing FIT pricing to competitive procurement pricing could provide a reasonable representation of energy procurement without the added cost of economic and social incentives.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
   - For example, from 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
   - The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
   - If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
   - The $3.3 billion difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.
   - This represents estimated average ratepayer savings of $1.50/ month relative to OPO forecasts.
   - The same approach could be considered for solar projects however, prior to LRP I in 2016, Ontario had not procured solar capacity competitively and international cost comparisons are challenging given differences in regional development costs.
   - This example does not include the value of participation price adders available for community and indigenous participation.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

2. The tax-base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT 1 solar and wind projects.

   - For example, 17 large FIT 1 wind and solar projects have Indigenous and/or Community participation making them eligible for a price adder in addition to their base contract price.

   - The estimated value of these price adders is approximately $17.1 million (NPV 2017) over the expected remaining term of their contracts.

   - This represents estimated ratepayer savings of approximately $0.01/month relative to OPO forecasts.

# Key Outcomes / Next Steps

- The proposed initiatives provide the following opportunities to:
  - Provide a greater focus on vulnerable consumers by funding electricity support programs through the tax-base.
    - Enhance existing and new support programs targeted at the most vulnerable consumers (i.e., OESP and RRRP); and
    - Better harmonize delivery rates across the province.
  - Re-set how energy infrastructure is funded by shifting costs to the tax-base from the rate-base.
  - Provide electricity consumers with greater choices and transparency (e.g., alternative rate plan based on a flat electricity rate, unpacking the Global Adjustment costs, etc);
  - Provide system benefits (e.g., market renewal);
  - Increase cost effectiveness and improve efficiency; and
  - Lower the cost of electricity for all consumers.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require legislative and/or regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

# Appendix

A. Rural or Remote Rate Protection (RRRP) – Overview and Enhancements
B. Fund Conservation Programs Through the Tax-Base
C. Eliminate the Industrial Conservation Initiative (ICI)
D. Cancel Large Renewable Procurement I (LRP I)

# A. RRRP Overview and Enhancements

- The Delivery line of the electricity bill is composed of Distribution and Transmission Costs. While transmission costs are uniform across the province, LDC costs vary by distributor and account for about 20% of the total bill for the electricity customers.
  - See slide X for a map of delivery rate increases between 2006 and 2016.
- The Rural or Remote Rate Protection (RRRP) framework was put in place in 2001 to help offset the higher costs to distribute electricity to Ontario residents who live in rural or remote locations.
- RRRP is available to: residential Hydro One R2 customers (~350,000 customers), Algoma Power customers (~11,600 customers); H1 remote customers (~3,500 customers).
  - To date, R2 customers receive a fixed amount of $125 million a year distributed amongst the customers. Algoma and Remote customers have RRRP calculated by the OEB each year that fluctuates based on average provincial distribution increases.
- Because the amount had been fixed for over a decade, the Province recently increased funding of the RRRP program for Hydro One R2 customers from $125 million to $240 million. This will be effective as of January 1, 2017, and will bring their delivery charges in line with the next highest charges from Hydro One's R1 customer class.

# B. Fund Conservation Programs Through the Tax-Base

- Propose to fund 2017-2020 electricity conservation and demand management program costs* using tax dollars instead of ratepayer dollars.
  - Funds received through the Hydro One Departure Tax could potentially be repurposed towards this.
- Total remaining 2017-2020 electricity conservation program costs are expected to be ~$2.1 billion.
- Post 2020, this option could evolve to funding conservation programs through the Greenhouse Gas Reduction Account.

**Considerations**

- Electricity conservation programs provide a number of benefits to society, however, Ontario's ratepayers have been covering these costs:
  - Avoiding/deferring future energy infrastructure investments, reducing disruption in communities (e.g., avoiding the need to build new natural gas generation);
  - Environmental benefits (e.g., reduced natural gas peaking generation and GHG emissions); and
  - Social and economic benefits (e.g., job creation and assistance managing electricity bills).
- There is precedence for using tax dollars to fund conservation programs.
  - Between 2007 and 2011, Ontario funded the Home Energy Savings retrofit program using tax dollars.
- Funding conservation programs though the tax-base is expected to result in a benefit of $3.40/month for residential electricity consumers in 2017. This could provide immediate short term relief to consumers while other rate mitigation initiatives are developed (e.g., market renewal, LDC efficiencies).

*** Note:** This includes costs towards the Conservation First Framework, Industrial Accelerator Program, Demand Response and the Conservation Fund)

# C. Eliminate the Industrial Conservation Initiative (ICI)

- The cost shift from the Industrial Conservation Initiative (ICI) could be removed from electricity bills by eliminating ICI.
  - The ICI allows large electricity consumers to lower their electricity costs by reducing their demand during peak hours.

**Considerations**

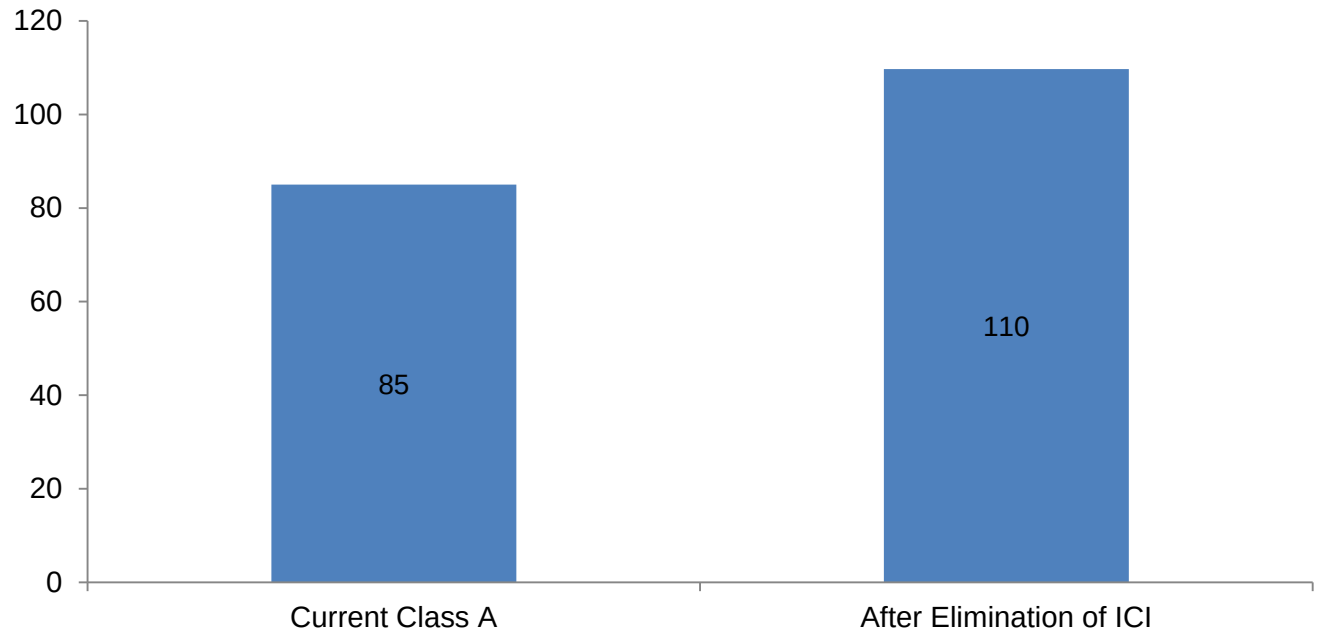
- Eliminating ICI would result in a benefit of more than $4/month for residential electricity consumers in 2017.
  - However, unless government took action to mitigate the associated cost shift back to industrial consumers, typical industrial prices would increase by about one-third. Such a price increase would pose significant challenges for energy-intensive consumers.
- Industrial stakeholders have indicated that ICI as an integral factor in maintaining competitiveness and retaining industry in the province.
  - Eliminating ICI would limit the “cost shift” onto residential consumers, but it would also lead to a reduction in industrial demand. The large industrial contribution to the fixed costs of running the electricity system would then need to be covered by remaining consumers.
- If ICI is retained, current IESO projections indicate that the cost shift will decrease each year going forward as Global Adjustment (GA) decreases (due to an expected increase in HOEP).
- Alternatively, ICI could be funded through the tax-base at a cost of $900 million annually. There is precedent to use the tax-base for industrial support programs, including the Northern Industrial Electricity Rate Program (NIERP) and the Jobs and Prosperity Fund.

# C. Eliminate the Industrial Conservation Initiative (cont'd)

- ICI currently provides a benefit of about $25/MWh to Class A electricity consumers.

**All-In Electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer.

# D. Cancel/Adjust Renewable Energy Procurements

- The Ministry could consider the following actions to further mitigate future impacts to electricity bills:

| Unallocated/Terminated Capacity | Announced Procurements | Executed Contracts |
|---|---|---|
| A. Do not procure unallocated or terminated capacity | B. Revise FIT 5 target | D. Cancel LRP I contracts |
| | C. Cancel FIT 6 | |

**Overarching Considerations**

- Cost savings associated with reducing or cancelling renewable energy procurements and programs will not reduce current electricity bills, but would result in future cost reductions relative to Ontario Planning Outlook forecasts.
- The IESO estimates implementing options A to C will reduce system costs by approximately $592 million ($2016) between 2019 and 2028, resulting in an average of approximately $0.50/month in savings to a typical residential electricity bill over the same period.
- The microFIT program is winding down end of 2017. Annual microFIT procurement targets have been undersubscribed.
- With a few exceptions (e.g. rollover of unallocated microFIT capacity; addition of terminated microFIT and small FIT capacity to FIT 5), plans for unallocated or terminated capacity are not defined in announcements or existing directions.

*Cancel/Adjust Announced Procurements:*

- Amendments to existing directions to IESO would be required to reduce FIT 5 and cancel FIT 6.
- The FIT 5 procurement is underway with a base target of 150 MW and inclusion of any capacity available from contract terminations under prior small FIT and microFIT procurements. The application window closed on November 25, 2016.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts

*Cancel Existing LRP I Contracts:*

- 16 LRP I contracts (approx. 455 MW) have been executed and projects are under development.
- None have met Key Development Milestones. Total value of LRP I estimated at approx. $1 billion (NPV to 2016).

**Considerations**

- To help inform a decision, IESO or OEB could be asked to evaluate and provide guidance to the Ministry on the system need for LRP I projects and potential ratepayer impacts/benefits.
- 13 of 16 LRP I contracts have Indigenous participation. Cancelling LRP I contracts would remove this economic development opportunity and likely damage relationships between Indigenous communities and the government.
- LRP I Contract includes an “Optional Termination” provision allowing IESO to terminate any contract prior to the “Commercial Operation Date” with 6 months written notice.
- The IESO obligations under the Optional Termination provision depend on whether the project has met all “Key Development Milestones”.
  - As no projects have met their Key Development Milestones, the estimated total cost payable to contract holders is about $8 million.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts (cont'd)

**Legal Analysis**

- Any new directive to cancel LRP I contracts would need to be approved by Cabinet, either as part of an LTEP implementation directive to IESO, or pursuant to the overall power to direct IESO with respect to procurements.
  - An amendment to an existing direction would not require Cabinet approval, however, further analysis is required to determine if direction to cancel LRP I contracts could be considered as amending existing direction.
- ENERGY has previously received advice that there is a high risk that a court would conclude that the Minister has no authority under the *Electricity Act , 1998* to issue a direction requiring IESO to terminate microFIT Conditional Offers and FIT Offer Notices that have already been issued to applicants, because these offers create vested contractual rights. This reasoning would likely apply equally to any direction to IESO to cancel LRP I contracts. Previous advice has also flagged a risk that the Province could be liable for damages in tort for inducing a breach of contract (or other claims).
- The risk and costs associated with potential law suits resulting from the cancellation of contracts requires further analysis. LSB recommends ENERGY seek an opinion from Crown Law Office Civil before proceeding.

---

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

# Financing the Global Adjustment

January 13, 2017

*Working Draft for Discussion Purposes Only*

# Purpose

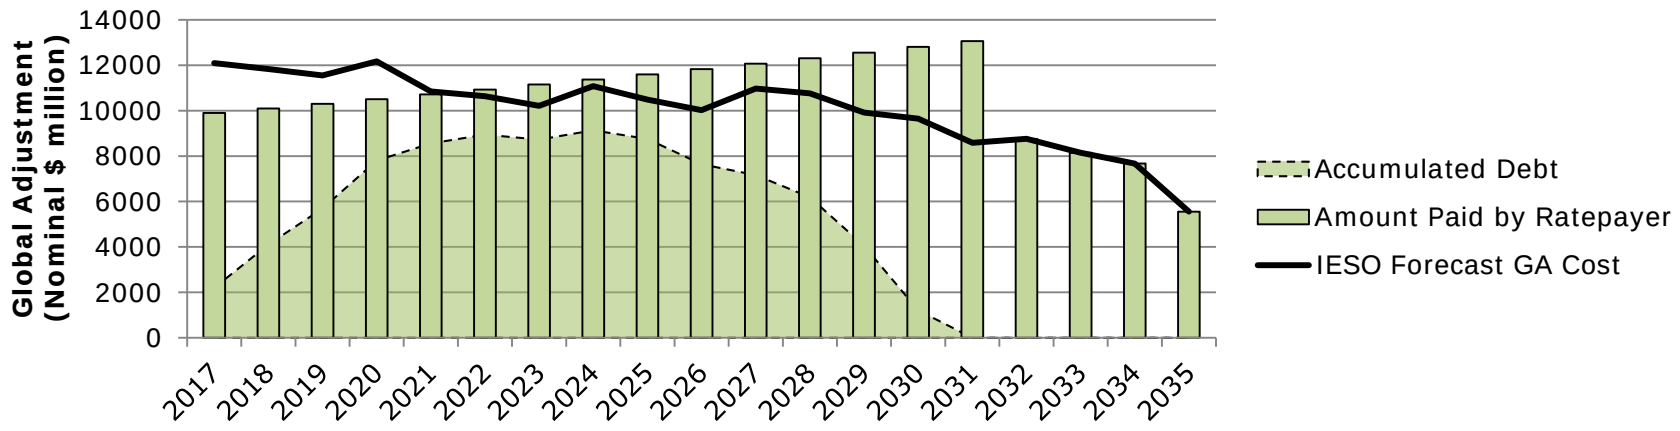
- To analyze the impact of partially financing the cost of the global adjustment (GA) to defer some of the cost to later years.
- The economic, legal and fiscal risks to ratepayers, stakeholders and government are qualitatively discussed.
- The remainder of the presentation quantitatively examines several different scenarios for financing the GA, showing:
  - The impact on residential bills; and
  - The amount of debt incurred.

# Rationale for Financing the GA

- The GA is comprised of costs for regulated and contracted generation, as well as conservation.
- Some contracted generation assets are expected to have a useful life that extends beyond the term of their current financial contracts (typically 20-years).
- Similarly, conservation costs are recovered through the GA on an annual basis while conservation initiatives provide benefits to the electricity system over the course of many years.
- Since the GA only includes costs related to the contractual life of these assets, there may be an opportunity to recognize the longer-term benefit of these assets to the electricity system and “bring forward” that benefit for ratepayers today, while deferring some of the current costs.
- An indicative GA financing proposal is presented that lowers ratepayers costs over the short term by borrowing money but increases costs over the long term when GA costs are forecast to be lower.
- Note that not all generating assets will continue operations at the end of their contract term. Regulatory constraints (i.e., nuclear licences) or low demand conditions (i.e., as experienced with current expiring NUGs) would mean that some generators will shutdown at the expiry of their contract. Future ratepayers would be paying for these assets that are no longer producing power.

# Indicative Proposal to Finance the Global Adjustment

- For the purpose of discussion, it is proposed that the amount of GA paid by ratepayers in each year over the forecast period is set at a fixed amount until the total amount of money borrowed has been completely paid back.
- All scenarios are assumed to begin January 1, 2017, setting the 2017 amount of GA paid by ratepayers at a value lower than the true cost of GA and increasing that amount year-over-year at inflation (assumed to be 2%) until the debt has been paid off.
- In this way, GA costs will be "smoothed" over time by lowering costs in the short term and increasing costs in the long term.
- In some scenarios, the amount of GA paid by ratepayers *above* the expected true cost of GA is capped so as to limit large increases in the cost of electricity in any given year.
- All analysis is based on forecasts from Independent Electricity System Operator's (IESO) Ontario Planning Outlook and assumes a 5% borrowing interest rate.



**Sample financing**: Ratepayers pay less than the cost of GA in early years, borrowing up to $9 billion that is fully paid off in 2031 by charging ratepayers more than the cost of GA in later years.

# Considerations and Risks – Ratepayer

Ratepayer:

- Borrowing money to finance the GA, while lowering costs in the short term, results in a more rapid rise in electricity prices beyond the rate of increase already expected.

- The GA financing proposal involves borrowing large amounts of money over a long period of time (16-30 years, depending on the scenario) to reduce electricity rates. This debt would be highly sensitive to interest rates which could extend repayment timelines or put significant pressure on electricity rates. A long-term interest rate of 5% is assumed for this analysis.

- GA and HOEP provide a natural hedge against each other – when one goes up, the other goes down – keeping total electricity costs relatively stable and predictable. Smoothing only the GA would lead to greater price volatility for consumers.

    - For example, if HOEP is higher than expected (due to higher gas or carbon prices, for example), all-in rates will rise significantly as the natural decrease in GA would not occur given the prescribed GA rate described in the indicative proposal.

- Should Ontario electricity demand be lower than forecasted, the cost of paying off the debt will be spread over a smaller pool of consumption, further increasing future costs for individual ratepayers.

# Considerations and Risks – Fiscal and Stakeholder

Fiscal / Accounting:

- Further analysis is required on whether such changes to the financing of the GA would affect the Province's current accounting treatment for the GA and represent a potential fiscal risk. As such, early engagement with Legal Services Branch and Treasury Board Secretariat is advised.
    - It is unclear whether legislation could determine the manner in which this initiative is accounted for. Further work is required.
- Historically electricity sector financing has been conducted by the Ontario Financing Authority, e.g., managing OEFC's stranded debt and borrowing on behalf of IESO. Further consultation with the OFA will be required to determine the appropriate vehicle for additional borrowing.
- The significant amount of additional Provincial borrowing needed to finance the GA, and associated risks (e.g., interest rates, repayment timelines), could put pressure on the Province's credit rating and overall borrowing capacity. Further analysis is required and would suggest early engagement with the OFA through which money will be borrowed.

Stakeholder:

- The significant deferral of electricity system costs over a long time-horizon and associated interest costs may draw criticism from some stakeholders as creating a new "stranded debt" in the sector. Note: the Debt Retirement Charge was removed from residential bills in 2016 and will be removed for remaining customers in 2018.

# Considerations and Risks – Legal

Legal:

- Legislation would be required to authorize the financing proposal.
  - Amendments to the *Electricity Act, 1998* (EA) could authorize the financing of certain costs within or part of the GA. However, whether any other legislation requires amendment is not known at this time.
  - The GA regime currently provides that “true costs” represent the true costs of making payments to generators or counter parties to contracts, not the incurring of discretionary financing or interest costs.
  - Considerations such as the need to analyze legal risks or the need to address costs retroactively (if the proposal requires a January 1, 2017 start) could add to the legal and drafting complexity;

- Introduction of a bill in the week of February 20th is an aggressive timeline that could require diversion of resources from other initiatives.

# GA Debt Financing Scenarios

1. Status Quo

   - Ratepayers continue paying the full cost of the GA in each year without incurring any debt.

2. Moderate short-term cost reductions with limits

   - The amount of GA paid by ratepayers in 2017 is lowered by $2.5 billion below the true cost of GA and increases at inflation (assumed to be 2%) in each subsequent year until the total amount of money borrowed is paid off.
   - Future GA over-payments above the true cost of GA are capped at $2 billion to limit electricity cost increases in any given year.

3. Maximized short-term cost reductions with limits

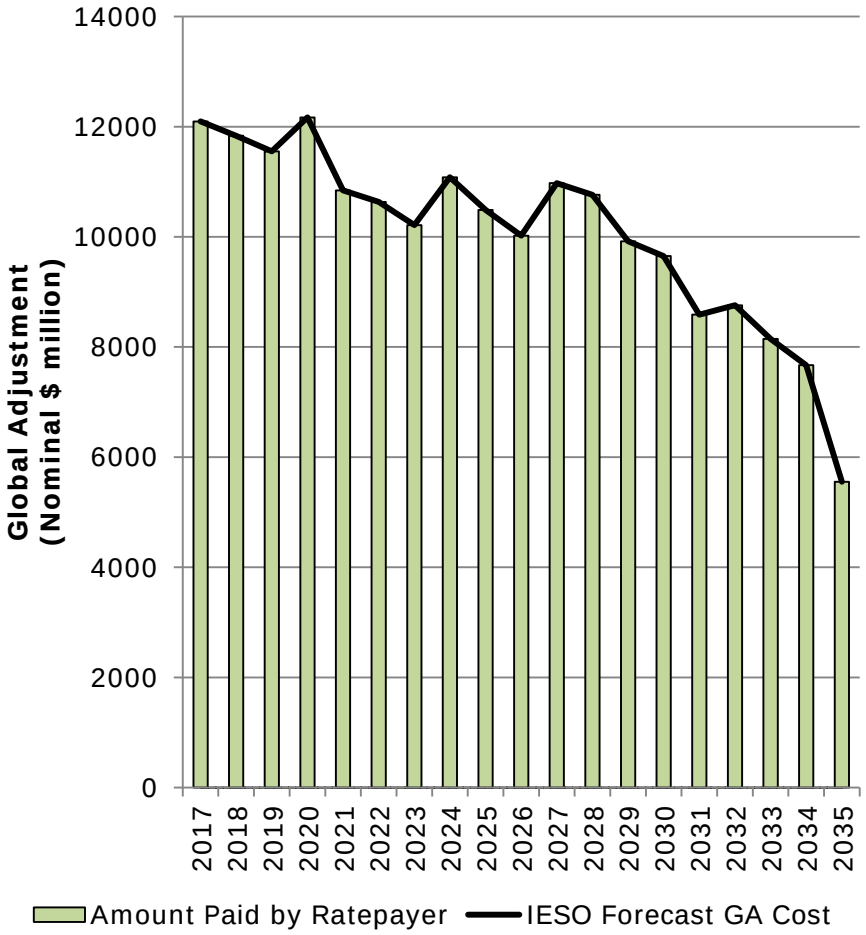
   - This scenario considers the maximum amount by which ratepayer GA costs in 2017 can be reduced such that the total amount of money borrowed is paid off over a 25-30 year financing period.
   - Future GA over-payments above the true cost of GA are capped at $2 billion to limit electricity cost increases in any given year.

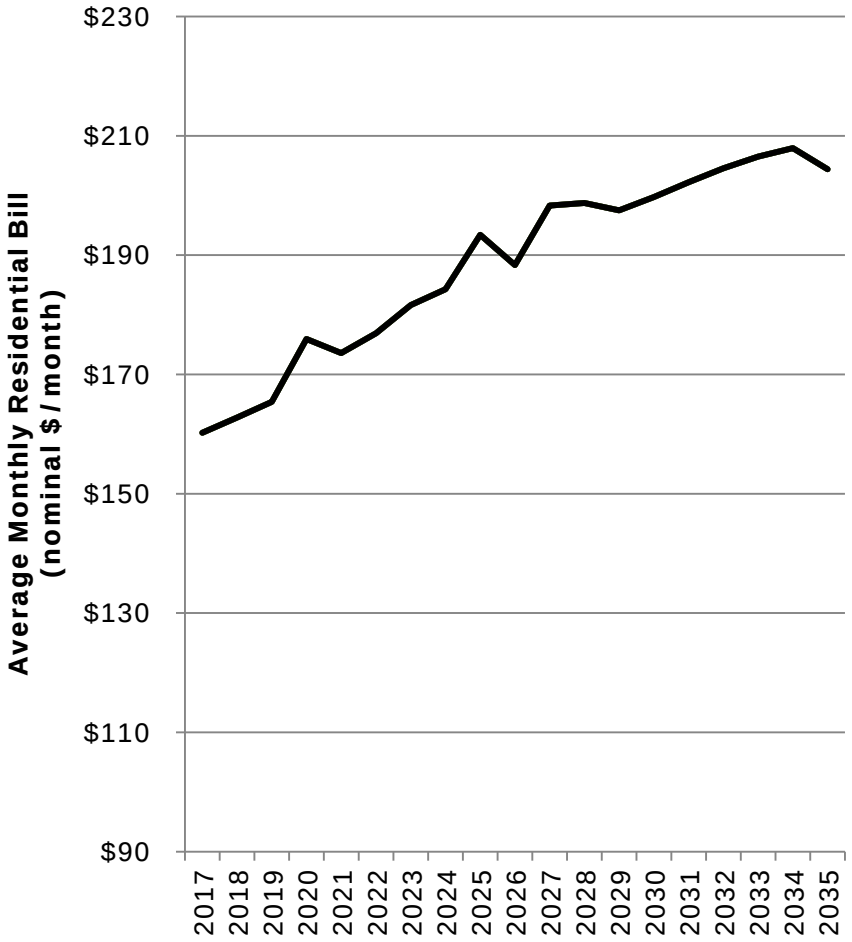
4. Maximized short-term cost reductions, no limits

   - This scenario considers the maximum amount by which ratepayer GA costs in 2017 can be reduced such that the total amount of money borrowed is paid off over a 25-30 year financing period.
   - No limit is placed on the amount charged to ratepayers above the true cost of GA.

# 1. Status Quo – Global and Residential Impacts

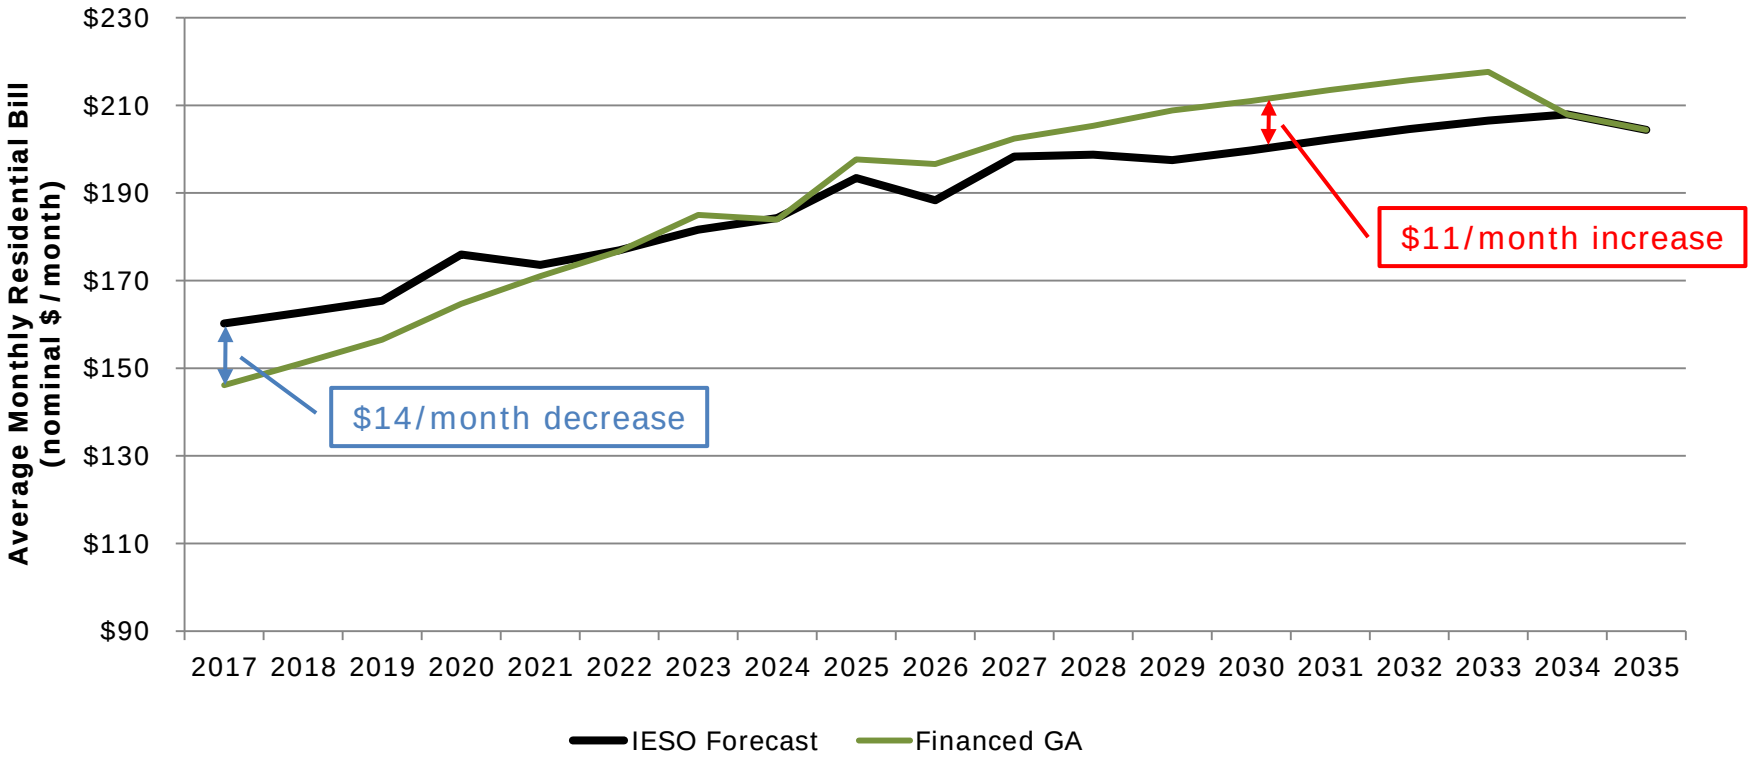
- Ratepayers continue paying the true cost of GA.





# 2. Moderate Short-term Cost Reduction with limits – Residential Impacts

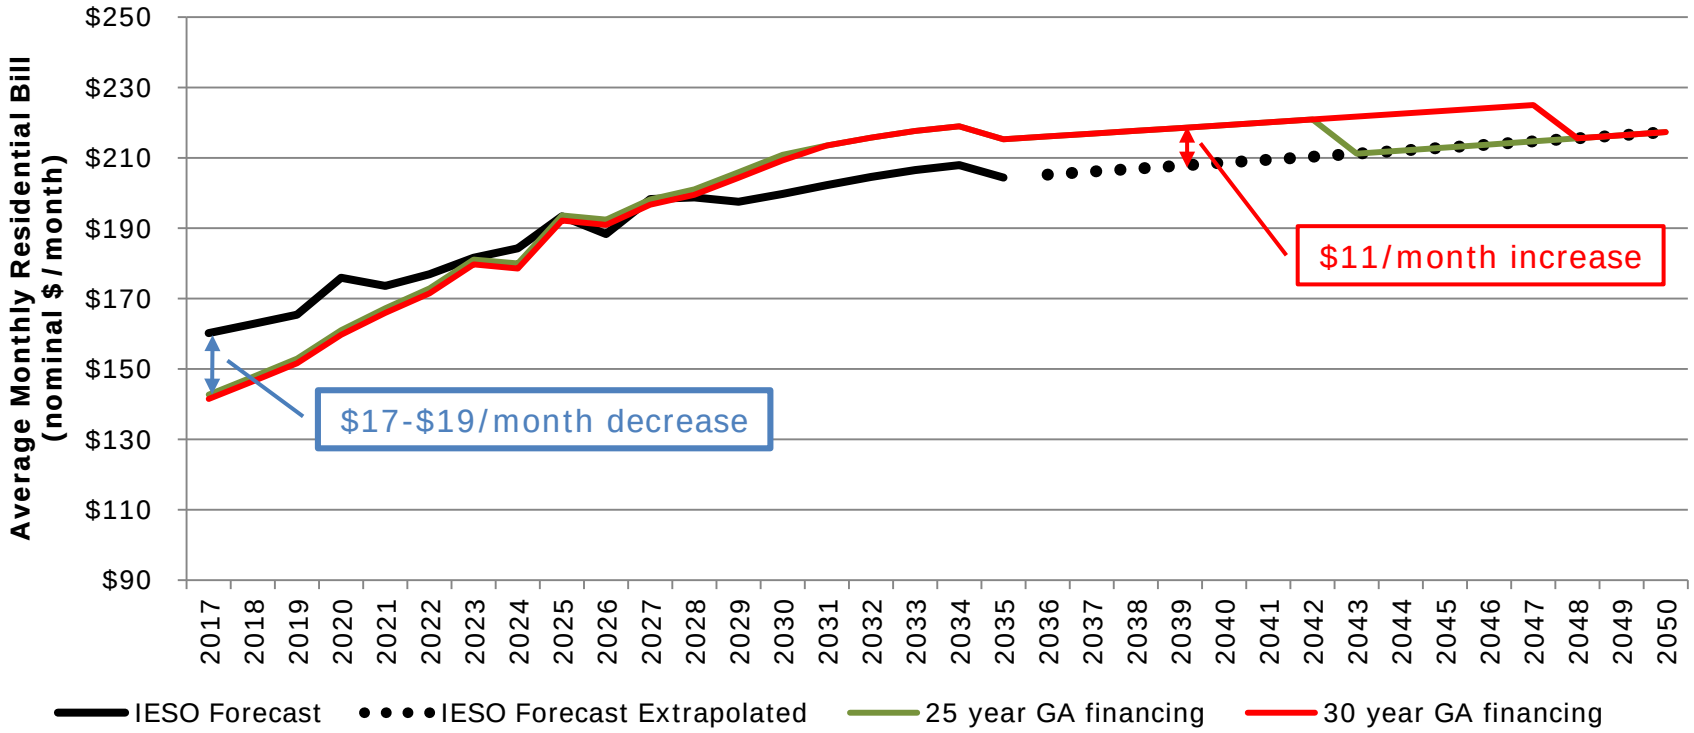
- In this scenario, the starting GA payment from all ratepayers in 2017 is lowered by $2.5 billion below the true cost of GA and is increased at inflation in subsequent years – subject to a cap of no more than $2 billion above the true cost of GA in any given year – until the borrowed money is repaid.



- By **borrowing up to $10.7 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $14/month** at the cost of **a long-term increase over 12 years of up to $11/month** above the true cost of electricity production.

# 3. Maximized Short-term Cost Reduction with limits – Residential Impacts

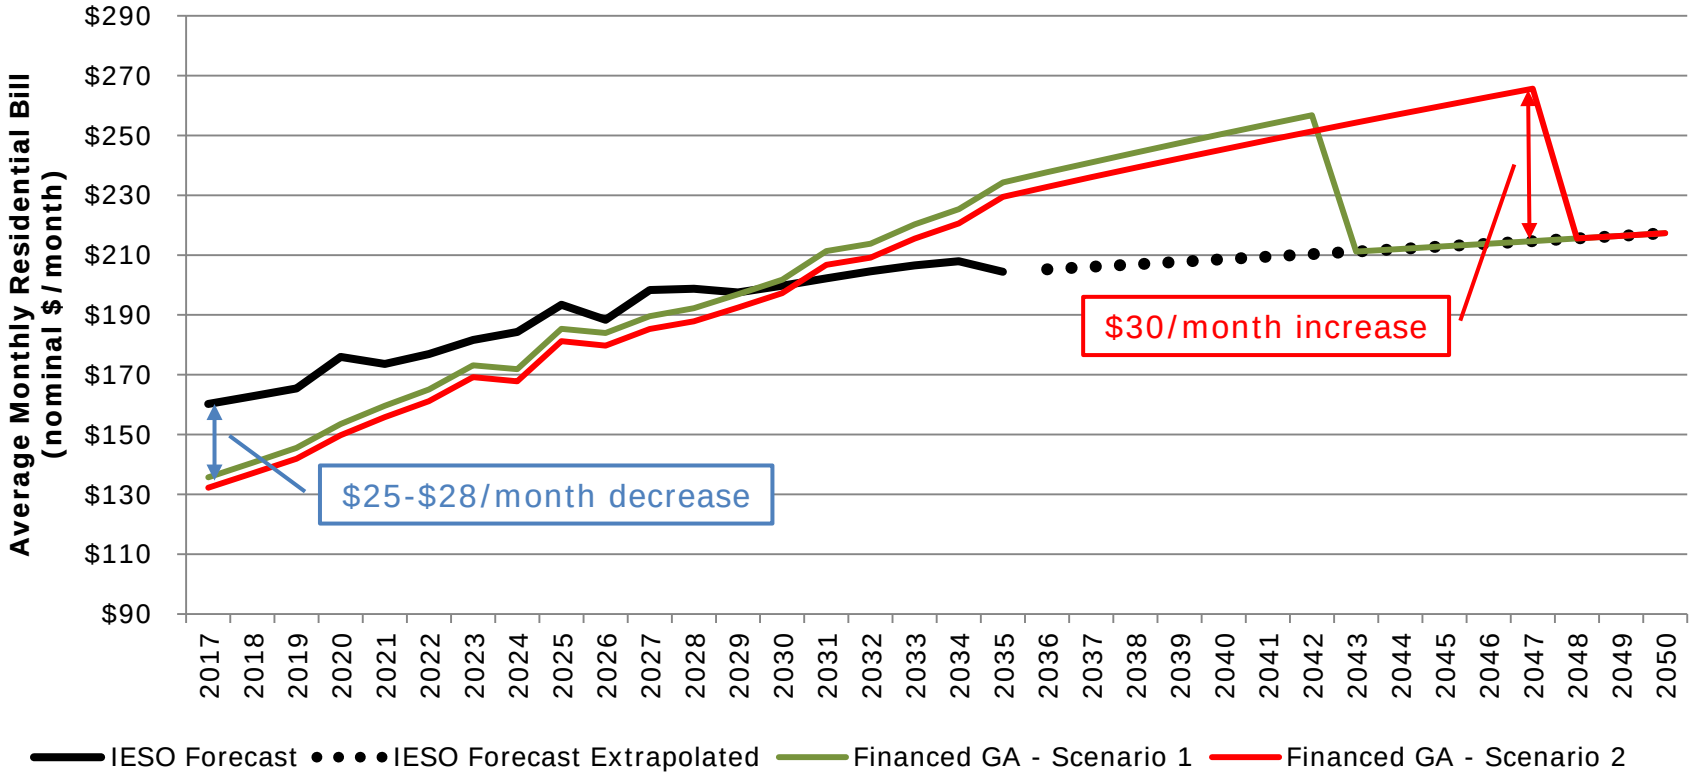
- In this scenario, the starting GA payment from all ratepayers in 2017 is lowered as much as possible and is increased at inflation in subsequent years – subject to a cap of no more than $2 billion above the true cost of GA in any given year – such that the borrowed money is paid back in 25 years (green line) and 30 years (red line) respectively.



- By **borrowing up to $23 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $17-$19/month** at the cost of **a long-term increase over 17-22 years of up to $11/month** above the true cost of electricity production.

# 4. Maximized Short-term Cost Reduction, no limits – Residential Impacts

- In this scenario, the starting GA payment from all ratepayers in 2017 is lowered as much as possible and is increased at inflation in subsequent years such that the borrowed money is paid back in 25 years (green line) and 30 years (red line) respectively. No limit is placed on the ratepayer GA over-payments in later years.



- By **borrowing up to $66 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $25-$28/month** at the cost of **a long-term increase over 12-17 years of up to $25-$30/month** above the true cost of electricity production.

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector – Update

## Working Draft

December 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure (i.e., $35 billion+ investment in cleaner generation and $15.5 billion investment in Hydro One transmission and distribution systems).

- Ontario has taken a number of actions to lower electricity cost for all consumers by:
  - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).
  - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., competitive LRP, no new NUG contracting).

- Following the 2016 Throne Speech, actions were announced to further reduce electricity costs by:
  - Providing an 8% rebate ($11/month savings), updating RRRP ($45/month savings), expanding ICI (up to one-third savings for participants), suspending the LRP II and the EFWSOP (up to $3.8 billion in cost savings) and recycling proceeds to industrial/ commercial consumers.

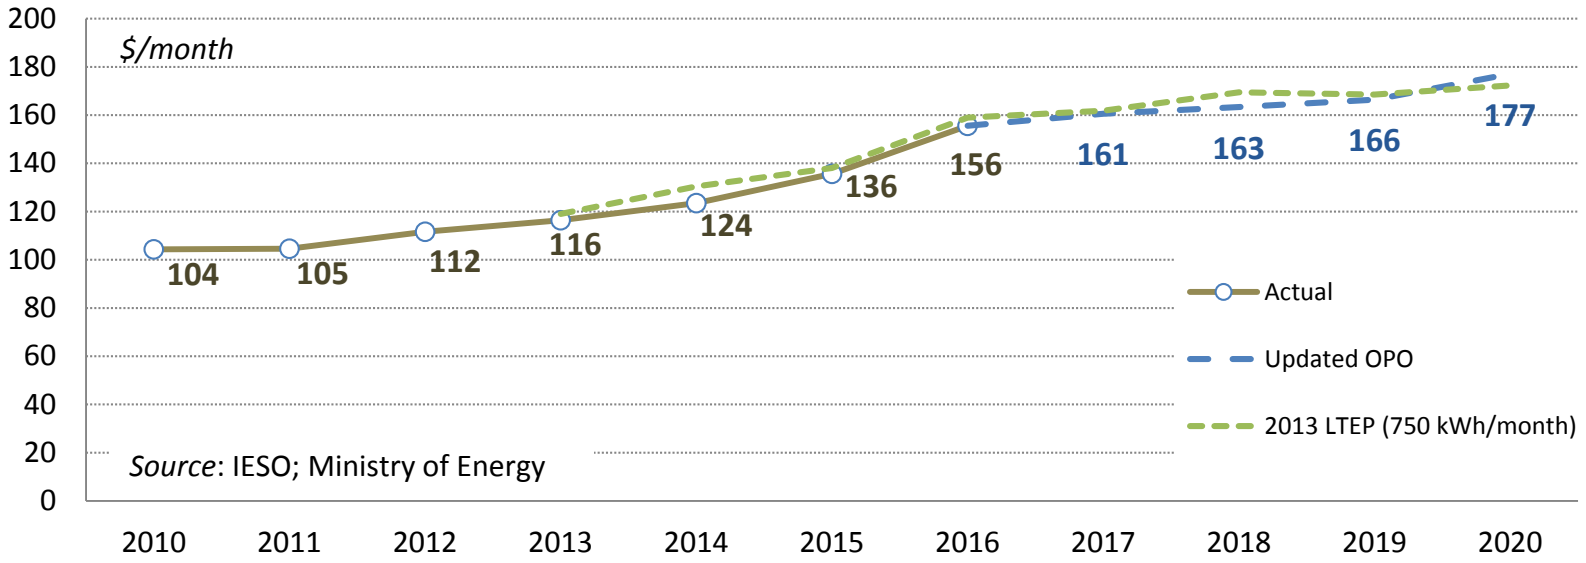
- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

# Electricity Prices – Residential

- Residential consumers electricity prices continue to be a concern for many Ontarians, particularly those that rely on electric heat.
  - **Note:** The typical residential bill is currently below the 2013 Long-Term Energy Plan (2013 LTEP) forecast.

**Typical Residential Electricity Bills**
*Historical and Forecast*



**Note**: The 2013 LTEP forecast for residential bills was based on 800 kWh/month without RRRP or electric heating; the above has been rebased to 750 kWh/month for comparison purposes. Typical residential are based on Toronto Hydro. The updated OPO forecast above includes the 8% rebate to offset the provincial portion of HST, ICI expansion and RRRP expansion.

# Broad Policy Themes / Rationale

- Support the continued reduction in the differential across distribution rates (as charged by Local Distribution Companies) across the Province through the potential enhancement of Rural or Remote Electricity Rate Protection, (RRRP). In order to not increase regulatory costs to customers as a result, this program can be moved to the tax-base.
- Provide a greater focus and support on lower income Ontarians by funding the Ontario Electricity Support Program (OESP) through the tax-base, as well as enhancing the support available through the program.
- Amortize electricity conservation and demand management (DM) programs over 15-years to provide lower costs for electricity consumers.
  - Alternatively, pay for conservation/DM programs through the tax-base and transition costs to the new "green bank entity" over time. Costs would be shifted in recognition of the burden borne by ratepayers in phasing out coal generation.
- Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding, such as remote electrification, large transmission projects, new or expanded interties and expansion of natural gas to underserved areas (i.e., rural and remote communities), etc.
- Empower energy agencies to increase cost effectiveness and improve efficiency by having – IESO modernize Ontario's electricity market through electricity market renewal initiatives, the OEB identify opportunities for future LDC cost reductions/efficiencies and work with OPG to find further efficiencies in operations and pass on savings to ratepayers.
- Give consumers more choice by allowing households to "opt into" an alternative rate plan, based on a flat electricity rate, as an interim measure as the Ontario Energy Board (OEB) develops more pricing options over time. Also give consumer greater transparency with respect to electricity costs by providing more details regarding the Global Adjustment (GA).
- Help small business manage their electricity costs and provide relief for cap and trade until proceeds recycling is fully operational by ending the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers, a benefit of $7/MWh.

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

Not included in chart is additional $18M/year to fund potential First Nations rate program through the Tax-Base.

# Existing Rate Mitigation Programs – Overview

- There are a number of existing programs funded by electricity ratepayers that help mitigate electricity bills for some customers, each of which has a unique policy rationale.

- Programs such as the as the Rural or Remote Rate Protection (RRRP) program are targeted at all customers who face the highest delivery costs in the province, while others such as the Ontario Electricity Support Program (OESP), are income tested and targeted at the most vulnerable energy consumers.
  - These program are not mutually exclusive and a customer could receive both the RRRP and the OESP.
  - There are other programs that are still under development such as options for a First Nations Rate currently being developed by the OEB as per the request of the Minister of Energy. These options are aimed to alleviate high delivery costs for on-reserve indigenous consumers.

- There are opportunities to enhance each of these programs. However, if enhancements are funded through the electricity rate-base, while they would lower costs for eligible consumers, they would raise costs for all other ratepayers.

- Given that these programs focus on promoting equity between different areas of the province (RRRP) or on social equity (OESP), they could be funded by the tax-base rather than the rate-base. This would allow their goals to be achieved and enhanced without increasing electricity rates. The following slides explore options to enhance each program using the tax-base.
  - These enhancements would also work in conjunction with the Ontario Energy Board's focus on reducing LDC costs outlined in option 6b.

# 1. Rural or Remote Rate Protection (RRRP) Expansion

- The Rural or Remote Rate Protection (RRRP) program supports the most costly-to-serve distribution customers in Ontario. It is not income tested and most of the support goes to Hydro One's R2 (low density) rate class and remote communities.
  - Costs to these Hydro One customers are higher than average because of their relatively low density. The OEB mandates that they pay the full cost of service and in recent rate filings has asked Hydro One to ensure this through cost allocation studies.
  - To mitigate these costs, the RRRP was recently enhanced to help lower the bills of Hydro One's R2 customers to around those of its R1 (medium density) customers.
- Although other LDCs do not have medium- and high-density rates, there is a wide range of distribution costs between LDCs. The RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - Could be done on its own or as part of exploring an Ontario-wide uniform "postage stamp" delivery rate.

**Considerations**

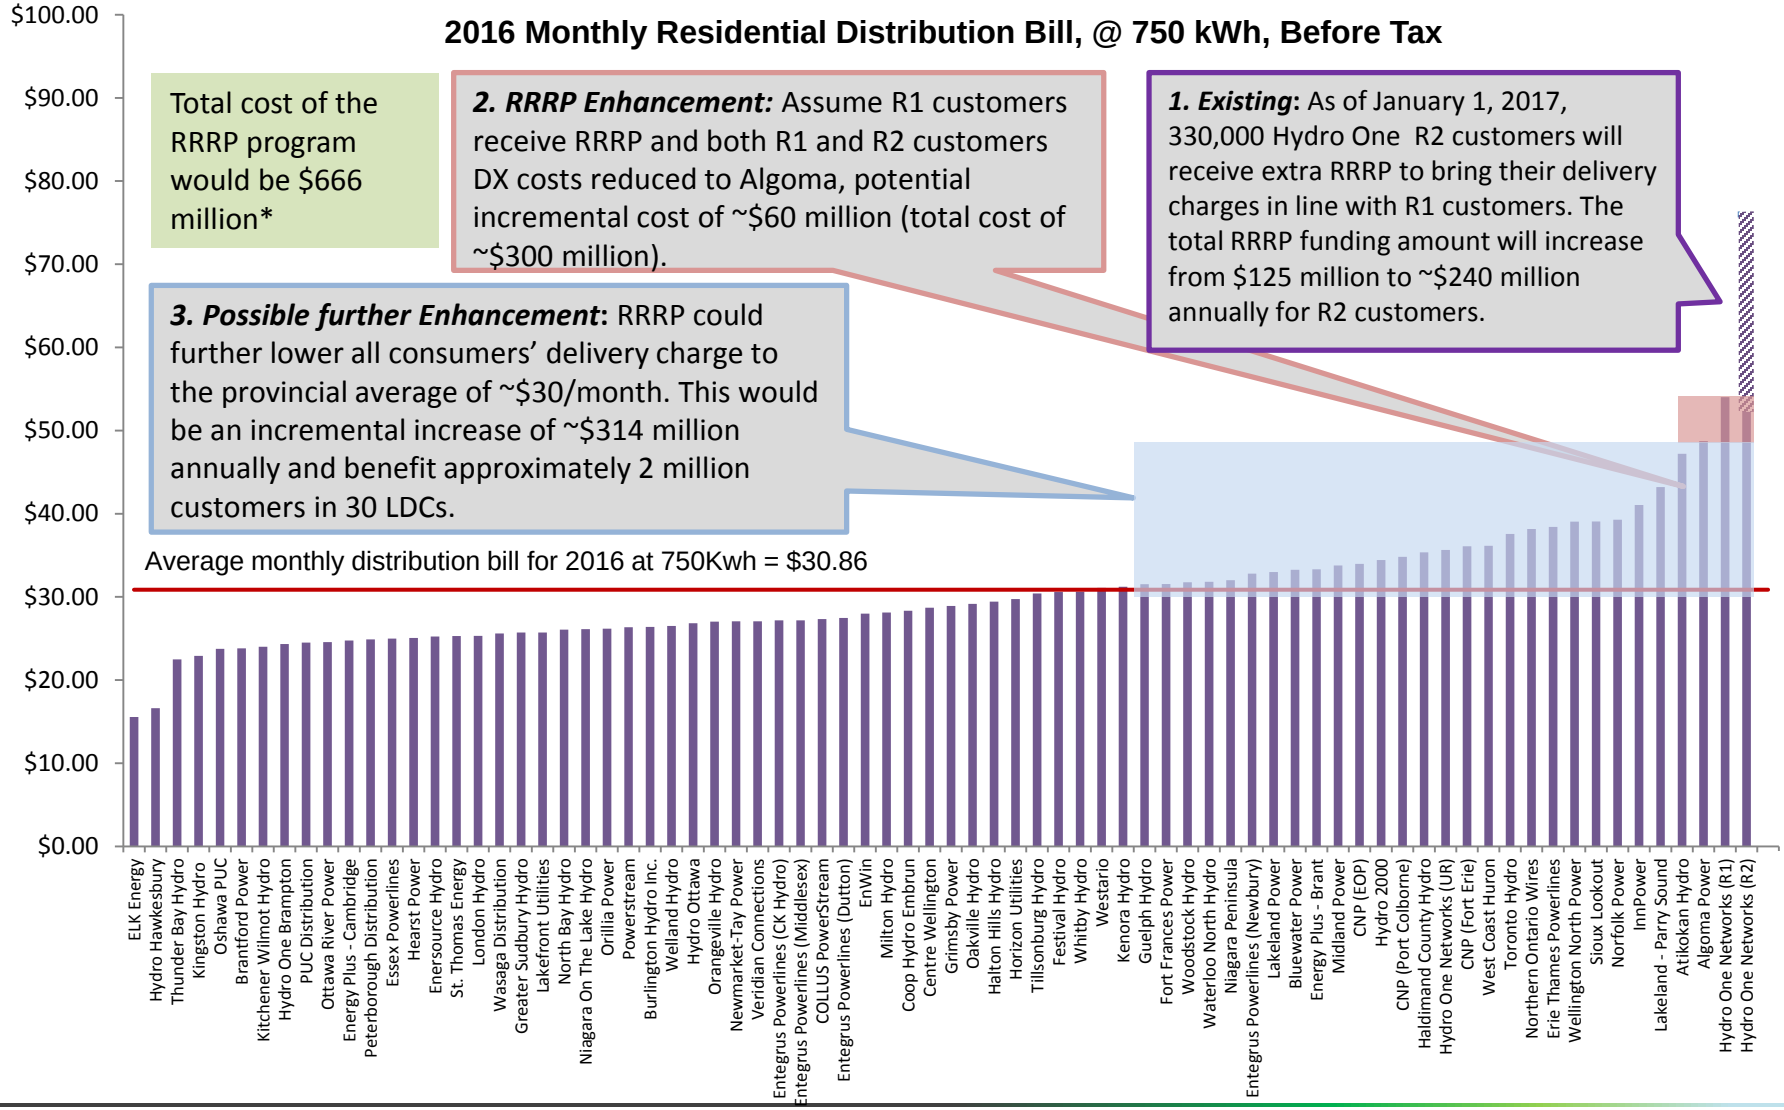
- RRRP will be enhanced for R2 customers on January 1, 2017 to have their costs reduced to approximately R1 distribution costs levels. The RRRP could be further enhanced to include R1 customers, and have R2 and R1 customers reduce their costs down to Algoma (see next slide). This would cost $300 million in the first year (and would adjust year over year).
- If there was a desire to reduce costs for all LDCs, a simple average of distribution cost before tax, across all rate zones is $30.86 per month, for a residential customer consuming 750 kWh per month.** Bringing all delivery rates down to this average would cost approximately $500 million for the first year, with escalation in line with average distribution rate increases.
  - This assumes Hydro One R2 consume 1,200 kWh and H1 R1 customers consume 1,000 kWh per month.
- If all customers were brought down to the average costs (see the chart on the next slide for more detail):
  - It is assumed that residential customers with bills less than the provincial average see no change;
  - Majority of the enhanced benefit would go to Hydro One R1 and Toronto Hydro customers; and
  - Mechanism to ensure that LDCs continue to be motivated to achieve efficiencies would need to be designed (see section 4).
- Enhanced RRRP support may be best provided from the tax-base, because if funded from the rate-base, it would increase the costs for all customers who may argue that it is unfair that they are being asked to pay more to subsidize those in other LDCs.
- In conjunction with using the tax-base to reduce delivery charges to the provincial average, the OEB could be asked to explore moving to a province-wide "postage stamp" delivery rate that would be the same across the province to be implemented over time.
  - Could be "winners and losers" as delivery rates less than the average would go up in a postage stamp model;
  - A "postage stamp" model could help incent LDC consolidation.

**Note:** This is based on preliminary estimates and the amount will fluctuate on monthly consumption from customers and LDCs have different customer base with different consumption types.

# 1. Rural or Remote Rate Protection (RRRP) Expansion (cont'd)



*Note: this includes the ~$50M currently supporting Algoma Power and Hydro One Remotes.*

# 2a. Enhance Ontario Electricity Support Program (OESP) Benefit

- The OESP is an income-tested, application based program that lowers the electricity costs of the most vulnerable consumers by providing a rebate directly on their electricity bills. The OESP provides basic benefits to most consumers and enhanced benefits to Indigenous customers and customers with electric heat and medical devices and at launch, it was estimated ~560,000 families could be eligible and some 261,000 applications have been submitted.

- The OESP program benefits could be increased across the board by 50%, which would mean:
  - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
  - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).

- The OESP program could also be further enhanced by working to ensure the program uptake is as close as possible to 100%:
  - Streamlining the application process to make it easier and quicker to get through;
  - Putting in place a more aggressive communications strategy to make sure people are aware of the program;
  - Increasing funding for key partner agencies to work directly with individuals who are applying; and
  - Exploring automatic OESP qualification for those who receive provincial programs (e.g., ODSP).

**Considerations**

- If the OESP was funded by the tax-base, it could also be explored whether the OESP could be better delivered as a provincial program via the tax system. This may help ensure that the program's participation rate is as high as possible.
  - At the time of program design, advice was given that a 40-50% participation rate would be high for an application-based program delivered through electricity bills.
  - The province would need to work with LDCs if the rebate was to appear on electricity bills rather than be delivered via the income tax system (e.g., through the Trillium Benefit).

# 1 & 2a. Fiscal Impacts of RRRP, OESP and First Nation Rate

- Table below shows estimates of program costs up to 2022:

| Year | OESP ($M) | OESP + 50%($M) | RRRP($M) | RRRP Enhancement ($M) | First Nations Delivery Rate($M) | TOTAL RANGE ($M) (from status quo to OESP and RRRP enhancements) |
|---|---|---|---|---|---|---|
| 2017 | $108 | $162 | $292 | $374 | $18 | $418 to $846 |
| 2018 | $150 | $226 | $300 | $384 | $18 | $468 to $928 |
| 2019 | $186 | $279 | $306 | $394 | $18 | $510 to $997 |
| 2020 | $215 | $322 | $315 | $404 | $18 | $548 to $1,059 |
| 2021 | $243 | $365 | $322 | $415 | $18 | $583 to $1,120 |
| 2022 | $272 | $408 | $329 | $426 | $18 | $619 to $1,181 |

1) Ontario Electricity Support Program (OESP)
   - After almost a year in market, close to 30% of potentially eligible customers are signed up.
   - The cost projections above assume the program grows to 100% of eligible consumers by 2022 and remains at that level.
   - The second column forecast also assumes the existing credit amounts increase by 50%.
     - Forecast assumes 10% administration costs
     - Forecast does not account for the approximately 142,000 low-income households that OEB estimated are not eligible because they do not directly receive an electricity bill.

2) Rural and Remote Rate Protection (RRRP)
   - Provides benefits to R2 Hydro One consumers, Algoma, and remote communities.
   - Includes the expanded coverage that will begin on January 1, 2017.
   - Expansion to cap distribution rates for other customers is based at $374M and assumes escalation of 2.6% (historical average dx rate increase). This is a conservative estimate, as Hydro One and Toronto Hydro increases could drive program costs beyond the average increase.

3) First Nation rate reduction (currently under development)
   - On November 14, 2016, OEB presented options to the Ministry on reducing costs for on-reserve First Nation customers.
   - OEB's recommended option to provide 100% delivery rate credit, which is estimated at $18.4 million per year.
     - Other options includes a seasonal fixed credit to account for demand changes over the year ($13 million) or a 50% total bill reduction ($23 million).

# 2b. Expand OESP Eligibility

**Expanded Coverage**

- When OESP was being created, the OEB estimated that are 713,000 low-income households, of which 20% do not receive electricity bills. Thus, only 571,000 would potentially be eligible for OESP.
- If moved to the tax base, the OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity.

**Eligibility Categories**

- OESP has two credits amounts:
    1) Basic credit of $30-50 per month, based on the level of income and the number of residents.
    2) Enhanced credit of $45-75 per month for those with unique electricity needs:
        a) Electric heating,
        b) Indigenous customers, and
        c) Certain electrically intensive medical devices.
- The enhanced credit can be expanded to include additional eligibility categories of customers. For example, a new “Low Density Consumer” category could be introduced that provides Hydro One R2 customers (highest distribution rates) eligible for OESP the enhanced credit.

**Considerations**

- Potential costs for expanded coverage and new eligibility categories depend on updated estimates and changes to program design and delivery.
- There would be value in keeping the OESP as an income-tested program to distinguish it from other initiatives (e.g. RRRP, which is designed to address disparity between rural and urban distribution costs).

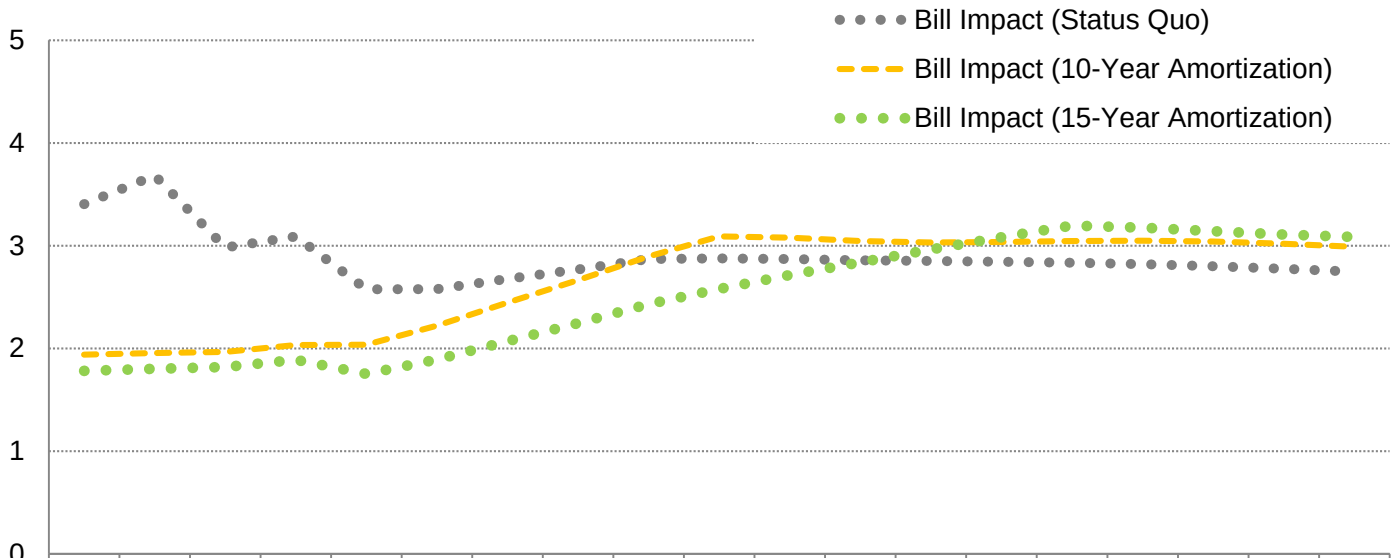
# 3a. Amortize Conservation Program Costs

- ~$3 billion from the electricity ratepayer base will be spent on conservation programs delivered under the Conservation First Framework (CFF) and the Industrial Accelerator Program (IAP) between 2015 and 2020.
- Currently, Conservation and Demand Management (CDM) program costs are recovered from the Global Adjustment (GA) mechanism about one month after expenses are incurred.
- As a potential rate mitigation measure, certain CDM costs could be amortized. This would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs).
  - The time period over which costs could be amortized would be over the lifetime of funded CDM measures.
  - ENERGY is working with IESO to determine the appropriate lifetime period – the graph on the next slide, which illustrates residential bill impacts, presents two cases: **10-year and 15-year measure lifetimes**.
- In both cases, amortizing a portion of conservation spending would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020. Over time the benefit would decrease and turn into a cost (higher electricity rates than would otherwise occur), as interest charges begin to grow. Estimated interest charges are as follows (a 3% interest rate is assumed; increases in interest rates could result in higher overall interest charges):
  - $712 million ($2016) – Amortizing eligible 2017-2035 CDM costs for 10-year period; and
  - $1.3 billion ($2016) – Amortizing eligible 2017-2035 CDM costs for 15-year period .
- Legislative changes would be needed to allow recovery of interest payments from ratepayers, or these costs could be recovered from the Consolidated Revenue Fund (CRF, or taxes).
- An alternative that could be explored would be to pay for CDM costs, or for a portion of these, from the tax-base (*see Appendix for more detail on tax funding option*).

# 3a. Amortize Conservation Program Costs (cont'd)

## Conservation Residential Bill Impact – Status Quo, 10-Year and 15-Year Amortization

***CDM Bill Impact ($/month)***



| | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 | 2031 | 2032 | 2033 | 2034 | 2035 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bill Impact (Status Quo) | 3.40 | 3.68 | 2.98 | 3.09 | 2.58 | 2.58 | 2.68 | 2.77 | 2.87 | 2.88 | 2.87 | 2.86 | 2.85 | 2.84 | 2.83 | 2.82 | 2.80 | 2.78 | 2.75 |
| Bill Impact (10-Year Amortization) | 1.94 | 1.95 | 1.97 | 2.03 | 2.04 | 2.22 | 2.45 | 2.67 | 2.90 | 3.09 | 3.08 | 3.05 | 3.03 | 3.04 | 3.04 | 3.05 | 3.04 | 3.02 | 2.99 |
| Bill Impact (15-Year Amortization) | 1.78 | 1.80 | 1.82 | 1.89 | 1.75 | 1.89 | 2.07 | 2.25 | 2.43 | 2.58 | 2.71 | 2.84 | 2.96 | 3.08 | 3.20 | 3.18 | 3.14 | 3.11 | 3.09 |

Source: IESO; Ministry of Energy

**Note**: Chart assumes that conservation incentive costs are available for amortization while administration cost are not. Although there is variable from year to year, incentives represent about two-thirds of conservation spending in Ontario. Chart assumes conservation spending continues at a similar rate beyond 2020. Chart assumes a 10 of 15-year borrowing rate of 3.0%.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- Under **Public Sector Accounting Board (PSAB) accounting standards**, used by both the Province and IESO, only certain assets can be amortized: 1) pensions and 2) tangible capital assets. Under PSAB an asset must meet several criteria to be considered a capital asset, including:
  - A tangible capital asset must be tangible and substantive and the Ontario government must have title and operate the asset.
  - A tangible capital asset must bring a tangible benefit to the government or to Ontario.

- CDM costs, on their own, do not meet the criteria of a tangible capital asset because customers would have ownership and control of installed CDM measures, not the Province or IESO.

- **Rate-regulated accounting** was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- If some of Ontario's CDM costs could be amortized, analysis shows that ratepayer impacts would be reduced in the short-term but interest charges on the loan would result in increased overall ratepayer costs in the longer-term.
- Legislative amendments would be needed to allow recovery of loan interest charges from GA.
- ENERGY staff have developed a note to seek an opinion from IESO's external auditor and from the Ontario Provincial Controller (OPC) to determine whether CDM costs could be amortized according to rate-regulated accounting standards.
- ENERGY is working with IESO to seek an opinion on the proposal from IESO's external auditor.
- ENERGY would then send the IESO external auditor's opinion along with ENERGY's explanatory note to the Ontario Provincial Controller (OPC) to seek a formal opinion on whether CDM costs could be amortized according to rate-regulated accounting standards.
- Further legal analysis would also be required to confirm legal viability and possible approaches to implementation.

# 3b. Rate Smoothing of Conservation Program Costs

- "Rate smoothing" could achieve the same rate reduction effect as amortization.
- Instead of taking out a loan to amortize conservation costs, a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Each year, IESO would defer recovery of a portion of annual conservation costs. Financing would also be required, such as from the OFA, to pay the interest on the deferral account. Interest would accrue on the deferred amounts, likely at the same rates as for the amortization option.
- Deferred costs could be recovered over any time period. If a 10 or 15 year-period was chosen, the rate impacts would be the same as in the amortization option.

**Considerations**

- Option would **not** require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open the Ministry to criticism by the Controller and/or Auditor General since the rate impact is the same.
- The Ministry would have more control under this option to change deferred amounts each year, as opposed to the terms set by a loan agreement under the amortization example.
- There is precedence to this approach for nuclear investments, which otherwise would result in volatile increases and decreases for Ontario ratepayers over the investment period. In 2015, the Ministry amended a regulation that requires the Ontario Energy Board (OEB) to set "smoothed" nuclear rates for OPG's Darlington and Pickering nuclear stations over a 20-year period.
  - The regulation allows OPG to defer recovery in rates of a portion of its nuclear revenue during the Darlington refurbishment (expected to be complete in 2026) and recover these deferred costs over the remaining ten years.
  - OPG will establish a "deferral account" to record the deferred amounts each year up to 2026 plus accumulated interest on the balance to reflect OPG's financing costs as a result of rate smoothing. The deferral account is then drawn down on a straight-line basis between 2026 and 2036.
- At minimum, new regulation would be required. However, further analysis is needed to determine the relevant regulation or legislation, to be amended for IESO (e.g., OEB regulation of IESO costs and fees, GA regulation for how IESO recovers its conservation costs from ratepayers).

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure

- Fund investments in specific energy infrastructure projects through the tax-base. **Note:** This could include the provincial portion of funding for the Remote First Nation Connection Project, a fund to support projects that improve adequacy and reliability in areas where new transmission would unlock economic growth and expansion of natural gas service to underserved communities.

**Considerations**

- Tax-base funding would allow for energy infrastructure to be built without impacting electricity and natural gas rates.

*Remote Connection Project:*

- Ontario ratepayers currently support costs of remote electricity service through RRRP on the order of $28 million/year
- Connecting 21 remote communities to the Ontario grid is supported by a positive business case due to diesel cost savings over time. If RRRP is funded through the tax base as proposed above, this project represents an opportunity to reduce impacts from RRRP.
- Direct investment in Ontario's portion of the capital costs of the project through a provincial fund (e.g., Trillium Trust) could also be considered along with mechanisms for cost recovery through transmission rates to refresh the fund as industry benefits from the transmission investment.
- The amount of investment and long-term savings depend on a federal contribution to the project and ENERGY is currently in discussions with Canada with the goal of concluding a cost-sharing agreement by spring 2017.
- A move to tax-based funding may have implications for cost oversight, since the OEB's mandate is to have oversight of ratepayer impacts. Alternative methods to review cost prudence of tax-based funding may be needed.

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (cont'd)

**Considerations (cont'd)**

*Transmission Projects to Enhance Economic Growth:*

- A tax-based fund could target investments in projects that have been identified in IESO regional plans and that would stimulate economic growth but are not proceeding due to cost barriers under the OEB's beneficiary pays principle. Investments could also target areas where the existing system poses challenges for delivering reliable service such as in parts of Northern Ontario with long single circuits.
- Potential opportunities for investment could include a transmission reinforcement in the **Greenstone area**, upgrades south of **Red Lake** and others TBD based on program design.
- This approach would allow a potion of project costs to be socialized to advance key projects without impacting rates or OEB's principles of cost allocation. Scope and scale of fund would be refined through program design.

*Natural Gas Expansion to Underserved Communities:*

- The Government has currently committed to expanding natural gas access to more communities in Ontario (i.e., $200 million Natural Gas Access Loan and $30 million Natural Gas Economic Development Grant).
  - Natural gas is an affordable heating source in Ontario. Its continues to be less expensive than alternative sources such as electric baseboards, heating oil and propane. For example, switching from oil to natural gas can save an average consumer an estimated $1,500 annually.
  - Increasing access to other energy sources such as natural gas, provides Ontarians with more options to meet their needs, reduce their energy costs and improve their quality of life.
  - Expansion of natural gas delivery infrastructure is widely supported in underserved communities (i.e., a recurring theme at ROMA) as a means to provide consumers and businesses in underserved communities with more affordable energy choices, attract new industry to Ontario and benefit agricultural producers.
- A grant program complements the Ontario Energy Board's recent decision enabling greater rate-based expansion to unserved areas, including rural and remote communities.
  - Applying Trillium Trust funding would make it possible to enhance the Grant Program and service more communities.

# 5. Dedicate Departure Tax

- In connection with the IPO, as a result of leaving the PILs regime and entering the corporate tax regime, Hydro One was deemed to dispose of its assets for proceeds equal to its fair market value, triggering a PILs liability of $2.6 billion (Departure Tax).
- This was paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt.
- The Province could explore repurposing some of those funds to the benefit of ratepayers.
- This may reduce the risk that the Ontario Energy Board (OEB) assigns to ratepayers the benefit from an associated tax asset, resulting in lower earnings and decreased share value for Hydro One. This decision is currently before the OEB, as part of Hydro One's Transmission rate application.
- If the Province were to transfer $2.6 billion in economic benefits to the rate base over 10 years suggest the following impacts (assuming 140TWh per year):
  - Residential Ratepayer Impact (if spread over 10 years): up to $1.39 per month on a typical bill; and
  - Industrial Ratepayer Impact (if spread over 10 years): up to $1.86 / MWh

**Considerations**

- Cost savings to ratepayers and associated fiscal impacts would depend on timing and which ratepayers (e.g., Hydro One customers, or all Ontario customers) will benefit from some or all of the $2.6 billion value.
- The departure tax was effectively a true-up for lower PILs payments from Hydro One in previous years – it was not a one-time windfall for the Province. In other words, it ensures that Hydro One paid all its tax obligations under the PILs regime before moving into the normal corporate tax regime.
- The related ~$2.4 billion fiscal benefit to the Province (from the deferred tax benefit) has already been credited to the Trillium Trust to be used to build infrastructure under Moving Ontario Forward.
- Repurposing funds paid to OEFC may have an impact on the defeasance of electricity stranded debt.
- While this is a shift from messaging that value from the broadening of ownership of Hydro One is being used pay down debt and fund transit and transportation, the Province could link to electricity infrastructure investments (e.g., as an offset to infrastructure investments already made in the sector, or to specific initiatives such as conservation).

# 6a. Empower Energy Agencies – IESO / Market Renewal

- Continue to move forward with IESO's Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2021, leading to a reduction of:
  - About $1/month or less than 1% at current retail prices for a typical residential bill; and
  - About $1.30/MWh at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.
- IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.

# 6b. LDC Efficiencies and Rates

- Reducing costs and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills.
  - Currently, LDCs recover costs through the Delivery line of the electricity bill, which is broken into Distribution and Transmission costs. LDCs are responsible for the Distribution costs of the electricity bill which account which account for about 20% of the total bill.
  - Distribution costs vary across the province as LDCs have different service territories and needs (e.g., geography, number of customers, density of customers, life/health of capital assets, etc). See next slide for more detail.
    - For example, comparing 2016 with 2006, distribution rates have increased by about 24.5% (or about 2.2% per year, compounded annually) across the Province, with significant variation between regions and LDCs (-17% to 148%). Overall consumer price inflation in Ontario for the same period increased by about 19% or 1.8% per year.

**Considerations**

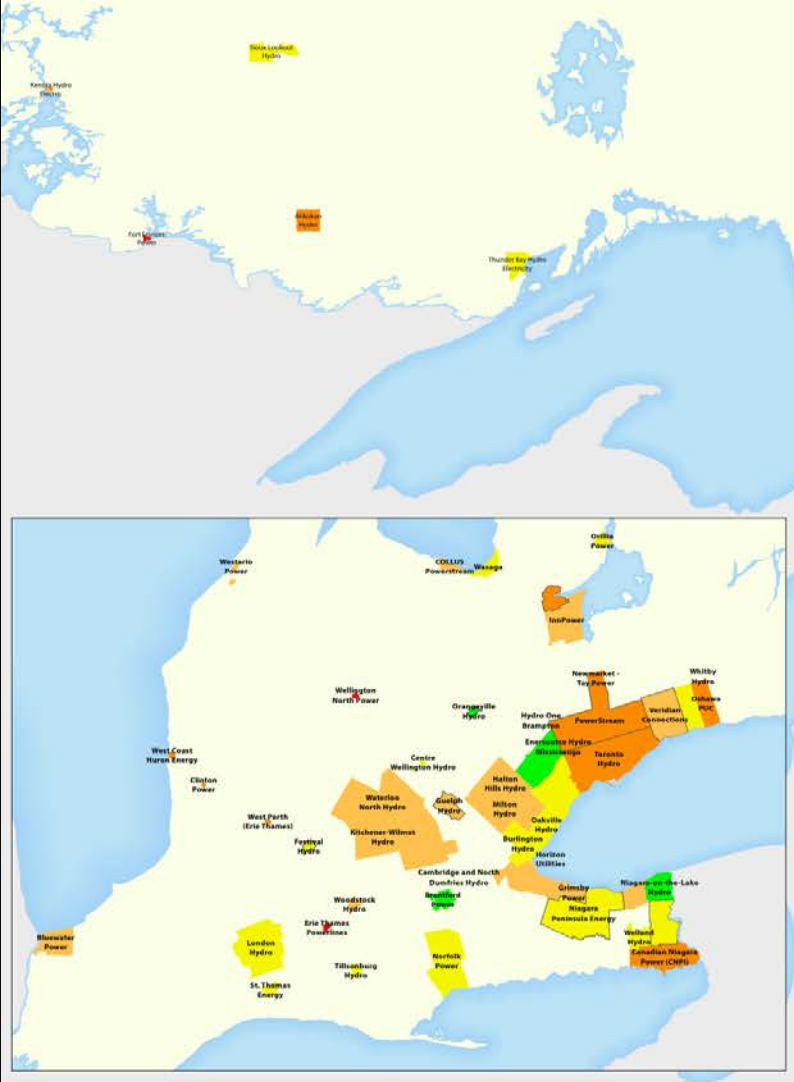
- The Ontario Energy Board (OEB) has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates. Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.

- There maybe opportunities to promote further cost reductions and performance improvements within the distribution sector as there is continued evolution of the regulatory framework in Ontario.
  - Tightening LDC requirements may also indirectly incent other desired policy outcomes, such as LDC consolidation and grid modernization to realize further cost reductions.
  - To further help address the costs associated with the Delivery line of the electricity bill, program such as the RRRP (previous slide) could be expanded to include other customers that may face higher costs.

- ENERGY could help promote or accelerate these efforts by asking the OEB through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and the 2017 Mandate Letter and other agency business planning processes.

- In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. The Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities. The panel recommended legislation to mandate consolidation.
  - Rather than mandating consolidation, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation. Further changes to the tax incentives and/or revisiting legislated consolidation could be considered.

# LDC Distribution Rate Changes (2006 vs 2016)



| Total Dx Rate | 2006 | 2016 | % Rate Change |
|---|---|---|---|
| Hydro One UR (High Density) | $29.13 | $35.65 | 22.4% |
| Hydro One R1 (Medium Density) | $37.73 | $54.02 | 43.2% |
| Hydro One R2 (Low Density) | $44.65 | $76.14 | 70.5% |

## Legend

**LDC Rate Comparison 2006 vs 2016**

**% Total Rate Change ( # of LDCs )**

- -17.3% to 0% ( 5 )
- 0.1% to 15% ( 25 )
- 15.1% to 30% ( 21 )
- 30.1% to 60% ( 16 )
- 60.1% to 89.3% ( 4 )
- Merged LDCs

Below LDCs had either acquired or merged: (# of merged LDCs)

Kilometers

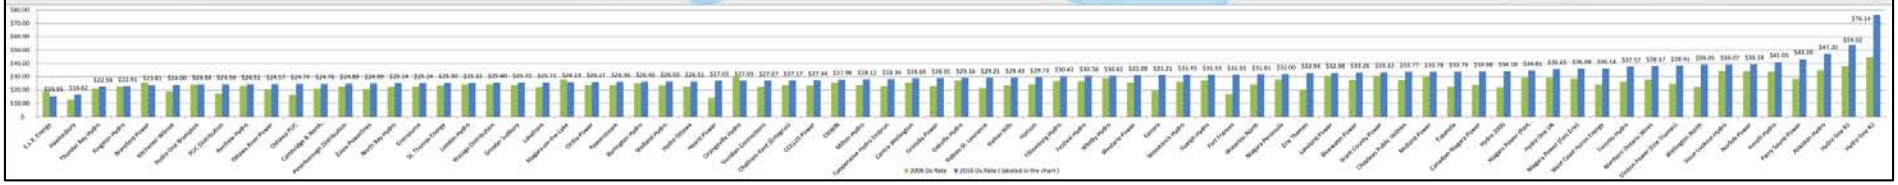
*Published December 2016*

## KEY FINDINGS

- In summary, distribution rates (including rate riders) have increased by about 24.5% across the Province, with significant variation between regions and LDCs (-17% to 148%).
- There is generally no correlation between LDC size or location and distribution rate increase in absolute or percentage terms.
- The current analysis shows no clear relationship between the percentage rate increase and the absolute rate level (that is, high rate increase LDCs may still have among the lowest rates, and low rate increases may have higher rates.
- No clear relationship between amalgamation and rates.
- The analysis does suggest that Hydro One has the highest rates, and some of their customers have seen higher than average rate increases.

## NOTES

- **Rate Calculation:** Monthly residential distribution bill rates, before taxes, are based on consumption of 750 kWh. Distribution charges account for approximately 23% of the average 2016 residential bill.
  All figures calculated by ENERGY staff without input from OEB.
- **Colours:** Colour coding of the map only depicts the change in LDC rate amounts (i.e. LDCs in red don't necessarily have the highest total rates).
- **Mergers:** Rates for customers in merged LDCs have experienced different levels of change. For merged entities, the largest LDC in 2006 was used. An accompanying map focuses on merged entities.
- **Points in Time:** Current analysis compares 2016 and 2006 only. Rates could have had an uneven trajectory, especially considering regulatory decisions such as time limited charges/rebates with temporary impacts.



# 6c. Empower Energy Agencies – OPG / Operational Efficiencies

- Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh).

**Considerations**

- OPG recently submitted its 2017-19 business plan to the Province for concurrence. That plan includes the following:
  - Enterprise total generating cost increasing from $48/MWh in 2016 to an average of $55/MWh over the plan period.
  - An average residential monthly bill increases of $1.05/month annually from 2017-2021.
- Much of this increase is due to the Darlington refurbishment project, which increases costs and reduces OPG's generation over the planning period.
- OPG has also shared its stretch targets for total cost of generation, which average $52/MWh over the 2017-19 plan, a ~$3/MWh reduction (5-6%) relative to its $55/MWh business plan targets.
- The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This is a public document that OEB would likely review and incorporate as part of OPG's current rate application.
- Consistent with regulations under the *Ontario Energy Board Act*, OPG is seeking smoothed rates for nuclear as part of its 2017-2021 rate application.
  - As a result, the benefit to ratepayers of reducing generation costs is uncertain.
  - Given that the application extends beyond the business plan period, and to ensure OPG does not delay costs beyond the planning horizon, the Province may want to provide additional direction for out year expenditures.
- If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.
  - The total cost of $3/MWh based on OPG's forecast production of 74 TWh/yr is about $240 million per year.
- The Province could work with OPG to craft language in the concurrence letter in order to avoid setting unintended precedents for future rate application processes.

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate

- OEB continues to move forward with its Regulated Price Plan (RPP) Roadmap:
  - The OEB is undertaking a comprehensive review of the RPP, including exploring the introduction of offering different pricing plan options for customers following the completion of pilot programs in 2018. The plan is expected to be implemented over a 3-5 year period.
- Until new pricing plans are available, the OEB could provide an "opt-in flat rate RPP" structure that could be made available to residential, farm and small business consumers on an interim basis (2-3 years) until a wider range of price plans are available, providing customers with pricing choice.
- Time-of-Use (TOU) pricing could also be introduced for non-RPP Class B consumers to reduce Global Adjustment (GA) volatility and reduce system costs.

| Current TOU | New Flat Rate |
|---|---|
| On: 18.0 ¢/kWh | 11.1 ¢/kWh |
| Mid: 13.2 ¢/kWh | |
| Off: 8.7 ¢/kWh | |

**Considerations**

- Would provide consumers with electricity pricing choice.
- The OEB has indicated that the option would lead to no overall change in system costs. Consumers with higher peak and mid-peak usage patterns would see a decrease in their electricity bills, while those with higher off-peak usage patterns would see an increase.
  - While the current strong supply conditions may allow for such an RPP structure (i.e., peak demand requirements can be easily met), administrative costs could be high (distributors would need to design/implement an opt-in process and associated billing system on an interim basis).

| | Current TOU | New Flat Rate |
|---|---|---|
| 1) Monthly electricity bill- higher peak and mid-peak usage patterns | $172 | $163 |
| 2) Monthly electricity bill- higher off-peak usage patterns | $152 | $163 |

***Note:** 1) assumes a consumer consumption pattern of 45%:30%:25% (Off-peak: Mid-peak: On-peak), while 2) assumes consumer consumption pattern of 80%:10%:10% (Off-peak: Mid-peak: On-peak). Estimates are based on OEB's online electricity bill calculator (for Toronto Hydro- November 2016 rates)

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate (cont'd)

**Considerations**

- The decision to undertake smart meter investments was partly justified on the basis of TOU pricing. If TOU pricing were to be made optional, some stakeholders could question the rationale for smart meter investments.
  - Rationale for offering a flat rate option could focus on providing customers with choice until new pricing plans are rolled out under the RPP roadmap.

- If a flat rate design is introduced, there could be significant consumer opposition to any return to a mandatory TOU.

- After the interim flat rate period, the OEB could offer a wider range of pricing plans to consumers.
  - As part of its RPP review, the OEB will be running pilots with LDCs to assess customer response to alternative time periods and pricing structures.
  - Learnings from these pilots will help inform potential changes to the RPP. Pilots are expected to be in market May 2017 and run for one year.

- Non-RPP Class B electricity consumers currently pay Global Adjustment (GA) on a volumetric basis. Moving them to TOU would provide an incentive to shift consumption to off-peak periods.
  - Consumers, including manufacturers, who are unwilling to shift would face higher costs and likely not be supportive of the changes.
  - The decision to pursue TOU pricing for non-RPP class B consumers will impact proceeds recycling as there is interplay between the two initiatives.

# 7b. Give Consumers More Rate Choices and Greater Transparency – Detailed Global Adjustment

- Provide electricity consumers greater transparency with respect to electricity generation costs by providing more details regarding the Global Adjustment (e.g., adding a line on hydro bills, quarterly energy reports, etc).

**Considerations**

- As electricity bills have increased, many consumers have complained about a lack of transparency on the drivers of electricity costs. In particular, consumers and legislative officers have singled out the GA.

- Providing consumers with additional information on the cost components and amounts recovered through the GA would help consumers understand how the different forms of electricity generation in Ontario contribute to consumers costs.

- Providing additional information to consumers on electricity commodity cost drivers without sufficient context or background could simply lead to increased complaints about particular generating technologies that make up large shares of costs (e.g., nuclear).

- Adding a breakout of the amount of GA on residential electricity bills could lead to further confusion due to the existing breakout of multiple time-of-use buckets.

- Alternatively, the existing quarterly Ontario Energy Report, which provides various energy sector data, could be leveraged to show a breakout of quarterly GA costs by fuel type. A link on electricity bills could point to this information.

# 8. Help Small Business Manage Their Electricity Cost – End DRC Early for Class B Electricity Consumers

- Propose to remove the $0.07/kWh Debt Retirement Charge (DRC) from the bills of commercial/small industrial Class B consumers beginning in 2017, instead of April 1, 2018.
  - **Note:** Class A consumers (e.g., large industrial) would continue to pay DRC until at least April 1, 2018.

**Considerations**

- For a Class B consumer currently paying about $152/MWh, removing the DRC would represent a savings of about 5%.
  - A 50% reduction in the DRC charge would represent a savings of about 2%.

- Alternatively, the reduction of the DRC could be to $0.035/kWh starting in 2017, to provide relief for cap and trade until proceeds recycling is fully operational.

- Residential consumers have had the DRC removed from bills since January 1, 2016. Taking DRC off commercial and small industrial bills would result in equal treatment for these groups of consumers.

- The savings for commercial and small industrial consumers associated with this proposal would drop to zero in April 2018, since this is the current planned date for removing the DRC from non-residential bills.

- Prior to moving forward with this proposal, additional analysis from Legal Services and the MOF would be needed.

# 9. Extend Length of Existing Wind / Solar Contracts

- Wind and solar developments are typically contracted through standard offer procurements on 20 year fixed terms at fixed pricing.
- Many of these projects have already reached commercial operation.
- The province could explore options for IESO to negotiate extensions to existing renewable energy contracts, for example, by 10 years, in return for the proponents agreeing to a lower price in the near term.

**Considerations**

- Projects in commercial operation offer potential for near-term rate reduction whereas projects that have yet to reach commercial operation provide potential to mitigate future rate increases only.
- The attractiveness of this option to contract holders would vary from project to project and would depend on project economics.
- Revised pricing would be subject to negotiation, and associated ratepayer savings would be difficult to forecast accurately.
- The duration of contract renegotiation is difficult to forecast and may not be achievable in the near term.
  - Proponents may have to renegotiate their project financing arrangements, ensure project investors are satisfied with any changes in ROI, and extend land leases.
- Project host communities and Indigenous communities whose traditional territory the projects are sited in may not be interested in these projects extending their operational period ; discussions/consultation may be required in advance of this potential option moving forward.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Should Ontario be successful in negotiating lower prices in the near term, it should be noted that contract holders will be in a strong bargaining position (given their existing fixed-priced contracts), and will likely extract additional value from the negotiations.

- Since the Minister of Energy is not a party, IESO would be required to renegotiate the contracts, which would likely involve a direction or directive to IESO.

- Further analysis is required as to how ENERGY could express its policy intent to have IESO renegotiate the contracts for a reduced rate at a longer term, however it is unlikely that IESO could guarantee the outcome.

- Further analysis is required to ascertain whether there is scope within the existing contracts for IESO to renegotiate their terms in this manner.

- Extending contract terms would also reduce planned flexibility and increase the risk of overpayment as this existing capacity would now be contracted into the 2040s and not the 2030s.

- Extending contract terms may require investments in component replacement and additional operation and maintenance costs that developers would seek to recover under any renegotiated contract.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Ontario has over 4,500 MW of wind in commercial operation, with the vast majority being large scale (>500kW) developments.
  - This includes over 2,700 MW of large FIT 1 and GEIA wind projects representing 47 contracts (average size ~58 MW) and over 1,000 MW of solar projects representing 103 contracts.

- Projects over 500 kW would offer the most savings potential as they represent the majority of installed renewables capacity and are spread across fewer contracts.

- Below are two potential approaches to reducing ratepayer costs in the near term by extending contract terms at reduced prices. An illustrative example of a typical large wind project is used.

- **Example:** 100 MW FIT 1 wind project achieving Commercial Operation in 2014 (i.e., 17 years remaining on initial 20 year contract), assuming a 10 year contract extension negotiated at the LRP I low weighted average wind price of $64.5/MWh;
  - (17 years @ $135/MWh + 10 years @ $64.5/MWh)
  - **Potential Approach 1:** Provide a single new contract price that is the average of the lower extension price and the FIT contract price over the new contract term. The new price would be lower over a longer term.
  - **Illustrative Example:** New contract for 27 years at $129/MWh.
  - New contract price set to allow 10% rate of return over 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract (remaining term extended for 10 additional years) |
|---|---|---|
| Contract Cost (NPV 2017) | $550 million | $582 million |
| Average Monthly Ratepayer Impact Over First 5 Years | $0.03 savings | |
| Average Monthly Ratepayer Impact Over Remaining 22 Years | $0.02 increase | |
| Average Monthly Ratepayer Impact Over Entire 27 Year Contract | $0.01 increase | |

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- **Potential Approach 2:** Offer facilities a revised contract that extends terms and is structured to offer lower pricing in the initial contract years and higher pricing in the later years of the contract.
  - For example, the New contract is $85.9/MWh over the first 5 years and $169/MWh over the remaining 22 years.
    - Price over first 5 years is LRP I weighted average wind price.
    - Price over remaining 22 years is set to allow 10% rate of return over entire 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract | |
|---|---|---|---|
| | | Initial 5 Years | Last 22 Years |
| Contract Cost (NPV 2017) | $550 million | $632 million | |
| Monthly Average Ratepayer Impact Over First 5 Years | $0.09 savings | | |
| Monthly Average Ratepayer Impact Over Remaining 22 Years | $0.07 increase | | |
| Monthly Average Ratepayer Impact Over Entire 27 Year Contract | $0.04 increase | | |

# 10. Tax Relief for Solar and Wind Contracts

- In 2010 and 2011 Ontario procured large scale projects (>500 kW) through the FIT program at standard offer pricing.

- The FIT program was the centerpiece of the GEA which established the economic and social goals of growing the green economy, including establishing a local renewable energy manufacturing base, supporting the development of green energy jobs, and providing incentives for Indigenous participation.

- To help achieve these economic and social goals, the FIT program offered pricing at above competitive procurement rates, and provided Indigenous and Community participation adders, which resulted in economic benefits to all Ontarians, but resulted in additional costs borne by Ontario's electricity ratepayers.

- Ontario could fund the added cost of some or all of these economic and social incentives by shifting their costs from the rate-base to the tax-base.
    1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
    2. The tax base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT.

**Considerations**

- If applied to projects in commercial operation the benefit to the ratepayer would be immediate.
- Comparing FIT pricing to competitive procurement pricing could provide a reasonable representation of energy procurement without the added cost of economic and social incentives.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
   - For example, from 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
   - The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
   - If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
   - The $3.3 billion difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.
   - This represents estimated average ratepayer savings of $1.50/ month relative to OPO forecasts.
   - The same approach could be considered for solar projects however, prior to LRP I in 2016, Ontario had not procured solar capacity competitively and international cost comparisons are challenging given differences in regional development costs.
   - This example does not include the value of participation price adders available for community and indigenous participation.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

2. The tax-base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT 1 solar and wind projects.

   - For example, 17 large FIT 1 wind and solar projects have Indigenous and/or Community participation making them eligible for a price adder in addition to their base contract price.

   - The estimated value of these price adders is approximately $17.1 million (NPV 2017) over the expected remaining term of their contracts.

   - This represents estimated ratepayer savings of approximately $0.01/month relative to OPO forecasts.

# Key Outcomes / Next Steps

- The proposed initiatives provide the following opportunities to:
  - Provide a greater focus on vulnerable consumers by funding electricity support programs through the tax-base.
    - Enhance existing and new support programs targeted at the most vulnerable consumers (i.e., OESP and RRRP); and
    - Better harmonize delivery rates across the province.
  - Re-set how energy infrastructure is funded by shifting costs to the tax-base from the rate-base.
  - Provide electricity consumers with greater choices and transparency (e.g., alternative rate plan based on a flat electricity rate, unpacking the Global Adjustment costs, etc);
  - Provide system benefits (e.g., market renewal);
  - Increase cost effectiveness and improve efficiency; and
  - Lower the cost of electricity for all consumers.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require legislative and/or regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

# Appendix

A. Rural or Remote Rate Protection (RRRP) – Overview and Enhancements
B. Fund Conservation Programs Through the Tax-Base
C. Eliminate the Industrial Conservation Initiative (ICI)
D. Cancel Large Renewable Procurement I (LRP I)

# A. RRRP Overview and Enhancements

- The Delivery line of the electricity bill is composed of Distribution and Transmission Costs. While transmission costs are uniform across the province, LDC costs vary by distributor and account for about 20% of the total bill for the electricity customers.
  - See slide X for a map of delivery rate increases between 2006 and 2016.
- The Rural or Remote Rate Protection (RRRP) framework was put in place in 2001 to help offset the higher costs to distribute electricity to Ontario residents who live in rural or remote locations.
- RRRP is available to: residential Hydro One R2 customers (~350,000 customers), Algoma Power customers (~11,600 customers); H1 remote customers (~3,500 customers).
  - To date, R2 customers receive a fixed amount of $125 million a year distributed amongst the customers. Algoma and Remote customers have RRRP calculated by the OEB each year that fluctuates based on average provincial distribution increases.
- Because the amount had been fixed for over a decade, the Province recently increased funding of the RRRP program for Hydro One R2 customers from $125 million to $240 million. This will be effective as of January 1, 2017, and will bring their delivery charges in line with the next highest charges from Hydro One's R1 customer class.

# B. Fund Conservation Programs Through the Tax-Base

- Propose to fund 2017-2020 electricity conservation and demand management program costs* using tax dollars instead of ratepayer dollars.
  - Funds received through the Hydro One Departure Tax could potentially be repurposed towards this.
- Total remaining 2017-2020 electricity conservation program costs are expected to be ~$2.1 billion.
- Post 2020, this option could evolve to funding conservation programs through the Greenhouse Gas Reduction Account.

**Considerations**

- Electricity conservation programs provide a number of benefits to society, however, Ontario's ratepayers have been covering these costs:
  - Avoiding/deferring future energy infrastructure investments, reducing disruption in communities (e.g., avoiding the need to build new natural gas generation);
  - Environmental benefits (e.g., reduced natural gas peaking generation and GHG emissions); and
  - Social and economic benefits (e.g., job creation and assistance managing electricity bills).
- There is precedence for using tax dollars to fund conservation programs.
  - Between 2007 and 2011, Ontario funded the Home Energy Savings retrofit program using tax dollars.
- Funding conservation programs though the tax-base is expected to result in a benefit of $3.40/month for residential electricity consumers in 2017. This could provide immediate short term relief to consumers while other rate mitigation initiatives are developed (e.g., market renewal, LDC efficiencies).

*** Note:** This includes costs towards the Conservation First Framework, Industrial Accelerator Program, Demand Response and the Conservation Fund)

# C. Eliminate the Industrial Conservation Initiative (ICI)

- The cost shift from the Industrial Conservation Initiative (ICI) could be removed from electricity bills by eliminating ICI.
  - The ICI allows large electricity consumers to lower their electricity costs by reducing their demand during peak hours.

**Considerations**

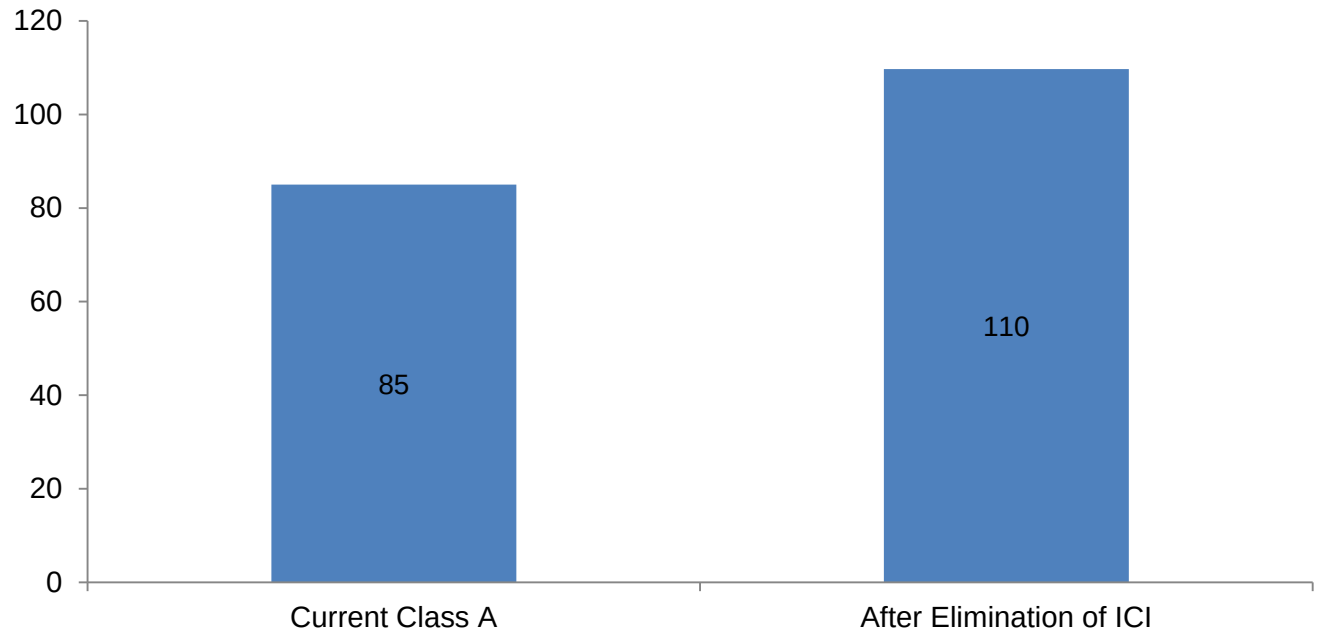
- Eliminating ICI would result in a benefit of more than $4/month for residential electricity consumers in 2017.
  - However, unless government took action to mitigate the associated cost shift back to industrial consumers, typical industrial prices would increase by about one-third. Such a price increase would pose significant challenges for energy-intensive consumers.
- Industrial stakeholders have indicated that ICI as an integral factor in maintaining competitiveness and retaining industry in the province.
  - Eliminating ICI would limit the “cost shift” onto residential consumers, but it would also lead to a reduction in industrial demand. The large industrial contribution to the fixed costs of running the electricity system would then need to be covered by remaining consumers.
- If ICI is retained, current IESO projections indicate that the cost shift will decrease each year going forward as Global Adjustment (GA) decreases (due to an expected increase in HOEP).
- Alternatively, ICI could be funded through the tax-base at a cost of $900 million annually. There is precedent to use the tax-base for industrial support programs, including the Northern Industrial Electricity Rate Program (NIERP) and the Jobs and Prosperity Fund.

# C. Eliminate the Industrial Conservation Initiative (cont'd)

- ICI currently provides a benefit of about $25/MWh to Class A electricity consumers.

**All-In Electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer.

# D. Cancel/Adjust Renewable Energy Procurements

- The Ministry could consider the following actions to further mitigate future impacts to electricity bills:

| Unallocated/Terminated Capacity | Announced Procurements | Executed Contracts |
|---|---|---|
| A. Do not procure unallocated or terminated capacity | B. Revise FIT 5 target | D. Cancel LRP I contracts |
| | C. Cancel FIT 6 | |

**Overarching Considerations**

- Cost savings associated with reducing or cancelling renewable energy procurements and programs will not reduce current electricity bills, but would result in future cost reductions relative to Ontario Planning Outlook forecasts.
- The IESO estimates implementing options A to C will reduce system costs by approximately $592 million ($2016) between 2019 and 2028, resulting in an average of approximately $0.50/month in savings to a typical residential electricity bill over the same period.
- The microFIT program is winding down end of 2017. Annual microFIT procurement targets have been undersubscribed.
- With a few exceptions (e.g. rollover of unallocated microFIT capacity; addition of terminated microFIT and small FIT capacity to FIT 5), plans for unallocated or terminated capacity are not defined in announcements or existing directions.

*Cancel/Adjust Announced Procurements:*

- Amendments to existing directions to IESO would be required to reduce FIT 5 and cancel FIT 6.
- The FIT 5 procurement is underway with a base target of 150 MW and inclusion of any capacity available from contract terminations under prior small FIT and microFIT procurements. The application window closed on November 25, 2016.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts

*Cancel Existing LRP I Contracts:*

- 16 LRP I contracts (approx. 455 MW) have been executed and projects are under development.
- None have met Key Development Milestones. Total value of LRP I estimated at approx. $1 billion (NPV to 2016).

**Considerations**

- To help inform a decision, IESO or OEB could be asked to evaluate and provide guidance to the Ministry on the system need for LRP I projects and potential ratepayer impacts/benefits.
- 13 of 16 LRP I contracts have Indigenous participation. Cancelling LRP I contracts would remove this economic development opportunity and likely damage relationships between Indigenous communities and the government.
- LRP I Contract includes an “Optional Termination” provision allowing IESO to terminate any contract prior to the “Commercial Operation Date” with 6 months written notice.
- The IESO obligations under the Optional Termination provision depend on whether the project has met all “Key Development Milestones”.
  - As no projects have met their Key Development Milestones, the estimated total cost payable to contract holders is about $8 million.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts (cont'd)

**Legal Analysis**

- Any new directive to cancel LRP I contracts would need to be approved by Cabinet, either as part of an LTEP implementation directive to IESO, or pursuant to the overall power to direct IESO with respect to procurements.
  - An amendment to an existing direction would not require Cabinet approval, however, further analysis is required to determine if direction to cancel LRP I contracts could be considered as amending existing direction.
- ENERGY has previously received advice that there is a high risk that a court would conclude that the Minister has no authority under the *Electricity Act , 1998* to issue a direction requiring IESO to terminate microFIT Conditional Offers and FIT Offer Notices that have already been issued to applicants, because these offers create vested contractual rights. This reasoning would likely apply equally to any direction to IESO to cancel LRP I contracts. Previous advice has also flagged a risk that the Province could be liable for damages in tort for inducing a breach of contract (or other claims).
- The risk and costs associated with potential law suits resulting from the cancellation of contracts requires further analysis. LSB recommends ENERGY seek an opinion from Crown Law Office Civil before proceeding.

ENERGY

# Rate Mitigation Plan Options

## Working Draft

January 2017

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure (i.e., $35 billion+ investment in cleaner generation and $15.5 billion investment in Hydro One transmission and distribution systems).

- Ontario has taken a number of actions to lower electricity costs for all consumers by:
  - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).
  - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., competitive LRP, no new NUG contracting).

- Following the 2016 Throne Speech, actions were announced to further reduce electricity costs by:
  - Providing an 8% rebate ($11/month savings), updating RRRP ($45/month savings), expanding ICI (up to one-third savings for participants) and suspending the LRP II and the EFWSOP (up to $3.8 billion in cost savings).

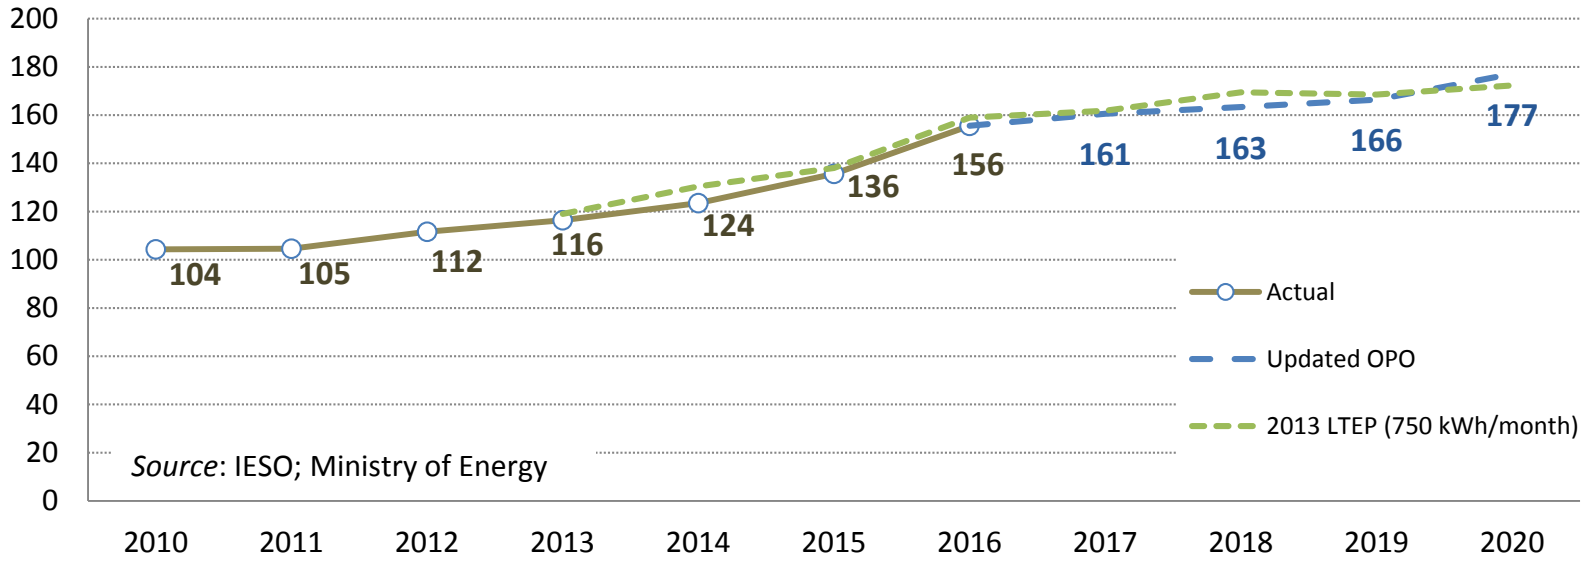
- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

# Context – Residential Electricity Prices

- Residential consumers electricity prices continue to be a concern for many Ontarians, particularly those that rely on electric heat.
  - **Note:** The typical residential bill is currently below the 2013 Long-Term Energy Plan (2013 LTEP) forecast.

**Typical Residential Electricity Bills**
*Historical and Forecast in $/month*

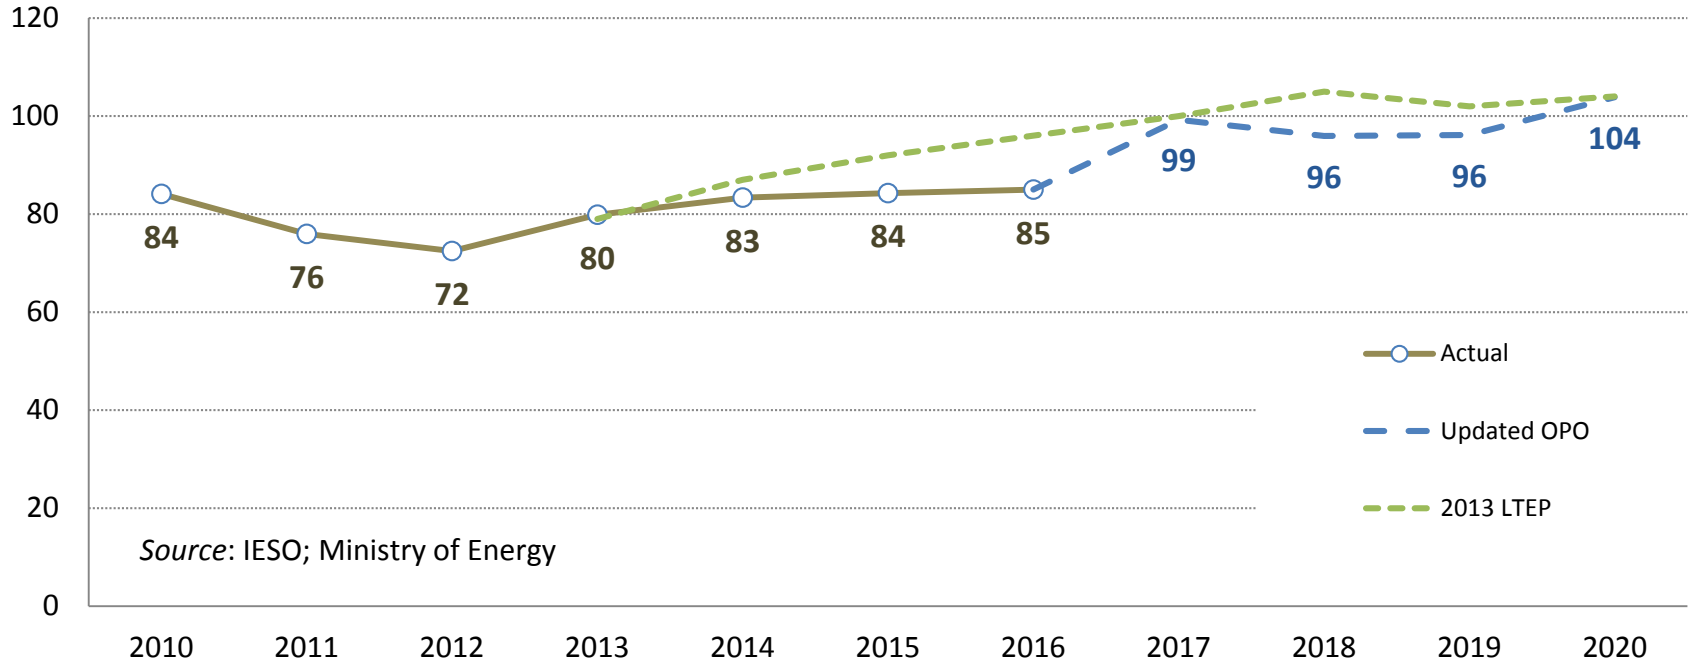


**Note**: The 2013 LTEP forecast for residential bills was based on 800 kWh/month without RRRP or electric heating; the above has been rebased to 750 kWh/month for comparison purposes. Typical residential are based on Toronto Hydro. The updated OPO forecast above includes the 8% rebate to offset the provincial portion of HST, ICI expansion and RRRP expansion.

# Context – Large Industrial Electricity Prices

- Industrial electricity prices continue to be a concern for many businesses.
  - **Note:** The typical industrial electricity price is currently below the 2013 LTEP forecast.

**Typical Class A Electricity Prices**
*Historical and Forecast in $/MWh*



**Note**: The 2013 LTEP forecast for industrial reflects a transmission connected Class A electricity consumer. The updated OPO forecast above includes ICI expansion and RRRP expansion.

# Broad Policy Themes / Rationale

- In recognition of the costs borne by ratepayers related to the to decarbonizing and modernizing the province's electricity sector:
  1. Provide significant and immediate rate relief through cost deferral of the global adjustment (GA).

  2. Provide a greater focus on vulnerable consumers by funding electricity support programs, such as the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Protection, (RRRP) through the tax-base. In addition, provide greater support for lower income Ontarians by enhancing the OESP, etc.

  3. Empower energy agencies to increase cost effectiveness and improve efficiency by having – Independent Electricity System Operator (IESO) modernize Ontario's electricity market through electricity market renewal initiatives, the Ontario Energy Board (OEB) identify opportunities for future LDC cost reductions/efficiencies and work with Ontario Power Generation (OPG) to find further efficiencies in operations and pass on savings to ratepayers.

  4. Enhance the existing 8% rebate that went into effect January 1, 2017.

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

| *$/750kWh* | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|---|
| 1. Global Adjustment (GA) Financing (Moderate) | - | 17.49 | 15.01 | 12.49 | 14.91 | 6.32 | 4.03 | Immediate |
| 2. Fund Electricity Support Programs Through the Tax-Base | | | | | | | | |
| a. Rural or Remote Rate Protection (RRRP) | - | 1.58 | 1.62 | 1.66 | 1.70 | 1.75 | 1.79 | Immediate |
| b. Ontario Electricity Support Program (OESP)* | - | 0.83 | 0.83 | 0.83 | 0.83 | 0.83 | 0.83 | Immediate |
| c. Low-Income Conservation | - | - | - | - | - | - | - | |
| d. First Nations Rate | - | - | - | - | - | - | - | |
| 3. Empowering Energy Agencies To Increase Cost Effectiveness and Improve Efficiency | | | | | | | | |
| a. IESO – Market Renewal | - | - | - | - | - | 1.00 | 1.03 | Long-Term |
| b. OEB – LDC Efficiencies/Rates* | - | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| c. OPG – Operational Efficiencies | - | 0.71 | 0.89 | 1.08 | 1.22 | 1.35 | 1.24 | Immediate |
| 4. Enhanced Tax-based RPP Rebate (5%) | - | 7.04 | 7.17 | 7.31 | 7.77 | 7.61 | 7.83 | Immediate |

***Note**: Savings based on currently approved OESP rate set by OEB.
**Note:** The above initiatives will provide similar benefits for non-RPP Class B electricity consumers. Class B includes small-medium enterprises (SMEs).

# Proposed Initiatives – Potential Savings for Average Industrial Electricity Consumers

| *$/MWh* | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|---|
| 1. Global Adjustment (GA) Financing (Moderate) | - | 14.49 | 12.43 | 10.33 | 12.35 | 5.23 | 3.33 | Immediate |
| 2. Fund Electricity Support Programs Through the Tax-Base | | | | | | | | |
| a. RRRP | - | 2.10 | 2.15 | 2.21 | 2.26 | 2.32 | 2.38 | Immediate |
| b. OESP* | - | 1.10 | 1.10 | 1.10 | 1.10 | 1.10 | 1.10 | Immediate |
| c. Low-Income Conservation | - | - | - | - | - | - | - | |
| d. First Nations Rate | - | - | - | - | - | - | - | |
| 3. Empowering Energy Agencies To Increase Cost Effectiveness and Improve Efficiency | | | | | | | | |
| a. IESO – Market Renewal | - | - | - | - | - | 1.34 | 1.38 | Long-Term |
| b. OEB – LDC Efficiencies / Rates* | - | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| c. OPG – Operational Efficiencies | - | 0.59 | 0.74 | 0.89 | 1.01 | 1.12 | 1.03 | Immediate |
| 4. Enhanced Tax-based RPP Rebate (5%) | - | - | - | - | - | - | - | Immediate |

***Note:** Savings based on current OESP charge as set by OEB.

# Fiscal Impacts

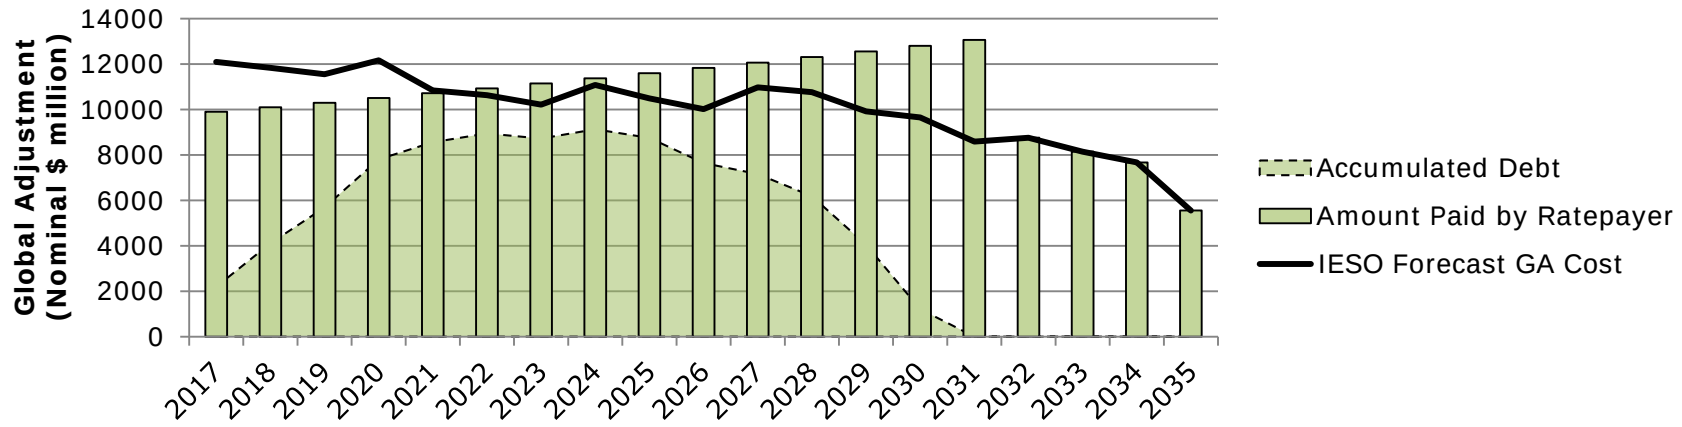
| *$M* | 2016-17 | 2017-18 | 2018-19 | 2019-20 | 2020-21 |
|---|---|---|---|---|---|
| 1. Global Adjustment (GA) Financing (Moderate) | TBC | TBC | TBC | TBC | TBC |
| 2. Fund Electricity Support Programs Through the Tax-Base* | | | | | |
| a. RRRP | - | $457 | $469 | $479 | $493 |
| b. OESP | - | 162 | 225 | 279 | 323 |
| c. Low-Income Conservation | - | 60 | 60 | 60 | 60 |
| d. First Nations Rate | - | 18 | 18 | 18 | 18 |
| 3. Empowering Energy Agencies To Increase Cost Effectiveness and Improve Efficiency | | | | | |
| a. IESO – Market Renewal | - | - | - | - | - |
| b. OEB – LDC Efficiencies / Rates | - | - | - | - | - |
| c. OPG – Operational Efficiencies** | - | - | - | - | - |
| 4. Enhanced Tax-based RPP Rebate (5%) | 169 | 699 | 679 | 732 | 724 |

***Note:** Includes costs of program expansion and various assumptions as detailed on relevant slides.
**** Note:** Risk to fiscal plan of up to $240 million annually (foregone net income) if OPG is unable to reach more aggressive operational efficiency targets.

**Source:** Ministry of Finance, Energy

# 1. Global Adjustment (GA) Financing

- It is proposed that the amount of global adjustment (GA) paid by ratepayers in each year over the forecast period is set at a fixed amount and money is borrowed to make up the remainder of the GA cost in each year.
- Starting on January 1, 2017, the amount of GA paid by ratepayers is set at a value lower than the true cost of GA in 2017 and is increased according to a pre-defined schedule until the debt has been paid off.
- GA costs will be "smoothed" over time by lowering costs in the short term and increasing costs in the long term.
- In some scenarios, the amount of GA paid by ratepayers *above* the expected actual cost of GA is capped so as to limit large increases in the cost of electricity in any given year.
- All analysis is based on forecasts from Independent Electricity System Operator (IESO), assumes a 5% annual borrowing interest rate and an inflation rate of 2% per year.



**Sample financing**: Ratepayers pay less than the cost of GA in early years, borrowing up to $9 billion that is fully paid off in 2031 by charging ratepayers more than the cost of GA in later years.

# 1. GA Financing – Options

1a. Moderate / GA Financing

- The amount of GA paid by ratepayers in 2017 is lowered by $3.2 and $3.4 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively.
- Future GA over-payments above the true cost of GA are capped at $2 billion to limit electricity cost increases in any given year.

1b. Moderate / GA Financing with Delayed Increase

- The starting GA payment from all ratepayers in 2017 is lowered by $1.1 billion, ratepayer payments *decrease* in the short term to keep residential bills relatively flat, then increases at 3% each year – up to a maximum of $2 billion above the true cost of GA – until the borrowed money is paid back over a 25 and 30 year financing period respectively.

Low / GA Financing (see in Appendix)

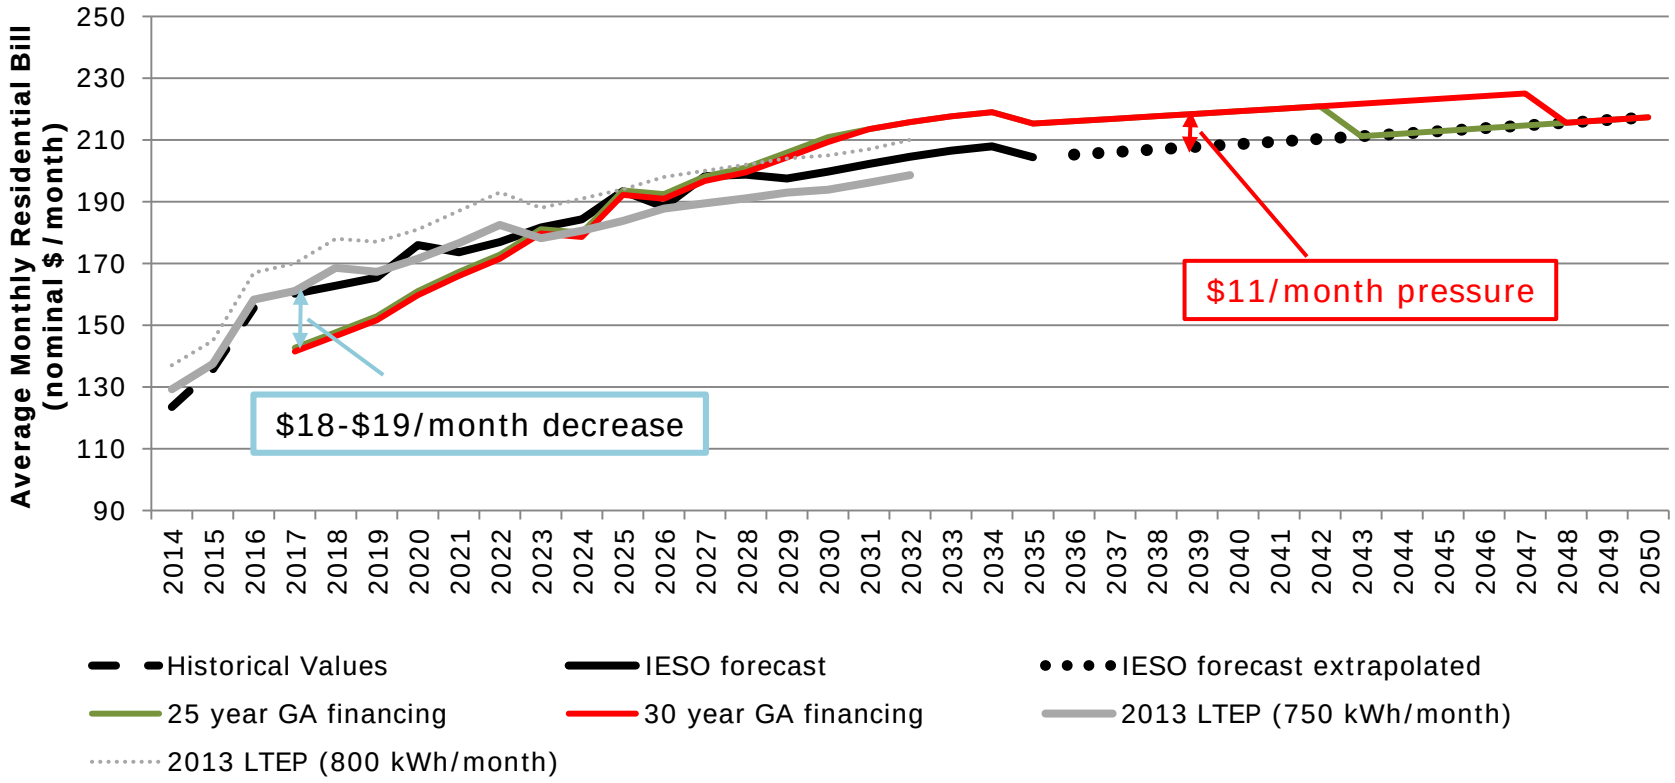
- The amount of GA paid by ratepayers in 2017 is lowered by $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off.
- Future GA over-payments above the true cost of GA are capped at $2 billion to limit electricity cost increases in any given year.

High / GA Financing (see in Appendix)

- The amount of GA paid by ratepayers in 2017 is lowered by $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively.
- No limit is placed on the amount charged to ratepayers above the true cost of GA.

# 1a. Moderate / GA Financing – Impact on Residential Electricity Bills

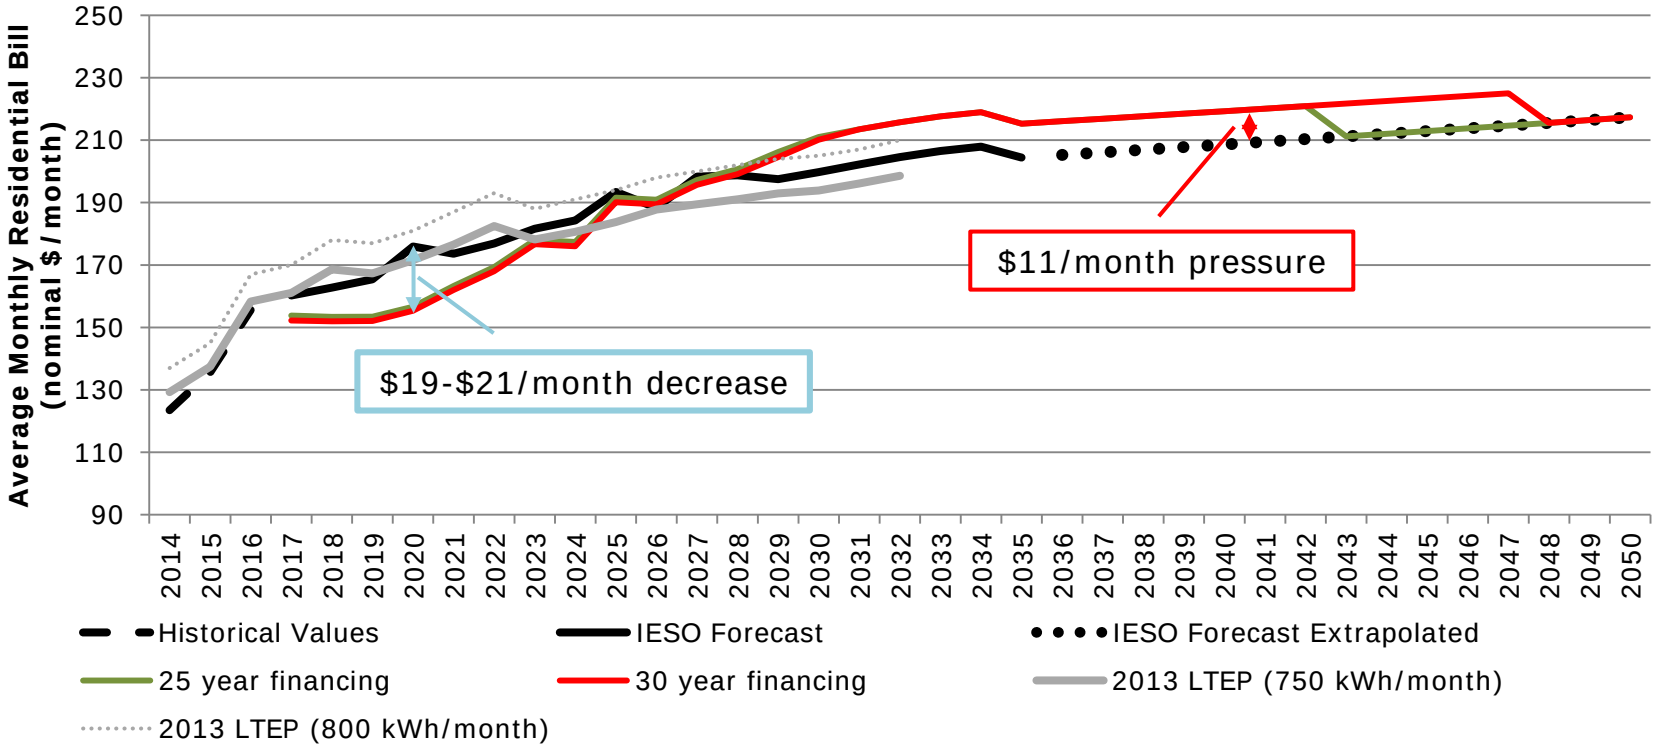
- In this scenario, the starting GA payment from all ratepayers in 2017 is lowered by $3.1 billion (green line) and $3.3 billion (red line) and increases at 2% each year – up to a cap of no more than $2 billion more than the true cost of GA in any year – until the borrowed money is paid back in 25 and 30 years respectively.



- By **borrowing up to $23 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $17-$19/month** at the cost of **increased future electricity bills over 14-19 years of up to $11/month** above the true cost of electricity production.

# 1b. Moderate / GA Financing with Delayed Increase in Payments – Impact on Residential Electricity Bills

- In this option, the starting GA payment from all ratepayers in 2017 is lowered by $1.1 billion, ratepayer payments *decrease* in the short term to keep residential bills relatively flat, then increases at 3% each year – up to a maximum of $2 billion above the true cost of GA – until the borrowed money is paid back over a 25 and 30 year financing period respectively.

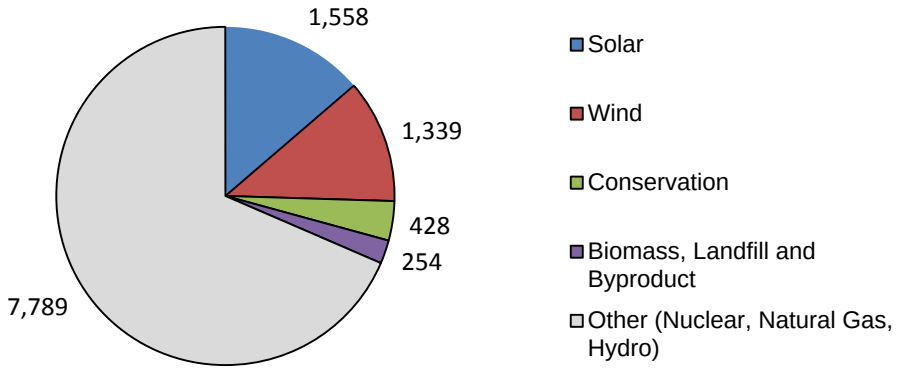


- By **borrowing up to $23 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $19-$21/month** at the cost of **increased future electricity bills over 14-19 years of up to $11/month** above the true cost of electricity production.

# 1. GA Financing – Cost Breakout

- The allocation of GA costs for most of 2016 are as follows:

GA costs year-to-date November 2016 ($ million)



- This cost breakdown will evolve over time as 2,181 MW of contracted generation comes online in the coming years.
- The proportion of GA costs is compared with the proportion of generation in the table below:

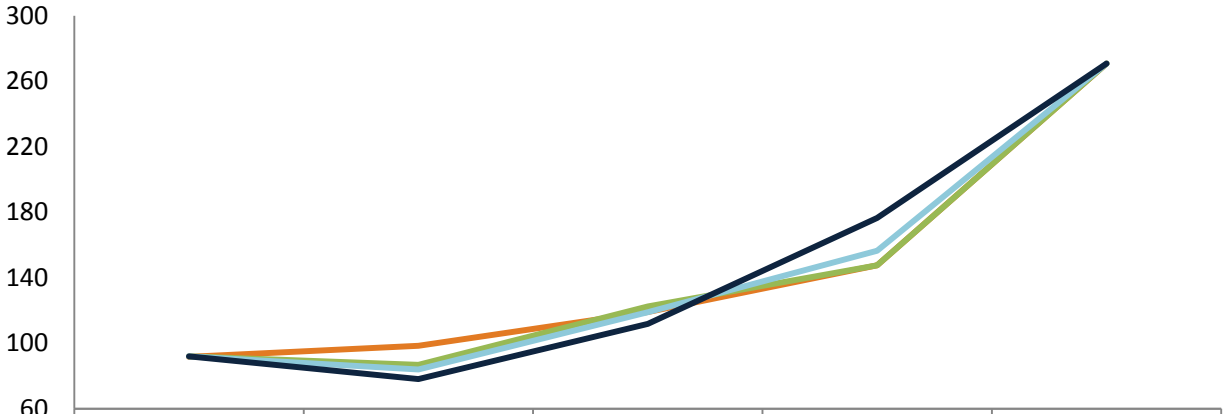
| | Fraction of GA Cost | Fraction of Generation* |
|---|---|---|
| **Solar** | 14% | 0.3% |
| **Wind** | 12% | 6.0% |
| **Biomass, Landfill and Byproduct** | 2% | 0.3% |
| **Conservation** | 4% | 0.0% |
| **Other (Nuclear, Natural Gas, Hydro)** | 69% | 93.4% |

***Note:** Only includes generation directly connected to the transmission system. Most solar generation, for example, is connected to the distribution system and is not represented in the generation column.

# 1. GA Financing – Impact of the Level of Financing on Large Industrial Electricity Consumers

- Below graph illustrates the estimated impact of the level of GA financing for an average Class A electricity consumer over a 25 year amortization period.

**Estimated All-In Electricity Price**
*for Average Class A in $/MWh*



| | 2016 | 2017 | 2027 | 2037 | 2047 |
|---|---|---|---|---|---|
| Status Quo | 92 | 98 | 119 | 148 | 271 |
| Low Financing | | 87 | 122 | 148 | 271 |
| Moderate Financing | - | 84 | 119 | 157 | 271 |
| High Financing | | 78 | 112 | 177 | 271 |

**Note:** Assumes that demand by industrial sector continues at average 2011-2015 levels. Please see the Appendix or more information on the estimated impact on large industrial electricity consumers.

# 1. GA Financing – Considerations

**Considerations**

*Ratepayer:*

- Borrowing money to finance the GA, while lowering costs in the short term, results in a more rapid rise in electricity prices beyond the rate of increase already expected.

- The GA financing proposal involves borrowing large amounts of money over a long period of time (16-30 years, depending on the scenario) to reduce electricity rates. This debt would be highly sensitive to interest rates which could extend repayment timelines or put significant pressure on electricity rates. A long-term interest rate of 5% is assumed for this analysis.

- GA and HOEP provide a natural hedge against each other – when one goes up, the other goes down – keeping total electricity costs relatively stable and predictable. Smoothing only the GA would lead to greater price volatility for consumers unless the schedule and amount of ratepayer payments was defined relative to the actual cost of GA.

- Some Class A consumers pay limited Global Adjustment and would receive little benefit under the financing proposal. These consumers also currently pay very low rates.

- Should Ontario electricity demand be lower than forecasted, the cost of paying off the debt will be spread over a smaller pool of consumption, further increasing future costs for individual ratepayers.

- In recognition that Class B electricity consumers pay the majority of GA costs, could limit GA cost reductions through financing to Class B consumers only.

# 1. GA Financing – Considerations (cont'd)

**Considerations**

*Fiscal / Accounting:*

- Further analysis is required on whether such changes to the financing of the GA would affect the Province's current accounting treatment for the GA and represent a potential fiscal risk. As such, early engagement with Legal Services Branch and Treasury Board Secretariat is advised.
  - It is unclear whether legislation could determine the manner in which this initiative is accounted for. Further work is required.

- Historically electricity sector financing has been conducted by the Ontario Financing Authority (i.e., managing OEFC's stranded debt and borrowing on behalf of IESO). Further consultation with the OFA will be required to determine the appropriate vehicle for additional borrowing.

- The significant amount of additional Provincial borrowing needed to finance the GA, and associated risks (e.g., interest rates, repayment timelines), could put pressure on the Province's credit rating and overall borrowing capacity. Further analysis is required and would suggest early engagement with the OFA through which money will be borrowed.

- The significant deferral of electricity system costs over a long time-horizon and associated interest costs may draw criticism from some stakeholders as creating a new "stranded debt" in the sector. **Note:** the Debt Retirement Charge (DRC) was removed from residential bills in 2016 and will be removed for remaining customers in 2018.

# 1. GA Financing – Guiding Principles (cont'd)

- Based on preliminary discussions with KPMG, the following key steps have been identified:
  - Create an "asset" (and confirm that it meets accounting requirements);
  - Identify who will hold the asset(s), this could include:
    - Province (e.g., OEFC, etc);
    - IESO; or
    - LDCs.
  - Determine the source of the financing (e.g., OFA, IO, etc)

- ENERGY is working with LSB, IESO, MOF, TBS and external accountants to identify legislative, regulatory and accounting requirements associated with GA financing option.

# 1. GA Financing – Considerations (cont'd)

**Considerations**

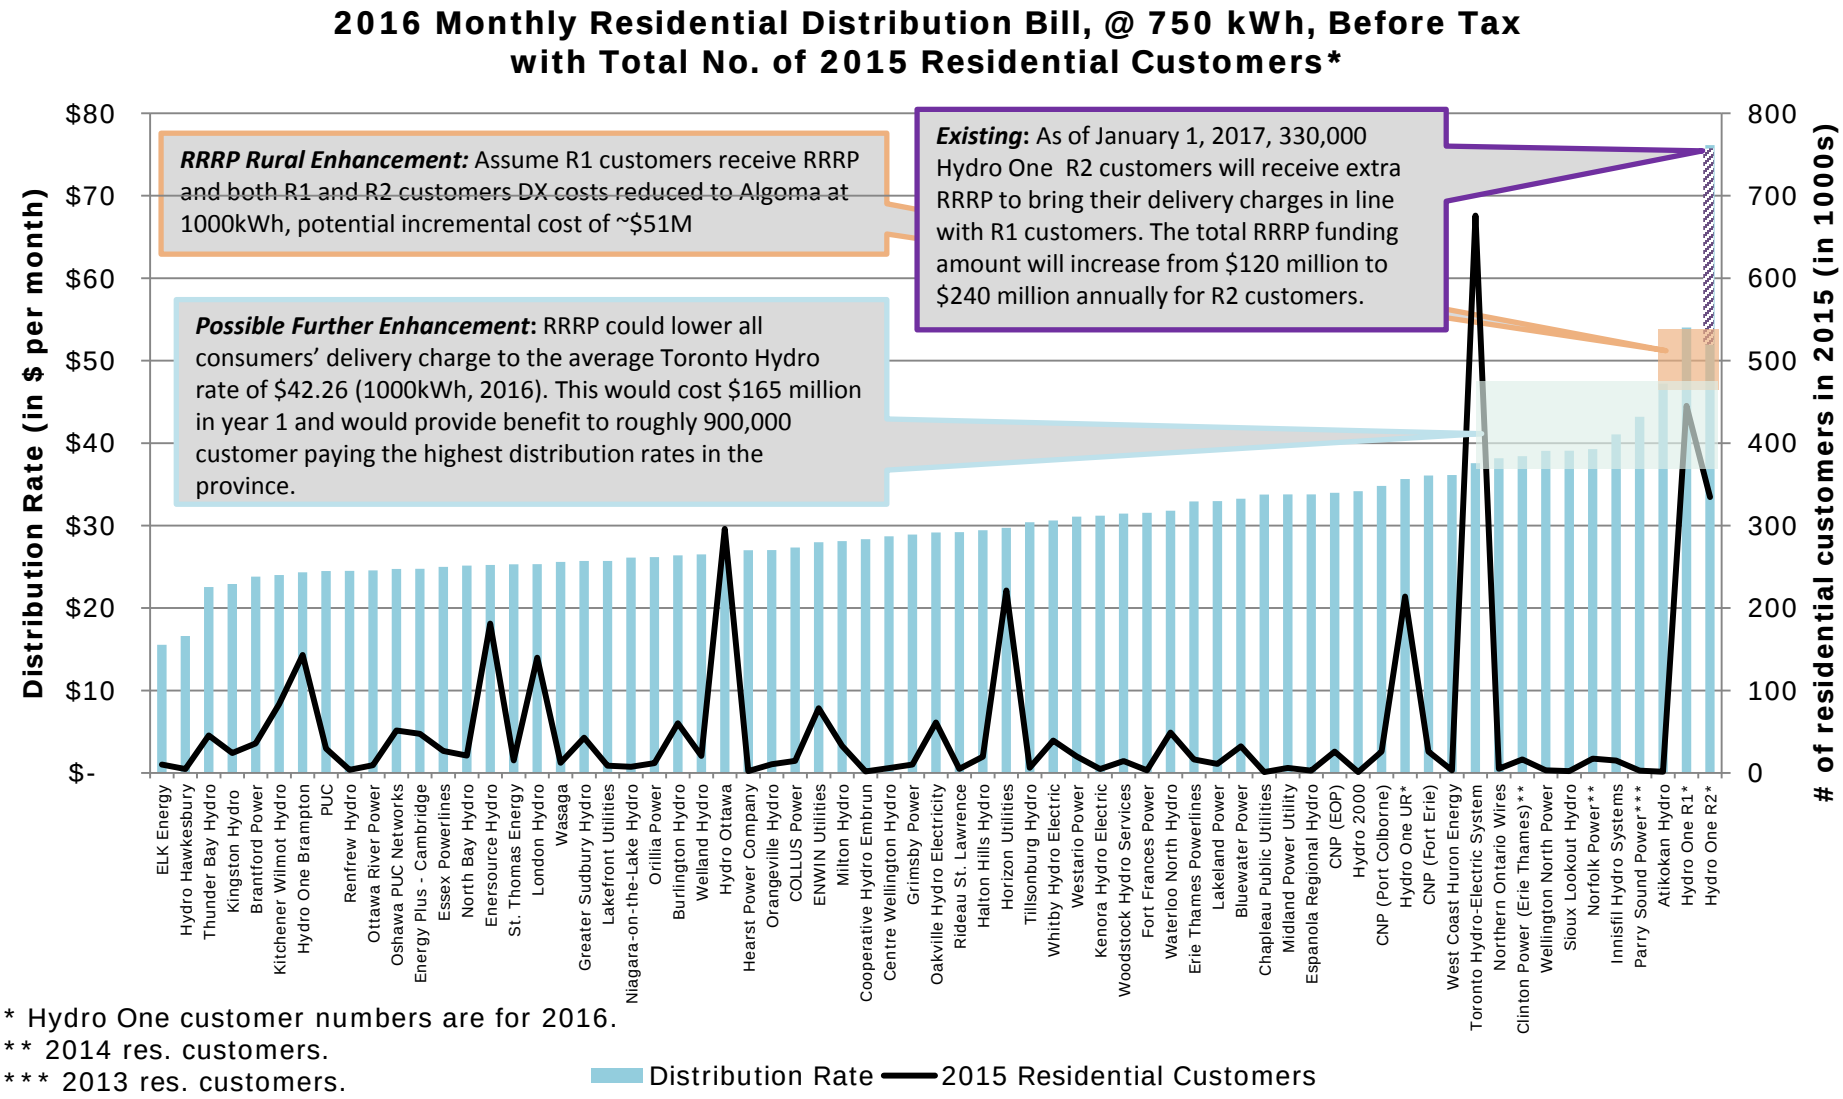
*Legal:*

- Legislation would be required to authorize the financing proposal.
  - Amendments to the *Electricity Act, 1998* (EA) could authorize the financing of certain costs within or part of the GA. However, whether any other legislation requires amendment is not known at this time.
  - The GA regime currently provides that "true costs" represent the true costs of making payments to generators or counter parties to contracts, not the incurring of discretionary financing or interest costs.
  - Considerations such as the need to analyze legal risks or the need to address costs retroactively (if the proposal requires a January 1, 2017 start) could add to the legal and drafting complexity. Further legal analysis is required.

# 2a. Fund Electricity Support Programs Through the Tax-Base – Rural or Remote Rate Protection (RRRP)

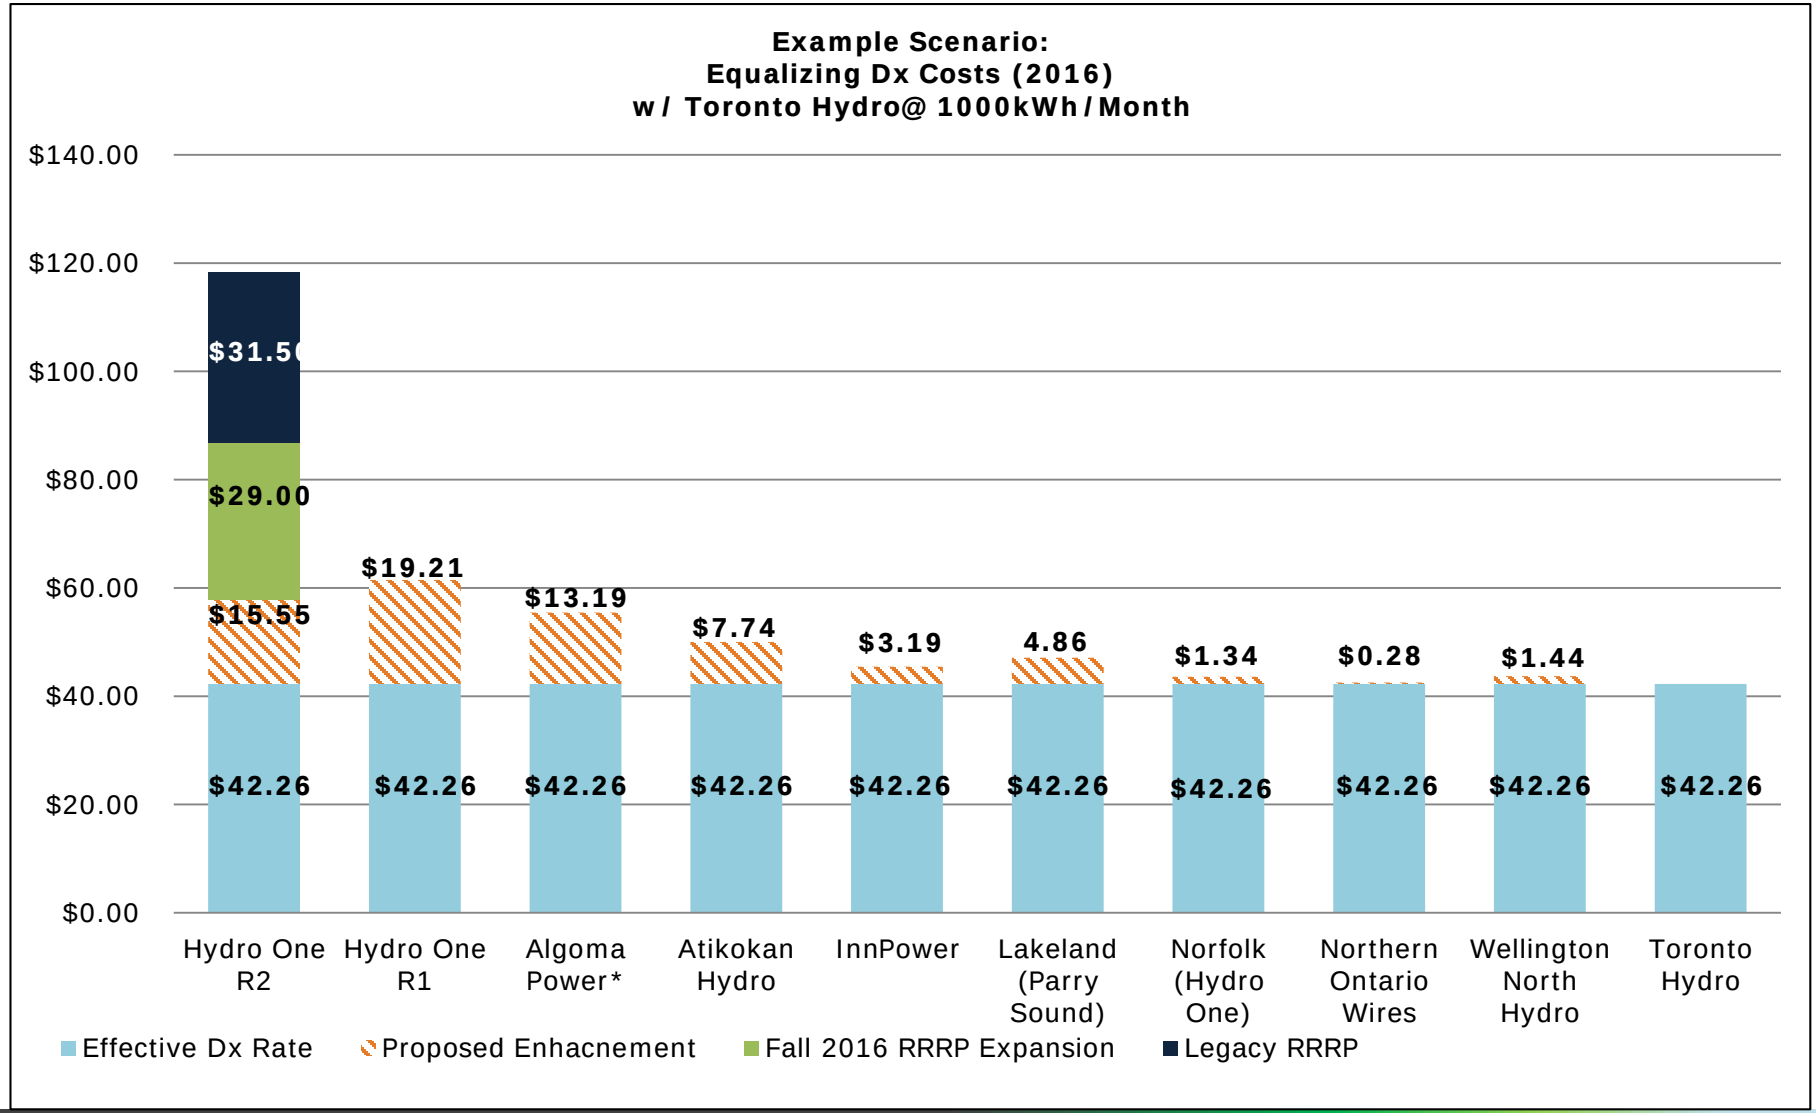
- RRRP supports the most costly-to-serve distributors in Ontario. It is not income tested and most of the support goes to Hydro One's R2 (low density) rate class and remote communities.
- The objective of the program is to reduce extreme distribution costs experienced in low density communities, and bring rates closer to those paid by other customers across the Province.
  - The OEB mandates that low density consumers pay the full cost of service and in recent rate filings has asked Hydro One to ensure this through cost allocation studies. RRRP is thus the mechanism by which these costs can be partly subsidized by all provincial ratepayers.
- Effective January 1, 2017, Ontario has enhanced program funding to further reduce Hydro One R2 distribution rates. As a result, a typical Hydro One R2 customer now pays roughly the same as a Hydro One R1 (medium density) customers, the next highest distribution rate.
- There is opportunity to continue the mitigation of delivery costs for the most costly-to-serve Ontario consumers by revising the program to either:
  - Bring other density based rural costs down by providing benefits to Hydro One R1 customers and ensuring that all RRRP recipients would pay roughly the same delivery costs; or
  - Expanding the program to other distributors that are costly to serve for reasons beyond density (e.g. to bring their distribution rates down to levels currently paid by customers of Toronto Hydro).
- An expansion of the program would result in a cost for all other ratepayers as the RRRP regulatory charge would need to be increased. In order to avoid this and not place an additional burden on consumers, the RRRP program could be transferred to the taxbase.
  - If left on the ratebase, program costs to consumers could rise from an average of $1.58/month to roughly $3.15/month.

# 2a. RRRP Expansion (cont'd)



* Hydro One customer numbers are for 2016.
** 2014 res. customers.
*** 2013 res. customers.

# 2a. RRRP Expansion – Ratepayer Impacts



***Note:** Algoma Power also receives $13.5 million (2017) to support operational costs.

# 2a. RRRP Expansion – Fiscal Impacts

- Table below shows estimate of program costs up to 2022

| Year | RRRP Status Quo($M) | RRRP Enhancement Phase 1 ($M) | RRRP Enhancement Phase 2 ($M) | TOTAL RANGE ($M) |
|---|---|---|---|---|
| 2017 | $292 | $51 | $114 | **$343 - $457** |
| 2018 | $300 | $52 | $117 | **$352 - $469** |
| 2019 | $306 | $54 | $119 | **$360 - $479** |
| 2020 | $315 | $55 | $123 | **$370 - $493** |
| 2021 | $322 | $56 | $127 | **$378 - $505** |
| 2022 | $329 | $58 | $129 | **$387 - $516** |

- Baseline cost of $292M includes all existing funding for Hydro One R2 (including recent $116 million expansion), Hydro One Remotes, and Algoma Power. Providing the enhanced support would cost an additional $165 million (Phase 1 – $51 million + Phase 2 – $114 million) in year 1.
- For forecast purposes, fiscal impacts are escalated at 2.6%/year. This reflects an estimate of the average yearly distribution rate increase.
  - The current RRRP program includes an adjustment mechanism to increase program funding by the same percentage as the average yearly distribution rate increase.
  - The continuation and appropriateness of this mechanism (and in fact all program design characteristics) would be considered in moving the program to the tax base.

# 2a. RRRP Expansion – Considerations

**Considerations**

- **Framework:** New legislation would be required to establish and define the parameters of a tax based RRRP. This may reveal additional considerations.
- **Policy Rationale:** Historically, RRRP has supported costs of LDCs that meet a density threshold. Expanding funding to additional LDCs that do not represent a density threshold (and selecting a specific LDC rate to serve as a cost cap) results in a fundamental change in the program. Program objectives must be considered if expansion is limited to specific LDCs.
- **Program Design:** Program specifics will affect eligible customers, credit amounts, and fiscal impact widely. Issues such as how eligibility is determined and if benefits are equal for all customers within an eligible LDC need to be examined. Financial flow-through mechanisms would need to be considered in consultation with IESO and LDCs. Likely to be modeled after processes used for the Ontario Rebate for Electricity Consumers (OREC).
- **Continuing Support:** There are multiple options and mechanisms available to adjust funding year-over-year depending on desired objective (continuously peg to Toronto, cover annual rate increases, provide inflationary support, amend as needed, etc…). Selection will impact fiscal projections.
- **Fiscal Risk:** As LDC rates change year-over-year, LDCs eligible for tax-based support will change and can cause significant fluctuation in fiscal projects and impacts. For example, if Toronto Hydro meets eligibility criteria in any given year, over 700,000 customers could become newly entitled to taxbase support.
- **Legal Risk:** The OEB is the energy sector's independent regulator and has sole authority to set rates. Ministry-OEB authority must be considered when prescribing cost levels.
- **Hydro One:** Providing tax-based support for Hydro One may be controversial following the broadening of ownership. Hydro One is also transitioning seasonal customers to its R2 and R1 classes; program eligibility will need to be considered.

# 2b. Ontario Electricity Support Program (OESP) Expansion

- The OESP is an income-tested, application based program that lowers the electricity costs of the most vulnerable consumers by providing a rebate directly on their electricity bills.
- The OESP provides basic benefits to most consumers and enhanced benefits to Indigenous customers and customers with electric heat and medical devices.
- OESP funding is collected from a charge levied on all electricity ratepayers. Based on current level of program up-take and funding collection, OESP program benefits could be increased across the board by 50%. This would mean:
  - Single low income consumers would see an increase from $30 to $45/ month ($540/year);
  - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year); and
  - Indigenous and Métis consumers would also see benefit increases at the same level as those with electric heat and medical devices.
    - The Ministry is also considering options to support a “Delivery” line credit for Indigenous consumers. This would cost ~$18 million/year (Option 2d on slide 8) and would save Indigenous consumers between $75 and $100/month.
- Greater focus and support can be placed on lower income Ontarians by funding OESP through the tax base. This would also reduce costs for all consumers as a result of eliminating the OESP charge.
  - Average residential customer savings: $0.83/month; and
  - Average industrial customer savings: $1.10/MWh.

# 2b. OESP Expansion – Fiscal Impacts

- Table below shows estimate of program costs up to 2022:

| Year | OESP Status Quo($M) | +50%($M) | TOTAL ($M) |
|---|---|---|---|
| 2017 | $108 | $54 | **$162** |
| 2018 | $150 | $75 | **$225** |
| 2019 | $186 | $93 | **$279** |
| 2020 | $215 | $108 | **$323** |
| 2021 | $243 | $122 | **$365** |
| 2022 | $272 | $136 | **$408** |

- 2017 program costs are based at current program sign-up rate – 30% of eligible consumers. Cost projections assume the program grows to 100% of eligible consumers by 2022 and remains at that level.
- At the time of program design, it was estimated that 40-50% participation would be high for an application-based program delivered through electricity bills. However OESP can be enhanced by working to ensure the program uptake is as close as possible to 100%:
  - Streamlining the application process to make it easier and quicker to get through;
  - Putting in place a more aggressive communications strategy to make sure people are aware of the program;
  - Increasing funding for key partner agencies to work directly with individuals who are applying; and
  - Exploring automatic OESP qualification for those who receive provincial programs (e.g., ODSP).
- OEB is currently exploring options for simplifying the OESP process, including exploring options with MCSS on auto-enrollment options, discussing options to eliminate wet signature consent forms with the federal government, and working with partners to do open houses to better reach vulnerable consumers.

# 2b. OESP Expansion – Considerations

- **Framework:** New legislation would be required to establish and define the parameters of a tax-based OESP. This may reveal additional considerations, including possible assessment as a tax credit.
- **Implementation:** Financial flow-through mechanisms would need to be considered in consultation with IESO and LDCs. Likely to be modeled after processes used for the Ontario Rebate for Electricity Consumers (OREC).
- **Alternative Delivery:** If the OESP was funded by the tax-base, it could also be explored whether the OESP could be better delivered as a provincial program via the tax system. This may help ensure that the program's participation rate is as high as possible, and could expand coverage to the ~142,000 low-income households that do not receive an electricity bill.
- **Transition to Social Assistance:** Moving OESP to the taxbase can be a transitional step in folding this program into a reform of social and disability assistance programs and enhancement of MCSS' Social Assistance Management System moving forward.
- **Additional Enhancements:** The enhanced credit could be expanded to include additional eligibility categories of customers. For example, a new "Low Density Consumer" category could be introduced that provides Hydro One R2 and/or R1 customers (highest distribution rates) who are already OESP eligible with the enhanced credit.
- **Variance Account:** The OEB has been collecting program funding in excess of program costs and has accrued a positive balance. This balance must be addressed when moving to the tax base.

# 2c. Low Income Conservation Benefit Program

- Existing low income programs delivered by LDCs and IESO help qualified homeowners and social and/or assisted housing providers improve the energy efficiency of their homes.
  - Programs include the Home Assistance Program and the Retrofit Program (Social Housing Stream).
- A new Low Income Conservation Benefit Program would build on existing programs.
  - Participants could receive incentives for conservation measures not currently covered (e.g. air conditioning, heat pumps (electric heated homes)).
  - Increased incentive amounts (e.g., under the existing Retrofit Program, incentives cover approx. 60% of the total cost of the energy efficiency upgrade).
  - Targeted education and awareness initiatives.
- The new program would be delivered through LDCs and/or IESO.
- The new program would coordinate with CCAP initiatives.
- The budget estimate below is illustrative and assumes annual program budgets three times the 2015 spending for the Home Assistance Program.

| | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|---|
| Proposed Budget ($ Million) | $60 | $60 | $60 | $60 | $60 | $60 |

- Further analysis is required on costing and implementation details, including alignment with the Conservation First Framework.

# 3a. IESO – Market Renewal

- Continue to move forward with Independent Electricity System Operator's (IESO) Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2021, leading to a reduction of:
  - About $1/month or less than 1% at current retail prices for a typical residential bill; and
  - About $1.30/MWh at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.
- IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.

# 3b. OEB – LDC Efficiencies and Rates

- Reducing costs and having LDCs become more efficient could result in a reduction of distribution costs on electricity bills.
  - Currently, LDCs recover costs through the Delivery line of the electricity bill, which is broken into Distribution and Transmission costs. LDCs are responsible for the Distribution costs of the electricity bill which account which account for about 20% of the total bill.
- Distribution costs vary across the province as LDCs have different service territories and needs (e.g., geography, number of customers, density of customers, life/health of capital assets, etc). See next slide for more detail.
  - For example, comparing 2016 with 2006, distribution rates have increased by about 24.5% (or about 2.2% per year, compounded annually) across the Province, with significant variation between regions and LDCs (-17% to 148%). Overall consumer price inflation in Ontario for the same period increased by about 19% or 1.8% per year.
- Over the same time period, distribution sector productivity and cost efficiency have decreased. This trend raises concern that customers are not realizing a net benefit from sector cost increases, as customers receive less value from the distribution portion of their bill.
  - OM&A costs per customer have increased on average from $235 in 2006 to $319 in 2015.
  - For the period 2002-2012, sector productivity has decreased by an annual average of -0.93% when including Hydro One and Toronto Hydro, the worst performers.
- In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. The Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities. The panel recommended legislation to mandate consolidation.
  - Rather than mandating consolidation, the government response was to pursue voluntary consolidation and put in place tax incentive for consolidation \further changes to the tax incentives and/or revisiting legislated consolidation could be considered.
- The Ontario Energy Board (OEB) has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates. Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
- ENERGY could help promote or accelerate these efforts by asking the OEB – through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and/or the 2017 Mandate Letter and other agency business planning processes – to consider opportunities to further drive these efficiency, productivity, and performance improvements.

# 3b. OEB – LDC Efficiencies and Rates – Potential LDC Cost Reduction Measures (cont'd)

| Option | Description | Potential Cost Impacts* | Timeline** | Notes |
|---|---|---|---|---|
| **Performance Standards with Rewards & Penalties** | Strengthen LDC scorecard by connecting to LDC financial performance through earnings sharing or penalties paid to consumers.<br>Ex: SAIDI/SAIFI; OM&A per customer | • 1-2% of revenue requirement could be recycled back to customers.<br>• Performance penalties would be real, periodic on-bill $ reductions.<br>• Cost reduction would only occur if standards are not met. | 1 year | UK Regulator Ofgem requires utilities to pay consumers up to £50 if reliability standards are not met. |
| **Enhanced Economic Regulation** | Revise rate-setting to reflect tightening productivity requirements and capital cost avoidance. | • <1% reduction in rates annually, with additional capital investment avoidance.<br>• Methods include stronger productivity factors, broader peer comparisons, and elimination of ICM. | 1-3 years | Incents innovation by requiring LDCs to provide equal or better service on less inflation-adjusted revenue annually. |
| **LDC Collaboration Incentives** | Create regulatory incentives for LDCs to pursue efficiencies and service sharing agreements. | • Potential to avoid individual LDC capital investments of up to six figures, plus additional OM&A tightening.<br>• Actual level of rate reduction dependent on specific LDC proposals. | 1 year for new guidelines, savings to be realized through LDC planning process. | LDCs have already indicated an interest in pursuing such arrangements but have expressed concern on regulatory barriers and costs. |
| **Line Loss Accountability** | Create appropriate benefit-sharing mechanism so LDCs are incented to pursue line loss reductions. | • Potential for 1-3% reduction in commodity charges associated with losses.<br>• Requirements dependent on business cases so costs don't outweigh benefits. | 1-2 years | Potential linkages with related proposal for in-front of the meter conservation. |

***Note:** Dependent on implementation specifics as determined by OEB

****Note:** Timelines begin from Ministry approval of OEB LTEP Implementation Plan

# 3b. OEB – LDC Efficiencies and Rates – Considerations

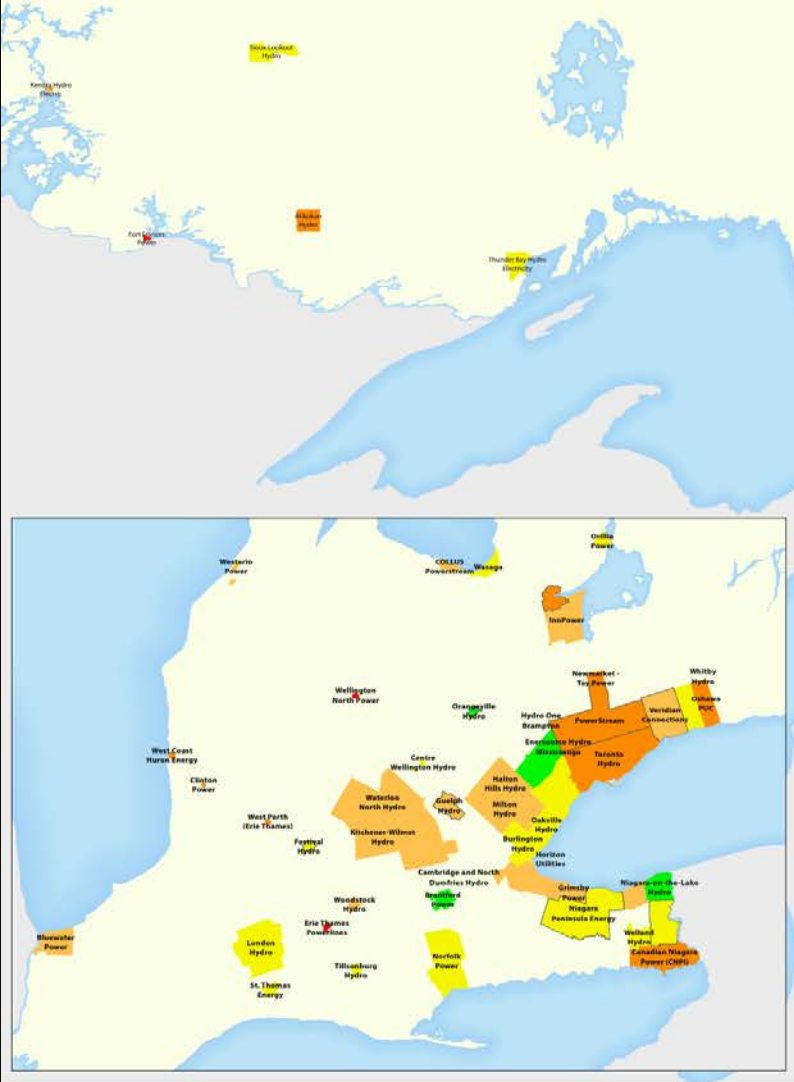
***Sector:***

- Exact bill reduction levels are unknown, but real OM&A and some capital cost avoidance can reasonably be expected.
- Could indirectly incent consolidation if LDCs feel they are unable to adequately manage their assets in light of tightening requirements.
- Any initiatives that have a direct impact on LDC profitability could affect the value of Hydro One.
- There is a tension between requiring productivity enhancements and creating firm performance standards. LDCs have to invest to maintain system levels, but also finding cost efficiencies, which is an incentive for innovation. The Ministry and the OEB may have to also explore reducing regulatory burden/barriers on LDCs so they have the tools available to satisfy new performance expectations.

***Regulatory:***

- The OEB is the electricity distribution sector's independent regulator and as such is responsible for establishing rate-setting mechanisms in line with its statutory objectives.
  - The Ministry would engage with OEB to align on approach, and provide only high-level direction so as to respect OEB's role in determining implementation specifics.
  - The OEB would likely need to conduct policy hearings and stakeholder consultations on these initiatives, though Ministry could request new rules be in place for next major LDC rate cycle.
- LDCs are resistant to peer comparison for a variety of historical and service territory issues. OEB econometric analysis has generally supported limiting peer comparisons. As comparisons would be an important component of benchmarking performance standards, the Ministry may experience sector pushback.
- Updating rate-setting mechanisms and regulatory processes could create regulatory uncertainty and limit LDC activity. The OEB has revised its processes multiple times over the past 15 years.

# LDC Distribution Rate Changes (2006 vs 2016)



| Total Dx Rate | 2006 | 2016 | % Rate Change |
|---|---|---|---|
| Hydro One UR (High Density) | $29.13 | $35.65 | 22.4% |
| Hydro One R1 (Medium Density) | $37.73 | $54.02 | 43.2% |
| Hydro One R2 (Low Density) | $44.65 | $76.14 | 70.5% |

## Legend

**LDC Rate Comparison 2006 vs 2016**

**% Total Rate Change ( # of LDCs )**

- -17.3% to 0% ( 5 )
- 0.1% to 15% ( 25 )
- 15.1% to 30% ( 21 )
- 30.1% to 60% ( 16 )
- 60.1% to 89.3% ( 4 )
- Merged LDCs

Below LDCs had either acquired or merged: (# of merged LDCs)

a. Powerstream Inc. ( 5 )
b. Chatham-Kent Hydro Inc. ( 13 )
c. Veridian Connections Inc. ( 4 )
d. Guelph Hydro Electric Systems Inc. ( 2 )
e. Festival Hydro Inc. ( 2 )
f. Orangeville Hydro Limited ( 2 )
g. Niagara Peninsula Energy Inc. ( 3 )
h. Peterborough Distribution Incorporated ( 3 )

*Only LDCs with distribution rates of 2006 and 2016 are shown.*
*Only the largest distribution areas are shown and smaller satellite areas are not all shown.*

*Strategic Network and Agency Policy Division,*
*Ministry of Energy*

0 30 60 120 180 240
Kilometers

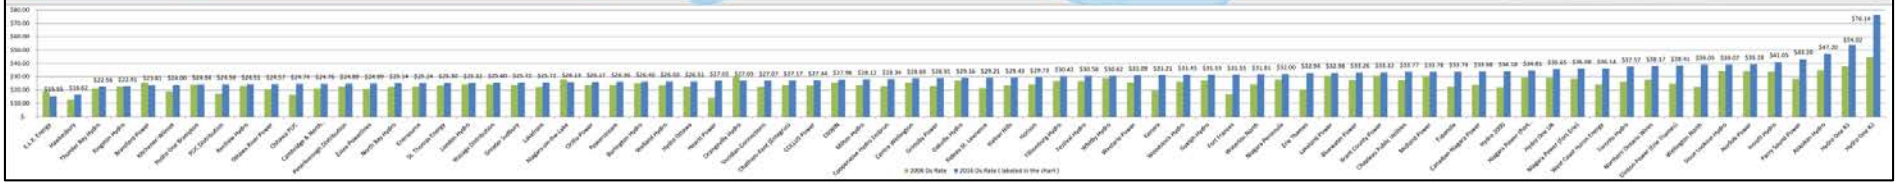
*Published December 2016*

## KEY FINDINGS

- In summary, distribution rates (including rate riders) have increased by about 24.5% across the Province, with significant variation between regions and LDCs (-17% to 148%).
- There is generally no correlation between LDC size or location and distribution rate increase in absolute or percentage terms.
- The current analysis shows no clear relationship between the percentage rate increase and the absolute rate level (that is, high rate increase LDCs may still have among the lowest rates, and low rate increases may have higher rates.
- No clear relationship between amalgamation and rates.
- The analysis does suggest that Hydro One has the highest rates, and some of their customers have seen higher than average rate increases.

## NOTES

- **Rate Calculation:** Monthly residential distribution bill rates, before taxes, are based on consumption of 750 kWh. Distribution charges account for approximately 23% of the average 2016 residential bill.
  All figures calculated by ENERGY staff without input from OEB.
- **Colours:** Colour coding of the map only depicts the change in LDC rate amounts (i.e. LDCs in red don't necessarily have the highest total rates).
- **Mergers:** Rates for customers in merged LDCs have experienced different levels of change. For merged entities, the largest LDC in 2006 was used. An accompanying map focuses on merged entities.
- **Points in Time:** Current analysis compares 2016 and 2006 only. Rates could have had an uneven trajectory, especially considering regulatory decisions such as time limited charges/rebates with temporary impacts.



# 3c. OPG – Operational Efficiencies

- Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh).

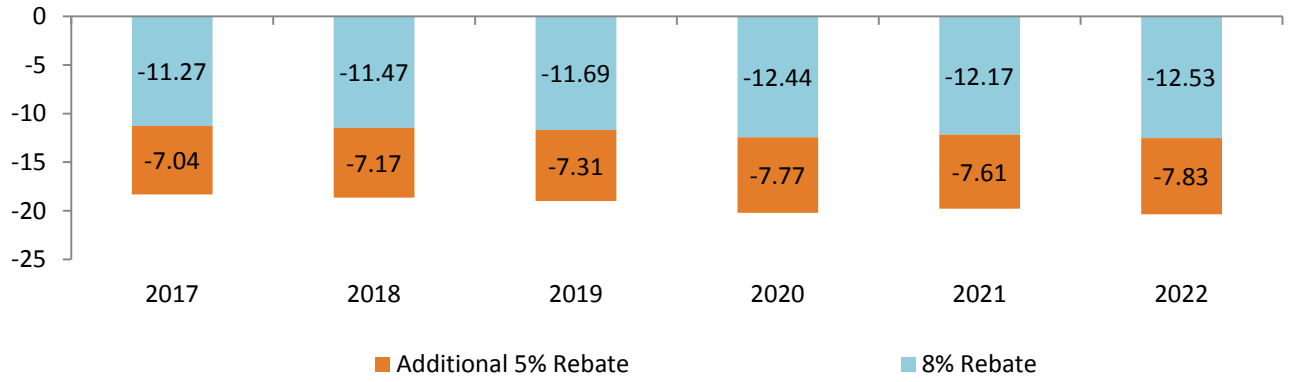
**Considerations**

- OPG recently submitted its 2017-19 business plan to the Province for concurrence. That plan includes the following:
  - Enterprise total generating cost increasing from $48/MWh in 2016 to an average of $55/MWh over the plan period.
  - An average residential monthly bill increases of $1.05/month annually from 2017-2021.
- Much of this increase is due to the Darlington refurbishment project, which increases costs and reduces OPG's generation over the planning period.
- OPG has also shared its stretch targets for total cost of generation, which average $52/MWh over the 2017-19 plan, a ~$3/MWh reduction (5-6%) relative to its $55/MWh business plan targets.
- The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This is a public document that OEB would likely review and incorporate as part of OPG's current rate application.
- Consistent with regulations under the *Ontario Energy Board Act*, OPG is seeking smoothed rates for nuclear as part of its 2017-2021 rate application.
  - As a result, the benefit to ratepayers of reducing generation costs is uncertain.
  - Given that the application extends beyond the business plan period, and to ensure OPG does not delay costs beyond the planning horizon, the Province may want to provide additional direction for out year expenditures.
- If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.
  - The total cost of $3/MWh based on OPG's forecast production of 74 TWh/yr is about $240 million per year.
- The Province could work with OPG to craft language in the concurrence letter in order to avoid setting unintended precedents for future rate application processes.

# 4. Enhanced Tax-Base RPP Rebate (5%)

- Enhancing the rebate by a further 5% on the amount before tax provides an average savings of about $7 each month or $84 annually for a typical residential electricity consumer.
- As of January 1, 2017, electricity consumers eligible for the Regulated Price Plan (RPP) receive an 8% rebate equivalent to the provincial portion of HST on their pre-tax bill.
- The eligibility criteria for the 8% rebate is as follows:
  - Consumers with a demand of 50 kW or less;
  - Consumers with a demand of 250,000 kWh/year or less;
  - Farms;
  - Multi-unit residential buildings and other facilities used as residential rental units;
  - Dwellings;
  - Condominiums; and
  - Co-operatives with housing units.

**Benefit for a Typical Residential RPP Consumer**
*in $/750-kWh month*



# 4. Enhanced Tax-Base RPP Rebate (5%) (cont'd)

**Considerations**

- Amendments would be required related to the *Ontario Rebate for Electricity Consumers Act, 2016.*
- The Act authorizes the making of regulations to reimburse electricity vendors for amounts credited to consumers' accounts under the Act. The Act authorizes the making of other regulations to put in place mechanisms needed to implement the financial assistance.
- The rebate could be made retroactive to January 1, 2017. Similar to the current 8% rebate, electricity consumers would receive a retroactive payment once the local distributor begins issuing the rebates if the distributor needs more time to adjust its billing systems.

**Fiscal Cost of an Enhanced Rebate**
*in $millions*

| Cost ($M) | 2016-2017 | 2017-2018 | 2018-2019 | 2019-2020 | 2020-2021 | 2021-2022 |
|---|---|---|---|---|---|---|
| **Cost of 8% rebate** | 271 | 1,119 | 1,086 | 1,171 | 1,159 | 1,208 |
| **Cost of 13% rebate** | 440 | 1,818 | 1,764 | 1,903 | 1,884 | 1,963 |
| **Cost of incremental 5% rebate** | 169 | 699 | 679 | 732 | 724 | 755 |

# Appendix

# Existing Rate Mitigation Programs – Overview

- There are a number of existing programs funded by electricity ratepayers that help mitigate electricity bills for some customers, each of which has a unique policy rationale.

- Programs such as the as the Rural or Remote Rate Protection (RRRP) program are targeted at all customers who face the highest delivery costs in the province, while others such as the Ontario Electricity Support Program (OESP), are income tested and targeted at the most vulnerable energy consumers.
  - These program are not mutually exclusive and a customer could receive both the RRRP and the OESP.
  - There are other programs that are still under development such as options for a First Nations Rate currently being developed by the OEB as per the request of the Minister of Energy. These options are ailed to alleviate high delivery costs for on-reserve indigenous consumers.

- There are opportunities to enhance each of these programs. However, if enhancements are funded through the electricity rate-base, while they would lower costs for eligible consumers, they would raise costs for all other ratepayers.

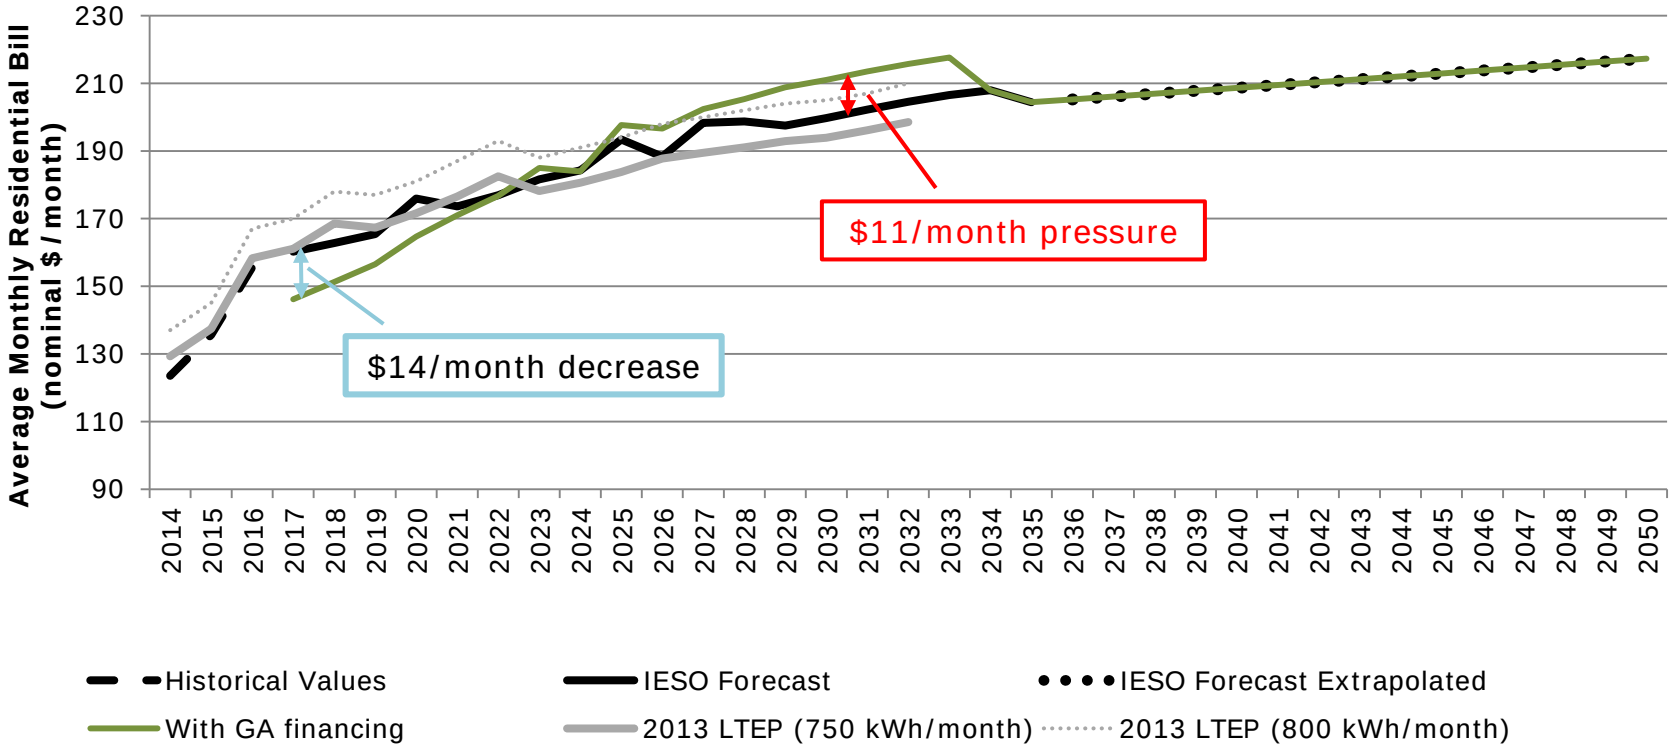
- Given that these programs focus on promoting equity between different area of the province (RRRP) or on social equity (OESP), they could be funded by the tax-base rather than the rate-base. This would allow their goals to be achieved and enhanced without increasing electricity rates. The following slides explore options to enhance each program using the tax-base.

# Global Adjustment (GA) Financing

- The global adjustment (GA) is comprised of costs for regulated and contracted generation, as well as conservation.
- Some contracted generation assets are expected to have a useful life that extends beyond the term of their current financial contracts (typically 20-years).
- Similarly, conservation costs are recovered through the GA on an annual basis while conservation initiatives provide benefits to the electricity system over the course of many years.
- Since the GA only includes costs related to the contractual life of these assets, there may be an opportunity to recognize the longer-term benefit of these assets to the electricity system and “bring forward” that benefit for ratepayers today, while deferring some of the current costs.
- An indicative GA financing proposal is presented that lowers ratepayers costs over the short term by borrowing money but increases costs over the long term when GA costs are forecast to be lower.
- **Note:** Not all generating assets will continue operations at the end of their contract term. Regulatory constraints (i.e., nuclear licences) or low demand conditions (i.e., as experienced with current expiring NUGs) would mean that some generators will shutdown at the expiry of their contract. Future ratepayers would be paying for these assets that are no longer producing power.

# Low / GA Financing – Impact on Residential Electricity Bills

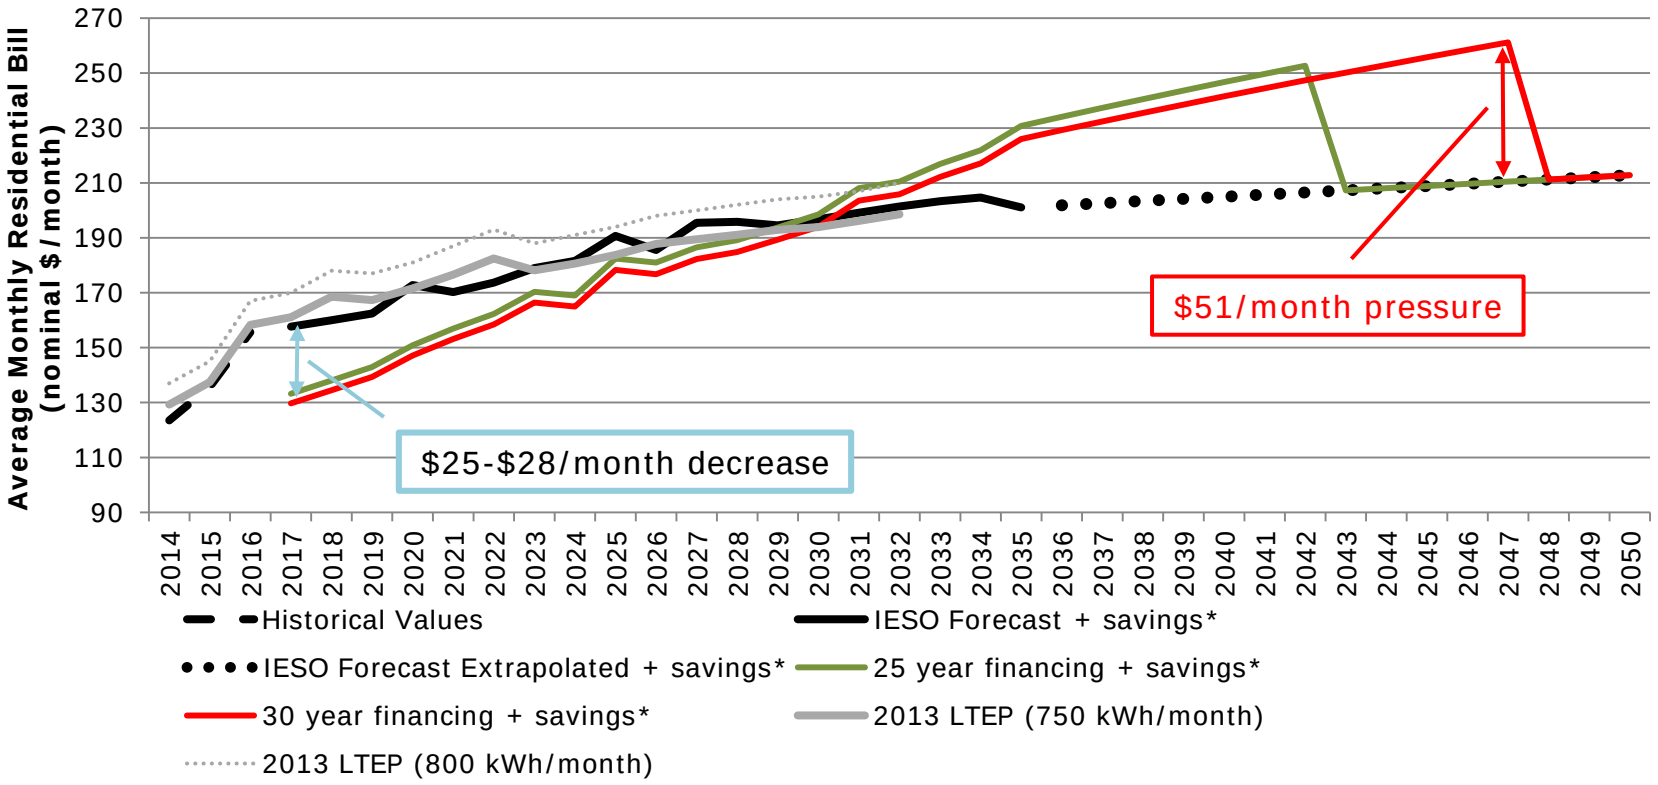
- In this option, the starting GA payment from all ratepayers in 2017 is lowered by $2.5 billion and increases at 2% each year – up to a cap of no more than $2 billion more than the true cost of GA in any year – until the borrowed money is paid back in 2032.



- By **borrowing up to $9.3 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $14/month** at the cost of **increased future electricity bills over 10 years of up to $11/month** above the true cost of electricity production.

# High / GA Financing – Impact on Residential Electricity Bills

- In this option, the starting GA payment from all ratepayers in 2017 is lowered by $4.4 and $5 billion and increases at 2% each year until the borrowed money is paid back over a 25 and 30 year financing period respectively.

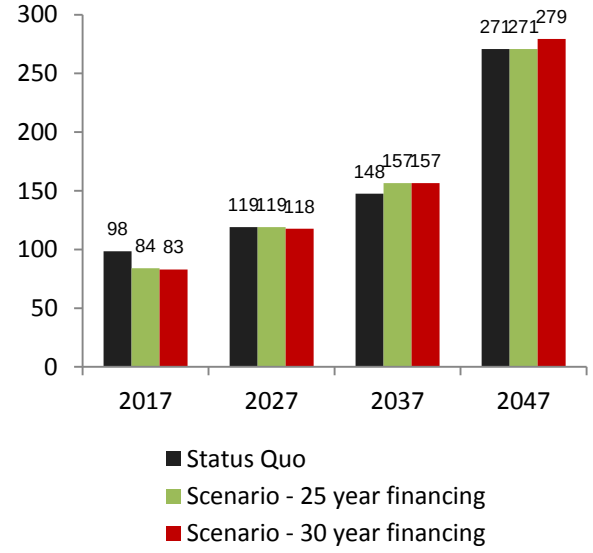


- By **borrowing up to $65 billion**, this scenario results in **a short-term residential electricity cost reduction of up to $25-$28/month** at the cost of **increased future electricity bills over 12-17 years of up to $46-$51/month** above the true cost of electricity production.

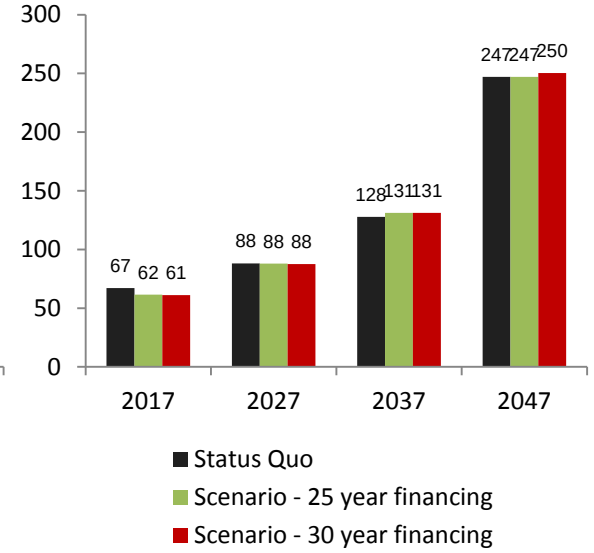
# GA Financing – Illustrative Impact for Large Industrial Electricity Consumers

- Below graphs illustrate the estimated impact under the moderate GA financing scenario for an average Class A electricity consumer, a consumer that pays low GA (i.e., pulp and paper) and high GA (i.e., refining and chemical manufacturing).

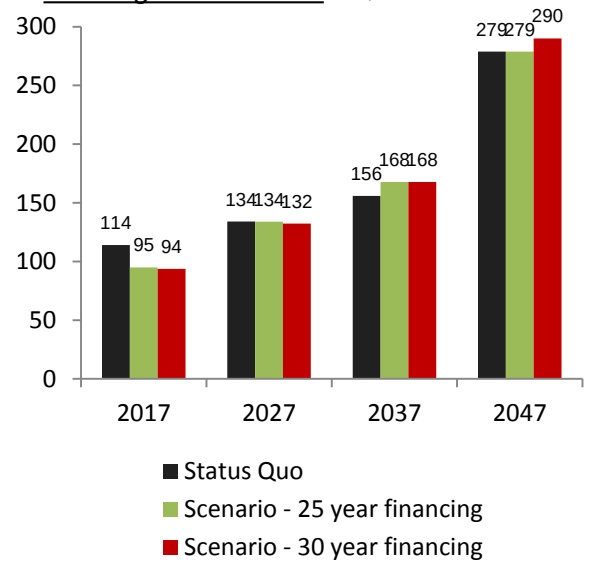
**Estimated All-In Electricity Price**
*for Average Class A in $/MWh*



**Estimated All-In Electricity Price**
*for Pulp & Paper in $/MWh*



**Estimated All-In Electricity Price**
*for Refining & Chemicals in $/MWh*



**Note:** Assumes that demand by industrial sector continues at average 2011-2015 levels.

# Extend Length of Existing Wind / Solar Contracts

- Wind and solar developments are typically contracted through standard offer procurements on 20 year fixed terms at fixed pricing.
- Many of these projects have already reached commercial operation.
- The province could explore options for IESO to negotiate extensions to existing renewable energy contracts, for example, by 10 years, in return for the contract holders agreeing to a lower price in the near term.

**Considerations**

- Projects in commercial operation offer potential for near-term rate reduction whereas projects that have yet to reach commercial operation provide potential to mitigate future rate increases only.
- The attractiveness of this option to contract holders would vary from project to project and would depend on project economics.
- Revised pricing would be subject to negotiation, and associated ratepayer savings would be difficult to forecast accurately.
- The duration of contract renegotiation is difficult to forecast and may not be achievable in the near term.
  - Proponents may have to renegotiate their project financing arrangements, ensure project investors are satisfied with any changes in ROI, and extend land leases.
- Project host communities and Indigenous communities whose traditional territory the projects are sited in may not be interested in these projects extending their operational period; discussions/consultation may be required in advance of this potential option moving forward.

# Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Should Ontario be successful in negotiating lower prices in the near term, it should be noted that contract holders will be in a strong bargaining position (given their existing fixed-priced contracts), and will likely extract additional value from the negotiations.

- The Province is not a party to the contracts and has never been involved in the negotiation of the contracts themselves. IESO would be required to renegotiate the contracts, which would likely involve a direction or directive to IESO.

- Further analysis is required as to how ENERGY could express its policy intent to have IESO renegotiate the contracts for a reduced rate at a longer term, however it is unlikely that IESO could guarantee the outcome.

- Further analysis is also required to ascertain whether there is scope within the existing contracts for IESO to renegotiate their terms in this manner.

- Extending contract terms may require investments in component replacement and additional operation and maintenance costs that developers would seek to recover under any renegotiated contract.

- Extending contract terms would reduce planned flexibility and increase the risk of overpayment as this existing capacity would now be contracted into the 2040s and not the 2030s.

# Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Ontario has over 4,500 MW of wind in commercial operation, with the vast majority being large scale (>500kW) developments.
  - This includes over 2,700 MW of large FIT 1 and GEIA wind projects representing 47 contracts (average size ~58 MW) and over 1,000 MW of solar projects representing 103 contracts.
- Below are two potential approaches to reducing ratepayer costs in the near term by extending contract terms at reduced prices. An illustrative example of a typical large wind project is used.
- **Example:** 100 MW FIT 1 wind project achieving Commercial Operation in 2014 (i.e., 17 years remaining on initial 20 year contract), assuming a 10 year contract extension negotiated at the LRP I low weighted average wind price of $64.5/MWh
  - (17 years @ $135/MWh + 10 years @ $64.5/MWh)
- **Potential Approach 1:** Provide a single new contract price that is the average of the lower extension price and the FIT contract price over the new contract term. The new price would be lower over a longer term.
  - **Illustrative Example:** New contract for 27 years at $129/MWh.
  - New contract price set to allow 10% rate of return over 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract (remaining term extended for 10 additional years) |
|---|---|---|
| Contract Cost (NPV 2017) | $550 Million | $582 Million |
| Average Monthly Ratepayer Impact Over First 5 Years | $0.03 savings | |
| Average Monthly Ratepayer Impact Over Remaining 22 Years | $0.02 increase | |
| Average Monthly Ratepayer Impact Over Entire 27 Year Contract | $0.01 increase | |

# Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- **Potential Approach 2:** Offer facilities a revised contract that extends terms and is structured to offer lower pricing in the initial contract years and higher pricing in the later years of the contract.
  - **Illustrative Example:** New contract for 27 years at $85.9/MWh over the first 5 years and $169/MWh over the remaining 22 years.
    - Price over first 5 years is LRP I weighted average wind price.
    - Price over remaining 22 years is set to allow 10% rate of return over entire 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract | |
|---|---|---|---|
| | | Initial 5 Years | Last 22 Years |
| Contract Cost (NPV 2017) | $550 Million | $632 Million | |
| Monthly Average Ratepayer Impact Over First 5 Years | $0.09 savings | | |
| Monthly Average Ratepayer Impact Over Remaining 22 Years | $0.07 increase | | |
| Monthly Average Ratepayer Impact Over Entire 27 Year Contract | $0.04 increase | | |

# Extend Length of Existing Wind / Solar Contracts (cont'd)

- Below are illustrative estimates of potential GA savings if all contracts for large FIT and GEIA wind and solar projects in commercial operation are renegotiated according to the approaches illustrated above.
- Estimates are for large (10 MW or greater) FIT 1 and GEIA wind and solar projects in commercial operation, totalling about 2,700 MW of wind and about 900 MW of solar capacity. A 10 year contract extension is assumed at a price of:
  - **For Wind:** LRP I low weighted wind price of $64.5/MWh
  - **For Solar:** LRP I low weighted solar price of $141.5/MWh

**Potential Approach 1:**

| | **Current Contracts*** | **New Extended Contracts** |
|---|---|---|
| Total Value (NPV 2017) | $22.9 Billion | $22.8 Billion |
| Average Annual Contract Value (First 5 Years) | $1.5 Billion | $1.3 Billion |
| *Figures assume projects remain operational after contract expiry at the LRP I low weighted price inflated to the year of contract expiry, as per OPO assumptions . | | |

**Potential Approach 2"**

| | **Current Contracts** | **New Extended Contracts** |
|---|---|---|
| Total Value (NPV 2017) | $ 22.9 Billion | $ 25.3 Billion |
| Average Annual Contract Value (First 5 Years) | 1.5 Billion | $1.0 Billion |

# Extend Length of Existing Wind / Solar Contracts (cont'd)

- Contract re-negotiations could be piloted with large wind and solar contract holders.
- For example, the top 5 contract holders by portfolio value (online projects 10 MW and larger) include:

| Contract Holder | Technology | # of Contracts | Capacity (MW) | Estimated Value (NPV 2017) |
|---|---|---|---|---|
| Samsung | Wind & Solar | 5 | 799 | $4.6 Billion |
| NextERA | Wind | 6 | 534 | $2.7 Billion |
| Pattern / Capital Power | Wind | 1 | 270 | $1.5 Billion |
| ENGIE | Wind | 4 | 265 | $1.2 Billion |
| Northland Power | Wind & Solar | 15 | 290 | $1.2 Billion |

# Other Options Considered – Typical Residential Electricity Consumer

| *$/750kWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| Conservation Funding Options | | | | | | | |
| a. Amortize Conservation Program Costs (15-Year Amortization) | 1.62 | 1.88 | 1.16 | 1.20 | 0.82 | 0.69 | Immediate |
| b. Fund Conservation Programs Through The Tax-Base | 3.47 | 3.83 | 3.17 | 3.35 | 2.84 | 2.90 | Immediate |
| Eliminate the Industrial Conservation Initiative (ICI) | 4.40 | 4.24 | 4.10 | 4.24 | 3.73 | 3.58 | Immediate |
| Cancel LRP I | - | - | TBD | TBD | TBD | TBD | Medium-Term |
| Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (e.g., Transmission upgrade, etc.) | - | - | - | 2.16 | 2.16 | 2.17 | Medium to Long-Term |
| Dedicate Departure Tax | 1.39 | 1.39 | 1.39 | 1.39 | 1.39 | 1.39 | Immediate |
| Give Residential Consumers More Rate Choices | - | - | - | - | - | - | n/a |
| Help Small Business Manage Their Electricity Costs (i.e., End DRC early for Class B electricity consumers)** | - | - | - | - | - | - | n/a |

**Note:** The above initiatives will provide similar benefits for non-RPP Class B electricity consumers. Proposal 1 assumes OESP participation of 50% and 5-year maturity. *Assessing the range of ratepayer impacts will be done through the LTEP development and implementation process in conjunction with the OEB. **Class B includes small-medium enterprises (SMEs).

# Options Considered – Average Industrial Electricity Consumers

| *$/MWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |

Hi Directors,

FYI - In case you don't have it, please attached the note that was shared with DMO back in December. In addition, I have attached the "Proposed Initiatives to Transform Ontario's Electricity Sector" deck with edits from your Branch last month.

Regards,
Gavin He

Subject: Fwd: Rate Mitigation

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,

Ron

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its deck.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC) which will provide a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017 for eligible small businesses, farms and residential consumers and has taken steps to expand the Rural or Remote Electricity Rate Protection program, expected to save eligible RRRP customers about $45 per month, when combined with OREC.

## COMMENTS

Energy's proposals generally involve shifting costs from the rate base to the tax base. While the subset of costed proposals may have a fairly limited residential rate payer impact (e.g. about $5-6/month for residential, less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost ($1 billion to $1.3 billion). Note these impacts are lower than those presented in an earlier deck ($1.3 billion to $1.9 billion). Energy also presents other proposals where costs and impacts are "TBD".

Over the past five years, the existing fiscally funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,225 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**Energy's Broad Policy Themes / Rationales**

A key theme / rationale cited by Energy is to no longer use rate-base to pay for "social programs" by shifting cost of OESP, RRRP and proposed First Nation Rate to tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments |
|---|---|
| Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility | • Significant fiscal exposure -- $0.4-0.45 bn at current levels, higher if enhanced. On-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. |
| Fund conservation programs through the tax-base for the remaining term of the existing CDM framework and transition costs to the new "green bank entity" over time | • Potentially significant fiscal impact – current program costs are about $0.45 bn<br>• Conservation programs do provide an electricity system benefits, but would now be fiscally-funded, so a cross-subsidisation from tax-base<br>• Accessing the cap&trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the diccal plan |
| Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term impact, unless TT funding displaces near-term, non-incremental projects coming onto service<br>• Could lower utility value, including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return |
| **E**nd the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers | • End of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end April 1, 2018.<br>• End of the DRC had previously been linked to retirement of residual stranded debt<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported |

**Detail on Proposals**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

<u>OESP & RRRP (Total of about $0.4 to 0.45 Billion/year</u>):

This would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and the Rural or Remote Electricity Rate Program (RRRP), to the tax base. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Energy notes that
  - The programs could provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility (e.g., by 50% in the table).
  - The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

<u>Fund Conservation Programs through the Tax-Base</u>:

This would be for the remaining term of the existing Conservation and Demand Management framework. Over time, the costs would be transitioned to the new "green bank entity", to shift cost recovery from ratepayers to cap and trade revenues.

- Energy's rationale for the cost shift would be in recognition of the burden borne by ratepayers in phasing out coal generation.

<u>Expanding the scope of the Trillium Trust to invest in energy infrastructure:</u>

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward.

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects,
  - in effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province as the income to the OEFC was fully offset by a reduction in ESDI resulting from reduced net income of Hydro One.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. [As the departure tax paid was fiscally neutral, OEFC's uplift was primarily the result of the related deferred tax benefit, as well as the s.50.3 benefit under the *Electricity Act, 1998*.]
- This would be a one-time measure, potentially spread out over a few years, and fiscal impact, as the departure tax amount was one-time.

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |
|---|---|---|---|---|---|
| OESP, RRRP, First Nation rate | | 398 | 419 | 433 | 447 |
| Conservation Programs through Tax Base | 110 | 450 | 450 | 450 | 450 |
| [Trillium Trust] | TBD | TBD | TBD | TBD | TBD |
| Departure Tax | | TBD | TBD | TBD | TBD |
| DRC removal for Class B | 110 | 450 | | | |
| **Proposed Program Total:** | **220** | **1,298** | **869** | **883** | **897** |
| | | | | | |
| OREC | 300 | 1,100* | 1,100* | 1,200* | 1,200* |
| Ending DRC | 330 | 330 | -- | -- | -- |
| NIERP | 120 | 120 | 120 | 120 | 120 |
| NOEC | 25 | 25 | 25 | 25 | 25 |
| OEPTC[2] | 450 | 460 | 470 | 481 | 481 |
| **Existing Program Total:[3]** | **1,225** | **2,005** | **1,715** | **1,826** | **1,826** |
| **TOTAL[3]** | **1,445** | **3,303** | **2,584** | **2,709** | **2,723** |

1. Based on forecasted numbers
2. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

3. Total would be significantly larger with the TBDs crystalized.

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector – Update

## Working Draft

December 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure (i.e., $35 billion+ investment in cleaner generation and $15.5 billion investment in Hydro One transmission and distribution systems).

- Ontario has taken a number of actions to lower electricity cost for all consumers by:
  - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).
  - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., competitive LRP, no new NUG contracting).

- Following the 2016 Throne Speech, actions were announced to further reduce electricity costs by:
  - Providing an 8%  per cent rebate ($11/month savings), updating RRRP ($45/month savings, combined with the 8% rebate), expanding ICI (up to one-third savings for participants), suspending the LRP II and the EFWSOP (up to $3.8 billion in cost savings) and recycling proceeds to industrial/ commercial consumers.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured,  the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP),  which provides an opportunity to consider a range of policy changes to  how the Ontario energy sector operates.

# Broad Policy Themes / Rationale

- No longer use rate-base to pay for social programs [despite the system benefit rationale] by shifting cost of OESP, RRRP and proposed First Nation Rate to tax-base.
- Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.
- Fund conservation programs through the tax-base for the remaining term of the existing CDM framework and transition costs to the new "green bank entity" over time. Costs would be shifted in recognition of the burden borne by ratepayers in phasing out coal generation.
- Expand the scope of the "Trillium Trust" beyond the Moving Ontario Forward initiative to make certain investments in energy infrastructure eligible for funding, such as remote electrification, large transmission projects, new or expanded interties ~~and expansion of natural gas to rural areas~~, etc. (note that expanding access to natural gas is already included under Moving Ontario Forward.)
- Empower energy agencies to increase cost effectiveness and improve efficiency by having – IESO modernize Ontario's electricity market through electricity market renewal initiatives, the OEB identify opportunities for future LDC cost reductions/efficiencies and work with OPG to find further efficiencies in operations and pass on savings to ratepayers.
- Give consumers more choice by allowing households to "opt into" a single rate plan as an interim measure as the Ontario Energy Board (OEB) develops more pricing options over time.
- Help small business manage their electricity costs and provide relief for cap and trade until proceeds recycling is fully operational by ending the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers.

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

| *$/750kWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| **Recommended Initiatives** | | | | | | | |
| 1. No Longer Fund Social Programs Through the Rate-Base (i.e., OESP, RRRP, First Nations rate) | 2.16 | 2.31 | 2.41 | 2.49 | 2.54 | 2.58 | Immediate |
| 2. Expand the OESP (i.e., 50% increase) | - | - | - | - | - | - | n/a |
| 3. Fund Conservation Programs Through The Tax-Base | 3.40 | 3.68 | 2.98 | 3.09 | 2.58 | 2.58 | Immediate |
| 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (e.g., Transmission upgrade, etc) | TBD | TBD | TBD | TBD | TBD | TBD | TBD |
| 5. Empower Energy Agencies to Increase Cost Effectiveness and Improve efficiency* | | | | | | | |
| a. IESO – Market Renewal | - | - | - | - | 1.00 | 1.03 | Long-Term |
| b. OEB – LDC efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| c. OPG – Operational efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| 6. Give Residential Consumers More Rate Choices | - | - | - | - | - | - | n/a |
| 7. Help Small Business Manage Their Electricity Costs (i.e., End DRC early for Class B electricity consumers)** | - | - | - | - | - | - | n/a |
| 8. Cancel / Adjust FIT | - | - | 0.13 | 0.13 | 0.14 | 0.14 | Long-Term |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| **Considered but not Recommended** | | | | | | | |

**Source:** Ministry of Finance, Energy

# Considerations / Outcomes

- The proposed initiatives provide the following opportunities to:
  - Lower the cost of electricity for all consumers;
  - Re-set how electricity programs and energy infrastructure is funded (i.e., shifting costs to the tax-base from rate-base);
  - Provide electricity consumers with greater choices (i.e., signal rate plan);
  - Provide system benefits (e.g., market renewal); and
  - Increase cost effectiveness and improve efficiency.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC) which will provide a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017 for eligible small businesses, farms and residential consumers and has taken steps to expand the Rural or Remote Electricity Rate Protection program, expected to save eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

A significant number of Energy's proposals ~~generally~~ involve shifting costs from the rate base to the tax base. While the subset of costed proposals may have a fairly limited residential rate payer impact (e.g. about $5-6/month for residential, less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost ($1 billion to $1.3 billion). Note these impacts are lower than those presented in an earlier deck ($1.3 billion to $1.9 billion). Energy also presents other proposals where costs and impacts are "TBD".

Over the past five years, the existing fiscally funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,225 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**Energy's Broad Policy Themes / Rationales**

A key theme / rationale cited by Energy is to no longer use rate-base to pay for "social programs" by shifting cost of OESP, RRRP and proposed First Nation Rate to tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments |
|---|---|
| **Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility** | • Significant fiscal exposure -- $0.4-0.45 bn at current levels, higher if enhanced. On-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. |
| **Fund conservation programs through the tax-base for the remaining term of the existing CDM framework and transition costs to the new "green bank entity" over time** | • Potentially significant fiscal impact – current program costs are about $0.45 bn<br>• Conservation programs do provide an electricity system benefits, but would now be fiscally-funded, so a cross-subsidisation from tax-base<br>• Accessing the cap&trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the diccal plan |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term impact, unless TT funding displaces near-term, non-incremental projects coming onto service<br>• Could lower utility value (share price) and impact fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return |

| | |
|---|---|
| | • In the case of projects located in First Nation territories it could have an upfront fiscal impact if Province is not able to amortize those projects (TBC with OPCD).<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a windfall. It was fiscally neutral, it represented revenue to OEFC and an expense to Hydro One.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. |
| **Empower Energy Agencies to Increase Cost Effectiveness and Improve Efficiency** | • IESO to modernize the electricity market through market renewal<br>• OEB to identify opportunities for future LDC efficiencies/rates<br>• OEB to work with OPG operational efficiencies and pass on to ratepayers |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding th Global Adjustment (GA) |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • End of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end April 1, 2018.<br>• End of the DRC had previously been linked to retirement of residual stranded debt<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant fiscal impact due to creation of large liability item (estimated to be up to $66Bn) either directly on the Province's books or upon consolidation<br>• Furthermore, likely entails significant legal / Constitutional Law risks. |

**Detail on Proposals**

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP (Total of about $0.4 to 0.45 Billion/year):

This would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and the Rural or Remote Electricity Rate Program (RRRP), to the tax base. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Energy notes that
  - The programs could provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility (e.g., by 50% in the table).
  - The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Fund Conservation Programs through the Tax-Base:

This would be for the remaining term of the existing Conservation and Demand Management framework. Over time, the costs would be transitioned to the new "green bank entity", to shift cost recovery from ratepayers to cap and trade revenues.

- Energy's rationale for the cost shift would be in recognition of the burden borne by ratepayers in phasing out coal generation.

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects,
  - in effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.

  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province as the income (revenue) to the OEFC was fully offset by a reduction in ESDI resulting from reduced net income (expense) of Hydro One.
- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase. [As the departure tax paid was fiscally neutral, OEFC's uplift was primarily the result of the related deferred tax benefit, as well as the s.50.3 benefit under the *Electricity Act, 1998*.]
- Having OEFC help implement this measure may require introducing changes to OEFC's objects as is legal mandate is to help reduce and pay down stranded debt.
- This would be a one-time measure, potentially spread out over a few years, and fiscal impact, as the departure tax amount was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
  - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
  - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
  - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
  - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.

**Commented [JK1]:** Not sure what exactly the single schedule system means...stayed away from mentioning as a result.

**Commented [JK2]:** http://www.ieso.ca/Pages/Participate/Stakeholder-Engagement/SE-114.aspx

- Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
- In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.

- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
  - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
  - If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of options to delay recovery of part of the Global Adjustment (GA) by debt financing and recovering over a 25 to 30 year period.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1:
  - Option 2:
  - Option 3:
  - Option4:
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact, such as having to book a large deficit amount.

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector – Update

## Working Draft

December 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure (i.e., $35 billion+ investment in cleaner generation and $15.5 billion investment in Hydro One transmission and distribution systems).

- Ontario has taken a number of actions to lower electricity cost for all consumers by:
  - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).
  - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., competitive LRP, no new NUG contracting).

- Following the 2016 Throne Speech, actions were announced to further reduce electricity costs by:
  - Providing an 8% rebate ($11/month savings), updating RRRP ($45/month savings), expanding ICI (up to one-third savings for participants), suspending the LRP II and the EFWSOP (up to $3.8 billion in cost savings) and recycling proceeds to industrial/ commercial consumers.

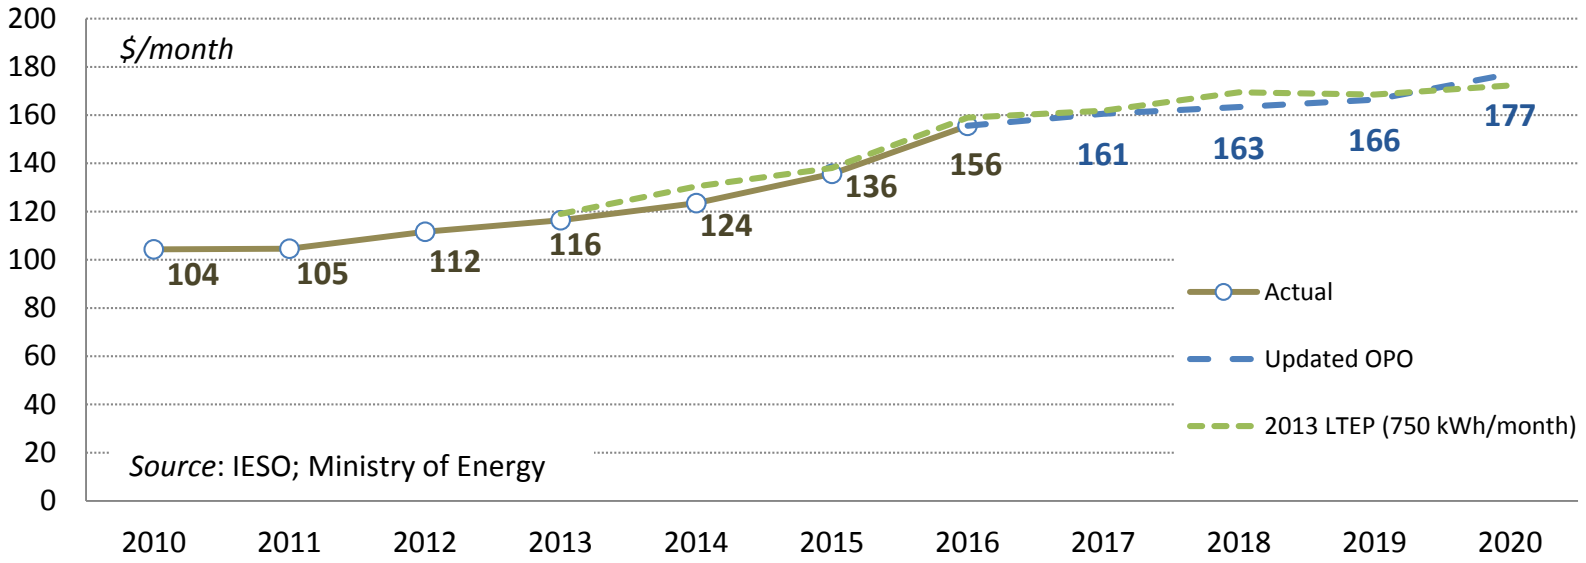
- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

# Electricity Prices – Residential

- Residential consumers electricity prices continue to be a concern for many Ontarians, particularly those that rely on electric heat.
  - **Note:** The typical residential bill is currently below the 2013 Long-Term Energy Plan (2013 LTEP) forecast.

**Typical Residential Electricity Bills**
*Historical and Forecast*



**Note**: The 2013 LTEP forecast for residential bills was based on 800 kWh/month without RRRP or electric heating; the above has been rebased to 750 kWh/month for comparison purposes. Typical residential are based on Toronto Hydro. The updated OPO forecast above includes the 8% rebate to offset the provincial portion of HST, ICI expansion and RRRP expansion.

# Broad Policy Themes / Rationale

- Support the continued reduction in the differential across distribution rates (as charged by Local Distribution Companies) across the Province through the potential enhancement of Rural or Remote Electricity Rate Protection, (RRRP). In order to not increase regulatory costs to customers as a result, this program can be moved to the tax-base.
- Provide a greater focus and support on lower income Ontarians by funding the Ontario Electricity Support Program (OESP) through the tax-base, as well as enhancing the support available through the program.
- Amortize electricity conservation and demand management (DM) programs over 15-years to provide lower costs for electricity consumers.
  - Alternatively, pay for conservation/DM programs through the tax-base and transition costs to the new "green bank entity" over time. Costs would be shifted in recognition of the burden borne by ratepayers in phasing out coal generation.
- Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding, such as remote electrification, large transmission projects, new or expanded interties and expansion of natural gas to underserved areas (i.e., rural and remote communities), etc.
- Empower energy agencies to increase cost effectiveness and improve efficiency by having – IESO modernize Ontario's electricity market through electricity market renewal initiatives, the OEB identify opportunities for future LDC cost reductions/efficiencies and work with OPG to find further efficiencies in operations and pass on savings to ratepayers.
- Give consumers more choice by allowing households to "opt into" an alternative rate plan, based on a flat electricity rate, as an interim measure as the Ontario Energy Board (OEB) develops more pricing options over time. Also give consumer greater transparency with respect to electricity costs by providing more details regarding the Global Adjustment (GA).
- Help small business manage their electricity costs and provide relief for cap and trade until proceeds recycling is fully operational by ending the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers, a benefit of $7/MWh.

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

Not included in chart is additional $18M/year to fund potential First Nations rate program through the Tax-Base.

# Existing Rate Mitigation Programs – Overview

- There are a number of existing programs funded by electricity ratepayers that help mitigate electricity bills for some customers, each of which has a unique policy rationale.

- Programs such as the as the Rural or Remote Rate Protection (RRRP) program are targeted at all customers who face the highest delivery costs in the province, while others such as the Ontario Electricity Support Program (OESP), are income tested and targeted at the most vulnerable energy consumers.
  - These program are not mutually exclusive and a customer could receive both the RRRP and the OESP.
  - There are other programs that are still under development such as options for a First Nations Rate currently being developed by the OEB as per the request of the Minister of Energy. These options are aimed to alleviate high delivery costs for on-reserve indigenous consumers.

- There are opportunities to enhance each of these programs. However, if enhancements are funded through the electricity rate-base, while they would lower costs for eligible consumers, they would raise costs for all other ratepayers.

- Given that these programs focus on promoting equity between different areas of the province (RRRP) or on social equity (OESP), they could be funded by the tax-base rather than the rate-base. This would allow their goals to be achieved and enhanced without increasing electricity rates. The following slides explore options to enhance each program using the tax-base.
  - These enhancements would also work in conjunction with the Ontario Energy Board's focus on reducing LDC costs outlined in option 6b.

# 1. Rural or Remote Rate Protection (RRRP) Expansion

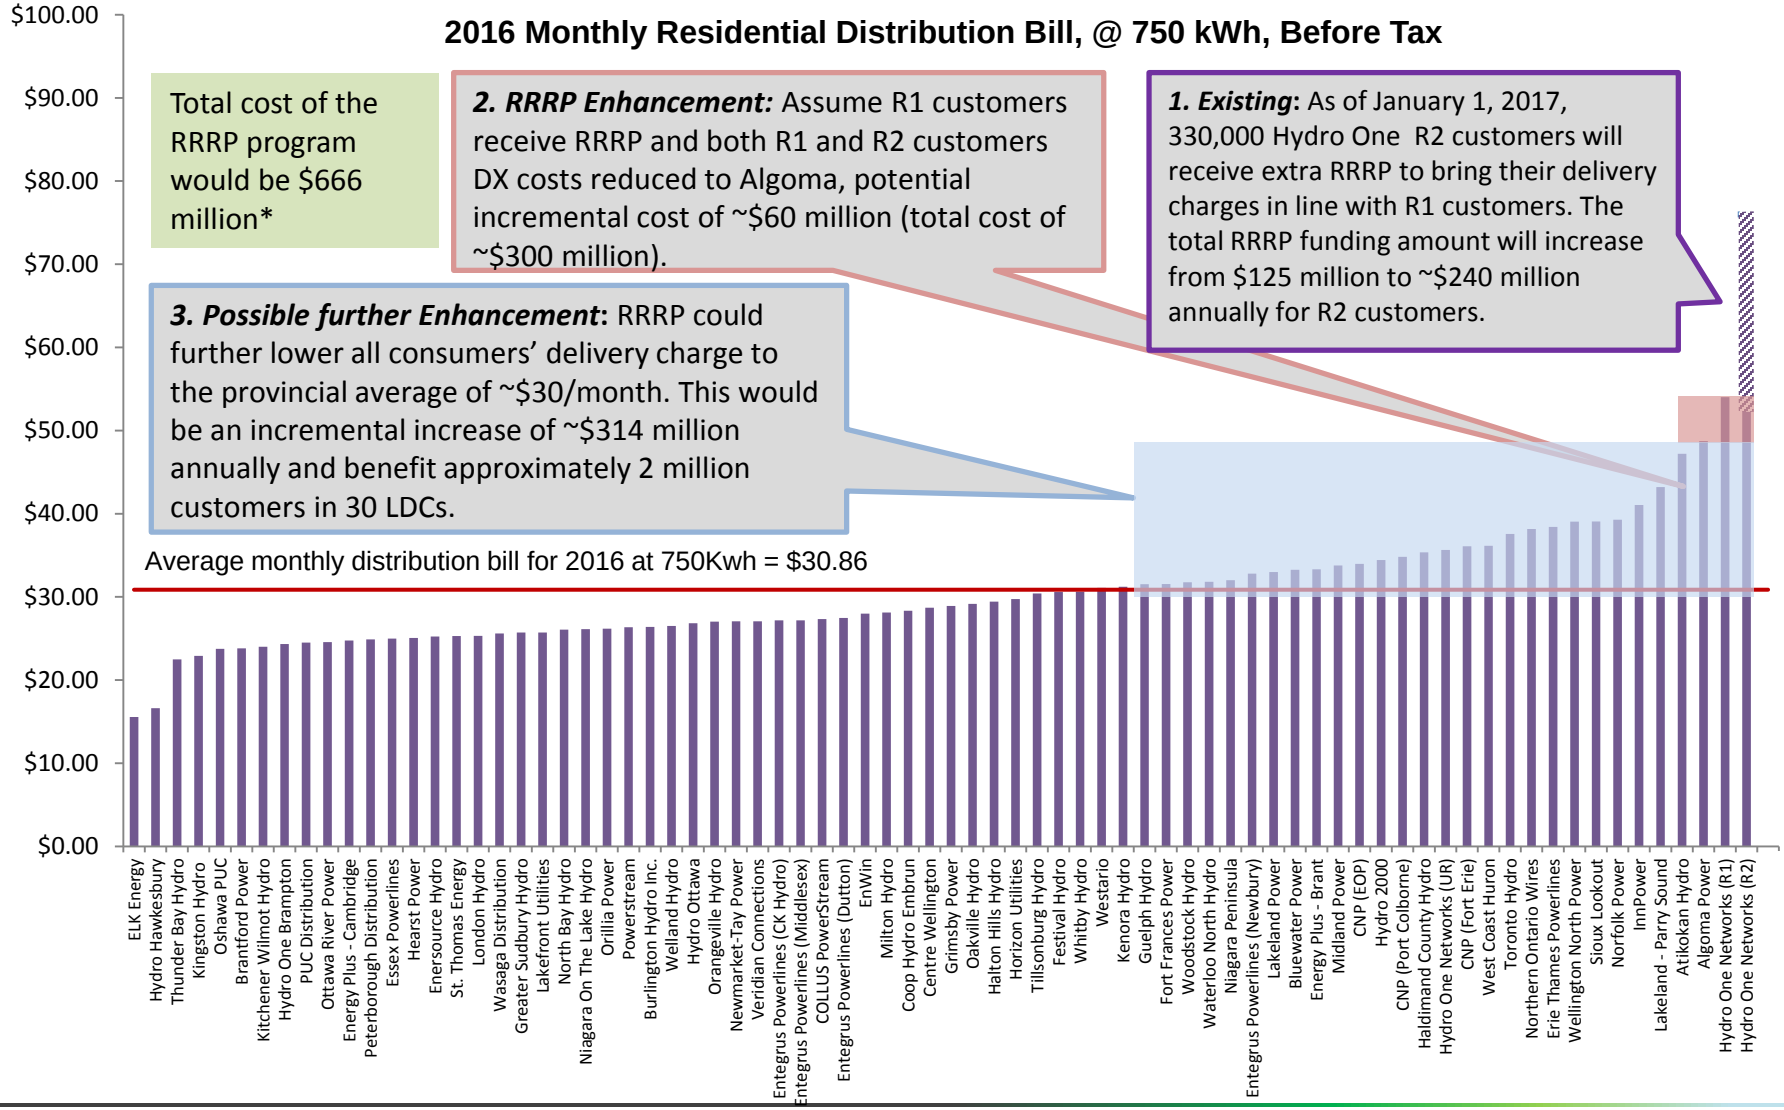
- The Rural or Remote Rate Protection (RRRP) program supports the most costly-to-serve distribution customers in Ontario. It is not income tested and most of the support goes to Hydro One's R2 (low density) rate class and remote communities.
  - Costs to these Hydro One customers are higher than average because of their relatively low density. The OEB mandates that they pay the full cost of service and in recent rate filings has asked Hydro One to ensure this through cost allocation studies.
  - To mitigate these costs, the RRRP was recently enhanced to help lower the bills of Hydro One's R2 customers to around those of its R1 (medium density) customers.
- Although other LDCs do not have medium- and high-density rates, there is a wide range of distribution costs between LDCs. The RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - Could be done on its own or as part of exploring an Ontario-wide uniform "postage stamp" delivery rate.

**Considerations**

- RRRP will be enhanced for R2 customers on January 1, 2017 to have their costs reduced to approximately R1 distribution costs levels. The RRRP could be further enhanced to include R1 customers, and have R2 and R1 customers reduce their costs down to Algoma (see next slide). This would cost $300 million in the first year (and would adjust year over year).
- If there was a desire to reduce costs for all LDCs, a simple average of distribution cost before tax, across all rate zones is $30.86 per month, for a residential customer consuming 750 kWh per month.** Bringing all delivery rates down to this average would cost approximately $500 million for the first year, with escalation in line with average distribution rate increases.
  - This assumes Hydro One R2 consume 1,200 kWh and H1 R1 customers consume 1,000 kWh per month.
- If all customers were brought down to the average costs (see the chart on the next slide for more detail):
  - It is assumed that residential customers with bills less than the provincial average see no change;
  - Majority of the enhanced benefit would go to Hydro One R1 and Toronto Hydro customers; and
  - Mechanism to ensure that LDCs continue to be motivated to achieve efficiencies would need to be designed (see section 4).
- Enhanced RRRP support may be best provided from the tax-base, because if funded from the rate-base, it would increase the costs for all customers who may argue that it is unfair that they are being asked to pay more to subsidize those in other LDCs.
- In conjunction with using the tax-base to reduce delivery charges to the provincial average, the OEB could be asked to explore moving to a province-wide "postage stamp" delivery rate that would be the same across the province to be implemented over time.
  - Could be "winners and losers" as delivery rates less than the average would go up in a postage stamp model;
  - A "postage stamp" model could help incent LDC consolidation.

**Note:** This is based on preliminary estimates and the amount will fluctuate on monthly consumption from customers and LDCs have different customer base with different consumption types.

# 1. Rural or Remote Rate Protection (RRRP) Expansion (cont'd)



*Note: this includes the ~$50M currently supporting Algoma Power and Hydro One Remotes.*

# 2a. Enhance Ontario Electricity Support Program (OESP) Benefit

- The OESP is an income-tested, application based program that lowers the electricity costs of the most vulnerable consumers by providing a rebate directly on their electricity bills. The OESP provides basic benefits to most consumers and enhanced benefits to Indigenous customers and customers with electric heat and medical devices and at launch, it was estimated ~560,000 families could be eligible and some 261,000 applications have been submitted.

- The OESP program benefits could be increased across the board by 50%, which would mean:
  - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
  - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).

- The OESP program could also be further enhanced by working to ensure the program uptake is as close as possible to 100%:
  - Streamlining the application process to make it easier and quicker to get through;
  - Putting in place a more aggressive communications strategy to make sure people are aware of the program;
  - Increasing funding for key partner agencies to work directly with individuals who are applying; and
  - Exploring automatic OESP qualification for those who receive provincial programs (e.g., ODSP).

**Considerations**

- If the OESP was funded by the tax-base, it could also be explored whether the OESP could be better delivered as a provincial program via the tax system. This may help ensure that the program's participation rate is as high as possible.
  - At the time of program design, advice was given that a 40-50% participation rate would be high for an application-based program delivered through electricity bills.
  - The province would need to work with LDCs if the rebate was to appear on electricity bills rather than be delivered via the income tax system (e.g., through the Trillium Benefit).

# 1 & 2a. Fiscal Impacts of RRRP, OESP and First Nation Rate

- Table below shows estimates of program costs up to 2022:

| Year | OESP ($M) | OESP + 50%($M) | RRRP($M) | RRRP Enhancement ($M) | First Nations Delivery Rate($M) | TOTAL RANGE ($M) (from status quo to OESP and RRRP enhancements) |
|---|---|---|---|---|---|---|
| 2017 | $108 | $162 | $292 | $374 | $18 | $418 to $846 |
| 2018 | $150 | $226 | $300 | $384 | $18 | $468 to $928 |
| 2019 | $186 | $279 | $306 | $394 | $18 | $510 to $997 |
| 2020 | $215 | $322 | $315 | $404 | $18 | $548 to $1,059 |
| 2021 | $243 | $365 | $322 | $415 | $18 | $583 to $1,120 |
| 2022 | $272 | $408 | $329 | $426 | $18 | $619 to $1,181 |

1) Ontario Electricity Support Program (OESP)
   - After almost a year in market, close to 30% of potentially eligible customers are signed up.
   - The cost projections above assume the program grows to 100% of eligible consumers by 2022 and remains at that level.
   - The second column forecast also assumes the existing credit amounts increase by 50%.
     - Forecast assumes 10% administration costs
     - Forecast does not account for the approximately 142,000 low-income households that OEB estimated are not eligible because they do not directly receive an electricity bill.

2) Rural and Remote Rate Protection (RRRP)
   - Provides benefits to R2 Hydro One consumers, Algoma, and remote communities.
   - Includes the expanded coverage that will begin on January 1, 2017.
   - Expansion to cap distribution rates for other customers is based at $374M and assumes escalation of 2.6% (historical average dx rate increase). This is a conservative estimate, as Hydro One and Toronto Hydro increases could drive program costs beyond the average increase.

3) First Nation rate reduction (currently under development)
   - On November 14, 2016, OEB presented options to the Ministry on reducing costs for on-reserve First Nation customers.
   - OEB's recommended option to provide 100% delivery rate credit, which is estimated at $18.4 million per year.
     - Other options includes a seasonal fixed credit to account for demand changes over the year ($13 million) or a 50% total bill reduction ($23 million).

# 2b. Expand OESP Eligibility

**Expanded Coverage**

- When OESP was being created, the OEB estimated that are 713,000 low-income households, of which 20% do not receive electricity bills. Thus, only 571,000 would potentially be eligible for OESP.
- If moved to the tax base, the OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity.

**Eligibility Categories**

- OESP has two credits amounts:
    1) Basic credit of $30-50 per month, based on the level of income and the number of residents.
    2) Enhanced credit of $45-75 per month for those with unique electricity needs:
        a) Electric heating,
        b) Indigenous customers, and
        c) Certain electrically intensive medical devices.
- The enhanced credit can be expanded to include additional eligibility categories of customers. For example, a new “Low Density Consumer” category could be introduced that provides Hydro One R2 customers (highest distribution rates) eligible for OESP the enhanced credit.

**Considerations**

- Potential costs for expanded coverage and new eligibility categories depend on updated estimates and changes to program design and delivery.
- There would be value in keeping the OESP as an income-tested program to distinguish it from other initiatives (e.g. RRRP, which is designed to address disparity between rural and urban distribution costs).

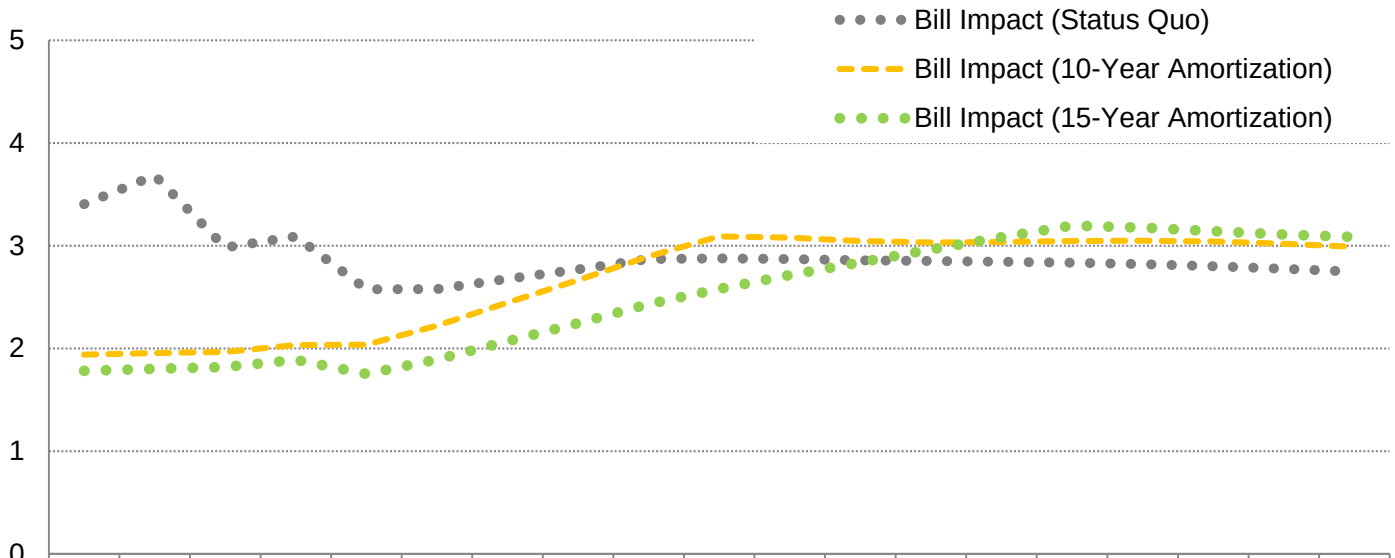
# 3a. Amortize Conservation Program Costs

- ~$3 billion from the electricity ratepayer base will be spent on conservation programs delivered under the Conservation First Framework (CFF) and the Industrial Accelerator Program (IAP) between 2015 and 2020.
- Currently, Conservation and Demand Management (CDM) program costs are recovered from the Global Adjustment (GA) mechanism about one month after expenses are incurred.
- As a potential rate mitigation measure, certain CDM costs could be amortized. This would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs).
  - The time period over which costs could be amortized would be over the lifetime of funded CDM measures.
  - ENERGY is working with IESO to determine the appropriate lifetime period – the graph on the next slide, which illustrates residential bill impacts, presents two cases: **10-year and 15-year measure lifetimes**.
- In both cases, amortizing a portion of conservation spending would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020. Over time the benefit would decrease and turn into a cost (higher electricity rates than would otherwise occur), as interest charges begin to grow. Estimated interest charges are as follows (a 3% interest rate is assumed; increases in interest rates could result in higher overall interest charges):
  - $712 million ($2016) – Amortizing eligible 2017-2035 CDM costs for 10-year period; and
  - $1.3 billion ($2016) – Amortizing eligible 2017-2035 CDM costs for 15-year period .
- Legislative changes would be needed to allow recovery of interest payments from ratepayers, or these costs could be recovered from the Consolidated Revenue Fund (CRF, or taxes).
- An alternative that could be explored would be to pay for CDM costs, or for a portion of these, from the tax-base (*see Appendix for more detail on tax funding option*).

# 3a. Amortize Conservation Program Costs (cont'd)

## Conservation Residential Bill Impact – Status Quo, 10-Year and 15-Year Amortization

***CDM Bill Impact ($/month)***



| | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 | 2031 | 2032 | 2033 | 2034 | 2035 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bill Impact (Status Quo) | 3.40 | 3.68 | 2.98 | 3.09 | 2.58 | 2.58 | 2.68 | 2.77 | 2.87 | 2.88 | 2.87 | 2.86 | 2.85 | 2.84 | 2.83 | 2.82 | 2.80 | 2.78 | 2.75 |
| Bill Impact (10-Year Amortization) | 1.94 | 1.95 | 1.97 | 2.03 | 2.04 | 2.22 | 2.45 | 2.67 | 2.90 | 3.09 | 3.08 | 3.05 | 3.03 | 3.04 | 3.04 | 3.05 | 3.04 | 3.02 | 2.99 |
| Bill Impact (15-Year Amortization) | 1.78 | 1.80 | 1.82 | 1.89 | 1.75 | 1.89 | 2.07 | 2.25 | 2.43 | 2.58 | 2.71 | 2.84 | 2.96 | 3.08 | 3.20 | 3.18 | 3.14 | 3.11 | 3.09 |

Source: IESO; Ministry of Energy

**Note**: Chart assumes that conservation incentive costs are available for amortization while administration cost are not. Although there is variable from year to year, incentives represent about two-thirds of conservation spending in Ontario. Chart assumes conservation spending continues at a similar rate beyond 2020. Chart assumes a 10 of 15-year borrowing rate of 3.0%.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- Under **Public Sector Accounting Board (PSAB) accounting standards**, used by both the Province and IESO, only certain assets can be amortized: 1) pensions and 2) tangible capital assets. Under PSAB an asset must meet several criteria to be considered a capital asset, including:
  - A tangible capital asset must be tangible and substantive and the Ontario government must have title and operate the asset.
  - A tangible capital asset must bring a tangible benefit to the government or to Ontario.

- CDM costs, on their own, do not meet the criteria of a tangible capital asset because customers would have ownership and control of installed CDM measures, not the Province or IESO.

- **Rate-regulated accounting** was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- If some of Ontario's CDM costs could be amortized, analysis shows that ratepayer impacts would be reduced in the short-term but interest charges on the loan would result in increased overall ratepayer costs in the longer-term.
- Legislative amendments would be needed to allow recovery of loan interest charges from GA.
- ENERGY staff have developed a note to seek an opinion from IESO's external auditor and from the Ontario Provincial Controller (OPC) to determine whether CDM costs could be amortized according to rate-regulated accounting standards.
- ENERGY is working with IESO to seek an opinion on the proposal from IESO's external auditor.
- ENERGY would then send the IESO external auditor's opinion along with ENERGY's explanatory note to the Ontario Provincial Controller (OPC) to seek a formal opinion on whether CDM costs could be amortized according to rate-regulated accounting standards.
- Further legal analysis would also be required to confirm legal viability and possible approaches to implementation.

# 3b. Rate Smoothing of Conservation Program Costs

- "Rate smoothing" could achieve the same rate reduction effect as amortization.
- Instead of taking out a loan to amortize conservation costs, a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Each year, IESO would defer recovery of a portion of annual conservation costs. Financing would also be required, such as from the OFA, to pay the interest on the deferral account. Interest would accrue on the deferred amounts, likely at the same rates as for the amortization option.
- Deferred costs could be recovered over any time period. If a 10 or 15 year-period was chosen, the rate impacts would be the same as in the amortization option.

**Considerations**

- Option would **not** require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open the Ministry to criticism by the Controller and/or Auditor General since the rate impact is the same.
- The Ministry would have more control under this option to change deferred amounts each year, as opposed to the terms set by a loan agreement under the amortization example.
- There is precedence to this approach for nuclear investments, which otherwise would result in volatile increases and decreases for Ontario ratepayers over the investment period. In 2015, the Ministry amended a regulation that requires the Ontario Energy Board (OEB) to set "smoothed" nuclear rates for OPG's Darlington and Pickering nuclear stations over a 20-year period.
  - The regulation allows OPG to defer recovery in rates of a portion of its nuclear revenue during the Darlington refurbishment (expected to be complete in 2026) and recover these deferred costs over the remaining ten years.
  - OPG will establish a "deferral account" to record the deferred amounts each year up to 2026 plus accumulated interest on the balance to reflect OPG's financing costs as a result of rate smoothing. The deferral account is then drawn down on a straight-line basis between 2026 and 2036.
- At minimum, new regulation would be required. However, further analysis is needed to determine the relevant regulation or legislation, to be amended for IESO (e.g., OEB regulation of IESO costs and fees, GA regulation for how IESO recovers its conservation costs from ratepayers).

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure

- Fund investments in specific energy infrastructure projects through the tax-base. **Note:** This could include the provincial portion of funding for the Remote First Nation Connection Project, a fund to support projects that improve adequacy and reliability in areas where new transmission would unlock economic growth and expansion of natural gas service to underserved communities.

**Considerations**

- Tax-base funding would allow for energy infrastructure to be built without impacting electricity and natural gas rates.
- Would require increasing the amount of funding committed to the Trillium Trust. All fiscal impacts from broadening Hydro One have been committed to the Trillium Trust $5.7 billion target and allocated to Moving Ontario Forward projects.
- There would be an ongoing fiscal impact from the amortization and funding of the investments. Where amortization is not possible there would be an upfront fiscal impact.

*Remote Connection Project:*

- Ontario ratepayers currently support costs of remote electricity service through RRRP on the order of $28 million/year
- Connecting 21 remote communities to the Ontario grid is supported by a positive business case due to diesel cost savings over time. If RRRP is funded through the tax base as proposed above, this project represents an opportunity to reduce impacts from RRRP.
- Direct investment in Ontario's portion of the capital costs of the project through a provincial fund (e.g., Trillium Trust) could also be considered along with mechanisms for cost recovery through transmission rates to refresh the fund as industry benefits from the transmission investment.
- The amount of investment and long-term savings depend on a federal contribution to the project and ENERGY is currently in discussions with Canada with the goal of concluding a cost-sharing agreement by spring 2017.
- A move to tax-based funding may have implications for cost oversight, since the OEB's mandate is to have oversight of ratepayer impacts. Alternative methods to review cost prudence of tax-based funding may be needed.

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (cont'd)

**Considerations (cont'd)**

*Transmission Projects to Enhance Economic Growth:*

- A tax-based fund could target investments in projects that have been identified in IESO regional plans and that would stimulate economic growth but are not proceeding due to cost barriers under the OEB's beneficiary pays principle. Investments could also target areas where the existing system poses challenges for delivering reliable service such as in parts of Northern Ontario with long single circuits.
- Potential opportunities for investment could include a transmission reinforcement in the **Greenstone area**, upgrades south of **Red Lake** and others TBD based on program design.
- This approach would allow a potion of project costs to be socialized to advance key projects without impacting rates or OEB's principles of cost allocation. Scope and scale of fund would be refined through program design.

*Natural Gas Expansion to Underserved Communities:*

- The Government has currently committed to expanding natural gas access to more communities in Ontario (i.e., $200 million Natural Gas Access Loan and $30 million Natural Gas Economic Development Grant).
  - Natural gas is an affordable heating source in Ontario. Its continues to be less expensive than alternative sources such as electric baseboards, heating oil and propane. For example, switching from oil to natural gas can save an average consumer an estimated $1,500 annually.
  - Increasing access to other energy sources such as natural gas, provides Ontarians with more options to meet their needs, reduce their energy costs and improve their quality of life.
  - Expansion of natural gas delivery infrastructure is widely supported in underserved communities (i.e., a recurring theme at ROMA) as a means to provide consumers and businesses in underserved communities with more affordable energy choices, attract new industry to Ontario and benefit agricultural producers.
- A grant program complements the Ontario Energy Board's recent decision enabling greater rate-based expansion to unserved areas, including rural and remote communities.
  - Applying Trillium Trust funding would make it possible to enhance the Grant Program and service more communities.

# 5. Dedicate Departure Tax

- In connection with the IPO, as a result of leaving the PILs regime and entering the corporate tax regime, Hydro One was deemed to dispose of its assets for proceeds equal to its fair market value, triggering a PILs liability of $2.6 billion (Departure Tax).
- This was paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt. The Province could explore repurposing some of those funds to the benefit of ratepayers.
- This may reduce the risk that the Ontario Energy Board (OEB) assigns to ratepayers the benefit from an associated tax asset, resulting in lower earnings and decreased share value for Hydro One. This decision is currently before the OEB, as part of Hydro One's Transmission rate application.
- If the Province were to transfer $2.6 billion in economic benefits to the rate base over 10 years suggest the following fiscal impacts (assuming 140TWh per year):
  - Residential Ratepayer Impact (if spread over 10 years): up to $1.39 per month on a typical bill; and
  - Industrial Ratepayer Impact (if spread over 10 years): up to $1.86 / MWh
- There would be no certainty that the OEB could still decide to allocate some or all of Hydro One's deferred tax benefit to ratepayers which would have fiscal impact (lower share price and lower net income over time).

**Considerations**

- Cost savings to ratepayers and associated fiscal impacts would depend on timing and which ratepayers (e.g., Hydro One customers, or all Ontario customers) will benefit from some or all of the $2.6 billion value.
- The departure tax was effectively a true-up for lower PILs payments from Hydro One in previous years – it was not a one-time windfall for the Province. In other words, it ensures that Hydro One paid all its tax obligations under the PILs regime before moving into the normal corporate tax regime.
- The related ~$2.4 billion fiscal benefit to the Province (from the deferred tax benefit) has already been credited to the Trillium Trust to be used to build infrastructure under Moving Ontario Forward.
- Repurposing funds paid to OEFC would ~~may~~ have an impact on the defeasance of electricity stranded debt and would cause the first increase in stranded debt since 2004.
- While this is a shift from messaging that value from the broadening of ownership of Hydro One is being used pay down debt and fund transit and transportation, the Province could link to electricity infrastructure investments (e.g., as an offset to ~~infrastructure investments already made in the sector, or to specific initiatives such as conservation~~).

# 6a. Empower Energy Agencies – IESO / Market Renewal

- Continue to move forward with IESO's Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2021, leading to a reduction of:
  - About $1/month or less than 1% at current retail prices for a typical residential bill; and
  - About $1.30/MWh at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.
- IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.

# 6b. LDC Efficiencies and Rates

- Reducing costs and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills.
  - Currently, LDCs recover costs through the Delivery line of the electricity bill, which is broken into Distribution and Transmission costs. LDCs are responsible for the Distribution costs of the electricity bill which account which account for about 20% of the total bill.
  - Distribution costs vary across the province as LDCs have different service territories and needs (e.g., geography, number of customers, density of customers, life/health of capital assets, etc). See next slide for more detail.
    - For example, comparing 2016 with 2006, distribution rates have increased by about 24.5% (or about 2.2% per year, compounded annually) across the Province, with significant variation between regions and LDCs (-17% to 148%). Overall consumer price inflation in Ontario for the same period increased by about 19% or 1.8% per year.

**Considerations**

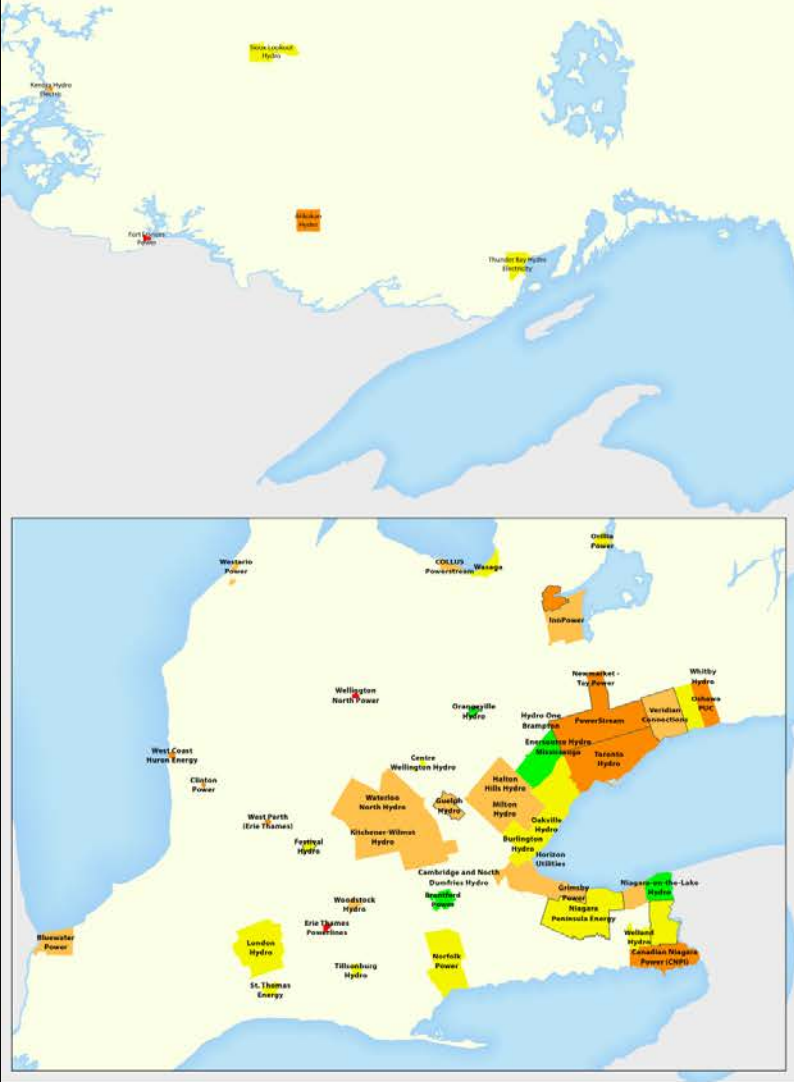
- The Ontario Energy Board (OEB) has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates. Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.

- There maybe opportunities to promote further cost reductions and performance improvements within the distribution sector as there is continued evolution of the regulatory framework in Ontario.
  - Tightening LDC requirements may also indirectly incent other desired policy outcomes, such as LDC consolidation and grid modernization to realize further cost reductions.
  - To further help address the costs associated with the Delivery line of the electricity bill, program such as the RRRP (previous slide) could be expanded to include other customers that may face higher costs.

- ENERGY could help promote or accelerate these efforts by asking the OEB through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and the 2017 Mandate Letter and other agency business planning processes.

- In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. The Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities. The panel recommended legislation to mandate consolidation.
  - Rather than mandating consolidation, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation. Further changes to the tax incentives and/or revisiting legislated consolidation could be considered.

# LDC Distribution Rate Changes (2006 vs 2016)



| Total Dx Rate | 2006 | 2016 | % Rate Change |
|---|---|---|---|
| Hydro One UR (High Density) | $29.13 | $35.65 | 22.4% |
| Hydro One R1 (Medium Density) | $37.73 | $54.02 | 43.2% |
| Hydro One R2 (Low Density) | $44.65 | $76.14 | 70.5% |

## Legend

**LDC Rate Comparison 2006 vs 2016**

**% Total Rate Change ( # of LDCs )**

- -17.3% to 0% ( 5 )
- 0.1% to 15% ( 25 )
- 15.1% to 30% ( 21 )
- 30.1% to 60% ( 16 )
- 60.1% to 89.3% ( 4 )
- Merged LDCs

Below LDCs had either acquired or merged: (# of merged LDCs)

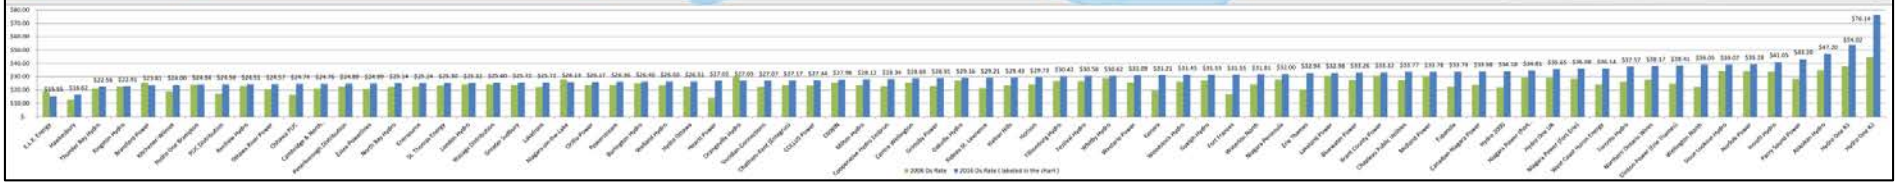
*Published December 2016*

## KEY FINDINGS

- In summary, distribution rates (including rate riders) have increased by about 24.5% across the Province, with significant variation between regions and LDCs (-17% to 148%).
- There is generally no correlation between LDC size or location and distribution rate increase in absolute or percentage terms.
- The current analysis shows no clear relationship between the percentage rate increase and the absolute rate level (that is, high rate increase LDCs may still have among the lowest rates, and low rate increases may have higher rates.
- No clear relationship between amalgamation and rates.
- The analysis does suggest that Hydro One has the highest rates, and some of their customers have seen higher than average rate increases.

## NOTES

- **Rate Calculation:** Monthly residential distribution bill rates, before taxes, are based on consumption of 750 kWh. Distribution charges account for approximately 23% of the average 2016 residential bill.
  All figures calculated by ENERGY staff without input from OEB.
- **Colours:** Colour coding of the map only depicts the change in LDC rate amounts (i.e. LDCs in red don't necessarily have the highest total rates).
- **Mergers:** Rates for customers in merged LDCs have experienced different levels of change. For merged entities, the largest LDC in 2006 was used. An accompanying map focuses on merged entities.
- **Points in Time:** Current analysis compares 2016 and 2006 only. Rates could have had an uneven trajectory, especially considering regulatory decisions such as time limited charges/rebates with temporary impacts.



# 6c. Empower Energy Agencies – OPG / Operational Efficiencies

- Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh).

**Considerations**

- OPG recently submitted its 2017-19 business plan to the Province for concurrence. That plan includes the following:
  - Enterprise total generating cost increasing from $48/MWh in 2016 to an average of $55/MWh over the plan period.
  - An average residential monthly bill increases of $1.05/month annually from 2017-2021.
- Much of this increase is due to the Darlington refurbishment project, which increases costs and reduces OPG's generation over the planning period.
- OPG has also shared its stretch targets for total cost of generation, which average $52/MWh over the 2017-19 plan, a ~$3/MWh reduction (5-6%) relative to its $55/MWh business plan targets.
- The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This is a public document that OEB would likely review and incorporate as part of OPG's current rate application.
- Consistent with regulations under the *Ontario Energy Board Act*, OPG is seeking smoothed rates for nuclear as part of its 2017-2021 rate application.
  - As a result, the benefit to ratepayers of reducing generation costs is uncertain.
  - Given that the application extends beyond the business plan period, and to ensure OPG does not delay costs beyond the planning horizon, the Province may want to provide additional direction for out year expenditures.
- If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.
  - The total cost of $3/MWh based on OPG's forecast production of 74 TWh/yr is about $240 million per year.
- The Province could work with OPG to craft language in the concurrence letter in order to avoid setting unintended precedents for future rate application processes.

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate

- OEB continues to move forward with its Regulated Price Plan (RPP) Roadmap:
  - The OEB is undertaking a comprehensive review of the RPP, including exploring the introduction of offering different pricing plan options for customers following the completion of pilot programs in 2018. The plan is expected to be implemented over a 3-5 year period.
- Until new pricing plans are available, the OEB could provide an "opt-in flat rate RPP" structure that could be made available to residential, farm and small business consumers on an interim basis (2-3 years) until a wider range of price plans are available, providing customers with pricing choice.
- Time-of-Use (TOU) pricing could also be introduced for non-RPP Class B consumers to reduce Global Adjustment (GA) volatility and reduce system costs.

| Current TOU | New Flat Rate |
|---|---|
| On: 18.0 ¢/kWh | 11.1 ¢/kWh |
| Mid: 13.2 ¢/kWh | |
| Off: 8.7 ¢/kWh | |

**Considerations**

- Would provide consumers with electricity pricing choice.
- The OEB has indicated that the option would lead to no overall change in system costs. Consumers with higher peak and mid-peak usage patterns would see a decrease in their electricity bills, while those with higher off-peak usage patterns would see an increase.
  - While the current strong supply conditions may allow for such an RPP structure (i.e., peak demand requirements can be easily met), administrative costs could be high (distributors would need to design/implement an opt-in process and associated billing system on an interim basis).

| | Current TOU | New Flat Rate |
|---|---|---|
| 1) Monthly electricity bill- higher peak and mid-peak usage patterns | $172 | $163 |
| 2) Monthly electricity bill- higher off-peak usage patterns | $152 | $163 |

***Note:** 1) assumes a consumer consumption pattern of 45%:30%:25% (Off-peak: Mid-peak: On-peak), while 2) assumes consumer consumption pattern of 80%:10%:10% (Off-peak: Mid-peak: On-peak). Estimates are based on OEB's online electricity bill calculator (for Toronto Hydro- November 2016 rates)

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate (cont'd)

**Considerations**

- The decision to undertake smart meter investments was partly justified on the basis of TOU pricing. If TOU pricing were to be made optional, some stakeholders could question the rationale for smart meter investments.
  - Rationale for offering a flat rate option could focus on providing customers with choice until new pricing plans are rolled out under the RPP roadmap.

- If a flat rate design is introduced, there could be significant consumer opposition to any return to a mandatory TOU.

- After the interim flat rate period, the OEB could offer a wider range of pricing plans to consumers.
  - As part of its RPP review, the OEB will be running pilots with LDCs to assess customer response to alternative time periods and pricing structures.
  - Learnings from these pilots will help inform potential changes to the RPP. Pilots are expected to be in market May 2017 and run for one year.

- Non-RPP Class B electricity consumers currently pay Global Adjustment (GA) on a volumetric basis. Moving them to TOU would provide an incentive to shift consumption to off-peak periods.
  - Consumers, including manufacturers, who are unwilling to shift would face higher costs and likely not be supportive of the changes.
  - The decision to pursue TOU pricing for non-RPP class B consumers will impact proceeds recycling as there is interplay between the two initiatives.

# 7b. Give Consumers More Rate Choices and Greater Transparency – Detailed Global Adjustment

- Provide electricity consumers greater transparency with respect to electricity generation costs by providing more details regarding the Global Adjustment (e.g., adding a line on hydro bills, quarterly energy reports, etc).

**Considerations**

- As electricity bills have increased, many consumers have complained about a lack of transparency on the drivers of electricity costs. In particular, consumers and legislative officers have singled out the GA.

- Providing consumers with additional information on the cost components and amounts recovered through the GA would help consumers understand how the different forms of electricity generation in Ontario contribute to consumers costs.

- Providing additional information to consumers on electricity commodity cost drivers without sufficient context or background could simply lead to increased complaints about particular generating technologies that make up large shares of costs (e.g., nuclear).

- Adding a breakout of the amount of GA on residential electricity bills could lead to further confusion due to the existing breakout of multiple time-of-use buckets.

- Alternatively, the existing quarterly Ontario Energy Report, which provides various energy sector data, could be leveraged to show a breakout of quarterly GA costs by fuel type. A link on electricity bills could point to this information.

# 8. Help Small Business Manage Their Electricity Cost – End DRC Early for Class B Electricity Consumers

- Propose to remove the $0.07/kWh Debt Retirement Charge (DRC) from the bills of commercial/small industrial Class B consumers beginning in 2017, instead of April 1, 2018.
  - **Note:** Class A consumers (e.g., large industrial) would continue to pay DRC until at least April 1, 2018.

**Considerations**

- For a Class B consumer currently paying about $152/MWh, removing the DRC would represent a savings of about 5%.
  - A 50% reduction in the DRC charge would represent a savings of about 2%.

- Alternatively, the reduction of the DRC could be to $0.035/kWh starting in 2017, to provide relief for cap and trade until proceeds recycling is fully operational.

- Residential consumers have had the DRC removed from bills since January 1, 2016. Taking DRC off commercial and small industrial bills would result in equal treatment for these groups of consumers.

- The savings for commercial and small industrial consumers associated with this proposal would drop to zero in April 2018, since this is the current planned date for removing the DRC from non-residential bills.

- Prior to moving forward with this proposal, additional analysis from Legal Services and the MOF would be needed.

# 9. Extend Length of Existing Wind / Solar Contracts

- Wind and solar developments are typically contracted through standard offer procurements on 20 year fixed terms at fixed pricing.
- Many of these projects have already reached commercial operation.
- The province could explore options for IESO to negotiate extensions to existing renewable energy contracts, for example, by 10 years, in return for the proponents agreeing to a lower price in the near term.

**Considerations**

- Projects in commercial operation offer potential for near-term rate reduction whereas projects that have yet to reach commercial operation provide potential to mitigate future rate increases only.
- The attractiveness of this option to contract holders would vary from project to project and would depend on project economics.
- Revised pricing would be subject to negotiation, and associated ratepayer savings would be difficult to forecast accurately.
- The duration of contract renegotiation is difficult to forecast and may not be achievable in the near term.
  - Proponents may have to renegotiate their project financing arrangements, ensure project investors are satisfied with any changes in ROI, and extend land leases.
- Project host communities and Indigenous communities whose traditional territory the projects are sited in may not be interested in these projects extending their operational period ; discussions/consultation may be required in advance of this potential option moving forward.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Should Ontario be successful in negotiating lower prices in the near term, it should be noted that contract holders will be in a strong bargaining position (given their existing fixed-priced contracts), and will likely extract additional value from the negotiations.

- Since the Minister of Energy is not a party, IESO would be required to renegotiate the contracts, which would likely involve a direction or directive to IESO.

- Further analysis is required as to how ENERGY could express its policy intent to have IESO renegotiate the contracts for a reduced rate at a longer term, however it is unlikely that IESO could guarantee the outcome.

- Further analysis is required to ascertain whether there is scope within the existing contracts for IESO to renegotiate their terms in this manner.

- Extending contract terms would also reduce planned flexibility and increase the risk of overpayment as this existing capacity would now be contracted into the 2040s and not the 2030s.

- Extending contract terms may require investments in component replacement and additional operation and maintenance costs that developers would seek to recover under any renegotiated contract.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Ontario has over 4,500 MW of wind in commercial operation, with the vast majority being large scale (>500kW) developments.
  - This includes over 2,700 MW of large FIT 1 and GEIA wind projects representing 47 contracts (average size ~58 MW) and over 1,000 MW of solar projects representing 103 contracts.

- Projects over 500 kW would offer the most savings potential as they represent the majority of installed renewables capacity and are spread across fewer contracts.

- Below are two potential approaches to reducing ratepayer costs in the near term by extending contract terms at reduced prices. An illustrative example of a typical large wind project is used.

- **Example:** 100 MW FIT 1 wind project achieving Commercial Operation in 2014 (i.e., 17 years remaining on initial 20 year contract), assuming a 10 year contract extension negotiated at the LRP I low weighted average wind price of $64.5/MWh;
  - (17 years @ $135/MWh + 10 years @ $64.5/MWh)
  - **Potential Approach 1:** Provide a single new contract price that is the average of the lower extension price and the FIT contract price over the new contract term. The new price would be lower over a longer term.
  - **Illustrative Example:** New contract for 27 years at $129/MWh.
  - New contract price set to allow 10% rate of return over 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract (remaining term extended for 10 additional years) |
|---|---|---|
| Contract Cost (NPV 2017) | $550 million | $582 million |
| Average Monthly Ratepayer Impact Over First 5 Years | $0.03 savings | |
| Average Monthly Ratepayer Impact Over Remaining 22 Years | $0.02 increase | |
| Average Monthly Ratepayer Impact Over Entire 27 Year Contract | $0.01 increase | |

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- **Potential Approach 2:** Offer facilities a revised contract that extends terms and is structured to offer lower pricing in the initial contract years and higher pricing in the later years of the contract.
  - For example, the New contract is $85.9/MWh over the first 5 years and $169/MWh over the remaining 22 years.
    - Price over first 5 years is LRP I weighted average wind price.
    - Price over remaining 22 years is set to allow 10% rate of return over entire 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract | |
|---|---|---|---|
| | | Initial 5 Years | Last 22 Years |
| Contract Cost (NPV 2017) | $550 million | $632 million | |
| Monthly Average Ratepayer Impact Over First 5 Years | $0.09 savings | | |
| Monthly Average Ratepayer Impact Over Remaining 22 Years | $0.07 increase | | |
| Monthly Average Ratepayer Impact Over Entire 27 Year Contract | $0.04 increase | | |

# 10. Tax Relief for Solar and Wind Contracts

- In 2010 and 2011 Ontario procured large scale projects (>500 kW) through the FIT program at standard offer pricing.

- The FIT program was the centerpiece of the GEA which established the economic and social goals of growing the green economy, including establishing a local renewable energy manufacturing base, supporting the development of green energy jobs, and providing incentives for Indigenous participation.

- To help achieve these economic and social goals, the FIT program offered pricing at above competitive procurement rates, and provided Indigenous and Community participation adders, which resulted in economic benefits to all Ontarians, but resulted in additional costs borne by Ontario's electricity ratepayers.

- Ontario could fund the added cost of some or all of these economic and social incentives by shifting their costs from the rate-base to the tax-base.
    1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
    2. The tax base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT.

**Considerations**

- If applied to projects in commercial operation the benefit to the ratepayer would be immediate.
- Comparing FIT pricing to competitive procurement pricing could provide a reasonable representation of energy procurement without the added cost of economic and social incentives.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
   - For example, from 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
   - The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
   - If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
   - The $3.3 billion difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.
   - This represents estimated average ratepayer savings of $1.50/ month relative to OPO forecasts.
   - The same approach could be considered for solar projects however, prior to LRP I in 2016, Ontario had not procured solar capacity competitively and international cost comparisons are challenging given differences in regional development costs.
   - This example does not include the value of participation price adders available for community and indigenous participation.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

2. The tax-base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT 1 solar and wind projects.

   - For example, 17 large FIT 1 wind and solar projects have Indigenous and/or Community participation making them eligible for a price adder in addition to their base contract price.

   - The estimated value of these price adders is approximately $17.1 million (NPV 2017) over the expected remaining term of their contracts.

   - This represents estimated ratepayer savings of approximately $0.01/month relative to OPO forecasts.

# Key Outcomes / Next Steps

- The proposed initiatives provide the following opportunities to:
  - Provide a greater focus on vulnerable consumers by funding electricity support programs through the tax-base.
    - Enhance existing and new support programs targeted at the most vulnerable consumers (i.e., OESP and RRRP); and
    - Better harmonize delivery rates across the province.
  - Re-set how energy infrastructure is funded by shifting costs to the tax-base from the rate-base.
  - Provide electricity consumers with greater choices and transparency (e.g., alternative rate plan based on a flat electricity rate, unpacking the Global Adjustment costs, etc);
  - Provide system benefits (e.g., market renewal);
  - Increase cost effectiveness and improve efficiency; and
  - Lower the cost of electricity for all consumers.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require legislative and/or regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

# Appendix

A. Rural or Remote Rate Protection (RRRP) – Overview and Enhancements
B. Fund Conservation Programs Through the Tax-Base
C. Eliminate the Industrial Conservation Initiative (ICI)
D. Cancel Large Renewable Procurement I (LRP I)

# A. RRRP Overview and Enhancements

- The Delivery line of the electricity bill is composed of Distribution and Transmission Costs. While transmission costs are uniform across the province, LDC costs vary by distributor and account for about 20% of the total bill for the electricity customers.
  - See slide X for a map of delivery rate increases between 2006 and 2016.
- The Rural or Remote Rate Protection (RRRP) framework was put in place in 2001 to help offset the higher costs to distribute electricity to Ontario residents who live in rural or remote locations.
- RRRP is available to: residential Hydro One R2 customers (~350,000 customers), Algoma Power customers (~11,600 customers); H1 remote customers (~3,500 customers).
  - To date, R2 customers receive a fixed amount of $125 million a year distributed amongst the customers. Algoma and Remote customers have RRRP calculated by the OEB each year that fluctuates based on average provincial distribution increases.
- Because the amount had been fixed for over a decade, the Province recently increased funding of the RRRP program for Hydro One R2 customers from $125 million to $240 million. This will be effective as of January 1, 2017, and will bring their delivery charges in line with the next highest charges from Hydro One's R1 customer class.

# B. Fund Conservation Programs Through the Tax-Base

- Propose to fund 2017-2020 electricity conservation and demand management program costs* using tax dollars instead of ratepayer dollars.
  - Funds received through the Hydro One Departure Tax could potentially be repurposed towards this.
- Total remaining 2017-2020 electricity conservation program costs are expected to be ~$2.1 billion.
- Post 2020, this option could evolve to funding conservation programs through the Greenhouse Gas Reduction Account.

**Considerations**

- Electricity conservation programs provide a number of benefits to society, however, Ontario's ratepayers have been covering these costs:
  - Avoiding/deferring future energy infrastructure investments, reducing disruption in communities (e.g., avoiding the need to build new natural gas generation);
  - Environmental benefits (e.g., reduced natural gas peaking generation and GHG emissions); and
  - Social and economic benefits (e.g., job creation and assistance managing electricity bills).
- There is precedence for using tax dollars to fund conservation programs.
  - Between 2007 and 2011, Ontario funded the Home Energy Savings retrofit program using tax dollars.
- Funding conservation programs though the tax-base is expected to result in a benefit of $3.40/month for residential electricity consumers in 2017. This could provide immediate short term relief to consumers while other rate mitigation initiatives are developed (e.g., market renewal, LDC efficiencies).

*** Note:** This includes costs towards the Conservation First Framework, Industrial Accelerator Program, Demand Response and the Conservation Fund)

# C. Eliminate the Industrial Conservation Initiative (ICI)

- The cost shift from the Industrial Conservation Initiative (ICI) could be removed from electricity bills by eliminating ICI.
  - The ICI allows large electricity consumers to lower their electricity costs by reducing their demand during peak hours.

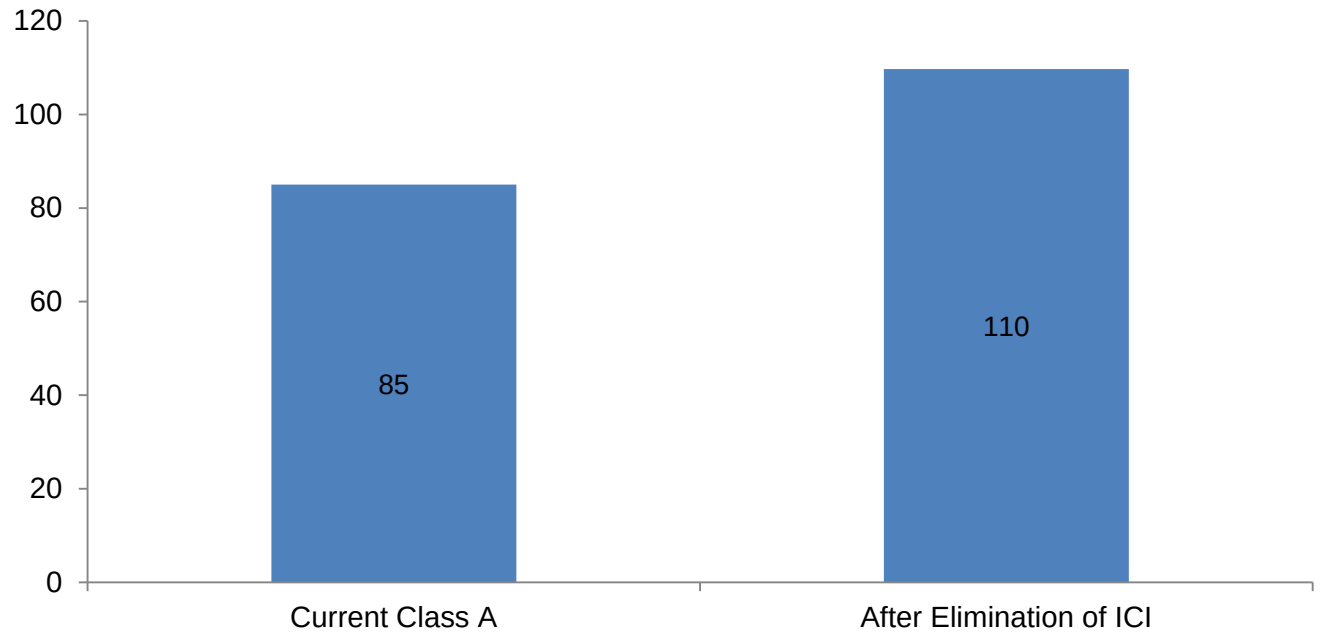
**Considerations**

- Eliminating ICI would result in a benefit of more than $4/month for residential electricity consumers in 2017.
  - However, unless government took action to mitigate the associated cost shift back to industrial consumers, typical industrial prices would increase by about one-third. Such a price increase would pose significant challenges for energy-intensive consumers.
- Industrial stakeholders have indicated that ICI as an integral factor in maintaining competitiveness and retaining industry in the province.
  - Eliminating ICI would limit the “cost shift” onto residential consumers, but it would also lead to a reduction in industrial demand. The large industrial contribution to the fixed costs of running the electricity system would then need to be covered by remaining consumers.
- If ICI is retained, current IESO projections indicate that the cost shift will decrease each year going forward as Global Adjustment (GA) decreases (due to an expected increase in HOEP).
- Alternatively, ICI could be funded through the tax-base at a cost of $900 million annually. There is precedent to use the tax-base for industrial support programs, including the Northern Industrial Electricity Rate Program (NIERP) and the Jobs and Prosperity Fund.

# C. Eliminate the Industrial Conservation Initiative (cont'd)

- ICI currently provides a benefit of about $25/MWh to Class A electricity consumers.

**All-In Electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer.

# D. Cancel/Adjust Renewable Energy Procurements

- The Ministry could consider the following actions to further mitigate future impacts to electricity bills:

| Unallocated/Terminated Capacity | Announced Procurements | Executed Contracts |
|---|---|---|
| A. Do not procure unallocated or terminated capacity | B. Revise FIT 5 target | D. Cancel LRP I contracts |
| | C. Cancel FIT 6 | |

**Overarching Considerations**

- Cost savings associated with reducing or cancelling renewable energy procurements and programs will not reduce current electricity bills, but would result in future cost reductions relative to Ontario Planning Outlook forecasts.
- The IESO estimates implementing options A to C will reduce system costs by approximately $592 million ($2016) between 2019 and 2028, resulting in an average of approximately $0.50/month in savings to a typical residential electricity bill over the same period.
- The microFIT program is winding down end of 2017. Annual microFIT procurement targets have been undersubscribed.
- With a few exceptions (e.g. rollover of unallocated microFIT capacity; addition of terminated microFIT and small FIT capacity to FIT 5), plans for unallocated or terminated capacity are not defined in announcements or existing directions.

*Cancel/Adjust Announced Procurements:*

- Amendments to existing directions to IESO would be required to reduce FIT 5 and cancel FIT 6.
- The FIT 5 procurement is underway with a base target of 150 MW and inclusion of any capacity available from contract terminations under prior small FIT and microFIT procurements. The application window closed on November 25, 2016.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts

*Cancel Existing LRP I Contracts:*

- 16 LRP I contracts (approx. 455 MW) have been executed and projects are under development.
- None have met Key Development Milestones. Total value of LRP I estimated at approx. $1 billion (NPV to 2016).

**Considerations**

- To help inform a decision, IESO or OEB could be asked to evaluate and provide guidance to the Ministry on the system need for LRP I projects and potential ratepayer impacts/benefits.
- 13 of 16 LRP I contracts have Indigenous participation. Cancelling LRP I contracts would remove this economic development opportunity and likely damage relationships between Indigenous communities and the government.
- LRP I Contract includes an “Optional Termination” provision allowing IESO to terminate any contract prior to the “Commercial Operation Date” with 6 months written notice.
- The IESO obligations under the Optional Termination provision depend on whether the project has met all “Key Development Milestones”.
  - As no projects have met their Key Development Milestones, the estimated total cost payable to contract holders is about $8 million.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts (cont'd)

**Legal Analysis**

- Any new directive to cancel LRP I contracts would need to be approved by Cabinet, either as part of an LTEP implementation directive to IESO, or pursuant to the overall power to direct IESO with respect to procurements.
  - An amendment to an existing direction would not require Cabinet approval, however, further analysis is required to determine if direction to cancel LRP I contracts could be considered as amending existing direction.
- ENERGY has previously received advice that there is a high risk that a court would conclude that the Minister has no authority under the *Electricity Act , 1998* to issue a direction requiring IESO to terminate microFIT Conditional Offers and FIT Offer Notices that have already been issued to applicants, because these offers create vested contractual rights. This reasoning would likely apply equally to any direction to IESO to cancel LRP I contracts. Previous advice has also flagged a risk that the Province could be liable for damages in tort for inducing a breach of contract (or other claims).
- The risk and costs associated with potential law suits resulting from the cancellation of contracts requires further analysis. LSB recommends ENERGY seek an opinion from Crown Law Office Civil before proceeding.

Subject: Fwd: Rate Mitigation

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

Hi Steve,

Attached are two decks on rate mitigation. We can use the decks as the basis for discussion at our meeting on Monday. I'll ask Keley to share with the other participants.

Serge

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC) which will provide a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017 for eligible small businesses, farms and residential consumers and has taken steps to expand the Rural or Remote Electricity Rate Protection program, expected to save eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

A significant number of Energy's proposals ~~generally~~ involve shifting costs from the rate base to the tax base. While the subset of costed proposals may have a fairly limited residential rate payer impact (e.g. about $5-6/month for residential, less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost ($1 billion to $1.3 billion). Note these impacts are lower than those presented in an earlier deck ($1.3 billion to $1.9 billion). Energy also presents other proposals where costs and impacts are "TBD".

Over the past five years, the existing fiscally funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,225 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**Energy's Broad Policy Themes / Rationales**

A key theme / rationale cited by Energy is to no longer use rate-base to pay for "social programs" by shifting cost of OESP, RRRP and proposed First Nation Rate to tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments |
|---|---|
| **Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility** | • Significant fiscal exposure -- $0.4-0.45 bn at current levels, higher if enhanced. On-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. |
| **Fund conservation programs through the tax-base for the remaining term of the existing CDM framework and transition costs to the new "green bank entity" over time** | • Potentially significant fiscal impact – current program costs are about $0.45 bn<br>• Conservation programs do provide an electricity system benefits, but would now be fiscally-funded, so a cross-subsidisation from tax-base<br>• Accessing the cap&trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the diccal plan |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term impact, unless TT funding displaces near-term, non-incremental projects coming onto service<br>• Could lower utility value (share price) and impact fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return |

| | |
|---|---|
| | • In the case of projects located in First Nation territories it could have an upfront fiscal impact if Province is not able to amortize those projects (TBC with OPCD).<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a windfall. It was fiscally neutral, it represented revenue to OEFC and an expense to Hydro One.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. |
| **Empower Energy Agencies to Increase Cost Effectiveness and Improve Efficiency** | • IESO to modernize the electricity market through market renewal<br>• OEB to identify opportunities for future LDC efficiencies/rates<br>• OEB to work with OPG operational efficiencies and pass on to ratepayers |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding th Global Adjustment (GA) |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • End of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end April 1, 2018.<br>• End of the DRC had previously been linked to retirement of residual stranded debt<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant fiscal impact due to creation of large liability item (estimated to be up to $66Bn) either directly on the Province's books or upon consolidation<br>• Furthermore, likely entails significant legal / Constitutional Law risks. |

**Detail on Proposals**

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP (Total of about $0.4 to 0.45 Billion/year):

This would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and the Rural or Remote Electricity Rate Program (RRRP), to the tax base. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Energy notes that
  - The programs could provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility (e.g., by 50% in the table).
  - The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Fund Conservation Programs through the Tax-Base:

This would be for the remaining term of the existing Conservation and Demand Management framework. Over time, the costs would be transitioned to the new "green bank entity", to shift cost recovery from ratepayers to cap and trade revenues.

- Energy's rationale for the cost shift would be in recognition of the burden borne by ratepayers in phasing out coal generation.

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects,
  - in effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.

  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province as the income (revenue) to the OEFC was fully offset by a reduction in ESDI resulting from reduced net income (expense) of Hydro One.
- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase. [As the departure tax paid was fiscally neutral, OEFC's uplift was primarily the result of the related deferred tax benefit, as well as the s.50.3 benefit under the *Electricity Act, 1998*.]
- Having OEFC help implement this measure may require introducing changes to OEFC's objects as is legal mandate is to help reduce and pay down stranded debt.
- This would be a one-time measure, potentially spread out over a few years, and fiscal impact, as the departure tax amount was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
  - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
  - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
  - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
  - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.

**Commented [JK1]:** Not sure what exactly the single schedule system means...stayed away from mentioning as a result.

**Commented [JK2]:** http://www.ieso.ca/Pages/Participate/Stakeholder-Engagement/SE-114.aspx

- Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
- In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.

- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
  - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
  - If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of options to delay recovery of part of the Global Adjustment (GA) by debt financing and recovering over a 25 to 30 year period.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1:
  - Option 2:
  - Option 3:
  - Option4:
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact, such as having to book a large deficit amount.

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector – Update

## Working Draft

December 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure (i.e., $35 billion+ investment in cleaner generation and $15.5 billion investment in Hydro One transmission and distribution systems).

- Ontario has taken a number of actions to lower electricity cost for all consumers by:
  - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).
  - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., competitive LRP, no new NUG contracting).

- Following the 2016 Throne Speech, actions were announced to further reduce electricity costs by:
  - Providing an 8% rebate ($11/month savings), updating RRRP ($45/month savings), expanding ICI (up to one-third savings for participants), suspending the LRP II and the EFWSOP (up to $3.8 billion in cost savings) and recycling proceeds to industrial/ commercial consumers.

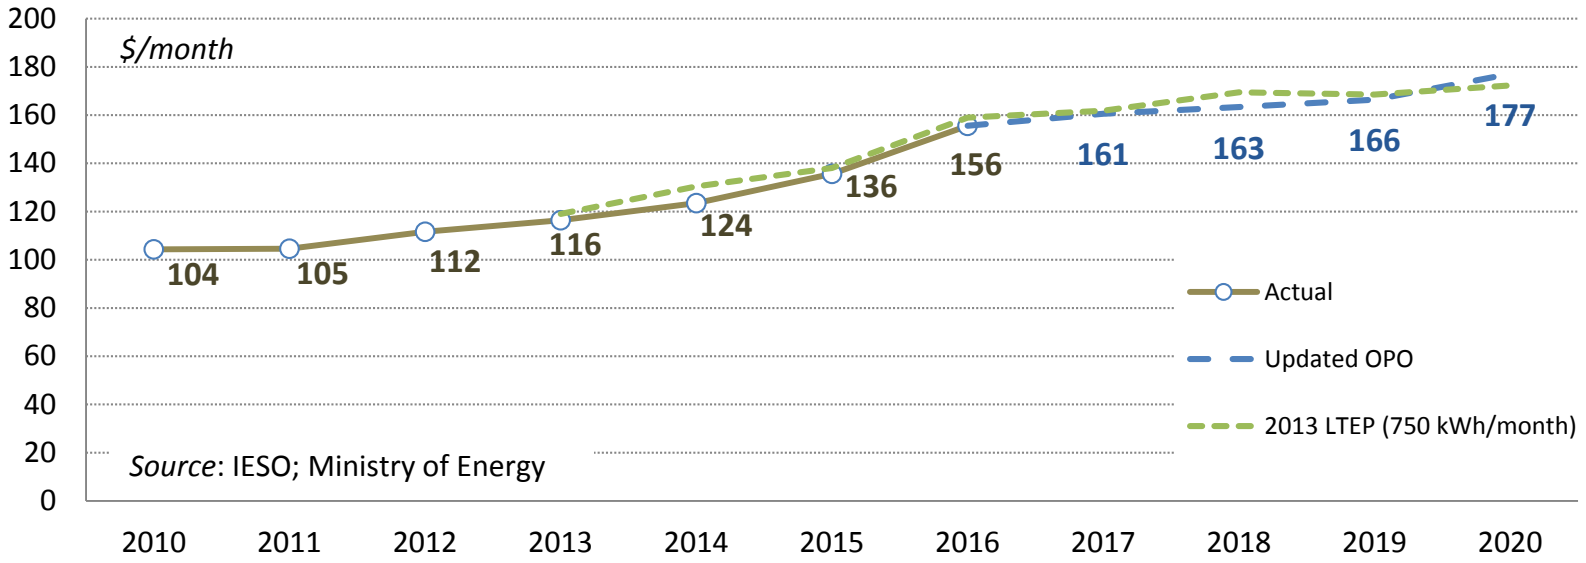
- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

# Electricity Prices – Residential

- Residential consumers electricity prices continue to be a concern for many Ontarians, particularly those that rely on electric heat.
  - **Note:** The typical residential bill is currently below the 2013 Long-Term Energy Plan (2013 LTEP) forecast.

**Typical Residential Electricity Bills**
*Historical and Forecast*



**Note**: The 2013 LTEP forecast for residential bills was based on 800 kWh/month without RRRP or electric heating; the above has been rebased to 750 kWh/month for comparison purposes. Typical residential are based on Toronto Hydro. The updated OPO forecast above includes the 8% rebate to offset the provincial portion of HST, ICI expansion and RRRP expansion.

# Broad Policy Themes / Rationale

- Support the continued reduction in the differential across distribution rates (as charged by Local Distribution Companies) across the Province through the potential enhancement of Rural or Remote Electricity Rate Protection, (RRRP). In order to not increase regulatory costs to customers as a result, this program can be moved to the tax-base.
- Provide a greater focus and support on lower income Ontarians by funding the Ontario Electricity Support Program (OESP) through the tax-base, as well as enhancing the support available through the program.
- Amortize electricity conservation and demand management (DM) programs over 15-years to provide lower costs for electricity consumers.
  - Alternatively, pay for conservation/DM programs through the tax-base and transition costs to the new "green bank entity" over time. Costs would be shifted in recognition of the burden borne by ratepayers in phasing out coal generation.
- Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding, such as remote electrification, large transmission projects, new or expanded interties and expansion of natural gas to underserved areas (i.e., rural and remote communities), etc.
- Empower energy agencies to increase cost effectiveness and improve efficiency by having – IESO modernize Ontario's electricity market through electricity market renewal initiatives, the OEB identify opportunities for future LDC cost reductions/efficiencies and work with OPG to find further efficiencies in operations and pass on savings to ratepayers.
- Give consumers more choice by allowing households to "opt into" an alternative rate plan, based on a flat electricity rate, as an interim measure as the Ontario Energy Board (OEB) develops more pricing options over time. Also give consumer greater transparency with respect to electricity costs by providing more details regarding the Global Adjustment (GA).
- Help small business manage their electricity costs and provide relief for cap and trade until proceeds recycling is fully operational by ending the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers, a benefit of $7/MWh.

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

**Source:** Ministry of Finance, Energy
**Note:** *Assumes RRRP enhancement to reduce distribution rates to $30 for LDCs and **Assumes increase OESP credit by 50%.
Not included in chart is additional $18M/year to fund potential First Nations rate program through the Tax-Base.

# Existing Rate Mitigation Programs – Overview

- There are a number of existing programs funded by electricity ratepayers that help mitigate electricity bills for some customers, each of which has a unique policy rationale.

- Programs such as the as the Rural or Remote Rate Protection (RRRP) program are targeted at all customers who face the highest delivery costs in the province, while others such as the Ontario Electricity Support Program (OESP), are income tested and targeted at the most vulnerable energy consumers.
  - These program are not mutually exclusive and a customer could receive both the RRRP and the OESP.
  - There are other programs that are still under development such as options for a First Nations Rate currently being developed by the OEB as per the request of the Minister of Energy. These options are aimed to alleviate high delivery costs for on-reserve indigenous consumers.

- There are opportunities to enhance each of these programs. However, if enhancements are funded through the electricity rate-base, while they would lower costs for eligible consumers, they would raise costs for all other ratepayers.

- Given that these programs focus on promoting equity between different areas of the province (RRRP) or on social equity (OESP), they could be funded by the tax-base rather than the rate-base. This would allow their goals to be achieved and enhanced without increasing electricity rates. The following slides explore options to enhance each program using the tax-base.
  - These enhancements would also work in conjunction with the Ontario Energy Board's focus on reducing LDC costs outlined in option 6b.

# 1. Rural or Remote Rate Protection (RRRP) Expansion

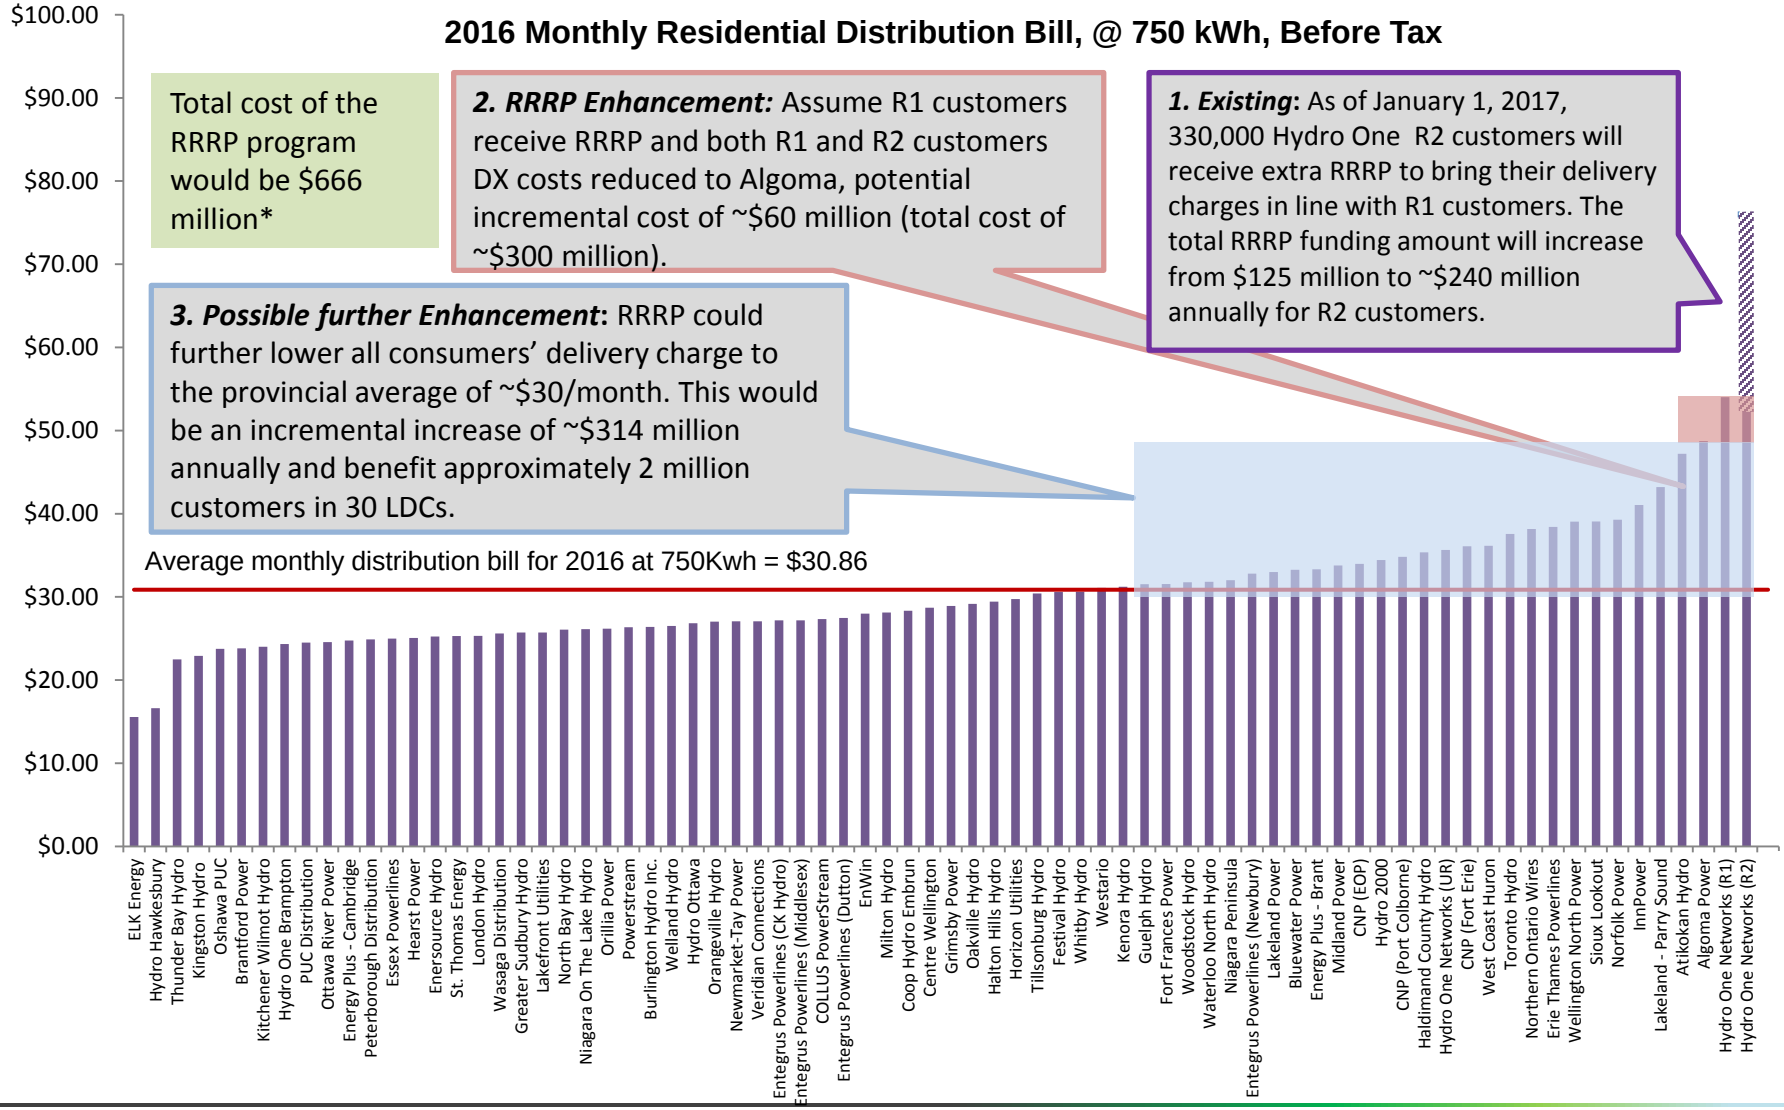
- The Rural or Remote Rate Protection (RRRP) program supports the most costly-to-serve distribution customers in Ontario. It is not income tested and most of the support goes to Hydro One's R2 (low density) rate class and remote communities.
  - Costs to these Hydro One customers are higher than average because of their relatively low density. The OEB mandates that they pay the full cost of service and in recent rate filings has asked Hydro One to ensure this through cost allocation studies.
  - To mitigate these costs, the RRRP was recently enhanced to help lower the bills of Hydro One's R2 customers to around those of its R1 (medium density) customers.
- Although other LDCs do not have medium- and high-density rates, there is a wide range of distribution costs between LDCs. The RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - Could be done on its own or as part of exploring an Ontario-wide uniform "postage stamp" delivery rate.

**Considerations**

- RRRP will be enhanced for R2 customers on January 1, 2017 to have their costs reduced to approximately R1 distribution costs levels. The RRRP could be further enhanced to include R1 customers, and have R2 and R1 customers reduce their costs down to Algoma (see next slide). This would cost $300 million in the first year (and would adjust year over year).
- If there was a desire to reduce costs for all LDCs, a simple average of distribution cost before tax, across all rate zones is $30.86 per month, for a residential customer consuming 750 kWh per month.** Bringing all delivery rates down to this average would cost approximately $500 million for the first year, with escalation in line with average distribution rate increases.
  - This assumes Hydro One R2 consume 1,200 kWh and H1 R1 customers consume 1,000 kWh per month.
- If all customers were brought down to the average costs (see the chart on the next slide for more detail):
  - It is assumed that residential customers with bills less than the provincial average see no change;
  - Majority of the enhanced benefit would go to Hydro One R1 and Toronto Hydro customers; and
  - Mechanism to ensure that LDCs continue to be motivated to achieve efficiencies would need to be designed (see section 4).
- Enhanced RRRP support may be best provided from the tax-base, because if funded from the rate-base, it would increase the costs for all customers who may argue that it is unfair that they are being asked to pay more to subsidize those in other LDCs.
- In conjunction with using the tax-base to reduce delivery charges to the provincial average, the OEB could be asked to explore moving to a province-wide "postage stamp" delivery rate that would be the same across the province to be implemented over time.
  - Could be "winners and losers" as delivery rates less than the average would go up in a postage stamp model;
  - A "postage stamp" model could help incent LDC consolidation.

**Note:** This is based on preliminary estimates and the amount will fluctuate on monthly consumption from customers and LDCs have different customer base with different consumption types.

# 1. Rural or Remote Rate Protection (RRRP) Expansion (cont'd)



*Note: this includes the ~$50M currently supporting Algoma Power and Hydro One Remotes.*

# 2a. Enhance Ontario Electricity Support Program (OESP) Benefit

- The OESP is an income-tested, application based program that lowers the electricity costs of the most vulnerable consumers by providing a rebate directly on their electricity bills. The OESP provides basic benefits to most consumers and enhanced benefits to Indigenous customers and customers with electric heat and medical devices and at launch, it was estimated ~560,000 families could be eligible and some 261,000 applications have been submitted.

- The OESP program benefits could be increased across the board by 50%, which would mean:
  - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
  - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).

- The OESP program could also be further enhanced by working to ensure the program uptake is as close as possible to 100%:
  - Streamlining the application process to make it easier and quicker to get through;
  - Putting in place a more aggressive communications strategy to make sure people are aware of the program;
  - Increasing funding for key partner agencies to work directly with individuals who are applying; and
  - Exploring automatic OESP qualification for those who receive provincial programs (e.g., ODSP).

**Considerations**

- If the OESP was funded by the tax-base, it could also be explored whether the OESP could be better delivered as a provincial program via the tax system. This may help ensure that the program's participation rate is as high as possible.
  - At the time of program design, advice was given that a 40-50% participation rate would be high for an application-based program delivered through electricity bills.
  - The province would need to work with LDCs if the rebate was to appear on electricity bills rather than be delivered via the income tax system (e.g., through the Trillium Benefit).

# 1 & 2a. Fiscal Impacts of RRRP, OESP and First Nation Rate

- Table below shows estimates of program costs up to 2022:

| Year | OESP ($M) | OESP + 50%($M) | RRRP($M) | RRRP Enhancement ($M) | First Nations Delivery Rate($M) | TOTAL RANGE ($M) (from status quo to OESP and RRRP enhancements) |
|---|---|---|---|---|---|---|
| 2017 | $108 | $162 | $292 | $374 | $18 | $418 to $846 |
| 2018 | $150 | $226 | $300 | $384 | $18 | $468 to $928 |
| 2019 | $186 | $279 | $306 | $394 | $18 | $510 to $997 |
| 2020 | $215 | $322 | $315 | $404 | $18 | $548 to $1,059 |
| 2021 | $243 | $365 | $322 | $415 | $18 | $583 to $1,120 |
| 2022 | $272 | $408 | $329 | $426 | $18 | $619 to $1,181 |

1) Ontario Electricity Support Program (OESP)
   - After almost a year in market, close to 30% of potentially eligible customers are signed up.
   - The cost projections above assume the program grows to 100% of eligible consumers by 2022 and remains at that level.
   - The second column forecast also assumes the existing credit amounts increase by 50%.
     - Forecast assumes 10% administration costs
     - Forecast does not account for the approximately 142,000 low-income households that OEB estimated are not eligible because they do not directly receive an electricity bill.

2) Rural and Remote Rate Protection (RRRP)
   - Provides benefits to R2 Hydro One consumers, Algoma, and remote communities.
   - Includes the expanded coverage that will begin on January 1, 2017.
   - Expansion to cap distribution rates for other customers is based at $374M and assumes escalation of 2.6% (historical average dx rate increase). This is a conservative estimate, as Hydro One and Toronto Hydro increases could drive program costs beyond the average increase.

3) First Nation rate reduction (currently under development)
   - On November 14, 2016, OEB presented options to the Ministry on reducing costs for on-reserve First Nation customers.
   - OEB's recommended option to provide 100% delivery rate credit, which is estimated at $18.4 million per year.
     - Other options includes a seasonal fixed credit to account for demand changes over the year ($13 million) or a 50% total bill reduction ($23 million).

# 2b. Expand OESP Eligibility

**Expanded Coverage**

- When OESP was being created, the OEB estimated that are 713,000 low-income households, of which 20% do not receive electricity bills. Thus, only 571,000 would potentially be eligible for OESP.
- If moved to the tax base, the OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity.

**Eligibility Categories**

- OESP has two credits amounts:
    1) Basic credit of $30-50 per month, based on the level of income and the number of residents.
    2) Enhanced credit of $45-75 per month for those with unique electricity needs:
        a) Electric heating,
        b) Indigenous customers, and
        c) Certain electrically intensive medical devices.
- The enhanced credit can be expanded to include additional eligibility categories of customers. For example, a new “Low Density Consumer” category could be introduced that provides Hydro One R2 customers (highest distribution rates) eligible for OESP the enhanced credit.

**Considerations**

- Potential costs for expanded coverage and new eligibility categories depend on updated estimates and changes to program design and delivery.
- There would be value in keeping the OESP as an income-tested program to distinguish it from other initiatives (e.g. RRRP, which is designed to address disparity between rural and urban distribution costs).

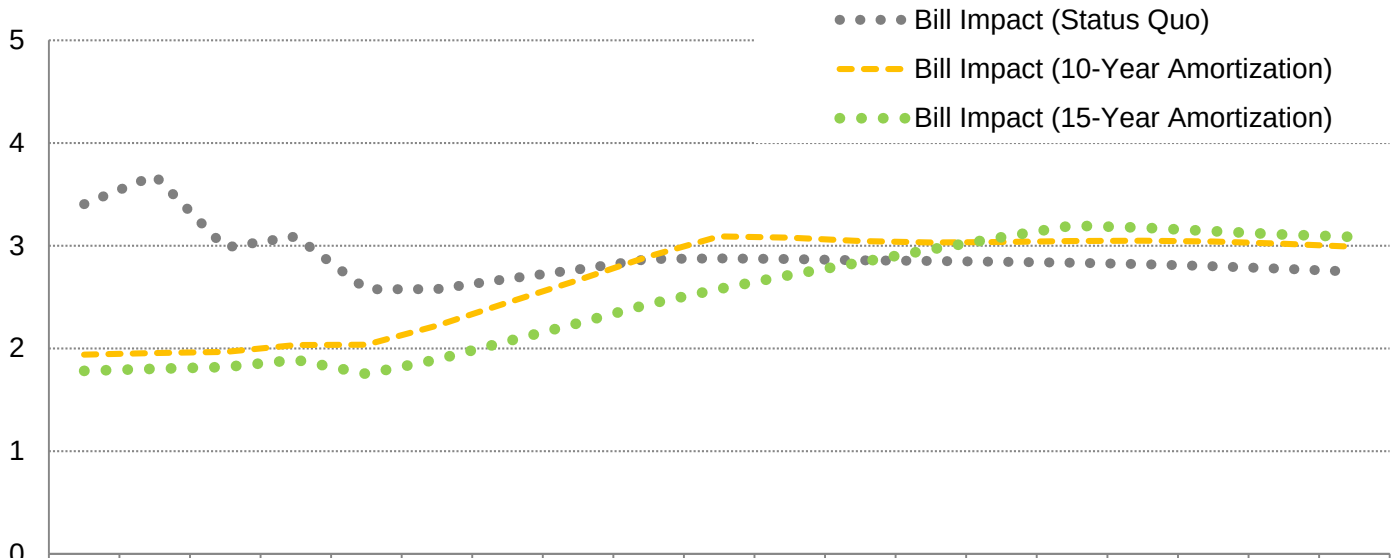
# 3a. Amortize Conservation Program Costs

- ~$3 billion from the electricity ratepayer base will be spent on conservation programs delivered under the Conservation First Framework (CFF) and the Industrial Accelerator Program (IAP) between 2015 and 2020.
- Currently, Conservation and Demand Management (CDM) program costs are recovered from the Global Adjustment (GA) mechanism about one month after expenses are incurred.
- As a potential rate mitigation measure, certain CDM costs could be amortized. This would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs).
  - The time period over which costs could be amortized would be over the lifetime of funded CDM measures.
  - ENERGY is working with IESO to determine the appropriate lifetime period – the graph on the next slide, which illustrates residential bill impacts, presents two cases: **10-year and 15-year measure lifetimes**.
- In both cases, amortizing a portion of conservation spending would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020. Over time the benefit would decrease and turn into a cost (higher electricity rates than would otherwise occur), as interest charges begin to grow. Estimated interest charges are as follows (a 3% interest rate is assumed; increases in interest rates could result in higher overall interest charges):
  - $712 million ($2016) – Amortizing eligible 2017-2035 CDM costs for 10-year period; and
  - $1.3 billion ($2016) – Amortizing eligible 2017-2035 CDM costs for 15-year period .
- Legislative changes would be needed to allow recovery of interest payments from ratepayers, or these costs could be recovered from the Consolidated Revenue Fund (CRF, or taxes).
- An alternative that could be explored would be to pay for CDM costs, or for a portion of these, from the tax-base (*see Appendix for more detail on tax funding option*).

# 3a. Amortize Conservation Program Costs (cont'd)

## Conservation Residential Bill Impact – Status Quo, 10-Year and 15-Year Amortization

***CDM Bill Impact ($/month)***



| | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 | 2031 | 2032 | 2033 | 2034 | 2035 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bill Impact (Status Quo) | 3.40 | 3.68 | 2.98 | 3.09 | 2.58 | 2.58 | 2.68 | 2.77 | 2.87 | 2.88 | 2.87 | 2.86 | 2.85 | 2.84 | 2.83 | 2.82 | 2.80 | 2.78 | 2.75 |
| Bill Impact (10-Year Amortization) | 1.94 | 1.95 | 1.97 | 2.03 | 2.04 | 2.22 | 2.45 | 2.67 | 2.90 | 3.09 | 3.08 | 3.05 | 3.03 | 3.04 | 3.04 | 3.05 | 3.04 | 3.02 | 2.99 |
| Bill Impact (15-Year Amortization) | 1.78 | 1.80 | 1.82 | 1.89 | 1.75 | 1.89 | 2.07 | 2.25 | 2.43 | 2.58 | 2.71 | 2.84 | 2.96 | 3.08 | 3.20 | 3.18 | 3.14 | 3.11 | 3.09 |

Source: IESO; Ministry of Energy

**Note**: Chart assumes that conservation incentive costs are available for amortization while administration cost are not. Although there is variable from year to year, incentives represent about two-thirds of conservation spending in Ontario. Chart assumes conservation spending continues at a similar rate beyond 2020. Chart assumes a 10 of 15-year borrowing rate of 3.0%.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- Under **Public Sector Accounting Board (PSAB) accounting standards**, used by both the Province and IESO, only certain assets can be amortized: 1) pensions and 2) tangible capital assets. Under PSAB an asset must meet several criteria to be considered a capital asset, including:
  - A tangible capital asset must be tangible and substantive and the Ontario government must have title and operate the asset.
  - A tangible capital asset must bring a tangible benefit to the government or to Ontario.

- CDM costs, on their own, do not meet the criteria of a tangible capital asset because customers would have ownership and control of installed CDM measures, not the Province or IESO.

- **Rate-regulated accounting** was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

# 3a. Amortize Conservation Program Costs (cont'd)

**Considerations**

- If some of Ontario's CDM costs could be amortized, analysis shows that ratepayer impacts would be reduced in the short-term but interest charges on the loan would result in increased overall ratepayer costs in the longer-term.
- Legislative amendments would be needed to allow recovery of loan interest charges from GA.
- ENERGY staff have developed a note to seek an opinion from IESO's external auditor and from the Ontario Provincial Controller (OPC) to determine whether CDM costs could be amortized according to rate-regulated accounting standards.
- ENERGY is working with IESO to seek an opinion on the proposal from IESO's external auditor.
- ENERGY would then send the IESO external auditor's opinion along with ENERGY's explanatory note to the Ontario Provincial Controller (OPC) to seek a formal opinion on whether CDM costs could be amortized according to rate-regulated accounting standards.
- Further legal analysis would also be required to confirm legal viability and possible approaches to implementation.

# 3b. Rate Smoothing of Conservation Program Costs

- "Rate smoothing" could achieve the same rate reduction effect as amortization.
- Instead of taking out a loan to amortize conservation costs, a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Each year, IESO would defer recovery of a portion of annual conservation costs. Financing would also be required, such as from the OFA, to pay the interest on the deferral account. Interest would accrue on the deferred amounts, likely at the same rates as for the amortization option.
- Deferred costs could be recovered over any time period. If a 10 or 15 year-period was chosen, the rate impacts would be the same as in the amortization option.

**Considerations**

- Option would **not** require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open the Ministry to criticism by the Controller and/or Auditor General since the rate impact is the same.
- The Ministry would have more control under this option to change deferred amounts each year, as opposed to the terms set by a loan agreement under the amortization example.
- There is precedence to this approach for nuclear investments, which otherwise would result in volatile increases and decreases for Ontario ratepayers over the investment period. In 2015, the Ministry amended a regulation that requires the Ontario Energy Board (OEB) to set "smoothed" nuclear rates for OPG's Darlington and Pickering nuclear stations over a 20-year period.
  - The regulation allows OPG to defer recovery in rates of a portion of its nuclear revenue during the Darlington refurbishment (expected to be complete in 2026) and recover these deferred costs over the remaining ten years.
  - OPG will establish a "deferral account" to record the deferred amounts each year up to 2026 plus accumulated interest on the balance to reflect OPG's financing costs as a result of rate smoothing. The deferral account is then drawn down on a straight-line basis between 2026 and 2036.
- At minimum, new regulation would be required. However, further analysis is needed to determine the relevant regulation or legislation, to be amended for IESO (e.g., OEB regulation of IESO costs and fees, GA regulation for how IESO recovers its conservation costs from ratepayers).

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure

- Fund investments in specific energy infrastructure projects through the tax-base. **Note:** This could include the provincial portion of funding for the Remote First Nation Connection Project, a fund to support projects that improve adequacy and reliability in areas where new transmission would unlock economic growth and expansion of natural gas service to underserved communities.

**Considerations**

- Tax-base funding would allow for energy infrastructure to be built without impacting electricity and natural gas rates.
- Would require increasing the amount of funding committed to the Trillium Trust. All fiscal impacts from broadening Hydro One have been committed to the Trillium Trust $5.7 billion target and allocated to Moving Ontario Forward projects.
- There would be an ongoing fiscal impact from the amortization and funding of the investments. Where amortization is not possible there would be an upfront fiscal impact.

*Remote Connection Project:*

- Ontario ratepayers currently support costs of remote electricity service through RRRP on the order of $28 million/year
- Connecting 21 remote communities to the Ontario grid is supported by a positive business case due to diesel cost savings over time. If RRRP is funded through the tax base as proposed above, this project represents an opportunity to reduce impacts from RRRP.
- Direct investment in Ontario's portion of the capital costs of the project through a provincial fund (e.g., Trillium Trust) could also be considered along with mechanisms for cost recovery through transmission rates to refresh the fund as industry benefits from the transmission investment.
- The amount of investment and long-term savings depend on a federal contribution to the project and ENERGY is currently in discussions with Canada with the goal of concluding a cost-sharing agreement by spring 2017.
- A move to tax-based funding may have implications for cost oversight, since the OEB's mandate is to have oversight of ratepayer impacts. Alternative methods to review cost prudence of tax-based funding may be needed.

# 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (cont'd)

**Considerations (cont'd)**

*Transmission Projects to Enhance Economic Growth:*

- A tax-based fund could target investments in projects that have been identified in IESO regional plans and that would stimulate economic growth but are not proceeding due to cost barriers under the OEB's beneficiary pays principle. Investments could also target areas where the existing system poses challenges for delivering reliable service such as in parts of Northern Ontario with long single circuits.
- Potential opportunities for investment could include a transmission reinforcement in the **Greenstone area**, upgrades south of **Red Lake** and others TBD based on program design.
- This approach would allow a potion of project costs to be socialized to advance key projects without impacting rates or OEB's principles of cost allocation. Scope and scale of fund would be refined through program design.

*Natural Gas Expansion to Underserved Communities:*

- The Government has currently committed to expanding natural gas access to more communities in Ontario (i.e., $200 million Natural Gas Access Loan and $30 million Natural Gas Economic Development Grant).
  - Natural gas is an affordable heating source in Ontario. Its continues to be less expensive than alternative sources such as electric baseboards, heating oil and propane. For example, switching from oil to natural gas can save an average consumer an estimated $1,500 annually.
  - Increasing access to other energy sources such as natural gas, provides Ontarians with more options to meet their needs, reduce their energy costs and improve their quality of life.
  - Expansion of natural gas delivery infrastructure is widely supported in underserved communities (i.e., a recurring theme at ROMA) as a means to provide consumers and businesses in underserved communities with more affordable energy choices, attract new industry to Ontario and benefit agricultural producers.
- A grant program complements the Ontario Energy Board's recent decision enabling greater rate-based expansion to unserved areas, including rural and remote communities.
  - Applying Trillium Trust funding would make it possible to enhance the Grant Program and service more communities.

# 5. Dedicate Departure Tax

- In connection with the IPO, as a result of leaving the PILs regime and entering the corporate tax regime, Hydro One was deemed to dispose of its assets for proceeds equal to its fair market value, triggering a PILs liability of $2.6 billion (Departure Tax).
- This was paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt. The Province could explore repurposing some of those funds to the benefit of ratepayers.
- This may reduce the risk that the Ontario Energy Board (OEB) assigns to ratepayers the benefit from an associated tax asset, resulting in lower earnings and decreased share value for Hydro One. This decision is currently before the OEB, as part of Hydro One's Transmission rate application.
- If the Province were to transfer $2.6 billion in economic benefits to the rate base over 10 years suggest the following fiscal impacts (assuming 140TWh per year):
  - Residential Ratepayer Impact (if spread over 10 years): up to $1.39 per month on a typical bill; and
  - Industrial Ratepayer Impact (if spread over 10 years): up to $1.86 / MWh
- There would be no certainty that the OEB could still decide to allocate some or all of Hydro One's deferred tax benefit to ratepayers which would have fiscal impact (lower share price and lower net income over time).

**Considerations**

- Cost savings to ratepayers and associated fiscal impacts would depend on timing and which ratepayers (e.g., Hydro One customers, or all Ontario customers) will benefit from some or all of the $2.6 billion value.
- The departure tax was effectively a true-up for lower PILs payments from Hydro One in previous years – it was not a one-time windfall for the Province. In other words, it ensures that Hydro One paid all its tax obligations under the PILs regime before moving into the normal corporate tax regime.
- The related ~$2.4 billion fiscal benefit to the Province (from the deferred tax benefit) has already been credited to the Trillium Trust to be used to build infrastructure under Moving Ontario Forward.
- Repurposing funds paid to OEFC would ~~may~~ have an impact on the defeasance of electricity stranded debt and would cause the first increase in stranded debt since 2004.
- While this is a shift from messaging that value from the broadening of ownership of Hydro One is being used pay down debt and fund transit and transportation, the Province could link to electricity infrastructure investments (e.g., as an offset to ~~infrastructure investments already made in the sector, or to specific initiatives such as conservation~~).

# 6a. Empower Energy Agencies – IESO / Market Renewal

- Continue to move forward with IESO's Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2021, leading to a reduction of:
  - About $1/month or less than 1% at current retail prices for a typical residential bill; and
  - About $1.30/MWh at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.
- IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.

# 6b. LDC Efficiencies and Rates

- Reducing costs and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills.
  - Currently, LDCs recover costs through the Delivery line of the electricity bill, which is broken into Distribution and Transmission costs. LDCs are responsible for the Distribution costs of the electricity bill which account which account for about 20% of the total bill.
  - Distribution costs vary across the province as LDCs have different service territories and needs (e.g., geography, number of customers, density of customers, life/health of capital assets, etc). See next slide for more detail.
    - For example, comparing 2016 with 2006, distribution rates have increased by about 24.5% (or about 2.2% per year, compounded annually) across the Province, with significant variation between regions and LDCs (-17% to 148%). Overall consumer price inflation in Ontario for the same period increased by about 19% or 1.8% per year.

**Considerations**

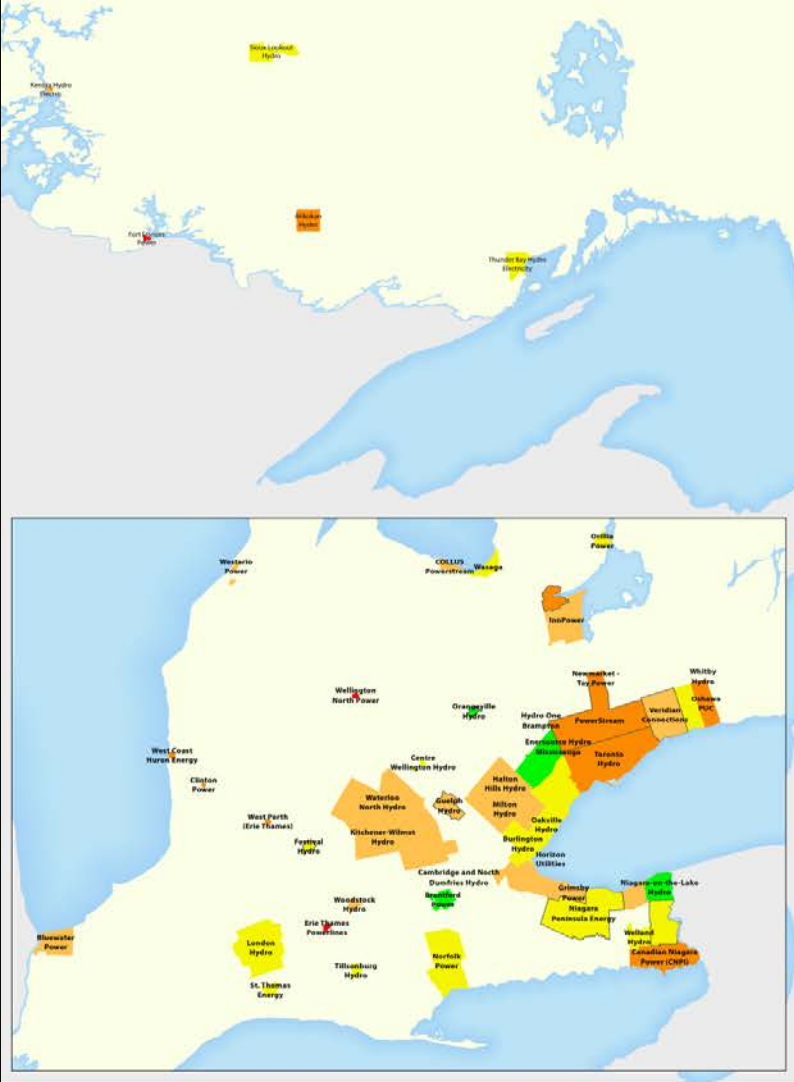
- The Ontario Energy Board (OEB) has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates. Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.

- There maybe opportunities to promote further cost reductions and performance improvements within the distribution sector as there is continued evolution of the regulatory framework in Ontario.
  - Tightening LDC requirements may also indirectly incent other desired policy outcomes, such as LDC consolidation and grid modernization to realize further cost reductions.
  - To further help address the costs associated with the Delivery line of the electricity bill, program such as the RRRP (previous slide) could be expanded to include other customers that may face higher costs.

- ENERGY could help promote or accelerate these efforts by asking the OEB through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and the 2017 Mandate Letter and other agency business planning processes.

- In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. The Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities. The panel recommended legislation to mandate consolidation.
  - Rather than mandating consolidation, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation. Further changes to the tax incentives and/or revisiting legislated consolidation could be considered.

# LDC Distribution Rate Changes (2006 vs 2016)



| Total Dx Rate | 2006 | 2016 | % Rate Change |
|---|---|---|---|
| Hydro One UR (High Density) | $29.13 | $35.65 | 22.4% |
| Hydro One R1 (Medium Density) | $37.73 | $54.02 | 43.2% |
| Hydro One R2 (Low Density) | $44.65 | $76.14 | 70.5% |

## Legend

**LDC Rate Comparison 2006 vs 2016**

**% Total Rate Change ( # of LDCs )**

- -17.3% to 0% ( 5 )
- 0.1% to 15% ( 25 )
- 15.1% to 30% ( 21 )
- 30.1% to 60% ( 16 )
- 60.1% to 89.3% ( 4 )
- Merged LDCs

Below LDCs had either acquired or merged: (# of merged LDCs)

a. Powerstream Inc. ( 5 )
b. Chatham-Kent Hydro Inc. ( 13 )
c. Veridian Connections Inc. ( 4 )
d. Guelph Hydro Electric Systems Inc. ( 2 )
e. Festival Hydro Inc. ( 2 )

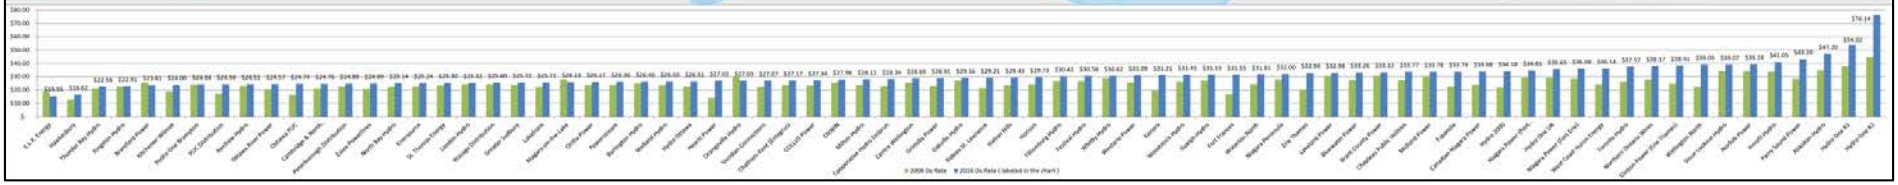
*Published December 2016*

## KEY FINDINGS

- In summary, distribution rates (including rate riders) have increased by about 24.5% across the Province, with significant variation between regions and LDCs (-17% to 148%).
- There is generally no correlation between LDC size or location and distribution rate increase in absolute or percentage terms.
- The current analysis shows no clear relationship between the percentage rate increase and the absolute rate level (that is, high rate increase LDCs may still have among the lowest rates, and low rate increases may have higher rates.
- No clear relationship between amalgamation and rates.
- The analysis does suggest that Hydro One has the highest rates, and some of their customers have seen higher than average rate increases.

## NOTES

- **Rate Calculation:** Monthly residential distribution bill rates, before taxes, are based on consumption of 750 kWh. Distribution charges account for approximately 23% of the average 2016 residential bill.
  All figures calculated by ENERGY staff without input from OEB.
- **Colours:** Colour coding of the map only depicts the change in LDC rate amounts (i.e. LDCs in red don't necessarily have the highest total rates).
- **Mergers:** Rates for customers in merged LDCs have experienced different levels of change. For merged entities, the largest LDC in 2006 was used. An accompanying map focuses on merged entities.
- **Points in Time:** Current analysis compares 2016 and 2006 only. Rates could have had an uneven trajectory, especially considering regulatory decisions such as time limited charges/rebates with temporary impacts.



# 6c. Empower Energy Agencies – OPG / Operational Efficiencies

- Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh).

**Considerations**

- OPG recently submitted its 2017-19 business plan to the Province for concurrence. That plan includes the following:
  - Enterprise total generating cost increasing from $48/MWh in 2016 to an average of $55/MWh over the plan period.
  - An average residential monthly bill increases of $1.05/month annually from 2017-2021.
- Much of this increase is due to the Darlington refurbishment project, which increases costs and reduces OPG's generation over the planning period.
- OPG has also shared its stretch targets for total cost of generation, which average $52/MWh over the 2017-19 plan, a ~$3/MWh reduction (5-6%) relative to its $55/MWh business plan targets.
- The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This is a public document that OEB would likely review and incorporate as part of OPG's current rate application.
- Consistent with regulations under the *Ontario Energy Board Act*, OPG is seeking smoothed rates for nuclear as part of its 2017-2021 rate application.
  - As a result, the benefit to ratepayers of reducing generation costs is uncertain.
  - Given that the application extends beyond the business plan period, and to ensure OPG does not delay costs beyond the planning horizon, the Province may want to provide additional direction for out year expenditures.
- If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.
  - The total cost of $3/MWh based on OPG's forecast production of 74 TWh/yr is about $240 million per year.
- The Province could work with OPG to craft language in the concurrence letter in order to avoid setting unintended precedents for future rate application processes.

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate

- OEB continues to move forward with its Regulated Price Plan (RPP) Roadmap:
  - The OEB is undertaking a comprehensive review of the RPP, including exploring the introduction of offering different pricing plan options for customers following the completion of pilot programs in 2018. The plan is expected to be implemented over a 3-5 year period.
- Until new pricing plans are available, the OEB could provide an "opt-in flat rate RPP" structure that could be made available to residential, farm and small business consumers on an interim basis (2-3 years) until a wider range of price plans are available, providing customers with pricing choice.
- Time-of-Use (TOU) pricing could also be introduced for non-RPP Class B consumers to reduce Global Adjustment (GA) volatility and reduce system costs.

| Current TOU | New Flat Rate |
|---|---|
| On: 18.0 ¢/kWh | 11.1 ¢/kWh |
| Mid: 13.2 ¢/kWh | |
| Off: 8.7 ¢/kWh | |

**Considerations**

- Would provide consumers with electricity pricing choice.
- The OEB has indicated that the option would lead to no overall change in system costs. Consumers with higher peak and mid-peak usage patterns would see a decrease in their electricity bills, while those with higher off-peak usage patterns would see an increase.
  - While the current strong supply conditions may allow for such an RPP structure (i.e., peak demand requirements can be easily met), administrative costs could be high (distributors would need to design/implement an opt-in process and associated billing system on an interim basis).

| | Current TOU | New Flat Rate |
|---|---|---|
| 1) Monthly electricity bill- higher peak and mid-peak usage patterns | $172 | $163 |
| 2) Monthly electricity bill- higher off-peak usage patterns | $152 | $163 |

***Note:** 1) assumes a consumer consumption pattern of 45%:30%:25% (Off-peak: Mid-peak: On-peak), while 2) assumes consumer consumption pattern of 80%:10%:10% (Off-peak: Mid-peak: On-peak). Estimates are based on OEB's online electricity bill calculator (for Toronto Hydro- November 2016 rates)

# 7a. Give Consumers More Rate Choices and Greater Transparency – Interim Flat Rate (cont'd)

**Considerations**

- The decision to undertake smart meter investments was partly justified on the basis of TOU pricing. If TOU pricing were to be made optional, some stakeholders could question the rationale for smart meter investments.
  - Rationale for offering a flat rate option could focus on providing customers with choice until new pricing plans are rolled out under the RPP roadmap.

- If a flat rate design is introduced, there could be significant consumer opposition to any return to a mandatory TOU.

- After the interim flat rate period, the OEB could offer a wider range of pricing plans to consumers.
  - As part of its RPP review, the OEB will be running pilots with LDCs to assess customer response to alternative time periods and pricing structures.
  - Learnings from these pilots will help inform potential changes to the RPP. Pilots are expected to be in market May 2017 and run for one year.

- Non-RPP Class B electricity consumers currently pay Global Adjustment (GA) on a volumetric basis. Moving them to TOU would provide an incentive to shift consumption to off-peak periods.
  - Consumers, including manufacturers, who are unwilling to shift would face higher costs and likely not be supportive of the changes.
  - The decision to pursue TOU pricing for non-RPP class B consumers will impact proceeds recycling as there is interplay between the two initiatives.

# 7b. Give Consumers More Rate Choices and Greater Transparency – Detailed Global Adjustment

- Provide electricity consumers greater transparency with respect to electricity generation costs by providing more details regarding the Global Adjustment (e.g., adding a line on hydro bills, quarterly energy reports, etc).

**Considerations**

- As electricity bills have increased, many consumers have complained about a lack of transparency on the drivers of electricity costs. In particular, consumers and legislative officers have singled out the GA.

- Providing consumers with additional information on the cost components and amounts recovered through the GA would help consumers understand how the different forms of electricity generation in Ontario contribute to consumers costs.

- Providing additional information to consumers on electricity commodity cost drivers without sufficient context or background could simply lead to increased complaints about particular generating technologies that make up large shares of costs (e.g., nuclear).

- Adding a breakout of the amount of GA on residential electricity bills could lead to further confusion due to the existing breakout of multiple time-of-use buckets.

- Alternatively, the existing quarterly Ontario Energy Report, which provides various energy sector data, could be leveraged to show a breakout of quarterly GA costs by fuel type. A link on electricity bills could point to this information.

# 8. Help Small Business Manage Their Electricity Cost – End DRC Early for Class B Electricity Consumers

- Propose to remove the $0.07/kWh Debt Retirement Charge (DRC) from the bills of commercial/small industrial Class B consumers beginning in 2017, instead of April 1, 2018.
  - **Note:** Class A consumers (e.g., large industrial) would continue to pay DRC until at least April 1, 2018.

**Considerations**

- For a Class B consumer currently paying about $152/MWh, removing the DRC would represent a savings of about 5%.
  - A 50% reduction in the DRC charge would represent a savings of about 2%.

- Alternatively, the reduction of the DRC could be to $0.035/kWh starting in 2017, to provide relief for cap and trade until proceeds recycling is fully operational.

- Residential consumers have had the DRC removed from bills since January 1, 2016. Taking DRC off commercial and small industrial bills would result in equal treatment for these groups of consumers.

- The savings for commercial and small industrial consumers associated with this proposal would drop to zero in April 2018, since this is the current planned date for removing the DRC from non-residential bills.

- Prior to moving forward with this proposal, additional analysis from Legal Services and the MOF would be needed.

# 9. Extend Length of Existing Wind / Solar Contracts

- Wind and solar developments are typically contracted through standard offer procurements on 20 year fixed terms at fixed pricing.
- Many of these projects have already reached commercial operation.
- The province could explore options for IESO to negotiate extensions to existing renewable energy contracts, for example, by 10 years, in return for the proponents agreeing to a lower price in the near term.

**Considerations**

- Projects in commercial operation offer potential for near-term rate reduction whereas projects that have yet to reach commercial operation provide potential to mitigate future rate increases only.
- The attractiveness of this option to contract holders would vary from project to project and would depend on project economics.
- Revised pricing would be subject to negotiation, and associated ratepayer savings would be difficult to forecast accurately.
- The duration of contract renegotiation is difficult to forecast and may not be achievable in the near term.
  - Proponents may have to renegotiate their project financing arrangements, ensure project investors are satisfied with any changes in ROI, and extend land leases.
- Project host communities and Indigenous communities whose traditional territory the projects are sited in may not be interested in these projects extending their operational period ; discussions/consultation may be required in advance of this potential option moving forward.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Should Ontario be successful in negotiating lower prices in the near term, it should be noted that contract holders will be in a strong bargaining position (given their existing fixed-priced contracts), and will likely extract additional value from the negotiations.

- Since the Minister of Energy is not a party, IESO would be required to renegotiate the contracts, which would likely involve a direction or directive to IESO.

- Further analysis is required as to how ENERGY could express its policy intent to have IESO renegotiate the contracts for a reduced rate at a longer term, however it is unlikely that IESO could guarantee the outcome.

- Further analysis is required to ascertain whether there is scope within the existing contracts for IESO to renegotiate their terms in this manner.

- Extending contract terms would also reduce planned flexibility and increase the risk of overpayment as this existing capacity would now be contracted into the 2040s and not the 2030s.

- Extending contract terms may require investments in component replacement and additional operation and maintenance costs that developers would seek to recover under any renegotiated contract.

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- Ontario has over 4,500 MW of wind in commercial operation, with the vast majority being large scale (>500kW) developments.
  - This includes over 2,700 MW of large FIT 1 and GEIA wind projects representing 47 contracts (average size ~58 MW) and over 1,000 MW of solar projects representing 103 contracts.

- Projects over 500 kW would offer the most savings potential as they represent the majority of installed renewables capacity and are spread across fewer contracts.

- Below are two potential approaches to reducing ratepayer costs in the near term by extending contract terms at reduced prices. An illustrative example of a typical large wind project is used.

- **Example:** 100 MW FIT 1 wind project achieving Commercial Operation in 2014 (i.e., 17 years remaining on initial 20 year contract), assuming a 10 year contract extension negotiated at the LRP I low weighted average wind price of $64.5/MWh;
  - (17 years @ $135/MWh + 10 years @ $64.5/MWh)
  - **Potential Approach 1:** Provide a single new contract price that is the average of the lower extension price and the FIT contract price over the new contract term. The new price would be lower over a longer term.
  - **Illustrative Example:** New contract for 27 years at $129/MWh.
  - New contract price set to allow 10% rate of return over 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract (remaining term extended for 10 additional years) |
|---|---|---|
| Contract Cost (NPV 2017) | $550 million | $582 million |
| Average Monthly Ratepayer Impact Over First 5 Years | $0.03 savings | |
| Average Monthly Ratepayer Impact Over Remaining 22 Years | $0.02 increase | |
| Average Monthly Ratepayer Impact Over Entire 27 Year Contract | $0.01 increase | |

# 9. Extend Length of Existing Wind / Solar Contracts (cont'd)

**Considerations (cont'd)**

- **Potential Approach 2:** Offer facilities a revised contract that extends terms and is structured to offer lower pricing in the initial contract years and higher pricing in the later years of the contract.
  - For example, the New contract is $85.9/MWh over the first 5 years and $169/MWh over the remaining 22 years.
    - Price over first 5 years is LRP I weighted average wind price.
    - Price over remaining 22 years is set to allow 10% rate of return over entire 27 year contract per FIT pricing approach.

| 100 MW Wind Project | Status Quo | 27 Year Contract | |
|---|---|---|---|
| | | Initial 5 Years | Last 22 Years |
| Contract Cost (NPV 2017) | $550 million | $632 million | |
| Monthly Average Ratepayer Impact Over First 5 Years | $0.09 savings | | |
| Monthly Average Ratepayer Impact Over Remaining 22 Years | $0.07 increase | | |
| Monthly Average Ratepayer Impact Over Entire 27 Year Contract | $0.04 increase | | |

# 10. Tax Relief for Solar and Wind Contracts

- In 2010 and 2011 Ontario procured large scale projects (>500 kW) through the FIT program at standard offer pricing.

- The FIT program was the centerpiece of the GEA which established the economic and social goals of growing the green economy, including establishing a local renewable energy manufacturing base, supporting the development of green energy jobs, and providing incentives for Indigenous participation.

- To help achieve these economic and social goals, the FIT program offered pricing at above competitive procurement rates, and provided Indigenous and Community participation adders, which resulted in economic benefits to all Ontarians, but resulted in additional costs borne by Ontario's electricity ratepayers.

- Ontario could fund the added cost of some or all of these economic and social incentives by shifting their costs from the rate-base to the tax-base.
    1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
    2. The tax base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT.

**Considerations**

- If applied to projects in commercial operation the benefit to the ratepayer would be immediate.
- Comparing FIT pricing to competitive procurement pricing could provide a reasonable representation of energy procurement without the added cost of economic and social incentives.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

1. The tax-base could fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.
   - For example, from 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
   - The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
   - If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
   - The $3.3 billion difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.
   - This represents estimated average ratepayer savings of $1.50/ month relative to OPO forecasts.
   - The same approach could be considered for solar projects however, prior to LRP I in 2016, Ontario had not procured solar capacity competitively and international cost comparisons are challenging given differences in regional development costs.
   - This example does not include the value of participation price adders available for community and indigenous participation.

# 10. Tax Relief for Solar and Wind Contracts (cont'd)

2. The tax-base could absorb the cost of the incentives paid to encourage Indigenous and Community participation in FIT 1 solar and wind projects.

   - For example, 17 large FIT 1 wind and solar projects have Indigenous and/or Community participation making them eligible for a price adder in addition to their base contract price.

   - The estimated value of these price adders is approximately $17.1 million (NPV 2017) over the expected remaining term of their contracts.

   - This represents estimated ratepayer savings of approximately $0.01/month relative to OPO forecasts.

# Key Outcomes / Next Steps

- The proposed initiatives provide the following opportunities to:
  - Provide a greater focus on vulnerable consumers by funding electricity support programs through the tax-base.
    - Enhance existing and new support programs targeted at the most vulnerable consumers (i.e., OESP and RRRP); and
    - Better harmonize delivery rates across the province.
  - Re-set how energy infrastructure is funded by shifting costs to the tax-base from the rate-base.
  - Provide electricity consumers with greater choices and transparency (e.g., alternative rate plan based on a flat electricity rate, unpacking the Global Adjustment costs, etc);
  - Provide system benefits (e.g., market renewal);
  - Increase cost effectiveness and improve efficiency; and
  - Lower the cost of electricity for all consumers.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require legislative and/or regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

# Appendix

A. Rural or Remote Rate Protection (RRRP) – Overview and Enhancements
B. Fund Conservation Programs Through the Tax-Base
C. Eliminate the Industrial Conservation Initiative (ICI)
D. Cancel Large Renewable Procurement I (LRP I)

# A. RRRP Overview and Enhancements

- The Delivery line of the electricity bill is composed of Distribution and Transmission Costs. While transmission costs are uniform across the province, LDC costs vary by distributor and account for about 20% of the total bill for the electricity customers.
  - See slide X for a map of delivery rate increases between 2006 and 2016.
- The Rural or Remote Rate Protection (RRRP) framework was put in place in 2001 to help offset the higher costs to distribute electricity to Ontario residents who live in rural or remote locations.
- RRRP is available to: residential Hydro One R2 customers (~350,000 customers), Algoma Power customers (~11,600 customers); H1 remote customers (~3,500 customers).
  - To date, R2 customers receive a fixed amount of $125 million a year distributed amongst the customers. Algoma and Remote customers have RRRP calculated by the OEB each year that fluctuates based on average provincial distribution increases.
- Because the amount had been fixed for over a decade, the Province recently increased funding of the RRRP program for Hydro One R2 customers from $125 million to $240 million. This will be effective as of January 1, 2017, and will bring their delivery charges in line with the next highest charges from Hydro One's R1 customer class.

# B. Fund Conservation Programs Through the Tax-Base

- Propose to fund 2017-2020 electricity conservation and demand management program costs* using tax dollars instead of ratepayer dollars.
  - Funds received through the Hydro One Departure Tax could potentially be repurposed towards this.
- Total remaining 2017-2020 electricity conservation program costs are expected to be ~$2.1 billion.
- Post 2020, this option could evolve to funding conservation programs through the Greenhouse Gas Reduction Account.

**Considerations**

- Electricity conservation programs provide a number of benefits to society, however, Ontario's ratepayers have been covering these costs:
  - Avoiding/deferring future energy infrastructure investments, reducing disruption in communities (e.g., avoiding the need to build new natural gas generation);
  - Environmental benefits (e.g., reduced natural gas peaking generation and GHG emissions); and
  - Social and economic benefits (e.g., job creation and assistance managing electricity bills).
- There is precedence for using tax dollars to fund conservation programs.
  - Between 2007 and 2011, Ontario funded the Home Energy Savings retrofit program using tax dollars.
- Funding conservation programs though the tax-base is expected to result in a benefit of $3.40/month for residential electricity consumers in 2017. This could provide immediate short term relief to consumers while other rate mitigation initiatives are developed (e.g., market renewal, LDC efficiencies).

*** Note:** This includes costs towards the Conservation First Framework, Industrial Accelerator Program, Demand Response and the Conservation Fund)

# C. Eliminate the Industrial Conservation Initiative (ICI)

- The cost shift from the Industrial Conservation Initiative (ICI) could be removed from electricity bills by eliminating ICI.
  - The ICI allows large electricity consumers to lower their electricity costs by reducing their demand during peak hours.

**Considerations**

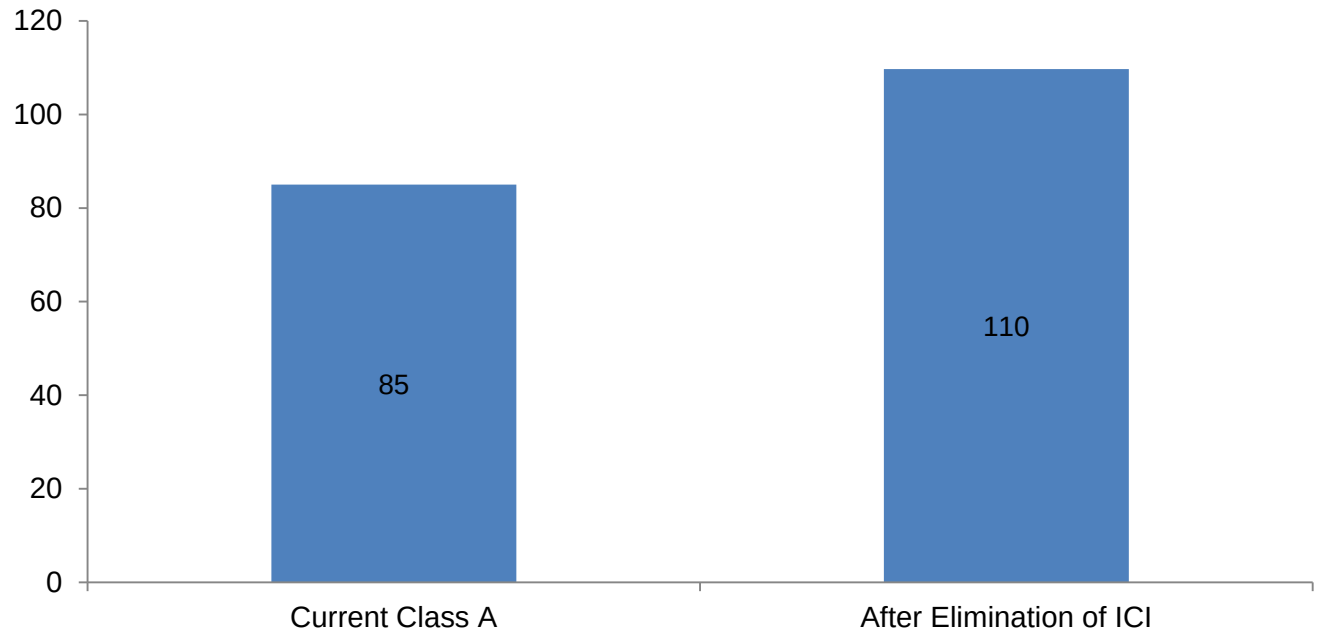
- Eliminating ICI would result in a benefit of more than $4/month for residential electricity consumers in 2017.
  - However, unless government took action to mitigate the associated cost shift back to industrial consumers, typical industrial prices would increase by about one-third. Such a price increase would pose significant challenges for energy-intensive consumers.
- Industrial stakeholders have indicated that ICI as an integral factor in maintaining competitiveness and retaining industry in the province.
  - Eliminating ICI would limit the “cost shift” onto residential consumers, but it would also lead to a reduction in industrial demand. The large industrial contribution to the fixed costs of running the electricity system would then need to be covered by remaining consumers.
- If ICI is retained, current IESO projections indicate that the cost shift will decrease each year going forward as Global Adjustment (GA) decreases (due to an expected increase in HOEP).
- Alternatively, ICI could be funded through the tax-base at a cost of $900 million annually. There is precedent to use the tax-base for industrial support programs, including the Northern Industrial Electricity Rate Program (NIERP) and the Jobs and Prosperity Fund.

# C. Eliminate the Industrial Conservation Initiative (cont'd)

- ICI currently provides a benefit of about $25/MWh to Class A electricity consumers.

**All-In Electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer.

# D. Cancel/Adjust Renewable Energy Procurements

- The Ministry could consider the following actions to further mitigate future impacts to electricity bills:

| Unallocated/Terminated Capacity | Announced Procurements | Executed Contracts |
|---|---|---|
| A. Do not procure unallocated or terminated capacity | B. Revise FIT 5 target | D. Cancel LRP I contracts |
| | C. Cancel FIT 6 | |

**Overarching Considerations**

- Cost savings associated with reducing or cancelling renewable energy procurements and programs will not reduce current electricity bills, but would result in future cost reductions relative to Ontario Planning Outlook forecasts.
- The IESO estimates implementing options A to C will reduce system costs by approximately $592 million ($2016) between 2019 and 2028, resulting in an average of approximately $0.50/month in savings to a typical residential electricity bill over the same period.
- The microFIT program is winding down end of 2017. Annual microFIT procurement targets have been undersubscribed.
- With a few exceptions (e.g. rollover of unallocated microFIT capacity; addition of terminated microFIT and small FIT capacity to FIT 5), plans for unallocated or terminated capacity are not defined in announcements or existing directions.

*Cancel/Adjust Announced Procurements:*

- Amendments to existing directions to IESO would be required to reduce FIT 5 and cancel FIT 6.
- The FIT 5 procurement is underway with a base target of 150 MW and inclusion of any capacity available from contract terminations under prior small FIT and microFIT procurements. The application window closed on November 25, 2016.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts

*Cancel Existing LRP I Contracts:*

- 16 LRP I contracts (approx. 455 MW) have been executed and projects are under development.
- None have met Key Development Milestones. Total value of LRP I estimated at approx. $1 billion (NPV to 2016).

**Considerations**

- To help inform a decision, IESO or OEB could be asked to evaluate and provide guidance to the Ministry on the system need for LRP I projects and potential ratepayer impacts/benefits.
- 13 of 16 LRP I contracts have Indigenous participation. Cancelling LRP I contracts would remove this economic development opportunity and likely damage relationships between Indigenous communities and the government.
- LRP I Contract includes an “Optional Termination” provision allowing IESO to terminate any contract prior to the “Commercial Operation Date” with 6 months written notice.
- The IESO obligations under the Optional Termination provision depend on whether the project has met all “Key Development Milestones”.
  - As no projects have met their Key Development Milestones, the estimated total cost payable to contract holders is about $8 million.

# D. Cancel/Adjust Renewable Energy Procurements – Existing Contracts (cont'd)

**Legal Analysis**

- Any new directive to cancel LRP I contracts would need to be approved by Cabinet, either as part of an LTEP implementation directive to IESO, or pursuant to the overall power to direct IESO with respect to procurements.
  - An amendment to an existing direction would not require Cabinet approval, however, further analysis is required to determine if direction to cancel LRP I contracts could be considered as amending existing direction.
- ENERGY has previously received advice that there is a high risk that a court would conclude that the Minister has no authority under the *Electricity Act , 1998* to issue a direction requiring IESO to terminate microFIT Conditional Offers and FIT Offer Notices that have already been issued to applicants, because these offers create vested contractual rights. This reasoning would likely apply equally to any direction to IESO to cancel LRP I contracts. Previous advice has also flagged a risk that the Province could be liable for damages in tort for inducing a breach of contract (or other claims).
- The risk and costs associated with potential law suits resulting from the cancellation of contracts requires further analysis. LSB recommends ENERGY seek an opinion from Crown Law Office Civil before proceeding.

> Hi Scott,
>
> The quick thought I had was then on a question on what the roles of each OEFC and IESO would be.
>
> I had thought what was being contemplated was that IESO would be held whole, and OEFC would "pay" -- borrowing money to do so], instead of IESO having ratepayers pay through the GA. In this scenario, OEFC has an expense to IESO, financed through debt as OEFC has no associated revenue (at least at the outset until the relative GA size is reversed over time. As a sub-option, if the contracts could be assigned to OEFC, then OEFC's NUG regulation could potentially be listed and have OEFC recover the costs over time, not in the year-of – but that would have a fiscal impact since expense in the early years would exceed recoveries through the GA.
>
> Your alternative seems to be where IESO simply borrows from OEFC, so for OEFC all of this is happening on the balance sheet, where OEFC borrows from the Province and then lends to IESO, so no net income statement or stranded debt impact on OEFC.

However, in this case, IESO is short. It has cash from the OEFC financing, but it doesn't have the annual revenue to cover its contractual obligations. Wouldn't that likely affect the IESO and how it accounts for the contracts?

In either case, I'd think that implementation and accounting questions would need to be addressed, (e.g., objects of the corps, legislation / regulations).

**Subject:** rate mitigation

Hi Ron,

Thinking more about our conversation yesterday around financing of a portion of "out-of-market" generation costs. If IESO entered into a financing arrangement with OEFC and agreed to repay these costs + interest over a set time period, could OEFC record a receivable to offset / avoid the in-year expense?

I ask this in part because one of the other options on the table is to renegotiate wind contracts to reduce current costs by offering to extend the length of the contracts. That will rely on private proponents' cost of capital. We could do the same thing using the Province's costs of funds by financing a portion of the current cost through the OEFC and then agreeing to have ratepayers repay in years 20-30, once contracts have expired, but the facilities potentially still have remaining operating life.

Just a thought – happy to chat.
Scott

MINISTRY OF
ENERGY

# Cap and Trade Auction Proceeds for Commercial and Industrial Electricity Consumers

**Working Draft**

November 2016

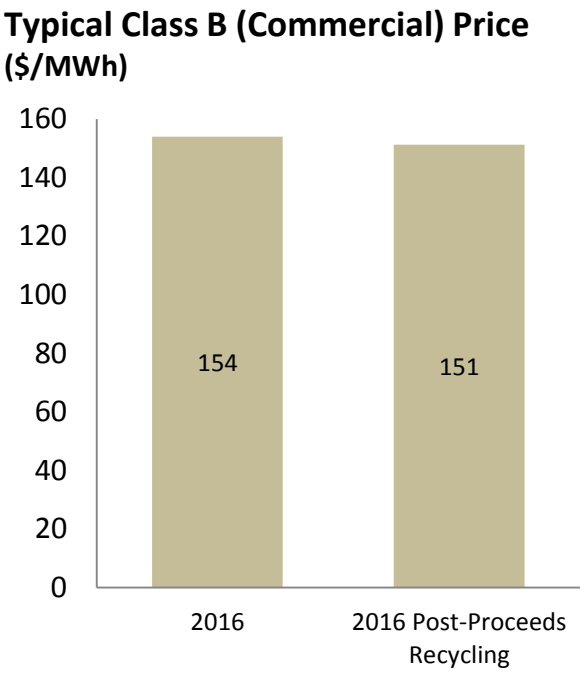
CONFIDENTIAL DRAFT

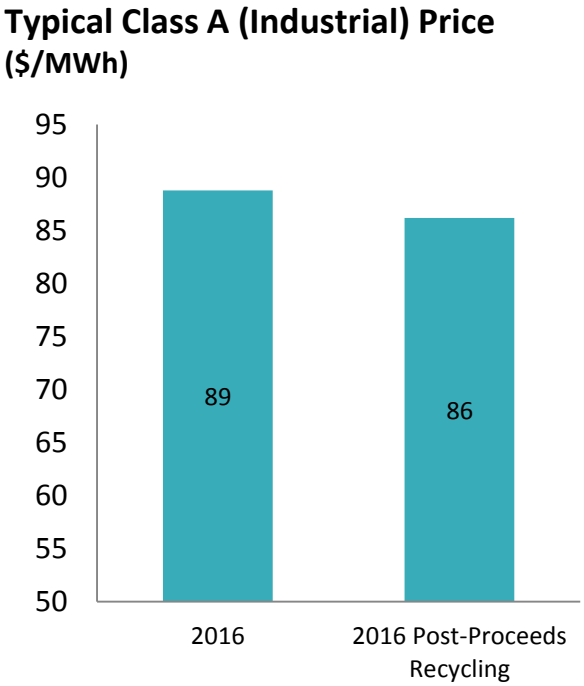
# Context / Current Status

- On September 12, 2016, the Throne Speech announced a number of initiatives to reduce electricity bills for consumers across Ontario, including the government's intention "to use a portion of the cap and trade auction proceeds to reduce greenhouse gas (GHG) emissions by helping industrial and commercial electricity consumers use less electricity, which will also help to keep rates affordable".
  - The Climate Change Action Plan (CCAP) indicates a desire to "Keep Electricity Rates Affordable" (Action 4.4) and states that up to $1.3 billion of cap and trade proceeds will be used to "offset the cost of greenhouse gas pollution reduction initiatives that are currently funded by residential and industrial consumers through their bills."
- On September 12, 2016, ENERGY was directed to work with MOECC to develop options to recycle cap and trade auction proceeds from the Greenhouse Gas Reduction Account (GGRA) to commercial and industrial electricity consumers over the first compliance period (2017-2020).
- The *Climate Change Mitigation and Low-carbon Economy Act, 2016,* requires that auction proceeds be used to fund initiatives that are reasonably likely to reduce, or support the reduction of, GHG emissions.

# Context – September 2016 Cabinet Submission

- In the September 12, 2016 Cabinet submission, ENERGY proposed to recycle approximately $1.1 billion of cap and trade auction proceeds through a volumetric rebate mechanism so commercial and industrial electricity consumers receive a net benefit. The below charts illustrate the consumer impacts of this recycling.





**Note:** Above graphs are for illustrative purposes. Recycling would not occur in 2016.

# Ontario's Climate Change Legislation and Action Plan

## Climate Change Legislation

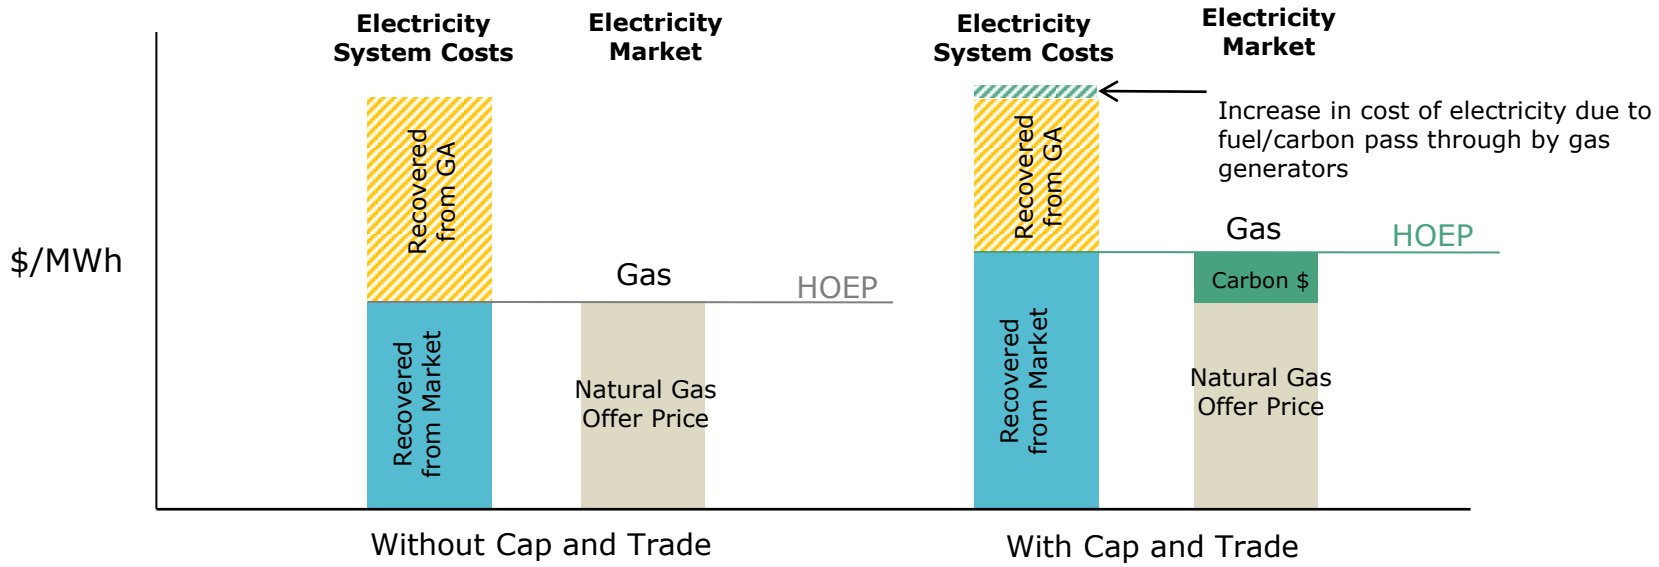
- The *Climate Change Mitigation and Low-Carbon Economy Act, 2016* requires that:
  - Auction proceeds from the Greenhouse Gas Reduction Account (GGRA) be used to directly and/or indirectly fund specific initiatives; and
  - Such initiatives must be reasonably likely to reduce, or support the reduction of, greenhouse gas (GHG) emissions, or be related to initiatives that are reasonably likely to do so (e.g., renewable energy, fuel switching, etc.).

## Climate Change Action Plan

- Released on June 8, 2016, Ontario's Climate Change Action Plan (CCAP) expresses support for actions that incent fuel switching to electricity, incent off-peak electricity consumption and offset the cost of current and future GHG reduction initiatives.
  - Action 4.4 of the CCAP states that up to $1.3 billion of cap and trade proceeds will be used to "offset the cost of greenhouse gas pollution reduction initiatives that are currently funded by residential and industrial consumers through their bills."
  - CCAP did not set out potential approaches for proceeds recycling to the electricity sector.

# Impact of Cap and Trade on the Electricity Market

- Under cap and trade, the wholesale hourly electricity price (HOEP) will increase in many hours as a result of peaking generators (i.e., often gas generators) including the cost of carbon in their offers. Fuel costs are essentially a pass through for these generators.
- The payments to gas generators through Global Adjustment (GA) will decrease a greater proportion of total system costs would be recovered through the market.
- On a net basis, these dynamics will cause the total system cost to increase as HOEP goes up, but GA goes down by a smaller amount.

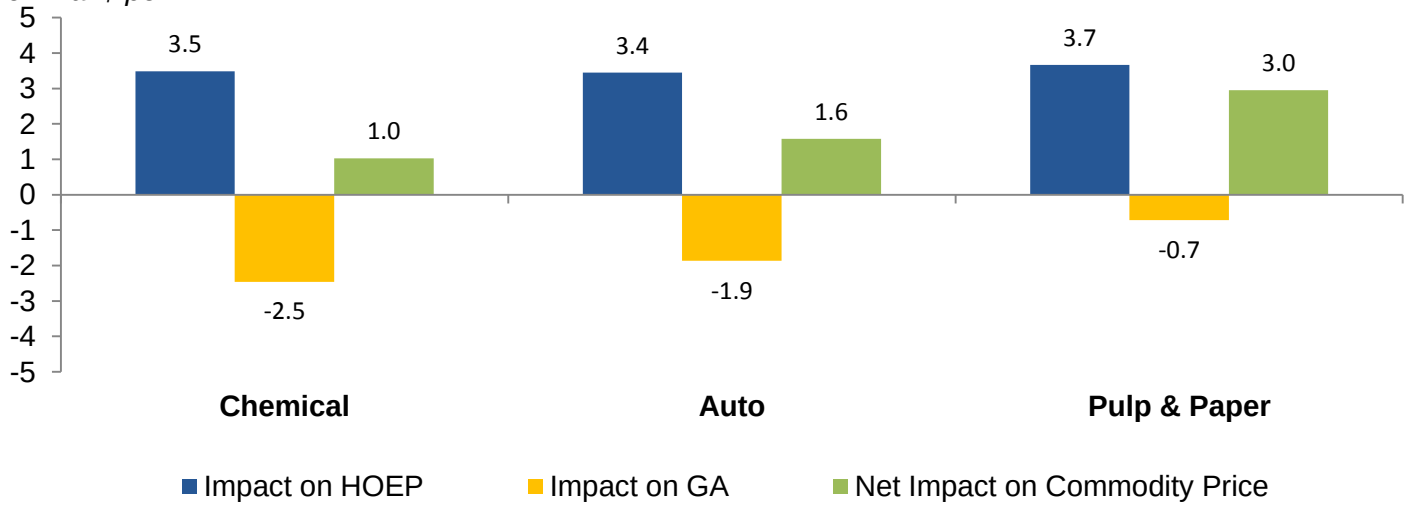


# Cap and Trade Impact on Electricity Consumers

- There is significant variation in the commodity cost of large electricity consumers due to differences in their Global Adjustment (GA) costs:
  - GA paid by Class A electricity consumers varies depending on their ability to take advantage of the Industrial Conservation Initiative (ICI) and reduce consumption during peak hours.
  - Under ICI, large electricity consumers pay GA based on their share of peak demand during the five peak hours of the year. These "Class A" consumers can pay lower GA if they are able to reduce consumption during peak times.

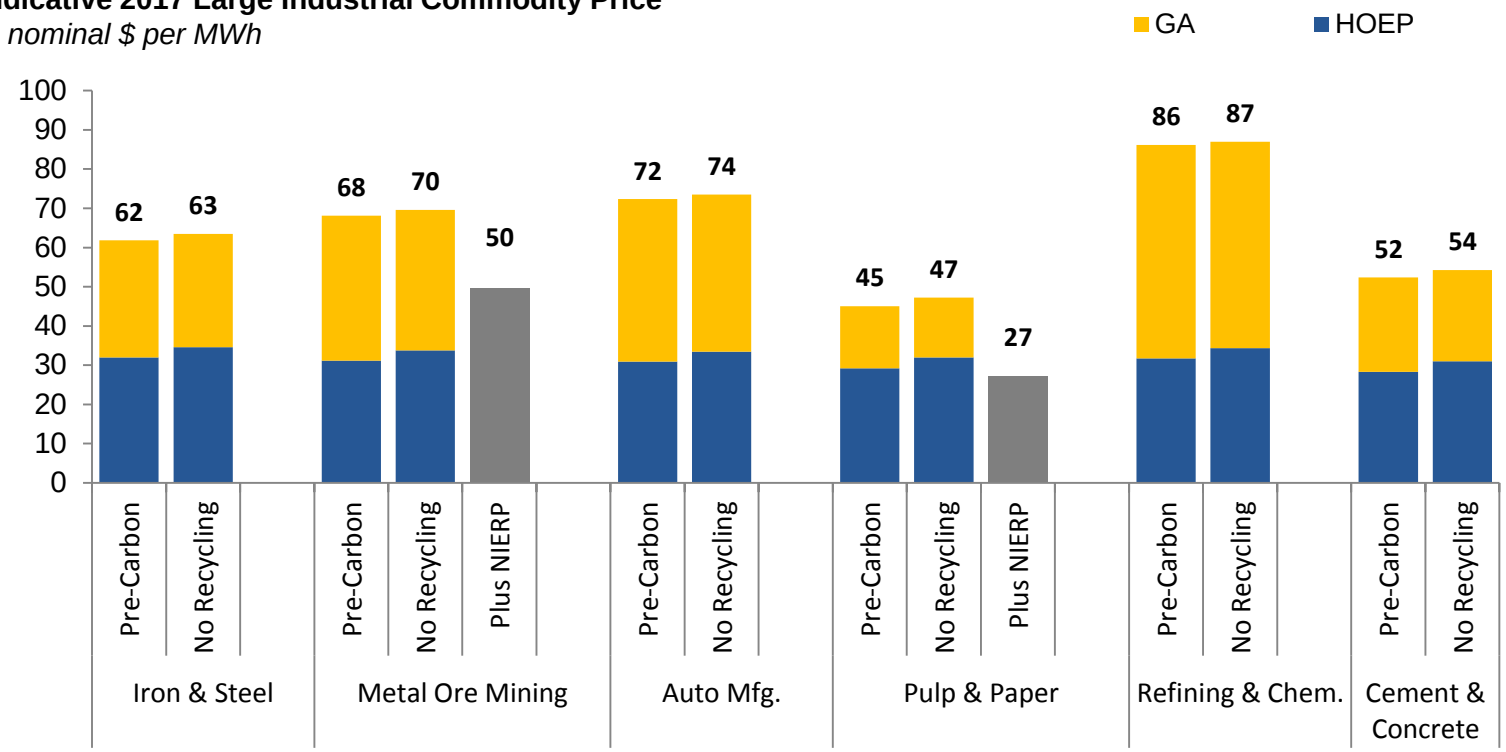
- Because of this variation, the net impact of cap and trade on the Hourly Ontario Energy Price (HOEP) and GA varies.

**Indicative Average Impact (2017-2020)**
*in nominal $ per MWh*



# Cap and Trade Impact on Electricity Consumers (cont'd)

**Indicative 2017 Large Industrial Commodity Price**
*in nominal $ per MWh*



**Note:**

**1)** The graph is based on transmission-connected industrials reflecting about 70 of the 300 consumers participating in ICI. While the graph shows an average, there is variation between individual facilities within sectors.

**2)** Most large industrial consumers in northern Ontario participate in the Northern Industrial Electricity Rebate Program (NIERP), which provides a $20/MWh rebate on eligible consumption. This impact is not included in the chart.

# Proceeds Recycling Options

# Proceeds Recycling Options – Overview

- Recycling cap and trade auction proceeds to lower the cost of electricity would:
  - Offset consumers' contributions to investments/initiatives which reduce GHGs (e.g., non-emitting generation and conservation programs);
  - Support CCAP goal of fuel-switching and electrification; and
  - Depending on the option chosen, incent "behavioural change" such as consuming electricity during off-peak times.

- The proposed auction proceeds recycling options include:
  1. Recycle proceeds back to electricity consumers via Global Adjustment (GA);
  2. Recycle proceeds volumetrically in all hours (as assumed in the September 12 Cabinet submission);
  3. Recycle proceeds volumetrically in off-peak hours; and
  4. Recycle proceeds via a hybrid approach through GA and volumetrically.

- The proposed options are intended to balance the ability to meet the CCAP commitments, provide consistency with the September 2016 direction, maintain the potential for linking funding to GHG reductions and minimize administrative complexity.

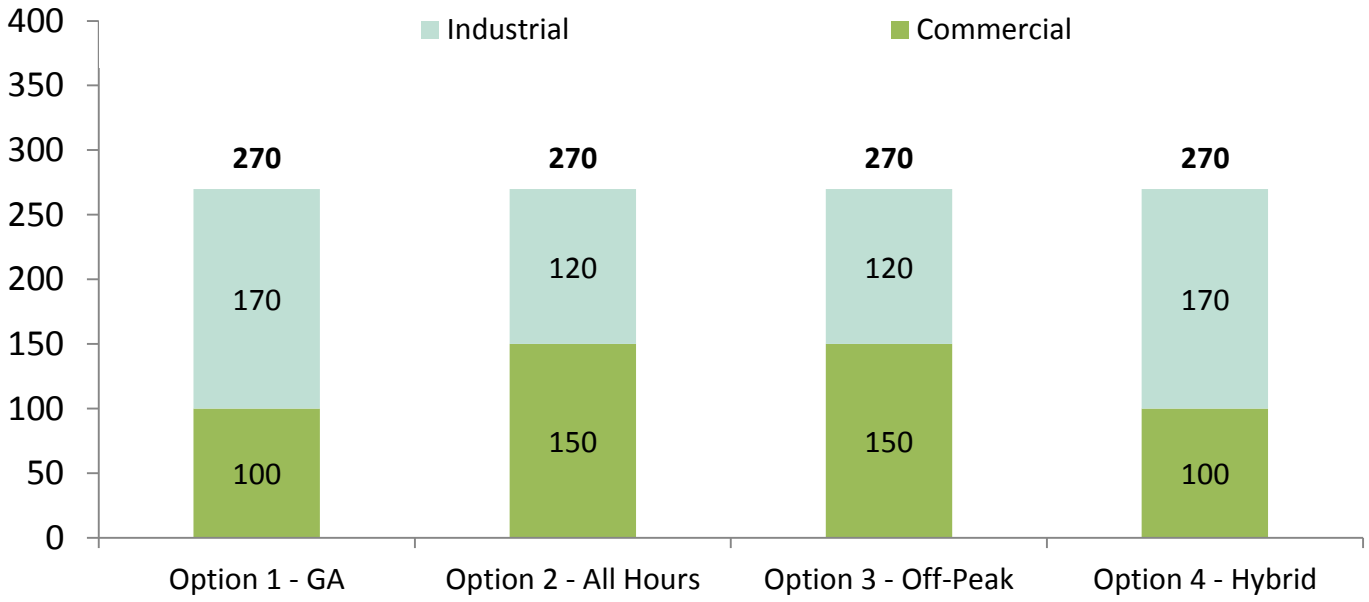
# Illustrative Impact to Electricity Consumers (2017-2020)

| Option | Total (2017-2020) | Avg. Residential Impact ($/month) | Avg. Class B Commercial Impact ($/MWh) | Class A Industrial Impact* ($/MWh) | | |
|---|---|---|---|---|---|---|
| | | | | High GA (e.g., chemical) | Medium (e.g., auto) | Low GA (e.g., pulp) |
| CCAP estimate was based on recycling via GA to offset the average industrial consumer | $1.3 billion | - $2.00 | - $2.50 | - $1.10 | $0 | $2.35 |
| 1. **Global Adjustment (GA) recycling** (Targeted amounts to Class A and Class B electricity consumers) | $1.1 billion | N/A** | - $1.70 | - $6.90 | - $4.50 | $0.60 |
| 2. **Volumetric recycling in "all hours"** (as assumed in the September 12 Cabinet submission) | $1.1 billion | N/A** | - $2.70 | - $3.25 | - $2.70 | - $1.30 |
| 3. **Volumetric recycling in "off-peak hours"** | $1.1 billion | N/A** | - $2.70 | - $3.15 | - $2.50 | - $1.60 |
| 4. **Hybrid option** (targeted amounts via GA to Class A, plus volumetric amount in "all hours" to Class A)*** | $1.1 billion | N/A** | - $1.70 | - $6.20 | - $4.50 | - $0.80 |

*** Note:** The above benefits do not include the cost of ICI expansion (impact of about $1/MWh) and the RRRP update (impact of about $0.76/MWh). Proceeds recycling is net of the cost of carbon and represents an estimated average of the proceeds required over the first compliance period (2017-2020).
**** Note:** Most residential consumers pay under the Regulated Price Plan (RPP). For simplicity, all non-RPP Class B consumers are referred to as "Class B/Commercial" throughout the deck. On September 15, 2016, the government introduced legislation that would provide an 8% rebate equal to the provincial portion of the Harmonized Sales Tax (HST) to consumers eligible for the RPP, such as residential households, small businesses and farms – exceeding the 2016 Budget commitment.
*****Note:** The estimates assume that 60% of proceeds for Class A is recycled via a targeted GA and 40% is recycled volumetrically; Class B consumers are assumed to receive recycling via a targeted GA.

# Average Annual Proceeds Required

**Average Annual Proceeds Required (2017-2020)**
*in $ millions per year*



**Note:** The CCAP estimate which was based on recycling via GA to offset the average industrial consumer allocated an average of $40 million per year to industrial electricity consumers and approximately $175 million per year to commercial electricity consumers over the first compliance period.

**Note:** Option 2 reflects the assumptions in the September 12, 2016 Cabinet submission. Option 4 assumes that 60% of proceeds for Class A is recycled via a targeted GA and 40% is recycled volumetrically; Class B consumers are assumed to receive recycling via a targeted GA.

# 1. Recycling Proceeds via the Global Adjustment (GA)

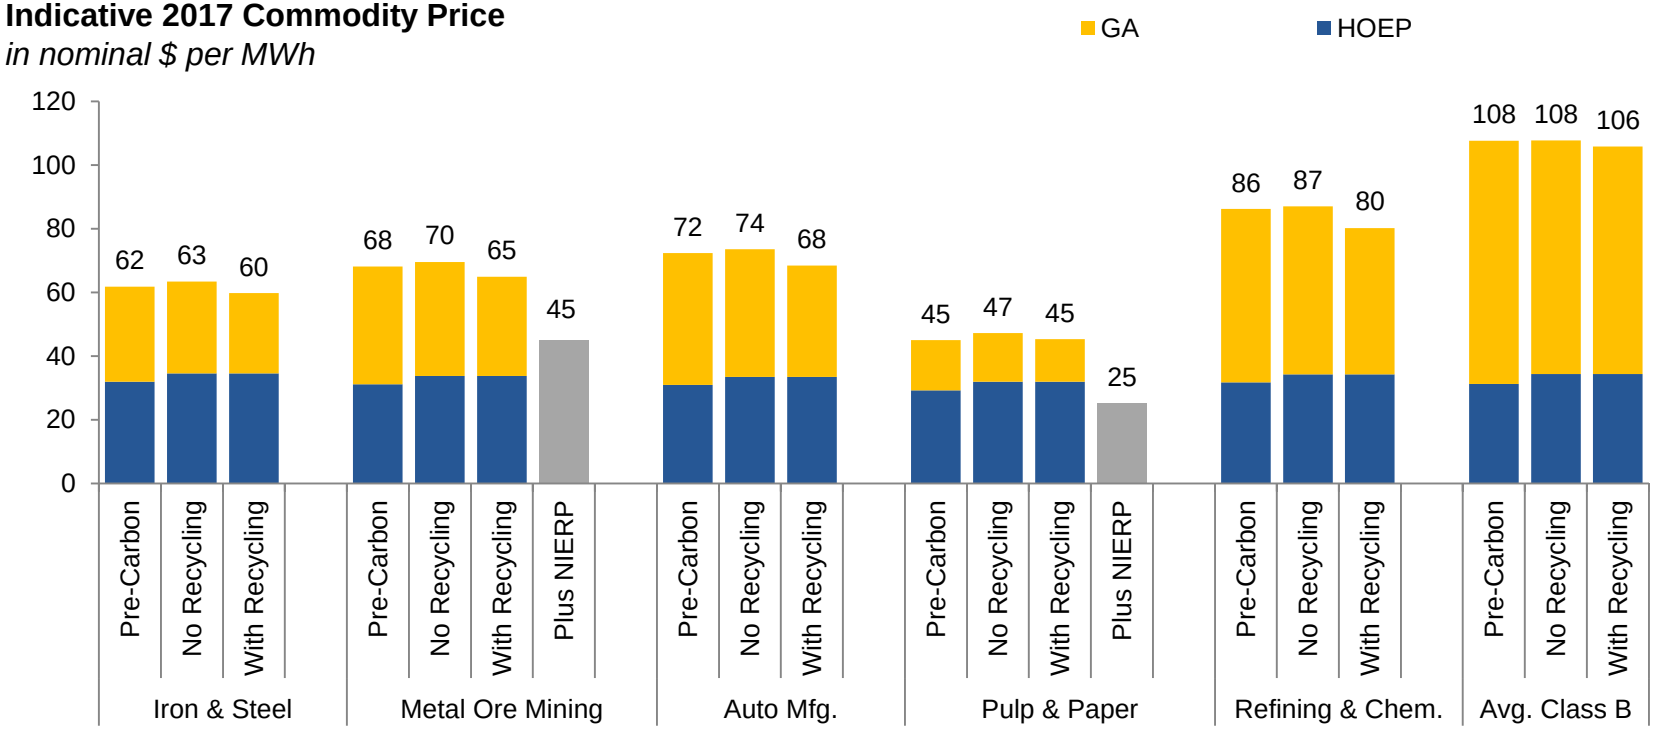
- Propose to recycle an annual average of $270 million in cap and trade auction proceeds through the Global Adjustment (GA) mechanism to commercial and industrial electricity consumers.
  - Proposal would recycle an annual average of approximately $100 million to offset the impact to the average Class B electricity consumers (i.e., commercial) and allocates the remaining $170 million per year to Class A electricity consumers (i.e., industrial) over the first compliance period (2017-2020).
  - Represents a reduction of approximately $60 million per year on average from the CCAP commitment.

**Considerations**

- Does not meet the September 12, 2016 commitment to provide a benefit to all industrial and commercial electricity consumers. Under this option, some industrial electricity consumers would continue to pay a carbon price and the net benefit would differ between consumers.
  - Many large industrials (particularly those participating in the ICI program) would not pay sufficient GA to benefit enough to offset the costs associated with the cap and trade program.
  - Class A consumers in sectors that are currently paying lower GA (e.g., pulp & paper, cement, iron & steel) would receive relatively less proceeds recycling compared to consumers in sectors that currently pay higher GA (e.g., auto manufacturing, petroleum products refining and chemical producers).
- Provides a strong link to the MOECC legislation and the GGRA since amounts would be used directly to lower the costs associated with GHG-lowering activities and initiatives (including the pooled costs of the FIT, microFIT, Large Renewables, Conservation and Demand-side Management (CDM)) and ratepayers incurring the highest GA costs would also see greater benefits.

# 1. Recycling Proceeds via GA – Variation in Electricity Costs

**Indicative 2017 Commodity Price**
*in nominal $ per MWh*



**Note:** The graph is based on transmission-connected industrials reflecting about 70 of the 300 electricity consumers that participate in ICI. While the graph shows an average, there is variation between individual facilities within sectors for Class A electricity consumers. The above benefits do not include the cost of ICI expansion (impact of $1/MWh) and the RRRP update (impact of $0.76/MWh).

# 2. Recycling Proceeds Volumetrically in “All Hours”

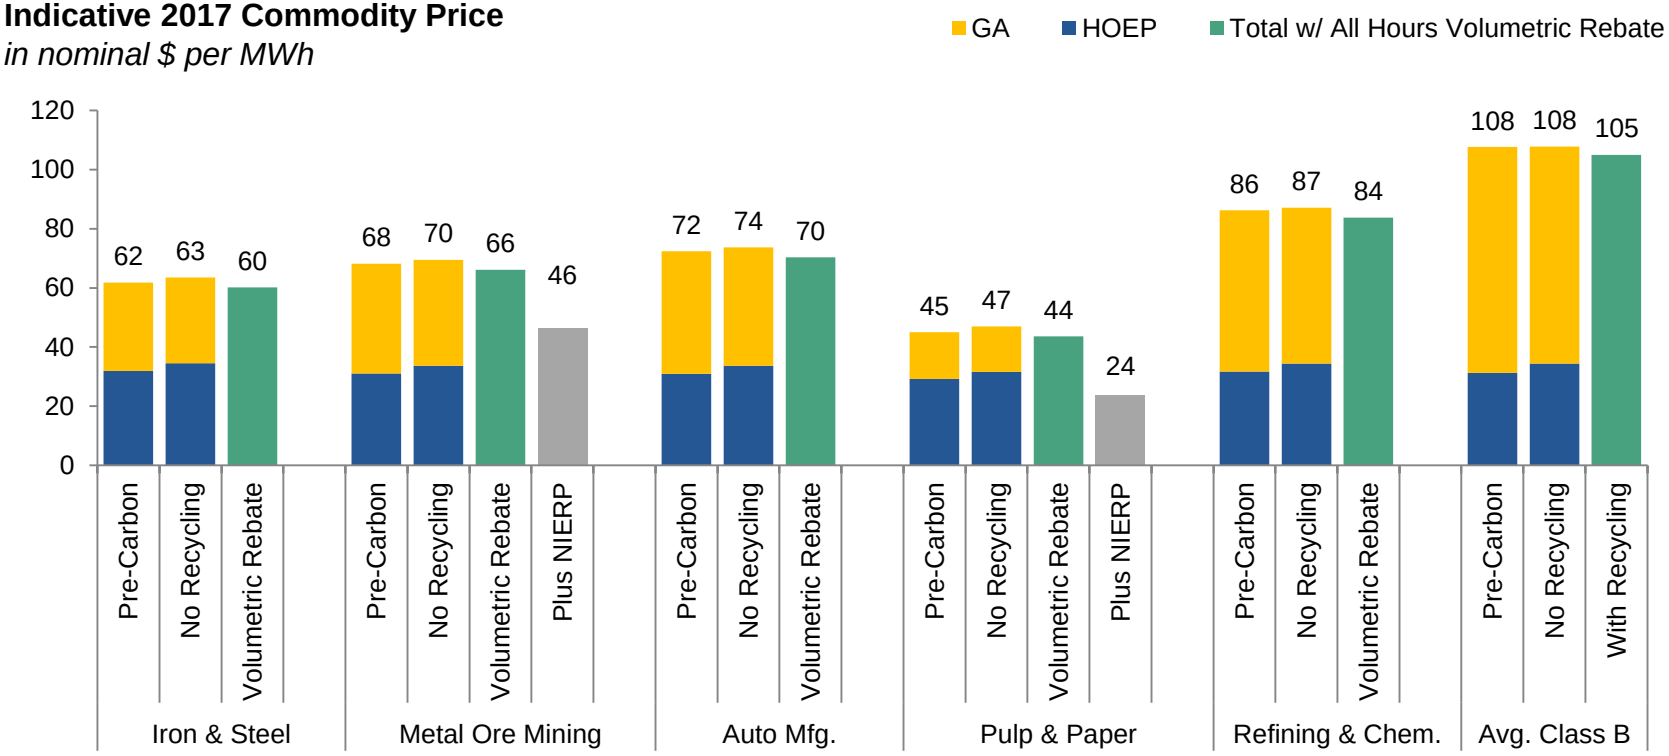
- Propose to recycle an annual average of $270 million in cap and trade auction proceeds through a volumetric mechanism in “all hours” to commercial and industrial electricity consumers.
  - Proposal would recycle an annual average of approximately $150 million for Class B electricity consumers ((i.e., commercial) and approximately $120 million per year for Class A electricity consumers (i.e., industrial) over the first compliance period (2017-2020).
  - This represents a reduction of approximately $60 million per year on average from the CCAP commitment.

**Considerations**

- Consistent with the September 2016 commitment to use cap and trade auction proceeds to provide a net benefit to commercial and industrial electricity consumers.
- Volumetric recycling is more administratively complex than recycling through GA.
- Under this option, the cost of continuing investments in cleaner generation and conservation which decrease GHG emissions would be offset for industrial and commercial consumers. Additionally, this option would maintain the price differential between on- and off-peak hours, thereby encouraging “behavioural change”.

# 2. Volumetric Recycling in "All Hours" – Variation in Electricity Costs

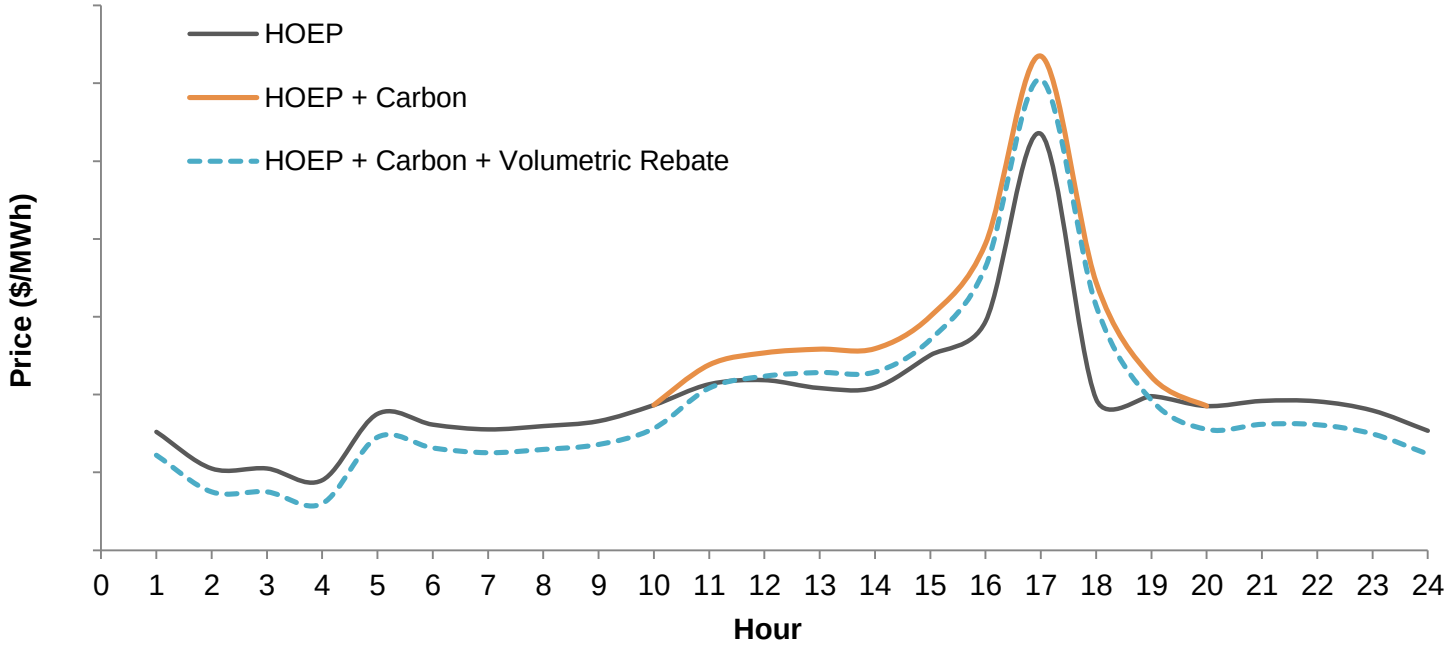
**Indicative 2017 Commodity Price**
*in nominal $ per MWh*



**Note:** The graph is based on transmission-connected industrials reflecting about 70 of the 300 electricity consumers that participate in ICI. While the graph shows an average, there is variation between individual facilities within sectors for Class A. The above benefits do not include the cost of ICI expansion (impact of $1/MWh) and the RRRP update (impact of $0.76/MWh).

# 2. Volumetric Recycling in “All Hours” – Illustrative Example

- Cap and trade will result in an increase in on-peak electricity prices. Redistributing auction proceeds volumetrically across “all hours” would maintain the incentive for off-peak electricity usage.



# 3. Recycling Proceeds Volumetrically in “Off-Peak” Hours

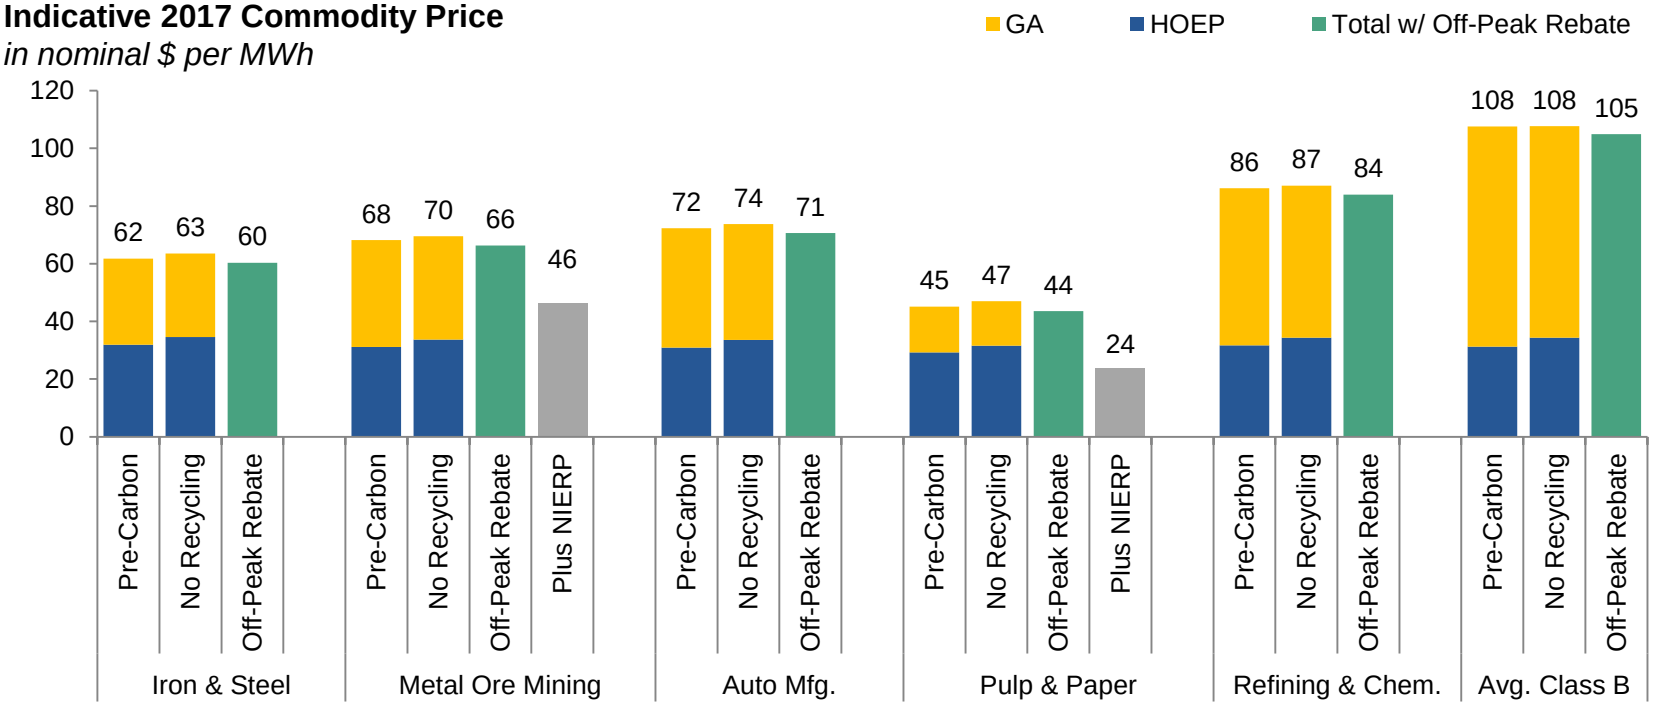
- Propose to recycle an annual average of $270 million in cap and trade auction proceeds through a volumetric mechanism in “off-peak” hours to commercial and industrial electricity consumers.
  - Proposal would recycle an annual average of approximately $150 million for Class B electricity consumers (i.e., commercial) and approximately $120 million per year for Class A electricity consumers (i.e., industrial) over the first compliance period.
  - This represents a reduction of approximately $60 million per year on average from the CCAP commitment.

**Considerations**

- Consistent with the September 2016 commitment to use cap and trade auction proceeds address the impact of cap and trade on commercial and industrial electricity consumers.
- Under this option, no industrial/commercial electricity consumer would be worse off as a result of the imposition of cap and trade.
- Volumetric recycling is more administratively complex than recycling through GA. Recycling in only off-peak hours would add further complexity to the process.
- Incenting consumption during “off-peak” hours, when Ontario’s current mix of resources typically emit low levels of emissions, could further reduce GHGs.

# 3. Volumetric Recycling in "Off-Peak" Hours – Variation in Electricity Costs

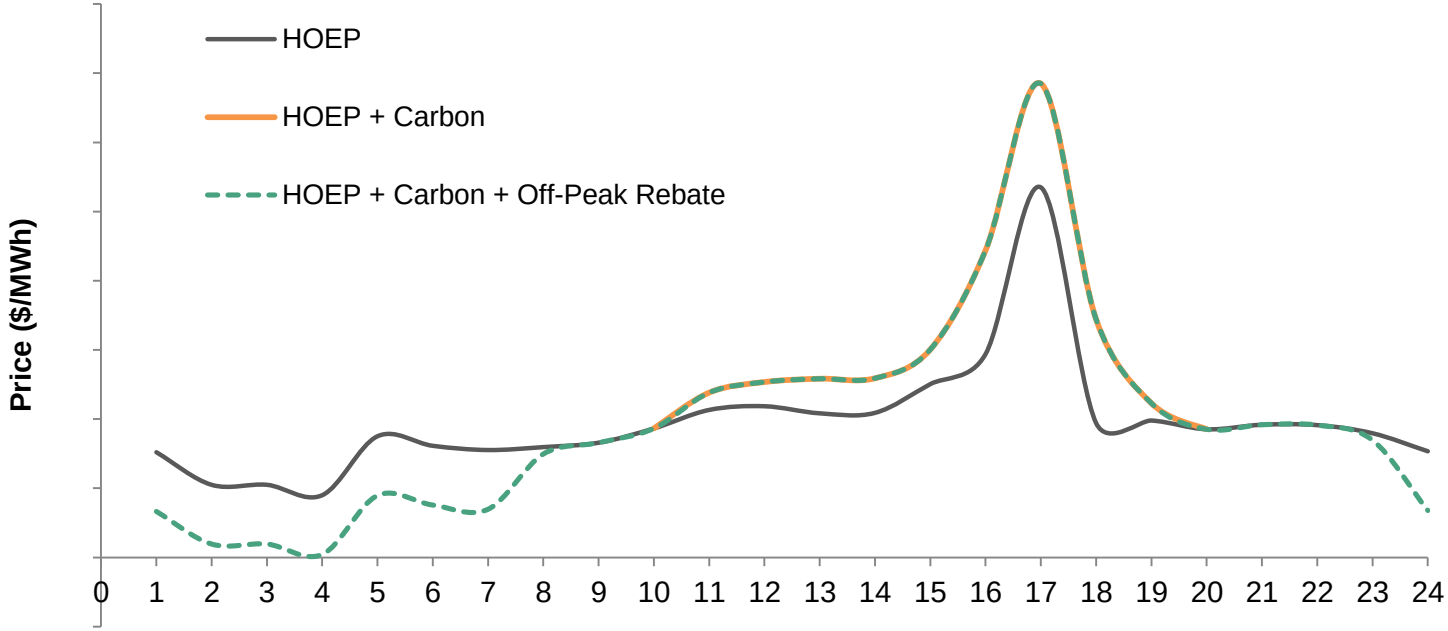
**Indicative 2017 Commodity Price**
*in nominal $ per MWh*



**Note:** The graph is based on transmission-connected industrials reflecting about 70 of the 300 electricity consumers that participate in ICI. While the graph shows an average, there is variation between individual facilities within sectors for Class A. The above benefits do not include the cost of ICI expansion (impact of $1/MWh) and the RRRP update (impact of $0.76/MWh). Estimates based on IESO's definition of "on peak" (hours 8 to 23 Monday to Friday ) and "off-peak" (all remaining hours in the week) for informal purposes; the wholesale market does not use a formal definition of on and off-peak hours.

# 3. Volumetric Recycling In "Off-Peak" Hours – Illustrative Example

- To further incent "off-peak" consumption, proceeds could be redistributed to off-peak hours only.



**Note:** Based on IESO's definition of on peak (hours 8 to 23 Monday to Friday ) and off-peak (all remaining hours in the week) for informal purposes; the wholesale market does not use a formal definition of "on-peak" and "off-peak" hours.

# 4. Recycle Proceeds via GA and Volumetrically (Hybrid)

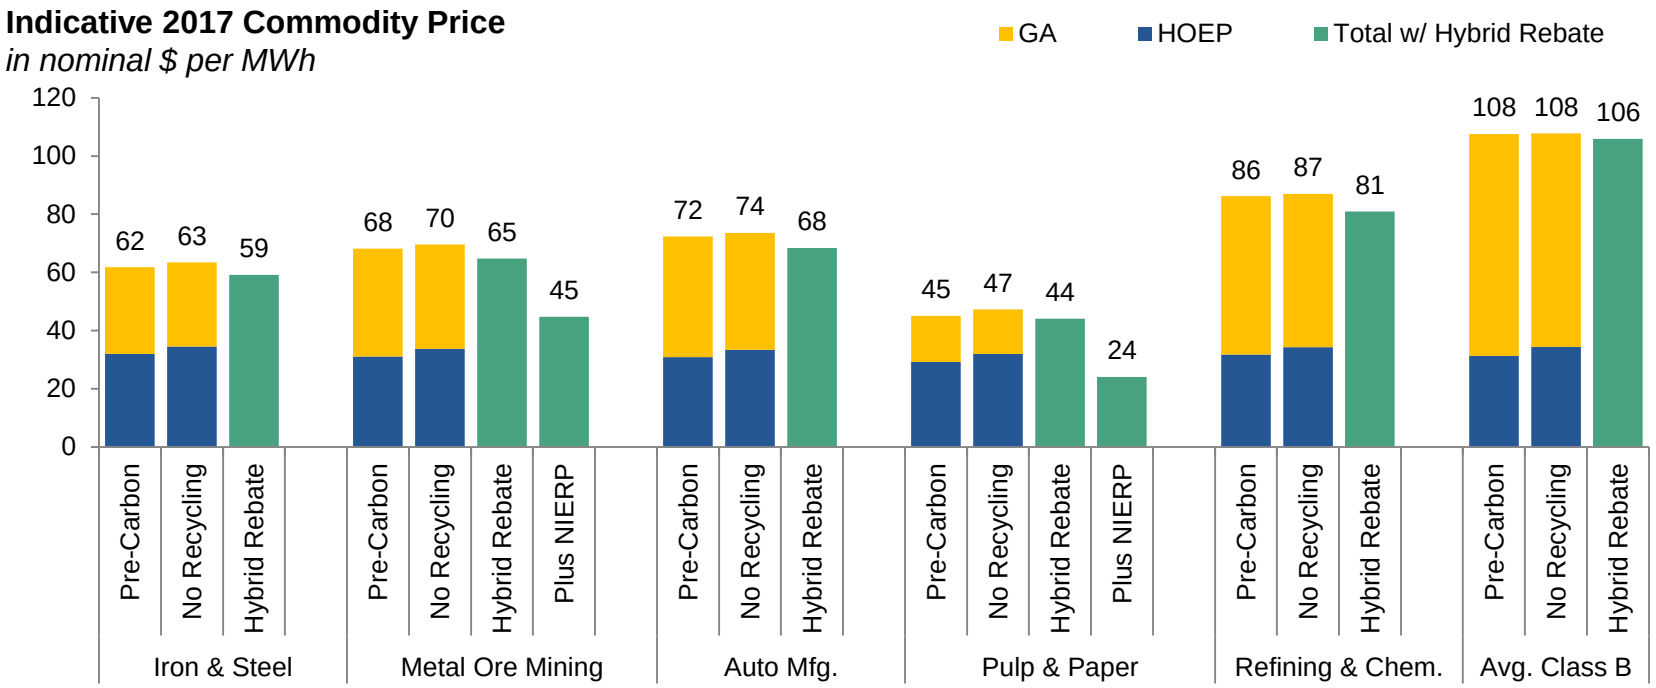
- Propose to recycle an annual average of $200 million in cap and trade auction proceeds through the GA mechanism to commercial and industrial electricity consumers, and an annual average of $70 million volumetrically to industrial electricity consumers.
  - Proposal would recycle an annual average of approximately $100 million to offset the impact to the average Class B electricity consumers (i.e., commercial) and approximately $170 million per year to Class A electricity consumers (i.e., industrial) over the first compliance period.
  - Represents a reduction of approximately $60 million per year on average from the CCAP commitment

**Considerations**

- Consistent with the September 2016 commitment to use cap and trade auction proceeds to provide a net benefit to commercial and industrial electricity consumers. Similar to the GA-only option, companies with a specific load profile (e.g., such as the ability to avoid the top five peaks to pay lower GA while consuming on-peak in all other hours) would receive less relative to other companies due to their exposure to GA.
  - While the use of the volumetric portion of a hybrid approach could lower the cost impact on consumers who not pay sufficient GA to benefit from a GA-only approach, certain Class A consumers would receive relatively less proceeds recycling.

- A hybrid approach provides a strong link to the MOECC legislation and the GGRA since amounts would be used directly to lower the costs associated with GHG-lowering activities and initiatives funded through GA. However, this option is the most administratively complex given that it involves multiple mechanisms.

# 4. Recycling Proceeds via Hybrid Approach – Variation in Electricity Costs



**Note:** The graph is based on transmission-connected industrials reflecting about 70 of the 300 electricity consumers that participate in ICI. While the graph shows an average, there is variation between individual facilities within sectors for Class A electricity consumers. The above benefits do not include the cost of ICI expansion (impact of $1/MWh) and the RRRP update (impact of $0.76/MWh). Assumes that two amounts could be targeted via GA. The estimates assume that 60% of proceeds for Class A is recycled via a targeted GA and 40% is recycled volumetrically.

# Rationale / Considerations

# Achieving the CCAP Commitment / Cost Savings

- The Climate Change Action Plan (CCAP) committed up to $1.3 billion over four years for electricity mitigation for industrial, commercial and residential electricity consumers from GGRA proceeds.

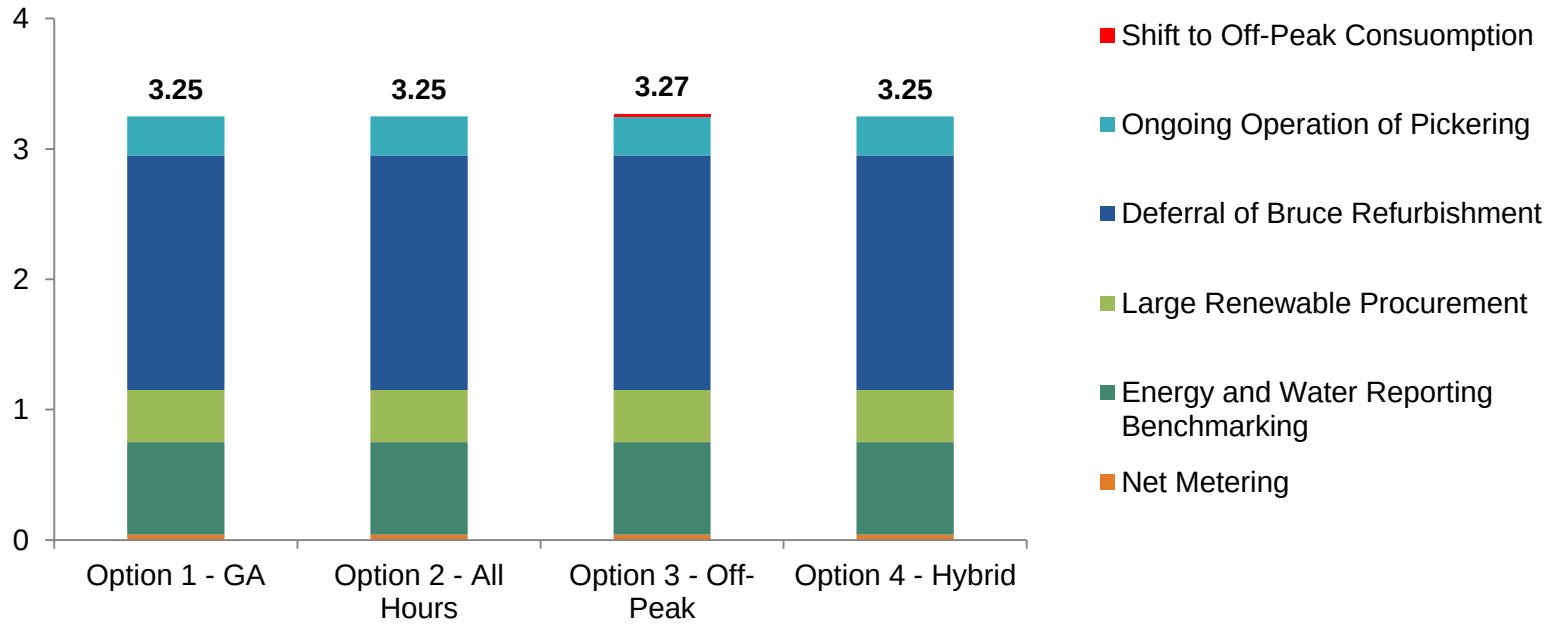
- The proposals require approximately 20% less in auction proceeds, saving approximately $0.24 billion relative to the CCAP commitment over the first compliance period (2017-2020).
  - The GA option assumes that two amounts could be targeted via GA – one specific to Class A electricity consumers and one specific to Class B consumers. This option does not meet the September 12 commitment as some industrial consumers would continue to pay a carbon price.
  - The volumetric proposals (i.e., “all hours” and “off-peak”) meet the 2016 Budget commitment and ensure that no industrial/commercial electricity consumer would be worse off as a result of cap and trade.
  - The hybrid option also assumes that two amounts could be targeted via GA and that government would specify amounts that would flow through GA and through a volumetric mechanism for Class A consumers. However, some industrial consumers with “specific load” shapes would continue to be disadvantaged compared to other consumers due to their lack of exposure to GA.

- Consistent with the September 12 minute, consideration could be given to allocating the $0.24 billion in reduced proceeds required towards other existing initiatives that also reduce greenhouse gas (GHG) emissions.

# Reducing GHG Emissions – Summary

- ENERGY has estimated the GHG emissions reductions associated with “planned/committed” electricity sector initiatives that were developed following the 2013 LTEP and the rebate in off-peak periods.

**Average Annual GHG Reductions (2017-2020)**
*in megatonnes (Mt) CO2*



# Reducing GHG Emissions – Investments in Clean Electricity and Conservation

- All the proposed options are capable, once fully developed, of demonstrating a link between proceeds recycling and the lowering of GHGs by offsetting the costs of investments in clear electricity generation and conservation (i.e., 90% GHG-free).

- Since 2003, Ontario has invested more than $30 billion in over 11,000 megawatts (MW) of new and refurbished clean generation, including nuclear, hydro, wind and solar – this represents about 30% of our current supply.

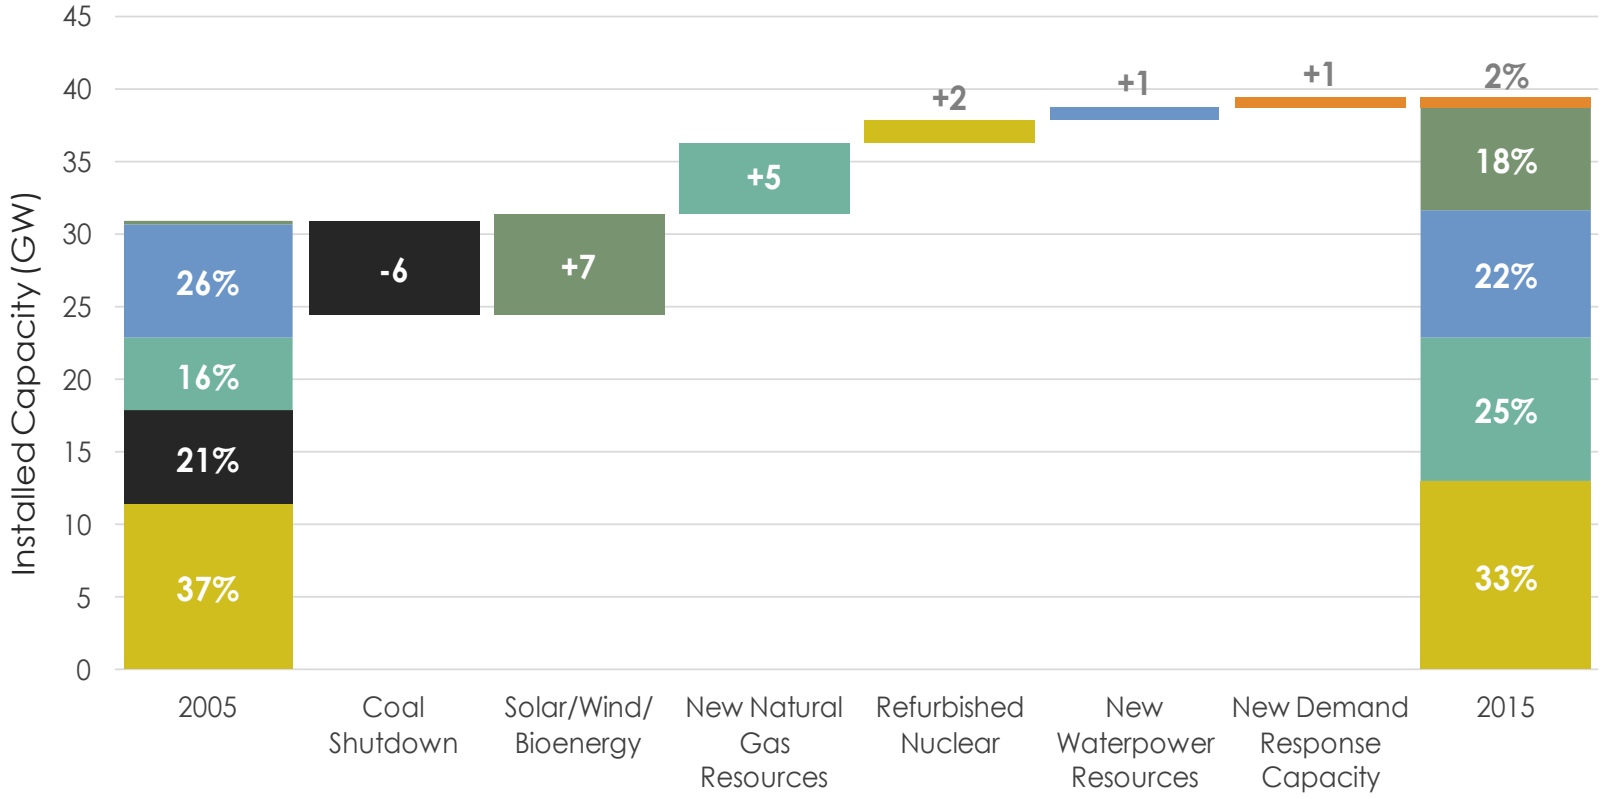
- The costs associated with these ongoing investments in the electricity sector to ensure a clean, low-GHG-emitting system are significant and continue to be borne by electricity ratepayers. Recycling helps pay for committed investments/initiatives which reduce GHGs (e.g., non-emitting generation, nuclear and conservation programs).

- Due to the long-term nature (typically 20 years) of electricity generation contracts and conservation programs, the associated costs are ongoing and are expected to be about $7 billion dollars annually during the first cap and trade compliance period. These costs will continue well beyond the timelines described in the CCAP.

- Decisions made since the 2013 LTEP, including approving Ontario Power Generation's plan to pursue Pickering life extension, represent an estimated more-than-3Mt reduction in emissions during the first compliance period.

# Reducing GHG Emissions – Investments in Clean Electricity and Conservation (cont'd)

**Change in Installed Supply Resources (2005-2015)**



Source: Ontario Planning Outlook, 2016

# Reducing GHG Emissions – Load Shifting / Fuel Switching

- All of the proposed options have the potential to reduce GHG emissions by incenting consumers to switch from using electricity over fossil fuels and using electricity during periods when there is less carbon in our electricity generation.

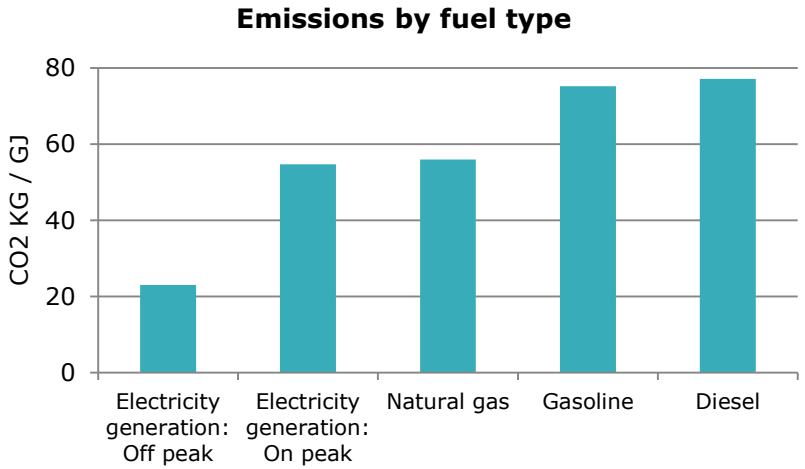
- All four options would make electricity more affordable, incenting fuel switching to electricity that is relatively cleaner than other fuels (i.e., natural gas, oil).

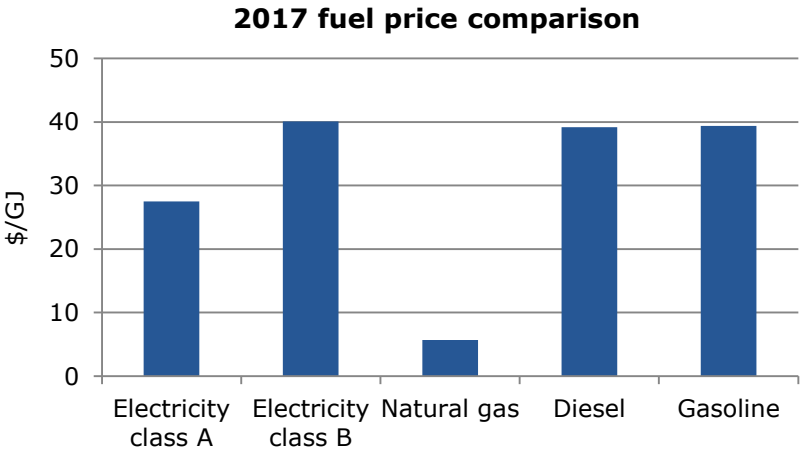
- The volumetric “all hours” option maintains existing price differentials while lowering the overall cost impact on consumers. This preserves the current market price-signal to load-shift from on-peak periods to off-peak.
  - The volumetric “off-peak” hours option would further increase the incentive to shift to off peak periods.
  - Both volumetric recycling options could lead to implementation/administrative complexity for LDCs.

- Based on ENERGY preliminary analysis, providing the rebate in off-peak periods could further reduce emissions by up to 20,000 tonnes (i.e., 0.02 Mt) over the first compliance period, with higher savings expected over the long term as the carbon price, consumer response and amount of recycling increases.

# Reducing GHG Emissions – Load Shifting / Fuel Switching (cont'd)

- The use of cap and trade auction proceeds to lower the cost of clean electricity would make it more competitive with traditionally cheaper fossil fuels, providing an incentive to fuel switch from fossil fuels to electricity is a "behavioural change" consistent with the goals of CCAP.
- During "off-peak" hours, Ontario's current mix of resources typically emit extremely low levels of GHG emissions.
- Ontario's grid electricity currently has an emission factor which is far lower than the carbon content of natural gas or diesel. This puts Ontario's electricity sector in a strong position to support fuel switching as a GHG-reducing activity.





*Source: ENERGY analysis, FTR 2016, OPO 2016, EIA, STATCAN*

# Implementation Considerations

- While the impact of cap and trade would be added to electricity bills as of January 2017, the offsetting effect of proceeds recycling may not occur immediately depending on implementation and potential alignment with the first auction expected in March 2017.

- Due to IESO and LDCs' need to implement billing system changes, proceeds recycling would likely not appear on bills immediately after January 1, 2017, but would require an initial catch-up/true-up payment at first. Recycling either primarily or exclusively to "off-peak" hours would increase administrative complexity for the IESO and LDCs.

- Any of the recycling options would require the tracking of the impact of carbon on HOEP. However, a "true-up" mechanism may need to be done more frequently (i.e., monthly) for the volumetric "all hours" and "off-peak" options.

- The volumetric options may require a "separate regulatory" line item of Class A and non-residential Class B electricity consumers' bills. Staff analysis is ongoing.

- Contemplated legislative amendments to implement proceeds recycling would require approval of the House (Legislature) including its committee process. However, legislation provides more certainty regarding legal authority.

# Stakeholder Considerations

| Stakeholder | Current Status / Comments |
|---|---|
| AMPCO | • ENERGY has regularly met with the Association of Major Power Consumers of Ontario (AMPCO). IESO and MOECC have attended some of the meetings.<br>• AMPCO expressed concerns regarding the GA option as some consumers would see an increase in the cost of electricity associated with the cap and trade program. These concerns would likely persist for a hybrid option.<br>• AMPCO is generally supportive of "volumetric" recycling and of providing a net benefit to electricity consumers. **Note:** Additional information on the potential impact was requested by AMPCO and its members.<br>• Following initial discussions on the "off-peak" proposal in October 2016, AMPCO raised concerns that some of their members would be worse off under the proposal. |
| LDCs | • ENERGY has established a rate mitigation working group with LDCs and the Electricity Distributors Association (EDA). Proceeds recycling has been discussed with the working group.<br>• LDCs have expressed concerns regarding the timing of implementing billing system changes which could take several months or more depending on complexity.<br>• LDCs have requested for further clarity on timing and the approach in order to scope the changes needed. |

# Legal Considerations

- Three broad legal issues arise with the proposal to use cap and trade auction proceeds for commercial and industrial electricity consumers:

1. Meeting the requirements of the *Climate Change Mitigation and Low-carbon Economy Act, 2016* (the “Act”)

2. Addressing constitutional law requirements to ensure that cap and trade proceeds will not be characterized as an unconstitutional tax; and

3. Ensuring sufficient authority within the electricity system to receive GGRA proceeds and apply them as intended.

# 1. Legal Considerations – Meeting the Requirements of the Act

- The Act allows funds collected from cap and trade to be used to fund, directly or indirectly, costs relating to listed initiatives that are reasonably likely to reduce, or support the reduction of greenhouse gas (GHG) emissions and costs relating to any other initiatives that are reasonably likely to do so.

- Listed initiatives include initiatives relating to the reduction of GHGs from energy sources and uses through the use of renewables and alternative energy sources, including:
  i. The production or installation of renewable, low-carbon, carbon-free and net zero alternative energy; and
  ii. distributed renewable energy generation and energy management technologies to eliminate the need for grid-based electricity during natural gas peaking.
  iii. Initiatives relating to the reduction of GHGs from industry, including fuel switching.

- The MOECC Minister must review and provide an evaluation of the initiatives to Treasury Board that considers, among other things, the potential GHG reductions of the initiative.

- The selected proceeds recycling option must therefore be able to demonstrably reduce GHGs.

- Evidence that links the use of proceeds with the GHG reduction will be required for compliance with the Act.

# 2. Legal Considerations – Constitutional Law

- In addition to meeting the requirements of the Act, in order for the cap and trade program to be characterized as a "regulatory charge", rather than an unlawful tax, it is critical that auction proceeds be spent on the regulatory purpose of the program - initiatives that are reasonably likely to reduce or support the reduction of GHGs**.**

- The way auction proceeds are used will be significant to characterizing the program as a regulatory charge:
  - The more tenuous the link between expenditures and the regulatory purpose of GHG emissions reduction (e.g., climate change adaptation), the greater the constitutional risk;
  - There is no requirement to spend proceeds received from one sector proportionally on that sector;
  - Ontario should begin by investing in projects very clearly related to reducing GHG emissions;
  - A court is unlikely to second guess the government's assessment of the value or wisdom of particular investments in GHG reduction initiatives; and
  - Auction proceeds can be spent on existing GHG reduction initiatives.

- The link between the use of proceeds in the electricity sector and the reduction of GHGs must be based on evidence that can withstand the scrutiny of the court.

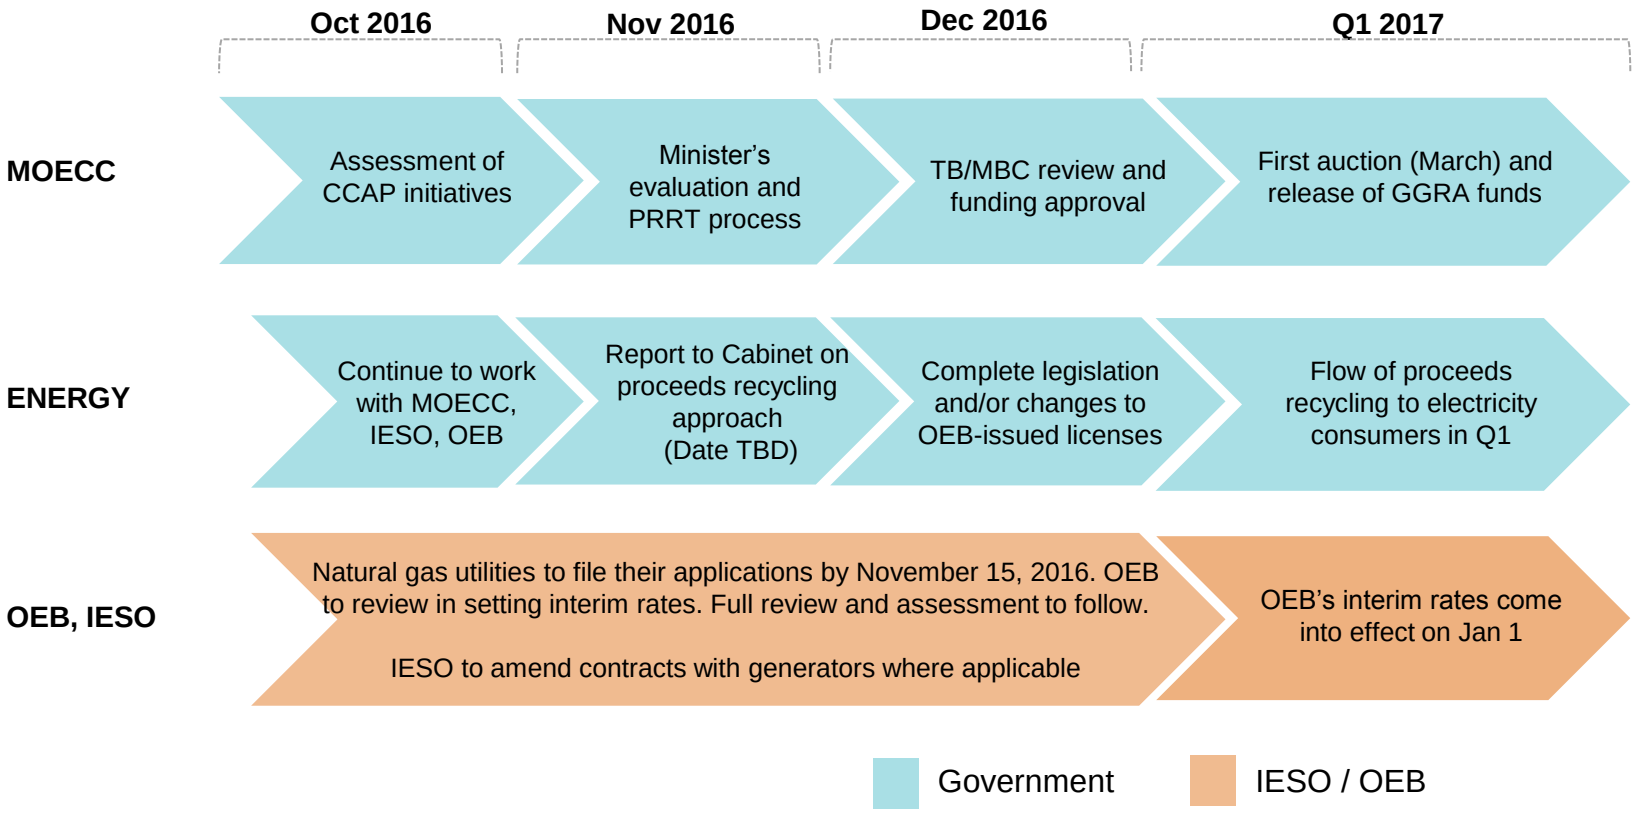
# 3. Legal Considerations – Ensuring Authority to Use Cap and Trade Proceeds

- While the Act allows funds collected from cap and trade to be used to fund various initiatives, neither the *Electricity Act, 1998* (EA) nor the *Ontario Energy Board Act* (OEBA) contemplate the use of cap and trade proceeds.
- This creates uncertainty about the abilities of IESO to receive and settle cap and trade amounts.
- Legislative amendments that allow IESO to receive and pay out cap and trade proceeds for the benefit of certain rate payers would provide this certainty.
- Similarly, legislative amendments that give the Ontario Energy Board (OEB) authority to take steps to implement proceeds recycling (such as amend licenses, create or amend a Code) would provide certainty.
- Without such certainty, IESO may feel constrained in their abilities to recycle proceeds as contemplated in this deck and their actions could be subject to scrutiny and, potentially, challenge.
- Despite the risk of legislative uncertainty, it is possible that existing legislative authority could be used to facilitate proceeds recycling.
- Implementation of all four options could be further supported with legal instruments such as an LGIC-approved directive to the OEB or a Memorandum of Understanding/ Service Level Agreement with IESO.

# Legal Considerations – Ensuring Authority to Use Cap and Trade Proceeds (cont'd)

| Option | Implementation Mechanism | Potential Additional Measures |
|---|---|---|
| GAM | • Legislation<br>• Amendments to O. Reg. 429/04 (GA Reg.) made under Electricity Act, 1998 | • MOU/SLA with IESO<br>• Amend IESO objects regulation |
| Volumetric all hours | • LGIC OIC and directive to OEB | • MOU/SLA with IESO<br>• Amend IESO objects regulation |
| Volumetric off-peak | • LGIC OIC and directive to OEB | • MOU/SLA with IESO<br>• Amend IESO objects regulation |
| Hybrid option | • Legislation<br>• Amendments to O. Reg. 429/04 (GA Reg.) made under Electricity Act, 1998<br>• LGIC OIC and directive to OEB | • MOU/SLA with IESO<br>• Amend IESO objects regulation |

# Key Dates and Milestones



# Next Steps

- ENERGY to work with Independent Electricity System Operator (IESO), Ontario Energy Board (OEB), LDCs (as necessary) and MOECC, MNDM and MEDG on final recycling approach.
  - Depending on the option chosen, begin working with OLC on legislative and regulatory amendments and creation of other instruments as needed.

- ENERGY to consult with LDCs and stakeholders regarding the design and implementation of proceeds recycling.

- ENERGY to report back to Cabinet on a recommended approach in November 2016.

# Appendix

# Cost of Electricity

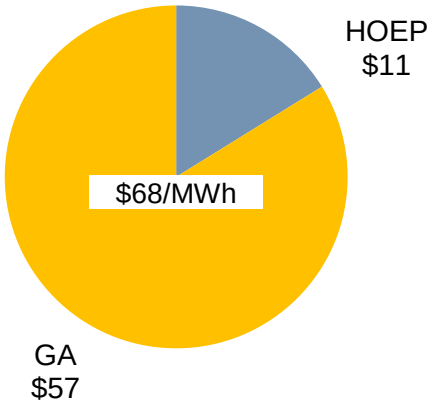
- Ontario's electricity consumers pay for electricity in different ways. The commodity cost of electricity is the sum of:
  - Hourly Ontario Energy Price (HOEP) which is the hour-by hour market clearing price that reflects the short run cost of producing power; and
  - Global Adjustment (GA) which ensures recovery of long run generation. Ontario's conservation programs and clean sources of electricity supply (e.g., renewables, etc.) are funded through the GA.

- Under the Industrial Conservation Initiative (ICI), part of the Global Adjustment regulation, large consumers pay GA based on their share of peak demand during the five peak hours of the year. These "Class A" consumers can pay lower GA if they are able to reduce consumption during peak hours.
  - Class A consumers* are typically large industrials.
  - In 2015, the "cost shift" from Class A to Class B consumers was about $890 million (i.e., a bill impact of approximately $4.90/month for a typical residential consumer).
  - About 300 participating consumers collectively reduced Ontario's peak demand by an estimated 1,000 MW in 2015.

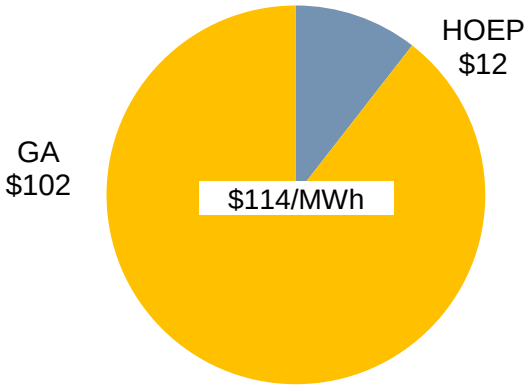
- Consumers not eligible for ICI pay GA on each unit of consumption.
  - These are known as Class B consumers and are typically commercial or institutional facilities.

**Commodity Cost of Electricity YTD June 2016**

**Class A (Industrial) in $/MWh**



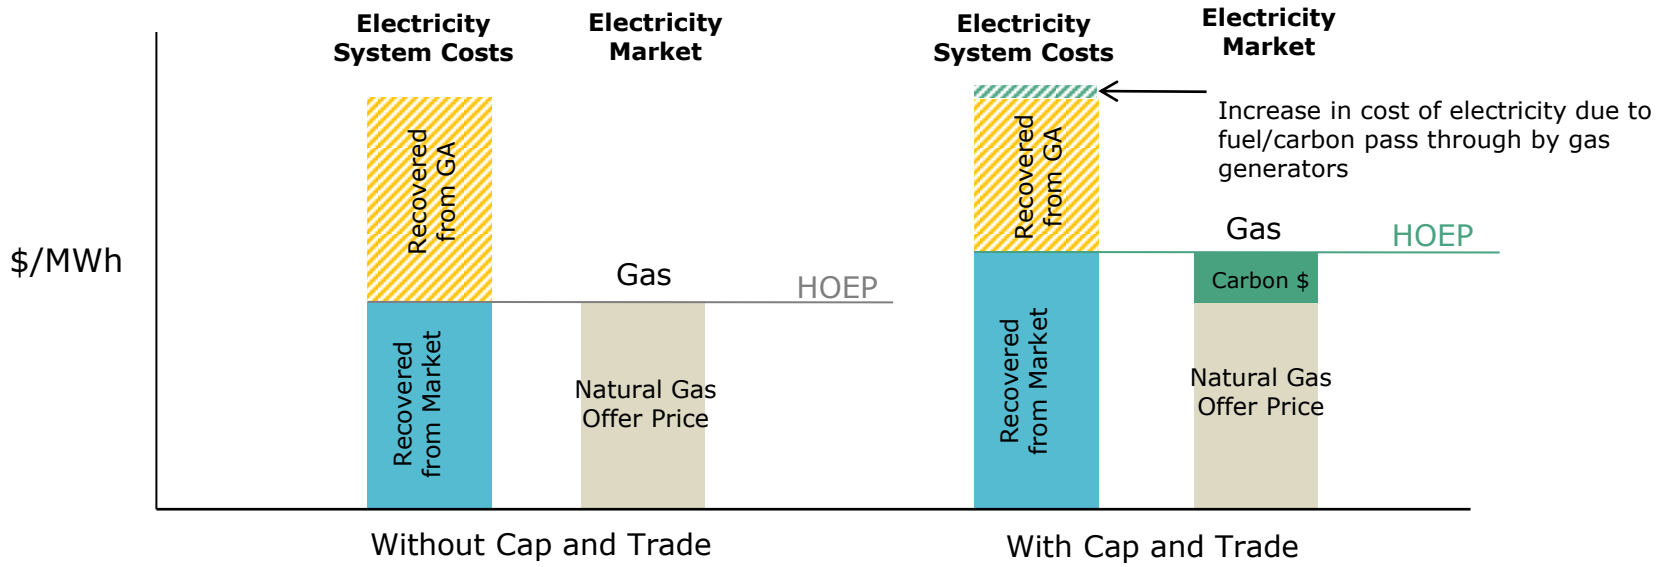
**Class B (Commercial) in $/MWh**



***** Reflects consumers are those with peak demand greater than 5 MW, and in electricity-intensive sectors with peak demand between 3 MW and 5 MW. Ontario is expanding the ICI by lowering the threshold to 0 MW and removing sector restrictions; new participants who in would see the change on their bills in 2018.

# Impact of Cap and Trade on the Electricity Market

- Under cap and trade, the wholesale hourly electricity price (HOEP) will increase in many hours as a result of peaking generators (i.e., often gas generators) including the cost of carbon in their offers. Fuel costs are essentially a pass through for these generators.
- The payments to gas generators through Global Adjustment (GA) will decrease as a greater proportion of total system costs would be recovered through the market.
- On a net basis, these dynamics are expected to cause the total system cost to increase as HOEP goes up, but GA goes down by a smaller amount.

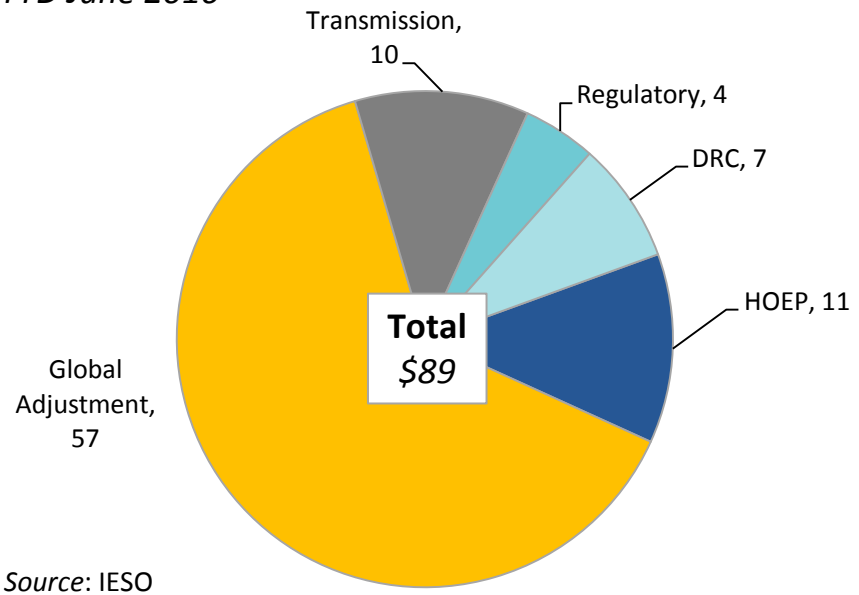


# Class A (Industrial) Electricity Prices

- There are currently about 300 large industrial consumers in Ontario.
- Measures in place to mitigate industrial electricity prices include the Industrial Conservation Initiative (ICI) and Northern Industrial Electricity Rate Program (NIERP).
- Under ICI, Class A consumers are charged GA based on their share of peak demand. ICI lowers costs for eligible large electricity consumers (i.e., those with monthly peak demand exceeding 3 MW) that reduce consumption during peak periods.
  - ICI consumers reduce their electricity rates one-third on average.

**Typical Large Industrial Price ($/MWh)**

*YTD June 2016*



*Source*: IESO

- Participants in NIERP receive a rebate of $20/MWh. On average, industrial electricity prices are reduced by about 20% through the program, reducing all-in prices to $69/MWh for these consumers. The program is funded through the tax base.

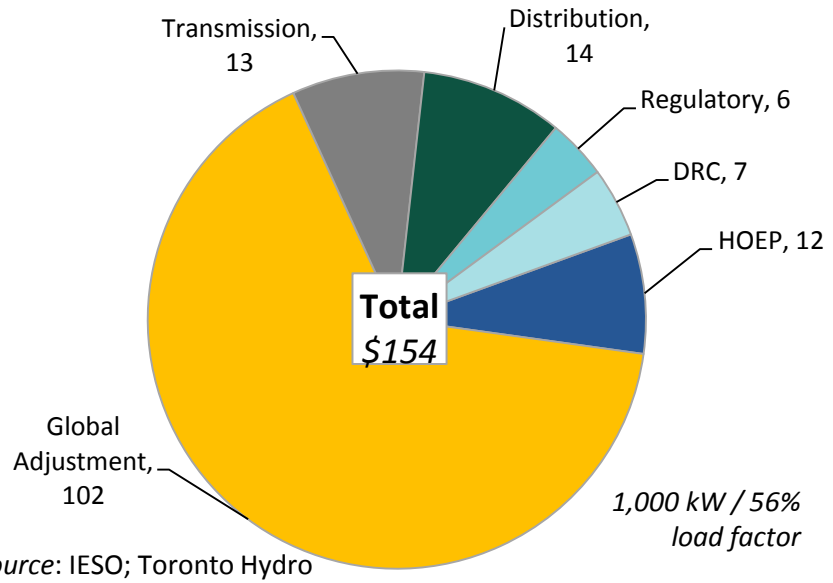
*** Note:** Industrial consumers receive input tax credits for their HST.

# Class B (Commercial) Electricity Prices

- There are approximately 55,000 commercial and institutional consumers in the province. These consumers are Class B consumers, and have separate line items on the electricity bill for HOEP and GA.
- There is a high degree of differentiation amongst consumers within the commercial sector in terms of size and consumption patterns. For example, an elementary school has a much different hourly load profile compared to a full service restaurant. This is an important consideration when looking at the bill impacts of policy options.

**Typical Commercial Price ($/MWh)**

*YTD June 2016 (Non-RPP Class B)*



*Source*: IESO; Toronto Hydro

- Consumers in the commercial sector do not pay time-of-use prices and have little incentive to shift demand away from high demand hours.
- Targeted pricing programs are currently not available for Class B consumers.

*** Note**: Most commercial consumers receive input tax credits for their HST.

**Memorandum**

**To: File**
**Date:** March 22, 2012
**Re**: Accounting Treatment for OPA Charges, Other Financial Assets and Other Financial Liabilities

---

1. **Charges – Overview**

"Charges" are amounts incurred by the OPA to recover amounts paid or payable by the OPA to another person with respect to electricity.

The OPA has a legislated responsibility to record the transactions flowing through the global adjustment mechanism. The global adjustment and settlement accounts have been created for this purpose. The global adjustment and settlement accounts record charges that flow between the OPA and the IESO. The account flows include the amounts paid and received for: Demand Response 2 (DR2), Demand Response 3 (DR3), non-utility generation (NUG), regulated nuclear generation balancing amount (nuclear) and regulated hydro electric generation balancing amount (hydro). These accounts are settled simultaneously by the IESO. The account also records the amounts paid and received for OPA contracts (standard offer, generation and conservation/demand management, Feed-In Tariff and hydroelectric contract initiatives) which the OPA settles on a monthly basis with the IESO.

The DR3, NUG, nuclear, hydro, and OPA contract balances are offset in the global adjustment account eliminating the need for a flow of funds between the IESO and the OPA. The OPA records the effect of the transactions to meet its legislated responsibility. The OPA's generation contracts are estimated each month and settled on the actual amount owing in the following month. This gives rise to timing differences. The settlement dates can cross calendar months, creating a monthly balance in the account. Differences created from timing or settlement dates are reclassified into accounts receivable at month end.

The OPA is entitled under legislation to recover eligible charge amounts, as per section 25.2 (3) of the Electricity Act:
*(3) For greater certainty, the OPA may, subject to the regulations, establish and impose charges to recover from consumers its costs and payments under procurement contracts.*

### 1.1 Accounting Treatment for OPA Contract and Conservation Charges

Charges are currently recorded as accounts receivable from the IESO in the OPA's financial statements, as they represent current assets that are recoverable within 1 year. Specifically, charges represent financial assets, as per **PS.S.1000.40** below and are only recorded as receivable once they have been incurred by the OPA. Under legislation, the OPA has a contractual right to receive cash from another party (in this case the IESO via the Global

Adjustment Mechanism) with respect to amounts incurred for eligible charge amounts. This concept is consistent with criteria (c) of the definition below:

*.**40*** *A financial asset is any asset that is:*

*(a) cash;*
*(b) a realizable asset that is convertible to cash;*
*(c) a contractual right to receive cash or another financial asset from another party;*
*(d) a contractual right to exchange financial instruments with another party under conditions that are potentially favourable to the government;*
*(e) an equity instrument of another entity;*
*(f) an investment in a government business enterprise or government business partnership;*
*(g) a financial claim on an outside organization or individual; or*
*(h) an inventory or item for sale that meets the criteria in FINANCIAL STATEMENT PRESENTATION, paragraph* **Error! Hyperlink reference not valid.***. [Former paragraph* **Error! Hyperlink reference not valid.** *retained in Archived Pronouncements]*

**Amounts Payable**

Amounts payable arise for OPA contract charges when the value of HOEP exceeds the value of the suppliers' contract price. In this case, the charges would become an OPA liability to the market in the form of charges payable to the IESO (which, in turn, must be returned to the market via the Global Adjustment). Such charges payable to the market meet the criteria for recognition as a liability, as outlined below:

**PS.3200.03**

*Liabilities should be recognized in the financial statements when:*

*(a) there is an appropriate basis of measurement; and*

*(b) a reasonable estimate can be made of the amount involved.* [SEPT. 2004]

---

## 2. Other financial assets and liabilities

Other financial assets and liabilities are made up of retailer settlement amounts, government procurements and regulated price plan variance amounts.

### 2.1 Other Financial Assets - Retailer Settlements and Government Procurements - Overview

Legislative provisions ensure that electricity retailers are made whole by the OPA for contracts with low-volume and designated consumers that were entered into before prices were frozen by legislation effective November 11, 2002. The OPA and retailers settling any differences between the HOEP and the contract price for each contract meet these provisions. When HOEP is greater than the contract price, the OPA receives payments from the retailers and records a financial liability. When HOEP is less than the contract price, the OPA pays the retailer and records a financial asset. The OPA tracks these variances in the retailer contract settlement deferral accounts. The retailer contract discount settlement account captures the funds related to the retailer incentives existing at the creation of the RPP. The retailer incentives captured are

held in a separate deferral account for settlement concurrent with the retailer settlement deferral accounts.

The OPA began amortizing these costs over the period of 2009-2011 to reflect the recovery of these amounts through its annual usage rate approved by the OEB. As at December 31, 2011, the balances of the retailer settlements are nil and have been recovered in full.

The OPA reimburses the government for costs incurred for electricity procurement and records the costs as a financial asset. Any subsequent balances are included in future revenue requirement submissions. The OPA began amortizing the government procurement costs in 2009 on a straight-line basis, and as at December 31, 2011, the balance to recover for these costs is nil.

### 2.2 Accounting Treatment – Retailer Settlements and Government Procurements

Under PSAS, retailer settlements and government procurements are treated as other financial assets in the OPA's financial statements. As they are normally not recovered within one year, they are categorized as non-current assets. As per **PS.S.1000**, retailer settlement and government procurement balances qualify as financial assets as per criteria (c) below:

> *.**40** A financial asset is any asset that is:*
>
> *(i) cash;*
> *(j) a realizable asset that is convertible to cash;*
> *(k) a contractual right to receive cash or another financial asset from another party;*
> *(l) a contractual right to exchange financial instruments with another party under conditions that are potentially favourable to the government;*
> *(m) an equity instrument of another entity;*
> *(n) an investment in a government business enterprise or government business partnership;*
> *(o) a financial claim on an outside organization or individual; or*
> *(p) an inventory or item for sale that meets the criteria in FINANCIAL STATEMENT PRESENTATION, paragraph* **Error! Hyperlink reference not valid.***. [Former paragraph* **Error! Hyperlink reference not valid.** *retained in Archived Pronouncements]*

The OPA is required to carry the balance related to retailer settlement variances between the HOEP and contract price, as per legislation. The OPA is also entitled to recover these balances through legislative provisions, which represent a contractual right to receive cash or another financial asset from another party, as per criteria (c) above. Where retailer settlements fall into a liability balance, they would be categorized as other financial liabilities, as they would meet the criteria for recognition of a liability, as outlined in section 3.1 below.

## 3. Other Financial Liabilities – Regulated Price Plan (RPP) Variance - Overview

While prices for RPP consumers are set every six months by the OEB based upon a forecast of the cost of power over the next year, it is likely that there will be a difference between the actual and forecast cost of supplying electricity to all RPP consumers. When the hourly Ontario

energy price (HOEP) is greater than the RPP, the OPA pays the excess amount and records a financial asset as the electricity market funds paid are receivable from the market. When the HOEP is less than the RPP, the OPA receives the difference and records a financial liability as the funds received will be returned to the market. The OPA tracks this variance in the RPP variance account.

### 3.1 Accounting Treatment – RPP

RPP variance amounts are recorded by the OPA as other financial liabilities in the financial statements, as they meet the liability criteria outlined below:

**PS. S.1000**

***.45*** *Liabilities have three essential characteristics:*

*(a) they embody a duty or responsibility to others, leaving a government little or no discretion to avoid settlement of the obligation;*

*(b) the duty or responsibility to others entails settlement by future transfer or use of assets, provision of goods or services, or other form of economic settlement at a specified or determinable date, on occurrence of a specified event, or on demand; and*

*(c) the transactions or events obligating the government have already occurred.*

Under legislation, the OPA is required to fund RPP variances where the HOEP is less than the RPP, which implies a duty or responsibility that the OPA has little to no discretion to avoid, as per criteria (a). For instances where the HOEP exceeds the RPP rate, the OPA would record a financial asset, as this circumstance would meet the criterion of **PS.S.1000.40** (financial asset), outlined in section 2.2 above.

**External Auditor Approval of Accounting Treatment**

The accounting treatment of OPA charges, retailer settlement, government procurement and RPP balances has been consistent since the OPA's inception and is approved by the OPA's external auditors on an annual basis. Based on governing legislation, the external auditors agree that these balances represent true assets and liabilities to the OPA. The signed auditors' report, along with the OPA's audited annual financial statements, can be found on the OPA website in the MD&A section of the OPA annual report.

| General: | CFS | IESO | |
|---|---|---|---|
| | Notes | Notes | Actions |
| Variance accounts are not all recognized on the CFS? In order to have an asset recognized on the books, need to have a receivable (amounts billed), unless an asset can be established another way (through legislation)<br><br>Current vs. future IESO role: if move from current settlement related role, and have to negotiate and manage the debt then it will seem more like the OFA. Option to use another party to provide this advice, and not have OFA hold the debt. | - Questionable whether any receivable reflected on the Province's f/s would be sufficiently supportable from the AG's perspective under PSAB.<br>- Consider if might be off-balance sheet financing based if debt acquired through 3rd party vs. OFA.<br>- Want to understand why the debt for the GA is not on the Province's books. (Q from MOE…why would it be assumed that cash flows related to the rate base would be consolidated on the Province's books and intermingled with cash flows related to tax base) | - Issue: 4 M Consumers wouldn't have a liability on their books that would correspond with a recoverable (one to many scenario with no amounts billed)<br>- Strategically difficult to pass along the recoverable to the LDCs as it would impact the d/e ratios; uncertain how many follow IFRS without rate regulated accounting; LDCs also don't have the credit capacity to absorb the debt<br>- Current IESO role: used as a settlement system to support the market (sets | - Considering creating a receivable through legislation (vs. direct contracts or billing)<br>- Need an 'authorized' expenditure in order to be recoverable. Assess on what basis we can create an asset which is recoverable. All extra costs need to be recognized as being recoverable (even interest)<br>- Since need legal authority to recover, presumably you would also need legal authority to defer and collect in the future but need to address the proposed change in role of the IESO<br>- Consider who would hold debt (OFA or third party) . Would be |

| | | | |
|---|---|---|---|
| | | HOEP every 5 mins, matches supply and demand, collects through GA for costs of reliable T,D, generation)<br>- As a successor company to previous Ontario Hydro, the IESO would borrow from the OEFC; OPA is a new construct so would borrow from the OFA if needed.<br>- IESO's original accounting was established as an agent for settlement purposes. Legacy contracts were for cash to suppliers which were recovered through the GA. John and Adrian were involved with est of the OPA and est of the RPP variance acct. Was never a GA var. OPA always reported the RPP act (1 set of books) – entered into 3500+ contracts with generating | higher rates? Would be provincial guarantee? OPA had AA credit rating and contracts entered into and debt borrowed based on that rating (one ranking lower than the province)<br>- James (legal) asked by Steen Hume to help to id what the new legislative responsibilities of the IESO might look like. |

| | | | |
|---|---|---|---|
| | | entities (40B) which NEVER appeared on the Province's books (no rev/exp or debt. These were considered executory contracts, or contractual obligations but NOT liabs of the OPA.<br>- On a monthly basis any GA amounts are settled through the GA; no liability reflected on the IESO's books – currently $10B of recoverable amounts not reflected on the IESO's books (no legal obligation, just an agent for settlement). Seen as a conduit to collect the monies paid to producers, even if does take possession.<br>- Proposal is that the RPP accounts which normally had a term of 6-12 months for recovery would be extended to 25 years | |

| | | | |
|---|---|---|---|
| | | - 2 sets of books (operating/market vs. financial)<br>- Amounts recoverable through GA NOT reflected on IESO's b/s as a flow through – no impact on the p&l<br>- Currently, the only debt that shows on the IESO's books is related to its operations, NOT MARKET DEBT | - IESO/KPMG to provide background supporting accounting for GA recoveries off book |
| ON vs. MB – legislates that all people of the province must be rate payers (cannot opt out of paying rates). ON doesn't have this requirement, but has a strong ratebase now so reasonable recoverability of costs through rates (the GA). Lenders rely upon this reasonable probability of recovery (AA rating) as basis to lend money to IESO to cover the time gap w.r.t. billings for GA. | | - The OEB has oversight and determines rates. If a regulator agreed that costs could be recovered, would meet requirements of rate regulated asset; but PSAB doesn't recognize rate regulated assets/liabs<br>- regulatory assets normally recovered over 5 years, so 25 years would have to be defended and proven as collectible<br>- would need certainty of recoverability to be an | |

| | | | |
|---|---|---|---|
| | | asset (OEB would consider intergenerational equity) in assessing recoverability | |
| Noted that 25 year period for rate mitigation is not the same as a longer term recovery period for capital refurbishment (intergenerational equity considerations)<br>Noted that other jurisdictions might have longer contract periods (wind and solar>20), and that operating period >20 in reality, so future costs likely lower to consumers. AB wind contracts>25 years. Justification for change → contract periods are too short | | | |
| | | | |
| Policy considerations:<br>1) Argument for rate mitigation deferral period (contracts to short; precedents)<br>2) IESO's changing role (James to consider)<br>3) Legislative requirements to allow for deferral (which costs would be authorized as recoverable)<br><br>Accounting considerations<br>4) How to create an asset (accounting vs. legislation) Would legislation create an asset on the IESO's books?<br>5) Off balance sheet financing (3rd party vs. OFA) and related accounting on IESO and CFS | | | |

---

Hi everyone,

Here's the latest electricity price TB assessment note for Chair's briefing today. We made some changes based on the Minister's comments yesterday but we will continue to make changes as we get more information over the coming days. Can I ask that you please track-change any changes back to us should you have any further comments?

Please note that Chair's briefing for this item is at 2:30 pm - please join us for the briefing.

Thanks,
Felix

# TREASURY BOARD / MANAGEMENT BOARD OF CABINET REQUEST ASSESSMENT NOTE

| | |
|---|---|
| **Ministry:** | Energy |
| **Meeting Date:** | September 13, 2016 |
| **Agenda Class:** | Major |
| **Last reviewed by:** N/A | **Tracking to:** Cabinet - September 14, 2016 |

| **SUBMISSION TITLE:** | Electricity Price Mitigation |
|---|---|

**NO MATERIALS RECEIVED –BASED ON DRAFT POLICY SUBMISSION**

## I. DECISION BEFORE THE BOARD

The Ministry of Energy is requesting approval of a suite of initiatives providing relief to various electricity consumer classes.

## II. RECOMMENDATIONS:

| | |
|---|---|
| • Approve a suite of initiatives to provide relief to various electricity consumer classes (pending Cabinet policy approval):<br>– Providing a pre-tax 8% rebate to Regulated Price Plan consumers;<br>– Expanding the Industrial Conservation Initiative;<br>– Updating the Rural and Remote Rate Protection program; and,<br>– Using $270M in cap and trade proceeds to ensure industrial and commercial consumers are not negatively impacted by cap and trade (A 1% reduction in rates). Balance of proceeds, $60M, intended for electricity relief through the Climate Change Action Plan could provide some fiscal offsets.<br>• Approve in principle an expenditure increase estimated at $261M in 2016-17 for the Electricity Price Mitigation, offset from the Treasury Board Contingency Fund. [estimate subject to refinement from the Ministry]<br>• Direct the Ministry to report back to TB/MBC with implementation details, including confirmation of financial implications, and required TB/MBC approvals to implement.<br>• Recommend to Cabinet that the Ministry proceed to Cabinet with the proposed legislation (TBD).<br>• | *Board Judgment* |

## III. FINANCIAL SUMMARY

| **$ Millions** | **2016-17** | **2017-18** | **2018-19** |

| Initiative cost requested | 261.0 | 1006.0 | 1004.0 |
| Initiative cost recommended | 261.0 | 1006.0 | 1004.0 |
| Recommended program base | 261.0 | 1006.0 | 1004.0 |
| Offset Recommended – Applies if cap and trade proceeds | 0.0 | 60.0 (TBD) | 60.0 (TBD) |

| | | | |
|---|---|---|---|
| diverted to in-plan initiatives | | | |
| Total Fiscal Impact | 261.0 | 946.0 | 944.0 |

## IV. KEY COMMENTS AND CONSIDERATIONS

Context

Electricity costs have increased as the province has made investments in clean energy generation and modernized electricity infrastructure. Electricity bills are expected to continue to increase as more renewable energy projects come online. Since 2010, average bills for residential consumers (i.e., using 750 kWh/month) have increased by over 50%. Rates paid by commercial and industrial electricity consumers have increased by 56% and 6% respectively over the same period. Appendix C provides supporting background information.

As part of the 2016 Budget, the government committed to offset the impact of cap and trade in Ontario for commercial and industrial electricity consumers, while also providing a benefit of up to $2 per month for residential electricity consumers. This included a commitment to provide a modest benefit of up to $2 per month, on average, to residential consumers. The Climate Change Action Plan (CCAP) included up to $1.32B over 4 years to help keep electricity rates affordable for residential and industrial consumers.

The Ontario Clean Energy Benefit (OCEB) expired December 31, 2015, as part of the originally planned, five-year legislated program put in place as a broad-based, transitional measure to a cleaner electricity system. OCEB was also put in place following the implementation of the Harmonised Sales Tax (HST). Unlike the previous provincial Retail Sales Tax (RST), the HST (and GST) included electricity in the taxable base. With the end of OCEB, the government ended the electricity Debt Retirement Charge (DRC) on residential users earlier than planned, as of January 1, 2016, and also put in place the low-income targeted Ontario Electricity Support Program (OESP).

In order to achieve the CCAP commitment and additional price mitigation, the Ministry of Energy has developed price mitigation options that consider tax-based levers, cap and trade proceeds, and shifting costs within the rate-base.

Proposal

The Ministry is proposing the following to mitigate electricity prices for consumers (Appendix D provides more information on each item below):

- Provide an 8% rebate on the pre-tax cost of electricity to consumers eligible for the Regulated Price Plan* (i.e., residential, small business and farms), equivalent to the provincial portion of HST
- Expand Industrial Conservation Initiative (ICI) eligibility by lowering the threshold to 1 MW, to provide support to Class B electricity consumers (i.e., commercial, institutional and small industrial)
- Update the Rural and Remote Rate Protection (RRRP) program, to provide relief to rural customers
- Recycle cap and trade proceeds to commercial and industrial electricity consumers to provide a modest (1%) reduction in rates

Public high-profile communications would coincide with introduction of legislation (September 2016). Currently, the 8% rebate would be available starting January 1, 2017 (it could be

prescribed earlier), along with updating the RRRP. Expanding ICI won't be added to bills until 2018 due to the time required to implement the expansion and for billing changes. Recycling cap and trade proceeds would commence in 2017.

The following tables provide an overview of the four initiatives, recipients, projected financial impact, grouping them based on whether taxpayers or ratepayers cover the costs:

| | Measure | Annual Impact | Targeted Recipients |
|---|---|---|---|
| **Taxpayers cover the costs (Potential to impact the Province's Fiscal Plan)** | | | |
| **1.** | 8% Rebate to Regulated Price Plan | Fiscal $1B* | Residential, small business and small farms, and other small users |
| **2a.** | Use cap and trade proceeds to commercial and industrial electricity consumers to provide a modest reduction in rates. (Implementation details under development). | ($270M) in cap and trade proceeds to offset $270M in costs of reducing rates by 1%.<br><br>No Fiscal Impact | For the 2016 Budget, cap and trade proceeds were projected at $330M/year.<br><br>See item 2b. regarding the residual amount of cap and trade proceeds ($330M - $270M = $60M) |
| **2b.** | The 8% rebate above allows for a portion of cap and trade proceeds to be redirected to other GHG reduction initiatives already in the fiscal plan. | ($60M) | Provides Fiscal Plan flexibility of $60M only if these proceeds are diverted to offset costs of other existing in-plan initiatives that reduce GHG emissions. |
| | **Total Fiscal Impact** | $946M | Matches Financial Summary on page 1 for 2017-18 |

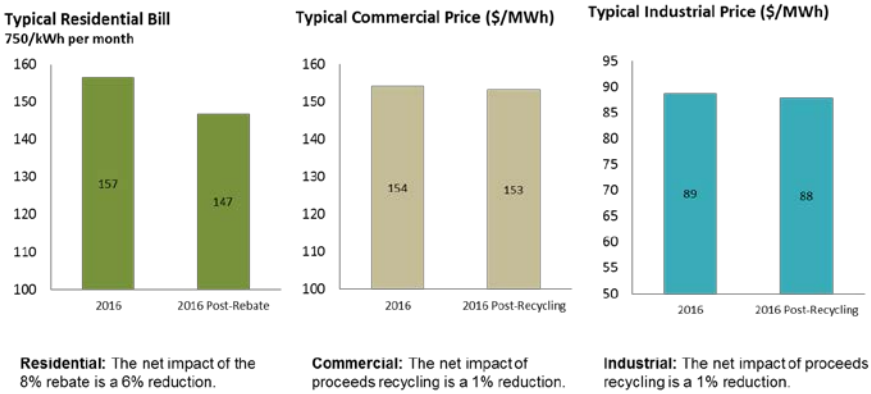
* Annual numbers from ENERGY.

| | Measure | Annual Impact | Targeted Recipients |
|---|---|---|---|
| **Ratepayers cover the costs (No impact to the Province's Fiscal Plan)** | | | |
| **3** | Expanding ICI eligibility to customers above 1MW in all sectors | Rate base ($47M/$82M)** | Intermediate and large-sized industrial, commercial and institutional consumers above 1MW in all sectors |
| **4.** | Updating Rural and Remote Rate Protection | Rate base ($110M) | Residents in rural or remote locations: Hydro One's lowest-density R2 customers. |

** Short-term/Long-term rate base impact, where short term is one year after expanded eligibility takes place and long-term is expected impact once new customers have time to change behavior.

Due to the nature of the ICI Global Adjustment mechanism and cost recovery of RRRP, the rate base proposals (#3 and #4) above benefit the targeted recipients, but come at a cost to all other electricity rate payers in Ontario.

The graphic from the Ministry on the following page highlights the bill impacts by electricity consumer class.



The residential net impact of the 8% rebate is a 6% reduction due to the costs of RRRP and ICI expansion being factored in after the 8% pre-tax rebate is calculated and applied. The original HST amount is then added in. The net benefit for residential is the 8% rebate less the cost of RRP and ICI expansion.

Fiscal Impact

The most recent Electricity Price Mitigation Options deck notes that "proceeding with an 8% Regulated Price Plan (RPP) rebate without a cap would cost an estimated $1 billion per year".

The $1 billion figure is a 2017 to 2020 calendar year average of cost estimates developed by Ministry of Energy staff, as follows:

| *$ millions* | **2017** | **2018** | **2019** | **2020** |
|---|---|---|---|---|
| | 1,003 | 1,014 | 975 | 1,049 |
| Avg. 2017-20 | 1,010 | | | |

- On a fiscal year basis, the above estimates become:

| *$ millions* | **2016-17** | **2017-18** | **2018-19** | **2019-20** |
|---|---|---|---|---|
| | 261 | 1,006 | 1,004 | 994 |
| 3-Year Avg. | 1,001 | | | |

The Ministry also indicates the current proposal would provide recycling of cap and trade proceeds to commercial and industrial consumers on a volumetric basis. This would require an estimated $60 million less per year in proceeds than previously estimated (i.e., providing fiscal plan flexibility of about $60M per year to commit to other GHG reduction initiatives in the fiscal plan).

There are no details as this point if the $261M in 2016-17 would be offset from the Treasury Board Contingency Fund or provided through supplementary estimates.

Cap and Trade Proceeds

The 2016 Budget committed to offset the impact of cap and trade for commercial and industrial consumers, while also providing a benefit of up to $2 per month for residential consumers (on

average). While residential and other consumers would benefit from the 8% pre-tax rebate, this does not apply to non-Regulated Price Plan consumers (larger industrial, commercial, and other consumers). As such, the Ministry is proposing to direct a portion of cap and trade auction proceeds to industrial and commercial consumers not in the RPP to go beyond mitigating cap and trade impacts and provide a 1% bill impact (shown in the graphic at top of page 4).

To be characterized as a regulatory charge under the cap and trade program, auction proceeds need to be spent on programs that are reasonably likely to reduce or support the reduction of greenhouse gases. It is unclear from current materials whether this proposal meets this requirement.

Considerations – Implementation

At this point, the Ministry has presented a high level overview of major implementation pieces:

- New legislation would be required to enable the 8% rebate proposal. Legislation would closely mirror the Ontario Clean Energy Benefit Act, 2010. If passed, the legislation would require a general regulation. Amendments would also be required to various regulations to expand ICI and RRRP.
- On-bill rebate delivery would likely require adjustments to LDC billing systems, which could impact delivery costs and timelines. The Ministry indicates will consult with LDCs (possibly through Ontario Energy Board) to accurately assess these impacts once the program has been announced. In the past, LDCs have asked for at least six months' notice when implementing billing system changes. Timing concerns may be alleviated by allowing LDCs to provide retroactive payments rebates if their systems cannot be updated in time for January 1, 2017. This was done with the OCEB.
- Detailed messaging on bills could be implemented (A bill mock-up is pending from the Ministry). The rebate would not be directly linked to HST. With electricity invoices containing multiple line items and LDC bill presentment varying widely, direction on rebate presentment will need to be flexible to allow LDCs to incorporate easily while ensuring government-preferred branding and messaging is conveyed.
- The Ministry will need to continue to consult with the Independent Electricity System Operator (IESO), Ontario Energy Board (OEB) and LDCs regarding implementation of proceeds recycling.

Legal Considerations

8% Rebate (shift costs from rate-base to tax base by providing a rebate equal to the provincial portion of HST):

- Providing the contemplated rebate under the proposed Bill does not, in and of itself, give rise to legal issues. As policy direction is given on the specifics of supporting regulations, any associated legal risks can be identified.

ICI Expansion (shift costs within rate-base by expanding eligibility for the ICI program to consumers of >1 MW):

- To establish that the charge is legitimate, it must be established that the purpose and effect of the charge is to facilitate the maintenance of a financially viable electricity system by way of load management or some other feature under which those who are

subsidized provide an overall system benefit enjoyed by those who subsidize them.

RRRP Update (shift costs within the rate-base by increasing the RRRP benefit paid to rural and remote customers):

- Increasing the amount of revenue devoted to the RRRP or expanding the scope of consumers eligible for the program does not raise new legal risk. There is a good argument that the RRRP is a regulatory charge, as it socializes some of the costs of distributing electricity to rural consumers. Overall the risk that the RRRP would be characterized as a tax is assessed as moderate (meaning equally good arguments on both sides).

Cap and Trade Proceeds Recycling (reduce impact on rate base and tax base by directing cap and trade auction proceeds to industrial consumers):

- To be characterized as regulatory charges under the cap and trade program, auction revenues should be spent on programs that reduce GHGs.

<u>Other Considerations</u>

- This request does not align with the 2016 Budget fiscal plan and there are no proposed offsets.
- The 8% rebate would provide a typical residential consumer about an $11 per month benefit on average (about $10, after the impact of RRRP and ICI expansion), exceeding the Budget 2016 $2 per month on average cap and trade commitment. Also, the budget committed to offsetting the impact of cap an trade on industrial and commercial consumers, a 1% reduction is being proposed using cap and trade proceeds, which could be recycled elsewhere on GHG reduction initiatives.
- Reduction in electricity prices that does not consider consumption amounts (e.g., without the cap in the previous OCEB program) does not promote electricity conservation and may be seen as unaligned with climate change objectives.
- There is potentially a need for supplementary estimates as the existing vote (2905) Electricity Price Mitigation does not include a separate item for the 8% rebate (2905 was used for the Ontario Clean Energy Benefit and currently includes the Northern Ontario Energy Credit).
- Other price mitigation measures introduced following the implementation of the HST, as well as the end of OCEB, would continue.
  - Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and NOEC were introduced/ enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).
  - The DRC on residential consumers was ended early, as of January 1, 2016 (about a $340 million impact in 2016-17).
  - OESP is a low-income targeted program funded by electricity consumers through the electricity rate base.

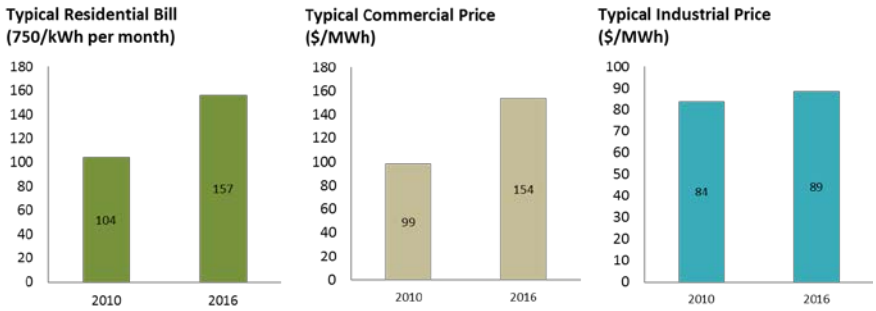
## APPENDIX C: ELECTRICITY SECTOR BACKGROUND

The Ministry has provided the following information to provide electricity sector context this item.

There are three classes of electricity consumers:

| | Regulated Price Plan | Class B | Class A |
|---|---|---|---|
| **Consumer Types** | • Residential<br>• Small Business<br>• Farms | • Commercial<br>• Institutional<br>• Small industrial | • Large commercial<br>• Large industrial |
| **Load Size** | Below 0.05 MW | Between 0.05 MW and 3 MW | Above 3 MW* |
| **Total Consumption** | 58 TWh | 57 TWh | 26 TWh |
| **Share of Consumption** | 41.1% | 40.4% | 18.4% |

Since 2010, average bills for residential consumers (i.e., using 750 kWh/month) have increased by over 50%. Rates paid by commercial and industrial electricity consumers have increased by 56% and 6% respectively over the same period.



**Note:** 2016 represents May 2016 for residential and YTD June 2016 for commercial and industrial.

Existing Rate Mitigation efforts are on-going:

- Ontario currently provides rate mitigation to various electricity consumer classes through a combination of tax-based and rate-based programs.
  - For example, Northern Ontario residential electricity consumers receive tax credits in recognition of higher electricity costs in the north and rural consumers receive a subsidy funded through the rate-base due to the higher cost of delivering power to rural areas.
  - As of 2016, the government removed the Debt Retirement Charge (DRC) from residential electricity bills. While this saves a typical residential electricity ratepayer about $60 per year, it is less than the benefit previously provided through the Ontario Clean Energy Benefit (OCEB).
  - OCEB provided a tax-base rebate of 10% rebate on the total cost of electricity charges related to electricity consumption on eligible bills between 2011 and 2015.
- Because electricity costs must be fully recovered from electricity consumers, rate mitigation funded through the rate-base often represents a shifting of costs from one consumer group to another (i.e., industrial to residential and commercial consumers).

- Rate-based initiatives are generally associated with incenting changes in behaviour that provide electricity system benefits (i.e., shifting electricity consumption from on-peak to off-peak periods).

- The following slides provide an overview of the programs currently available to different electricity consumer classes along with the cost shift associated with several of the programs:

| Program | Consumer Type | Rate/Tax-based | Description |
|---|---|---|---|
| Northern Ontario Energy Credit | **Residential** | Tax | Delivered as part of the Ontario Trillium Benefit, provides individuals living in northern Ontario with a credit of up to $146 per year for the 2016 benefit year. |
| Ontario Energy and Property Tax Credit | | Tax | Also delivered as part of the Ontario Trillium Benefit, provides up to $1,008 per year for low-to moderate-income individuals and families. |
| Ontario Electricity Support Program | | Rate | Provides ongoing assistance directly on the bills of eligible low-income electricity consumers. |
| Rural or Remote Rate Protection | | Rate | Provided to rural and remote residential and farm customers because the cost of distributing power to remote areas is much higher than for urban areas. |
| saveONenergy Conservation Programs (including Home Assistance Program for low income customers) | | Rate | Delivered by LDCs which provide financial incentives for electricity-saving measures like LEDs, ENERGYSTAR certified ceiling fans, baseboard programmable thermostats, clotheslines, and advanced powerbars. |
| saveONenergy Conservation Programs (including Retrofit Program for Buildings and other programs) | **Commercial** | Rate | saveONenergy suite of electricity conservation programs for commercial customers offered by local distribution companies (LDCs) help businesses save energy to better manage their electricity consumption and reduce their annual electricity costs. See Appendix for more information. |
| Industrial Conservation Initiative | **Industrial** | Rate | Encourages Ontario's largest consumers to reduce consumption during peak periods to save on average 25% on their electricity bills. |
| Industrial Accelerator Program | | Rate | Provides financial incentives of up to $10 million to transmission-connected electricity consumers, to invest in energy-efficiency or self-generation which would reduce the amount of electricity withdrawn from the provincial grid. |
| Industrial Electricity Incentive | | Rate | Provides reduced electricity rates for companies starting or expanding operations in Ontario. |
| Northern Industrial Electricity Rate Program | | Tax | Provides $20 megawatt per hour (MWh) rebate for qualifying large northern industrial consumers. |
| Demand Response | | Rate | Provides payments to businesses and industry to shift consumption at times when the electricity system is stressed. DR currently provides ~500 MW of capacity to the system. |

Ontario has implemented several programs that have shifted costs amongst electricity consumer classes (i.e., residential, commercial and industrial). The table below shows the estimated cost shifts in the province's electricity system that result from three existing government programs (i.e., ICI, RRRP and OESP):

| Cost Shift Impact | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| Residential Bill ($/month for 750 kWh) | 3.55 | 4.07 | 3.85 | 4.46 | 5.68 | 6.55 |
| Commercial – Class B ($/MWh) | 4.74 | 5.43 | 5.14 | 5.94 | 7.57 | 8.73 |
| Industrial – Class A ($/MWh) | -20.97 | -25.26 | -22.38 | -24.68 | -32.56 | -31.55 |

**Note:** Negative values indicate a benefit; positive values denote an incremental charge.

A number of actions have and are being taken to reduce overall electricity system costs. Despite these actions to reduce system costs, electricity rates continue to increase for consumers:

- Renegotiating the Green Energy Investment Agreement, reducing contract costs by $3.7 billion;
- Deferring the construction of two new nuclear reactors at Ontario Power Generation's Darlington facility, avoiding an estimated $15 billion in new construction costs;
- Approving Ontario Power Generation's plans to enable the ongoing operation of Pickering up to 2024, which is expected to save ratepayers as much as $600 million.

- Reducing Feed-In-Tariff (FIT) prices through annual price reviews, saving ratepayers at least $1.9 billion relative to the 2013 Long-Term Energy Plan (2013 LTEP) forecast; and
- Removing an expected $3.3 billion in Large Renewable Procurement (LRP) costs relative to the 2013 Long-Term Energy Plan (2013 LTEP) forecast, based on the results of the first phase of the LRP.
- Despite these actions to reduce system costs, electricity rates continue to increase for consumers.

## APPENDIX D: FURTHER INFORMATION SUPPORTING PROPOSED INITIATIVES

he following information has been provided by the Ministry.

**1. Provide an 8% rebate to consumers eligible for the Regulated Price Plan* (i.e., residential, small business and farms), equivalent to the provincial portion of HST**

The Ministry is proposing to introduce legislation/regulation to provide a rebate of 8% to consumers eligible for the Regulated Price Plan. The below table indicates which consumers would or would not receive the benefit. This would be equivalent to the provincial portion of the HST.

- Those ineligible to receive the 8% rebate will benefit from one or more of the other initiatives under this proposal (e.g., ICI expansion, proceeds recycling, etc).
- An HST exemption would require federal approval. Engaging in discussions with the federal government would take time and would likely result in not meeting the targeted implementation date.

| **Eligible for the 8% rebate** (< 50 kW or < 250,000 kWh/year) | **Not eligible for the 8% rebate** (> 50 kW or > 250,000 kWh/year) |
|---|---|
| • Residential Regulated Price Plan consumers<br>• Residential retail consumers<br>• Multi-unit residential buildings and other facilities used as residential rental units<br>• Long-term care homes and school residences<br>• Regulated Price Plan eligible farms<br>• Small businesses<br>– Coffee / snack retailer<br>– Convenience store<br>– Apparel store<br>– Hair salon<br>– Small insurance office | • Class A consumers<br>– Manufacturer<br>– Large grocery store<br>– Mines<br>– Auto assembly plants<br>• Class B consumers (except farms that have opted out of the Regulated Price Plan)<br>– Commercial offices (low rise)<br>– Hotel<br>– General warehousing |

**2. Expand ICI eligibility by lowering the threshold to 1 MW, to provide support to Class B electricity consumers (i.e., commercial, institutional and small industrial)**

Currently, electricity consumers over 5 MW and consumers from 3-5 MW in certain energy intensive sectors are eligible for ICI (i.e., approximately 300 Class A consumers). Consumers participating in ICI include the following sectors: pulp and paper, auto, manufacturing, chemicals and mines.

ICI would be expanded so that all consumers over 1 MW are eligible for the program, which would:

- Reduce electricity peak demand by incenting more consumers to lower their electricity demand during peak periods;
- Reduce electricity bills for new ICI participants who are able to reduce their electricity demand during peak demand periods; and
- Increase the electricity bills for non-ICI participants to ensure full cost recovery in the electricity system.

| | Benefit to New ICI Participants | System Benefit | Financial Impact | Residential Bill Impact |
|---|---|---|---|---|
| | Bill Savings | Peak Demand Reduction (MW) | GA shifted to Class B ($M) | |
| Short-term | Up to 21% | 80 | 47 | Increase of $0.42/month |
| Long-term | Up to 34% | 165 | 82 | Increase of $0.74/month |

The different impacts refer to the amount of time it takes for new Class A consumers to respond to the expanded ICI eligibility. The bill impacts assume a 25% uptake, which would increase Class A consumption by roughly 3 TWh, leaving an estimated 54 TWh in Class B that are either between 0.05-1 MW or choose not to opt in to ICI. This would represent an estimated 300 additional consumers in ICI, though they would represent a much smaller share of the consumption than the 300 consumers currently participating. Newly eligible consumers in the program would mostly fall into the small industrial, institutional and commercial category, including: automotive supply chain companies, office tower, large shopping mall, greenhouses and others.

## 3. Update the Rural and Remote Rate Protection (RRRP) program, to provide relief to rural customers

The Ministry is proposing to provide an additional $110M in rate protection to eligible rural or remote electricity consumers, and consider options to periodically adjust the amount of rate protection available to these consumers going forward.

RRRP is a rate-based funded subsidy program that helps offset the higher costs to distribute electricity to Ontario residents who live in rural or remote locations all across the Province.

- Today, RRRP is a $175M program. For an average residential customer, the cost of supporting RRRP is roughly $1 per month. For other customers, the cost can range from $65 for a greenhouse to $8,000 for a medium industrial.
- The majority of the program funding ($125.5M) provides a subsidy to Hydro One's lowest-density customers – classified as R2 customers. There are approximately 329,000 R2 customers. The current program provides a monthly subsidy for R2 customers of $31.50.
- RRRP funding supporting R2 customers has been capped at the current level since 2004. As a result, the impact of its assistance has diluted over time as electricity costs have risen.

An additional $110Mn in program funding would see an increased subsidy of ~$28 /month. This would bring R2 bills in line with Hydro One R1 (medium density) bills at 1000kWh.

- This would increase the R2 portion of the RRRP to $235 million with a monthly impact on an average residential consumer of ~$0.60.
- The RRRP could be indexed at inflation or "trued up" on a regular basis to ensure the subsidy remains constant.

## 4. Recycle cap and trade proceeds to commercial and industrial electricity consumers to provide a modest reduction in rates

The 2016 Budget committed to offset the impact of cap and trade for commercial and industrial consumers, while also providing a benefit of up to $2 per month for residential consumers.

- To meet the 2016 Budget commitment, the Climate Change Action Plan (CCAP), committed $1.3 billion from the GGRA over the first compliance period (2017-2020).
- However, providing a 8% rebate to Regulated Price Plan consumers would allow for GGRA proceeds previously committed to residential consumers to be redirected to other consumers classes and/or GHG reduction initiatives in the fiscal plan.

The current proposal would provide additional recycling to commercial and industrial consumers, while requiring an estimated $60 million less per year (i.e., a reduction of $240M over the first four year compliance period).

The following table identifies the illustrative impacts.

| | Average Annual Fiscal Impact | Average Annual Greenhouse Gas Reduction Account (GGRA) Proceeds Impact | Regulated Price Plan (Residential) Impact | | Class B (Commercial) Impact | Class A (Industrial) Impact | |
|---|---|---|---|---|---|---|---|
| | | | *Average (750 kWh/ month)* | *Rural** (1000 kWh/ month)* | | *Existing* | *New* |
| • 8% rebate to Regulated Price Plan consumers<br>• ICI Expansion<br>• RRRP Update<br>• Proceeds Recycling | $1.0 billion | $270 million annually | -$10/ month<br><br>(-6%) | -$45/ month<br><br>(-20%) | -$1/MWh<br><br>(-1%) | -$1/ MWh<br><br>(-1%) | Up to -$52/MWh<br><br>(-34%) |

***Note:** The impact of cap and trade would not be added to electricity bills until 2017 and the impact of ICI would not be added to bills until 2018 due to the time required to implement the expansion and for billing changes. However, both the impact of cap and trade and ICI have been included above for illustrative purposes.

****Note**: Rural customers refers to customers of Hydro One eligible to receive RRRP (R2 rate class customers)

## APPENDIX E: PROPOSED POLICY MINUTE

CABINET AGREED THAT:

1. THE MINISTRY OF ENERGY (ENERGY), WITH SUPPORT FROM THE MINISTRY OF FINANCE (MOF), SHALL PREPARE LEGISLATION THAT WOULD PROVIDE AN EIGHT PERCENT (8%) REBATE ON THE PRE-TAX COST OF ELECTRICITY FOR THE FOLLOWING CLASSES OF CONSUMERS:
   A. ALL CONSUMERS ELIGIBLE TO BE BILLED UNDER THE ONTARIO ENERGY BOARD'S REGULATED PRICE PLAN; AND
   B. ANY OTHER CONSUMERS WHO WERE ELIGIBLE FOR FINANCIAL ASSISTANCE UNDER THE *ONTARIO CLEAN ENERGY BENEFIT ACT, 2010* (OCEBA) DURING THE PERIOD THAT PROGRAM WAS IN PLACE.

2. THE LEGISLATION SHALL BE GENERALLY MODELLED UPON THE OCEBA, AND WOULD INCLUDE THE FOLLOWING ELEMENTS:
   A. THE REBATE WOULD BE AVAILABLE STARTING JANUARY 1, 2017 AND BEFORE SUCH DATE AS MAY BE PRESCRIBED;
   B. THE REBATE WOULD NOT BE SUBJECT TO A CAP UNLESS A CAP IS PRESCRIBED;
   C. THE LEGISLATION WOULD SPECIFY THE TYPES OF COSTS TO WHICH THE REBATE WOULD OR WOULD NOT BE APPLIED, WITH AUTHORITY TO MAKE CHANGES BY REGULATION;
   D. THE LEGISLATION WOULD ADDRESS INVOICING REQUIREMENTS, INCLUDING AUTHORITY TO PRESCRIBE HOW THE REBATE IS TO APPEAR ON CONSUMER ELECTRICITY BILLS;
   E. THE LEGISLATION WOULD INCLUDE AUTHORITY TO PRESCRIBE THE WAY IN WHICH THE REBATE IS TO BE FLOWED THROUGH TO CONSUMERS, AND THE WAY IN WHICH ELECTRICITY VENDORS PROVIDING THE REBATE ARE TO BE REIMBURSED;
   F. THE LEGISLATION WOULD INCLUDE RECORD-KEEPING REQUIREMENTS FOR ELECTRICITY VENDORS AND ANY OTHER PRESCRIBED PERSONS; AND
   G. THE LEGISLATION WOULD INCLUDE INSPECTION POWERS FOR INSPECTORS APPOINTED BY THE MINISTER OF FINANCE, INCLUDING POWERS RELATED TO RECOVERY OF OVERPAYMENTS.
3. ENERGY AMEND O. REG. 429/04 (ADJUSTMENTS UNDER SECTION 25.33 OF THE ACT) MADE UNDER THE ELECTRICITY ACT, 1998 TO EXPAND ELIGIBILITY FOR CLASS A CONSUMERS AND CLASS A MARKET PARTICIPANTS UNDER THE INDUSTRIAL CONSERVATION INITIATIVE (ICI) TO ALL ELECTRICITY CONSUMERS AND MARKET PARTICIPANTS WITH A PEAK DEMAND ABOVE AN AVERAGE OF ONE MEGAWATT (1MW) WITH NO SECTORAL RESTRICTIONS ON PARTICIPATION.
4. ENERGY AMEND O. REG 442/01 (RURAL OR REMOTE ELECTRICITY RATE PROTECTION) MADE UNDER THE ONTARIO ENERGY BOARD ACT, 1998 TO INCREASE THE TOTAL AMOUNT OF RATE PROTECTION AVAILABLE TO LOW DENSITY HYDRO ONE INC. CONSUMERS UNDER THE RURAL OR REMOTE RATE PROTECTION PROGRAM BY $110 MILLION, EFFECTIVE JANUARY 1, 2017.
5. ENERGY CONSIDER AND, IF APPROPRIATE, UTILIZE A MECHANISM TO PERIODICALLY ADJUST THE TOTAL ANNUAL AMOUNT OF RATE PROTECTION AVAILABLE TO HYDRO ONE INC. CONSUMERS UNDER THE RURAL OR REMOTE ELECTRICITY RATE PROTECTION REGULATION / PROGRAM, EFFECTIVE JANUARY 1, 2018.
6. ENERGY TO RECYCLE UP TO AN AVERAGE OF $270 MILLION OF CAP AND TRADE AUCTION PROCEEDS FROM THE GREENHOUSE GAS REDUCTION ACCOUNT PER YEAR OVER THE FIRST COMPLIANCE PERIOD (2017-2020) TO COMMERCIAL AND INDUSTRIAL ELECTRICITY CONSUMERS.
7. ENERGY AND MOF TO WORK WITH CABINET OFFICE (CO) AND PREMIER'S OFFICE (PO) ON COMMUNICATIONS PLAN.

**From:** Francisco Chinchon
**To:** Ronald Kwan; John Kim
**Subject:** Latest price mitigation deck
**Date:** Thursday, January 12, 2017 1:31:04 PM

---

Hi Ron, John,

Just got a call from Helen G. at OPCD. They received the latest draft of Energy's price mitigation deck and they would want to discuss the concept of a potential amortization of the GA (or the concept included in the deck) as there might be reporting/accounting issues. She is happy to discuss once you have reviewed the deck…

Thanks,

Francisco

Pls. see attached.

Thanks,

John.

**ANNOTATED AGENDA**
**MO UPDATE: September 7, 2016**

## 1. Electricity Price Mitigation

- The Ministry of Energy is asked to consider options on electricity price mitigation, including HST rebates.
- Current options include:
    - Providing an 8% rebate to Regulated Price Plan consumers, similar in structure to the level of support provided in the former OCEB program at 10%.
    - Providing rate-based relief to certain electricity consumers by shifting costs within the electricity sector, such as expanding the ICI eligibility threshold to customers above 1MW in all sectors.
- CEFD staff are working to provide support based on its experience with the OCEB modelling.

---

Hi Directors,

Ron will be having his MO Bi-weekly tomorrow afternoon, so could you please send me an annotated agenda **before noon on Monday, December 12, 2016**?

I am really sorry for the short turnaround time as I just noticed the meeting is tomorrow. I will send out the request earlier going forward.

For you convenience, I have attached the previous annotate agenda and policy one paper for your consideration.

Thanks,
Gavin He

**ANNOTATED AGENDA**
**MO UPDATE: November 28, 2016**

## 1. Trillium Trust Disbursements

- CEFD staff continue working on a TB and PRRT submission to set a framework for drawing on the balance of the Trillium Trust. OFA and MOF are working with staff from TBS and other ministries responsible for infrastructure projects.

    - The proposed framework would determine the methodology for allocating Trillium Trust amounts that will go to support spending on identified Moving Ontario Forward projects.

    - Recommended approach is to
        1) divide the total Trillium Trust amounts evenly between inside the GTHA and outside the GTHA, and
        2) draw a pre-determined share of Moving Ontario project spending from the Trillium Trust: 30% for inside the GTHA projects and 50% for outside the GTHA projects.

      Given lower total projected spending on projects outside the GTHA in the medium term, and in order to accelerate the use of Trillium Trust amounts, those projects would receive a higher portion of their overall funding from the Trust as compared to projects inside the GTHA.

- The submission will also seek approval for amounts in 2016/17, and is currently tracking for Treasury Board on December 14.

- Following approval, amounts for 2017/18 and later years will be set through the annual PRRT process, based on the formula in the framework.

## 2. Debt Retirement Charge (DRC) Regulation Update

- Ministry of Energy has proposed amendments to the 2005 Net Metering Regulation (O. Reg. 541/05) in the Ontario Energy Board Act, 1998, (OEBA) which includes removing the 500 kilowatts (kW) maximum output capacity restriction to expand the eligibility to larger customers. The intention of that proposal is to enable larger customers to “right-size” renewable energy systems to their load.
    - Energy is tracking to LRC on December 13th, 2016.

- This proposal will require s corresponding change to the definition of net metering generation facility in O. Reg 493/01 related to the DRC, a regulation under the Electricity Act, 1998.
    - As a DRC regulation, this proposed amendment would be under the signature of the Minister of Finance.

- This change is expected to have a small fiscal impact, up to $100,000, in reduced DRC revenues. (Budget 2016 projected about $625 million in DRC revenues.)
    - As there is an estimated fiscal impact, TBS staff advise that TB/MBC approval is required prior to the LRC approval, and TBS staff are liaising with CO on the logistics for the December 6, 2016 TB date.
    - TBS staff stressed that due to the timeline, a strong rationale regarding the timeline as well as MO (MOF) to MO (TBS) outreach would likely be required.

- The suggested change may require a regulatory registry process, staff and MOF Legal are checking if an exemption can be granted [if pursuing the December 13 LRC date].
    - Ministry of Energy posted its planned OEBA regulation amendment in August.
    - Legislative Counsel subsequently informed Energy of the associated DRC regulation issue.

### 3. IESO $975M Line of Credit Extension Minister's Directive Package

- CEFD staff have put together a package on a Minister's Directive to the OFA, following the Independent Electricity System Operator's (IESO) request for a three-year extension, to December 31, 2019, of the $975 million revolving credit facility provided by the Ontario Financing Authority (OFA).

### 4. Loans to Trusts of the Power Workers' Union (PWU) and Society of Energy Professionals (SEP)

- The Minister of Finance's consent will be required for amendments to the PWU and SEP trusts loan agreements to clarify the distribution waterfall for the purpose of paying Administrative Costs of up to $100,000 each, annually, permitted out of Excess Hydro One Distributions. Excess Hydro One Distributions are, for any quarter, residual Hydro One dividend payment amounts left after payment of all interest owed and taxes payable by the respective Borrowers.

- OFA staff are reviewing with MoF Legal the amendments prepared by Tory's to ensure that it is clear that PWU/SEP are allowed to each deduct and pay $100,000 in administrative costs from the excess distributions prior to using the balance of the excess distributions to make a mandatory payment.

- The proposed timing is a target date of December 15 to have the above-noted amendments in place. This would be in advance of the next quarterly dividend payment from Hydro One, allowing for the improved clarity on the distribution waterfall to be in place by then.

- The Power Workers Union (PWU) had also asked about assigning its beneficial interests in the trust it established for the purposes of the Hydro One loan transaction to a new trust. This new trust would have PWU's members as secondary beneficiaries, and the PWU as the primary beneficiary. The initial trust was

established with the PWU as the ultimate beneficiary so that the parties could execute the Hydro One share sale transaction without a prospectus, with the PWU having sufficient assets to qualify as an accredited investor.

- OFA and MoF Legal have no major concerns with the proposed assignment. However, given the material change to the purchaser of the shares, the Province should require an opinion from Tory's that this change will not affect the initial precept under which the share purchase was made.
  - For transparency, the Minister needs an OIC to consent to this change, which may become public, hence the request for confidentiality re this change is problematic; and
  - Legal fees incurred by the Province to accommodate this request should be borne by PWU.
- We are waiting to hear back from PWU to confirm that they still wish to proceed with the above-noted assignment request given that an OIC would be required.

## 5. ALGP: Coral Rapids Conditional Offer Package

- Coral Rapids Power Corporation ("CRP"), wholly-owned by Taykwa Tagamou Nation ("TTN"), is seeking a loan guarantee under the ALGP of about $18.2 million. This loan would allow CRP to finance its investment in a partnership which was formed to own and operate the 28 MW Peter Sutherland Sr. Generating Station at a lower interest rate than the alternative (a loan from its partner).

- In addition, the IESO, which holds the power purchase agreement with the project requires CRP hold a minimum level of interest in the partnership.
  - As such, CRP is eager to finalize the loan guarantee as soon as possible.

- This item is currently on the December 13 LRC agenda in order to obtain an OIC for this application that would authorize the Minister of Finance to provide a loan guarantee, subject to certain terms and conditions.
  - Receipt of an OIC is required prior to execution of the final loan guarantee agreement.

- As this application involves the interest of a Schedule 1 bank (the proposed lender is TD) the screening measures are expected to apply.
  - Staff propose that approval to proceed to LRC and of the conditional offer letter be sought from the President of the Treasury Board. The briefing for Minister Sandals is scheduled for Thursday December 1.

## 6. NUG Curtailments

- IESO has recently engaged with several NUG owners, in consultation with OEFC, to explore potential curtailments of gas-fired NUG facilities.

- IESO has offered curtailment over the remainder of the existing contract terms for contracts expiring pre-2020 or for the next 1-2 years for those contracts expiring post-2020.

- Currently, these discussions have been most active with Atlantic Power and TransAlta with respect to the following facilities.

| Owner | Facility Name | Fuel | Capacity (MW) | Location | PPA Expiry Date |
|---|---|---|---|---|---|
| Atlantic Power | North Bay Power Plant | Natural Gas | 31 | North Bay | 31-Dec-2017 |
| | | Waste Heat | 9 | | |
| Atlantic Power | Kapuskasing Power Plant | Natural Gas | 30 | Kapuskasing | 31-Dec-2017 |
| | | Waste Heat | 10 | | |
| TransAlta | Mississauga Cogeneration Plant | Natural Gas | 110 | Mississauga | 31-Dec-2018 |
| Atlantic Power | Nipigon Power Plant | Natural Gas | 32 | Orient Bay | 31-Dec-2022 |
| | | Waste Heat | 8 | | |

- IESO is aiming to have curtailments of the above NUGs begin at the start of 2017. Staff for OEFC will work with IESO staff on implementing any curtailments agreed to by IESO and NUGs.

## 7. Global Adjustment Lawsuit

- On June 20, 2016, OEFC submitted an application for leave to appeal to the Supreme Court of Canada the April 19, 2016, decision by the Ontario Court of Appeal that dismissed OEFC's appeal of the March 12, 2015, lower court decision.
    - OEFC's position has consistently been that it has administered these power purchase agreements in a manner that it believes has been correct.
    - A decision on the leave to appeal application is expected this fall.

- A decision on the leave to appeal application may occur anytime between now and the end of the year.

- On September 13, 2016, the Ontario Court of Appeal denied OEFC's motion for a stay of the court order that would require payment of increased rates that result from the March 12, 2015, decision of the Ontario Superior Court of Justice.

- OEFC made the retroactive payment of $178 million, including interest on October 21, 2016.
    - In addition to the payments to the NUGs, NUGs with generator debt are entitled to retroactive increased rates totalling approximately $3.5 million. This

amount will be recovered by OEFC from IESO and applied to reduce outstanding generator debts.
    - Therefore, OEFC will recover a total of approximately $181.5 million from the IESO.

- OEFC's recovery of the retroactive payments from the IESO is occurring over three months (October to December 2016), in response to a request from the Deputy Minister of Energy.

## 8. MaRS proposed $290M takeout financing, with associated MRIS $94M loan

- MRIS will be seeking TB approval on November 29th, followed by seeking Cabinet approval on December 6th.

- OFA is not opposed to the proposed MRIS loan.

- OFA provided the following comments on the TB submission:
    - Interest rate provided to the Province is lower than that provided to Manulife et al even though we are in a riskier position in terms of priority of payment and holding lower-ranking security.
    - The overall cost that the transaction will impose on MaRS compared to their current payments on the Provincial financing are significant ($24M higher).
    - The new MRIS loan would not be one term loan (like the Manulife loan) bur rather two facilities: one $32M term loan with a fixed interest rate and one $52M floating rate facility based on a "cash flow sweep" approach with the Province at the bottom of the cash flow priority for payment of these loans.
    - The security retained by the Province may not be enforceable until 20135 per standstill agreement requested by Manulife.
    - MaRS should provide written assurance to the Province that it will not seek a debt service subsidy or any other additional funding in the event that it is unable to cover its new debt service obligations.

## 9. FAA Section 28 Sharing Protocol

- TBS comments on the sharing protocol has been incorporated. Protocol is undergoing a final staff level review before being circulated to DM/MO and briefings set up.

- An OFA/MoF/TBS working group has been established to review options for modernizing s.28 of the FAA.

## 10. OCGC New Mandate & Scale-Up Venture Fund

- MRIS/OCGC TB submission on OCGC's new mandate is on the back burner.

- OFA working with MRIS/OCGC staff re: finalization of documentation to support MRIS Minister's request for s. 28 approval of Scale-Up Venture by Minister of Finance.

## 11. Green Bank

- MOECC's submission on the establishment of and the accountability framework for the new climate change agency is now tracking to a TB/MBC meeting on either Dec 14th or 15th (per TB staff).

- A revised draft submission is being reviewed by staff. A copy of the draft regulation has not been circulated yet.

- Major concern is lack of specifics re proposed financing programs and what the draft regulation will contain, given that the draft regulation is expected to be filed with the TB submission, but most of the agency's programs - especially the financing programs - are still in the very early development stage.

**Broadening Ownership of Hydro One and associated transactions**

Following the Premier's Advisory Council on Government Assets' final report the 2015 Budget announced the government was moving forward with an initial public offering (IPO) of 15 per cent, with additional shares being made available in subsequent years until totalling up to 60 per cent of the Province's common shares in Hydro One.

- In May 2016 the government completed a secondary offering of 14 per cent common shares. After this sale the government holds about 70 per cent of the common shares in Hydro One.
    - Discussions will be needed with OPCD to determine the accounting treatment of the purchase of shares by OPG.
    - A regulation under the Trillium Trust Act is required to dedicate the net revenue gains.
    - Providing an amount to OEFC under s.50.3 of the Electricity Act is also required.

- In July 2016 the Province announced that in connection with broadening the ownership of Hydro One, the government agreed-in-principle to sell up to 2.5% of Hydro One common shares at $18 per share to First Nations in Ontario and to provide a 25 year loan (Ministry of Finance) for $268 million to finance the acquisition of the shares. Ontario also agreed to provide up to $45 million in cash (Ministry of Energy) to be used as seed capital by First Nations.
    - The government will have to approve the terms agreed with COO and subject to 80 per cent or more of FNs agreeing to the terms the government will be expected to execute the sale purchase agreement (SPA) and associated loan agreement with FN represented by COO in December 2017
    - The Loan Agreement is anticipated to be provided through the Ministry of Finance (an operating asset is requested through the PRRT process, and to be signed by the Minister of Finance.

- As part of the 2017 Budget and fiscal planning process the government has to decide when to sell additional shares and how to allocate sales through fiscal 2017/18 and 2018/19.

- The government will also need to decide on crediting the Trillium Trust with the net revenue gains from asset optimization transactions that may close in calendar 2017 (Hydro One shares, Seaton Lands, OPG head office properties).

**Electricity Price Mitigation**

Following the implementation of Ontario Rebate for Electricity Consumers (OREC), effective January 1, 2017, other electricity price mitigation policies would be on the governments, and specifically the Ministry of Energy's agenda, in the coming months.

- Any electricity price mitigation policy initiatives not on the rate base would have a fiscal impact.
- The OREC is expected to cost $300M in 2016-17 and about $1.2Bn starting in 2017-18.

**OPG Lending, Darlington Refurbishment**

- Received Minister's Directive on June 17, 2016, for general corporate purposes including Darlington Refurbishment project up to $700 million.
- Directive provides approval for subsequent loans not totalling more than $3 billion but is subject to approval of OPG's business plan.
- Ontario Power Generation (OPG) has commenced refurbishment of the first of four units at its Darlington Nuclear Generating Station in October 2016. [Prior to commencement of each additional Unit, OPG will seek Cabinet Approval.]

**OPG Business Plan**

OPG is expected to provide its 2017-2019 Business Plan to the Minister of Energy for approval in the first half of 2017. Energy should provide a draft OPG business plan projection for fiscal planning purposes in January 2017.

**OPG Rates**

OPG has provided submitted its 2017-2021 Rate Application to the Ontario Energy Board in May 27, 2016. The rate application is currently undergoing the regulatory review process.

Hi John

One small edit including an explanatory comment.

Thanks

Ken k

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the ~~[~~*Ontario Rebate for Electricity Consumers Act, 2016*~~] – NTD, pending the legislature considering the Bill], including~~ and the regulations thereunder (the "Act"), certain consumers will be entitled to receive ~~a credit, known as the~~ financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ("~~" or "~~OREC"), against~~", in respect of~~ the cost of electricity consumed by them ~~during the period~~ commencing January 1, 2017;

2. ~~Funds in respect of the~~ Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to ~~most~~specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act~~, its regulations and the Market Rules~~;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the OREC Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

1. **Payment Authorization**

   (i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

   (ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

   (iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

      i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

      ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

2. **Payment Process**

   ~~a) The Ministry is registered with the IESO as an IESO Program Participant.~~

   a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

   ~~c)~~b) The Ministry will take all necessary steps to provide the OFA with access to the ~~Ministry's~~ IESO ~~account and will arrange for~~Portal so that the OFA ~~to~~will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

   ~~d)~~c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

   ~~e)~~d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

   ~~f)~~e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

3. **Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ~~ensure that~~provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of ~~has full access to~~ such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

~~e)~~

## 4. OREC Cost Forecasting

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the ~~Corporate and Electricity Finance Division of~~ the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to ~~complete and accurate~~ data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process~~.~~.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

~~d)a) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.~~

d) ~~e)~~ The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement ~~of~~on the forecasts.

e) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for the appropriated amount or for a change in the appropriated amount for OREC.

## 5. Limited Role of the OFA

**Commented [KK2]:** Throughout the MOU we have used "OFA" to stand in for all divsions, referring to the OFA here as well keeps it consistent.

**Formatted:** Indent: Left: 0.25", Numbered + Level: 1 + Numbering Style: a, b, c, … + Start at: 1 + Alignment: Left + Aligned at: 0.75" + Indent at: 1"

**Commented [SQ23]:** The only change outlined in the latest version.

**Commented [KR4]:** Does the OFA agree that there should be a provision contemplating agreement on the forecasts? Would it be sufficient to simply reqire tht senior management be briefed?

**Commented [RK5]:** How about dealing with it by switching the order and slightly amending the new "e)"?

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400

**Attachments:** OPG 2017 Business Plan Summary v3_Markup.docx

## ONTARIO POWER GENERATION – 2017-19 BUSINESS PLAN

On November 28, 2016, OPG provided its 2017-19 Business Plan ("Business Plan") to the Minister of Energy. This Business Plan is similar to the previous 2016-18 Business Plan, which was enclosed in OPG's 2017-2021 rate application, submitted to the Ontario Energy Board (OEB) on May 27, 2016, notwithstanding the redacted portions.

### Fiscal Impacts

The following tables provides a comparision between Budget 2016 and the latest financial projectsions submitted by OPG in its 2017-19 Business Plan.

Note that OPG contributions to the fiscal plan in Budget 2016 was primarily based on OPG's 2015 business plan, as its board-approved 2016-18 multi-year business plan had not yet been approved and provided when the 2016 Budget fiscal plan was locked.

Earnings Before Tax is now forecasted to be lower by $250 million in 2016-17, lower in 2017-18 by $173 million, lower in 2018-19 by $42 million and higher in 2019-20 by $84 million.

The 2017-18 forecasts in the Business Plan have had preliminary adjustments for fiscal planning purposes to remove for this table~~account for~~ the projected pre-tax gain on the sale of OPG headquarters properties to avoid double-counting as those revenue amounts are included under asset optimisation.

Note that the following is on OPG's U.S. GAAP basis of accounting, and does not show consolidation adjustment for the nuclear funds, nor potential IFRS consolidation adjustments.

| Budget 2016 / Fiscal Plan ($M) | 2016-17 | 2017-18 | 2018-19 | 2019-20 |
|---|---|---|---|---|
| Net Income After Tax (Adjusted) | 471 | 586 | 673 | 705 |
| Income Tax PILs | 224 | 159 | 182 | 108 |
| **Earnings Before Tax** | **695** | **745** | **855** | **812** |

| OPG 2017-19 Business Plan ($M) | 2016-17 | 2017-18 | 2018-19 | 2019-20 |
|---|---|---|---|---|
| Net Income After Tax (Adjusted) | 349 | 406* | 678 | 726 |
| Income Tax PILs | 96 | 166** | 135 | 170 |
| **Earnings Before Tax** | **445** | **572*** | **813** | **896** |
| **EBT Variance to Fiscal Plan** | **(250)** | **(173)***** | **(42)** | **84** |

* Pre-tax gain on sale of OPG head office property of $296M is backed out in the net income after tax calculation in 2017-18. In 2017 Business Plan, Net Income Attributable to Shareholder in 2017-18 is $702M. The expected gain on sale is reflected as an asset optimization component captured in the Sales and Rental line under Non Tax Revenue.
** Income Tax PILs do not have OPG head office sale backed out. Further details required from OPG.
*** Budget 2016/Fiscal Plan included OPG headquarter sales in 2016-17 which was deferred to 2017-18 in the 2017 Business Plan, and impacts removed in the above table.

**Formatted:** Font: 10 pt, Bold, Italic

**Formatted:** Centered

**Key Highlights**

*Fiscal and Rate Payer Impacts*

- The 2017-19 Business Plan is largely unchanged from the 2016-18 one in terms of commitments for Net Income. Consistent with the previous plan, the 2017-19 Business Plan projects net income growing to about $730 million in 2019 and $1 billion in 2021.
    - The OPG business plan reflects its rate application, which includes OPG rate increases of about~~...~~ 1.5% per year for hydroelectric base rate starting in 2017 and 11% per year increase for nuclear generation consistent with its rate smoothing proposal, which are estimated ~~is expected~~ to result in average increases of about 0.7% or $1.05 per month annually on a typical residential customer's monthly bill. (Commodity costs represent about ~~xx~~50% of a typical bill, and OPG generation accounts for about yy% of total commodity costs.)
- As the decision for OPG's rate application is not expected until Q3 2017, the outcome of the new rate application will not be known in time to be reflected in OPG's projected results that will be included in the 2017 Document's fiscal plan, nor consolidated with the Province's 2016-17 fiscal year results.
    - In the 2017-19 Business Plan, new regulated rates are effective January 1, 2017.
    - A delay in this effective date is expected to result in an approximately $50 million to $60 million reduction in net income per month.
    - The b~~B~~usiness p~~P~~lan does not assume retroactive application for the rates, but does have the recognition of regulatory assets for the portion of the nuclear revenue requirement deferred for future recovery under nuclear rate smoothing starting in 2017.

~~*Accounting Treatments and Reporting Standards*~~

- ~~As the OEB has been holding a generic consultation on the treatment of rate-regulated utilities' pensions and other post-employment benefits (OPEBs), OPG currently collects pension and OPEB costs on a cash basis with the difference between cash and accrual recorded in a deferral account until the conclusion of the consultation.~~
    - ~~There would be a significant financial impact if OPG is required to permanently collect pension and OPEB costs on cash basis.~~
- ~~Adoption of International Financial Reporting Standards (IFRS) would result in a significant increase in income volatility and would require a reassessment of OPG's fiscal commitments in the Business Plan. OPG's current exemption with the Ontario Securities Commission that allows it to report on a basis other than IFRS expires at the end of 2018.~~

*Executive Compensation Framework*

- OPG reports that it~~'~~s current management compensation restraint initiatives have made attracting and retaining talent a challenge. OPG has requested approval for a proposed Executive Compensation Framework (ECF), generally targeted at the 50th percentile of market peers.
    - *CEFD Staff Comments*: On November 22, 2016, the Province amended the Executive Compensation Framework regulation to ensure broader public sector organizations can benchmark compensation for senior nuclear technical experts against other jobs that

**Commented [RK1]:** Can we say that OPG has asked for the rates to be retroactive to January 2017 (through deferral accounts to be recovered going forward?) Has OPG asked for an effective date for its new rates, and, if so, has the OEB agreed?

Is the effective date a risk to the projections?

Does OPG`s BP assume retroactive application so 16-17 includes an accrued amount for new rates to approved in 2017:Q3?

**Commented [AP2]:** BP assumes effective date in application is January 1 , 2017. It seems that OPG has not yet asked for rates to be retroactive, but they will likely do that during the first hearings (will be considered a preliminary matter) similar to what Hydro One did during the November 24, 2016 hearing for EB-2016-0160 (got deferral account approved for rates as of January 1, 2017 due to proceedings surpassing that date).

**Commented [AP3]:** BP states it is within OEB's authority to set a later effective date, which would negatively impact OPG's monthly income by ~$50M to $60M per month for the 2017/2018.

**Formatted**

**Formatted:** Font: 10 pt, Bold, Italic

**Formatted:** Centered

require the same unique skills and experience. This amendment will ensure Ontario is able to attract and retain the highly specialized executive talent necessary to safely operate its large nuclear facilities and generate Ontario's single largest source of emissions-free electricity.

*Other Highlights*

- The sale of OPG's head office is on track for 2017-18 fiscal year.
- OPG's headcount continues to decline, as reported in the monthly update. Note that the Darlington Refurbishment headcount is not considered part of ongoing operations.
- Total long-term debt for general corporate (i.e., financing through OEFC) is forecast to increase by $1.6 billion, from $0.2 billion in 2016 to $1.8 billion in 2017.
- The Business Plan includes approved budget and schedule for the Darlington Refurbishment Project, with first unit beginning in October 2016, and assumes it returns to service in February 2020.
- The plan assumes all six operating Pickering units operate until 2022, with four of these units operating until 2024. The plan includes additional costs and outage days to achieve Pickering operations beyond 2020, in line with the business case approved by the Board.
    - The Business plan reflects currently approved station service lives, *for accounting purposes*, for the Pickering GS to the end of 2020 and for the Darlington GS to 2052.
        - The Pickering service life will be reassessed upon technical work confirming ability to achieve operations beyond 2020.

- OPG presented 4 proposals in the Business Plan to provide greater sharedholer value and keeping electricity prices low. Note, while these proposals are presented in the BP, they are **not** assumed in the Business Plan.
    - Align OPG's Capital Structure with the OEB's deemed capital structure to improve OPG's actual return on equity.
        - *CEFD Staff Comments:* OPG's revenue requirements are based on deemed capital structure rather than actual capital structure. As a result, OPG's shareholder (the Province) is not compensated for the increased equity capital put at risk. Therefore, OPG is referring to a higher measured percentage rate of return being higher, not higher net income. For the same net income, with lower equity, the ROE percentage would be higher. Furthermore, should the level of debt be increased to achieve the deemed capital structure, the weighted cost of capital and revenue requirement would reflect the increased debt service costs.
        - ~~*CEFD Staff Comments:* While this would likely achieve greater shareholder value, it is not clear how this would enable OPG to provide electricity rate benefits~~.
    - Invest in OPG's assets to maintain OPG's critical size, so it can continue to mitigate prices for customers, about 30% to 40% below other generators.
    - OPG to establish a dividend program tied to key business outcomes, which could return about $2.4 billion to the shareholder. The Province could use this dividend to fund government priorities including lowering the price of electricity should it so choose.

**Formatted:** Font: 10 pt, Bold, Italic

**Formatted:** Centered

- Staff comment: Dividends are not revenues to the Province. OPGès net income is. Using the dividend cash for rate mitigation would have a dollar-for-dollar fiscal impact upfront, plus an IOD impact.

  - Use OPG public debt to reduce Provincial debt through public financing strategy.
    - Maturing debt and future additional debt could be financed through the public debt markets. In addition, the OEB's deemed capital structure can be achieved and drive a level of discipline and commercial orientation within the Company.
      - Staff comment: To-date, the government has not permitted OPG to borrow in public capital markets for general corporate purposes. OPG borrowing on its own would likely have a negative foscal impact as its cost of borrowing is expected to be higher than the Provincee's.

**Key Risks**

*Risk: Accounting Treatments and Reporting Standards*

- As the OEB has been holding a generic consultation on the treatment of rate-regulated utilities' pensions and other post-employment benefits (OPEBs), OPG currently collects pension and OPEB costs in regulated rates on a cash basis, with the difference between cash and accrual recorded in a deferral account until the conclusion of the consultation and OEB decision.
  - There would be a significant financial impact if OPG is required to permanently collect pension and OPEB costs on cash basis with no deferral account recovery.
- Adoption of International Financial Reporting Standards (IFRS) would result in a significant increase in income volatility and would require a reassessment of OPG's fiscal commitments in the Business Plan. OPG's current exemption with the Ontario Securities Commission that allows it to report on a basis other than IFRS expires at the end of 2018.

*OEB's decision on OPG's 2016 rate application*

- Could have potential impact on OPG's rate-regulated operations.
  - Furthermore a delay in the effective date of the newly regulated rates might reduce OPG's net income by approximately $50 million to $60 million per month, for the 2017-18 fiscal year. The Business Plan assumes an effective date of the newly regulated rates on January 1, 2017.

*Other Risks*

- Failure to keep the Darlington refurbishment project on track in terms of cost, schedule, and other associated activities.
- Failure to maintain appropriate staff level and resources during Darlington refurbishment and Pickering operations.
- Risk of technical challenges in confirming ability to operate Pickering beyond 2020.
- Additional rRisks from reporting OPG on an IFRS basis, as OPG planning and financials are still on a U.S. GAAP basis.

**Formatted**

**Formatted**

**Formatted:** Underline

**Formatted:** Indent: Left: 0.25", No bullets or numbering

**Formatted:** Font: Italic, Underline

**Formatted:** No bullets or numbering

**Formatted:** Font: Italic, Underline

**Commented [RK4]:** We should elaborate on this.

**Formatted:** Font: 10 pt, Bold, Italic

**Formatted:** Centered

- IFRS 14, the interim standard for rate regulated accounting effective January 1, 2016, allows entities adopting IFRS to avoid major changes in accounting policy until the IASB broader project to develop a reporting standard on rate-regulated activities is completed.
- Some regulatory accounts may not be recognized by the eventual IFRS principles as creating economic benefits and obligations, resulting in the loss of potential repayments through the OEB process.
- IFRS adoption may lead to the creation of new regulatory accounts, including regulatory liabilities that, if disposal is approved by the OEB, would lead to recovery payments from OPG to ratepayers.
- Principle differences for several different accounting methods between US GAAP and IFRS, including pension costs, asset retirement obligations, and fair value measurement, may significantly impact the financial statements of OPG as well as the Province on consolidation.
- The cost of switching accounting standards, including the retrospective application of IFRS principles, must also be considered.

| **Attachments:** | MOU - MoE OFA- DAP Nov 25 - track changes to v3_clean.docx<br>MOU - MoE OFA- DAP Nov 25.doc<br>MOU - MoE OFA re OREC(v3)_Clean.doc |

---

Hi Caroline/Ken,

We have received a marked up version of the MOU between the OFA and MoE related to the OREC regulation. I did a quick blackline and there were actually other changes that were not highlighted and was advisable to check with you whether you see any issues/comments. The changes seem to revolve around the definitions of the program etc.

V3_clean = what we had last sent over
DAP Nov 25 = the latest markup we received
Track changes to v3_clean - quick blackline to show additional changes not shown in the markup received.

Hoping you can take a quick look.

Thank you,
Salman

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the ~~[~~*Ontario Rebate for Electricity Consumers Act, 2016*~~] – NTD, pending the legislature considering the Bill], including~~ and the regulations thereunder (the "Act"), certain consumers will be entitled to receive ~~a credit, known as the~~ financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ~~("~~" or "OREC~~"), against~~", in respect of the cost of electricity consumed by them ~~during the period~~ commencing January 1, 2017;

2. ~~Funds in respect of the~~ Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to ~~most~~specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act~~, its regulations and the Market Rules~~;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the ~~OREC~~Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f)of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

1. **Payment Authorization**

   (i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

   (ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

   (iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

      i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

      ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

2. **Payment Process**

   ~~a) The Ministry is registered with the IESO as an IESO Program Participant.~~

   a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

   ~~c)~~b) The Ministry will take all necessary steps to provide the OFA with access to the ~~Ministry's~~ IESO ~~account and will arrange for~~Portal so that the OFA ~~to~~will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

   ~~d)~~c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

   ~~e)~~d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

   ~~f)~~e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

3. **Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ensure that the Ministry has full access to such records.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

e)

**Commented [SQ22]:** What would this access look like? Are they expecting us to set up up an external site with all of our files/modeling as well?

Just need to clarify expectations.

## 4. OREC Cost Forecasting

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the Corporate and Electricity Finance Division of the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to ~~complete and accurate~~ data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process .

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.

e) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement of the forecasts.

**Formatted:** Font: Not Bold

**Commented [SQ23]:** The only change outlined in the latest version.

## 5. Limited Role of the OFA

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

## 6. Review and Termination

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

Formatted: Highlight

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

Formatted: Highlight

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:

e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ensure that the Ministry has full access to such records.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

e)

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the Corporate and Electricity Finance Division of the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process .

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.

~~d)~~ e) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement of the forecasts.

**Formatted:** Indent: Left: 0.5", No bullets or numbering

**Formatted:** No bullets or numbering

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

Formatted: Highlight

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

Formatted: Highlight

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.
Attention:
email:

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated: , 2016**

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the [*Ontario Rebate for Electricity Consumers Act, 2016*] – NTD, pending the legislature considering the Bill], including the regulations thereunder (the "Act"), certain consumers will be entitled to receive a credit, known as the Ontario Rebate for Electricity Consumers ("OREC"), against the cost of electricity consumed by them during the period commencing January 1, 2017;

2. Funds in respect of the OREC will flow to most distributors and unit sub-metering providers through the Independent Electricity System Operator ("IESO") in accordance with the Act, its regulations and the Market Rules;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the OREC (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f)of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

**1. Payment Authorization**

(i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

(ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

(iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

**2. Payment Process**

a) The Ministry is registered with the IESO as an IESO Program Participant.

b) The Ministry will take all necessary steps to provide the OFA with access to the Ministry's IESO account and will arrange for the OFA to have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

## 4. OREC Cost Forecasting

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the Corporate and Electricity Finance Division of the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies and unit sub-metering providers) to the IESO received by the Ministry. This includes providing electronic portal access to complete and accurate data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process .

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.

## 5. Limited Role of the OFA

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

## 6. Review and Termination

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

## 7. No Service Charges

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

## 8. Contacts

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

## 9. Notice

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.
Attention:
email:

c) In the case of the Ministry, the addresses for notice are:
Hand Delivery:
Ministry of Energy
880 Bay Street, 5th Floor
Attention:
email:

## 10. Execution

The parties have executed this MOU, effective as of the date first above written.

| **Date:** | Tuesday, December 06, 2016 10:56:07 AM |
| **Attachments:** | Price Mitigation Proposals_Dec5-16_v11_SPFB Markup.pptx |

---

Hi John,

I have included comments in the attached version of the price mitigation deck on slides 3, 4, 5, 8, 13, 14, 15, 20.

I will be out this afternoon, so could you combine with comments on the deck you will submit to Ron.

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector

## Working Draft

December 5, 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure.
  - Since 2003, the Province has invested more than $35 billion in over 16,000 megawatts (MW) of new and refurbished cleaner generation, including nuclear, natural gas and renewables.
  - Over the same period, Hydro One has invested $15.5 billion to enhance and renew its transmission and distribution systems.
  - As additional electricity generation comes online, nuclear units are refurbished and distribution and transmission investments are made, prices are forecast to continue to increase.

- Actions have been taken to drive down electricity costs, including deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., introduction of wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).

- Additional steps have been taken to increase cost effectiveness and improve efficiency by adopting new electricity market approaches, such as:
  - Enhancing competition between developers of large renewable projects through the Large Renewable Procurement (LRP) process to drive down price and secure clean, reliable generation for the province;
  - Directing IESO to end the process of negotiating new NUG contracts pending the development of a Capacity Auction (i.e., Market Renewal); and
  - Launching the first IESO Demand Response Auction (i.e., a competitive process through which demand-side resources are selected to be available to reduce their electricity consumption as needed).

# Context (Cont'd)

- Following the 2016 Throne Speech, a number of actions were announced to further reduce electricity costs, such as:
  - Providing an 8 per cent rebate, equivalent to the provincial portion of HST, for approximately 5 million eligible electricity consumers including residences, small businesses and farms;
  - Increasing the amount of rate protection available to approximately 330,000 eligible rural customers living in low-density areas by updating the Rural or Remote Rate Protection (RRRP) program;
  - Lowering the Industrial Conservation Initiative (ICI) threshold to 1 MW and removing sector restrictions so that more consumers can benefit;
  - Suspending the second round of the Large Renewable Procurement (LRP II); and
  - Recycling a portion of cap and trade auction proceeds to keep rates affordable for industrial and commercial electricity consumers.

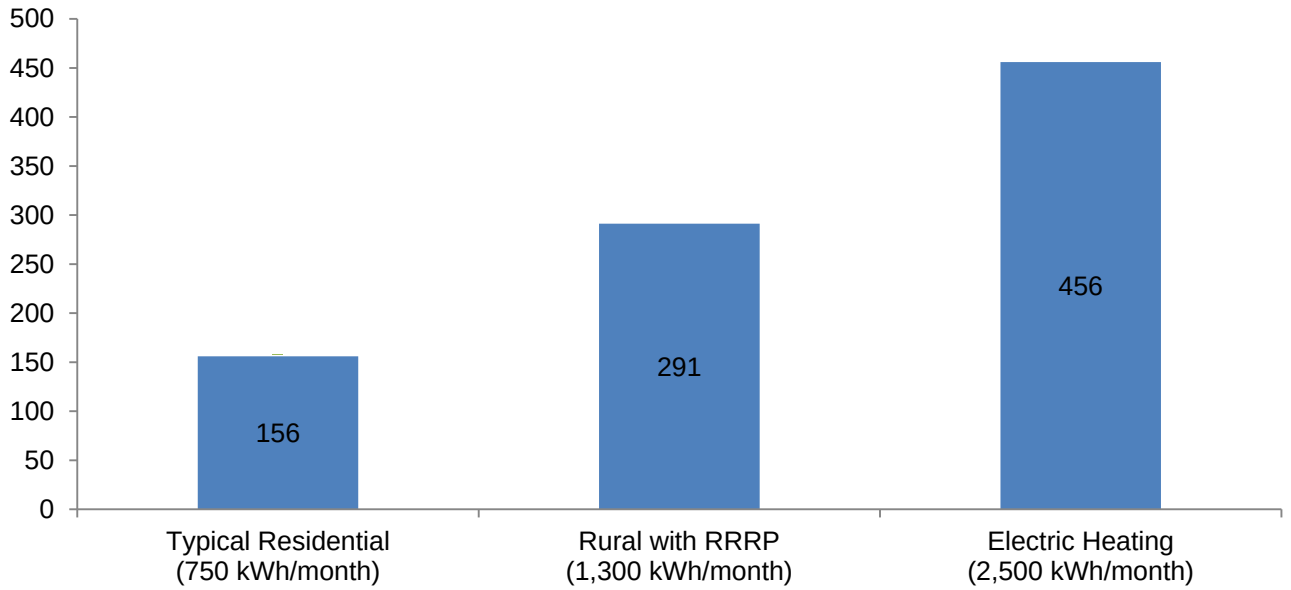
- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured and the need for wholesale market renewal.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

# Current Electricity Prices – Residential

- Residential consumers electricity prices continue to be a concern for many Ontarians, particularly those that rely on electric heat.
  - **Note:** The typical residential bills are currently below the 2013 Long-Term Energy Plan (2013 LTEP) forecasts ($159 / 750kWh)

**Residential Electricity Bills**
*in $/month*

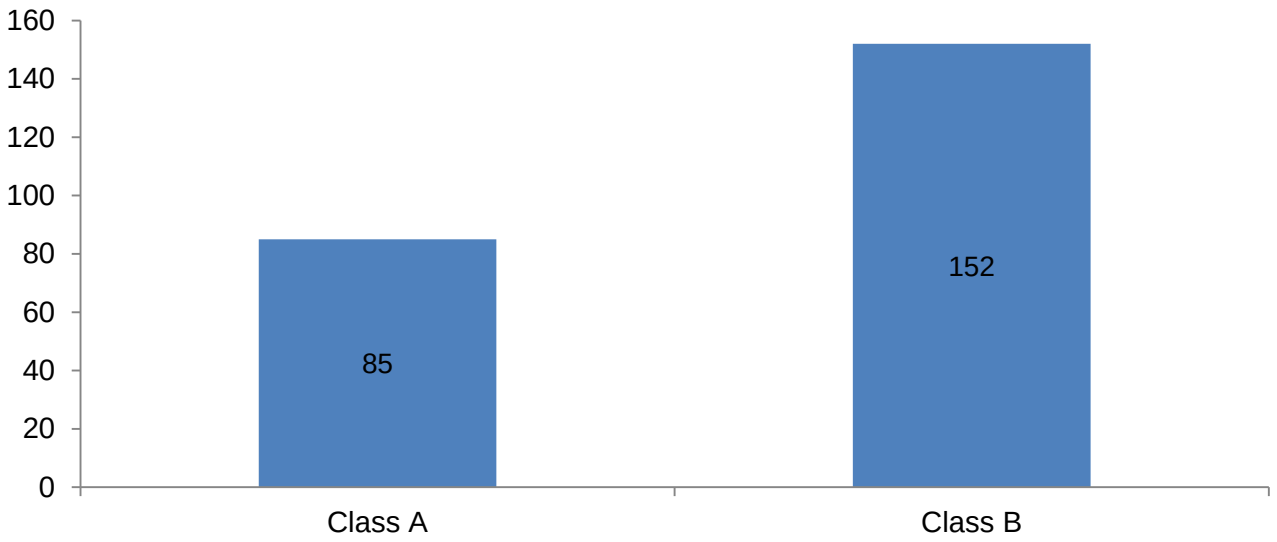


**Note**: Typical residential and electric heating shown above are based on Toronto Hydro; rural is based on connection to Hydro One as a R2 customer eligible to receive the Rural or Remote Rate Protection (RRRP) credit of $31.50.

# Current Electricity Prices – Industrial and Commercial

- While large industrial electricity consumers (i.e., Class A) rates are competitive with other jurisdictions, rates for commercial/small industrial consumers (i.e., Class B) are higher by comparison.
  - **Note:** Current industrial and commercial prices are below 2013 LTEP forecasts ($96 / MWh)

**Current All-In electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer. Class B reflects a 1 MW load operating at 56% load factor and connected to Toronto Hydro.

# Proposed Initiatives – Overview

- The suite of proposed initiatives are intended to:
  - Transform how the electricity market operates in Ontario;
  - Re-set how government programs are funded (i.e., rate-base vs tax-base);
  - Provide system benefits (e.g., industrial load retention);
  - Lower the cost of electricity for residential and industrial consumers; and
  - Increase cost effectiveness and improve efficiency.

- The proposed initiatives include:
  1. Implement Market Renewal Initiatives
  2. Fund Electricity Support Programs Through The Tax-base
  3. Eliminate the Industrial Conservation Initiative (ICI)
  4. Amortize Conservation Program Costs
  5. LDC Efficiencies
  6. Rate Design Initiatives
  7. Reduced Cost of OPG Borrowing
  8. End Debt Retirement Charge (DRC) Early for Commercial/Small Industrial Class B Electricity Consumers
  9. Dedicate Departure Tax
  10. Cancel/Adjust Renewable Energy Procurements

- The proposed initiatives provide opportunities to reduce electricity costs for residential and industrial consumers while at the same time transforming the province's electricity market and yielding benefits for the electricity system.

# Proposed Initiatives – Impacts

- Each of the proposed initiatives under consideration target different government programs and different parts of the electricity bill. The proposals impact different classes of electricity consumers to varying degrees.

| Proposal | Program / Initiative | Line on Bills | Who Benefits |
|---|---|---|---|
| 1. Implement Market Renewal Initiatives | Market Renewal | Electricity, Global Adjustment, Regulatory | Market Renewal: All electricity consumers |
| 2. Fund Electricity Support Programs Through The Tax-base | OESP, RRRP | Regulatory | All electricity consumers evenly |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | ICI | Electricity, Global Adjustment | Only Class B electricity consumers (i.e., residential) **Note:** Will have a negative impact on Industrial consumers. |
| 4. Amortize Conservation Program Costs | Amortization | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |
| 5. LDC Efficiencies | Distribution efficiencies | Delivery | All embedded consumers |
| 6. Rate Design Initiatives | Rate structures | Electricity, Global Adjustment | Rate Design Initiatives: Participating electricity consumers |
| 7. Reduced Cost of OPG Borrowing | n/a | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |
| 8. End DRC Early for Commercial/Small Industrial Class B Electricity Consumers | Debt Retirement Charge (DRC) | DRC | Class B consumers (i.e., small business and commercial consumers, etc) |
| 9. Dedicate Departure Tax | Departure Tax | TBD | TBD |
| 10. Cancel/Adjust Renewable Energy Procurements | FIT, LRP | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

| *$/750kWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| 1. Implement Market Renewal Initiatives | - | - | - | 1.58 | 1.59 | 1.60 | Longer-Term |
| 2. Fund Electricity Support Programs through the Tax-base | 2.18 | 2.30 | 2.31 | 2.45 | 2.48 | 2.51 | Immediate |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | 4.40 | 4.24 | 4.10 | 4.24 | 3.73 | 3.58 | Immediate |
| 4. Amortize Conservation Program Costs | 1.67 | 1.56 | 1.21 | 0.81 | 0.54 | 0.3 | Immediate |
| 5. LDC Efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Near-Term |
| 6. Rate Design Initiatives* | - | - | - | - | - | - | Immediate |
| 7. Reduced Cost of OPG Borrowing | 0.13 | 0.13 | 0.13 | 0.18 | 0.18 | 0.18 | Immediate |
| 8. End DRC Early for Class B Electricity Consumers** | - | - | - | - | - | - | n/a |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| 10. Cancel / Adjust Renewable Energy Procurements | - | - | TBD | TBD | TBD | TBD | Longer-Term |
| **Total** | | | | | | | |

**Note:** The above initiatives will provide similar benefits for non-RPP Class B electricity consumers. Proposal 2 assumes OESP participation of 50% and 5-year maturity. *Savings estimates do not include changes related to rate design. ** Class B includes small-medium enterprises (SMEs).

# Proposed Initiatives – Potential Savings for Average Industrial Electricity Consumers

| *$/MWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| 1. Implement Market Renewal Initiatives | - | - | - | 2.11 | 2.12 | 2.13 | Longer-Term |
| 2. Fund Electricity Support Programs through the Tax-base | 2.91 | 3.06 | 3.17 | 3.27 | 3.33 | 3.38 | Immediate |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | (24.12) | (23.21) | (22.45) | (23.23) | (20.42) | (19.61) | Immediate |
| 4. Amortize Conservation Program Costs | 1.15 | 1.08 | 0.84 | 0.56 | 0.37 | 0.25 | Immediate |
| 5. LDC Efficiencies | n/a | n/a | n/a | n/a | n/a | n/a | Near-Term |
| 6. Rate Design Initiatives* | - | - | - | - | - | - | Immediate |
| 7. Reduced Cost of OPG Borrowing | 0.10 | 0.10 | 0.10 | 0.15 | 0.15 | 0.15 | Immediate |
| 8. End DRC Early for Class B Electricity Consumers** | - | - | - | - | - | - | n/a |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| 10. Cancel / Adjust Renewable Energy Procurements | - | - | TBD | TBD | TBD | TBD | Longer-Term |
| **Total** | | | | | | | |

**Note:** Proposal 2 assumes OESP participation of 50% and 5-year maturity. Proposal 3 reflects the elimination of ICI, as opposed to moving ICI cost shift to the taxbase. The $1.75/MWh savings associated with Proposal 7 in 2018 accounts for the fact that under the status quo, DRC will be removed from bills in April 2018. *Savings estimates do not include changes related to rate design. ** Class B includes small-medium enterprises (SMEs).

# Fiscal Considerations

- Funding electricity support programs (i.e., OESP, RRRP, First Nations Delivery Rate) from the tax-base represents approximately $440 million on average annually.

- Ending the Debt Retirement Charge (DRC) for commercial and small industrial electricity consumers (i.e., Class B) early would represent an additional fiscal pressure of $xx [placeholder for OFA] on the province.

- If the Industrial Conservation Initiative were funded though the tax-base instead of being eliminated, this would represent a $900 million annual cost to the fiscal plan.

- Reducing OPG borrowing costs to the Province's cost of funds is expected to result in a $20 to $35 million annual fiscal pressure to the province [TBC by OPG / OFA].

- Fiscal impacts of allocating a portion of the departure tax to ratepayers will depend on the size of the allocation, as well as timing for the flow of value. The maximum, direct one-time impact is $2.6 billion, with potential ancillary impacts on residual stranded debt defeasance.

# 1. Electricity Market Renewal Initiatives

- Continue to move forward with IESO's Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2020, leading to a reduction of:
  - About $1.60/month or about 1% at current retail prices for a typical residential bill; and
  - About $2/MWh or more than 2% at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.

# 2. Fund Electricity Support Programs Through the Tax-Base

- Propose to fund electricity support programs, including Ontario Electricity Support Program (OESB) and Rural or Remote Electricity Rate Protection (RRRP), through the tax-base instead of a regulated charge. This would allow the OESP and the RRRP charges to be removed from the Regulatory line on electricity bills.

**Considerations**

*Consumer Impacts and implementation*

- Transitioning OESP and RRRP to the tax-base would reduce a typical residential bill by about $2.35/month by 2020, and delivering the First Nation rate reduction through tax base would avoid about $0.10/month for a potential total savings of $2.45/month by 2020). As all programs provide strong social benefits, there is precedent for funding these programs through the tax-base.
- To address concerns from low income electricity consumers improvements to OESP could be implemented by increasing credits (could be up to double the current credits)
  - Single low income consumer would see a change from $30 to $45/ month ($540/year):
  - Family of four with electric heat could see a credit of $82.50/month ($990/year); and
  - Would mean no impact on consumer bills and no change to current OESP charge.
- RRRP and OESP are included in the “Regulatory” line on bills. If RRRP and OESP were eliminated from bills, the Regulatory line would decrease; however, as the Regulatory line is the smallest line item component of invoices, there is risk the decrease may not be perceived by customers.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined.
- The non-rate mechanism to remove delivery charges from on-reserve First Nation customer monthly bills needs to be further explored.Funding RRRP and/or OESP with tax revenue would require amendments to existing legislation and regulations.

# 2. Fund Electricity Support Programs Through the Tax-Base (cont'd)

- Table below shows estimates of program costs up to 2020:

| Year | OESP | RRRP | First Nations Delivery Rate | TOTAL |
|---|---|---|---|---|
| 2017 | $106M | $292M | $18M | **$416M** |
| 2018 | $119M | $300M | $18M | **$437M** |
| 2019 | $127M | $306M | $18M | **$451M** |
| 2020 | $132M | $315M | $18M | **$465M** |

1) Ontario Electricity Support Program (OESP)
   - After almost a year in market, close to 30% of potentially eligible customers are signed up.
   - The cost projections below assume the program grows to 50% of eligible consumers by 2020 (also assumes 10% administration costs).

2) Rural and Remote Rate Protection (RRRP)
   - Provides benefits to R2 Hydro One consumers, Algoma, and remote communities.
   - Includes the expanded coverage that will begin on January 1, 2017.

3) First Nation rate reduction (currently under development)
   - On November 14, 2016, OEB presented options to the Ministry on reducing costs for on-reserve First Nation customers.
   - OEB's recommended option to provide 100% delivery rate credit, which is estimated at $18.4 million per year.
     - Other options includes a seasonal fixed credit to account for demand changes over the year ($13 million) or a 50% total bill reduction ($23 million).

# 3. Eliminate the Industrial Conservation Initiative (ICI)

- The cost shift from the Industrial Conservation Initiative (ICI) could be removed from electricity bills by eliminating ICI.
  - The ICI allows large electricity consumers to lower their electricity costs by reducing their demand during peak hours.

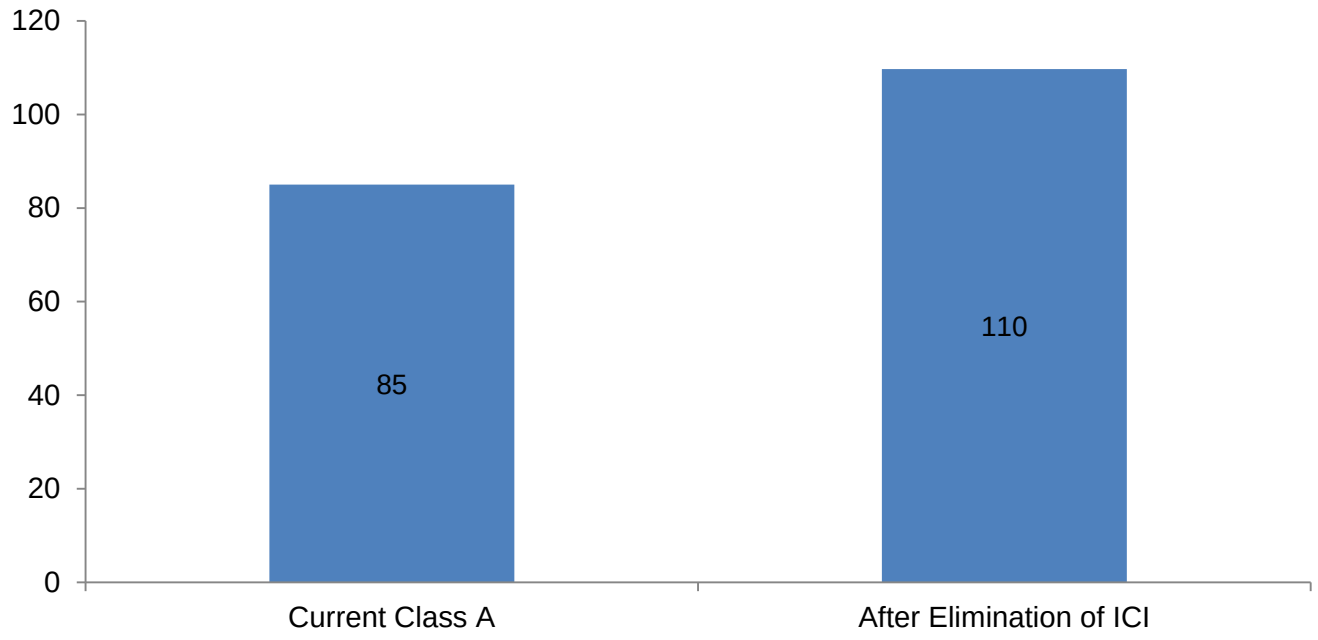
**Considerations**

- Eliminating ICI would result in a benefit of more than $4/month for residential electricity consumers in 2017.
  - However, unless government took action to mitigate the associated cost shift back to industrial consumers, typical industrial prices would increase by about one-third. Such a price increase would pose significant challenges for energy-intensive consumers.
- Industrial stakeholders have indicated that ICI as an integral factor in maintaining competitiveness and retaining industry in the province.
  - Eliminating ICI would limit the “cost shift” onto residential consumers, but it would also lead to a reduction in industrial demand. The large industrial contribution to the fixed costs of running the electricity system would then need to be covered by remaining consumers.
- If ICI is retained, current IESO projections indicate that the cost shift will decrease each year going forward as Global Adjustment (GA) decreases (due to an expected increase in HOEP).
- Alternatively, ICI could be funded through the tax-base at a cost of $900 million annually. There is precedent to use the tax-base for industrial support programs, including the Northern Industrial Electricity Rate Program (NIERP) and the Jobs and Prosperity Fund.

# 3. Eliminate the Industrial Conservation Initiative (cont'd)

- ICI currently provides a benefit of about $25/MWh to Class A electricity consumers.

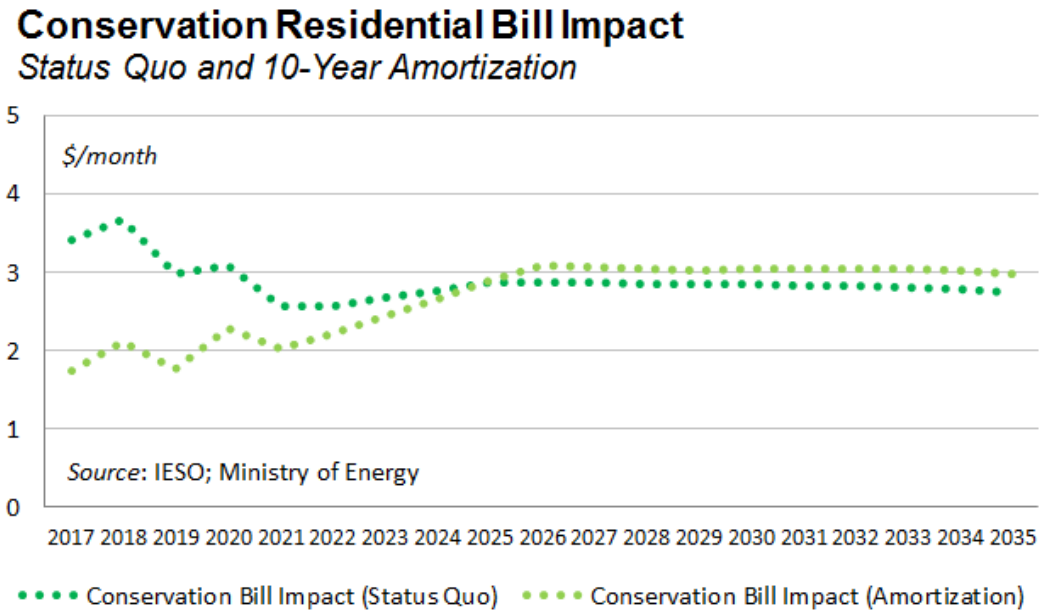
**All-In Electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer.

# 4. Amortize Conservation Program Costs

- ~$3 billion from the electricity ratepayer base will be spent on conservation programs delivered under the Conservation First Framework and the Industrial Accelerator Program (IAP) between 2015 and 2020.
- Currently, Conservation and Demand Management (CDM) program costs are recovered from the Global Adjustment (GA) mechanism about one month after expenses are incurred.
- As a potential rate mitigation measure, certain CDM costs could be amortized.
- Amortizing a portion of conservation spending would produce a benefit for electricity ratepayers in excess of $1/month at the outset. Over time, the benefit would decrease and turn into a cost, as interest charges begin to grow.



**Note**: Chart assumes that conservation incentive costs are available for amortization while administration cost are not. Although there is variable from year to year, incentives represent about two-thirds of conservation spending in Ontario. Chart assumes conservation spending continues at a similar rate beyond 2020. Chart assumes a 10-year borrowing rate of 3.0%.

# 4. Amortize Conservation Program Costs (cont'd)

## Considerations

- Under **Public Sector Accounting Board (PSAB) accounting standards**, used by both the Province and IESO, only certain assets can be amortized: 1) pensions and 2) tangible capital assets. Under PSAB an asset must meet several criteria to be considered a capital asset, including:
  - A tangible capital asset must be tangible and substantive and the Ontario government must have title and operate the asset.
  - A tangible capital asset must bring a tangible benefit to the government or to Ontario.

- CDM costs, on their own, do not meet the criteria of a tangible capital asset because customers would have ownership and control of installed CDM measures, not the Province or IESO.

- **Rate-regulated accounting** was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

# 4. Amortize Conservation Program Costs (cont'd)

**Considerations**

- If some of Ontario's CDM costs could be amortized, analysis shows that ratepayer impacts would be reduced in the short-term but interest charges on the loan would result in increased overall ratepayer costs in the longer-term.

- Legislative amendments would be needed to allow recovery of loan interest charges from GA.

- If there is a desire to proceed:
  - Formal accounting advice will need to be sought from IESO's external auditor as well as the Ontario Provincial Controller (OPC) to determine whether CDM costs could be amortized according to rate-regulated accounting standards.
  - Further legal analysis would also be required to confirm legal viability and possible approaches to implementation.

# 5. LDC Efficiencies

- Consider opportunities for future LDC cost reductions and efficiencies through the regulatory framework.

**Considerations**

- The Ontario Energy Board has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
- Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
- There maybe opportunities to promote further cost reductions and performance improvements within the distribution sector as there is continued evolution of the regulatory framework in Ontario.
  - Tightening LDC requirements may also indirectly incent other desired policy outcomes, such as LDC consolidation and grid modernization to realize further cost reductions.
- ENERGY could help promote or accelerate these efforts by asking the OEB through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and the 2017 Mandate Letter and other agency business planning processes.
- In addition, further changes to the departure and transfer tax regimes could be considered to provide a further incentive for LDC mergers and acquisitions.

# 6. Rate Design Initiatives

- OEB continues to move forward with its Regulated Price Plan (RPP) Roadmap:
  - The OEB is undertaking a comprehensive review of the RPP, including exploring the introduction of offering different pricing plan options for customers following the completion of pilot programs in 2018. The plan is expected to be implemented over a 3-5 year period.

- Until new pricing plans are available, the OEB could provide an "opt-in flat rate RPP" structure that could be made available to residential, farm and small business consumers on an interim basis (2-3 years) until a wider range of price plans are available.
- Time-of-Use (TOU) pricing could also be introduced for non-RPP Class B consumers to reduce Global Adjustment (GA) volatility and reduce system costs.

| Current TOU | New Flat Rate |
|---|---|
| On: 18.0 ¢/kWh | 11.1 ¢/kWh |
| Mid: 13.2 ¢/kWh | |
| Off: 8.7 ¢/kWh | |

**Considerations**

- The OEB has indicated that the option would lead to no overall change in system costs. Consumers with higher peak and mid-peak usage patterns would see a decrease in their electricity bills, while those with higher off-peak usage patterns would see an increase.
  - While the current strong supply conditions may allow for such an RPP structure (i.e., peak demand requirements can be easily met), administrative costs could be high (distributors would need to design/implement an opt-in process and associated billing system on an interim basis).

| | Current TOU | New Flat Rate |
|---|---|---|
| 1) Monthly electricity bill- higher peak and mid-peak usage patterns | $172 | $163 |
| 2) Monthly electricity bill- higher off-peak usage patterns | $152 | $163 |

***Note:** 1) assumes a consumer consumption pattern of 45%:30%:25% (Off-peak: Mid-peak: On-peak), while 2) assumes consumer consumption pattern of 80%:10%:10% (Off-peak: Mid-peak: On-peak). Estimates are based on OEB's online electricity bill calculator (for Toronto Hydro-November 2016 rates)

# 6. Rate Design Initiatives (cont'd)

**Considerations**

- The decision to undertake smart meter investments was partly justified on the basis of TOU pricing. If TOU pricing were to be made optional, some stakeholders could question the rationale for smart meter investments.
  - Rationale for offering a flat rate option could focus on providing customers with choice until new pricing plans are rolled out under the RPP roadmap.

- If a flat rate design is introduced, there could be significant consumer opposition to any return to a mandatory TOU.

- After the interim flat rate period, the OEB could offer a wider range of pricing plans to consumers.
  - As part of its RPP review, the OEB will be running pilots with LDCs to assess customer response to alternative time periods and pricing structures.
  - Learnings from these pilots will help inform potential changes to the RPP. Pilots are expected to be in market May 2017 and run for one year.

- Non-RPP Class B electricity consumers currently pay Global Adjustment (GA) on a volumetric basis. Moving them to TOU would provide an incentive to shift consumption to off-peak periods.
  - Consumers, including manufacturers, who are unwilling to shift would face higher costs and likely not be supportive of the changes.
  - The decision to pursue TOU pricing for non-RPP class B consumers will impact proceeds recycling as there is interplay between the two initiatives.

# 7. Reduced Cost of OPG Borrowing

- OPG currently borrows for corporate purposes from the OEFC
- Seek to reduce OPG's borrowing costs and pass on savings to ratepayers by:
  - Reducing or removing the spread that OEFC applies to OPG for any new corporate debt; or
  - Allowing OPG to refinance its existing debt at longer maturities through the OEFC in order to take advantage of the current, favourable interest rate environment.
- Assuming the full spread is removed from all OEFC debt, OPG borrowing costs could be reduced by 50-100 basis points, representing annual savings of about $20-$25 million, increasing to $30-$35 million, as OPG's outstanding OEFC debt rises from ~$3.3 billion in 2016 to ~$4.7 billion in 2020.
- OPG could apply to the OEB as part of its current rate application to flow this benefit to ratepayers.

**Considerations**

- Further work is required to determine potential OPG savings from these initiatives.
- Allowing OPG to refinance would have a negative fiscal impact on the Province.
- Spreads are expected to decline, reducing the relative impact of this change, given lower overall interest rates and reduced volatility.
- Providing OPG with greater access to longer term (20-30 year) debt may also reduce costs:
  - OPG's average term to maturity for OEFC debt is 5.7 years, as compared to 22.2 years for privately financed project debt. This contrasts with most corporations and government which have been working to extend average debt terms in order to take advantage of the low interest rate environment.
  - Longer terms would also better match to the life of OPG's assets.
  - Recently, OEFC has allowed OPG to apply for 50% of its financing requirements in the form of longer term (25-30 year debt). Moving closer to 100% would accelerate this transition.

# 8. End DRC Early for Commercial/Small Industrial Class B Electricity Consumers

- Propose to remove the $0.07/kWh Debt Retirement Charge (DRC) from the bills of commercial/small industrial Class B consumers beginning in 2017, instead of April 1, 2018.
  - **Note:** Class A consumers (e.g., large industrial) would continue to pay DRC until at least April 1, 2018.

**Considerations**

- For a Class B consumer currently paying about $152/MWh, removing the DRC would represent a savings of about 5%.
  - A 50% reduction in the DRC charge would represent a savings of about 2%.

- Alternatively, the reduction of the DRC could be to $0.035/kWh starting in 2017, to provide relief for cap and trade until proceeds recycling is fully operational.

- Residential consumers have had the DRC removed from bills since January 1, 2016. Taking DRC off commercial and small industrial bills would result in equal treatment for these groups of consumers.

- The savings for commercial and small industrial consumers associated with this proposal would drop to zero in April 2018, since this is the current planned date for removing the DRC from non-residential bills.

- Prior to moving forward with this proposal, additional analysis from Legal Services and the MOF would be needed.

# 9. Dedicate Departure Tax

- In connection with the IPO, as a result of leaving the PILs regime and entering the corporate tax regime, Hydro One was deemed to dispose of its assets for proceeds equal to its fair market value, triggering a PILs liability of $2.6 billion (Departure Tax).
- This was paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt.
- The Province could explore repurposing some of those funds to the benefit of ratepayers.
- This may reduce the risk that the Ontario Energy Board (OEB) assigns to ratepayers the benefit from an associated tax asset, resulting in lower earnings and decreased share value for Hydro One. This decision is currently before the OEB, as part of Hydro One's Transmission rate application.

**Considerations**

- Cost savings to ratepayers would depend on timing and which ratepayers (e.g., Hydro One customers, or all Ontario customers) will benefit from some or all of the $2.6 billion value.
- While this is a shift from messaging that value from the broadening of ownership of Hydro One is being used pay down debt and fund transit and transportation, the Province could link to electricity infrastructure investments (e.g., as an offset to infrastructure investments already made in the sector, or to specific initiatives such as conservation).
- These funds were paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt. Repurposing may have an impact on the defeasance of this debt.

# 10. Cancel/Adjust Renewable Energy Procurements

- The Ministry could consider the following actions to further mitigate future impacts to electricity bills:

| Unallocated/Terminated Capacity | Announced Procurements | Executed Contracts |
|---|---|---|
| A. Do not procure unallocated or terminated capacity | B. Revise FIT 5 target | D. Cancel LRP I contracts |
| | C. Cancel FIT 6 | |

**Overarching Considerations**

- Cost savings associated with reducing or cancelling renewable energy procurements and programs will not reduce current electricity bills, but would result in future cost reductions relative to Ontario Planning Outlook forecasts.
- The IESO estimates implementing options A to C will reduce system costs by approximately $592 million ($2016) between 2019 and 2028, resulting in an average of approximately $0.50/month in savings to a typical residential electricity bill over the same period. [cost reductions from LRP I contract cancellations TBC]
- The microFIT program is winding down end of 2017. Annual microFIT procurement targets have been undersubscribed.
- With a few exceptions (e.g., rollover of unallocated microFIT capacity; addition of terminated microFIT and small FIT capacity to FIT 5), plans for unallocated or terminated capacity are not defined in announcements or existing directions.

**Cancel/Adjust Announced Procurements**

- Amendments to existing directions to the IESO would be required to reduce FIT 5 and cancel FIT 6.
- The FIT 5 procurement is underway with a base target of 150 MW and inclusion of any capacity available from contract terminations under prior small FIT and microFIT procurements. The application window closed on November 25, 2016.

# 10. Cancel/Adjust Renewable Energy Procurements – Existing Contracts

**Cancel Existing LRP I Contracts**

- 16 LRP I contracts (approx. 455 MW) have been executed and projects are under development.
- None have met Key Development Milestones. Total value of LRP I estimated at approx. $1 billion (NPV to 2016).

[Placeholder for IESO: Cost calculation relative to OPO and associated bill impact]

**Considerations**

- To help inform a decision, IESO or OEB could be asked to evaluate and provide guidance to the Ministry on the system need for LRP I projects and potential ratepayer impacts/benefits.
- 13 of 16 LRP I contracts have Indigenous participation. Cancelling LRP I contracts would remove this economic development opportunity and likely damage relationships between Indigenous communities and the government.
- LRP I Contract includes an “Optional Termination” provision allowing IESO to terminate any contract prior to the “Commercial Operation Date” with 6 months written notice.
- The IESO obligations under the Optional Termination provision depend on whether the project has met all “Key Development Milestones”.
  - As no projects have met their Key Development Milestones, the estimated total cost payable to contract holders is about $8 million.

# 10. Cancel/Adjust Renewable Energy Procurements – Existing Contracts (cont'd)

## Legal Analysis

- Under the *Electricity Act, 1998*, the Minister has the authority to amend previous directions without approval from Cabinet. Although an amendment to an existing direction would not require Cabinet approval, it is unlikely that a direction to cancel LRP I contracts could be considered as amending an existing direction. The previous LRP directions set out the broad policy framework that was reflected in the procurement, but the contracts themselves, once executed, are stand alone documents which the IESO had legal authority to execute. Revoking previous LRP directions does not affect that authority or have the effect of cancelling the procurement.
- As a result, any new directive to cancel LRP I contracts would need to be approved by Cabinet, either as part of an LTEP implementation directive to IESO, or pursuant to the overall power to direct IESO with respect to procurements outside the LTEP process. However, there is a risk that such a directive could be subject to challenge.
- ENERGY has previously received advice that there is a high risk that a court would conclude that the Minister has no authority under the *Electricity Act , 1998* to issue a direction requiring IESO to terminate microFIT Conditional Offers and FIT Offer Notices that have already been issued to applicants, because these offers create vested contractual rights and the Minister would require clear legislative authority to interfere with those rights. This reasoning would likely apply equally to any direction or directive to IESO to cancel LRP I contracts.
- Previous advice has also flagged a moderately high risk that the Province could be liable for damages in tort for inducing a breach of contract if it issues a direction to IESO that interferes with vested contractual rights without clear statutory authority to do so. LRP I contract holders could also assert other claims, such as misfeasance in public office.
- The risk and costs associated with potential law suits resulting from the cancellation of contracts requires further analysis, including analysis of whether any statutory amendments would be required to provide clear authority to cancel the contracts. LSB recommends ENERGY seek an opinion from Crown Law Office Civil before proceeding.

# Summary

- Reductions in electricity rates could be achieved by eliminating existing, planned or directed initiatives from the rate-base or shifting these costs to the tax-base.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

# Appendix

# Electricity Consumer Classes

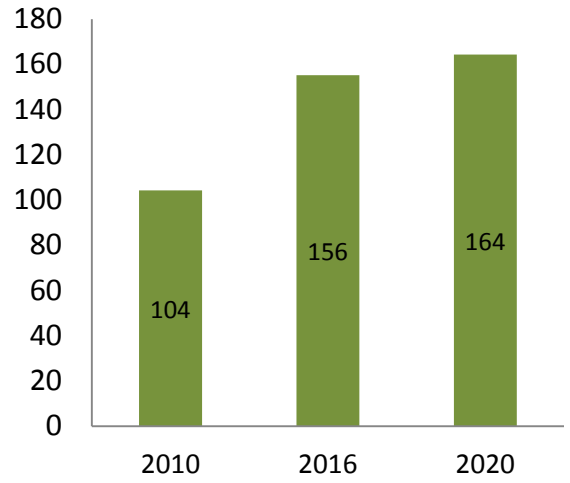
- In Ontario, there are three classes of electricity consumers:

| | Regulated Price Plan | Class B | Class A |
|---|---|---|---|
| **Consumer Types** | • Residential<br>• Small Business<br>• Farms | • Commercial<br>• Institutional<br>• Small industrial | • Large commercial<br>• Large industrial |
| **Load Size** | Below 0.05 MW | Between 0.05 MW and 1 MW | Above 1 MW |
| **Total Consumption** | 58 TWh | 57 TWh | 26 TWh |
| **Share of Consumption** | 41.1% | 40.4% | 18.4% |

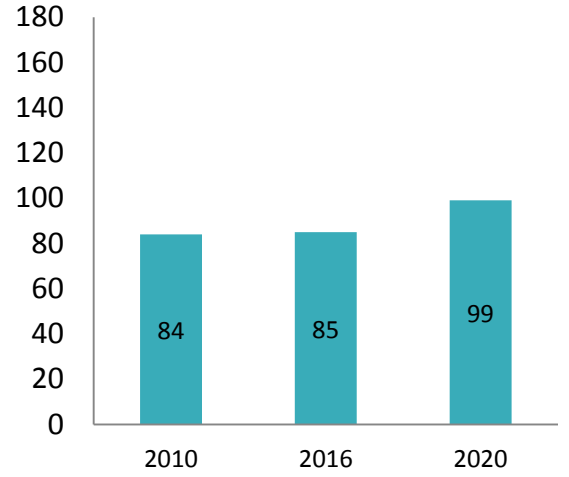
# Prices by Electricity Consumer Class

- Since 2010, average bills for residential consumers (i.e., using 750 kWh/month) have increased by over 50%. Rates are forecast to continue to increase, with residential consumers paying an estimated 6% by 2020.
- Industrial electricity rates have remained relatively flat over the same time period, due primarily to the Industrial Conservation Initiative (ICI). ICI represents a cost shift of about $5/month for residential electricity consumers. Industrial electricity consumers are forecast to see an increase of 16% by and 2020.

**Typical Residential Bill (750/kWh per month)**



**Typical Class A (Industrial) Price ($/MWh)**



**Note:** 2016 represents year-to-date September 2016 for industrial. Cap and trade proceeds recycling is included for the industrial consumer for 2020.

# Rate Mitigation Levers

- To provide further rate relief to Ontario electricity consumers, the government can use one or more of the levers outlined below:
  - **Tax-based Lever:**
    - Provide rebates funded from the tax-base or transfer items currently paid through the rate-base to the tax-base.
  - **Rate-based Lever:**
    - Shifts costs within the rate-base from one customer group to another to achieve electricity system benefits and/or policy goals.
  - **Cap and Trade Proceeds Lever:**
    - Use cap and trade proceeds on initiatives that help reduce greenhouse gas (GHG) emissions from the electricity sector (e.g., recycling proceeds during off-peak periods) while providing benefits to some or all electricity consumers.

# Traditional Rate Mitigation Programs

- Ontario has implemented a number of rate-based programs to help residential and industrial electricity consumers:
  - The Ontario Electricity Support Program (OESP) provides ongoing assistance directly on the bills of eligible low-income electricity consumers
  - The Rural or Remote Rate Protection (RRRP) program is provided to rural and remote residential and farm customers because the cost of distributing power to remote areas is much higher than for urban areas.
  - The Industrial Conservation Initiative (ICI) encourages Ontario's largest consumers to reduce consumption during peak periods while reducing system costs.
- There are also tax-base programs to help manage electricity prices:
  - Rebate the provincial portion of the HST from the electricity bills of residential, small business and farms as of January 1, 2017.
  - Northern Industrial Electricity Rate Program (NIERP), in which participants receive a rebate of two cents per kilowatt hour. On average, industrial electricity prices can be reduced by up to 20%.
- While rate-based programs provide relief to certain electricity consumers, they shift other costs to remaining ratepayers (See Appendix for additional details).

# Driving Down Prices for Consumers

- Since 2013, a number of actions have been taken to drive down prices for consumers wherever possible:
  - Renegotiating the Green Energy Investment Agreement, reducing contract costs by $3.7 billion;
  - Deferring the construction of two new nuclear reactors at Ontario Power Generation's Darlington facility, avoiding an estimated $15 billion in new construction costs;
  - Approving Ontario Power Generation's plans to enable the ongoing operation of Pickering up to 2024, which is expected to save ratepayers as much as $600 million;
  - Reducing Feed-In-Tariff (FIT) prices through annual price reviews, saving ratepayers at least $1.9 billion relative to the 2013 Long-Term Energy Plan (2013 LTEP) forecast; and
  - Suspending the second round of the Large Renewable Procurement (LRP II) process and the Energy-from-Waste Standard Offer Program to save up to $3.8 billion in electricity system costs relative to 2013 LTEP.

# Cost Shifts in the Electricity Sector – Current Programs

- Several programs in the electricity sector “shift costs” from one group of electricity consumers to another:
  - **Rural or Remote Rate Protect** (**RRRP)** is a longstanding program that reduces the delivery charge for rural electricity consumers and is paid for by all consumers in Ontario through a regulatory charge on bills.
  - **Ontario Electricity Support Program (OESP)** is funded via a regulatory charge on consumer bills and provides support for qualifying low income electricity consumers.
  - **Industrial Conservation Initiative (ICI)** empowers large consumers to lower their costs by reducing their demand during peak hours. In the process, ICI shifts costs from large electricity consumers to all other consumers in Ontario.
  - **Industrial Electricity Incentive** (**IEI**) program, offers reduced electricity prices for companies starting or expanding operations in Ontario. All electricity consumers in Ontario pay for the price reduction that IEI participants receive.

# Cost Shifts in the Electricity Sector (Cont'd)

- The tables on the right show the estimated cost shifts that result from existing government programs.
- ICI has had the largest cost shift of all the programs, due to the large size of Global Adjustment (GA) and the way that it is recovered from consumer classes.
- RRRP and OESP impact the regulatory line on consumer bills, while ICI, IEI and conservation affect GA (i.e., Electricity line on bills of Regulated Price Plan consumers).

**Cost Shift Impacts - Residential Bill**

*Typical 750 kWh/month Toronto Hydro consumer*

| *$/month* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 2.65 | 3.25 | 3.88 | 3.53 | 4.75 | 4.77 |
| RRRP | 0.90 | 0.82 | 0.84 | 0.92 | 0.93 | 0.94 |
| OESP | - | - | - | - | - | 0.84 |
| Conservation | 1.85 | 1.92 | 2.00 | 1.58 | 2.43 | 2.45 |
| IEI | - | - | 0.08 | 0.09 | 0.11 | 0.12 |
| **Total** | **5.41** | **5.99** | **6.81** | **6.13** | **8.21** | **9.12** |

**Cost Shift Impacts - Industrial Bill**

*Typical Class A consumer*

| *$/MWh* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | -22.17 | -26.36 | -30.29 | -25.91 | -33.79 | -33.92 |
| RRRP | 1.20 | 1.10 | 1.12 | 1.23 | 1.24 | 1.25 |
| OESP | - | - | - | - | - | 1.13 |
| Conservation | 1.53 | 1.59 | 1.66 | 1.31 | 2.01 | 2.02 |
| IEI | - | - | 0.07 | 0.08 | 0.09 | 0.10 |
| **Total** | **-19.43** | **-23.67** | **-27.44** | **-23.29** | **-30.45** | **-29.43** |

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Cost Shifts in the Electricity Sector (Cont'd)

- The table on the right shows the total cost for various government electricity programs. These programs are currently funded through the electricity system ratebase.

- Funding of these programs through the fiscal plan would remove these costs from the electricity system (i.e., Placing these costs on the taxbase).

**Cost of Programs**

*By government program*

| *$M* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 506 | 615 | 736 | 670 | 890 | 893 |
| RRRP | 172 | 156 | 159 | 176 | 174 | 176 |
| OESP | - | - | - | - | - | 158 |
| Conservation | 329 | 339 | 354 | 280 | 425 | 428 |
| IEI | - | - | 15 | 16 | 18 | 19 |

- For example, removing the roughly $900 million of program cost from the Industrial Conservation Initiative (ICI) program would save the typical residential electricity consumer $4.77 per month in 2016.

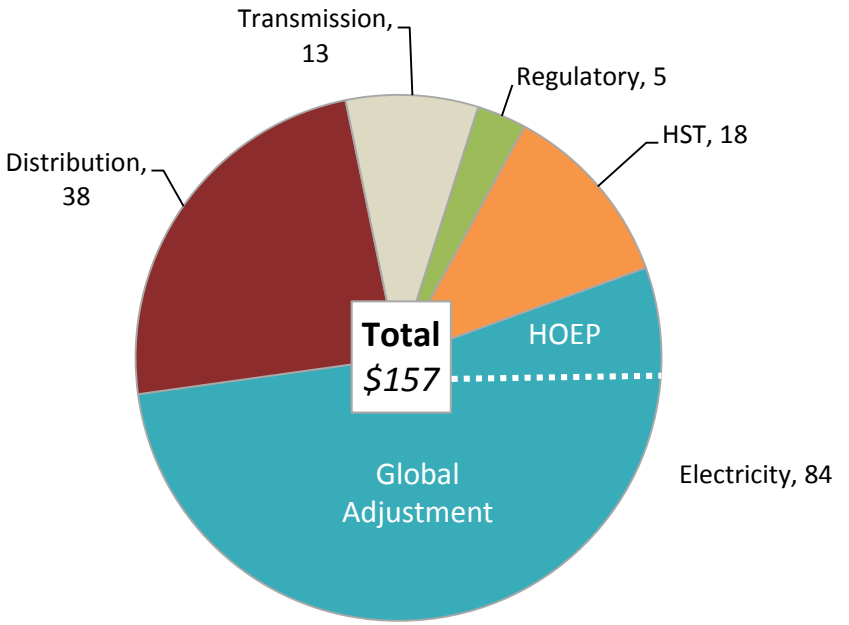
**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Residential Electricity Prices

- There are approximately 4.5 million residential consumers in Ontario.
- The Regulated Price Plan includes nearly all residential consumers, as well as small businesses. Regulated Price Plan consumers pay a blended commodity rate regulated by the OEB, which is set every six months.
- For households, the Debt Retirement Charge (DRC) was removed from residential electricity bills as of January 1, 2016.
- In addition, the Ontario Electricity Support Program (OESP) provides an ongoing rate reduction directly on the bills of low-income electricity consumers who have applied and meet the eligibility requirements. The program is funded through the rate base.
- Rural customers, in particular those with electrical heating, pay higher monthly bills.

**Typical Residential Monthly Bills ($)**

*As of November 1, 2016 (750 kWh/month)*



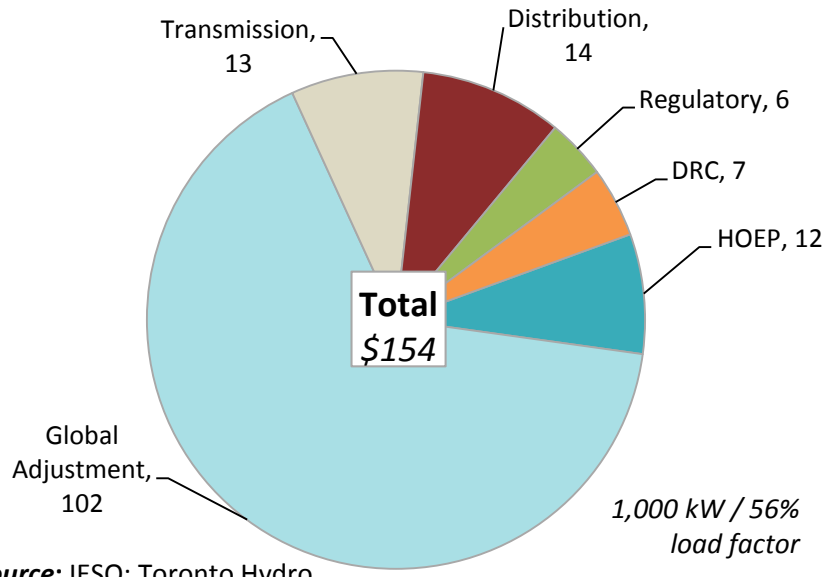
***Source*:** OEB, Toronto Hydro

# Commercial Electricity Prices

- There are approximately 55,000 commercial and institutional consumers in the province. These consumers are Class B consumers, and have separate line items on the electricity bill for HOEP and GA.
- There is a high degree of differentiation amongst consumers within the commercial sector in terms of size and consumption patterns. For example, an elementary school has a much different hourly load profile compared to a full service restaurant. This is an important consideration when looking at the bill impacts of policy options.

**Typical Commercial Price ($/MWh)**

*YTD June 2016 (Non-RPP Class B)*



***Source*:** IESO; Toronto Hydro

- Consumers in the commercial sector do not pay time-of-use prices and have little incentive to shift demand away from high demand hours.
- Targeted pricing programs are currently not available for Class B consumers.

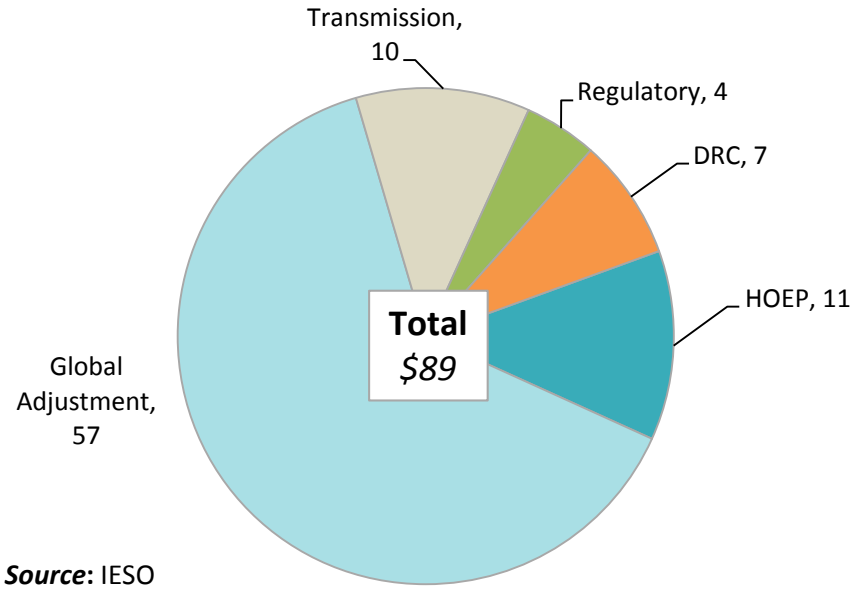
*** Note**: Most commercial consumers receive input tax credits for their HST.

# Industrial Electricity Prices

- There are about 300 large industrial consumers in Ontario.
- Measures in place to mitigate industrial electricity prices include ICI and NIERP.
- ICI lowers costs for eligible large electricity consumers (i.e., those with monthly peak demand exceeding 3 MW) that reduce consumption during peak periods.
  - ICI consumers reduce their electricity rates by 25% on average.

**Typical Large Industrial Price ($/MWh)**

*YTD June 2016*



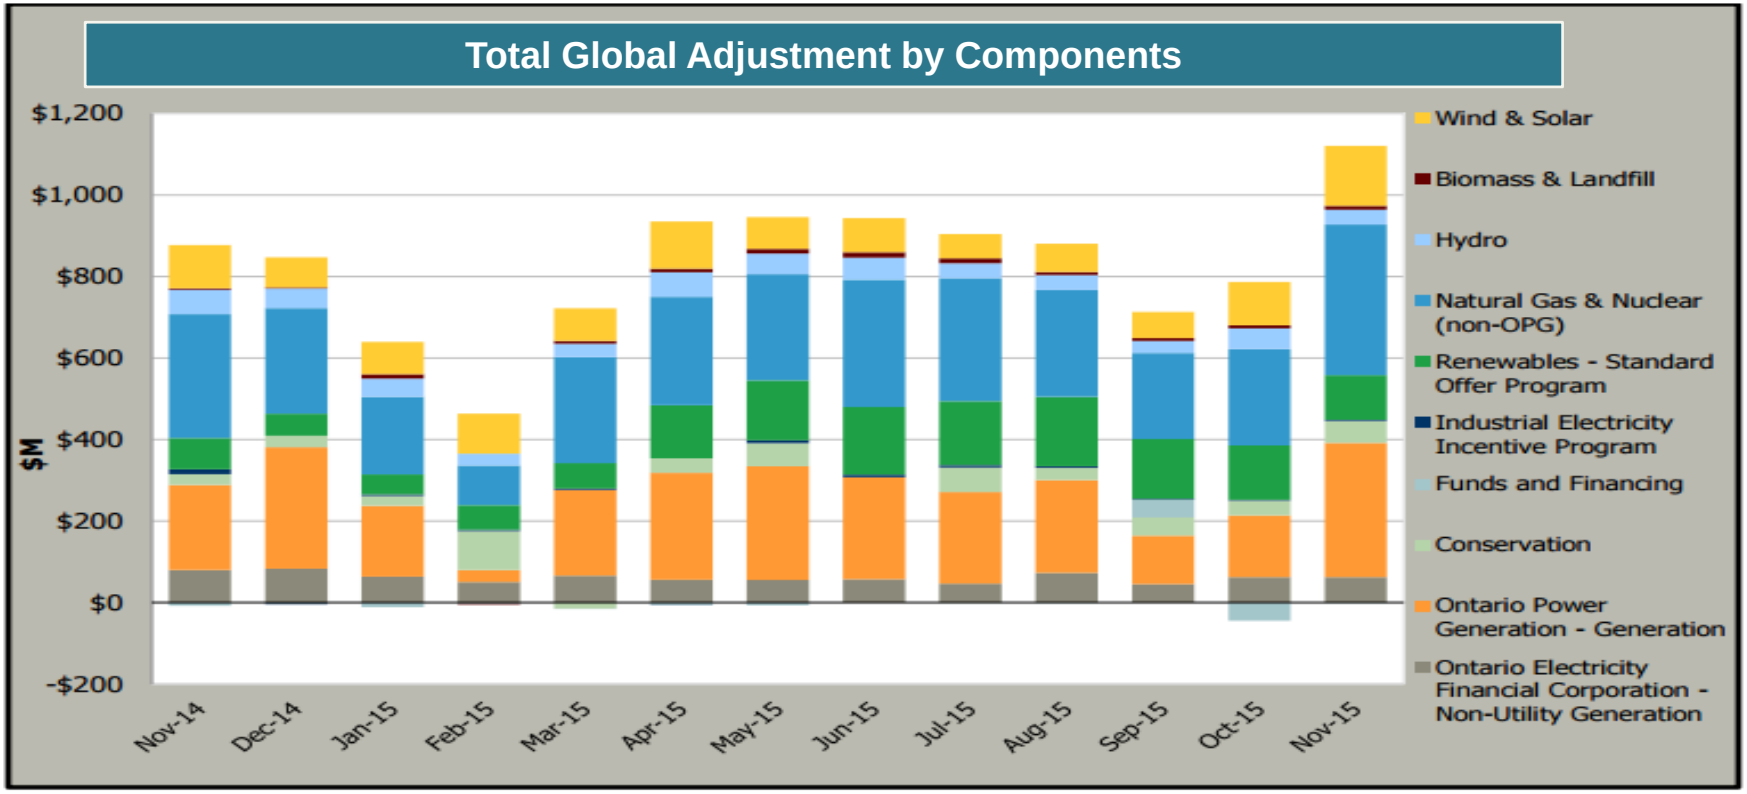
***Source*: IESO**

- Participants in NIERP receive a rebate of $20/MWh. On average, industrial electricity prices are reduced by about 20% through the program, reducing all-in prices to $69/MWh for these consumers. The program is funded through the tax base.

*** Note:** Industrial consumers receive input tax credits for their HST.

# Total Components of Global Adjustment

- Global Adjustment (GA) is a market mechanism that recovers costs from electricity consumers, including the cost of almost all conservation programs in the province (i.e., approximately half a billion dollars in 2016).



**Source:** IESO Monthly Market Report (November 2015)

# Cancel/Adjust Renewable Energy Procurements

# LRP I Pre-Construction Liability Limits

- All 16 successful LRP I developers accepted Optional Termination Provisions when the LRP I Contracts were executed in April 2016.
- If IESO chooses to enact the Optional Termination provision before a project has met all Key Development Milestones, IESO is required to pay pre-construction development costs up to the Pre Construction Liability Limit.
- Pre-construction development costs include costs incurred for feasibility studies, obtaining site access rights, work towards environmental approvals, business development plans, negotiation of contracts for design, equipment, construction and financing, reasonable overhead expenses, and other reasonable costs incurred.
- The Pre Construction Liability Limits are:
  - Non-Rooftop Solar: $250,000 plus $10.00/kW of Contract Capacity
  - Waterpower: $500,000 plus $20.00/kW of Contract Capacity
  - On-Shore Wind: $400,000 plus $2.00/kW of Contract Capacity
- According to the LRP I Optional Termination provision, the developer has a duty to take reasonable steps to mitigate losses, liabilities, costs and damages incurred as a result of the Optional Termination.
  - The IESO will not provide compensation for amounts which are attributable to a developer's failure to take reasonable steps to mitigate.

Ontario

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector

## Working Draft

December 5, 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure.
  - Since 2003, the Province has invested more than $35 billion in over 16,000 megawatts (MW) of new and refurbished cleaner generation, including nuclear, natural gas and renewables.
  - Over the same period, Hydro One has invested $15.5 billion to enhance and renew its transmission and distribution systems.
  - As additional electricity generation comes online, nuclear units are refurbished and distribution and transmission investments are made, prices are forecast to continue to increase.

- Actions have been taken to drive down electricity costs, including deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., introduction of wind dispatch) and decreasing the cost of renewable procurements (e.g., Green Energy Investment Agreement ~~GEIA~~ renegotiation, decreasing FIT prices).

- Additional steps have been taken to increase cost effectiveness and improve efficiency by adopting new electricity market approaches, such as:
  - Enhancing competition between developers of large renewable projects through the Large Renewable Procurement (LRP) process to drive down price and secure clean, reliable generation for the province;
  - Directing IESO to end the process of negotiating new NUG contracts pending the development of a Capacity Auction (i.e., Market Renewal); and
  - Launching the first IESO Demand Response Auction (i.e., a competitive process through which demand-side resources are selected to be available to reduce their electricity consumption as needed).

# Context (Cont'd)

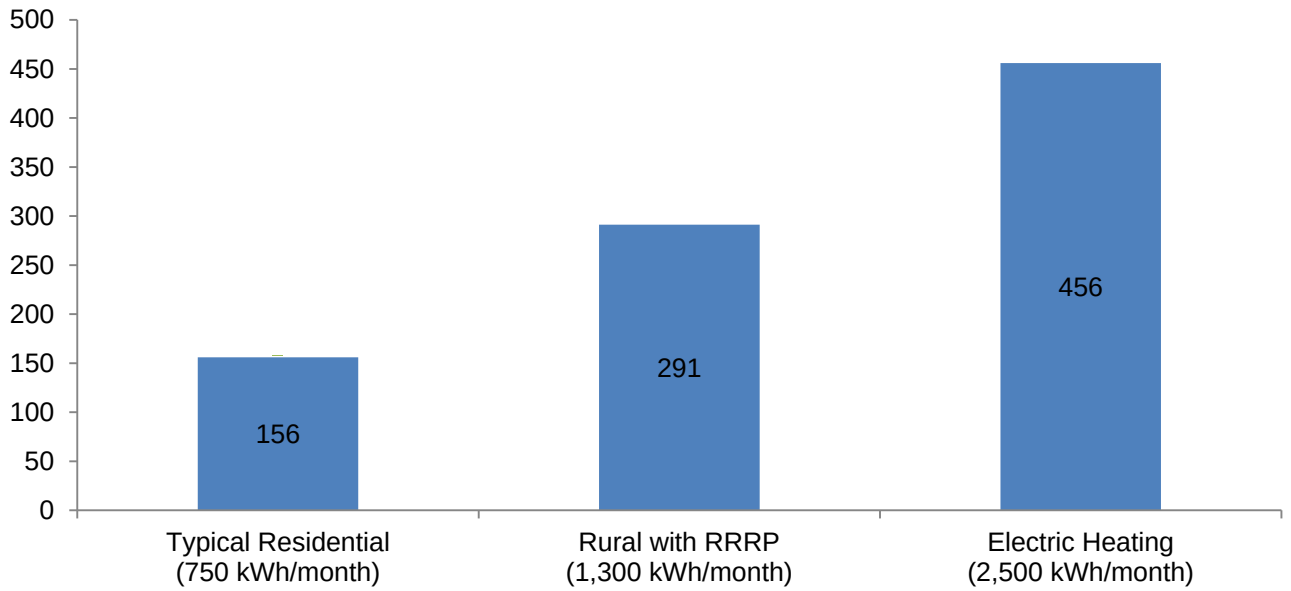
- Following the 2016 Throne Speech, a number of actions were announced to further reduce electricity costs, such as:
  - Providing an 8 per cent rebate before tax, equivalent to the provincial portion of HST, for approximately 5 million eligible electricity consumers including residences, small businesses and farms;
  - Increasing the amount of rate protection available to approximately 330,000 eligible rural customers living in low-density areas by updating the Rural or Remote Rate Protection (RRRP) program;
  - Lowering the Industrial Conservation Initiative (ICI) threshold to 1 MW and removing sector restrictions so that more consumers can benefit;
  - Suspending the second round of the Large Renewable Procurement (LRP II) and the Energy-from-Waste Standard Offer Program to save up to $3.8 billion in costs; and
  - Recycling a portion of cap and trade auction proceeds to keep rates affordable for industrial and commercial electricity consumers.
- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured and the need for wholesale market renewal.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

# Current Electricity Prices – Residential

- Residential consumers electricity prices continue to be a concern for many Ontarians, particularly those that rely on electric heat.
  - **Note:** The typical residential bills are currently below the 2013 ~~Long-Term Energy Plan (2013~~ LTEP~~)~~ forecasts ($159 / 750kWh)

**Residential Electricity Bills**
*in $/month*

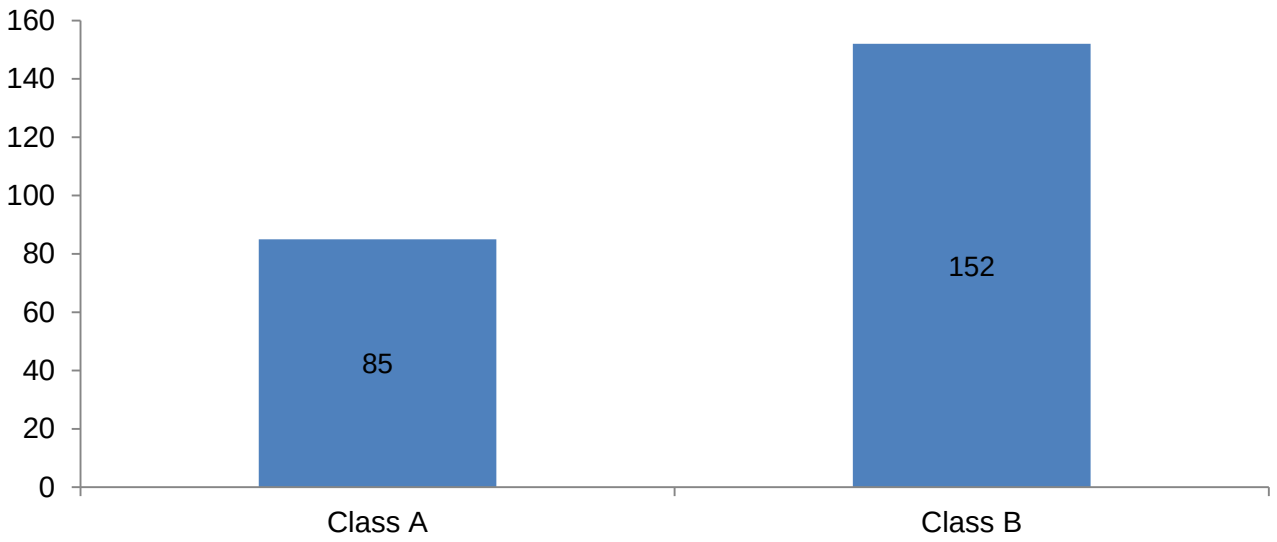


**Note**: Typical residential and electric heating shown above are based on Toronto Hydro; rural is based on connection to Hydro One as a R2 customer eligible to receive the Rural or Remote Rate Protection (RRRP) credit of $31.50.

# Current Electricity Prices – Industrial and Commercial

- While large industrial electricity consumers (i.e., Class A) rates are competitive with other jurisdictions, rates for commercial/small industrial consumers (i.e., Class B) are higher by comparison.
  - **Note:** Current industrial and commercial prices are below 2013 LTEP forecasts ($96 / MWh)

**Current All-In electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer. Class B reflects a 1 MW load operating at 56% load factor and connected to Toronto Hydro.

# Current Status on Taxpayer Funded Electricity Price Mitigation

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,200* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| **TOTAL** | **1,530** | **1,544** | **1,564** | **1,639** | **1,525** | **1,195** | **2,105** |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from November LRC Submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt Retirement Charge
NIERP – Northern Ontario Electricity Rate Program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

- The table above shows the annual amount of taxpayer funded electricity price mitigation from 2011-12 to 2017-18.
- From 2011-12 to 2015-16 there has been an annual fiscal impact of approximately $1.6 billion due to electricity price mitigation programs.
- In 2016-17, the fiscal impact due to electricity price mitigation programs is estimated at approximately $1.2 billion.
- In 2017-18, due primarily to the start of the Ontario Rebate for Electricity Consumers, the expected fiscal impact due to electricity price mitigation programs is approximately $2.1 billion and before considering any additional funding from the tax base.

# Proposed Initiatives – Overview

- The suite of proposed initiatives are intended to:
  - Transform how the electricity market operates in Ontario;
  - Re-set how government programs are funded (i.e., rate-base vs tax-base);
  - Provide system benefits (e.g., industrial load retention);
  - Lower the cost of electricity for residential and industrial consumers; and
  - Increase cost effectiveness and improve efficiency.

- The proposed initiatives include:
  1. Implement Market Renewal Initiatives
  2. Fund Electricity Support Programs Through The Tax-base
  3. Eliminate the Industrial Conservation Initiative (ICI)
  4. Amortize Conservation Program Costs
  5. LDC Efficiencies
  6. Rate Design Initiatives
  7. Reduced Cost of OPG Borrowing
  8. End Debt Retirement Charge (DRC) Early for Commercial/Small Industrial Class B Electricity Consumers
  9. Dedicate Departure Tax
  10. Cancel/Adjust Renewable Energy Procurements

- The proposed initiatives provide opportunities to reduce electricity costs for residential and industrial consumers while at the same time transforming the province's electricity market and yielding benefits for the electricity system.

# Proposed Initiatives – Impacts

- Each of the proposed initiatives under consideration target different government programs and different parts of the electricity bill. The proposals impact different classes of electricity consumers to varying degrees.

| Proposal | Program / Initiative | Line on Bills | Who Benefits |
|---|---|---|---|
| 1. Implement Market Renewal Initiatives | Market Renewal | Electricity, Global Adjustment, Regulatory | Market Renewal: All electricity consumers |
| 2. Fund Electricity Support Programs Through The Tax-base | OESP, RRRP | Regulatory | All electricity consumers evenly |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | ICI | Electricity, Global Adjustment | Only Class B electricity consumers (i.e., residential) **Note:** Will have a negative impact on Industrial consumers. |
| 4. Amortize Conservation Program Costs | Amortization | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |
| 5. LDC Efficiencies | Distribution efficiencies | Delivery | All embedded consumers |
| 6. Rate Design Initiatives | Rate structures | Electricity, Global Adjustment | Rate Design Initiatives: Participating electricity consumers |
| 7. Reduced Cost of OPG Borrowing | n/a | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |
| 8. End DRC Early for Commercial/Small Industrial Class B Electricity Consumers | Debt Retirement Charge (DRC) | DRC | Class B consumers (i.e., small business and commercial consumers, etc) |
| 9. Dedicate Departure Tax | Departure Tax | TBD | TBD |
| 10. Cancel/Adjust Renewable Energy Procurements | FIT, LRP | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

| *$/750kWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| 1. Implement Market Renewal Initiatives | - | - | - | 1.58 | 1.59 | 1.60 | Longer-Term |
| 2. Fund Electricity Support Programs through the Tax-base | 2.18 | 2.30 | 2.31 | 2.45 | 2.48 | 2.51 | Immediate |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | 4.40 | 4.24 | 4.10 | 4.24 | 3.73 | 3.58 | Immediate |
| 4. Amortize Conservation Program Costs | 1.67 | 1.56 | 1.21 | 0.81 | 0.54 | 0.3 | Immediate |
| 5. LDC Efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Near-Term |
| 6. Rate Design Initiatives* | - | - | - | - | - | - | Immediate |
| 7. Reduced Cost of OPG Borrowing | 0.13 | 0.13 | 0.13 | 0.18 | 0.18 | 0.18 | Immediate |
| 8. End DRC Early for Class B Electricity Consumers** | - | - | - | - | - | - | n/a |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| 10. Cancel / Adjust Renewable Energy Procurements | - | - | TBD | TBD | TBD | TBD | Longer-Term |
| **Total decrease on typical monthly bill** | **8.38** | **8.23** | **7.75** | **9.26** | **8.52** | **8.17** | |

**Note:** The above initiatives will provide similar benefits for non-RPP Class B electricity consumers. Proposal 2 assumes OESP participation of 50% and 5-year maturity. *Savings estimates do not include changes related to rate design. ** Class B includes small-medium enterprises (SMEs).

# Proposed Initiatives – Potential Savings for Average Industrial Electricity Consumers

| *$/MWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| 1. Implement Market Renewal Initiatives | - | - | - | 2.11 | 2.12 | 2.13 | Longer-Term |
| 2. Fund Electricity Support Programs through the Tax-base | 2.91 | 3.06 | 3.17 | 3.27 | 3.33 | 3.38 | Immediate |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | (24.12) | (23.21) | (22.45) | (23.23) | (20.42) | (19.61) | Immediate |
| 4. Amortize Conservation Program Costs | 1.15 | 1.08 | 0.84 | 0.56 | 0.37 | 0.25 | Immediate |
| 5. LDC Efficiencies | n/a | n/a | n/a | n/a | n/a | n/a | Near-Term |
| 6. Rate Design Initiatives* | - | - | - | - | - | - | Immediate |
| 7. Reduced Cost of OPG Borrowing | 0.10 | 0.10 | 0.10 | 0.15 | 0.15 | 0.15 | Immediate |
| 8. End DRC Early for Class B Electricity Consumers** | - | - | - | - | - | - | n/a |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| 10. Cancel / Adjust Renewable Energy Procurements | - | - | TBD | TBD | TBD | TBD | Longer-Term |
| **Total increase on industrial bill** | **19.96** | **18.97** | **18.34** | **17.14** | **14.45** | **13.7** | |

**Note:** Proposal 2 assumes OESP participation of 50% and 5-year maturity. Proposal 3 reflects the elimination of ICI, as opposed to moving ICI cost shift to the taxbase. The $1.75/MWh savings associated with Proposal 7 in 2018 accounts for the fact that under the status quo, DRC will be removed from bills in April 2018. *Savings estimates do not include changes related to rate design. ** Class B includes small-medium enterprises (SMEs).

# Fiscal Considerations

- Funding electricity support programs (i.e., OESP, RRRP, First Nations Delivery Rate) from the tax-base represents approximately $440 million on average annually.

- Ending the Debt Retirement Charge (DRC) for commercial and small industrial electricity consumers (i.e., Class B) early would represent an additional fiscal pressure of about $450 ~~[placeholder for OFA]~~ on the province.

- If the Industrial Conservation Initiative were funded though the tax-base instead of being eliminated, this would represent a $900 million annual cost to the fiscal plan.

- Reducing OPG borrowing costs to the Province's cost of funds is expected to result in a $30 ~~20 to $35~~ million annual fiscal pressure in 2017 to the province ~~[TBC by OPG / OFA]~~ based on new borrowing and increasing based on cumulative borrowing.

- Fiscal impacts of allocating a portion of the departure tax to ratepayers will depend on the size of the allocation, as well as timing for the flow of value. The maximum, direct one-time impact is $2.6 billion, with potential ancillary impacts on residual stranded debt defeasance.
- A summary of the annual fiscal impacts of the proposed initiatives is presented in the next slide

SLIDE ADDED BY CEFD

# Proposed Taxpayer Funded Electricity Price Mitigation

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |
|---|---|---|---|---|---|
| ~~OCEB~~ | – | – | | | |
| OREC | 300 | 1,200* | 1,200* | 1,200* | 1,200* |
| Ending DRC[2] | 330 | 330 | 330 | 330 | 330 |
| NIERP | 120 | 120 | 120 | 120 | 120 |
| NOEC | 25 | 25 | 25 | 25 | 25 |
| OEPTC[3] | 450 | 460 | 470 | 481 | 481 |
| TOTAL | **1,195** | **2,105** | **2145** | **2156** | **2156** |
| 1. Electricity Market Renewal Initiative | | TBD | TBD | TBD | TBD |
| 2. OESP | | 106 | 119 | 127 | 132 |
| 2. RRRP | | 292 | 300 | 306 | 315 |
| 2. First Nations Delivery Rate | | 18 | 18 | 18 | 18 |
| 3. Fund ICI through Tax Base | | 900 | 900 | 900 | 900 |
| TOTAL | **1195** | **3,421** | **3,482** | **3,507** | **3,521** |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

- As shown above if all measures proposed in this deck were to be accepted taxpayer funded contributions to electricity price mitigation would increase to about $3.5 billion by 2020-21. That is a 67% increase from the current forecast for 2017-18.
- These amounts were not considered in the 2016-17 Fiscal Plan and could put at risk the Province's fiscal objectives for 2017-18 and beyond.

# 1. Electricity Market Renewal Initiatives

- Continue to move forward with IESO's Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2020, leading to a reduction of:
  - About $1.60/month or about 1% at current retail prices for a typical residential bill; and
  - About $2/MWh or more than 2% at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.

# 2. Fund Electricity Support Programs Through the Tax-Base

- Propose to fund electricity support programs, including Ontario Electricity Support Program (OESBP) and Rural or Remote Electricity Rate Protection (RRRP), through the tax-base instead of a regulated charge. This would allow the OESP and the RRRP charges to be removed from the Regulatory line on electricity bills.

**Considerations**

*Consumer Impacts and implementation*

- Transitioning OESP and RRRP to the tax-base would reduce a typical residential bill by about $2.35/month by 2020, and delivering the First Nation rate reduction through tax base would avoid about $0.10/month for a potential total savings of $2.45/month by 2020). As all programs provide strong social benefits, there is precedent for funding these programs through the tax-base.

- To address concerns from low income electricity consumers improvements to OESP could be implemented by increasing credits (could be up to double the current credits)
  - Single low income consumer would see a change from $30 to $45/ month ($540/year):
  - Family of four with electric heat could see a credit of $82.50/month ($990/year); and
  - Would mean no impact on consumer bills and no change to current OESP charge.
- RRRP and OESP are included in the “Regulatory” line on bills. If RRRP and OESP were eliminated from bills, the Regulatory line would decrease; however, as the Regulatory line is the smallest line item component of invoices, there is risk the decrease may not be perceived by customers.

- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined.

- The non-rate mechanism to remove delivery charges from on-reserve First Nation customer monthly bills needs to be further explored.Funding RRRP and/or OESP with tax revenue would require amendments to existing legislation and regulations.

# 2. Fund Electricity Support Programs Through the Tax-Base (cont'd)

- Table below shows estimates of program costs up to 2020:

| Year | OESP | RRRP | First Nations Delivery Rate | TOTAL |
|---|---|---|---|---|
| 2017 | $106M | $292M | $18M | **$416M** |
| 2018 | $119M | $300M | $18M | **$437M** |
| 2019 | $127M | $306M | $18M | **$451M** |
| 2020 | $132M | $315M | $18M | **$465M** |

1) Ontario Electricity Support Program (OESP)
   - After almost a year in market, close to 30% of potentially eligible customers are signed up.
   - The cost projections below assume the program grows to 50% of eligible consumers by 2020 (also assumes 10% administration costs).

2) Rural and Remote Rate Protection (RRRP)
   - Provides benefits to R2 Hydro One consumers, Algoma, and remote communities.
   - Includes the expanded coverage that will begin on January 1, 2017.

3) First Nation rate reduction (currently under development)
   - On November 14, 2016, OEB presented options to the Ministry on reducing costs for on-reserve First Nation customers.
   - OEB's recommended option to provide 100% delivery rate credit, which is estimated at $18.4 million per year.
     - Other options includes a seasonal fixed credit to account for demand changes over the year ($13 million) or a 50% total bill reduction ($23 million).

# 3. Eliminate the Industrial Conservation Initiative (ICI)

- The cost shift from the Industrial Conservation Initiative (ICI) could be removed from electricity bills by eliminating ICI.
  - The ICI allows large electricity consumers to lower their electricity costs by reducing their demand during peak hours.

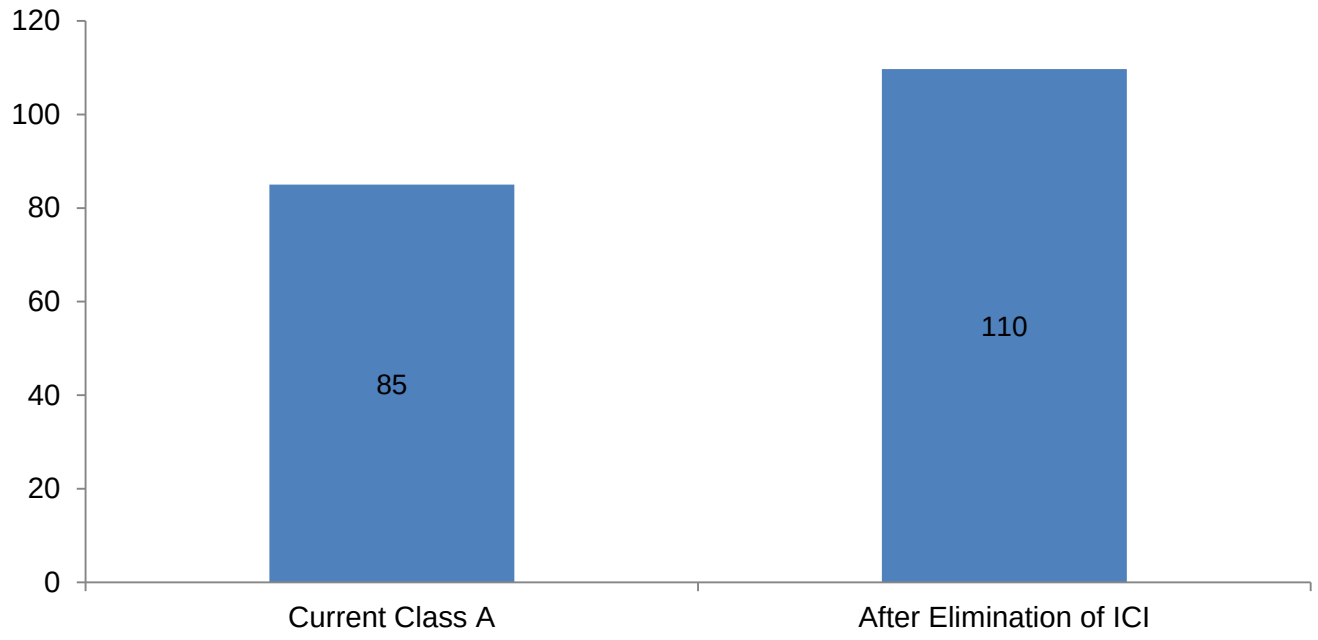
**Considerations**

- Eliminating ICI would result in a benefit of more than $4/month for residential electricity consumers in 2017.
  - However, unless government took action to mitigate the associated cost shift back to industrial consumers, typical industrial prices would increase by about one-third. Such a price increase would pose significant challenges for energy-intensive consumers.
- Industrial stakeholders have indicated that ICI as an integral factor in maintaining competitiveness and retaining industry in the province.
  - Eliminating ICI would limit the “cost shift” onto residential consumers, but it would also lead to a reduction in industrial demand. The large industrial contribution to the fixed costs of running the electricity system would then need to be covered by remaining consumers.
- If ICI is retained, current IESO projections indicate that the cost shift will decrease each year going forward as Global Adjustment (GA) decreases (due to an expected increase in HOEP).
- Alternatively, ICI could be funded through the tax-base at a cost of $900 million annually. There is precedent to use the tax-base for industrial support programs, including the Northern Industrial Electricity Rate Program (NIERP) and the Jobs and Prosperity Fund.

# 3. Eliminate the Industrial Conservation Initiative (cont'd)

- ICI currently provides a benefit of about $25/MWh to Class A electricity consumers.

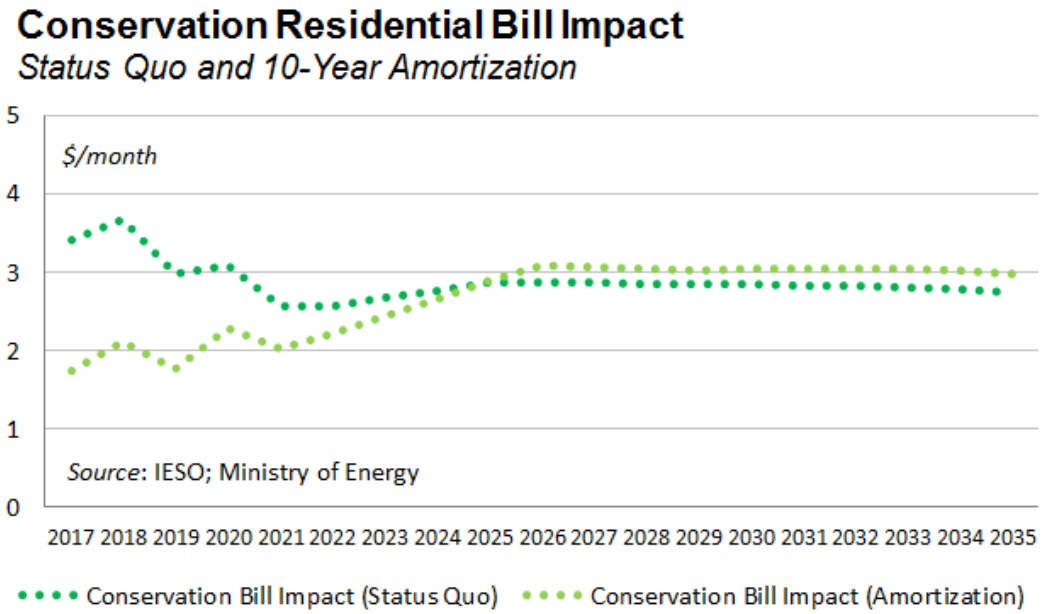
**All-In Electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer.

# 4. Amortize Conservation Program Costs

- ~$3 billion from the electricity ratepayer base will be spent on conservation programs delivered under the Conservation First Framework and the Industrial Accelerator Program (IAP) between 2015 and 2020.
- Currently, Conservation and Demand Management (CDM) program costs are recovered from the Global Adjustment (GA) mechanism about one month after expenses are incurred.
- As a potential rate mitigation measure, certain CDM costs could be amortized.
- Amortizing a portion of conservation spending would produce a benefit for electricity ratepayers in excess of $1/month at the outset. Over time, the benefit would decrease and turn into a cost, as interest charges begin to grow.



**Note**: Chart assumes that conservation incentive costs are available for amortization while administration cost are not. Although there is variable from year to year, incentives represent about two-thirds of conservation spending in Ontario. Chart assumes conservation spending continues at a similar rate beyond 2020. Chart assumes a 10-year borrowing rate of 3.0%.

# 4. Amortize Conservation Program Costs (cont'd)

## Considerations

- Under **Public Sector Accounting Board (PSAB) accounting standards**, used by both the Province and IESO, only certain assets can be amortized: 1) pensions and 2) tangible capital assets. Under PSAB an asset must meet several criteria to be considered a capital asset, including:
  - A tangible capital asset must be tangible and substantive and the Ontario government must have title and operate the asset.
  - A tangible capital asset must bring a tangible benefit to the government or to Ontario.

- CDM costs, on their own, do not meet the criteria of a tangible capital asset because customers would have ownership and control of installed CDM measures, not the Province or IESO.

- **Rate-regulated accounting** was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

# 4. Amortize Conservation Program Costs (cont'd)

**Considerations**

- If some of Ontario's CDM costs could be amortized, analysis shows that ratepayer impacts would be reduced in the short-term but interest charges on the loan would result in increased overall ratepayer costs in the longer-term.

- Legislative amendments would be needed to allow recovery of loan interest charges from GA.

- If there is a desire to proceed:
  - Formal accounting advice will need to be sought from IESO's external auditor as well as the Ontario Provincial Controller (OPC) to determine whether CDM costs could be amortized according to rate-regulated accounting standards.
  - Further legal analysis would also be required to confirm legal viability and possible approaches to implementation.

# 5. LDC Efficiencies

- Consider opportunities for future LDC cost reductions and efficiencies through the regulatory framework.

**Considerations**

- The Ontario Energy Board has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
- Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
- There maybe opportunities to promote further cost reductions and performance improvements within the distribution sector as there is continued evolution of the regulatory framework in Ontario.
  - Tightening LDC requirements may also indirectly incent other desired policy outcomes, such as LDC consolidation and grid modernization to realize further cost reductions.
- ENERGY could help promote or accelerate these efforts by asking the OEB through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and the 2017 Mandate Letter and other agency business planning processes.
- In addition, further changes to the departure and transfer tax regimes could be considered to provide a further incentive for LDC mergers and acquisitions.

# 6. Rate Design Initiatives

- OEB continues to move forward with its Regulated Price Plan (RPP) Roadmap:
  - The OEB is undertaking a comprehensive review of the RPP, including exploring the introduction of offering different pricing plan options for customers following the completion of pilot programs in 2018. The plan is expected to be implemented over a 3-5 year period.

- Until new pricing plans are available, the OEB could provide an "opt-in flat rate RPP" structure that could be made available to residential, farm and small business consumers on an interim basis (2-3 years) until a wider range of price plans are available.
- Time-of-Use (TOU) pricing could also be introduced for non-RPP Class B consumers to reduce Global Adjustment (GA) volatility and reduce system costs.

| Current TOU | New Flat Rate |
|---|---|
| On: 18.0 ¢/kWh | 11.1 ¢/kWh |
| Mid: 13.2 ¢/kWh | |
| Off: 8.7 ¢/kWh | |

**Considerations**

- The OEB has indicated that the option would lead to no overall change in system costs. Consumers with higher peak and mid-peak usage patterns would see a decrease in their electricity bills, while those with higher off-peak usage patterns would see an increase.
  - While the current strong supply conditions may allow for such an RPP structure (i.e., peak demand requirements can be easily met), administrative costs could be high (distributors would need to design/implement an opt-in process and associated billing system on an interim basis).

| | Current TOU | New Flat Rate |
|---|---|---|
| 1) Monthly electricity bill- higher peak and mid-peak usage patterns | $172 | $163 |
| 2) Monthly electricity bill- higher off-peak usage patterns | $152 | $163 |

***Note:** 1) assumes a consumer consumption pattern of 45%:30%:25% (Off-peak: Mid-peak: On-peak), while 2) assumes consumer consumption pattern of 80%:10%:10% (Off-peak: Mid-peak: On-peak). Estimates are based on OEB's online electricity bill calculator (for Toronto Hydro-November 2016 rates)

# 6. Rate Design Initiatives (cont'd)

**Considerations**

- The decision to undertake smart meter investments was partly justified on the basis of TOU pricing. If TOU pricing were to be made optional, some stakeholders could question the rationale for smart meter investments.
  - Rationale for offering a flat rate option could focus on providing customers with choice until new pricing plans are rolled out under the RPP roadmap.

- If a flat rate design is introduced, there could be significant consumer opposition to any return to a mandatory TOU.

- After the interim flat rate period, the OEB could offer a wider range of pricing plans to consumers.
  - As part of its RPP review, the OEB will be running pilots with LDCs to assess customer response to alternative time periods and pricing structures.
  - Learnings from these pilots will help inform potential changes to the RPP. Pilots are expected to be in market May 2017 and run for one year.

- Non-RPP Class B electricity consumers currently pay Global Adjustment (GA) on a volumetric basis. Moving them to TOU would provide an incentive to shift consumption to off-peak periods.
  - Consumers, including manufacturers, who are unwilling to shift would face higher costs and likely not be supportive of the changes.
  - The decision to pursue TOU pricing for non-RPP class B consumers will impact proceeds recycling as there is interplay between the two initiatives.

# 7. Reduced Cost of OPG Borrowing

- OPG currently borrows for corporate purposes from the OEFC
- Seek to reduce OPG's borrowing costs and pass on savings to ratepayers by:
  - Reducing or removing the spread that OEFC applies to OPG for any new corporate debt; or
  - Allowing OPG to refinance its existing debt at longer maturities through the OEFC in order to take advantage of the current, favourable interest rate environment.
- Assuming the full spread is removed from all OEFC debt, OPG borrowing costs could be reduced by 50-100 basis points, representing annual savings of about $20-$25 million, increasing to $30-$35 million, as OPG's outstanding OEFC debt rises from ~$3.3 billion in 2016 to ~$4.7 billion in 2020.
- OPG could apply to the OEB as part of its current rate application to flow this benefit to ratepayers.

**Considerations**

- Further work is required to determine potential OPG savings from these initiatives.
- Allowing OPG to refinance would have a negative fiscal impact on the Province.
- Spreads are expected to decline, reducing the relative impact of this change, given lower overall interest rates and reduced volatility.
- Providing OPG with greater access to longer term (20-30 year) debt may also reduce costs:
  - OPG's average term to maturity for OEFC debt is 5.7 years, as compared to 22.2 years for privately financed project debt. This contrasts with most corporations and government which have been working to extend average debt terms in order to take advantage of the low interest rate environment.
  - Longer terms would also better match to the life of OPG's assets.
  - Recently, OEFC has allowed OPG to apply for 50% of its financing requirements in the form of longer term (25-30 year debt). Moving closer to 100% would accelerate this transition.

# 8. End DRC Early for Commercial/Small Industrial Class B Electricity Consumers

- Propose to remove the $0.07/kWh Debt Retirement Charge (DRC) from the bills of commercial/small industrial Class B consumers beginning in 2017, instead of April 1, 2018.
  - **Note:** Class A consumers (e.g., large industrial) would continue to pay DRC until at least April 1, 2018.

**Considerations**

- For a Class B consumer currently paying about $152/MWh, removing the DRC would represent a savings of about 5%.
  - A 50% reduction in the DRC charge would represent a savings of about 2%.

- Alternatively, the reduction of the DRC could be to $0.035/kWh starting in 2017, to provide relief for cap and trade until proceeds recycling is fully operational.

- Residential consumers have had the DRC removed from bills since January 1, 2016. Taking DRC off commercial and small industrial bills would result in equal treatment for these groups of consumers.

- The savings for commercial and small industrial consumers associated with this proposal would drop to zero in April 2018, since this is the current planned date for removing the DRC from non-residential bills.

- Prior to moving forward with this proposal, additional analysis from Legal Services and the MOF would be needed.

# 9. Dedicate Departure Tax

- In connection with the IPO, as a result of leaving the PILs regime and entering the corporate tax regime, Hydro One was deemed to dispose of its assets for proceeds equal to its fair market value, triggering a PILs liability of $2.6 billion (Departure Tax).
- This was paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt.
- The Province could explore repurposing some of those funds to the benefit of ratepayers.
- This may reduce the risk that the Ontario Energy Board (OEB) assigns to ratepayers the benefit from an associated tax asset, resulting in lower earnings and decreased share value for Hydro One. This decision is currently before the OEB, as part of Hydro One's Transmission rate application.

**Considerations**

- Cost savings to ratepayers would depend on timing and which ratepayers (e.g., Hydro One customers, or all Ontario customers) will benefit from some or all of the $2.6 billion value.
- While this is a shift from messaging that value from the broadening of ownership of Hydro One is being used pay down debt and fund transit and transportation, the Province could link to electricity infrastructure investments (e.g., as an offset to infrastructure investments already made in the sector, or to specific initiatives such as conservation).
- These funds were paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt. Repurposing may have an impact on the defeasance of this debt.

# 10. Cancel/Adjust Renewable Energy Procurements

- The Ministry could consider the following actions to further mitigate future impacts to electricity bills:

| Unallocated/Terminated Capacity | Announced Procurements | Executed Contracts |
|---|---|---|
| A. Do not procure unallocated or terminated capacity | B. Revise FIT 5 target | D. Cancel LRP I contracts |
| | C. Cancel FIT 6 | |

**Overarching Considerations**

- Cost savings associated with reducing or cancelling renewable energy procurements and programs will not reduce current electricity bills, but would result in future cost reductions relative to Ontario Planning Outlook forecasts.
- The IESO estimates implementing options A to C will reduce system costs by approximately $592 million ($2016) between 2019 and 2028, resulting in an average of approximately $0.50/month in savings to a typical residential electricity bill over the same period. [cost reductions from LRP I contract cancellations TBC]
- The microFIT program is winding down end of 2017. Annual microFIT procurement targets have been undersubscribed.
- With a few exceptions (e.g., rollover of unallocated microFIT capacity; addition of terminated microFIT and small FIT capacity to FIT 5), plans for unallocated or terminated capacity are not defined in announcements or existing directions.

**Cancel/Adjust Announced Procurements**

- Amendments to existing directions to the IESO would be required to reduce FIT 5 and cancel FIT 6.
- The FIT 5 procurement is underway with a base target of 150 MW and inclusion of any capacity available from contract terminations under prior small FIT and microFIT procurements. The application window closed on November 25, 2016.

# 10. Cancel/Adjust Renewable Energy Procurements – Existing Contracts

**Cancel Existing LRP I Contracts**

- 16 LRP I contracts (approx. 455 MW) have been executed and projects are under development.
- None have met Key Development Milestones. Total value of LRP I estimated at approx. $1 billion (NPV to 2016).

[Placeholder for IESO: Cost calculation relative to OPO and associated bill impact]

**Considerations**

- To help inform a decision, IESO or OEB could be asked to evaluate and provide guidance to the Ministry on the system need for LRP I projects and potential ratepayer impacts/benefits.
- 13 of 16 LRP I contracts have Indigenous participation. Cancelling LRP I contracts would remove this economic development opportunity and likely damage relationships between Indigenous communities and the government.
- LRP I Contract includes an “Optional Termination” provision allowing IESO to terminate any contract prior to the “Commercial Operation Date” with 6 months written notice.
- The IESO obligations under the Optional Termination provision depend on whether the project has met all “Key Development Milestones”.
  - As no projects have met their Key Development Milestones, the estimated total cost payable to contract holders is about $8 million.

# 10. Cancel/Adjust Renewable Energy Procurements – Existing Contracts (cont'd)

## Legal Analysis

- Under the *Electricity Act, 1998*, the Minister has the authority to amend previous directions without approval from Cabinet. Although an amendment to an existing direction would not require Cabinet approval, it is unlikely that a direction to cancel LRP I contracts could be considered as amending an existing direction. The previous LRP directions set out the broad policy framework that was reflected in the procurement, but the contracts themselves, once executed, are stand alone documents which the IESO had legal authority to execute. Revoking previous LRP directions does not affect that authority or have the effect of cancelling the procurement.
- As a result, any new directive to cancel LRP I contracts would need to be approved by Cabinet, either as part of an LTEP implementation directive to IESO, or pursuant to the overall power to direct IESO with respect to procurements outside the LTEP process. However, there is a risk that such a directive could be subject to challenge.
- ENERGY has previously received advice that there is a high risk that a court would conclude that the Minister has no authority under the *Electricity Act , 1998* to issue a direction requiring IESO to terminate microFIT Conditional Offers and FIT Offer Notices that have already been issued to applicants, because these offers create vested contractual rights and the Minister would require clear legislative authority to interfere with those rights. This reasoning would likely apply equally to any direction or directive to IESO to cancel LRP I contracts.
- Previous advice has also flagged a moderately high risk that the Province could be liable for damages in tort for inducing a breach of contract if it issues a direction to IESO that interferes with vested contractual rights without clear statutory authority to do so. LRP I contract holders could also assert other claims, such as misfeasance in public office.
- The risk and costs associated with potential law suits resulting from the cancellation of contracts requires further analysis, including analysis of whether any statutory amendments would be required to provide clear authority to cancel the contracts. LSB recommends ENERGY seek an opinion from Crown Law Office Civil before proceeding.

# Summary

- Reductions in electricity rates could be achieved by eliminating existing, planned or directed initiatives from the rate-base or shifting these costs to the tax-base.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

- As shown before the positive impact to residential ratepayers is very limited (between $8 and $9 per month) while the impact to the Province's fiscal position would be material (about $1.5 billion a year).

# Appendix

# Electricity Consumer Classes

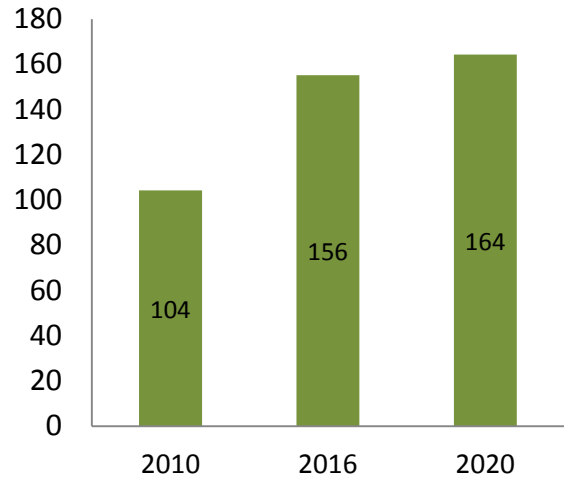
- In Ontario, there are three classes of electricity consumers:

| | Regulated Price Plan | Class B | Class A |
|---|---|---|---|
| **Consumer Types** | • Residential<br>• Small Business<br>• Farms | • Commercial<br>• Institutional<br>• Small industrial | • Large commercial<br>• Large industrial |
| **Load Size** | Below 0.05 MW | Between 0.05 MW and 1 MW | Above 1 MW |
| **Total Consumption** | 58 TWh | 57 TWh | 26 TWh |
| **Share of Consumption** | 41.1% | 40.4% | 18.4% |

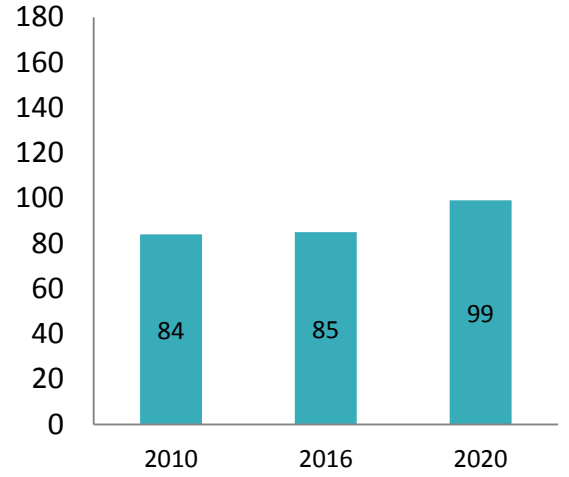
# Prices by Electricity Consumer Class

- Since 2010, average bills for residential consumers (i.e., using 750 kWh/month) have increased by over 50%. Rates are forecast to continue to increase, with residential consumers paying an estimated 6% by 2020.
- Industrial electricity rates have remained relatively flat over the same time period, due primarily to the Industrial Conservation Initiative (ICI). ICI represents a cost shift of about $5/month for residential electricity consumers. Industrial electricity consumers are forecast to see an increase of 16% by and 2020.

**Typical Residential Bill (750/kWh per month)**



**Typical Class A (Industrial) Price ($/MWh)**



**Note:** 2016 represents year-to-date September 2016 for industrial. Cap and trade proceeds recycling is included for the industrial consumer for 2020.

# Rate Mitigation Levers

- To provide further rate relief to Ontario electricity consumers, the government can use one or more of the levers outlined below:
  - **Tax-based Lever:**
    - Provide rebates funded from the tax-base or transfer items currently paid through the rate-base to the tax-base.
  - **Rate-based Lever:**
    - Shifts costs within the rate-base from one customer group to another to achieve electricity system benefits and/or policy goals.
  - **Cap and Trade Proceeds Lever:**
    - Use cap and trade proceeds on initiatives that help reduce greenhouse gas (GHG) emissions from the electricity sector (e.g., recycling proceeds during off-peak periods) while providing benefits to some or all electricity consumers.

# Traditional Rate Mitigation Programs

- Ontario has implemented a number of rate-based programs to help residential and industrial electricity consumers:
  - The Ontario Electricity Support Program (OESP) provides ongoing assistance directly on the bills of eligible low-income electricity consumers
  - The Rural or Remote Rate Protection (RRRP) program is provided to rural and remote residential and farm customers because the cost of distributing power to remote areas is much higher than for urban areas.
  - The Industrial Conservation Initiative (ICI) encourages Ontario's largest consumers to reduce consumption during peak periods while reducing system costs.
- There are also tax-base programs to help manage electricity prices:
  - Rebate the provincial portion of the HST from the electricity bills of residential, small business and farms as of January 1, 2017.
  - Northern Industrial Electricity Rate Program (NIERP), in which participants receive a rebate of two cents per kilowatt hour. On average, industrial electricity prices can be reduced by up to 20%.
- While rate-based programs provide relief to certain electricity consumers, they shift other costs to remaining ratepayers (See Appendix for additional details).

# Driving Down Prices for Consumers

- Since 2013, a number of actions have been taken to drive down prices for consumers wherever possible:
  - Renegotiating the Green Energy Investment Agreement, reducing contract costs by $3.7 billion;
  - Deferring the construction of two new nuclear reactors at Ontario Power Generation's Darlington facility, avoiding an estimated $15 billion in new construction costs;
  - Approving Ontario Power Generation's plans to enable the ongoing operation of Pickering up to 2024, which is expected to save ratepayers as much as $600 million;
  - Reducing Feed-In-Tariff (FIT) prices through annual price reviews, saving ratepayers at least $1.9 billion relative to the 2013 Long-Term Energy Plan (2013 LTEP) forecast; and
  - Suspending the second round of the Large Renewable Procurement (LRP II) process and the Energy-from-Waste Standard Offer Program to save up to $3.8 billion in electricity system costs relative to 2013 LTEP.

# Cost Shifts in the Electricity Sector – Current Programs

- Several programs in the electricity sector “shift costs” from one group of electricity consumers to another:
  - **Rural or Remote Rate Protect** (**RRRP)** is a longstanding program that reduces the delivery charge for rural electricity consumers and is paid for by all consumers in Ontario through a regulatory charge on bills.
  - **Ontario Electricity Support Program (OESP)** is funded via a regulatory charge on consumer bills and provides support for qualifying low income electricity consumers.
  - **Industrial Conservation Initiative (ICI)** empowers large consumers to lower their costs by reducing their demand during peak hours. In the process, ICI shifts costs from large electricity consumers to all other consumers in Ontario.
  - **Industrial Electricity Incentive** (**IEI**) program, offers reduced electricity prices for companies starting or expanding operations in Ontario. All electricity consumers in Ontario pay for the price reduction that IEI participants receive.

# Cost Shifts in the Electricity Sector (Cont'd)

- The tables on the right show the estimated cost shifts that result from existing government programs.
- ICI has had the largest cost shift of all the programs, due to the large size of Global Adjustment (GA) and the way that it is recovered from consumer classes.
- RRRP and OESP impact the regulatory line on consumer bills, while ICI, IEI and conservation affect GA (i.e., Electricity line on bills of Regulated Price Plan consumers).

**Cost Shift Impacts - Residential Bill**

*Typical 750 kWh/month Toronto Hydro consumer*

| *$/month* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 2.65 | 3.25 | 3.88 | 3.53 | 4.75 | 4.77 |
| RRRP | 0.90 | 0.82 | 0.84 | 0.92 | 0.93 | 0.94 |
| OESP | - | - | - | - | - | 0.84 |
| Conservation | 1.85 | 1.92 | 2.00 | 1.58 | 2.43 | 2.45 |
| IEI | - | - | 0.08 | 0.09 | 0.11 | 0.12 |
| **Total** | **5.41** | **5.99** | **6.81** | **6.13** | **8.21** | **9.12** |

**Cost Shift Impacts - Industrial Bill**

*Typical Class A consumer*

| *$/MWh* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | -22.17 | -26.36 | -30.29 | -25.91 | -33.79 | -33.92 |
| RRRP | 1.20 | 1.10 | 1.12 | 1.23 | 1.24 | 1.25 |
| OESP | - | - | - | - | - | 1.13 |
| Conservation | 1.53 | 1.59 | 1.66 | 1.31 | 2.01 | 2.02 |
| IEI | - | - | 0.07 | 0.08 | 0.09 | 0.10 |
| **Total** | **-19.43** | **-23.67** | **-27.44** | **-23.29** | **-30.45** | **-29.43** |

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Cost Shifts in the Electricity Sector (Cont'd)

- The table on the right shows the total cost for various government electricity programs. These programs are currently funded through the electricity system ratebase.

- Funding of these programs through the fiscal plan would remove these costs from the electricity system (i.e., Placing these costs on the taxbase).

**Cost of Programs**

*By government program*

| *$M* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 506 | 615 | 736 | 670 | 890 | 893 |
| RRRP | 172 | 156 | 159 | 176 | 174 | 176 |
| OESP | - | - | - | - | - | 158 |
| Conservation | 329 | 339 | 354 | 280 | 425 | 428 |
| IEI | - | - | 15 | 16 | 18 | 19 |

- For example, removing the roughly $900 million of program cost from the Industrial Conservation Initiative (ICI) program would save the typical residential electricity consumer $4.77 per month in 2016.

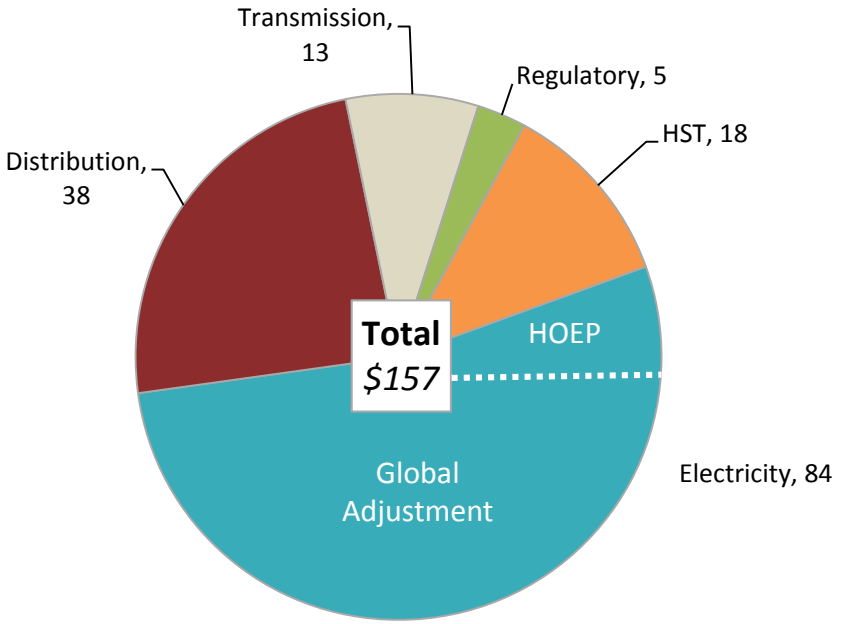
**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Residential Electricity Prices

- There are approximately 4.5 million residential consumers in Ontario.
- The Regulated Price Plan includes nearly all residential consumers, as well as small businesses. Regulated Price Plan consumers pay a blended commodity rate regulated by the OEB, which is set every six months.
- For households, the Debt Retirement Charge (DRC) was removed from residential electricity bills as of January 1, 2016.
- In addition, the Ontario Electricity Support Program (OESP) provides an ongoing rate reduction directly on the bills of low-income electricity consumers who have applied and meet the eligibility requirements. The program is funded through the rate base.
- Rural customers, in particular those with electrical heating, pay higher monthly bills.

**Typical Residential Monthly Bills ($)**

*As of November 1, 2016 (750 kWh/month)*



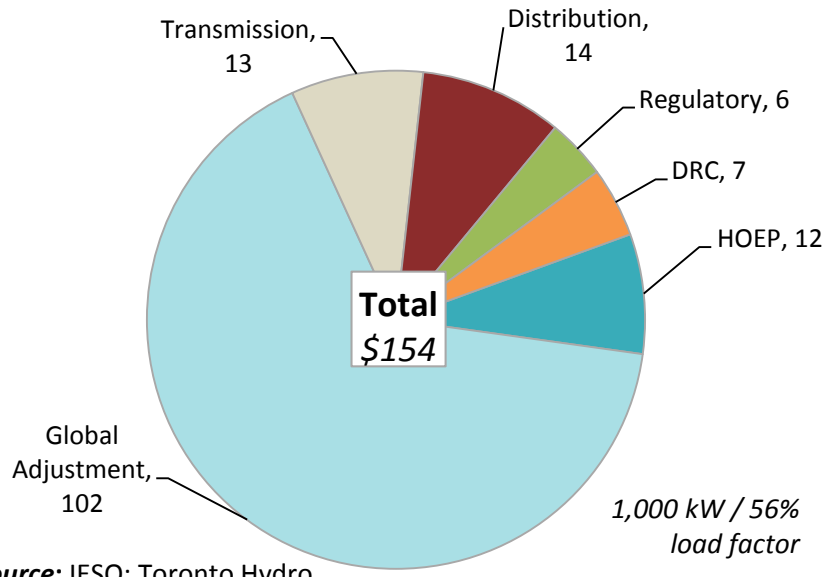
***Source*: OEB, Toronto Hydro**

# Commercial Electricity Prices

- There are approximately 55,000 commercial and institutional consumers in the province. These consumers are Class B consumers, and have separate line items on the electricity bill for HOEP and GA.
- There is a high degree of differentiation amongst consumers within the commercial sector in terms of size and consumption patterns. For example, an elementary school has a much different hourly load profile compared to a full service restaurant. This is an important consideration when looking at the bill impacts of policy options.

**Typical Commercial Price ($/MWh)**

*YTD June 2016 (Non-RPP Class B)*



***Source*:** IESO; Toronto Hydro

- Consumers in the commercial sector do not pay time-of-use prices and have little incentive to shift demand away from high demand hours.
- Targeted pricing programs are currently not available for Class B consumers.

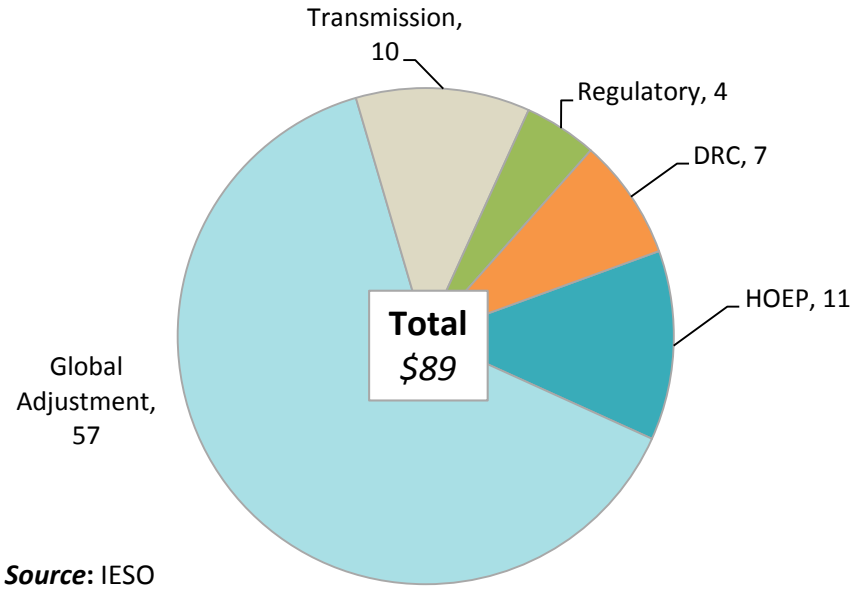
*** Note**: Most commercial consumers receive input tax credits for their HST.

# Industrial Electricity Prices

- There are about 300 large industrial consumers in Ontario.
- Measures in place to mitigate industrial electricity prices include ICI and NIERP.
- ICI lowers costs for eligible large electricity consumers (i.e., those with monthly peak demand exceeding 3 MW) that reduce consumption during peak periods.
  - ICI consumers reduce their electricity rates by 25% on average.

**Typical Large Industrial Price ($/MWh)**

*YTD June 2016*



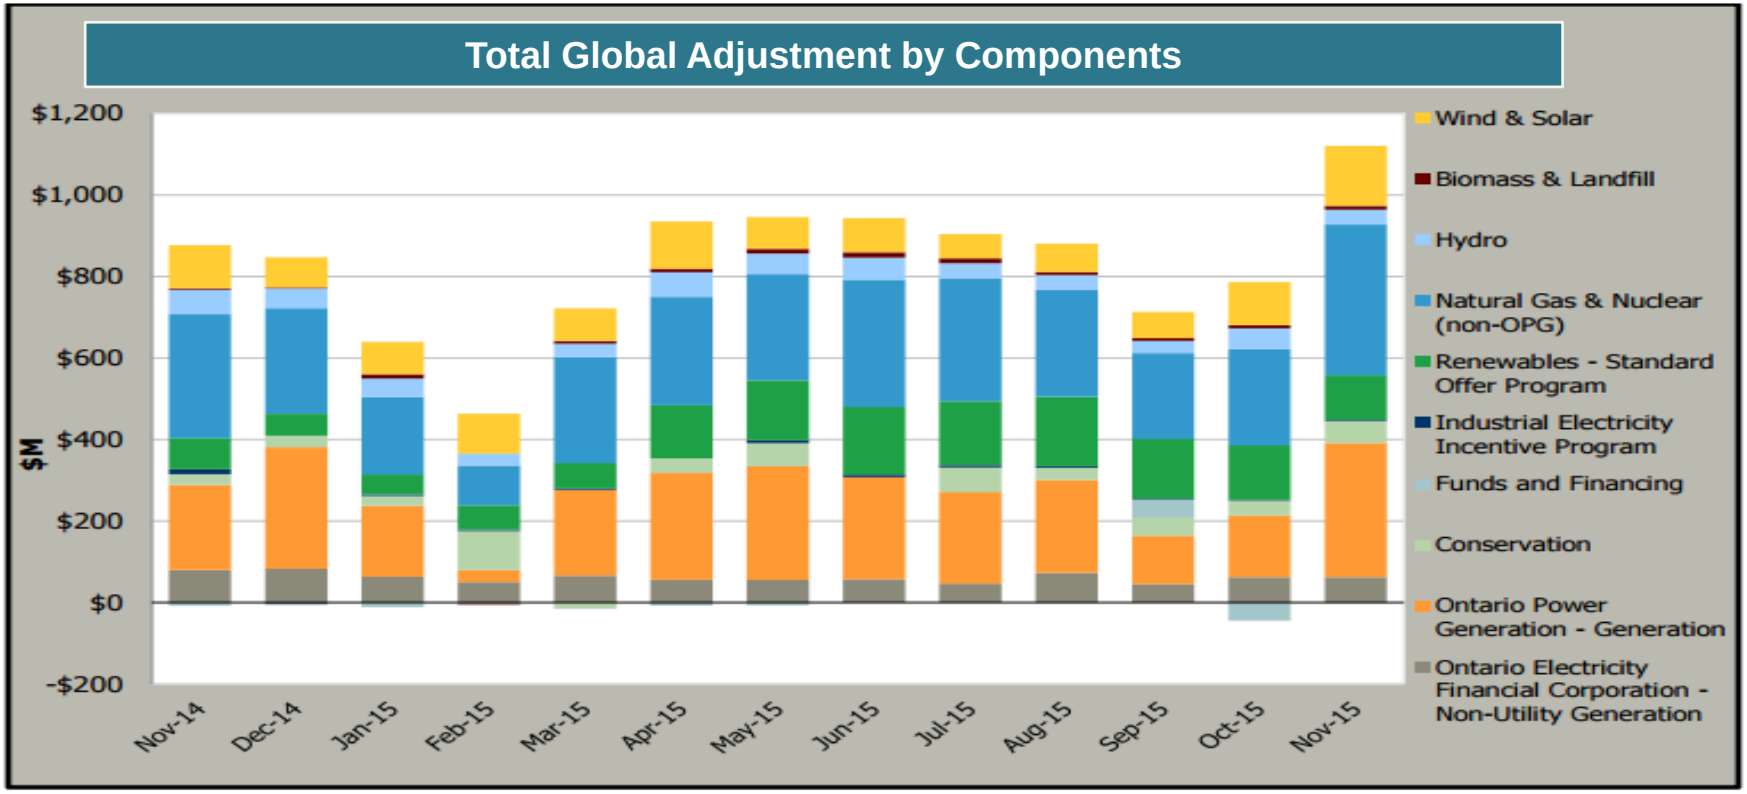
***Source*: IESO**

- Participants in NIERP receive a rebate of $20/MWh. On average, industrial electricity prices are reduced by about 20% through the program, reducing all-in prices to $69/MWh for these consumers. The program is funded through the tax base.

*** Note:** Industrial consumers receive input tax credits for their HST.

# Total Components of Global Adjustment

- Global Adjustment (GA) is a market mechanism that recovers costs from electricity consumers, including the cost of almost all conservation programs in the province (i.e., approximately half a billion dollars in 2016).



**Source:** IESO Monthly Market Report (November 2015)

# Cancel/Adjust Renewable Energy Procurements

# LRP I Pre-Construction Liability Limits

- All 16 successful LRP I developers accepted Optional Termination Provisions when the LRP I Contracts were executed in April 2016.
- If IESO chooses to enact the Optional Termination provision before a project has met all Key Development Milestones, IESO is required to pay pre-construction development costs up to the Pre Construction Liability Limit.
- Pre-construction development costs include costs incurred for feasibility studies, obtaining site access rights, work towards environmental approvals, business development plans, negotiation of contracts for design, equipment, construction and financing, reasonable overhead expenses, and other reasonable costs incurred.
- The Pre Construction Liability Limits are:
  - Non-Rooftop Solar: $250,000 plus $10.00/kW of Contract Capacity
  - Waterpower: $500,000 plus $20.00/kW of Contract Capacity
  - On-Shore Wind: $400,000 plus $2.00/kW of Contract Capacity
- According to the LRP I Optional Termination provision, the developer has a duty to take reasonable steps to mitigate losses, liabilities, costs and damages incurred as a result of the Optional Termination.
  - The IESO will not provide compensation for amounts which are attributable to a developer's failure to take reasonable steps to mitigate.

Some early comments and an edit….in red.

Ontario

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector

## Working Draft

December 5, 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure.
  - Since 2003, the Province has invested more than $35 billion in over 16,000 megawatts (MW) of new and refurbished cleaner generation, including nuclear, natural gas and renewables.
  - Over the same period, Hydro One has invested $15.5 billion to enhance and renew its transmission and distribution systems.
  - As additional electricity generation comes online, nuclear units are refurbished and distribution and transmission investments are made, prices are forecast to continue to increase.

- Actions have been taken to drive down electricity costs, including deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., introduction of wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).

- Additional steps have been taken to increase cost effectiveness and improve efficiency by adopting new electricity market approaches, such as:
  - Enhancing competition between developers of large renewable projects through the Large Renewable Procurement (LRP) process to drive down price and secure clean, reliable generation for the province;
  - Directing IESO to end the process of negotiating new NUG contracts pending the development of a Capacity Auction (i.e., Market Renewal); and
  - Launching the first IESO Demand Response Auction (i.e., a competitive process through which demand-side resources are selected to be available to reduce their electricity consumption as needed).

# Context (Cont'd)

- Following the 2016 Throne Speech, a number of actions were announced to further reduce electricity costs, such as:
  - Providing an 8 per cent rebate, equivalent to the provincial portion of HST, for approximately 5 million eligible electricity consumers including residences, small businesses and farms;
  - Increasing the amount of rate protection available to approximately 330,000 eligible rural customers living in low-density areas by updating the Rural or Remote Rate Protection (RRRP) program;
  - Lowering the Industrial Conservation Initiative (ICI) threshold to 1 MW and removing sector restrictions so that more consumers can benefit;
  - Suspending the second round of the Large Renewable Procurement (LRP II); and
  - Recycling a portion of cap and trade auction proceeds to keep rates affordable for industrial and commercial electricity consumers.

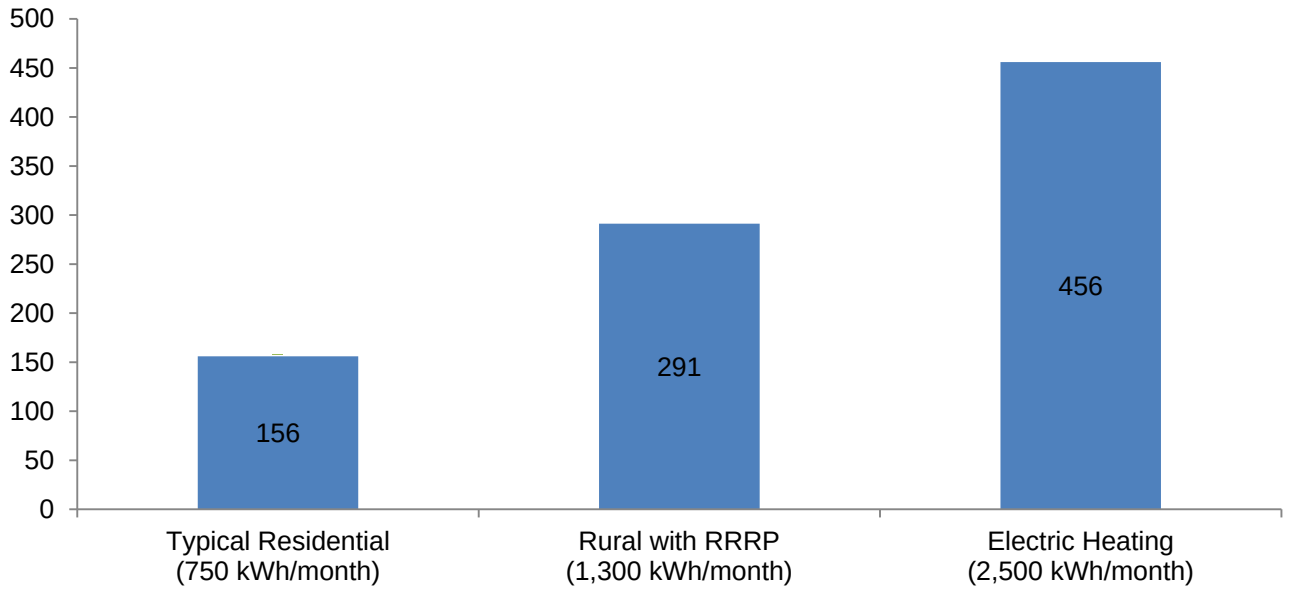
- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured and the need for wholesale market renewal.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

# Current Electricity Prices – Residential

- Residential consumers electricity prices continue to be a concern for many Ontarians, particularly those that rely on electric heat.
  - **Note:** The typical residential bills are currently below the 2013 Long-Term Energy Plan (2013 LTEP) forecasts ($159 / 750kWh)

**Residential Electricity Bills**
*in $/month*

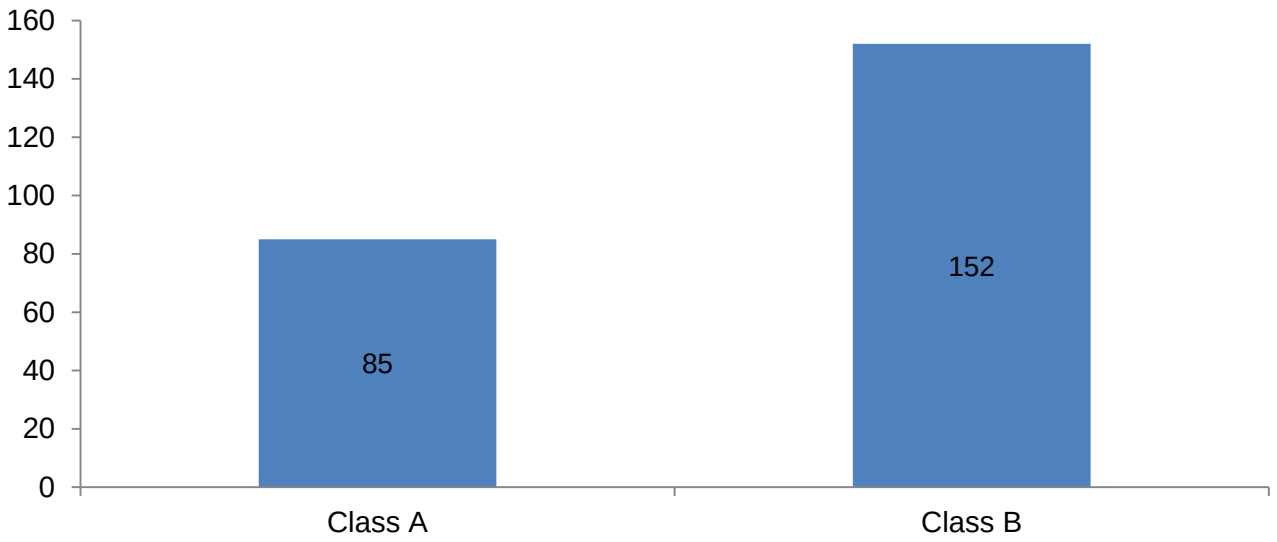


**Note**: Typical residential and electric heating shown above are based on Toronto Hydro; rural is based on connection to Hydro One as a R2 customer eligible to receive the Rural or Remote Rate Protection (RRRP) credit of $31.50.

# Current Electricity Prices – Industrial and Commercial

- While large industrial electricity consumers (i.e., Class A) rates are competitive with other jurisdictions, rates for commercial/small industrial consumers (i.e., Class B) are higher by comparison.
  - **Note:** Current industrial and commercial prices are below 2013 LTEP forecasts ($96 / MWh)

**Current All-In electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer. Class B reflects a 1 MW load operating at 56% load factor and connected to Toronto Hydro.

# Proposed Initiatives – Overview

- The suite of proposed initiatives are intended to:
  - Transform how the electricity market operates in Ontario;
  - Re-set how government programs are funded (i.e., rate-base vs tax-base);
  - Provide system benefits (e.g., industrial load retention);
  - Lower the cost of electricity for residential and industrial consumers; and
  - Increase cost effectiveness and improve efficiency.

- The proposed initiatives include:
  1. Implement Market Renewal Initiatives
  2. Fund Electricity Support Programs Through The Tax-base
  3. Eliminate the Industrial Conservation Initiative (ICI)
  4. Amortize Conservation Program Costs
  5. LDC Efficiencies
  6. Rate Design Initiatives
  7. Reduced Cost of OPG Borrowing
  8. End Debt Retirement Charge (DRC) Early for Commercial/Small Industrial Class B Electricity Consumers
  9. Dedicate Departure Tax
  10. Cancel/Adjust Renewable Energy Procurements

- The proposed initiatives provide opportunities to reduce electricity costs for residential and industrial consumers while at the same time transforming the province's electricity market and yielding benefits for the electricity system.

# Proposed Initiatives – Impacts

- Each of the proposed initiatives under consideration target different government programs and different parts of the electricity bill. The proposals impact different classes of electricity consumers to varying degrees.

| Proposal | Program / Initiative | Line on Bills | Who Benefits |
|---|---|---|---|
| 1. Implement Market Renewal Initiatives | Market Renewal | Electricity, Global Adjustment, Regulatory | Market Renewal: All electricity consumers |
| 2. Fund Electricity Support Programs Through The Tax-base | OESP, RRRP | Regulatory | All electricity consumers evenly |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | ICI | Electricity, Global Adjustment | Only Class B electricity consumers (i.e., residential) **Note:** Will have a negative impact on Industrial consumers. |
| 4. Amortize Conservation Program Costs | Amortization | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |
| 5. LDC Efficiencies | Distribution efficiencies | Delivery | All embedded consumers |
| 6. Rate Design Initiatives | Rate structures | Electricity, Global Adjustment | Rate Design Initiatives: Participating electricity consumers |
| 7. Reduced Cost of OPG Borrowing | n/a | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |
| 8. End DRC Early for Commercial/Small Industrial Class B Electricity Consumers | Debt Retirement Charge (DRC) | DRC | Class B consumers (i.e., small business and commercial consumers, etc) |
| 9. Dedicate Departure Tax | Departure Tax | TBD | TBD |
| 10. Cancel/Adjust Renewable Energy Procurements | FIT, LRP | Electricity, Global Adjustment | Class B electricity consumers and to a lesser extent Class A consumers |

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

| *$/750kWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| 1. Implement Market Renewal Initiatives | - | - | - | 1.58 | 1.59 | 1.60 | Longer-Term |
| 2. Fund Electricity Support Programs through the Tax-base | 2.18 | 2.30 | 2.31 | 2.45 | 2.48 | 2.51 | Immediate |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | 4.40 | 4.24 | 4.10 | 4.24 | 3.73 | 3.58 | Immediate |
| 4. Amortize Conservation Program Costs | 1.67 | 1.56 | 1.21 | 0.81 | 0.54 | 0.3 | Immediate |
| 5. LDC Efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Near-Term |
| 6. Rate Design Initiatives* | - | - | - | - | - | - | Immediate |
| 7. Reduced Cost of OPG Borrowing | 0.13 | 0.13 | 0.13 | 0.18 | 0.18 | 0.18 | Immediate |
| 8. End DRC Early for Class B Electricity Consumers** | - | - | - | - | - | - | n/a |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| 10. Cancel / Adjust Renewable Energy Procurements | - | - | TBD | TBD | TBD | TBD | Longer-Term |
| **Total** | | | | | | | |

**Note:** The above initiatives will provide similar benefits for non-RPP Class B electricity consumers. Proposal 2 assumes OESP participation of 50% and 5-year maturity. *Savings estimates do not include changes related to rate design. ** Class B includes small-medium enterprises (SMEs).

# Proposed Initiatives – Potential Savings for Average Industrial Electricity Consumers

| *$/MWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| 1. Implement Market Renewal Initiatives | - | - | - | 2.11 | 2.12 | 2.13 | Longer-Term |
| 2. Fund Electricity Support Programs through the Tax-base | 2.91 | 3.06 | 3.17 | 3.27 | 3.33 | 3.38 | Immediate |
| 3. Eliminate the Industrial Conservation Initiative (ICI) | (24.12) | (23.21) | (22.45) | (23.23) | (20.42) | (19.61) | Immediate |
| 4. Amortize Conservation Program Costs | 1.15 | 1.08 | 0.84 | 0.56 | 0.37 | 0.25 | Immediate |
| 5. LDC Efficiencies | n/a | n/a | n/a | n/a | n/a | n/a | Near-Term |
| 6. Rate Design Initiatives* | - | - | - | - | - | - | Immediate |
| 7. Reduced Cost of OPG Borrowing | 0.10 | 0.10 | 0.10 | 0.15 | 0.15 | 0.15 | Immediate |
| 8. End DRC Early for Class B Electricity Consumers** | - | - | - | - | - | - | n/a |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| 10. Cancel / Adjust Renewable Energy Procurements | - | - | TBD | TBD | TBD | TBD | Longer-Term |
| **Total** | | | | | | | |

**Note:** Proposal 2 assumes OESP participation of 50% and 5-year maturity. Proposal 3 reflects the elimination of ICI, as opposed to moving ICI cost shift to the taxbase. The $1.75/MWh savings associated with Proposal 7 in 2018 accounts for the fact that under the status quo, DRC will be removed from bills in April 2018. *Savings estimates do not include changes related to rate design. ** Class B includes small-medium enterprises (SMEs).

# Fiscal Considerations

- Funding electricity support programs (i.e., OESP, RRRP, First Nations Delivery Rate) from the tax-base represents approximately $440 million on average annually.

- Ending the Debt Retirement Charge (DRC) for commercial and small industrial electricity consumers (i.e., Class B) early would represent an additional fiscal pressure of $xx [placeholder for OFA] on the province.

- If the Industrial Conservation Initiative were funded though the tax-base instead of being eliminated, this would represent a $900 million annual cost to the fiscal plan.

- Reducing OPG borrowing costs to the Province's cost of funds is expected to result in a $20 to $35 million annual fiscal pressure to the province [TBC by OPG / OFA].

- Fiscal impacts of allocating a portion of the departure tax to ratepayers will depend on the size of the allocation, as well as timing for the flow of value. The maximum, direct one-time impact is $2.6 billion, with potential ancillary impacts on residual stranded debt defeasance.

# 1. Electricity Market Renewal Initiatives

- Continue to move forward with IESO's Market Renewal initiatives:
  - Market Renewal encompasses projects such as a single-schedule system (from the current two-schedule system), more frequent intertie scheduling to better align with other jurisdictions and a day-ahead market. There will be up front capital costs to enable the initiative. IESO is currently assessing these costs.
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.

**Considerations**

- Changes related to IESO's Market Renewal initiatives, reflected in HOEP and uplifts, are estimated to save up to $300 million per year, starting in 2020, leading to a reduction of:
  - About $1.60/month or about 1% at current retail prices for a typical residential bill; and
  - About $2/MWh or more than 2% at current all-in prices for industrial and SME electricity consumers.
- The IESO's Market Renewal is a broad initiative that will impact all aspects of Ontario's electricity market. Ontario has had a uniform price since market opening.
- Adopting a technology-agnostic stance will lower the overall cost of providing electricity service by selecting the most cost-effective resources to fulfill various system needs.

# 2. Fund Electricity Support Programs Through the Tax-Base

- Propose to fund electricity support programs, including Ontario Electricity Support Program (OESB) and Rural or Remote Electricity Rate Protection (RRRP), through the tax-base instead of a regulated charge. This would allow the OESP and the RRRP charges to be removed from the Regulatory line on electricity bills.

**Considerations**

*Consumer Impacts and implementation*

- Transitioning OESP and RRRP to the tax-base would reduce a typical residential bill by about $2.35/month by 2020, and delivering the First Nation rate reduction through tax base would avoid about $0.10/month for a potential total savings of $2.45/month by 2020). As all programs provide strong social benefits, there is precedent for funding these programs through the tax-base.
- To address concerns from low income electricity consumers improvements to OESP could be implemented by increasing credits (could be up to double the current credits)
  - Single low income consumer would see a change from $30 to $45/ month ($540/year):
  - Family of four with electric heat could see a credit of $82.50/month ($990/year); and
  - Would mean no impact on consumer bills and no change to current OESP charge.
- RRRP and OESP are included in the “Regulatory” line on bills. If RRRP and OESP were eliminated from bills, the Regulatory line would decrease; however, as the Regulatory line is the smallest line item component of invoices, there is risk the decrease may not be perceived by customers.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined.
- The non-rate mechanism to remove delivery charges from on-reserve First Nation customer monthly bills needs to be further explored.Funding RRRP and/or OESP with tax revenue would require amendments to existing legislation and regulations.

# 2. Fund Electricity Support Programs Through the Tax-Base (cont'd)

- Table below shows estimates of program costs up to 2020:

| Year | OESP | RRRP | First Nations Delivery Rate | TOTAL |
|---|---|---|---|---|
| 2017 | $106M | $292M | $18M | **$416M** |
| 2018 | $119M | $300M | $18M | **$437M** |
| 2019 | $127M | $306M | $18M | **$451M** |
| 2020 | $132M | $315M | $18M | **$465M** |

1) Ontario Electricity Support Program (OESP)
   - After almost a year in market, close to 30% of potentially eligible customers are signed up.
   - The cost projections below assume the program grows to 50% of eligible consumers by 2020 (also assumes 10% administration costs).

2) Rural and Remote Rate Protection (RRRP)
   - Provides benefits to R2 Hydro One consumers, Algoma, and remote communities.
   - Includes the expanded coverage that will begin on January 1, 2017.

3) First Nation rate reduction (currently under development)
   - On November 14, 2016, OEB presented options to the Ministry on reducing costs for on-reserve First Nation customers.
   - OEB's recommended option to provide 100% delivery rate credit, which is estimated at $18.4 million per year.
     - Other options includes a seasonal fixed credit to account for demand changes over the year ($13 million) or a 50% total bill reduction ($23 million).

# 3. Eliminate the Industrial Conservation Initiative (ICI)

- The cost shift from the Industrial Conservation Initiative (ICI) could be removed from electricity bills by eliminating ICI.
  - The ICI allows large electricity consumers to lower their electricity costs by reducing their demand during peak hours.

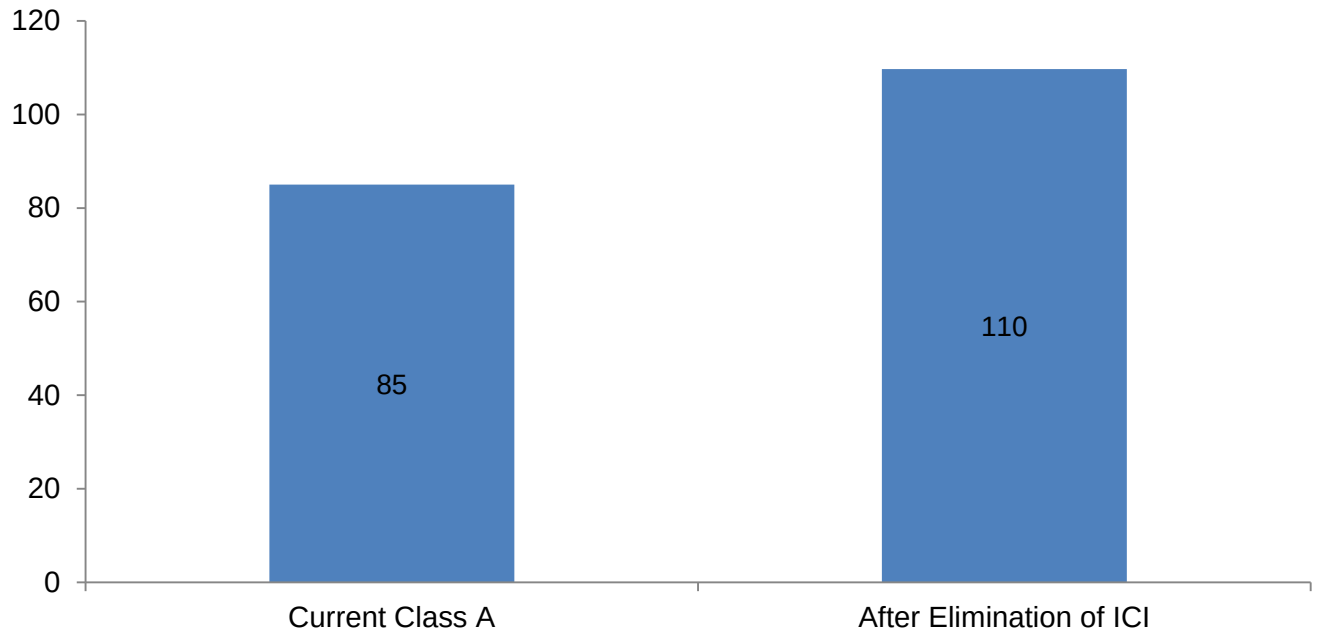
**Considerations**

- Eliminating ICI would result in a benefit of more than $4/month for residential electricity consumers in 2017.
  - However, unless government took action to mitigate the associated cost shift back to industrial consumers, typical industrial prices would increase by about one-third. Such a price increase would pose significant challenges for energy-intensive consumers.
- Industrial stakeholders have indicated that ICI as an integral factor in maintaining competitiveness and retaining industry in the province.
  - Eliminating ICI would limit the “cost shift” onto residential consumers, but it would also lead to a reduction in industrial demand. The large industrial contribution to the fixed costs of running the electricity system would then need to be covered by remaining consumers.
- If ICI is retained, current IESO projections indicate that the cost shift will decrease each year going forward as Global Adjustment (GA) decreases (due to an expected increase in HOEP).
- Alternatively, ICI could be funded through the tax-base at a cost of $900 million annually. There is precedent to use the tax-base for industrial support programs, including the Northern Industrial Electricity Rate Program (NIERP) and the Jobs and Prosperity Fund.

# 3. Eliminate the Industrial Conservation Initiative (cont'd)

- ICI currently provides a benefit of about $25/MWh to Class A electricity consumers.

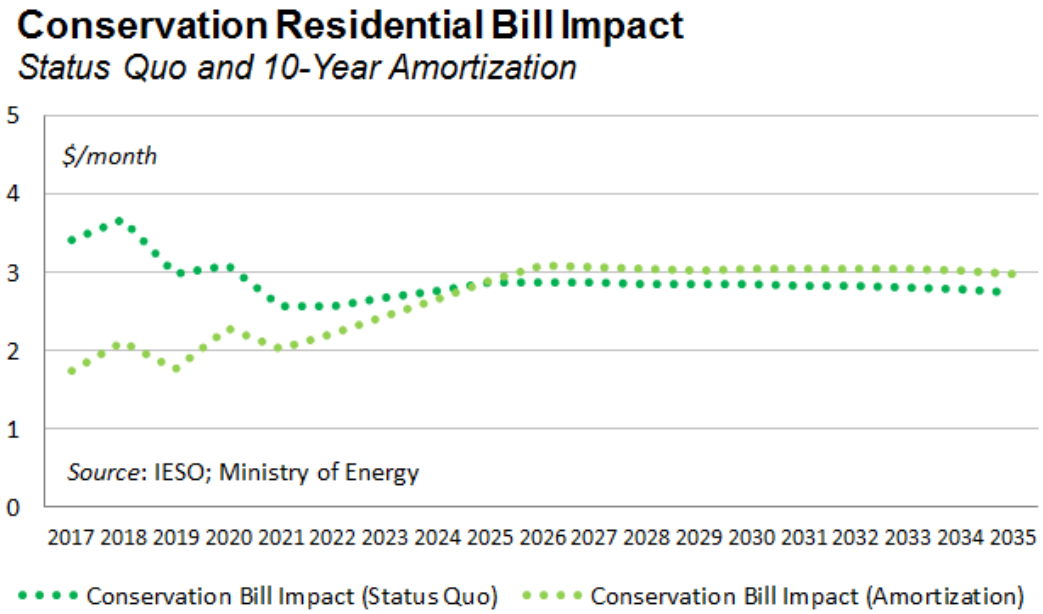
**All-In Electricity Price**
*in $/MWh*



**Note**: Based on year-to-date (YTD) September 2016 prices. Class A reflects a transmission-connected consumer.

# 4. Amortize Conservation Program Costs

- ~$3 billion from the electricity ratepayer base will be spent on conservation programs delivered under the Conservation First Framework and the Industrial Accelerator Program (IAP) between 2015 and 2020.
- Currently, Conservation and Demand Management (CDM) program costs are recovered from the Global Adjustment (GA) mechanism about one month after expenses are incurred.
- As a potential rate mitigation measure, certain CDM costs could be amortized.
- Amortizing a portion of conservation spending would produce a benefit for electricity ratepayers in excess of $1/month at the outset. Over time, the benefit would decrease and turn into a cost, as interest charges begin to grow.



**Note**: Chart assumes that conservation incentive costs are available for amortization while administration cost are not. Although there is variable from year to year, incentives represent about two-thirds of conservation spending in Ontario. Chart assumes conservation spending continues at a similar rate beyond 2020. Chart assumes a 10-year borrowing rate of 3.0%.

# 4. Amortize Conservation Program Costs (cont'd)

## Considerations

- Under **Public Sector Accounting Board (PSAB) accounting standards**, used by both the Province and IESO, only certain assets can be amortized: 1) pensions and 2) tangible capital assets. Under PSAB an asset must meet several criteria to be considered a capital asset, including:
  - A tangible capital asset must be tangible and substantive and the Ontario government must have title and operate the asset.
  - A tangible capital asset must bring a tangible benefit to the government or to Ontario.

- CDM costs, on their own, do not meet the criteria of a tangible capital asset because customers would have ownership and control of installed CDM measures, not the Province or IESO.

- **Rate-regulated accounting** was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

# 4. Amortize Conservation Program Costs (cont'd)

**Considerations**

- If some of Ontario's CDM costs could be amortized, analysis shows that ratepayer impacts would be reduced in the short-term but interest charges on the loan would result in increased overall ratepayer costs in the longer-term.

- Legislative amendments would be needed to allow recovery of loan interest charges from GA.

- If there is a desire to proceed:
  - Formal accounting advice will need to be sought from IESO's external auditor as well as the Ontario Provincial Controller (OPC) to determine whether CDM costs could be amortized according to rate-regulated accounting standards.
  - Further legal analysis would also be required to confirm legal viability and possible approaches to implementation.

# 5. LDC Efficiencies

- Consider opportunities for future LDC cost reductions and efficiencies through the regulatory framework.

**Considerations**

- The Ontario Energy Board has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
- Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
- There maybe opportunities to promote further cost reductions and performance improvements within the distribution sector as there is continued evolution of the regulatory framework in Ontario.
  - Tightening LDC requirements may also indirectly incent other desired policy outcomes, such as LDC consolidation and grid modernization to realize further cost reductions.
- ENERGY could help promote or accelerate these efforts by asking the OEB through the LTEP Implementation Directive, s. 35 of the *Ontario Energy Board Act, 1998*, and the 2017 Mandate Letter and other agency business planning processes.
- In addition, further changes to the departure and transfer tax regimes could be considered to provide a further incentive for LDC mergers and acquisitions.

# 6. Rate Design Initiatives

- OEB continues to move forward with its Regulated Price Plan (RPP) Roadmap:
  - The OEB is undertaking a comprehensive review of the RPP, including exploring the introduction of offering different pricing plan options for customers following the completion of pilot programs in 2018. The plan is expected to be implemented over a 3-5 year period.

- Until new pricing plans are available, the OEB could provide an "opt-in flat rate RPP" structure that could be made available to residential, farm and small business consumers on an interim basis (2-3 years) until a wider range of price plans are available.
- Time-of-Use (TOU) pricing could also be introduced for non-RPP Class B consumers to reduce Global Adjustment (GA) volatility and reduce system costs.

| Current TOU | New Flat Rate |
|---|---|
| On: 18.0 ¢/kWh | 11.1 ¢/kWh |
| Mid: 13.2 ¢/kWh | |
| Off: 8.7 ¢/kWh | |

**Considerations**

- The OEB has indicated that the option would lead to no overall change in system costs. Consumers with higher peak and mid-peak usage patterns would see a decrease in their electricity bills, while those with higher off-peak usage patterns would see an increase.
  - While the current strong supply conditions may allow for such an RPP structure (i.e., peak demand requirements can be easily met), administrative costs could be high (distributors would need to design/implement an opt-in process and associated billing system on an interim basis).

| | Current TOU | New Flat Rate |
|---|---|---|
| 1) Monthly electricity bill- higher peak and mid-peak usage patterns | $172 | $163 |
| 2) Monthly electricity bill- higher off-peak usage patterns | $152 | $163 |

***Note:** 1) assumes a consumer consumption pattern of 45%:30%:25% (Off-peak: Mid-peak: On-peak), while 2) assumes consumer consumption pattern of 80%:10%:10% (Off-peak: Mid-peak: On-peak). Estimates are based on OEB's online electricity bill calculator (for Toronto Hydro-November 2016 rates)

# 6. Rate Design Initiatives (cont'd)

**Considerations**

- The decision to undertake smart meter investments was partly justified on the basis of TOU pricing. If TOU pricing were to be made optional, some stakeholders could question the rationale for smart meter investments.
  - Rationale for offering a flat rate option could focus on providing customers with choice until new pricing plans are rolled out under the RPP roadmap.

- If a flat rate design is introduced, there could be significant consumer opposition to any return to a mandatory TOU.

- After the interim flat rate period, the OEB could offer a wider range of pricing plans to consumers.
  - As part of its RPP review, the OEB will be running pilots with LDCs to assess customer response to alternative time periods and pricing structures.
  - Learnings from these pilots will help inform potential changes to the RPP. Pilots are expected to be in market May 2017 and run for one year.

- Non-RPP Class B electricity consumers currently pay Global Adjustment (GA) on a volumetric basis. Moving them to TOU would provide an incentive to shift consumption to off-peak periods.
  - Consumers, including manufacturers, who are unwilling to shift would face higher costs and likely not be supportive of the changes.
  - The decision to pursue TOU pricing for non-RPP class B consumers will impact proceeds recycling as there is interplay between the two initiatives.

# 7. Reduced Cost of OPG Borrowing

- OPG currently borrows for corporate purposes from the OEFC
- Seek to reduce OPG's borrowing costs and pass on savings to ratepayers by:
  - Reducing or removing the spread that OEFC applies to OPG for any new corporate debt; or
  - Allowing OPG to refinance its existing debt at longer maturities through the OEFC in order to take advantage of the current, favourable interest rate environment.
- Assuming the full spread is removed from all OEFC debt, OPG borrowing costs could be reduced by 50-100 basis points, representing annual savings of about $20-$25 million, increasing to $30-$35 million, as OPG's outstanding OEFC debt rises from ~$3.3 billion in 2016 to ~$4.7 billion in 2020.
- OPG could apply to the OEB as part of its current rate application to flow this benefit to ratepayers.

**Considerations**

- Further work is required to determine potential OPG savings from these initiatives.
- Allowing OPG to refinance would have a negative fiscal impact on the Province.
- Spreads are expected to decline, reducing the relative impact of this change, given lower overall interest rates and reduced volatility.
- Providing OPG with greater access to longer term (20-30 year) debt may also reduce costs:
  - OPG's average term to maturity for OEFC debt is 5.7 years, as compared to 22.2 years for privately financed project debt. This contrasts with most corporations and government which have been working to extend average debt terms in order to take advantage of the low interest rate environment.
  - Longer terms would also better match to the life of OPG's assets.
  - Recently, OEFC has allowed OPG to apply for 50% of its financing requirements in the form of longer term (25-30 year debt). Moving closer to 100% would accelerate this transition.

# 8. End DRC Early for Commercial/Small Industrial Class B Electricity Consumers

- Propose to remove the $0.007/kWh Debt Retirement Charge (DRC) from the bills of commercial/small industrial Class B consumers beginning in 2017, instead of April 1, 2018.
  - **Note:** Class A consumers (e.g., large industrial) would continue to pay DRC until at least April 1, 2018.

**Considerations**

- For a Class B consumer currently paying about $152/MWh, removing the DRC would represent a savings of about 5%.
  - A 50% reduction in the DRC charge would represent a savings of about 2%.

- Alternatively, the reduction of the DRC could be to $0.035/kWh starting in 2017, to provide relief for cap and trade until proceeds recycling is fully operational.

- Residential consumers have had the DRC removed from bills since January 1, 2016. Taking DRC off commercial and small industrial bills would result in equal treatment for these groups of consumers.

- The savings for commercial and small industrial consumers associated with this proposal would drop to zero in April 2018, since this is the current planned date for removing the DRC from non-residential bills.

- Prior to moving forward with this proposal, additional analysis from Legal Services and the MOF would be needed.

# 9. Dedicate Departure Tax

- In connection with the IPO, as a result of leaving the PILs regime and entering the corporate tax regime, Hydro One was deemed to dispose of its assets for proceeds equal to its fair market value, triggering a PILs liability of $2.6 billion (Departure Tax).
- This was paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt.
- The Province could explore repurposing some of those funds to the benefit of ratepayers.
- This may reduce the risk that the Ontario Energy Board (OEB) assigns to ratepayers the benefit from an associated tax asset, resulting in lower earnings and decreased share value for Hydro One. This decision is currently before the OEB, as part of Hydro One's Transmission rate application.

**Considerations**

- Cost savings to ratepayers would depend on timing and which ratepayers (e.g., Hydro One customers, or all Ontario customers) will benefit from some or all of the $2.6 billion value.
- While this is a shift from messaging that value from the broadening of ownership of Hydro One is being used pay down debt and fund transit and transportation, the Province could link to electricity infrastructure investments (e.g., as an offset to infrastructure investments already made in the sector, or to specific initiatives such as conservation).
- These funds were paid to the Ontario Electricity Financial Corporation (OEFC), to be dedicated towards repayment of electricity sector stranded debt. Repurposing may have an impact on the defeasance of this debt.

# 10. Cancel/Adjust Renewable Energy Procurements

- The Ministry could consider the following actions to further mitigate future impacts to electricity bills:

| Unallocated/Terminated Capacity | Announced Procurements | Executed Contracts |
|---|---|---|
| A. Do not procure unallocated or terminated capacity | B. Revise FIT 5 target | D. Cancel LRP I contracts |
| | C. Cancel FIT 6 | |

**Overarching Considerations**

- Cost savings associated with reducing or cancelling renewable energy procurements and programs will not reduce current electricity bills, but would result in future cost reductions relative to Ontario Planning Outlook forecasts.
- The IESO estimates implementing options A to C will reduce system costs by approximately $592 million ($2016) between 2019 and 2028, resulting in an average of approximately $0.50/month in savings to a typical residential electricity bill over the same period. [cost reductions from LRP I contract cancellations TBC]
- The microFIT program is winding down end of 2017. Annual microFIT procurement targets have been undersubscribed.
- With a few exceptions (e.g., rollover of unallocated microFIT capacity; addition of terminated microFIT and small FIT capacity to FIT 5), plans for unallocated or terminated capacity are not defined in announcements or existing directions.

**Cancel/Adjust Announced Procurements**

- Amendments to existing directions to the IESO would be required to reduce FIT 5 and cancel FIT 6.
- The FIT 5 procurement is underway with a base target of 150 MW and inclusion of any capacity available from contract terminations under prior small FIT and microFIT procurements. The application window closed on November 25, 2016.

# 10. Cancel/Adjust Renewable Energy Procurements – Existing Contracts

**Cancel Existing LRP I Contracts**

- 16 LRP I contracts (approx. 455 MW) have been executed and projects are under development.
- None have met Key Development Milestones. Total value of LRP I estimated at approx. $1 billion (NPV to 2016).

[Placeholder for IESO: Cost calculation relative to OPO and associated bill impact]

**Considerations**

- To help inform a decision, IESO or OEB could be asked to evaluate and provide guidance to the Ministry on the system need for LRP I projects and potential ratepayer impacts/benefits.
- 13 of 16 LRP I contracts have Indigenous participation. Cancelling LRP I contracts would remove this economic development opportunity and likely damage relationships between Indigenous communities and the government.
- LRP I Contract includes an “Optional Termination” provision allowing IESO to terminate any contract prior to the “Commercial Operation Date” with 6 months written notice.
- The IESO obligations under the Optional Termination provision depend on whether the project has met all “Key Development Milestones”.
  - As no projects have met their Key Development Milestones, the estimated total cost payable to contract holders is about $8 million.

# 10. Cancel/Adjust Renewable Energy Procurements – Existing Contracts (cont'd)

## Legal Analysis

- Under the *Electricity Act, 1998*, the Minister has the authority to amend previous directions without approval from Cabinet. Although an amendment to an existing direction would not require Cabinet approval, it is unlikely that a direction to cancel LRP I contracts could be considered as amending an existing direction. The previous LRP directions set out the broad policy framework that was reflected in the procurement, but the contracts themselves, once executed, are stand alone documents which the IESO had legal authority to execute. Revoking previous LRP directions does not affect that authority or have the effect of cancelling the procurement.
- As a result, any new directive to cancel LRP I contracts would need to be approved by Cabinet, either as part of an LTEP implementation directive to IESO, or pursuant to the overall power to direct IESO with respect to procurements outside the LTEP process. However, there is a risk that such a directive could be subject to challenge.
- ENERGY has previously received advice that there is a high risk that a court would conclude that the Minister has no authority under the *Electricity Act , 1998* to issue a direction requiring IESO to terminate microFIT Conditional Offers and FIT Offer Notices that have already been issued to applicants, because these offers create vested contractual rights and the Minister would require clear legislative authority to interfere with those rights. This reasoning would likely apply equally to any direction or directive to IESO to cancel LRP I contracts.
- Previous advice has also flagged a moderately high risk that the Province could be liable for damages in tort for inducing a breach of contract if it issues a direction to IESO that interferes with vested contractual rights without clear statutory authority to do so. LRP I contract holders could also assert other claims, such as misfeasance in public office.
- The risk and costs associated with potential law suits resulting from the cancellation of contracts requires further analysis, including analysis of whether any statutory amendments would be required to provide clear authority to cancel the contracts. LSB recommends ENERGY seek an opinion from Crown Law Office Civil before proceeding.

# Summary

- Reductions in electricity rates could be achieved by eliminating existing, planned or directed initiatives from the rate-base or shifting these costs to the tax-base.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

# Appendix

# Electricity Consumer Classes

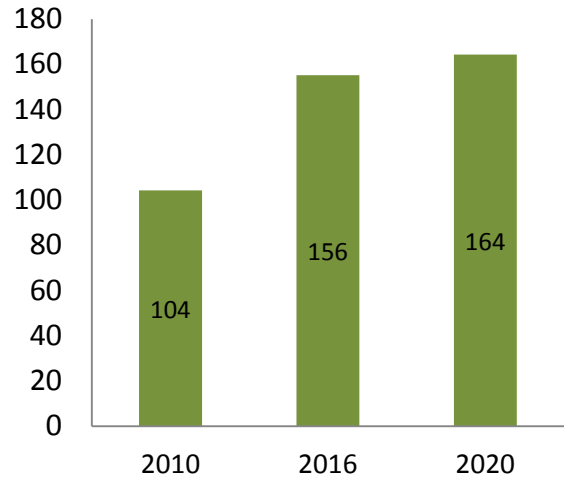
- In Ontario, there are three classes of electricity consumers:

| | Regulated Price Plan | Class B | Class A |
|---|---|---|---|
| **Consumer Types** | • Residential<br>• Small Business<br>• Farms | • Commercial<br>• Institutional<br>• Small industrial | • Large commercial<br>• Large industrial |
| **Load Size** | Below 0.05 MW | Between 0.05 MW and 1 MW | Above 1 MW |
| **Total Consumption** | 58 TWh | 57 TWh | 26 TWh |
| **Share of Consumption** | 41.1% | 40.4% | 18.4% |

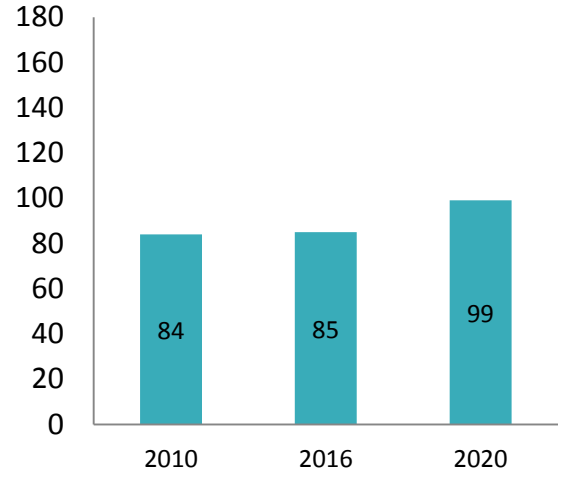
# Prices by Electricity Consumer Class

- Since 2010, average bills for residential consumers (i.e., using 750 kWh/month) have increased by over 50%. Rates are forecast to continue to increase, with residential consumers paying an estimated 6% by 2020.
- Industrial electricity rates have remained relatively flat over the same time period, due primarily to the Industrial Conservation Initiative (ICI). ICI represents a cost shift of about $5/month for residential electricity consumers. Industrial electricity consumers are forecast to see an increase of 16% by and 2020.

**Typical Residential Bill (750/kWh per month)**



**Typical Class A (Industrial) Price ($/MWh)**



**Note:** 2016 represents year-to-date September 2016 for industrial. Cap and trade proceeds recycling is included for the industrial consumer for 2020.

# Rate Mitigation Levers

- To provide further rate relief to Ontario electricity consumers, the government can use one or more of the levers outlined below:
  - **Tax-based Lever:**
    - Provide rebates funded from the tax-base or transfer items currently paid through the rate-base to the tax-base.
  - **Rate-based Lever:**
    - Shifts costs within the rate-base from one customer group to another to achieve electricity system benefits and/or policy goals.
  - **Cap and Trade Proceeds Lever:**
    - Use cap and trade proceeds on initiatives that help reduce greenhouse gas (GHG) emissions from the electricity sector (e.g., recycling proceeds during off-peak periods) while providing benefits to some or all electricity consumers.

# Traditional Rate Mitigation Programs

- Ontario has implemented a number of rate-based programs to help residential and industrial electricity consumers:
  - The Ontario Electricity Support Program (OESP) provides ongoing assistance directly on the bills of eligible low-income electricity consumers
  - The Rural or Remote Rate Protection (RRRP) program is provided to rural and remote residential and farm customers because the cost of distributing power to remote areas is much higher than for urban areas.
  - The Industrial Conservation Initiative (ICI) encourages Ontario's largest consumers to reduce consumption during peak periods while reducing system costs.
- There are also tax-base programs to help manage electricity prices:
  - Rebate the provincial portion of the HST from the electricity bills of residential, small business and farms as of January 1, 2017.
  - Northern Industrial Electricity Rate Program (NIERP), in which participants receive a rebate of two cents per kilowatt hour. On average, industrial electricity prices can be reduced by up to 20%.
- While rate-based programs provide relief to certain electricity consumers, they shift other costs to remaining ratepayers (See Appendix for additional details).

# Driving Down Prices for Consumers

- Since 2013, a number of actions have been taken to drive down prices for consumers wherever possible:
  - Renegotiating the Green Energy Investment Agreement, reducing contract costs by $3.7 billion;
  - Deferring the construction of two new nuclear reactors at Ontario Power Generation's Darlington facility, avoiding an estimated $15 billion in new construction costs;
  - Approving Ontario Power Generation's plans to enable the ongoing operation of Pickering up to 2024, which is expected to save ratepayers as much as $600 million;
  - Reducing Feed-In-Tariff (FIT) prices through annual price reviews, saving ratepayers at least $1.9 billion relative to the 2013 Long-Term Energy Plan (2013 LTEP) forecast; and
  - Suspending the second round of the Large Renewable Procurement (LRP II) process and the Energy-from-Waste Standard Offer Program to save up to $3.8 billion in electricity system costs relative to 2013 LTEP.

# Cost Shifts in the Electricity Sector – Current Programs

- Several programs in the electricity sector “shift costs” from one group of electricity consumers to another:
  - **Rural or Remote Rate Protect** (**RRRP)** is a longstanding program that reduces the delivery charge for rural electricity consumers and is paid for by all consumers in Ontario through a regulatory charge on bills.
  - **Ontario Electricity Support Program (OESP)** is funded via a regulatory charge on consumer bills and provides support for qualifying low income electricity consumers.
  - **Industrial Conservation Initiative (ICI)** empowers large consumers to lower their costs by reducing their demand during peak hours. In the process, ICI shifts costs from large electricity consumers to all other consumers in Ontario.
  - **Industrial Electricity Incentive** (**IEI**) program, offers reduced electricity prices for companies starting or expanding operations in Ontario. All electricity consumers in Ontario pay for the price reduction that IEI participants receive.

# Cost Shifts in the Electricity Sector (Cont'd)

- The tables on the right show the estimated cost shifts that result from existing government programs.
- ICI has had the largest cost shift of all the programs, due to the large size of Global Adjustment (GA) and the way that it is recovered from consumer classes.
- RRRP and OESP impact the regulatory line on consumer bills, while ICI, IEI and conservation affect GA (i.e., Electricity line on bills of Regulated Price Plan consumers).

**Cost Shift Impacts - Residential Bill**

*Typical 750 kWh/month Toronto Hydro consumer*

| *$/month* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 2.65 | 3.25 | 3.88 | 3.53 | 4.75 | 4.77 |
| RRRP | 0.90 | 0.82 | 0.84 | 0.92 | 0.93 | 0.94 |
| OESP | - | - | - | - | - | 0.84 |
| Conservation | 1.85 | 1.92 | 2.00 | 1.58 | 2.43 | 2.45 |
| IEI | - | - | 0.08 | 0.09 | 0.11 | 0.12 |
| **Total** | **5.41** | **5.99** | **6.81** | **6.13** | **8.21** | **9.12** |

**Cost Shift Impacts - Industrial Bill**

*Typical Class A consumer*

| *$/MWh* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | -22.17 | -26.36 | -30.29 | -25.91 | -33.79 | -33.92 |
| RRRP | 1.20 | 1.10 | 1.12 | 1.23 | 1.24 | 1.25 |
| OESP | - | - | - | - | - | 1.13 |
| Conservation | 1.53 | 1.59 | 1.66 | 1.31 | 2.01 | 2.02 |
| IEI | - | - | 0.07 | 0.08 | 0.09 | 0.10 |
| **Total** | **-19.43** | **-23.67** | **-27.44** | **-23.29** | **-30.45** | **-29.43** |

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Cost Shifts in the Electricity Sector (Cont'd)

- The table on the right shows the total cost for various government electricity programs. These programs are currently funded through the electricity system ratebase.

- Funding of these programs through the fiscal plan would remove these costs from the electricity system (i.e., Placing these costs on the taxbase).

**Cost of Programs**

*By government program*

| *$M* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 506 | 615 | 736 | 670 | 890 | 893 |
| RRRP | 172 | 156 | 159 | 176 | 174 | 176 |
| OESP | - | - | - | - | - | 158 |
| Conservation | 329 | 339 | 354 | 280 | 425 | 428 |
| IEI | - | - | 15 | 16 | 18 | 19 |

- For example, removing the roughly $900 million of program cost from the Industrial Conservation Initiative (ICI) program would save the typical residential electricity consumer $4.77 per month in 2016.

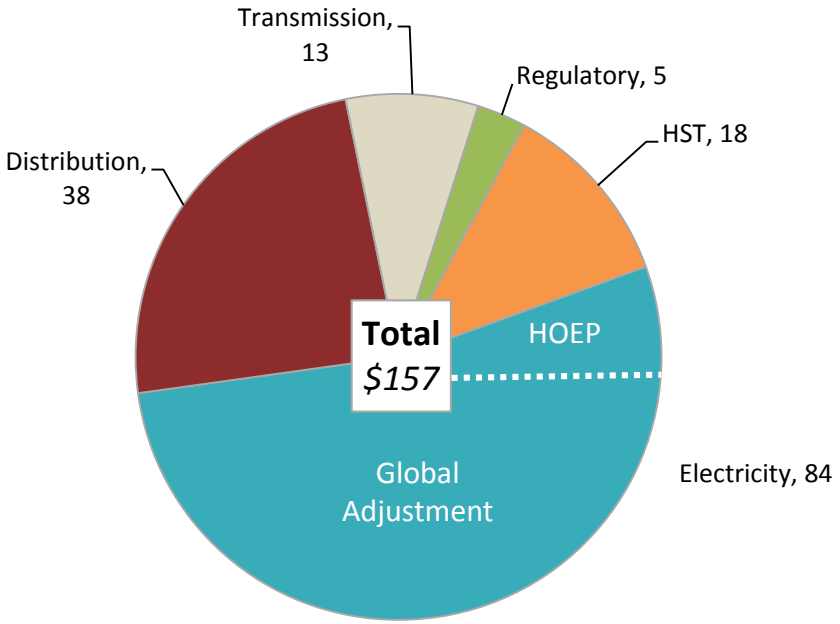
**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Residential Electricity Prices

- There are approximately 4.5 million residential consumers in Ontario.
- The Regulated Price Plan includes nearly all residential consumers, as well as small businesses. Regulated Price Plan consumers pay a blended commodity rate regulated by the OEB, which is set every six months.
- For households, the Debt Retirement Charge (DRC) was removed from residential electricity bills as of January 1, 2016.
- In addition, the Ontario Electricity Support Program (OESP) provides an ongoing rate reduction directly on the bills of low-income electricity consumers who have applied and meet the eligibility requirements. The program is funded through the rate base.
- Rural customers, in particular those with electrical heating, pay higher monthly bills.

**Typical Residential Monthly Bills ($)**

*As of November 1, 2016 (750 kWh/month)*



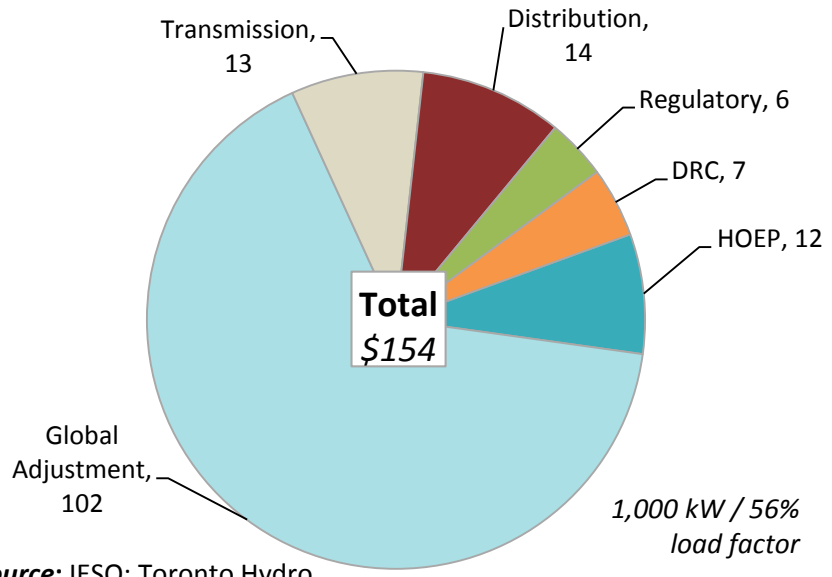
***Source*:** OEB, Toronto Hydro

# Commercial Electricity Prices

- There are approximately 55,000 commercial and institutional consumers in the province. These consumers are Class B consumers, and have separate line items on the electricity bill for HOEP and GA.
- There is a high degree of differentiation amongst consumers within the commercial sector in terms of size and consumption patterns. For example, an elementary school has a much different hourly load profile compared to a full service restaurant. This is an important consideration when looking at the bill impacts of policy options.

**Typical Commercial Price ($/MWh)**

*YTD June 2016 (Non-RPP Class B)*



***Source*:** IESO; Toronto Hydro

- Consumers in the commercial sector do not pay time-of-use prices and have little incentive to shift demand away from high demand hours.
- Targeted pricing programs are currently not available for Class B consumers.

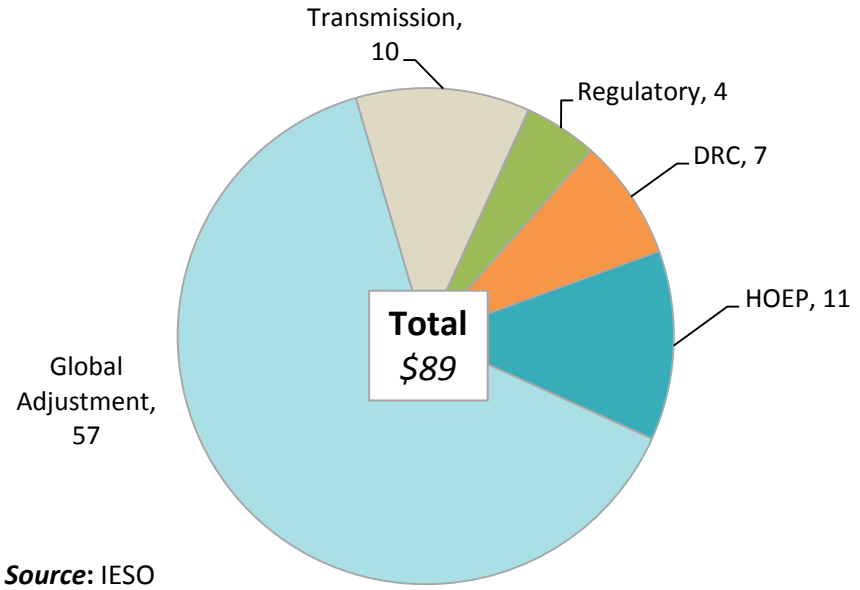
*** Note**: Most commercial consumers receive input tax credits for their HST.

# Industrial Electricity Prices

- There are about 300 large industrial consumers in Ontario.
- Measures in place to mitigate industrial electricity prices include ICI and NIERP.
- ICI lowers costs for eligible large electricity consumers (i.e., those with monthly peak demand exceeding 3 MW) that reduce consumption during peak periods.
  - ICI consumers reduce their electricity rates by 25% on average.

**Typical Large Industrial Price ($/MWh)**

*YTD June 2016*



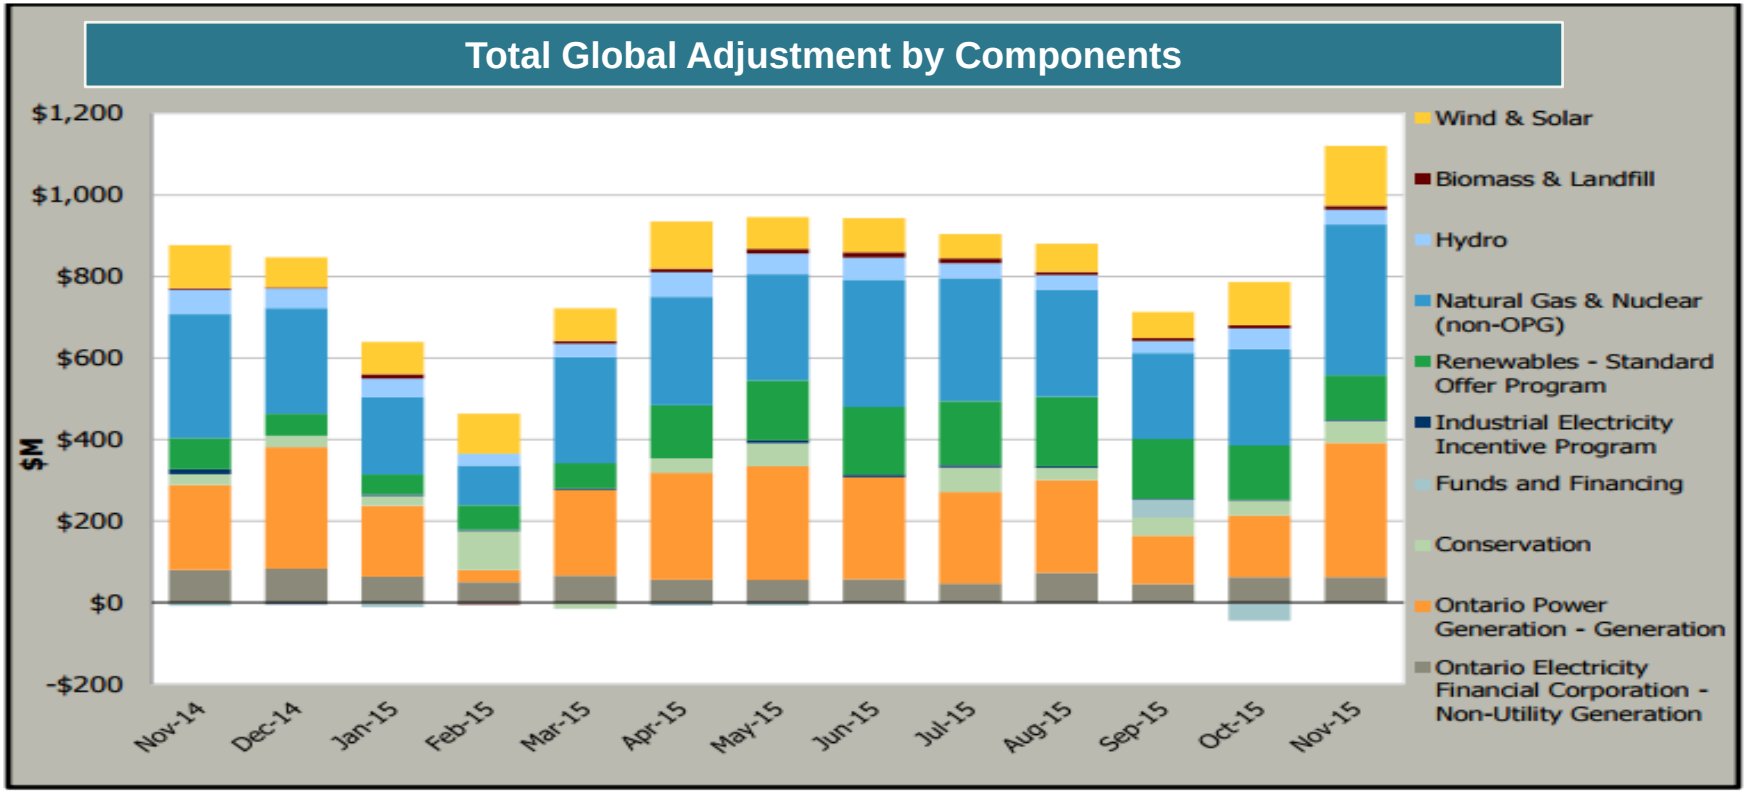
***Source*: IESO**

- Participants in NIERP receive a rebate of $20/MWh. On average, industrial electricity prices are reduced by about 20% through the program, reducing all-in prices to $69/MWh for these consumers. The program is funded through the tax base.

*** Note:** Industrial consumers receive input tax credits for their HST.

# Total Components of Global Adjustment

- Global Adjustment (GA) is a market mechanism that recovers costs from electricity consumers, including the cost of almost all conservation programs in the province (i.e., approximately half a billion dollars in 2016).



**Source:** IESO Monthly Market Report (November 2015)

# Cancel/Adjust Renewable Energy Procurements

# LRP I Pre-Construction Liability Limits

- All 16 successful LRP I developers accepted Optional Termination Provisions when the LRP I Contracts were executed in April 2016.
- If IESO chooses to enact the Optional Termination provision before a project has met all Key Development Milestones, IESO is required to pay pre-construction development costs up to the Pre Construction Liability Limit.
- Pre-construction development costs include costs incurred for feasibility studies, obtaining site access rights, work towards environmental approvals, business development plans, negotiation of contracts for design, equipment, construction and financing, reasonable overhead expenses, and other reasonable costs incurred.
- The Pre Construction Liability Limits are:
  - Non-Rooftop Solar: $250,000 plus $10.00/kW of Contract Capacity
  - Waterpower: $500,000 plus $20.00/kW of Contract Capacity
  - On-Shore Wind: $400,000 plus $2.00/kW of Contract Capacity
- According to the LRP I Optional Termination provision, the developer has a duty to take reasonable steps to mitigate losses, liabilities, costs and damages incurred as a result of the Optional Termination.
  - The IESO will not provide compensation for amounts which are attributable to a developer's failure to take reasonable steps to mitigate.

# Electricity Price Mitigation

Corporate and Electricity Finance Division
December 7, 2016

DRAFT

# General Comments on Energy's Deck

- Energy's deck note various actions taken to-date to reduce costs or cost pressures, such as deferring generation supply investments, improving market efficiency, and reducing the costs of existing procurements.
- Aside from reducing costs on the electricity bill, it is not clear what principles are being applied, short term or long term for electricity pricing.
  - A principle that was applied in the past was to ensure that electricity consumers paid the true cost of electricity, for example.
  - The Energy proposals appear to be about, in part at least, moving some costs from the rate base to the tax base.
- However, the Energy proposals may be seen as having a fairly limited impact, e.g., a little over $8/month for residential, or a little over 5% of the monthly bill (though not all of the proposals have been costed / assessed).
  - The proposals would have a significant fiscal cost [about $1.5 billion per year in new fiscal costs].
- There is already significant amounts of existing fiscally-funded electricity price mitigation
  - Averages over $1.5 billion per year over the past five years, and estimated to increase to about $2 billion in 17-18 (see subsequent slide for estimated costs over time, and likely increasing over time), with the total tax-based costs rising to about $3.5 billion in 2017-18.
  - These existing mitigation costs are not presented in Energy's deck.
  - Also not included is any "hidden" price mitigation through constrained financial performance of, e.g., OPG.

DRAFT

# Context: Taxpayer Funded Electricity Price Mitigation

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |

| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| **TOTAL** | **1,530** | **1,544** | **1,564** | **1,639** | **1,525** | **1,195** | **2,005** |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* * Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt Retirement Charge
NIERP – Northern Ontario Electricity Rate Program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

- The table above shows the annual amount of taxpayer funded electricity price mitigation from 2011-12 to 2017-18.
- From 2011-12 to 2015-16 there has been an annual fiscal impact of approximately $1.6 billion due to electricity price mitigation programs.
- In 2016-17, the fiscal impact due to electricity price mitigation programs is estimated at approximately $1.2 billion.
- In 2017-18, due primarily to the start of the Ontario Rebate for Electricity Consumers, the expected fiscal impact due to electricity price mitigation programs is approximately $2.1 billion.

# Electricity Price Mitigation

General Decision Points on Program Features:

- Funding: Rate base vs Tax base
  - Tax base programs have a direct fiscal impact on the Province's finances, and shift costs based on taxpayer incidence and impact on expenditure room for other, non-electricity, programs.
  - Rate base programs shift costs from one group of ratepayers to another.
- On-bill vs Not On-bill
  - Recent focus has been on on-bill programs, such as OESP and OREC.
  - Older tax-base funded programs that are not visible on the bill are still in place, such as NOEC and OEPTC.
  - As OESP enrollment increases, could consider phasing out the non-bill benefits of NOEC and OEPTC.
- Targeted vs General
  - Recent new programs include both general (OREC) and targeted (OESP) programs.
  - Consideration could be made to make OREC more conservation-friendly (e.g., a monthly eligible consumption cap brought in, as with the former Ontario Clean Energy Benefit), and maybe a higher cap in the winter to allow for space heating costs.
  - A targeted industrial program recently extended and made on-going is the Northern Industrial Electricity Rate (NIER) program.

# Energy's Proposals

Energy is proposing additional electricity price mitigation programs, currently funded through the electricity system, be fiscally-funded. They could be upwards of $2 bn/year, (plus the departure tax), which is not included in the fiscal plan, which would challenge the path to balance.

- OESP & RRRP (Total of about $0.4 Bn/yr): This includes shifting the cost of the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Program (RRRP) to the tax base. Note that the fiscal exposure is larger if the OESP take up rate is larger, faster than assumed.

- Industrial Conservation Initiative (ICI -- About $900+ M/yr): Energy also shows, as a potential residential price mitigation measure, the cancellation of the ICI.
  - Energy is not initially proposing it be continued instead as taxpayer funded, but notes the about 30% price increase (from $85/MWH to $110), if ICI is cancelled, for the large Class A customers benefiting from ICI currently.
  - As this cost estimate is for 2016, prior to the planned expansion of the ICI, this could further increase the fiscal exposure by about $100 million).

- Departure Tax: As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation.
  - This was paid to the Ontario Electricity Financial Corporation and helped reduce stranded debt.
  - Using some or all of it for price mitigation would change the net stranded debt paydown by OEFC resulting from the IPO. This would also be a one-time measure (potentially over a few years), and fiscal impact, as the departure tax amount was one-time.

- Other fiscal cost risks (Total of about $0.8+ Bn):
  - Amortisation of conservation costs also poses a fiscal risk (about $0.4 bn/yr),
  - Ending the DRC early for Class B customers (commercial, small industrial) (about $0.4 bn/yr to 2017-18)
  - Lowering of the debt interest paid by OPG (about $30 – 70 million/yr between 2017 and 2021),

DRAFT

# Fiscal Mitigation Options

- With the addition of recent and new price mitigation measures, a review should be initiated on fiscally-funded programs. There could be a phase down / out transition period considered. Examples include the following:

- Ontario Energy and Property Tax Credit (OEPTC) and Northern Ontario Energy Credit (NOEC):
  - Phase down and/or out the non-on-bill benefits of. (Save up to about $460 M/yr)
  - These targeted, low-income measures were introduced after the HST was introduced.
  - The OESP provides a larger, targeted and on-bill relief to qualifying consumers.

- Ontario Rebate for Electricity Consumers (OREC):
  - Introduce over time a monthly eligible consumption cap, with perhaps a higher cap in the winter to allow for space heating costs.
  - As with the prior OCEB cap, provides a rough incentive for conservation and correlation to larger homes. A higher cap in winter may help with space-heating issue.
  - May be challenging to implement.

- Greenhouse Gas Reduction Account:
  - If ICI is put on the tax-base, make it eligible for GGRA funding.
  - Positioned as, e.g., providing annual benefits from participants conserving and shifting off-peak to reduce reliance on GHG-emitting peaking plants

# Appendix

DRAFT

# Background on Taxpayer-funded Electricity Price Mitigation

| Program | Annual Fiscal Impacts ($M) | Date | Details |
|---|---|---|---|
| **Ontario Clean Energy Benefit (OCEB)** | ~1,000 | Jan 1 2011 to Dec 31, 2015 | OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax. Effective September 1, 2012, 10 per cent benefit was capped for the first 3,000 kWh of electricity consumed per month. OCEB expired December 31, 2015, as legislated. |
| **Removed Debt Retirement Charge (DRC) from Residential Bills** | ~330 | Jan 1, 2016 to Mar 31, 2018 | The government removed the DRC from residential electricity users' bills as of January 1, 2016. This is saving a typical residential user about $70 each year and meant ending the DRC earlier for these users than otherwise provided for in the *Electricity Act, 1998*. |
| **Ontario Rebate for Electricity Consumers (OREC)** | ~1,200 | Jan 1, 2017 onward | This ongoing program will rebate -- directly on consumers' residential electricity bills -- an amount equal to the provincial portion of the Harmonized Sales Tax (HST). |
| **Northern Industrial Electricity Rate (NIER) Program** | 120 | March 2010 | As announced in Budget 2015, the government committed to ongoing support for northern industrials with $120 million allocated annually. NIER was previously extended in 2012 for an additional three-year term, effective April 1, 2013 and also for a year effective April 1, 2016, with an allocation up to $120 million per year.<br>Qualifying participants receive a rebate of two cents per kilowatt-hour (kWh) up to a maximum of $20 million per year per company.<br>NIER initially established as a three-year program in Budget 2010, effective April 1, 2010. |
| **Northern Ontario Energy Credit** | ~25 | Budget 2010 | Delivered as part of the Ontario Trillium Benefit, provides individuals living in northern Ontario with a credit of up to $146 per year for the 2016 benefit year, and families up to $224.[1] |
| **Ontario Energy Property Tax Credit** | ~445[1] | Budget 2010 | Delivered as part of the Ontario Trillium Benefit, energy portion provides up to $224 per year (inflation adjusted) for low-to moderate-income individuals and families, and for qualifying seniors.[1] |

1. Energy portion cost only. Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and NOEC were introduced/enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).

DRAFT

# Timeline: Taxpayer-funded Electricity Price Mitigation

**Budget 2010: OEPTC, NOEC Proposed as part of the Ontario Trillium Benefit**

*In the 2011 Budget, the government combined the payments of three existing tax credits — the Ontario Sales Tax Credit, the Ontario Energy and Property Tax Credit, and the Northern Ontario Energy Credit — to create the OTB. The OTB is paid in monthly instalments throughout the year, which helps people meet their expenses as bills arrive.*

**Ontario Clean Energy Benefit** (Jan 1 2011 to Dec 31 2015)

*The OCEB was introduced in the 2010 Ontario Economic Outlook and Fiscal Review to help consumers transition to a cleaner electricity system. As set out in legislation, the OCEB ended on December 31, 2015. The Province has introduced rate mitigation measures to be implemented after December 31, 2015.*

*OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax, for the first 3,000 kilowatt-hours (kWh) of monthly electricity consumption.*

**Removing DRC from Residential Bills** (Jan 1 2016 to Mar 31 2018)

*The government removed the DRC from residential electricity users' bills beginning on January 1, 2016. This saves a typical residential user about $70 each year and ends the DRC earlier for these users than otherwise provided for in the Electricity Act, 1998.*

**Ontario Rebate for Electricity Consumers**

*As of January 1, 2017, OREC will reduce electricity costs by an amount equal to the provincial portion of the HST for about five million residential consumers, farms and small businesses.*

2010 2011 2012 2013 2014 2015 2016 2017

## History of Northern Industrial Electricity Price Relief

**November 2006**

*The Ontario government announced the Northern Pulp and Paper Electricity Transition Program (NPPETP), a three-year $140 million, to be effective retroactively to October 1, 2006*

**Budget 2009**

*The government announced extension of the NPPETP by one year providing about $58 million with electricity price rebates of 1.8 cents/kWh.*

**Budget 2010**

*NIER program announced, with a projected fiscal cost of $150 M per year, to provide electricity price rebates for qualifying large industrial facilities in northern Ontario. An additional $21.8 million allocated for existing NPPETP in 2010-11 to be integrated with NIER.*

**September 2010**

*Transition from NPPETP to NIER: pulp and paper mills participating in NPPETP continued to receive the NPPETP rebate of 1.8 cents/kWh until September 30, 2010, with those qualifying for NIER receiving a top-up rebate of 0.2 cents/kWh.*

**December 2012**

*The government announced the extension of the NIER for three years, capping the rebates to a maximum of 2011-12 consumptions levels or $20 million, whichever is lower.*

DRAFT

# Potential Fiscal Impact to the Electricity Sector

- The electricity sector has a significant impact on the Province's fiscal position; through both the revenue and expense sides of the Province's fiscal position.
  - Electricity Rate mitigation programs funded through the tax base have a direct fiscal impact on the Province's finances.
  - Alternatively, electricity rate mitigation programs funded by the rate base shift costs from one group of ratepayers to another.
- The Province's electricity sector agencies and corporations are each consolidated into the government's financial statements, and directly affect the Province's surplus/deficit position.
  - Ontario Power Generation (OPG) financial results have a dollar-for-dollar impact on the Province.
    - Electricity price mitigation strategies involving OPG would lead to a direct fiscal impact.
  - Hydro One financial results have a direct impact on the Province, based on the Province's proportionate ownership.
    - The Province currently holds about 70 per cent of Hydro One.

DRAFT

# Proposed Taxpayer Funded Electricity Price Mitigation
(To be revised)

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |
|---|---|---|---|---|---|
| OCEB | - | - | - | - | - |
| OREC | 300 | 1,100* | 1,100* | 1,200* | 1,200* |
| Ending DRC[2] | 330 | 330 | -- | -- | -- |
| NIERP | 120 | 120 | 120 | 120 | 120 |
| NOEC | 25 | 25 | 25 | 25 | 25 |
| OEPTC[3] | 450 | 460 | 470 | 481 | 481 |
| **CURRENT TOTAL** | **1,195** | **2,005** | **1,715** | **1,826** | **1,826** |
| 1. OESP | | 106 | 119 | 127 | 132 |
| 2. RRRP | | 292 | 300 | 306 | 315 |
| 3. First Nations Delivery Rate | | 18 | 18 | 18 | 18 |
| 4. Fund ICI through Tax Base | | 900+ | 900+ | 900+ | 900+ |
| 5. Departure Tax | | TBD | TBD | TBD | TBD |
| 6. Conservation Amortisation | | | | | |
| 7. DRC Ended for Class B | | | | | |
| 8. Other | | | | | |
| **TOTAL** | **1195** | **3,421** | **3,152** | **3,177** | **3,191** |

1. 2016-17, 2017-18 based on forecasted numbers
2. Estimated impact up to March 31, 2018
3. OEPTC amounts in all years based on energy component of the rebate.

- As shown above, if all measures proposed in this deck were to be accepted taxpayer funded contributions to electricity price mitigation would increase to about $3.2 billion, or more, by 2020-21. That is about a 60% increase from the current forecast for 2017-18.
- These amounts were not considered in the 2016-17 Fiscal Plan and could put at risk the Province's fiscal objectives for 2017-18 and beyond.

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt Retirement Charge
NIERP – Northern Ontario Electricity Rate Program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

- The table above shows the annual amount of taxpayer funded electricity price mitigation from 2011-12 to 2017-18.
- From 2011-12 to 2015-16 there has been an annual fiscal impact of approximately $1.6 billion due to electricity price mitigation programs.
- In 2016-17, the fiscal impact due to electricity price mitigation programs is estimated at approximately $1.2 billion.
- In 2017-18, due primarily to the start of the Ontario Rebate for Electricity Consumers, the expected fiscal impact due to electricity price mitigation programs is approximately $2.0 billion.

# Electricity Price Mitigation

General Decision Points on Program Features:

- Funding: Rate base vs Tax base
  - Tax base programs have a direct fiscal impact on the Province's finances, and shift costs based on taxpayer incidence and impact on expenditure room for other, non-electricity, programs.
  - Rate base programs shift costs from one group of ratepayers to another.
- On-bill vs Not On-bill
  - Recent focus has been on on-bill programs, such as OESP and OREC.
  - Older tax-base funded programs that are not visible on the bill are still in place, such as NOEC and OEPTC.
  - As OESP enrollment increases, could consider phasing out the non-bill benefits of NOEC and OEPTC.
- Targeted vs General
  - Recent new programs include both general (OREC) and targeted (OESP) programs.
  - Consideration could be made to make OREC more conservation-friendly (e.g., a monthly eligible consumption cap brought in, as with the former Ontario Clean Energy Benefit), and maybe a higher cap in the winter to allow for space heating costs.
  - A targeted industrial program recently extended and made on-going is the Northern Industrial Electricity Rate (NIER) program.

# Energy's Proposals

Energy is proposing additional electricity price mitigation programs, currently funded through the electricity system, be fiscally-funded. They could be upwards of $2 bn/year, (plus the departure tax), which is not included in the fiscal plan, which would challenge the path to balance.

- OESP & RRRP (Total of about $0.4 Bn/yr): This includes shifting the cost of the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Program (RRRP) to the tax base. Note that the fiscal exposure is larger if the OESP take up rate is larger, faster than assumed.

- Industrial Conservation Initiative (ICI -- About $900+ M/yr): Energy also shows, as a potential residential price mitigation measure, the cancellation of the ICI.
  - Energy is not initially proposing it be continued instead as taxpayer funded, but notes that about 30% price increase (from $85/MWh to $110), if ICI is cancelled, for the large Class A customers benefiting from ICI currently.
  - As this cost estimate is for 2016, prior to the planned expansion of the ICI, this could further increase the fiscal exposure by about $100 million).

- Departure Tax: As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation.
  - This was paid to the Ontario Electricity Financial Corporation and helped reduce stranded debt.
  - Using some or all of it for price mitigation would change the net stranded debt paydown by OEFC resulting from the IPO. This would also be a one-time measure (potentially over a few years), and fiscal impact, as the departure tax amount was one-time.

- Other fiscal cost risks (Total of about $0.8+ Bn):
  - Amortisation of conservation costs also poses a fiscal risk (about $0.4 bn/yr),
  - Ending the DRC early for Class B customers (commercial, small industrial) (about $0.4 bn/yr to 2017-18)
  - Lowering of the debt interest paid by OPG (about $30 – 70 million/yr between 2017 and 2021),

DRAFT

# Fiscal Mitigation Options

- With the addition of recent and new price mitigation measures, a review should be initiated on fiscally-funded programs. There could be a phase down / out transition period considered. Examples include the following:

- Ontario Energy and Property Tax Credit (OEPTC) and Northern Ontario Energy Credit (NOEC):
  - Phase down and/or out the non-on-bill benefits of. (Save up to about $460 M/yr)
  - These targeted, low-income measures were introduced after the HST was introduced.
  - The OESP provides a larger, targeted and on-bill relief to qualifying consumers.

- Ontario Rebate for Electricity Consumers (OREC):
  - Introduce over time a monthly eligible consumption cap, with perhaps a higher cap in the winter to allow for space heating costs.
  - As with the prior OCEB cap, provides a rough incentive for conservation and correlation to larger homes. A higher cap in winter may help with space-heating issue.
  - May be challenging to implement.

- Greenhouse Gas Reduction Account:
  - If ICI is put on the tax-base, make it eligible for GGRA funding.
  - Positioned as, e.g., providing annual benefits from participants conserving and shifting off-peak to reduce reliance on GHG-emitting peaking plants

| 1. OESP | | 106 | 119 | 127 | 132 |
| 2. RRRP | | 292 | 300 | 306 | 315 |
| 3. First Nations Delivery Rate | | 18 | 18 | 18 | 18 |
| 4. Fund ICI through Tax Base | | 900+ | 900+ | 900+ | 900+ |
| 5. Departure Tax | | TBD | TBD | TBD | TBD |
| 6. Conservation Amortisation | | TBD | TBD | TBD | TBD |
| 7. DRC Ended for Class B | 110 | 450 | | | |
| 8. Other | | 30 | 45 | 60 | 70 |
| TOTAL | 1,305 | 3,901 | 3,197 | 3,237 | 3,261 |

1. 2016-17, 2017-18 based on forecasted numbers
2. Estimated impact up to March 31, 2018
3. OEPTC amounts in all years based on energy component of the rebate.

- As shown above, if all measures proposed in this deck were to be accepted taxpayer funded contributions to electricity price mitigation would increase to about $3.4 – 3.9 billion in 2017-18. That is a 65-95% increase from the current forecast for 2017-18..
- These amounts were not considered in the 2016-17 Fiscal Plan and could put at risk the Province's fiscal objectives for 2017-18 and beyond.

# Appendix

DRAFT

# Background on Taxpayer-funded Electricity Price Mitigation

| Program | Annual Fiscal Impacts ($M) | Date | Details |
|---|---|---|---|
| **Ontario Clean Energy Benefit (OCEB)** | ~1,000 | Jan 1 2011 to Dec 31, 2015 | OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax. Effective September 1, 2012, 10 per cent benefit was capped for the first 3,000 kWh of electricity consumed per month. OCEB expired December 31, 2015, as legislated. |
| **Removed Debt Retirement Charge (DRC) from Residential Bills** | ~330 | Jan 1, 2016 to Mar 31, 2018 | The government removed the DRC from residential electricity users' bills as of January 1, 2016. This is saving a typical residential user about $70 each year and meant ending the DRC earlier for these users than otherwise provided for in the *Electricity Act, 1998*. |
| **Ontario Rebate for Electricity Consumers (OREC)** | ~1,200 | Jan 1, 2017 onward | This ongoing program will rebate -- directly on consumers' residential electricity bills -- an amount equal to the provincial portion of the Harmonized Sales Tax (HST). |
| **Northern Industrial Electricity Rate (NIER) Program** | 120 | March 2010 | As announced in Budget 2015, the government committed to ongoing support for northern industrials with $120 million allocated annually. NIER was previously extended in 2012 for an additional three-year term, effective April 1, 2013 and also for a year effective April 1, 2016, with an allocation up to $120 million per year.<br>Qualifying participants receive a rebate of two cents per kilowatt-hour (kWh) up to a maximum of $20 million per year per company.<br>NIER initially established as a three-year program in Budget 2010, effective April 1, 2010. |
| **Northern Ontario Energy Credit** | ~25 | Budget 2010 | Delivered as part of the Ontario Trillium Benefit, provides individuals living in northern Ontario with a credit of up to $146 per year for the 2016 benefit year, and families up to $224.[1] |
| **Ontario Energy Property Tax Credit** | ~445[1] | Budget 2010 | Delivered as part of the Ontario Trillium Benefit, energy portion provides up to $224 per year (inflation adjusted) for low-to moderate-income individuals and families, and for qualifying seniors.[1] |

1. Energy portion cost only. Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and NOEC were introduced/enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).

DRAFT

# Timeline: Taxpayer-funded Electricity Price Mitigation

**Budget 2010: OEPTC, NOEC Proposed as part of the Ontario Trillium Benefit**

*In the 2011 Budget, the government combined the payments of three existing tax credits — the Ontario Sales Tax Credit, the Ontario Energy and Property Tax Credit, and the Northern Ontario Energy Credit — to create the OTB. The OTB is paid in monthly instalments throughout the year, which helps people meet their expenses as bills arrive.*

**Ontario Clean Energy Benefit** (Jan 1 2011 to Dec 31 2015)

*The OCEB was introduced in the 2010 Ontario Economic Outlook and Fiscal Review to help consumers transition to a cleaner electricity system. As set out in legislation, the OCEB ended on December 31, 2015. The Province has introduced rate mitigation measures to be implemented after December 31, 2015.*

*OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax, for the first 3,000 kilowatt-hours (kWh) of monthly electricity consumption.*

**Removing DRC from Residential Bills** (Jan 1 2016 to Mar 31 2018)

*The government removed the DRC from residential electricity users' bills beginning on January 1, 2016. This saves a typical residential user about $70 each year and ends the DRC earlier for these users than otherwise provided for in the Electricity Act, 1998.*

**Ontario Rebate for Electricity Consumers**

*As of January 1, 2017, OREC will reduce electricity costs by an amount equal to the provincial portion of the HST for about five million residential consumers, farms and small businesses.*

2010 2011 2012 2013 2014 2015 2016 2017

## History of Northern Industrial Electricity Price Relief

**November 2006**

*The Ontario government announced the Northern Pulp and Paper Electricity Transition Program (NPPETP), a three-year $140 million, to be effective retroactively to October 1, 2006*

**Budget 2009**

*The government announced extension of the NPPETP by one year providing about $58 million with electricity price rebates of 1.8 cents/kWh.*

**Budget 2010**

*NIER program announced, with a projected fiscal cost of $150 M per year, to provide electricity price rebates for qualifying large industrial facilities in northern Ontario. An additional $21.8 million allocated for existing NPPETP in 2010-11 to be integrated with NIER.*

**September 2010**

*Transition from NPPETP to NIER: pulp and paper mills participating in NPPETP continued to receive the NPPETP rebate of 1.8 cents/kWh until September 30, 2010, with those qualifying for NIER receiving a top-up rebate of 0.2 cents/kWh.*

**December 2012**

*The government announced the extension of the NIER for three years, capping the rebates to a maximum of 2011-12 consumptions levels or $20 million, whichever is lower.*

DRAFT

# Potential Fiscal Impact to the Electricity Sector

- The electricity sector has a significant impact on the Province's fiscal position; through both the revenue and expense sides of the Province's fiscal position.
  - Electricity Rate mitigation programs funded through the tax base have a direct fiscal impact on the Province's finances.
  - Alternatively, electricity rate mitigation programs funded by the rate base shift costs from one group of ratepayers to another.
- The Province's electricity sector agencies and corporations are each consolidated into the government's financial statements, and directly affect the Province's surplus/deficit position.
  - Ontario Power Generation (OPG) financial results have a dollar-for-dollar impact on the Province.
    - Electricity price mitigation strategies involving OPG would lead to a direct fiscal impact.
  - Hydro One financial results have a direct impact on the Province, based on the Province's proportionate ownership.
    - The Province currently holds about 70 per cent of Hydro One.

ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector – Update

## Working Draft

December 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure (i.e., $35 billion+ investment in cleaner generation and $15.5 billion investment in Hydro One transmission and distribution systems).

- Ontario has taken a number of actions to lower electricity cost for all consumers by:
  - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).
  - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., competitive LRP, no new NUG contracting).

- Following the 2016 Throne Speech, actions were announced to further reduce electricity costs by:
  - Providing an 8%  per cent rebate ($11/month savings), updating RRRP ($45/month savings, combined with the 8% rebate), expanding ICI (up to one-third savings for participants), suspending the LRP II and the EFWSOP (up to $3.8 billion in cost savings) and recycling proceeds to industrial/ commercial consumers.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured,  the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP),  which provides an opportunity to consider a range of policy changes to  how the Ontario energy sector operates.

# Broad Policy Themes / Rationale

- No longer use rate-base to pay for social programs [despite the system benefit rationale] by shifting cost of OESP, RRRP and proposed First Nation Rate to tax-base.
- Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.
- Fund conservation programs through the tax-base for the remaining term of the existing CDM framework and transition costs to the new "green bank entity" over time. Costs would be shifted in recognition of the burden borne by ratepayers in phasing out coal generation.
- Expand the scope of the "Trillium Trust" beyond the Moving Ontario Forward initiative to make certain investments in energy infrastructure eligible for funding, such as remote electrification, large transmission projects, new or expanded interties ~~and expansion of natural gas to rural areas~~, etc. (note that expanding access to natural gas is already included under Moving Ontario Forward.)
- Empower energy agencies to increase cost effectiveness and improve efficiency by having – IESO modernize Ontario's electricity market through electricity market renewal initiatives, the OEB identify opportunities for future LDC cost reductions/efficiencies and work with OPG to find further efficiencies in operations and pass on savings to ratepayers.
- Give consumers more choice by allowing households to "opt into" a single rate plan as an interim measure as the Ontario Energy Board (OEB) develops more pricing options over time.
- Help small business manage their electricity costs and provide relief for cap and trade until proceeds recycling is fully operational by ending the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers.

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

| *$/750kWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| **Recommended Initiatives** | | | | | | | |
| 1. No Longer Fund Social Programs Through the Rate-Base (i.e., OESP, RRRP, First Nations rate) | 2.16 | 2.31 | 2.41 | 2.49 | 2.54 | 2.58 | Immediate |
| 2. Expand the OESP (i.e., 50% increase) | - | - | - | - | - | - | n/a |
| 3. Fund Conservation Programs Through The Tax-Base | 3.40 | 3.68 | 2.98 | 3.09 | 2.58 | 2.58 | Immediate |
| 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (e.g., Transmission upgrade, etc) | TBD | TBD | TBD | TBD | TBD | TBD | TBD |
| 5. Empower Energy Agencies to Increase Cost Effectiveness and Improve efficiency* | | | | | | | |
| a. IESO – Market Renewal | - | - | - | - | 1.00 | 1.03 | Long-Term |
| b. OEB – LDC efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| c. OPG – Operational efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| 6. Give Residential Consumers More Rate Choices | - | - | - | - | - | - | n/a |
| 7. Help Small Business Manage Their Electricity Costs (i.e., End DRC early for Class B electricity consumers)** | - | - | - | - | - | - | n/a |
| 8. Cancel / Adjust FIT | - | - | 0.13 | 0.13 | 0.14 | 0.14 | Long-Term |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| **Considered but not Recommended** | | | | | | | |
| 1. Eliminate the Industrial Conservation Initiative (ICI) | 4.40 | 4.24 | 4.10 | 4.24 | 3.73 | 3.58 | Immediate |
| 2. Cancel LRP I | - | - | TBD | TBD | TBD | TBD | Medium-Term |

**Note:** The above initiatives will provide similar benefits for non-RPP Class B electricity consumers. Proposal 1 assumes OESP participation of 50% and 5-year maturity. *Assessing the range of ratepayer impacts will be done through the LTEP development and implementation process in conjunction with the OEB. **Class B includes small-medium enterprises (SMEs).

# Proposed Initiatives – Potential Savings for Average Industrial Electricity Consumers

| *$/MWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| **Recommended Initiatives** | | | | | | | |
| 1. No Longer Fund Social Programs Through the Rate-Base (i.e., OESP, RRRP, First Nations rate) | 2.88 | 3.08 | 3.21 | 3.33 | 3.39 | 3.44 | Immediate |
| 2. Expand the OESP (i.e., 50% increase) | - | - | - | - | - | - | n/a |
| 3. Fund Conservation Programs Through The Tax-Base | 2.82 | 3.05 | 2.47 | 2.56 | 2.13 | 2.14 | Immediate |
| 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (e.g., Transmission upgrade, etc) | TBD | TBD | TBD | TBD | TBD | TBD | TBD |
| 5. Empower Energy Agencies to Increase Cost Effectiveness and Improve efficiency* | | | | | | | |
| a. IESO – Market Renewal | - | - | - | - | 1.34 | 1.38 | Long-Term |
| b. OEB – LDC efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| c. OPG – Operational efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| 6. Give Residential Consumers More Rate Choices | - | - | - | - | - | - | n/a |
| 7. Help Small Business Manage Their Electricity Costs (i.e., End DRC early for Class B electricity consumers)** | - | - | - | - | - | - | n/a |
| 8. Cancel / Adjust FIT | - | - | 0.10 | 0.10 | 0.11 | 0.11 | Long-Term |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| **Considered but not Recommended** | | | | | | | |
| 1. Eliminate the Industrial Conservation Initiative (ICI) | (24.12) | (23.21) | (22.45) | (23.23) | (20.42) | (19.61) | Immediate |
| 2. Cancel LRP I | - | - | TBD | TBD | TBD | TBD | Medium-Term |

**Note:** The above initiatives will provide similar benefits for non-RPP Class B electricity consumers. Proposal 1 assumes OESP participation of 50% and 5-year maturity. *Assessing the range of ratepayer impacts will be done through the LTEP development and implementation process in conjunction with the OEB. **Class B includes small-medium enterprises (SMEs).

# Proposed Taxpayer Funded Electricity Price Mitigation

| *($M)* | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |
|---|---|---|---|---|---|
| **Recommended Initiatives** | | | | | |
| 1. No Longer Fund Social Programs Through the Rate-Base (i.e., OESP, RRRP, First Nations rate) | | 398 | 419 | 433 | 447 |
| 2. Expand the OESP (i.e., 50% increase) | TBD | TBD | TBD | TBD | TBD |
| 3. Fund Conservation Programs Through The Tax-Base | 110 | 450 | 450 | 450 | 450 |
| 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (e.g., Transmission upgrade, etc) | TBD | TBD | TBD | TBD | TBD |
| 5. Empower Energy Agencies to Increase Cost Effectiveness and Improve efficiency* | | | | | |
| a. IESO – Market Renewal | - | - | - | - | - |
| b. OEB – LDC efficiencies | - | - | - | - | - |
| c. OPG – Borrowing | - | - | - | - | - |
| 6. Give Residential Consumers More Rate Choices | - | - | - | - | - |
| 7. Help Small Business Manage Their Electricity Costs (i.e., End DRC early for Class B electricity consumers)** | 110 | 450 | - | - | - |
| 8. Cancel / Adjust FIT | - | - | - | - | - |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD |
| **Considered but not Recommended** | | | | | |
| 1. Eliminate the Industrial Conservation Initiative (ICI) | - | - | - | - | - |
| 2. Cancel LRP I | - | - | - | - | - |

**Source:** Ministry of Finance, Energy

# Considerations / Outcomes

- The proposed initiatives provide the following opportunities to:
  - Lower the cost of electricity for all consumers;
  - Re-set how electricity programs and energy infrastructure is funded (i.e., shifting costs to the tax-base from rate-base);
  - Provide electricity consumers with greater choices (i.e., signal rate plan);
  - Provide system benefits (e.g., market renewal); and
  - Increase cost effectiveness and improve efficiency.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

---

Hi Felix….question for you. Do you have any new materials that show the OREC cost estimates? If so, could you share?

Thanks,

John.

I'd actually not consider that figure economic comparison, as we're comparing the new BP net income to the Budget one that included a consolidation adjustment of 241 at the time. So the comparison would be against the Public Accounts consolidation adjustment which is 247.

I'd change to positive 27, if doing a true economic comparison.

John.

Do you know why the drop in 2015-16 and 2016-17? Is it all related to unrealized gains or losses on the nuclear funds net of bruce variance account.

Is it also lower regulated rates than anticipated in last plan?

**Subject:** Re: A call from OPCD

Thanks John. Have a good weekend and recover from your jet lag

Copying Cindy, as neither Gadi nor I, as non-accountants admittedly, could see how this could not have a fiscal impact either, and for the same reasons.

Cindy, are you providing comments directly back to Energy, and, if so, when? Sooner rather than later would seem appropriate to me.

Ron

---

**From:** John Kim
**Sent:** January 13, 2017 4:13 PM
**To:** Ronald Kwan
**Subject:** A call from OPCD

Hi Ron,

Helen Graham and Cindy Veinot gave me a call. Helen called first and then asked me to a call with Cindy.

So DM of Energy appears to have engaged DM of TBS which is how OPCD received the deck. Energy asked for comments from an accounting perspective which is how OPCD seemed to have gotten engaged.

They wanted mostly clarification on Global Adjustment and what it covers. Cindy's comments were to the point that she would not see how this will not lead to a fiscal hit. That you cannot create a receivable/asset , unless there is a counterparty or unless it is a rate regulated entity.

I'm running out of steam so will be heading out shortly but will try to provide you with a note this weekend.

Thanks,

John.

**Cc:** Veinot, Cindy (TBS)
**Subject:** Re: A call from OPCD

Thanks John. Have a good weekend and recover from your jet lag

Copying Cindy, as neither Gadi nor I, as non-accountants admittedly, could see how this could not have a fiscal impact either, and for the same reasons.

Cindy, are you providing comments directly back to Energy, and, if so, when? Sooner rather than later would seem appropriate to me.

Ron

**From:** John Kim
**Sent:** January 13, 2017 4:13 PM
**To:** Ronald Kwan
**Subject:** A call from OPCD

Hi Ron,

Helen Graham and Cindy Veinot gave me a call. Helen called first and then asked me to a call with Cindy.

So DM of Energy appears to have engaged DM of TBS which is how OPCD received the deck. Energy asked for comments from an accounting perspective which is how OPCD seemed to have gotten

engaged.

They wanted mostly clarification on Global Adjustment and what it covers. Cindy's comments were to the point that she would not see how this will not lead to a fiscal hit. That you cannot create a receivable/asset , unless there is a counterparty or unless it is a rate regulated entity.

I'm running out of steam so will be heading out shortly but will try to provide you with a note this weekend.

Thanks,

John.

**Subject:** RE: Benefit Implementation

Hi all,

FYI – The Ministry is currently creating a new reporting portal for the Rebate program. The following staff from the OFA had access to the Ministry's previous clean energy benefit portal:

Adrian Nalasco - adrian.nalasco@ofina.on.ca
Darren Scanlan - Darren.Scanlan@ofina.on.ca
Ronald Kwan - Ronald.Kwan@ofina.on.ca

Can you confirm whether the OFA would like to carry forward with the same contacts? If not, could you please update this list to provide the 3 contacts you would like to have access?

We are looking for this information by the end of the week and will just use the current 3 contacts if no changes are received.

Thank you,

-Robert

Hi all, just wanted to remind everybody about timing as we will need to get these MOUs finalized for a Jan 1 implementation date. Can I ask when we can all agree to an MOU that can be signed by ADMs?

On our end we need to send to our DM and MO as well, so I would like to send that mid-week this week.

**Subject:** RE: Benefit Implementation

Hi John,

In response to your question we have updated the language in the MOU Section 3. b) to be more clear. Please see the below language that we plan to include in this MOU.

"The OFA will keep and maintain all records related to the OREC for a period of seven (7)

years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time."

Does this language provide the level of clarity that you are looking for? If not, please let me know and we can discuss.

Thank you,

-Robert

**Subject:** RE: Benefit Implementation

Hi John,

In regards to records that the OFA must maintain related to the OREC, we do not need to have direct database access to your records, but records should be available upon request of the Ministry. Most likely we would ask for documents to be shared electronically via email if necessary, unless directed otherwise.

Regards,

-Robert

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the ~~[~~*Ontario Rebate for Electricity Consumers Act, 2016*~~] – NTD, pending the legislature considering the Bill], including~~ and the regulations thereunder (the "Act"), certain consumers will be entitled to receive ~~a credit, known as the~~ financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ("~~" or "~~OREC"), against~~", in respect of~~ the cost of electricity consumed by them ~~during the period~~ commencing January 1, 2017;

2. ~~Funds in respect of the~~ Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to ~~most~~specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act~~, its regulations and the Market Rules~~;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the OREC Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

1. **Payment Authorization**

   (i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

   (ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

   (iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

      i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

      ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

2. **Payment Process**

   ~~a) The Ministry is registered with the IESO as an IESO Program Participant.~~

   a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

   ~~c)~~b) The Ministry will take all necessary steps to provide the OFA with access to the ~~Ministry's~~ IESO ~~account and will arrange for~~Portal so that the OFA ~~to~~will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

   ~~d)~~c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

   ~~e)~~d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

   ~~f)~~e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

3. **Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ~~ensure that~~provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of ~~has full access to~~ such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

~~e)~~

## 4. OREC Cost Forecasting

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the ~~Corporate and Electricity Finance Division of~~ the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to ~~complete and accurate~~ data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process~~.~~.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

~~d)a) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.~~

d) ~~e)~~ The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement ~~of~~on the forecasts.

e) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for the appropriated amount or for a change in the appropriated amount for OREC.

## 5. Limited Role of the OFA

**Commented [KK2]:** Throughout the MOU we have used "OFA" to stand in for all divsions, referring to the OFA here as well keeps it consistent.

**Formatted:** Indent: Left: 0.25", Numbered + Level: 1 + Numbering Style: a, b, c, … + Start at: 1 + Alignment: Left + Aligned at: 0.75" + Indent at: 1"

**Commented [SQ23]:** The only change outlined in the latest version.

**Commented [KR4]:** Does the OFA agree that there should be a provision contemplating agreement on the forecasts? Would it be sufficient to simply reqire tht senior management be briefed?

**Commented [RK5]:** How about dealing with it by switching the order and slightly amending the new "e)"?

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.
Attention:
email:

c) In the case of the Ministry, the addresses for notice are:
Hand Delivery:
Ministry of Energy
880 Bay Street, 5th Floor
Attention:
email:

**10. Execution**

The parties have executed this MOU, effective as of the date first above written.

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy

Hi all, just wanted to remind everybody about timing as we will need to get these MOUs finalized for a Jan 1 implementation date. Can I ask when we can all agree to an MOU that can be signed by ADMs?

On our end we need to send to our DM and MO as well, so I would like to send that mid-week this week.

Hi John,

In response to your question we have updated the language in the MOU Section 3. b) to be more clear. Please

see the below language that we plan to include in this MOU.

> "The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time."

Does this language provide the level of clarity that you are looking for? If not, please let me know and we can discuss.

Thank you,

-Robert

**Subject:** RE: Benefit Implementation

Hi all, just wanted to remind everybody about timing as we will need to get these MOUs finalized for a Jan 1 implementation date. Can I ask when we can all agree to an MOU that can be signed by ADMs?

On our end we need to send to our DM and MO as well, so I would like to send that mid-week this week.

**Subject:** RE: Benefit Implementation

Hi John,

In response to your question we have updated the language in the MOU Section 3. b) to be more clear. Please see the below language that we plan to include in this MOU.

> "The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time."

Does this language provide the level of clarity that you are looking for? If not, please let me know and we can discuss.

Thank you,

-Robert

**Subject:** RE: Benefit Implementation

Hi John,

In regards to records that the OFA must maintain related to the OREC, we do not need to have direct database access to your records, but records should be available upon request of the Ministry. Most likely we would ask for documents to be shared electronically via email if necessary, unless directed otherwise.

Regards,

-Robert

Hi, attached is the ENERGY-OFA MOU, one or two adjustments in the attached.

If you are in agreement let us know and we can clean up and get ready for signature. We'll need to complete this first week of December.

Thanks,

**Subject:** RE: Benefit Implementation

Hi Michael,

Attached is a working draft of the MOU. OFA Legal had based it on the OCEB one, slightly updated for the proposed new rebate. I'm sure Energy will have some updates to suggest on it too.

Hi all,

FYI – The Ministry is currently creating a new reporting portal for the Rebate program. The following staff from the OFA had access to the Ministry's previous clean energy benefit portal:

Adrian Nalasco - adrian.nalasco@ofina.on.ca
Darren Scanlan - Darren.Scanlan@ofina.on.ca
Ronald Kwan - Ronald.Kwan@ofina.on.ca

Can you confirm whether the OFA would like to carry forward with the same contacts? If not, could you please update this list to provide the 3 contacts you would like to have access?

We are looking for this information by the end of the week and will just use the current 3 contacts if no changes are received.

Thank you,

-Robert

Hi all, just wanted to remind everybody about timing as we will need to get these MOUs finalized for a Jan 1 implementation date. Can I ask when we can all agree to an MOU that can

be signed by ADMs?

On our end we need to send to our DM and MO as well, so I would like to send that mid-week this week.

**Subject:** RE: Benefit Implementation

Hi John,

In response to your question we have updated the language in the MOU Section 3. b) to be more clear. Please see the below language that we plan to include in this MOU.

> "The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time."

Does this language provide the level of clarity that you are looking for? If not, please let me know and we can discuss.

Thank you,

-Robert

**Subject:** RE: Benefit Implementation

Hi John,

In regards to records that the OFA must maintain related to the OREC, we do not need to have direct database access to your records, but records should be available upon request of the Ministry. Most likely we would ask for documents to be shared electronically via email if necessary, unless directed otherwise.

Regards,

-Robert

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the ~~[~~*Ontario Rebate for Electricity Consumers Act, 2016*~~] – NTD, pending the legislature considering the Bill], including~~ and the regulations thereunder (the "Act"), certain consumers will be entitled to receive ~~a credit, known as the~~ financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ("" or "OREC"), against", in respect of the cost of electricity consumed by them ~~during the period~~ commencing January 1, 2017;

2. ~~Funds in respect of the~~ Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to ~~most~~specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act~~, its regulations and the Market Rules~~;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the OREC Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

**1. Payment Authorization**

(i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

(ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

(iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

**2. Payment Process**

~~a) The Ministry is registered with the IESO as an IESO Program Participant.~~

a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

~~c)~~b) The Ministry will take all necessary steps to provide the OFA with access to the ~~Ministry's~~ IESO ~~account and will arrange for~~Portal so that the OFA ~~to~~will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

~~d)~~c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

~~e)~~d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

~~f)~~e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ~~ensure that~~provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of ~~has full access to~~ such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

~~e)~~

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the Corporate and Electricity Finance Division of the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to ~~complete and accurate~~ data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process~~.~~.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

~~d)a) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.~~

d) ~~e)~~ The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement ~~of~~on the forecasts.

e) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for the appropriated amount or for a change in the appropriated amount for OREC.

**5. Limited Role of the OFA**

**Formatted:** Indent: Left: 0.25", Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.75" + Indent at: 1"

**Commented [SQ22]:** The only change outlined in the latest version.

**Commented [KR3]:** Does the OFA agree that there should be a provision contemplating agreement on the forecasts? Would it be sufficient to simply reqire tht senior management be briefed?

**Commented [RK4R3]:** How about dealing with it by switching the order and slightly amending the new "e)"?

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.
Attention:
email:

c) In the case of the Ministry, the addresses for notice are:
Hand Delivery:
Ministry of Energy
880 Bay Street, 5th Floor
Attention:
email:

**10. Execution**

The parties have executed this MOU, effective as of the date first above written.

Hi Ron,

Please find attached the draft MOU between OFA and Ministry of Energy regarding the OREC.

The MOU was reviewed by OFA Legal and Energy. Please note that Ken had a comment under 4(e), which was the proposed edits from Energy. We have reviewed the language and we are of the view that there's some strategic interest in keeping that bullet in.

Please let me know if you have any questions.

Thanks,
Gavin He

Hi, attached is the ENERGY-OFA MOU, one or two adjustments in the attached.

If you are in agreement let us know and we can clean up and get ready for signature. We'll need to complete this first week of December.

Thanks,

---

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the ~~[~~*Ontario Rebate for Electricity Consumers Act, 2016*~~] – NTD, pending the legislature considering the Bill], including~~ and the regulations thereunder (the "Act"), certain consumers will be entitled to receive ~~a credit, known as the~~ financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ("~~" or "~~OREC"), against~~", in respect of~~ the cost of electricity consumed by them ~~during the period~~ commencing January 1, 2017;

2. ~~Funds in respect of the~~ Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to ~~most~~specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act~~, its regulations and the Market Rules~~;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the OREC Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

1. **Payment Authorization**

   (i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

   (ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

   (iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

      i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

      ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

2. **Payment Process**

   ~~a) The Ministry is registered with the IESO as an IESO Program Participant.~~

   a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

   ~~c)~~b) The Ministry will take all necessary steps to provide the OFA with access to the ~~Ministry's~~ IESO ~~account and will arrange for~~Portal so that the OFA ~~to~~will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

   ~~d)~~c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

   ~~e)~~d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

   ~~f)~~e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

3. **Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ~~ensure that~~provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of ~~has full access to~~ such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

~~e)~~

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the Corporate and Electricity Finance Division of the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to ~~complete and accurate~~ data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process~~.~~.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.

e) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement ~~of~~on the forecasts.

**Commented [SQ22]:** The only change outlined in the latest version.

**Commented [KR3]:** Does the OFA agree that there should be a provision contemplating agreement on the forecasts? Would it be sufficient to simply reqire tht senior management be briefed?

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.

Attention:
email:

c) In the case of the Ministry, the addresses for notice are:
Hand Delivery:
Ministry of Energy
880 Bay Street, 5th Floor
Attention:
email:

**10. Execution**

The parties have executed this MOU, effective as of the date first above written.

**Her Majesty the Queen in right of Ontario**

Hi John,

In response to your question we have updated the language in the MOU Section 3. b) to be more clear. Please see the below language that we plan to include in this MOU.

> "The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time."

Does this language provide the level of clarity that you are looking for? If not, please let me know and we can discuss.

Thank you,

-Robert

Hi John,

In regards to records that the OFA must maintain related to the OREC, we do not need to have direct database access to your records, but records should be available upon request of the Ministry. Most likely we would ask for documents to be shared electronically via email if necessary, unless directed otherwise.

Regards,

-Robert

**Subject:** RE: Benefit Implementation

Hi Michael,

Attached is a working draft of the MOU. OFA Legal had based it on the OCEB one, slightly updated for the proposed new rebate. I'm sure Energy will have some updates to suggest on it too.

Hi Ken,

I have staff reviewing and we will go to Legal to get a sense of their comfort. We blacklined against the version we sent and there were other changes than the one change tracked.

Will get back to you once Legal provides their comments.

Thanks,

John.

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the *Ontario Rebate for Electricity Consumers Act, 2016* and the regulations thereunder (the "Act"), certain consumers will be entitled to receive financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers" or "OREC", in respect of the cost of electricity consumed by them commencing January 1, 2017;

2. Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f)of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

**1. Payment Authorization**

(i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

(ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

(iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

**2. Payment Process**

a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

b) The Ministry will take all necessary steps to provide the OFA with access to the IESO Portal so that the OFA will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ensure that the Ministry has full access to such records.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

e)

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the Corporate and Electricity Finance Division of the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process .

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.

~~d)~~ e) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement of the forecasts.

**Formatted:** Indent: Left: 0.5", No bullets or numbering

**Formatted:** No bullets or numbering

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

Formatted: Highlight

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

Formatted: Highlight

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.

**Attachments:** RE Benefit implementation.msg

---

Hi John,

Just to add to this, Gavin looked at this and brought up two good points:

- How about any late payments? Any interest/penalty? Who will be responsible for any late charges?
- Payment turnaround time? Within how many days after the invoice is received?

I don't think the first bullet applies here, as we'll be provided appropriate instructions. We could suggest that OFA Accounting attach an appendix to this on the form of instructions they expect to receive, if it helps them.

The second bullet isn't obvious in the MOU and could be better clarified in here. The instructions will provide the date for OFA to process towards, but does Accounting a perquisite number of days? I think Ken K's group has reviewed this the last time, so its likely not a concern.

Salman

**Subject:** RE: Benefit Implementation

Hi John,

There were a few other changes, most of which are just clarifying the program definitions. One thing they did add that they did not track in their changes provided to us was:

The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ensure that the Ministry has full access to such records.

Only comment here is that we should clarify what they mean by access. In the MOU, when the OFA says we need access to documents etc, we refer to a portal. Is this what they expect from us? Just need to make sure we have expectations lined up.

Saved here.

Salman

I am ok as well Ron, Ken R and I had discussions as he developed the draft so I am familiar with sections of accounting and payments.

George is taking one last look but any changes that he may come up with will be minor and related to procedure. If George has any suggestions, I can outline them at the meeting itself, BTW I will be calling is since as you may heard PA is really heating up so I want to be at the office.

Thanks

Ken k

> As per the Ontario Rebate for Electricity Consumers Act that was introduced September 15, the Ministry is moving forward in ensuring that these initiatives are implemented by January 1, 2017. We were hoping to have a discussion with you both, as there was involvement from the OFA in this legislation as well as the delivery of the Ontario Clean Energy Benefit rebate. We hope to leverage existing systems that are in place with OFA, IESO, LDCs and the Ministry to deliver the 8% rebate and discuss if there are other elements in the delivery of this rebate that need to be adjusted or re-evaluated. I think our Deputies have already chatted avout this and I was hoping that once we've had some preliminary discussions, we can discuss any updates to the MOU

as well.

Are you available this week or early next week to have a preliminary chat?

Thanks,

Michael

**Subject:** RE: Benefit Implementation

Hi all, just wanted to remind everybody about timing as we will need to get these MOUs finalized for a Jan 1 implementation date. Can I ask when we can all agree to an MOU that can be signed by ADMs?

On our end we need to send to our DM and MO as well, so I would like to send that mid-week this week.

-Sunita

**Cc:** Kandeepan, Ken (OFA); Singh, Inayat (ENERGY); Salman Qadir; Gavin He; Chander, Sunita (ENERGY)
**Subject:** RE: Benefit Implementation

Hi John,

In response to your question we have updated the language in the MOU Section 3. b) to be more clear. Please see the below language that we plan to include in this MOU.

> "The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time."

Does this language provide the level of clarity that you are looking for? If not, please let me know and we can discuss.

Thank you,

-Robert

**Cc:** Kandeepan, Ken (OFA); Singh, Inayat (ENERGY); Salman Qadir; Gavin He
**Subject:** RE: Benefit Implementation

Hi Sunita, Robert,

We need some clarity on what you mean by this not most likely.

Thanks,

John.

**Subject:** RE: Benefit Implementation

Hi John,

In regards to records that the OFA must maintain related to the OREC, we do not need to have direct database access to your records, but records should be available upon request of the Ministry. Most likely we would ask for documents to be shared electronically via email if necessary, unless directed otherwise.

Regards,

-Robert

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the *Ontario Rebate for Electricity Consumers Act, 2016* and the regulations thereunder (the "Act"), certain consumers will be entitled to receive financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers" or "OREC", in respect of the cost of electricity consumed by them commencing January 1, 2017;

2. Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

**1. Payment Authorization**

(i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

(ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

(iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

**2. Payment Process**

a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

b) The Ministry will take all necessary steps to provide the OFA with access to the IESO Portal so that the OFA will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ~~ensure that~~provide the Ministry ~~has full access to~~ with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

~~e)~~

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the ~~Corporate and Electricity Finance Division of the~~ OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process~~.~~.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement on the forecasts.

~~d)~~e) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for the appropriated amount or for a change in the appropriated amount for OREC.

~~e) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement of the forecasts.~~

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

John Kim
Tel: (416) 212-6996
email: john.kim@ofina.on.ca

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.

Toronto, ON M7A 1Y7
Attention: John Kim
email: john.kim@ofina.on.ca

**To:** John Kim <John.Kim@ofina.on.ca>
**Subject:** RE: Benefit Implementation

Hi John,

There were a few other changes, most of which are just clarifying the program definitions. One thing they did add that they did not track in their changes provided to us was:

The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ensure that the Ministry has full access to such records.

Only comment here is that we should clarify what they mean by access. In the MOU, when the OFA says we need access to documents etc, we refer to a portal. Is this what they expect from us? Just need to make sure we have expectations lined up.

Saved here.

**Subject:** RE: Benefit Implementation

Hi Michael,

Attached is a working draft of the MOU. OFA Legal had based it on the OCEB one, slightly updated for the proposed new rebate. I'm sure Energy will have some updates to suggest on it too.

<MOU - MoE OFA- DAP Nov 25.doc>

**From:** Salman Qadir
**To:** John Kim
**Subject:** RE: Benefit Implementation
**Date:** Tuesday, November 29, 2016 5:46:51 PM
**Attachments:** MOU - MoE OFA- DAP Nov 25 - track changes to v3_clean.docx

---

Hi John,

There were a few other changes, most of which are just clarifying the program definitions. One thing they did add that they did not track in their changes provided to us was:

The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ensure that the Ministry has full access to such records.

Only comment here is that we should clarify what they mean by access. In the MOU, when the OFA says we need access to documents etc, we refer to a portal. Is this what they expect from us? Just need to make sure we have expectations lined up.

Saved here.

Salman

<MOU - MoE OFA- DAP Nov 25.doc>

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the ~~[~~*Ontario Rebate for Electricity Consumers Act, 2016*~~] – NTD, pending the legislature considering the Bill], including~~ and the regulations thereunder (the "Act"), certain consumers will be entitled to receive ~~a credit, known as the~~ financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ~~("~~" or "OREC~~"), against~~", in respect of the cost of electricity consumed by them ~~during the period~~ commencing January 1, 2017;

2. ~~Funds in respect of the~~ Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to ~~most~~specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act~~, its regulations and the Market Rules~~;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the ~~OREC~~Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f)of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

1. **Payment Authorization**

   (i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

   (ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

   (iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

      i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

      ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

2. **Payment Process**

   ~~a) The Ministry is registered with the IESO as an IESO Program Participant.~~

   a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

   ~~c)~~b) The Ministry will take all necessary steps to provide the OFA with access to the ~~Ministry's~~ IESO ~~account and will arrange for~~Portal so that the OFA ~~to~~will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

   ~~d)~~c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

   ~~e)~~d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

   ~~f)~~e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

3. **Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ensure that the Ministry has full access to such records.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

e)

**Commented [SQ22]:** What would this access look like? Are they expecting us to set up up an external site with all of our files/modeling as well?

Just need to clarify expectations.

## 4. OREC Cost Forecasting

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the Corporate and Electricity Finance Division of the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to ~~complete and accurate~~ data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process .

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.

e) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement of the forecasts.

**Formatted:** Font: Not Bold

**Commented [SQ23]:** The only change outlined in the latest version.

## 5. Limited Role of the OFA

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

## 6. Review and Termination

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

Formatted: Highlight

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

Formatted: Highlight

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.
Attention:
email:

Formatted: Highlight

c) In the case of the Ministry, the addresses for notice are:
Hand Delivery:
Ministry of Energy
880 Bay Street, 5th Floor
Attention:
email:

Formatted: Highlight

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the *Ontario Rebate for Electricity Consumers Act, 2016* and the regulations thereunder (the "Act"), certain consumers will be entitled to receive financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers" or "OREC", in respect of the cost of electricity consumed by them commencing January 1, 2017;

2. Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f)of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

**1. Payment Authorization**

(i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

(ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

(iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

**2. Payment Process**

a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

b) The Ministry will take all necessary steps to provide the OFA with access to the IESO Portal so that the OFA will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ensure that the Ministry has full access to such records.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

e)

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the Corporate and Electricity Finance Division of the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process .

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.

~~d)~~ e) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement of the forecasts.

**Formatted:** Indent: Left: 0.5", No bullets or numbering

**Formatted:** No bullets or numbering

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

Formatted: Highlight

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

Formatted: Highlight

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.
Attention:
email:

Formatted: Highlight

c) In the case of the Ministry, the addresses for notice are:
Hand Delivery:
Ministry of Energy

Formatted: Highlight

880 Bay Street, 5th Floor
Attention:
email:

Formatted: Highlight

Formatted: Highlight

**10. Execution**

The parties have executed this MOU, effective as of the date first above written.

**Her Majesty the Queen in right of Ontario**

Hi Ron,

Please find attached the draft MOU between OFA and Ministry of Energy regarding the OREC.

The MOU was reviewed by OFA Legal and Energy. Please note that Ken had a comment under 4(e), which was the proposed edits from Energy. We have reviewed the language and we are of the view that there's some strategic interest in keeping that bullet in.

Please let me know if you have any questions.

Thanks,
Gavin He

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the *Ontario Rebate for Electricity Consumers Act, 2016* and the regulations thereunder (the "Act"), certain consumers will be entitled to receive financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers" or "OREC", in respect of the cost of electricity consumed by them commencing January 1, 2017;

2. Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

**1. Payment Authorization**

(i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

(ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

(iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

**2. Payment Process**

a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

b) The Ministry will take all necessary steps to provide the OFA with access to the IESO Portal so that the OFA will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ~~ensure that~~provide the Ministry ~~has full access to~~ with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

~~e)~~

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the ~~Corporate and Electricity Finance Division of the~~ OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process~~.~~.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement on the forecasts.

~~d)~~e) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for the appropriated amount or for a change in the appropriated amount for OREC.

~~e) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement of the forecasts.~~

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

John Kim
Tel: (416) 212-6996
email: john.kim@ofina.on.ca

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.

Toronto, ON M7A 1Y7
Attention: John Kim
email: john.kim@ofina.on.ca

c) In the case of the Ministry, the addresses for notice are:
Hand Delivery:
Ministry of Energy
~~880 Bay Street, 5th~~77 Grenville St.
7th Floor
Toronto, ON M7A 2C1
Attention:
email:

Commented [SQ22]: Please confirm.

**10. Execution**

The parties have executed this MOU, effective as of the date first above written.

Ontario Financing Authority

Formatted: Indent: First line: 0.22"

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the *Ontario Rebate for Electricity Consumers Act, 2016* and the regulations thereunder (the "Act"), certain consumers will be entitled to receive financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ("" or "OREC"), against", in respect of the cost of electricity consumed by them commencing January 1, 2017;

2. Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the OREC Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

**1. Payment Authorization**

(i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

(ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

(iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

**2. Payment Process**

a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

b) The Ministry will take all necessary steps to provide the OFA with access to the IESO Portal so that the OFA will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement on the forecasts.

e) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for the appropriated amount or for a change in the appropriated amount for OREC.

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

John Kim
Tel: (416) 212-6996
email: john.kim@ofina.on.ca

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:
Ontario Financing Authority
Suite 1400
1 Dundas St. W.
Toronto, ON M7A 1Y7
Attention: John Kim
email: john.kim@ofina.on.ca

Hi Ron,

Ken Kandeepan just made an edit on 4 (b) on page 3:

He just changed "The Ministry will provide to *the Corporate and Electricity Finance Division of* the OFA all IESO invoices and settlement statements…" to "The Ministry will provide to the OFA all IESO invoices and settlement statements…", for consistency purpose.

Please let us know if you are okay with the edits. If so, I will provide this back to Energy.

Thanks,
Gavin He

Hi Ron,

Please find attached the draft MOU between OFA and Ministry of Energy regarding the OREC.

The MOU was reviewed by OFA Legal and Energy. Please note that Ken had a comment under 4(e), which was the proposed edits from Energy. We have reviewed the language and we are of the view that there's some strategic interest in keeping that bullet in.

Please let me know if you have any questions.

Thanks,

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the ~~[~~*Ontario Rebate for Electricity Consumers Act, 2016*~~] – NTD, pending the legislature considering the Bill], including~~ and the regulations thereunder (the "Act"), certain consumers will be entitled to receive ~~a credit, known as the~~ financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ("~~" or "~~OREC"), against~~", in respect of~~ the cost of electricity consumed by them ~~during the period~~ commencing January 1, 2017;

2. ~~Funds in respect of the~~ Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to ~~most~~specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act~~, its regulations and the Market Rules~~;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the OREC Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

1. **Payment Authorization**

   (i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

   (ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

   (iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

      i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

      ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

2. **Payment Process**

   ~~a) The Ministry is registered with the IESO as an IESO Program Participant.~~

   a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

   ~~c)~~b) The Ministry will take all necessary steps to provide the OFA with access to the ~~Ministry's~~ IESO ~~account and will arrange for~~Portal so that the OFA ~~to~~will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

   ~~d)~~c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

   ~~e)~~d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

   ~~f)~~e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

3. **Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will ~~ensure that~~provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of ~~has full access to~~ such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

~~e)~~

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the ~~Corporate and Electricity Finance Division of~~ the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to ~~complete and accurate~~ data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process~~.~~.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

~~d)a) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for a change in the appropriated amount for OREC.~~

d) ~~e)~~ The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement ~~of~~on the forecasts.

e) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for the appropriated amount or for a change in the appropriated amount for OREC.

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. For greater clarity, the OFA will not be responsible for auditing or otherwise verifying the correctness of the IESO invoices, monitoring the IESO's application of the Payments, monitoring the balance from time to time of the Appropriated Amount, or ensuring the Appropriated Amount is sufficient.

**6. Review and Termination**

a) The Ministry and the OFA will review this MOU annually.

b) This MOU may be terminated by either party at any time, on 90 days notice.

c) Upon termination of this MOU, the OFA will cease to make any Payments.

d) The parties will cooperate to help to ensure a smooth transition of the payment function upon termination.

**7. No Service Charges**

The OFA will not charge the Ministry for the OFA's services or for its disbursements or other expenses incurred under this MOU.

**8. Contacts**

a) Each party shall designate a member of its staff to be a contact person for the purposes of administering this MOU.

b) As of the date of this MOU the OFA's contact person is:

Tel:
email:

c) As of the date of this MOU the Ministry's contact person is:

Tel:
email:

d) Either party may designate a different member of its staff as its contact person by providing notice to the other party in accordance with section 9.

**9. Notice**

a) Any notice under this MOU shall be in writing and shall be deemed given when delivered by hand or email, and addressed to the party's contact person.

b) In the case of the OFA, the addresses for notice are:
Hand Delivery:

**Memorandum of Understanding**
**Relating to the**
**Ontario Rebate for Electricity Consumers**

**Dated:** **, 2016**

Commented [RH1]: TBD

**Between:**

**Her Majesty the Queen in right of Ontario**
as represented by the Minister of Energy ("**Ministry**")

**And:**

**Ontario Financing Authority**
an agency of the Province of Ontario (the "**OFA**")

**Whereas:**

1. Pursuant to the *Ontario Rebate for Electricity Consumers Act, 2016* and the regulations thereunder (the "Act"), certain consumers will be entitled to receive financial assistance, in this Memorandum of Understanding ("MOU") called the "Ontario Rebate for Electricity Consumers ("" or "OREC"), against", in respect of the cost of electricity consumed by them commencing January 1, 2017;

2. Reimbursement for OREC provided to consumers and persons receiving invoices from unit sub-meter providers ("Reimbursement") will flow to specified electricity distributors, retailers and unit sub-metering providers ("Payment Recipients") through the Independent Electricity System Operator ("IESO") in accordance with the Act;

3. Under the Act, the Ministry will be required to pay amounts to the IESO on account of the OREC Reimbursement (the "Payments") out of amounts appropriated by the Legislature for that purpose ("Appropriated Amount");

4. The Ministry considers it advisable for the OFA to make the Payments on behalf of the Ministry and the OFA has agreed to make the Payments on behalf of the Ministry;

5. The Ministry and the OFA have also agreed to work together on OREC cost forecasting;

6. The Ministry and the OFA wish to enter into this MOU pursuant to clause 7 (3)(f) of the *Ministry of Energy Act* and subsection 30 (1) of the *Capital Investment Plan Act, 1993* to confirm their agreement regarding the terms on which the OFA will make the Payments and on which the Ministry and the OFA will work together on OREC cost forecasting.

**Therefore:**

The Ministry and the OFA agree as follows:

**1. Payment Authorization**

(i) The Ministry authorizes the OFA to make the Payments on behalf of the Ministry and the OFA agrees to make the Payments on behalf of the Ministry.

(ii) The Ministy shall ensure that the certificate under section 11.4 of the *Financial Administration Act* required for each of the Payments is obtained.

(iii) It is agreed by the Ministry and the OFA that the OFA is acting as agent, on behalf of the Ministry, for the purposes of

i. Transacting with the Ontario Shared Services "IFIS" system in order to access funds appropriated for the Ministry in respect of the Act, and

ii. Making the required Payments on behalf of the Ministry as further described in this MOU.

**2. Payment Process**

a) The Ministry has an account with the IESO under which the IESO will issue invoices to the Ministry for the Payments. The IESO will provide the Ministry with access to these invoices by giving the Ministry access to a secure IESO portal containing these invoices ("IESO Portal").

b) The Ministry will take all necessary steps to provide the OFA with access to the IESO Portal so that the OFA will have access to each IESO invoice to the Ministry, at the same time the IESO issues the invoice to the Ministry.

c) The OFA will make the Payments on behalf of the Ministry, in the amount of the IESO invoices.

d) The Payments will be made in accordance with the IESO Market Rules and IESO Manuals for settlements and billing of market participants, as amended from time to time.

e) The Payments will be made from the Consolidated Revenue Fund and the amount of each Payment will be entered by the OFA into the Province's IFIS system under a pre-defined Ministry account immediately upon the completion of the Payment or shortly thereafter.

**3. Reporting Requirements and Records**

a) The OFA will deliver a notice by e-mail to the Ministry's contact person to confirm the completion of each Payment in the amount of the IESO invoice.

b) The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time.

c) The requirements under this section shall survive any termination of the MOU.

d) The Public Accounts, Volume 3 reporting related to the Payments will be performed by the Ministry.

**4. OREC Cost Forecasting**

a) The Ministry and the OFA will work together to prepare and review cost forecasts, estimates, and analysis related to the OREC.

b) The Ministry will provide to the OFA all IESO invoices and settlement statements relating to the OREC, and any reports by OREC transfer payment recipients (e.g. Local Distribution Companies, retailers, and unit sub-metering providers) to the IESO, that are received by the Ministry. This includes providing electronic portal access to data and reports by OREC transfer payment recipients expected to be provided through an electronic portal reporting process.

c) The OFA and the Ministry will collaborate to prepare fiscal year cost estimates and monthly cashflow estimates for OREC.

d) The OFA and the Ministry will ensure senior management in their respective organizations are briefed and updated on the OREC forecasting on a regular basis to ensure there is mutual understanding and agreement on the forecasts.

e) The Ministry and the OFA acknowledge and agree that the actual costs of OREC may not be the same as the forecasted costs, and the OFA bears no liability for any differences between the forecast and actual costs of OREC, nor does the OFA have any responsibility for any application to Treasury Board for the appropriated amount or for a change in the appropriated amount for OREC.

**5. Limited Role of the OFA**

The OFA will only be responsible for making the Payments in accordance with section 2 and assisting in OREC cost forecasting in accordance with section 4. **Subject:** RE: Benefit Implementation

Hi all,

FYI – The Ministry is currently creating a new reporting portal for the Rebate program. The following staff from the OFA had access to the Ministry's previous clean energy benefit portal:

Adrian Nalasco - adrian.nalasco@ofina.on.ca
Darren Scanlan - Darren.Scanlan@ofina.on.ca
Ronald Kwan - Ronald.Kwan@ofina.on.ca

Can you confirm whether the OFA would like to carry forward with the same contacts? If not, could you please update this list to provide the 3 contacts you would like to have access?

We are looking for this information by the end of the week and will just use the current 3 contacts if no changes are received.

Thank you,

-Robert

Hi all, just wanted to remind everybody about timing as we will need to get these MOUs finalized for a Jan 1 implementation date. Can I ask when we can all agree to an MOU that can be signed by ADMs?

On our end we need to send to our DM and MO as well, so I would like to send that mid-week this week.

**Subject:** RE: Benefit Implementation

Hi John,

In response to your question we have updated the language in the MOU Section 3. b) to be more clear. Please see the below language that we plan to include in this MOU.

> "The OFA will keep and maintain all records related to the OREC for a period of seven (7) years, and will provide the Ministry with electronic copies (or paper copies, if requested by the Ministry) of such of those records as the Ministry may request from time to time."

Does this language provide the level of clarity that you are looking for? If not, please let me know and we can discuss.

Thank you,

-Robert

**Subject:** RE: Benefit Implementation

Hi John,

In regards to records that the OFA must maintain related to the OREC, we do not need to have direct database access to your records, but records should be available upon request of the Ministry. Most likely we would ask for documents to be shared electronically via email if necessary, unless directed otherwise.

Regards,

-Robert

| **Last reviewed by:** | **Tracking to:** Cabinet – September ~~14~~13, 2016 |

**[BASED ON DRAFT CABINET SUBMISSION]**

| | |
|---|---|
| **SUBMISSION TITLE:** | Electricity Price Mitigation (Ontario Rebate for Electricity Consumers) |

## I. REQUEST/DECISION REQUIRED:

The Ministry of Energy is proposing measures to provide relief to various electricity consumer classes. These measure include:

1.a. Provide an ~~pre-tax~~ 8% rebate, equal to the provincial portion of HST, to consumers eligible for the ~~to~~ Regulated Price Plan (RPP) ~~consumers~~;

1.b. Updating Rural or Remote Rate Protection (RRRP) by adding additional $110 million in rate-based funding to R2 low density electricity consumers from the current level of $127 million [$125.5 million in the latest Energy deck];

2.a. Expanding the Industrial Conservation Initiative (ICI) eligibility to customers above 1MW in all sectors;

~~2.b.~~ Recycle cap and trade proceeds ($60 million) to commercial and industrial electricity consumers to provide a modest 1% reduction in rates, with modest savings from proceeds intended for electricity relief through the Climate Change Action Plan to provide fiscal offsets ($60 million).

~~2.c.~~

~~2.d.~~2.b. ~~[Approve in principle an expenditure increase estimated at $261M [estimate subject to refinement from ENERGY] in 2016-17 for the Electricity Price Mitigation, offset from the Treasury Board Contingency Fund.]~~

**Commented [RK1]:** Let's put in the amount of increase -- $110M, to the existing $127M

**Commented [JK2]:** From the latest minute.

**Commented [RK3]:** Let's put in the estimated amount.

**Commented [SK24]:** Re-ordered/numbered to align with revised deck.

**Commented [SK25]:** Unclear if this is necessary for the cabinet note as the TB/MBC note may be worried more on fiscal implications.

**Commented [RK6]:** Remove from here, but should be part of fiscal impact part of the note.

**Commented [SK27R6]:** Will do. It's in the financial summary section.

## II. KEY POINTS:

Context

Electricity costs have increased as the province has made investments in clean energy generation and modernized electricity infrastructure. Electricity bills are expected to continue to increase as more renewable energy projects come online.

As part of the 2016 Budget, the government committed to mitigating electricity cost impacts that were anticipated from the cap and trade program. The Climate Change Action Plan (CCAP) included up to $1.32B over 4 years to help keep electricity rates affordable for residential and industrial consumers. This included a commitment to provide a modest benefit of up to $2 per month, on average, to residential consumers.

**Tab x**

The Ontario Clean Energy Benefit (OCEB) expired December 31, 2015, as part of the originally planned, five-year legislated program put in place as a broad-based, transitional measure to a cleaner electricity system. OCEB was also put in place following the implementation of the Harmonised Sales Tax (HST). Unlike the previous provincial Retail Sales Tax (RST), the HST (and GST) included electricity in the taxable base. With the end of OCEB, the government ended the electricity Debt Retirement Charge (DRC) on residential users earlier than planned, as of January 1, 2016, and also put in place the low-income targeted Ontario Electricity Support Program (OESP).

In order to achieve the CCAP commitment and additional price mitigation, the Ministry of Energy has developed price mitigation options that consider tax-based levers, cap and trade proceeds, and shifting costs within the rate-base.

Proposal

| | Measure | Targeted Recipients | Impact (annually) | |
|---|---|---|---|---|
| | | | Fiscal | Rate Base |
| **1.a** | 8% Rebate to Regulated Price Plan eligible consumers | Residential, small business, small farms and other small users | $1B | - |
| **1.b** | Updating Rural or Remote Rate Protection | Residents in rural or remote locations: Hydro One's lowest-density R2 customers. | - | $110M |
| **2.a** | Expanding ICI eligibility to customers above 1MW in all sectors | Intermediate and large-sized industrial, commercial and institutional consumers above 1MW in all sectors | - | $47M/ $82M* |
| **2.b** | Redirecting cap and trade proceeds recycling:<br>• As part of the original CCAP policy, $330M of the cap & trade proceeds was to be recycled for electricity price mitigation for residential and non-residential users.<br>• Under this proposal, a lower total amount of $270 M would be used to mitigate non-residential users.<br>• Therefore, provides $60M for potential fiscal offsets to the 8% rebate. | Commercial and industrial electricity customers | ($60M)** | - |

*Short-term/Long-term rate base impact, where short term is one year after expanded eligibility takes place and long-term is expected impact once new customers have time to change behavior.
**To meet the Budget 2016 commitment, the Climate Change Action Plan (CCAP) committed $1.3B from the Greenhouse Gas Reduction Account (GGRA) or about $330M annually. Current proposal will require $60M less or $270M annually. Assumes the $60M is diverted to in-plan initiatives.

- ENERGY provided the following overview of bill impacts:

| Regulated Price Plan (Residential) Impact[1]* | Class B (Commercial)[4] | Class A (Industrial)[4] |
|---|---|---|

**Commented [SK28]:** Table below from the latest ENERGY Deck (FPC Major Project Morning of Sept 8).

**Tab x**

| Average[2] (750 kWh/month) | Rural[3**] (1000 kWh/month) | | Existing | New |
|---|---|---|---|---|
| -$1011/month (-68%) | -$45/month (-20%) | -$1/MWh (-1%) | -$1/MWh (-1%) | Up to -$52/MWh (-34%) |

Note: The impact of cap and trade would not be added to electricity bills until 2017 and impact of ICI would not be added until 2018. All impacts included here for illustrative purposes

1*. ENERGY did not provide the monthly impact for other Regulated Price Plan not classified as Residential (eg. farms, small businesses) that would benefit from the 8% Rebate to Regulated Price Plan.

2. Regulated Price Plan Impact represents the pre-tax values of 8% rebate and does not include the impact of ICI expansion and RRRP update (total impact of $1.31/month based on 750 kWh/month).

3.** Rural customers refers to those Hydro One customers eligible to receive RRRP (R2 rate class customers). Impact shown is pre-tax and does not include the impact of ICI expansion and RRRP update (total impact of $1.74/month based on 1000 kWh/month).

4. The impact of cap and trade would not be added to electricity bills until 2017 and impact of ICI would not be added until 2018.

**1.a. 8% Rebate to Regulated Price Plan (RPP)**

- An 8% rebate ~~on the pre-tax portion~~ for Regulated Price Plan (RPP) eligible consumers would be equal to the provincial portion of HST and funded by the tax base.
- The $1 billion figure is a 2017 to 2020 calendar year average of cost estimates developed by Ministry of Energy staff, as follows:

| *$ millions* | **2017** | **2018** | **2019** | **2020** |
|---|---|---|---|---|
| | 1,003 | 1,014 | 975 | 1,049 |
| Avg. 2017-20 | 1,010 | | | |

- On a fiscal year basis, the above estimates become:

| *$ millions* | **2016-17** | **2017-18** | **2018-19** | **2019-20** |
|---|---|---|---|---|
| | 261 | 1,006 | 1,004 | 994 |
| 3-Year Avg. | 1,001 | | | |

- Ministry of Energy staff are in the process of developing a refined estimate of the cost.

- The rebate would appear directly on bills. As such, Local Distribution Companies (LDC) would be the delivery mechanism for the rebate.
  - While non-Regulated Price Plan eligible consumers would not see a benefit from the 8% rebate under this option, all industrial and commercial consumers would receive proceeds recycling through the Greenhouse Gas Reduction Account (GGRA).
  - Commercial and industrial consumers would also continue to receive input tax credits and Public Service Bodies would continue to receive PSB rebates.
- New legislation would be required and closely mirror the Ontario Clean Energy Benefit (OCEB) Act, 2010. More details further below.
- On-bill rebate delivery would likely require adjustments to Local Distribution Company (LDC) billing systems, which could impact delivery costs and timelines.
- In the past, LDCs have asked for at least six months' notice when implementing billing system changes.

  - One option to address any timing concerns is to allow LDCs to provide retroactive payments if their systems cannot be updated in time for January 1, 2017. This was done with the OCEB.
- The rebate would not be directly linked to HST.

**1.b. Updating (Increasing) Rural or Remote Rate Protection**

- RRRP funding supporting Hydro One R2 (rural) customers capped at current levels since 2004.
- The current program provides a monthly subsidy of ~~a about~~ $~~32~~31.50/month.
- Proposal will provide an additional $110 million in support to approximately 329,000 R2 customers to $235 million annually.
- Proposal will increase the subsidy by about $28/month and equalize R2 bills with Hydro One R1 (medium) density customers at 1,000 kWh.
- All residential consumers would see an average cost increase of about $0.60/month.
- ENERGY is considering options to periodically adjust the amount of rate protection eg. indexed at inflation or "trued up" on a regular basis.

**Commented [RK9]:** On what basis?

**2.a. Expanding ICI Eligibility to customers above 1MW in all sectors**

- Lower threshold for participation in ICI to 1 MW and remove sectoral restrictions.
- Most newly eligible ICI participants who choose to opt-in to the program would be able to reduce their electricity costs substantially. All other consumers would see a relatively small increase in their bills.
- Expanding the ICI will reduce electricity peak demand by incenting more consumers to lower their electricity demand during peak periods (80MW in the short term and 165 MW in the long term)
- Bill savings to new participants up to 21% in the short term and up to 34% long-term.
- Newly eligible consumers in the program would mostly fall into the small industrial, institutional and commercial category, including: automotive supply chain companies, office tower, large shopping mall, greenhouses and others.
  - Companies that would become eligible under such an expansion include Kellogg, Canlan Ice Sports, Cambridge Towel, SLACAN and Casino Rama.
- Class B consumers would have a collective increase in the Global Adjustment of $47M in the short term and $~~87M~~ 82M in the long term from this initiative.
- Residential consumers would see an average cost increase of $0.42/month in the short term and $0.74/month in the long term.

**2.b. Redirect Cap and Trade Proceeds Recycling**

- The 2016 Budget committed to offset the impact of cap and trade for commercial and industrial electricity consumers, while also providing a benefit of up to $2 per month for residential electricity consumers.
- Ontario's Climate Change Action Plan (CCAP) includes up to $1.32 billion over 4 years to help keep electricity rates affordable for residential and industrial consumers.
- ~~The GGRA allocated $120M to average residential consumers, $170M to commercial and $40M to industrial consumers.~~

**Commented [SK210]:** Suggest deletion. This breakdown is not in the latest deck. Furthermore the chart on Slide 21 shows $335M original allocation, not $330M.

**Tab x**

- The 8% rebate to the Regulated Price Plan consumers more than fulfills the commitment to reduce residential rates by $2/month.
    - Proposal would lead to savings of the $120M in GGRA proceeds previously allocated to residential consumers, and help offset the fiscal impact of the 8% rebate to the Regulated Price Plan consumers.
- To provide additional price mitigation to commercial and industrial electricity consumers, ENERGY is proposing to direct an additional $60M annually of cap and trade auction proceeds (to $270~~M~~ million from a previous amount of $210~~M~~ million annually) to industrial and commercial consumers not in the RPP to mitigate impacts.
- The current proposal would require an estimated $60 million less per year, or $0.24 billion less over the first compliance period.

## III. KEY CONSIDERATIONS

- This request ~~on~~for an 8% rebate does not align with the 2016 Budget fiscal plan and there are very limited~~no~~ ($60~~M~~ million) proposed offsets.

- Due to the nature of the ICI Global Adjustment mechanism and cost recovery of the RRRP, the rate base proposals (~~##~~21b and ~~#3~~#2a), while benefiting the targeted recipients, would **come at a cost to all other electricity rate payers in Ontario**.

- ~~This request does not align with the 2016 Budget fiscal plan and there are no proposed offsets.~~

- Other price mitigation measures introduced following the implementation of the HST, as well as the end of OCEB, would continue.
    - Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and Northern Ontario Energy Credit (NOEC) were introduced/ enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).
    - The DRC on residential consumers was ended early, as of January 1, 2016 (about a $340 million impact in 2016-17).
    - OESP is a low-income targeted program funded by electricity consumers through the electricity rate base.

- 

**8% Rebate to Regulated Price Plan**

- The 8% ~~pre-tax~~ rebate would provide a typical residential consumer about an $11 per month benefit on average (about $10, after the impact of RRRP and ICI expansion), exceeding the Budget 2016 $2 per month on average, cap and trade commitment.

- This 8% ~~pre-tax~~ rebate equal to the provincial portion of HST is similar to the previous Ontario Clean Energy Benefit (See Appendix for background) which provided a 10% post-tax rebate.
- The proposal indicates the Regulated Price Plan consumption amount to be 58TWh [Slide 2 in latest, FPC-Major Projects Deck]. Unclear if this applies to all eligible RPP consumers. A p~~P~~reliminary MOF estimate for consumption ~~for~~under the OCEB program approximated annual OCEB-eligible consumption range of 64-68TWh ~~of annual electricity consumption~~ between September 2011 and December 2015. [This would represent about 10-17% more in additional program cost to the current estimate of $1 billion per year.]
- The OCEB legislation was set out with an end date, and was subsequently modified to be capped at 3,000 kWh per month for all electricity customers after 8 months of the program.
    - This proposal does not specify any consumption caps nor an end date.
- Due to the lack of a cap, compared to OCEB, this proposal is more generous to the high volume RPP users.

  - OCEB rebate was applicable for up to 36,000 kWh annually (12 months times 3,000 kWh cap per month) while this proposal would be **more generous for those consuming more than 50,850 kWh** annually.
  - Furthermore, highest volume users in this proposal would receive **up to 392% more** than under the OCEB program.
- Unclear why any proposals for a cap would be any more complex or onerous to LDCs than prior OCEB cap (instituted beginning September 2012 to termination of OCEB program in December 2015). However, cap may affect some types of consumers more than others, such as small businesses, condo dwellers in separately-metered units paying for electricity usage in the common elements, and residential consumers heating with electricity.

- ~~Blanket r~~Reduction in electricity prices for all users irrespective of consumption amounts hamper efforts to conserve electricity, and mutes TOU price signals.
- [Businesses ~~that fall under the Regulated Price Plan~~ pay little to no HST due to the Input Tax Credit. For those businesses eligible for the Regulated Price plan, ~~T~~the 8% reduction can be deemed a windfall ~~for these users~~.]

**Updating Rural or Remote Rate Protection**

- According to ENERGY, the RRRP is a $175M program with the majority of program funding ($125.5M) to Hydro One's lowest-density 'R2' customers
- ~~Unclear why customers on RRRP who are not Hydro One's R2 customers are not also targeted for this benefit.~~

**Expanding ICI Eligibility to customers above 1MW in all sectors**

- Not all users with demand above 1MW will be in a position to take full advantage of the ICI expansion (eg. inability to load shift during peaks).
- Consumers in the commercial sector currently do not pay time-of-use prices and have little incentive to shift demand away from high demand hours.
  - Expansion of the ICI can give commercial consumers who are able to shift demand during peak hours, the opportunity to opt-in and benefit.

**Redirect Cap and Trade Proceeds Recycling**

- Deck implies $60M in savings ~~from 8% Rebate for the RPP consumers.~~compared to earlier climate change electricity price mitigation recycling plan.
  - ~~Unclear, how the redirected amount $60M ($120M-$60M) will be allocated to commercial and industrial users.~~
  - A fiscal offset to the initiative would materialize only if the $60M is diverted to in-plan initiatives.

## IV. Cabinet Committee Discussion Summary

n/a

**Commented [SK11]:** 36000*0.113/0.08 = 50,850

36000 – max OCEB eligible consumption
0.113 – pre-tax effective OCEB rebate
0.08 – pre-tax effective rebate (8%)

**Commented [SK212]:** 36000 – max OCEB eligible consumption
0.113 – pre-tax effective OCEB rebate

36000*0.113 = 4068 [OCEB effective rebated consumption]

Max under proposal: 250,000
pre-tax effective rebate: 0.08
Proposal's effective rebated consumption: 250,000*0.08 = 20,000

(20,000-4068)/4068 = **3.9164**

**Commented [SK213]:** Is this referring to the issue with common elements in condos and how they fall under one bill separate from the units?

**Commented [SK214]:** I'm trying to say that there's a portion of RRRP customers who will not receive this benefit.

Is there a reason these other customers are not also getting the expansion?

**Commented [JK15]:** Which sectors? There was a deck recently that showed the composition of GA in the bills paid by sectors. I believe it was one of the price mitigation decks.

**Commented [SK216R15]:** This is a general statement.

Slide 32 in the 20160902_330pm deck.

## V. Financial Summary

| $ Millions | 2016-17 | 2017-18 | 2018-19 |
|---|---|---|---|
| Initiative cost requested | 261 | 1,006 | 1,004 |
| Requested program base | 261 | 1,006 | 1,004 |
| Total fiscal impact (draw from c-funds) | 261 | 1,006 | 1,004 |

## VI. Performance Measures

[To estimate the impact of the program, the savings provided to the various consumers, and any potential for adjustments to the program, information should be provided from LDCs on consumption profiles and rebate amounts, particularly those affected by the 8% rebate on Regulated Price Plan Consumers.]

## APPENDIX A: PROPOSED POLICY MINUTE

[WORK IN PROGRESS, WAITING ON ENERGY'S FINAL SUBMISSION]

Cabinet agreed that:

1. ENERGY implement electricity price mitigation for residential, commercial and industrial consumers through the following:

i) Provide a rebate of 8% on the pre-tax cost of electricity for all electricity consumers eligible to be billed under the Ontario Energy Board's Regulated Price Plan (RPP); and any other consumers who would be eligible for RPP if their electricity account was with a licensed distributor.

ii) Increase the total amount of rate protection available to R2 with low density electricity consumers under the Rural or Remote Rate Protection Program (RRRP) by increasing the subsidy by $110 million from its current level of $127 million which has been capped since 2004.

iii) Implement a mechanism to periodically adjust the total annual amount of rate protection available to R2 low density electricity consumers under the RRRP, effective on or after January 1, 2018.

iv) Expanding eligibility for participation in the Industrial Conservation Initiative (ICI) to smaller industrial, institutional and commercial customers by lowering the eligibility threshold to 1 MW and removing restrictions on eligible sectors.

2. ENERGY seek necessary TB/MBC approvals.

3. ENERGY seek approvals for:

i) the proposed *Ontario Rebate for Electricity Consumers Act, 2016* – and any supporting regulations under the proposed *Ontario Rebate for Electricity Consumers Act, 2016*, and with other complementary regulatory amendments and consequential legislative amendments to the *Ontario Energy Board Act, 1998* and the *Ontario Clean Energy Benefit Act, 2010*, subject to the Legislature's approval of the Act, including the following elements:

   i. The rebate would be available starting January 1, 2017;
   ii. The legislation would specify the types of costs to which the rebate would or would not be applied, with authority to make changes by regulation;
   iii. The legislation would address invoicing requirements, including authority to prescribe how the rebate is to appear on consumers electricity bills;
   iv. The legislation would include authority to prescribe the way in which the rebate is to be flowed through to consumers, and the way in which electricity vendors providing the rebate are to be reimbursed;

**Commented [SK217]:** This was from the Policy Minute. I assume this is the 'Minute' we are waiting for.

v. The legislation would include record-keeping requirements for electricity vendors and other prescribed persons;
vi. The legislation would include inspection powers for inspectors appointed by the minister of Finance, including powers related to the recovery of overpayments.
vii. The legislation would provide for regulation-making authority to establish a limitation period for ceasing payments and reimbursement based on past entitlement. Similar amendments would be provided for the *Ontario Clean Energy Benefit Act, 2010* but would allow the ceasing of all payments and reimbursements after a prescribed date.

4. ENERGY notes the following amendments:

i) Amendments to Ontario Regulation 429/04 (Adjustments Under Section 25.33 of the Act) made under the *Electricity Act, 1998* to lower the Industrial Conservation Initiative (ICI) threshold to 1 megawatt and require electricity consumers and market participants between 1 MW and 5 MW to opt in.

ii) Amendments to Ontario Regulation 442/01 (Rural or Remote Electricity Rate Protection) made under the Ontario Energy Board Act, 1998, to increase support through the Rural and Remote Rate Protection Plan to R2 low density rural electricity customers and provide for a periodic adjustment mechanism.

5. ENERGY work with MOECC to recycle an estimated annual average of $270 million of Cap and Trade auction proceeds from the Greenhouse Gas Reduction Account for non-RPP commercial and industrial electricity consumers over the first compliance period (2017-2020) through a volumetric rebate mechanism.

6. ENERGY and MOF work with Cabinet Office, Premier's office to develop a communications plan.

~~CABINET AGREED THAT:~~

~~1. THE MINISTRY OF ENERGY (ENERGY), WITH SUPPORT FROM THE MINISTRY OF FINANCE (MOF), SHALL PREPARE LEGISLATION THAT WOULD PROVIDE AN EIGHT PERCENT (8%) REBATE ON THE PRE-TAX COST OF ELECTRICITY FOR THE FOLLOWING CLASSES OF CONSUMERS:~~
~~A. ALL CONSUMERS ELIGIBLE TO BE BILLED UNDER THE ONTARIO ENERGY BOARD'S REGULATED PRICE PLAN; AND~~
~~B. ANY OTHER CONSUMERS WHO WERE ELIGIBLE FOR FINANCIAL ASSISTANCE UNDER THE *ONTARIO CLEAN ENERGY BENEFIT ACT, 2010* (OCEBA) DURING THE PERIOD THAT PROGRAM WAS IN PLACE.~~

~~2. THE LEGISLATION SHALL BE GENERALLY MODELLED UPON THE OCEBA, AND WOULD INCLUDE THE FOLLOWING ELEMENTS:~~
~~A. THE REBATE WOULD BE AVAILABLE STARTING JANUARY 1, 2017 AND BEFORE SUCH DATE AS MAY BE PRESCRIBED;~~
~~B. THE REBATE WOULD NOT BE SUBJECT TO A CAP UNLESS A CAP IS PRESCRIBED;~~
~~C. THE LEGISLATION WOULD SPECIFY THE TYPES OF COSTS TO WHICH THE REBATE WOULD OR WOULD NOT BE APPLIED, WITH AUTHORITY TO MAKE CHANGES BY REGULATION;~~

D. THE LEGISLATION WOULD ADDRESS INVOICING REQUIREMENTS, INCLUDING AUTHORITY TO PRESCRIBE HOW THE REBATE IS TO APPEAR ON CONSUMER ELECTRICITY BILLS;
E. THE LEGISLATION WOULD INCLUDE AUTHORITY TO PRESCRIBE THE WAY IN WHICH THE REBATE IS TO BE FLOWED THROUGH TO CONSUMERS, AND THE WAY IN WHICH ELECTRICITY VENDORS PROVIDING THE REBATE ARE TO BE REIMBURSED;
F. THE LEGISLATION WOULD INCLUDE RECORD-KEEPING REQUIREMENTS FOR ELECTRICITY VENDORS AND ANY OTHER PRESCRIBED PERSONS; AND
G. THE LEGISLATION WOULD INCLUDE INSPECTION POWERS FOR INSPECTORS APPOINTED BY THE MINISTER OF FINANCE, INCLUDING POWERS RELATED TO RECOVERY OF OVERPAYMENTS.

3. ENERGY AMEND O. REG. 429/04 (ADJUSTMENTS UNDER SECTION 25.33 OF THE ACT) MADE UNDER THE ELECTRICITY ACT, 1998 TO EXPAND ELIGIBILITY FOR CLASS A CONSUMERS AND CLASS A MARKET PARTICIPANTS UNDER THE INDUSTRIAL CONSERVATION INITIATIVE (ICI) TO ALL ELECTRICITY CONSUMERS AND MARKET PARTICIPANTS WITH A PEAK DEMAND ABOVE AN AVERAGE OF ONE MEGAWATT (1MW) WITH NO SECTORAL RESTRICTIONS ON PARTICIPATION.
4. ENERGY AMEND O. REG 442/01 (RURAL OR REMOTE ELECTRICITY RATE PROTECTION) MADE UNDER THE ONTARIO ENERGY BOARD ACT, 1998 TO INCREASE THE TOTAL AMOUNT OF RATE PROTECTION AVAILABLE TO LOW DENSITY HYDRO ONE INC. CONSUMERS UNDER THE RURAL OR REMOTE RATE PROTECTION PROGRAM BY $110 MILLION, EFFECTIVE JANUARY 1, 2017.
5. ENERGY CONSIDER AND, IF APPROPRIATE, UTILIZE A MECHANISM TO PERIODICALLY ADJUST THE TOTAL ANNUAL AMOUNT OF RATE PROTECTION AVAILABLE TO HYDRO ONE INC. CONSUMERS UNDER THE RURAL OR REMOTE ELECTRICITY RATE PROTECTION REGULATION / PROGRAM, EFFECTIVE JANUARY 1, 2018.
6. ENERGY TO RECYCLE UP TO AN AVERAGE OF $270 MILLION OF CAP AND TRADE AUCTION PROCEEDS FROM THE GREENHOUSE GAS REDUCTION ACCOUNT PER YEAR OVER THE FIRST COMPLIANCE PERIOD (2017-2020) TO COMMERCIAL AND INDUSTRIAL ELECTRICITY CONSUMERS.
7. ENERGY AND MOF TO WORK WITH CABINET OFFICE (CO) AND PREMIER'S OFFICE (PO) ON COMMUNICATIONS PLAN.

**Tab x**

## APPENDIX B: BACKGROUND – ONTARIO CLEAN ENERGY BENEFIT

Commented [RK18]: What about using the eligibility table in Energy's submission?

- OCEB was in effect from 2011 to 2015, and provided residential, farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax.
    - Effective September 2012 electricity consumption eligible for the 10 per cent benefit was capped at the first 3,000 kWh of electricity consumed per month.
- OCEB helped Ontario families through the transition to a more reliable and cleaner electricity system, with the monthly cap balancing the fiscal implications of providing electricity relief.
- OCEB costs totalled $1,006 million in 2013-14 and $1,078 million in 2014-15, with a projected cost for 2015-16 of $860 million (for the 9 months remaining in the program).

| **Eligible Consumers** | |
|---|---|
| **Categories Listed in Legislation (coincides with categories eligible for RPP)** | |
| **Residential** | • a dwelling<br>• a property within the meaning of the Condominium Act, 1998<br>• a residential complex, within the meaning of the Residential Tenancies Act, 2006<br>• a property that includes one or more housing units and that is owned or leased by a co-operative within the meaning of the Co-operative Corporations Act |
| **Farms** | • carries on a business that is a farming business for the purposes of the Farm Registration and Farm Organizations Funding Act, 1993, and<br>• holds a valid registration number assigned under that Act or the consumer's obligation to file a farming business registration form was waived pursuant to an order made under subsection 22 (6) of that Act |
| **Demand for electricity of 50 kW or less, or consumes not more than 250,000 kWh annually** | Would include small business, smaller broader- public-sector entities, and other small users. |
| **Special Cases (not eligible for RPP, but eligible for OCEB)** | |
| **Consumers On Retail Contracts** | Includes consumers with existing retail contracts and those who sign them during the duration of the program. |
| **Cornwall Electric and Hydro One Remote Communities Inc.** | Included since they are licensed distributors. |
| **Other Consumers Prescribed by Regulation** | 10 First Nations remote unlicensed distributors have been added by regulation. |
| **Exclusions** | |
| **Generators** | Generation station service and the microFIT distribution service charge are excluded in legislation. |

Hi Ron,

Pls. see attached updated note. It's not clear if this item will stay on the agenda tomorrow afternoon for the TBS DM briefing but we would like to get it done and send to TBS for the record.

Thanks,

John.

**[BASED ON DRAFT CABINET SUBMISSION]**

**SUBMISSION TITLE:** Electricity Price Mitigation (Ontario Rebate for Electricity Consumers)

## I. REQUEST/DECISION REQUIRED:

The Ministry of Energy is proposing measures to provide relief to various electricity consumer classes. These measure include:

1.a. Provide an ~~pre-tax~~ 8% rebate, equal to the provincial portion of HST, to consumers eligible for the ~~to~~ Regulated Price Plan (RPP) ~~consumers~~;

1.b. Updating Rural or Remote Rate Protection (RRRP);

2.a. Expanding the Industrial Conservation Initiative (ICI) eligibility to customers above 1MW in all sectors;

~~2.b.~~ Recycle cap and trade proceeds to commercial and industrial electricity consumers to provide a modest 1% reduction in rates, with modest savings from proceeds intended for electricity relief through the Climate Change Action Plan to provide fiscal offsets.

~~2.c.~~

~~2.d.~~2.b. ~~[Approve in principle an expenditure increase estimated at $261M [estimate subject to refinement from ENERGY] in 2016-17 for the Electricity Price Mitigation, offset from the Treasury Board Contingency Fund.]~~

**Commented [RK1]:** Let's put in the amount of increase -- $110M, to the existing $127M

**Commented [RK2]:** Let's put in the estimated amount.

**Commented [SK23]:** Re-ordered/numbered to align with revised deck.

**Commented [SK24]:** Unclear if this is necessary for the cabinet note as the TB/MBC note may be worried more on fiscal implications.

**Commented [RK5]:** Remove from here, but should be part of fiscal impact part of the note.

**Commented [SK26R5]:** Will do. It's in the financial summary section.

## II. KEY POINTS:

Context

Electricity costs have increased as the province has made investments in clean energy generation and modernized electricity infrastructure. Electricity bills are expected to continue to increase as more renewable energy projects come online.

As part of the 2016 Budget, the government committed to mitigating electricity cost impacts that were anticipated from the cap and trade program. The Climate Change Action Plan (CCAP) included up to $1.32B over 4 years to help keep electricity rates affordable for residential and industrial consumers. This included a commitment to provide a modest benefit of up to $2 per month, on average, to residential consumers.

The Ontario Clean Energy Benefit (OCEB) expired December 31, 2015, as part of the originally planned, five-year legislated program put in place as a broad-based, transitional measure to a

cleaner electricity system. OCEB was also put in place following the implementation of the Harmonised Sales Tax (HST). Unlike the previous provincial Retail Sales Tax (RST), the HST (and GST) included electricity in the taxable base. With the end of OCEB, the government ended the electricity Debt Retirement Charge (DRC) on residential users earlier than planned, as of January 1, 2016, and also put in place the low-income targeted Ontario Electricity Support Program (OESP).

In order to achieve the CCAP commitment and additional price mitigation, the Ministry of Energy has developed price mitigation options that consider tax-based levers, cap and trade proceeds, and shifting costs within the rate-base.

Proposal

| | Measure | Targeted Recipients | Impact (annually) | |
|---|---|---|---|---|
| | | | Fiscal | Rate Base |
| **1.a** | 8% Rebate to Regulated Price Plan eligible consumers | Residential, small business, small farms and other small users | $1B | - |
| **1.b** | Updating Rural or Remote Rate Protection | Residents in rural or remote locations: Hydro One's lowest-density R2 customers. | - | $110M |
| **2.a** | Expanding ICI eligibility to customers above 1MW in all sectors | Intermediate and large-sized industrial, commercial and institutional consumers above 1MW in all sectors | - | $47M/ $82M* |
| **2.b** | Redirecting cap and trade proceeds recycling:<br>• As part of the original CCAP policy, $330M of the cap & trade proceeds was to be recycled for electricity price mitigation for residential and non-residential users.<br>• Under this proposal, a lower total amount of $270 M would be used to mitigate non-residential users.<br>• Therefore, provides $60M for potential fiscal offsets to the 8% rebate. | Commercial and industrial electricity customers | ($60M)** | - |

*Short-term/Long-term rate base impact, where short term is one year after expanded eligibility takes place and long-term is expected impact once new customers have time to change behavior.
**To meet the Budget 2016 commitment, the Climate Change Action Plan (CCAP) committed $1.3B from the Greenhouse Gas Reduction Account (GGRA) or about $330M annually. Current proposal will require $60M less or $270M annually. Assumes the $60M is diverted to in-plan initiatives.

- ENERGY provided the following overview of bill impacts:

| Regulated Price Plan (Residential) Impact[1]* | | Class B (Commercial)[4] | Class A (Industrial)[4] | |
|---|---|---|---|---|
| Average[2] (750 kWh/month) | Rural[3]** (1000 kWh/month) | | Existing | New |

**Commented [SK27]:** Table below from the latest ENERGY Deck (FPC Major Project Morning of Sept 8).

| | | | | |
|---|---|---|---|---|
| -$~~10~~11/month (-~~68~~%) | -$45/month (-20%) | -$1/MWh (-1%) | -$1/MWh (-1%) | Up to -$52/MWh (-34%) |

~~Note: The impact of cap and trade would not be added to electricity bills until 2017 and impact of ICI would not be added until 2018. All impacts included here for illustrative purposes~~

1~~*~~. ENERGY did not provide the monthly impact for other Regulated Price Plan not classified as Residential (eg. farms, small businesses) that would benefit from the 8% Rebate to Regulated Price Plan.

2. Regulated Price Plan Impact represents the pre-tax values of 8% rebate and does not include the impact of ICI expansion and RRRP update (total impact of $1.31/month based on 750 kWh/month).

3.~~**~~ Rural customers refers to those Hydro One customers eligible to receive RRRP (R2 rate class customers). Impact shown is pre-tax and does not include the impact of ICI expansion and RRRP update (total impact of $1.74/month based on 1000 kWh/month).

4. The impact of cap and trade would not be added to electricity bills until 2017 and impact of ICI would not be added until 2018.

**1.a. 8% Rebate to Regulated Price Plan (RPP)**

- An 8% rebate ~~on the pre-tax portion~~ for Regulated Price Plan (RPP) eligible consumers would be equal to the provincial portion of HST and funded by the tax base.
- The $1 billion figure is a 2017 to 2020 calendar year average of cost estimates developed by Ministry of Energy staff, as follows:

| *$ millions* | **2017** | **2018** | **2019** | **2020** |
|---|---|---|---|---|
| | 1,003 | 1,014 | 975 | 1,049 |
| Avg. 2017-20 | 1,010 | | | |

- On a fiscal year basis, the above estimates become:

| *$ millions* | **2016-17** | **2017-18** | **2018-19** | **2019-20** |
|---|---|---|---|---|
| | 261 | 1,006 | 1,004 | 994 |
| 3-Year Avg. | 1,001 | | | |

- Ministry of Energy staff are in the process of developing a refined estimate of the cost.

- The rebate would appear directly on bills. As such, Local Distribution Companies (LDC) would be the delivery mechanism for the rebate.
  - While non-Regulated Price Plan eligible consumers would not see a benefit from the 8% rebate under this option, all industrial and commercial consumers would receive proceeds recycling through the Greenhouse Gas Reduction Account (GGRA).
  - Commercial and industrial consumers would also continue to receive input tax credits and Public Service Bodies would continue to receive PSB rebates.
- New legislation would be required and closely mirror the Ontario Clean Energy Benefit (OCEB) Act, 2010. More details further below.
- On-bill rebate delivery would likely require adjustments to Local Distribution Company (LDC) billing systems, which could impact delivery costs and timelines.
- In the past, LDCs have asked for at least six months' notice when implementing billing system changes.

  - One option to address any timing concerns is to allow LDCs to provide retroactive payments if their systems cannot be updated in time for January 1, 2017. This was done with the OCEB.
- The rebate would not be directly linked to HST.

**1.b. Updating (Increasing) Rural or Remote Rate Protection**

- RRRP funding supporting Hydro One R2 (rural) customers capped at current levels since 2004.
- The current program provides a monthly subsidy of ~~a about~~ $~~32~~31.50/month.
- Proposal will provide an additional $110 million in support to approximately 329,000 R2 customers to $235 million annually.
- Proposal will increase the subsidy by about $28/month and equalize R2 bills with Hydro One R1 (medium) density customers at 1,000 kWh.
- All residential consumers would see an average cost increase of about $0.60/month.
- ENERGY is considering options to periodically adjust the amount of rate protection eg. indexed at inflation or "trued up" on a regular basis.

**Commented [RK8]:** On what basis?

**2.a. Expanding ICI Eligibility to customers above 1MW in all sectors**

- Lower threshold for participation in ICI to 1 MW and remove sectoral restrictions.
- Most newly eligible ICI participants who choose to opt-in to the program would be able to reduce their electricity costs substantially. All other consumers would see a relatively small increase in their bills.
- Expanding the ICI will reduce electricity peak demand by incenting more consumers to lower their electricity demand during peak periods (80MW in the short term and 165 MW in the long term)
- Bill savings to new participants up to 21% in the short term and up to 34% long-term.
- Newly eligible consumers in the program would mostly fall into the small industrial, institutional and commercial category, including: automotive supply chain companies, office tower, large shopping mall, greenhouses and others.
  - Companies that would become eligible under such an expansion include Kellogg, Canlan Ice Sports, Cambridge Towel, SLACAN and Casino Rama.
- Class B consumers would have a collective increase in the Global Adjustment of $47M in the short term and $~~87M~~ 82M in the long term from this initiative.
- Residential consumers would see an average cost increase of $0.42/month in the short term and $0.74/month in the long term.

**2.b. Redirect Cap and Trade Proceeds Recycling**

- The 2016 Budget committed to offset the impact of cap and trade for commercial and industrial electricity consumers, while also providing a benefit of up to $2 per month for residential electricity consumers.
- Ontario's Climate Change Action Plan (CCAP) includes up to $1.32 billion over 4 years to help keep electricity rates affordable for residential and industrial consumers.
- ~~The GGRA allocated $120M to average residential consumers, $170M to commercial and $40M to industrial consumers.~~

**Commented [SK29]:** Suggest deletion. This breakdown is not in the latest deck. Furthermore the chart on Slide 21 shows $335M original allocation, not $330M.

**Tab x**

- The 8% rebate to the Regulated Price Plan consumers more than fulfills the commitment to reduce residential rates by $2/month.
    - Proposal would lead to savings of the $120M in GGRA proceeds previously allocated to residential consumers, and help offset the fiscal impact of the 8% rebate to the Regulated Price Plan consumers.
- To provide additional price mitigation to commercial and industrial electricity consumers, ENERGY is proposing to direct an additional $60M annually of cap and trade auction proceeds (to $270M from a previous amount of $210M annually) to industrial and commercial consumers not in the RPP to mitigate impacts.
- The current proposal would require an estimated $60 million less per year, or $0.24 billion less over the first compliance period.

## III. KEY CONSIDERATIONS

- This request ~~on~~for an 8% rebate does not align with the 2016 Budget fiscal plan and there are very limited~~no~~ ($60M) proposed offsets.

- Due to the nature of the ICI Global Adjustment mechanism and cost recovery of the RRRP, the rate base proposals (~~##~~21b and ~~#3~~#2a), while benefiting the targeted recipients, would **come at a cost to all other electricity rate payers in Ontario**.

- ~~This request does not align with the 2016 Budget fiscal plan and there are no proposed offsets.~~

- Other price mitigation measures introduced following the implementation of the HST, as well as the end of OCEB, would continue.
    - Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and Northern Ontario Energy Credit (NOEC) were introduced/ enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).
    - The DRC on residential consumers was ended early, as of January 1, 2016 (about a $340 million impact in 2016-17).
    - OESP is a low-income targeted program funded by electricity consumers through the electricity rate base.

-

**8% Rebate to Regulated Price Plan**

- The 8% ~~pre-tax~~ rebate would provide a typical residential consumer about an $11 per month benefit on average (about $10, after the impact of RRRP and ICI expansion), exceeding the Budget 2016 $2 per month on average, cap and trade commitment.

- This 8% ~~pre-tax~~ rebate equal to the provincial portion of HST is similar to the previous Ontario Clean Energy Benefit (See Appendix for background) which provided a 10% post-tax rebate.
- The proposal indicates the Regulated Price Plan consumption amount to be 58TWh [Slide 2 in latest, FPC-Major Projects Deck]. Unclear if this applies to all eligible RPP consumers. A p~~P~~reliminary MOF estimate for consumption ~~for~~under the OCEB program approximated annual OCEB-eligible consumption range of 64-68TWh ~~of annual electricity consumption~~ between September 11 and December 2015. [This would represent about 10-17% more in additional program cost to the current estimate of $1 billion per year.]
- The OCEB legislation was set out with an end date, and was subsequently modified to be capped at 3,000 kWh per month for all electricity customers after 8 months of the program.
    - This proposal does not specify any consumption caps nor an end date.
- Due to the lack of a cap, compared to OCEB, this proposal is more generous to the high volume RPP users.

  - OCEB rebate was applicable for up to 36,000 kWh annually (12 months times 3,000 kWh cap per month) while this proposal would be **more generous for those consuming more than 50,850 kWh** annually.
  - Furthermore, highest volume users in this proposal would receive **up to 392% more** than under the OCEB program.
- Unclear why any proposals for a cap would be any more complex or onerous to LDCs than prior OCEB cap (instituted beginning September 2012 to termination of OCEB program in December 2015). However, cap may affect some types of consumers more than others, such as small businesses, condo dwellers in separately-metered units paying for electricity usage in the common elements, and residential consumers heating with electricity.

- ~~Blanket r~~Reduction in electricity prices for all users irrespective of consumption amounts hamper efforts to conserve electricity, and mutes TOU price signals.
- [Businesses ~~that fall under the Regulated Price Plan~~ pay little to no HST due to the Input Tax Credit. For those businesses eligible for the Regulated Price plan, ~~T~~the 8% reduction can be deemed a windfall ~~for these users~~.]

**Updating Rural or Remote Rate Protection**

- According to ENERGY, the RRRP is a $175M program with the majority of program funding ($125.5M) to Hydro One's lowest-density 'R2' customers
- ~~Unclear why customers on RRRP who are not Hydro One's R2 customers are not also targeted for this benefit.~~

**Expanding ICI Eligibility to customers above 1MW in all sectors**

- Not all users with demand above 1MW will be in a position to take full advantage of the ICI expansion (eg. inability to load shift during peaks).
- Consumers in the commercial sector currently do not pay time-of-use prices and have little incentive to shift demand away from high demand hours.
  - Expansion of the ICI can give commercial consumers who are able to shift demand during peak hours, the opportunity to opt-in and benefit.

**Redirect Cap and Trade Proceeds Recycling**

- Deck implies $60M in savings ~~from 8% Rebate for the RPP consumers.~~compared to earlier climate change electricity price mitigation recycling plan.
  - ~~Unclear, how the redirected amount $60M ($120M-$60M) will be allocated to commercial and industrial users.~~
  - A fiscal offset to the initiative would materialize only if the $60M is diverted to in-plan initiatives.

## IV. Cabinet Committee Discussion Summary

n/a

**Commented [SK10]:** 36000*0.113/0.08 = 50,850

36000 – max OCEB eligible consumption
0.113 – pre-tax effective OCEB rebate
0.08 – pre-tax effective rebate (8%)

**Commented [SK211]:** 36000 – max OCEB eligible consumption
0.113 – pre-tax effective OCEB rebate

36000*0.113 = 4068 [OCEB effective rebated consumption]

Max under proposal: 250,000
pre-tax effective rebate: 0.08
Proposal's effective rebated consumption: 250,000*0.08 = 20,000

(20,000-4068)/4068 = **3.9164**

**Commented [SK212]:** Is this referring to the issue with common elements in condos and how they fall under one bill separate from the units?

**Commented [SK13]:** Will need to verify

**Commented [SK214]:** I'm trying to say that there's a portion of RRRP customers who will not receive this benefit.

Is there a reason these other customers are not also getting the expansion?

**Commented [JK15]:** Which sectors? There was a deck recently that showed the composition of GA in the bills paid by sectors. I believe it was one of the price mitigation decks.

**Commented [SK216R15]:** This is a general statement.

Slide 32 in the 20160902_330pm deck.

## V. Financial Summary

| $ Millions | 2016-17 | 2017-18 | 2018-19 |
|---|---|---|---|
| Initiative cost requested | 261 | 1,006 | 1,004 |
| Requested program base | 261 | 1,006 | 1,004 |
| Total fiscal impact (draw from c-funds) | 261 | 1,006 | 1,004 |

## VI. Performance Measures

[To estimate the impact of the program, the savings provided to the various consumers, and any potential for adjustments to the program, information should be provided from LDCs on consumption profiles and rebate amounts, particularly those affected by the 8% rebate on Regulated Price Plan Consumers.]

## APPENDIX A: PROPOSED POLICY MINUTE

[WORK IN PROGRESS, WAITING ON ENERGY'S FINAL SUBMISSION]

Cabinet agreed that:

1. ENERGY implement electricity price mitigation for residential, commercial and industrial consumers through the following:

i) Provide a rebate of 8% on the pre-tax cost of electricity for all electricity consumers eligible to be billed under the Ontario Energy Board's Regulated Price Plan (RPP); and any other consumers who would be eligible for RPP if their electricity account was with a licensed distributor.

ii) Increase the total amount of rate protection available to R2 with low density electricity consumers under the Rural or Remote Rate Protection Program (RRRP) by increasing the subsidy by $110 million from its current level of $127 million which has been capped since 2004.

iii) Implement a mechanism to periodically adjust the total annual amount of rate protection available to R2 low density electricity consumers under the RRRP, effective on or after January 1, 2018.

iv) Expanding eligibility for participation in the Industrial Conservation Initiative (ICI) to smaller industrial, institutional and commercial customers by lowering the eligibility threshold to 1 MW and removing restrictions on eligible sectors.

2. ENERGY seek necessary TB/MBC approvals.

3. ENERGY seek approvals for:

i) the proposed *Ontario Rebate for Electricity Consumers Act, 2016* – and any supporting regulations under the proposed *Ontario Rebate for Electricity Consumers Act, 2016*, and with other complementary regulatory amendments and consequential legislative amendments to the *Ontario Energy Board Act, 1998* and the *Ontario Clean Energy Benefit Act, 2010*, subject to the Legislature's approval of the Act, including the following elements:

i. The rebate would be available starting January 1, 2017;
ii. The legislation would specify the types of costs to which the rebate would or would not be applied, with authority to make changes by regulation;
iii. The legislation would address invoicing requirements, including authority to prescribe how the rebate is to appear on consumers electricity bills;
iv. The legislation would include authority to prescribe the way in which the rebate is to be flowed through to consumers, and the way in which electricity vendors providing the rebate are to be reimbursed;

**Commented [SK217]:** This was from the Policy Minute. I assume this is the 'Minute' we are waiting for.

v. The legislation would include record-keeping requirements for electricity vendors and other prescribed persons;
vi. The legislation would include inspection powers for inspectors appointed by the minister of Finance, including powers related to the recovery of overpayments.
vii. The legislation would provide for regulation-making authority to establish a limitation period for ceasing payments and reimbursement based on past entitlement. Similar amendments would be provided for the *Ontario Clean Energy Benefit Act, 2010* but would allow the ceasing of all payments and reimbursements after a prescribed date.

4. ENERGY notes the following amendments:

i) Amendments to Ontario Regulation 429/04 (Adjustments Under Section 25.33 of the Act) made under the *Electricity Act, 1998* to lower the Industrial Conservation Initiative (ICI) threshold to 1 megawatt and require electricity consumers and market participants between 1 MW and 5 MW to opt in.

ii) Amendments to Ontario Regulation 442/01 (Rural or Remote Electricity Rate Protection) made under the Ontario Energy Board Act, 1998, to increase support through the Rural and Remote Rate Protection Plan to R2 low density rural electricity customers and provide for a periodic adjustment mechanism.

5. ENERGY work with MOECC to recycle an estimated annual average of $270 million of Cap and Trade auction proceeds from the Greenhouse Gas Reduction Account for non-RPP commercial and industrial electricity consumers over the first compliance period (2017-2020) through a volumetric rebate mechanism.

6. ENERGY and MOF work with Cabinet Office, Premier's office to develop a communications plan.

~~CABINET AGREED THAT:~~

~~1. THE MINISTRY OF ENERGY (ENERGY), WITH SUPPORT FROM THE MINISTRY OF FINANCE (MOF), SHALL PREPARE LEGISLATION THAT WOULD PROVIDE AN EIGHT PERCENT (8%) REBATE ON THE PRE-TAX COST OF ELECTRICITY FOR THE FOLLOWING CLASSES OF CONSUMERS:~~
~~A. ALL CONSUMERS ELIGIBLE TO BE BILLED UNDER THE ONTARIO ENERGY BOARD'S REGULATED PRICE PLAN; AND~~
~~B. ANY OTHER CONSUMERS WHO WERE ELIGIBLE FOR FINANCIAL ASSISTANCE UNDER THE *ONTARIO CLEAN ENERGY BENEFIT ACT, 2010* (OCEBA) DURING THE PERIOD THAT PROGRAM WAS IN PLACE.~~

~~2. THE LEGISLATION SHALL BE GENERALLY MODELLED UPON THE OCEBA, AND WOULD INCLUDE THE FOLLOWING ELEMENTS:~~
~~A. THE REBATE WOULD BE AVAILABLE STARTING JANUARY 1, 2017 AND BEFORE SUCH DATE AS MAY BE PRESCRIBED;~~
~~B. THE REBATE WOULD NOT BE SUBJECT TO A CAP UNLESS A CAP IS PRESCRIBED;~~
~~C. THE LEGISLATION WOULD SPECIFY THE TYPES OF COSTS TO WHICH THE REBATE WOULD OR WOULD NOT BE APPLIED, WITH AUTHORITY TO MAKE CHANGES BY REGULATION;~~

D. THE LEGISLATION WOULD ADDRESS INVOICING REQUIREMENTS, INCLUDING AUTHORITY TO PRESCRIBE HOW THE REBATE IS TO APPEAR ON CONSUMER ELECTRICITY BILLS;
E. THE LEGISLATION WOULD INCLUDE AUTHORITY TO PRESCRIBE THE WAY IN WHICH THE REBATE IS TO BE FLOWED THROUGH TO CONSUMERS, AND THE WAY IN WHICH ELECTRICITY VENDORS PROVIDING THE REBATE ARE TO BE REIMBURSED;
F. THE LEGISLATION WOULD INCLUDE RECORD-KEEPING REQUIREMENTS FOR ELECTRICITY VENDORS AND ANY OTHER PRESCRIBED PERSONS; AND
G. THE LEGISLATION WOULD INCLUDE INSPECTION POWERS FOR INSPECTORS APPOINTED BY THE MINISTER OF FINANCE, INCLUDING POWERS RELATED TO RECOVERY OF OVERPAYMENTS.

3. ENERGY AMEND O. REG. 429/04 (ADJUSTMENTS UNDER SECTION 25.33 OF THE ACT) MADE UNDER THE ELECTRICITY ACT, 1998 TO EXPAND ELIGIBILITY FOR CLASS A CONSUMERS AND CLASS A MARKET PARTICIPANTS UNDER THE INDUSTRIAL CONSERVATION INITIATIVE (ICI) TO ALL ELECTRICITY CONSUMERS AND MARKET PARTICIPANTS WITH A PEAK DEMAND ABOVE AN AVERAGE OF ONE MEGAWATT (1MW) WITH NO SECTORAL RESTRICTIONS ON PARTICIPATION.
4. ENERGY AMEND O. REG 442/01 (RURAL OR REMOTE ELECTRICITY RATE PROTECTION) MADE UNDER THE ONTARIO ENERGY BOARD ACT, 1998 TO INCREASE THE TOTAL AMOUNT OF RATE PROTECTION AVAILABLE TO LOW DENSITY HYDRO ONE INC. CONSUMERS UNDER THE RURAL OR REMOTE RATE PROTECTION PROGRAM BY $110 MILLION, EFFECTIVE JANUARY 1, 2017.
5. ENERGY CONSIDER AND, IF APPROPRIATE, UTILIZE A MECHANISM TO PERIODICALLY ADJUST THE TOTAL ANNUAL AMOUNT OF RATE PROTECTION AVAILABLE TO HYDRO ONE INC. CONSUMERS UNDER THE RURAL OR REMOTE ELECTRICITY RATE PROTECTION REGULATION / PROGRAM, EFFECTIVE JANUARY 1, 2018.
6. ENERGY TO RECYCLE UP TO AN AVERAGE OF $270 MILLION OF CAP AND TRADE AUCTION PROCEEDS FROM THE GREENHOUSE GAS REDUCTION ACCOUNT PER YEAR OVER THE FIRST COMPLIANCE PERIOD (2017-2020) TO COMMERCIAL AND INDUSTRIAL ELECTRICITY CONSUMERS.
7. ENERGY AND MOF TO WORK WITH CABINET OFFICE (CO) AND PREMIER'S OFFICE (PO) ON COMMUNICATIONS PLAN.

**Tab x**

## APPENDIX B: BACKGROUND – ONTARIO CLEAN ENERGY BENEFIT

Commented [RK18]: What about using the eligibility table in Energy's submission?

- OCEB was in effect from 2011 to 2015, and provided residential, farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax.
    - Effective September 2012 electricity consumption eligible for the 10 per cent benefit was capped at the first 3,000 kWh of electricity consumed per month.
- OCEB helped Ontario families through the transition to a more reliable and cleaner electricity system, with the monthly cap balancing the fiscal implications of providing electricity relief.
- OCEB costs totalled $1,006 million in 2013-14 and $1,078 million in 2014-15, with a projected cost for 2015-16 of $860 million (for the 9 months remaining in the program).

| **Eligible Consumers** | |
|---|---|
| **Categories Listed in Legislation (coincides with categories eligible for RPP)** | |
| **Residential** | • a dwelling<br>• a property within the meaning of the Condominium Act, 1998<br>• a residential complex, within the meaning of the Residential Tenancies Act, 2006<br>• a property that includes one or more housing units and that is owned or leased by a co-operative within the meaning of the Co-operative Corporations Act |
| **Farms** | • carries on a business that is a farming business for the purposes of the Farm Registration and Farm Organizations Funding Act, 1993, and<br>• holds a valid registration number assigned under that Act or the consumer's obligation to file a farming business registration form was waived pursuant to an order made under subsection 22 (6) of that Act |
| **Demand for electricity of 50 kW or less, or consumes not more than 250,000 kWh annually** | Would include small business, smaller broader- public-sector entities, and other small users. |
| **Special Cases (not eligible for RPP, but eligible for OCEB)** | |
| **Consumers On Retail Contracts** | Includes consumers with existing retail contracts and those who sign them during the duration of the program. |
| **Cornwall Electric and Hydro One Remote Communities Inc.** | Included since they are licensed distributors. |
| **Other Consumers Prescribed by Regulation** | 10 First Nations remote unlicensed distributors have been added by regulation. |
| **Exclusions** | |
| **Generators** | Generation station service and the microFIT distribution service charge are excluded in legislation. |

***Policy***

Cabinet agreed that:

1. ENERGY implement electricity price mitigation for residential, commercial and industrial consumers through the following:

i) Provide a rebate of 8% on the pre-tax cost of electricity for all electricity consumers eligible to be billed under the Ontario Energy Board's Regulated Price Plan (RPP); and any other consumers who would be eligible for RPP if their electricity account w~~as~~ere with a licensed distributor.

ii) Increase the total amount of rate protection available to R2 ~~with~~ low density electricity consumers under the Rural or Remote Rate Protection Program (RRRP) by increasing the subsidy by $110 million from its current level of $127 million, which has been capped since 2004.

iii) Implement a mechanism to periodically adjust the total annual amount of rate protection available to R2 low density electricity consumers under the RRRP, effective on or after January 1, 2018.

**Commented [RK1]:** Shouldn't this be better defined on the nature of the mechanism (inflation adjustment?) and / or what is being targeted as the effect of the mechanism (e.g., to pay similar amount as an R1 consumer, or some other target)?

iv) Expand~~ing~~ eligibility for participation in the Industrial Conservation Initiative (ICI) to smaller industrial, institutional and commercial customers by lowering the eligibility threshold to 1 MW and removing restrictions on eligible sectors.

2. ENERGY seek necessary TB/MBC approvals.

3. ENERGY seek approvals for:

i) the proposed *Ontario Rebate for Electricity Consumers Act, 2016* ~~**– NTD LSB – please confirm what title to use.]** and any supporting regulations under the proposed *Ontario Rebate for Electricity Consumers Act, 2016*, and with other complementary regulatory amendments and consequential legislative amendments to the *Ontario Energy Board Act, 1998* and the *Ontario Clean Energy Benefit Act, 2010*,~~ which would, subject to the Legislature's approval of the Act, includ~~e~~~~ing~~ the following elements:

i. The rebate would be available starting January 1, 2017;
ii. The legislation would specify the types of costs to which the rebate would or would not be applied, with authority to make changes by regulation;
iii. The legislation would address invoicing requirements, including authority to prescribe how the rebate is to appear on consumers' electricity bills;
iv. The legislation would include authority to prescribe the way in which the rebate is to be flowed through to consumers, and the way

in which electricity vendors providing the rebate are to be reimbursed;

v. The legislation would include record-keeping requirements for electricity vendors and other prescribed persons;

vi. The legislation would include inspection powers for inspectors appointed by the ~~m~~Minister of Finance, including powers related to the recovery of overpayments.

~~vi.~~vii. The legislation would include consequential amendments to the *Ontario Energy Board Act, 1998* and the *Ontario Clean Energy Benefit Act, 2010*,

viii. The legislation would provide for regulation-making authority to establish a limitation period for ceasing payments and reimbursement based on past entitlement. Similar amendments would be provided for the *Ontario Clean Energy Benefit Act, 2010* but would allow the ceasing of all payments and reimbursements after a prescribed date.

4. ENERGY to report back to LRC and Cabinet for approval of any supporting regulations under the proposed *Ontario Rebate for Electricity Consumers Act, 2016*, and with other complementary regulatory amendments.

5.~~4~~. ENERGY notes the following amendments:

i) Amendments to Ontario Regulation 429/04 (Adjustments Under Section 25.33 of the Act) made under the *Electricity Act, 1998* to lower the Industrial Conservation Initiative (ICI) threshold to 1 megawatt and require electricity consumers and market participants between 1 MW and 5 MW to opt in.

ii) Amendments to Ontario Regulation 442/01 (Rural or Remote Electricity Rate Protection) made under the Ontario Energy Board Act, 1998, to increase support through the Rural and Remote Rate Protection Plan to R2 low density ~~rural~~ electricity customers and provide for a periodic adjustment mechanism.

~~5~~6. ENERGY work with MOECC to recycle an estimated annual average of $270 million of Cap and Trade auction proceeds from the Greenhouse Gas Reduction Account for non-RPP commercial and industrial electricity consumers over the first compliance period (2017-2020) through a volumetric rebate mechanism.

~~6~~7. ENERGY and MOF work with Cabinet Office, Premier's office to develop a communications plan.

~~***TB/MBC***~~

**Commented [RK2]:** Shouldn't the clause indicate what the amendments are about – e.g., wrt the OEBA, to implement the proposed ORECA; and for OCEBA, to have wrap up timelines as per viii below, or is Energy asking for more? If so, what?

**Commented [RK3]:** Comment as above.

~~TBC with TBS~~

***~~LRC~~***

Cabinet approved version of the proposed ~~[name]~~ *Ontario Rebate for Electricity Consumers Act, 2016* ~~of this draft legislation~~ for introduction, subject to the following:

1. The Office of Legislative Counsel is authorized to prepare a French version and to make minor adjustments to the English version, for the purpose of ensuring consistency between the two versions and making other improvements or correcting mistakes discovered in the translation process.

---

Hi Ron,

Pls. see attached updated note. It's not clear if this item will stay on the agenda tomorrow afternoon for the TBS DM briefing but we would like to get it done and send to TBS for the record.

Thanks,

John.

**Subject:** Re: Cabinet note

Hi John,

I did not have time for a full review. I made a few quick suggestions. Is this briefing still happening?

Ron

**CABINET BRIEFING NOTE**

| | |
|---|---|
| **Committee:** | Cabinet |
| **Meeting Date:** | September ~~14~~13, 2016 |
| **Ministry:** | ENERGY |
| **Last reviewed by:** | **Tracking to:** Cabinet – September ~~14~~13, 2016 |

**[BASED ON DRAFT CABINET SUBMISSION]**

**SUBMISSION TITLE:** Electricity Price Mitigation (Ontario Rebate for Electricity Consumers)

## I. REQUEST/DECISION REQUIRED:

The Ministry of Energy is proposing measures to provide relief to various electricity consumer classes. These measure include:

1.a. Provide an ~~pre-tax~~ 8% rebate equal to the provincial portion of HST to consumers eligible for the ~~to~~ Regulated Price Plan (RPP) ~~consumers~~;

1.b. Updating Rural or Remote Rate Protection (RRRP);

2.a. Expanding the Industrial Conservation Initiative (ICI) eligibility to customers above 1MW in all sectors;

~~2.b.~~ Recycle cap and trade proceeds to commercial and industrial electricity consumers to provide a modest 1% reduction in rates, with modest savings from proceeds intended for electricity relief through the Climate Change Action Plan to provide fiscal offsets.

~~2.c.~~

~~2.d.~~2.b. ~~[Approve in principle an expenditure increase estimated at $261M [estimate subject to refinement from ENERGY] in 2016-17 for the Electricity Price Mitigation, offset from the Treasury Board Contingency Fund.]~~

**Commented [SK21]:** Re-ordered/numbered to align with revised deck.

**Commented [SK22]:** Unclear if this is necessary for the cabinet note as the TB/MBC note may be worried more on fiscal implications.

**Commented [RK3]:** Remove from here, but should be part of fiscal impact part of the note.

**Commented [SK24R3]:** Will do. It's in the financial summary section.

## II. KEY POINTS:

Context

Electricity costs have increased as the province has made investments in clean energy generation and modernized electricity infrastructure. Electricity bills are expected to continue to increase as more renewable energy projects come online.

As part of the 2016 Budget, the government committed to mitigating electricity cost impacts that were anticipated from the cap and trade program. The Climate Change Action Plan (CCAP) included up to $1.32B over 4 years to help keep electricity rates affordable for residential and industrial consumers. This included a commitment to provide a modest benefit of up to $2 per month, on average, to residential consumers.

The Ontario Clean Energy Benefit (OCEB) expired December 31, 2015, as part of the originally planned, five-year legislated program put in place as a broad-based, transitional measure to a

cleaner electricity system. OCEB was also put in place following the implementation of the Harmonised Sales Tax (HST). Unlike the previous provincial Retail Sales Tax (RST), the HST (and GST) included electricity in the taxable base. With the end of OCEB, the government ended the electricity Debt Retirement Charge (DRC) on residential users earlier than planned, as of January 1, 2016, and also put in place the low-income targeted Ontario Electricity Support Program (OESP).

In order to achieve the CCAP commitment and additional price mitigation, the Ministry of Energy has developed price mitigation options that consider tax-based levers, cap and trade proceeds, and shifting costs within the rate-base.

Proposal

| | Measure | Targeted Recipients | Impact (annually) | |
|---|---|---|---|---|
| | | | Fiscal | Rate Base |
| **1.a** | 8% Rebate to Regulated Price Plan eligible consumers | Residential, small business, small farms and other small users | $1B | - |
| **1.b** | Updating Rural or Remote Rate Protection | Residents in rural or remote locations: Hydro One's lowest-density R2 customers. | - | $110M |
| **2.a** | Expanding ICI eligibility to customers above 1MW in all sectors | Intermediate and large-sized industrial, commercial and institutional consumers above 1MW in all sectors | - | $47M/ $82M* |
| **2.b** | Redirecting cap and trade proceeds recycling:<br>• As part of the original CCAP policy, $330M of the cap & trade proceeds was to be recycled for electricity price mitigation for residential and non-residential users.<br>• Under this proposal, $270 M would be used to mitigate non-residential users<br>• provides $60M for potential fiscal offsets to the 8% rebate | Commercial and industrial electricity customers | ($60M)** | - |

*Short-term/Long-term rate base impact, where short term is one year after expanded eligibility takes place and long-term is expected impact once new customers have time to change behavior.
**To meet the Budget 2016 commitment, the Climate Change Action Plan (CCAP) committed $1.3B from the Greenhouse Gas Reduction Account (GGRA) or about $330M annually. Current proposal will require $60M less or $270M annually. Assumes the $60M is diverted to in-plan initiatives.

- ENERGY provided the following overview of bill impacts:

| Regulated Price Plan (Residential) Impact[1]* | | Class B (Commercial)[4] | Class A (Industrial)[4] | |
|---|---|---|---|---|
| Average[2] (750 kWh/month) | Rural[3]** (1000 kWh/month) | | Existing | New |

**Commented [SK25]:** Table below from the latest ENERGY Deck (FPC Major Project Morning of Sept 8).

| | | | | |
|---|---|---|---|---|
| -$~~10~~11/month (-~~6~~8%) | -$45/month (-20%) | -$1/MWh (-1%) | -$1/MWh (-1%) | Up to -$52/MWh (-34%) |

~~Note: The impact of cap and trade would not be added to electricity bills until 2017 and impact of ICI would not be added until 2018. All impacts included here for illustrative purposes~~

1~~*~~. ENERGY did not provide the monthly impact for other Regulated Price Plan not classified as Residential (eg. farms, small businesses) that would benefit from the 8% Rebate to Regulated Price Plan.

2. Regulated Price Plan Impact represents the pre-tax values of 8% rebate and does not include the impact of ICI expansion and RRRP update (total impact of $1.31/month based on 750 kWh/month).

3.~~**~~ Rural customers refers to those Hydro One customers eligible to receive RRRP (R2 rate class customers). Impact shown is pre-tax and does not include the impact of ICI expansion and RRRP update (total impact of $1.74/month based on 1000 kWh/month).

4. The impact of cap and trade would not be added to electricity bills until 2017 and impact of ICI would not be added until 2018.

**1.a. 8% Rebate to Regulated Price Plan (RPP)**

- An 8% rebate ~~on the pre-tax portion~~ for Regulated Price Plan (RPP) eligible consumers would be equal to the provincial portion of HST and funded by the tax base.
- The $1 billion figure is a 2017 to 2020 calendar year average of cost estimates developed by Ministry of Energy staff, as follows:

| *$ millions* | **2017** | **2018** | **2019** | **2020** |
|---|---|---|---|---|
| | 1,003 | 1,014 | 975 | 1,049 |
| Avg. 2017-20 | 1,010 | | | |

- On a fiscal year basis, the above estimates become:

| *$ millions* | **2016-17** | **2017-18** | **2018-19** | **2019-20** |
|---|---|---|---|---|
| | 261 | 1,006 | 1,004 | 994 |
| 3-Year Avg. | 1,001 | | | |

- Ministry of Energy staff are in the process of developing a refined estimate of the cost.

- The rebate would appear directly on bills. As such, Local Distribution Companies (LDC) would be the delivery mechanism for the rebate.
  - While non-Regulated Price Plan eligible consumers would not see a benefit from the 8% rebate under this option, all industrial and commercial consumers would receive proceeds recycling through the Greenhouse Gas Reduction Account (GGRA).
  - Commercial and industrial consumers would also continue to receive input tax credits and Public Service Bodies would continue to receive PSB rebates.
- New legislation would be required and closely mirror the Ontario Clean Energy Benefit (OCEB) Act, 2010. More details further below.
- On-bill rebate delivery would likely require adjustments to Local Distribution Company (LDC) billing systems, which could impact delivery costs and timelines.
- In the past, LDCs have asked for at least six months' notice when implementing billing system changes.

  - One option to address any timing concerns is to allow LDCs to provide retroactive payments if their systems cannot be updated in time for January 1, 2017. This was done with the OCEB.
- The rebate would not be directly linked to HST.

**1.b. Updating (Increasing) Rural or Remote Rate Protection**

- RRRP funding supporting Hydro One R2 (rural) customers capped at current levels since 2004.
- The current program provides a monthly subsidy of ~~a about~~ $~~32~~31.50/month.
- Proposal will provide an additional $110 million in support to approximately 329,000 R2 customers to $235 million annually.
- Proposal will increase the subsidy by about $28/month and equalize R2 bills with Hydro One R1 (medium) density customers at 1,000 kWh.
- All residential consumers would see an average cost increase of about $0.60/month.
- ENERGY is considering options to periodically adjust the amount of rate protection eg. indexed at inflation or “trued up” on a regular basis.

**2.a. Expanding ICI Eligibility to customers above 1MW in all sectors**

- Lower threshold for participation in ICI to 1 MW and remove sectoral restrictions.
- Most newly eligible ICI participants who choose to opt-in to the program would be able to reduce their electricity costs substantially. All other consumers would see a relatively small increase in their bills.
- Expanding the ICI will reduce electricity peak demand by incenting more consumers to lower their electricity demand during peak periods (80MW in the short term and 165 MW in the long term)
- Bill savings to new participants up to 21% in the short term and up to 34% long-term.
- Newly eligible consumers in the program would mostly fall into the small industrial, institutional and commercial category, including: automotive supply chain companies, office tower, large shopping mall, greenhouses and others.
  - Companies that would become eligible under such an expansion include Kellogg, Canlan Ice Sports, Cambridge Towel, SLACAN and Casino Rama.
- Class B consumers would have a collective increase in the Global Adjustment of $47M in the short term and $~~87M~~ 82M in the long term from this initiative.
- Residential consumers would see an average cost increase of $0.42/month in the short term and $0.74/month in the long term.

**2.b. Redirect Cap and Trade Proceeds Recycling**

- The 2016 Budget committed to offset the impact of cap and trade for commercial and industrial electricity consumers, while also providing a benefit of up to $2 per month for residential electricity consumers.
- Ontario’s Climate Change Action Plan (CCAP) includes up to $1.32 billion over 4 years to help keep electricity rates affordable for residential and industrial consumers.
- ~~The GGRA allocated $120M to average residential consumers, $170M to commercial and $40M to industrial consumers.~~

**Commented [SK26]:** Suggest deletion. This breakdown is not in the latest deck. Furthermore the chart on Slide 21 shows $335M original allocation, not $330M.

**Tab x**

- The 8% rebate to the Regulated Price Plan consumers fulfills the commitment to reduce residential rates by $2/month.
    - Proposal would lead to savings of the $120M in GGRA proceeds previously allocated to residential consumers, and help offset the fiscal impact of the 8% rebate to the Regulated Price Plan consumers.
- To provide price mitigation to commercial and industrial electricity consumers, ENERGY is proposing to direct an additional $60M of cap and trade auction proceeds to industrial and commercial consumers not in the RPP to mitigate impacts.
- The current proposal would require an estimated $60 million less per year, or $0.24 billion less over the first compliance period.

## III. KEY CONSIDERATIONS

- This request ~~on~~for an 8% rebate does not align with the 2016 Budget fiscal plan and there are no proposed offsets.

- Due to the nature of the ICI Global Adjustment mechanism and cost recovery of the RRRP, the rate base proposals (~~##~~21b and ~~#3~~#2a), while benefiting the targeted recipients, would **come at a cost to all other electricity rate payers in Ontario**.

- ~~This request does not align with the 2016 Budget fiscal plan and there are no proposed offsets.~~

- Other price mitigation measures introduced following the implementation of the HST, as well as the end of OCEB, would continue.
    - Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and Northern Ontario Energy Credit (NOEC) were introduced/ enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).
    - The DRC on residential consumers was ended early, as of January 1, 2016 (about a $340 million impact in 2016-17).
    - OESP is a low-income targeted program funded by electricity consumers through the electricity rate base.

- 

**8% Rebate to Regulated Price Plan**

- The 8% ~~pre-tax~~ rebate would provide a typical residential consumer about an $11 per month benefit on average (about $10, after the impact of RRRP and ICI expansion), exceeding the Budget 2016 $2 per month on average, cap and trade commitment.

- This 8% ~~pre-tax~~ rebate equal to the provincial portion of HST is similar to the previous Ontario Clean Energy Benefit (See Appendix for background) which provided a 10% post-tax rebate.
- The proposal indicates the Regulated Price Plan consumption amount to be 58TWh [Slide 2 in latest, FPC-Major Projects Deck]. Unclear if this applies to all eligible RPP consumers. A p~~P~~reliminary MOF estimate for consumption ~~for~~under the OCEB program approximated annual OCEB-eligible consumption range of 64-68TWh ~~of annual electricity consumption~~ between September 11 and December 2015. [This would represent about 10-17% more in additional program cost to the current estimate of $1 billion per year.]
- The OCEB legislation was set out with an end date, and was subsequently modified to be capped at 3,000 kWh per month for all electricity customers after 8 months of the program.
    - This proposal does not specify any consumption caps nor an end date.
- Due to the lack of a cap, compared to OCEB, this proposal is more generous to the high volume RPP users.

  - OCEB rebate was applicable for up to 36,000 kWh annually (12 months times 3,000 kWh cap per month) while this proposal would be **more generous for those consuming more than 50,850 kWh** annually.
  - Furthermore, highest volume users in this proposal would receive **up to 392% more** than under the OCEB program.
- Unclear why any proposals for a cap would be any more complex or onerous to LDCs than prior OCEB cap (instituted beginning September 2012 to termination of OCEB program in December 2015). However, cap may affect some types of consumers more than others, such as small businesses, condo dwellers in separately-metered units paying for electricity usage in the common elements, and residential consumers heating with electricity.

- ~~Blanket r~~Reduction in electricity prices for all users irrespective of consumption amounts hamper efforts to conserve electricity, and mutes TOU price signals.
- [Businesses ~~that fall under the Regulated Price Plan~~ pay little to no HST due to the Input Tax Credit. For those businesses eligible for the Regulated Price plan, ~~T~~the 8% reduction can be deemed a windfall ~~for these users~~.]

**Updating Rural or Remote Rate Protection**

- According to ENERGY, the RRRP is a $175M program with the majority of program funding ($125.5M) to Hydro One's lowest-density 'R2' customers
- ~~Unclear why customers on RRRP who are not Hydro One's R2 customers are not also targeted for this benefit.~~

**Expanding ICI Eligibility to customers above 1MW in all sectors**

- Not all users with demand above 1MW will be in a position to take full advantage of the ICI expansion (eg. inability to load shift during peaks).
- Consumers in the commercial sector currently do not pay time-of-use prices and have little incentive to shift demand away from high demand hours.
  - Expansion of the ICI can give commercial consumers who are able to shift demand during peak hours, the opportunity to opt-in and benefit.

**Redirect Cap and Trade Proceeds Recycling**

- Deck implies $60M in savings ~~from 8% Rebate for the RPP consumers.~~compared to earlier climate change electricity price mitigation recycling plan.
  - ~~Unclear, how the redirected amount $60M ($120M-$60M) will be allocated to commercial and industrial users.~~
  - A fiscal offset to the initiative would materialize only if the $60M is diverted to in-plan initiatives.

## IV. Cabinet Committee Discussion Summary

n/a

**Commented [SK7]:** 36000*0.113/0.08 = 50,850

36000 – max OCEB eligible consumption
0.113 – pre-tax effective OCEB rebate
0.08 – pre-tax effective rebate (8%)

**Commented [SK28]:** 36000 – max OCEB eligible consumption
0.113 – pre-tax effective OCEB rebate

36000*0.113 = 4068 [OCEB effective rebated consumption]

Max under proposal: 250,000
pre-tax effective rebate: 0.08
Proposal's effective rebated consumption: 250,000*0.08 = 20,000

(20,000-4068)/4068 = **3.9164**

**Commented [SK29]:** Is this referring to the issue with common elements in condos and how they fall under one bill separate from the units?

**Commented [SK10]:** Will need to verify

**Commented [SK211]:** I'm trying to say that there's a portion of RRRP customers who will not receive this benefit.

Is there a reason these other customers are not also getting the expansion?

**Commented [JK12]:** Which sectors? There was a deck recently that showed the composition of GA in the bills paid by sectors. I believe it was one of the price mitigation decks.

**Commented [SK213R12]:** This is a general statement.

Slide 32 in the 20160902_330pm deck.

## V. Financial Summary

| $ Millions | 2016-17 | 2017-18 | 2018-19 |
|---|---|---|---|
| Initiative cost requested | 261 | 1,006 | 1,004 |
| Requested program base | 261 | 1,006 | 1,004 |
| Total fiscal impact (draw from c-funds) | 261 | 1,006 | 1,004 |

## VI. Performance Measures

[To estimate the impact of the program, the savings provided to the various consumers, and any potential for adjustments to the program, information should be provided from LDCs on consumption profiles and rebate amounts, particularly those affected by the 8% rebate on Regulated Price Plan Consumers.]

## APPENDIX A: PROPOSED POLICY MINUTE

[WORK IN PROGRESS, WAITING ON ENERGY'S FINAL SUBMISSION]

Cabinet agreed that:

1. ENERGY implement electricity price mitigation for residential, commercial and industrial consumers through the following:

i) Provide a rebate of 8% on the pre-tax cost of electricity for all electricity consumers eligible to be billed under the Ontario Energy Board's Regulated Price Plan (RPP); and any other consumers who would be eligible for RPP if their electricity account was with a licensed distributor.

ii) Increase the total amount of rate protection available to R2 with low density electricity consumers under the Rural or Remote Rate Protection Program (RRRP) by increasing the subsidy by $110 million from its current level of $127 million which has been capped since 2004.

iii) Implement a mechanism to periodically adjust the total annual amount of rate protection available to R2 low density electricity consumers under the RRRP, effective on or after January 1, 2018.

iv) Expanding eligibility for participation in the Industrial Conservation Initiative (ICI) to smaller industrial, institutional and commercial customers by lowering the eligibility threshold to 1 MW and removing restrictions on eligible sectors.

2. ENERGY seek necessary TB/MBC approvals.

3. ENERGY seek approvals for:

i) the proposed *Ontario Rebate for Electricity Consumers Act, 2016* – and any supporting regulations under the proposed *Ontario Rebate for Electricity Consumers Act, 2016*, and with other complementary regulatory amendments and consequential legislative amendments to the *Ontario Energy Board Act, 1998* and the *Ontario Clean Energy Benefit Act, 2010*, subject to the Legislature's approval of the Act, including the following elements:

   i. The rebate would be available starting January 1, 2017;
   ii. The legislation would specify the types of costs to which the rebate would or would not be applied, with authority to make changes by regulation;
   iii. The legislation would address invoicing requirements, including authority to prescribe how the rebate is to appear on consumers electricity bills;
   iv. The legislation would include authority to prescribe the way in which the rebate is to be flowed through to consumers, and the way in which electricity vendors providing the rebate are to be reimbursed;

**Commented [SK214]:** This was from the Policy Minute. I assume this is the 'Minute' we are waiting for.

v. The legislation would include record-keeping requirements for electricity vendors and other prescribed persons;
vi. The legislation would include inspection powers for inspectors appointed by the minister of Finance, including powers related to the recovery of overpayments.
vii. The legislation would provide for regulation-making authority to establish a limitation period for ceasing payments and reimbursement based on past entitlement. Similar amendments would be provided for the *Ontario Clean Energy Benefit Act, 2010* but would allow the ceasing of all payments and reimbursements after a prescribed date.

4. ENERGY notes the following amendments:

i) Amendments to Ontario Regulation 429/04 (Adjustments Under Section 25.33 of the Act) made under the *Electricity Act, 1998* to lower the Industrial Conservation Initiative (ICI) threshold to 1 megawatt and require electricity consumers and market participants between 1 MW and 5 MW to opt in.

ii) Amendments to Ontario Regulation 442/01 (Rural or Remote Electricity Rate Protection) made under the Ontario Energy Board Act, 1998, to increase support through the Rural and Remote Rate Protection Plan to R2 low density rural electricity customers and provide for a periodic adjustment mechanism.

5. ENERGY work with MOECC to recycle an estimated annual average of $270 million of Cap and Trade auction proceeds from the Greenhouse Gas Reduction Account for non-RPP commercial and industrial electricity consumers over the first compliance period (2017-2020) through a volumetric rebate mechanism.

6. ENERGY and MOF work with Cabinet Office, Premier's office to develop a communications plan.

~~CABINET AGREED THAT:~~

~~1. THE MINISTRY OF ENERGY (ENERGY), WITH SUPPORT FROM THE MINISTRY OF FINANCE (MOF), SHALL PREPARE LEGISLATION THAT WOULD PROVIDE AN EIGHT PERCENT (8%) REBATE ON THE PRE-TAX COST OF ELECTRICITY FOR THE FOLLOWING CLASSES OF CONSUMERS:~~
~~A. ALL CONSUMERS ELIGIBLE TO BE BILLED UNDER THE ONTARIO ENERGY BOARD'S REGULATED PRICE PLAN; AND~~
~~B. ANY OTHER CONSUMERS WHO WERE ELIGIBLE FOR FINANCIAL ASSISTANCE UNDER THE *ONTARIO CLEAN ENERGY BENEFIT ACT, 2010* (OCEBA) DURING THE PERIOD THAT PROGRAM WAS IN PLACE.~~

~~2. THE LEGISLATION SHALL BE GENERALLY MODELLED UPON THE OCEBA, AND WOULD INCLUDE THE FOLLOWING ELEMENTS:~~
~~A. THE REBATE WOULD BE AVAILABLE STARTING JANUARY 1, 2017 AND BEFORE SUCH DATE AS MAY BE PRESCRIBED;~~
~~B. THE REBATE WOULD NOT BE SUBJECT TO A CAP UNLESS A CAP IS PRESCRIBED;~~
~~C. THE LEGISLATION WOULD SPECIFY THE TYPES OF COSTS TO WHICH THE REBATE WOULD OR WOULD NOT BE APPLIED, WITH AUTHORITY TO MAKE CHANGES BY REGULATION;~~

D. THE LEGISLATION WOULD ADDRESS INVOICING REQUIREMENTS, INCLUDING AUTHORITY TO PRESCRIBE HOW THE REBATE IS TO APPEAR ON CONSUMER ELECTRICITY BILLS;
E. THE LEGISLATION WOULD INCLUDE AUTHORITY TO PRESCRIBE THE WAY IN WHICH THE REBATE IS TO BE FLOWED THROUGH TO CONSUMERS, AND THE WAY IN WHICH ELECTRICITY VENDORS PROVIDING THE REBATE ARE TO BE REIMBURSED;
F. THE LEGISLATION WOULD INCLUDE RECORD-KEEPING REQUIREMENTS FOR ELECTRICITY VENDORS AND ANY OTHER PRESCRIBED PERSONS; AND
G. THE LEGISLATION WOULD INCLUDE INSPECTION POWERS FOR INSPECTORS APPOINTED BY THE MINISTER OF FINANCE, INCLUDING POWERS RELATED TO RECOVERY OF OVERPAYMENTS.

3. ENERGY AMEND O. REG. 429/04 (ADJUSTMENTS UNDER SECTION 25.33 OF THE ACT) MADE UNDER THE ELECTRICITY ACT, 1998 TO EXPAND ELIGIBILITY FOR CLASS A CONSUMERS AND CLASS A MARKET PARTICIPANTS UNDER THE INDUSTRIAL CONSERVATION INITIATIVE (ICI) TO ALL ELECTRICITY CONSUMERS AND MARKET PARTICIPANTS WITH A PEAK DEMAND ABOVE AN AVERAGE OF ONE MEGAWATT (1MW) WITH NO SECTORAL RESTRICTIONS ON PARTICIPATION.
4. ENERGY AMEND O. REG 442/01 (RURAL OR REMOTE ELECTRICITY RATE PROTECTION) MADE UNDER THE ONTARIO ENERGY BOARD ACT, 1998 TO INCREASE THE TOTAL AMOUNT OF RATE PROTECTION AVAILABLE TO LOW DENSITY HYDRO ONE INC. CONSUMERS UNDER THE RURAL OR REMOTE RATE PROTECTION PROGRAM BY $110 MILLION, EFFECTIVE JANUARY 1, 2017.
5. ENERGY CONSIDER AND, IF APPROPRIATE, UTILIZE A MECHANISM TO PERIODICALLY ADJUST THE TOTAL ANNUAL AMOUNT OF RATE PROTECTION AVAILABLE TO HYDRO ONE INC. CONSUMERS UNDER THE RURAL OR REMOTE ELECTRICITY RATE PROTECTION REGULATION / PROGRAM, EFFECTIVE JANUARY 1, 2018.
6. ENERGY TO RECYCLE UP TO AN AVERAGE OF $270 MILLION OF CAP AND TRADE AUCTION PROCEEDS FROM THE GREENHOUSE GAS REDUCTION ACCOUNT PER YEAR OVER THE FIRST COMPLIANCE PERIOD (2017-2020) TO COMMERCIAL AND INDUSTRIAL ELECTRICITY CONSUMERS.
7. ENERGY AND MOF TO WORK WITH CABINET OFFICE (CO) AND PREMIER'S OFFICE (PO) ON COMMUNICATIONS PLAN.

**Tab x**

## APPENDIX B: BACKGROUND – ONTARIO CLEAN ENERGY BENEFIT

- OCEB was in effect from 2011 to 2015, and provided residential, farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax.
    - Effective September 2012 electricity consumption eligible for the 10 per cent benefit was capped at the first 3,000 kWh of electricity consumed per month.
- OCEB helped Ontario families through the transition to a more reliable and cleaner electricity system, with the monthly cap balancing the fiscal implications of providing electricity relief.
- OCEB costs totalled $1,006 million in 2013-14 and $1,078 million in 2014-15, with a projected cost for 2015-16 of $860 million (for the 9 months remaining in the program).

| **Eligible Consumers** | |
|---|---|
| **Categories Listed in Legislation (coincides with categories eligible for RPP)** | |
| **Residential** | • a dwelling<br>• a property within the meaning of the Condominium Act, 1998<br>• a residential complex, within the meaning of the Residential Tenancies Act, 2006<br>• a property that includes one or more housing units and that is owned or leased by a co-operative within the meaning of the Co-operative Corporations Act |
| **Farms** | • carries on a business that is a farming business for the purposes of the Farm Registration and Farm Organizations Funding Act, 1993, and<br>• holds a valid registration number assigned under that Act or the consumer's obligation to file a farming business registration form was waived pursuant to an order made under subsection 22 (6) of that Act |
| **Demand for electricity of 50 kW or less, or consumes not more than 250,000 kWh annually** | Would include small business, smaller broader- public-sector entities, and other small users. |
| **Special Cases (not eligible for RPP, but eligible for OCEB)** | |
| **Consumers On Retail Contracts** | Includes consumers with existing retail contracts and those who sign them during the duration of the program. |
| **Cornwall Electric and Hydro One Remote Communities Inc.** | Included since they are licensed distributors. |
| **Other Consumers Prescribed by Regulation** | 10 First Nations remote unlicensed distributors have been added by regulation. |
| **Exclusions** | |
| **Generators** | Generation station service and the microFIT distribution service charge are excluded in legislation. |

Hi,

Let me review that. I think their estimates may have been based on OCEB anyway, so may need to rephrase.

Ron

Hi Ron,

Pls. see attached updated note. It's not clear if this item will stay on the agenda tomorrow afternoon for the TBS DM briefing but we would like to get it done and send to TBS for the record.

Thanks,

John.

I've added a bunch of comments. Lots of issues.

If there was the same issue for all 4 charts, I just put it in a comment box once.

Please see attached or found here:

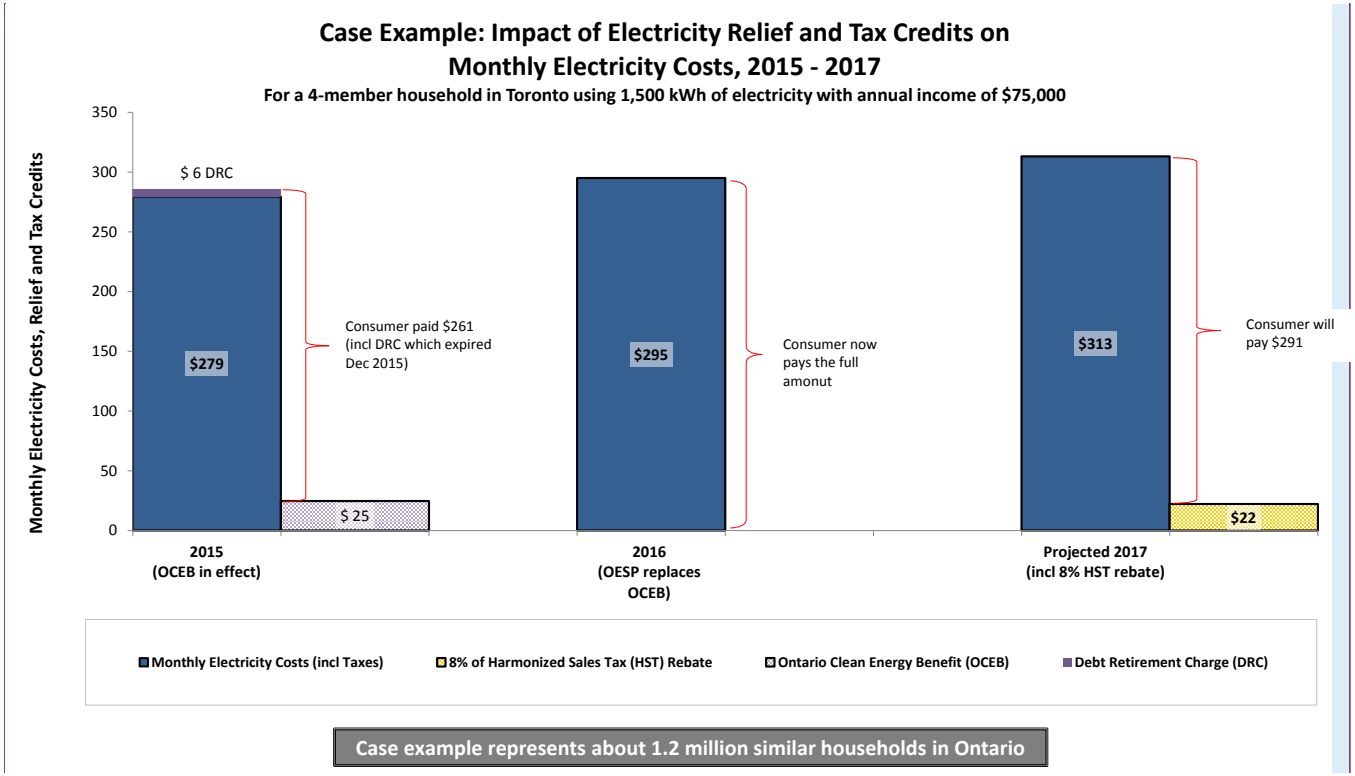
**Subject:** Case Examples Impacts of Electricity Relief and Tax Credits Sept 16 201 .docx

Hi,

See attached from Tax.

Please review and provide comments and any potential suggested revisions.

Thanks,
Ron



**Source: Ministry of Finance estimates**

**NOTES:**

1. Case example assumes the family owns a house in Toronto and pays property taxes worth about $3,500.
2. Case example family has an electricity meter with the Toronto Hydro.
3. Monthly electricity costs are based on OEB bill calculator, with a 'time-of-use' pattern (off-peak 62%, mid-peak 23% and on-peak 15%) and total electricity usage of 1,500 kWh. Sensitivity analysis on 'time-of-use' patterns and electricity usage shows minimal differences in monthly costs.
4. ~~According to the Ontario Energy Board (OEB), a~~A ~~similar family type~~ consumer using 1,500 kWh~~to the case example~~ paid ~~about~~ $10.50~~6~~ per month in 2015 for the DRC.
5. Case example family receives full OCEB benefits in 2015. The OCEB provided a 10% rebate on the first 3,000 kWh of electricity usage
6. For 2016 and 2017, the case example family is not entitled to any OESP payments. (The OESP cut-off is $52,000).
7. Case example family at its current income level is not entitled to OSTC and ~~PEPTC~~OEPTC.
8. Case example family does not receive the Northern Ontario Energy Credit (NOEC) as they live in Toronto, Ontario.

**Commented [SK21]:** **Same issues for all the charts:** What is the source of the Monthly Electricity Costs in 2015, 2016 and 2017?

**Commented [SK22]:** 1,500 kWh seems high for Toronto. Presumably natural gas heating rather than electric heating.

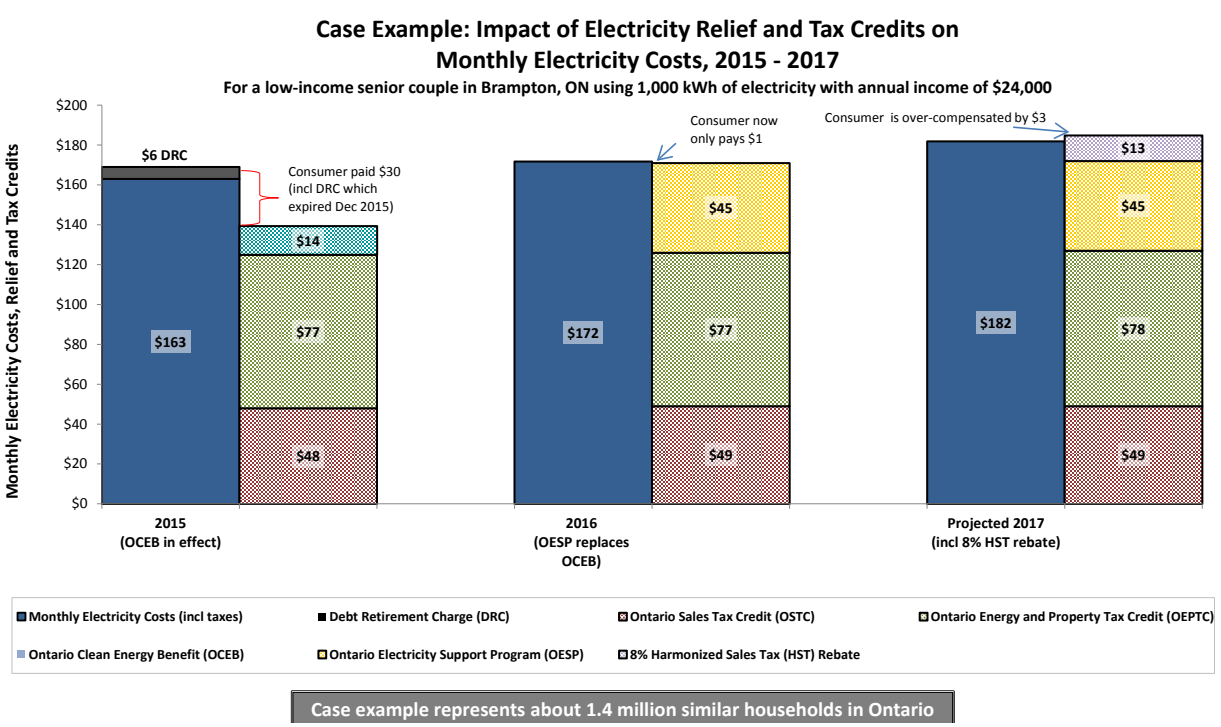
**Same issues for all four charts:** The title for the 2016 bar says 'OESP replaces OCEB'. This is an inaccurate statement, suggest deletion.

The title for the 2017 bar says 'incl. 8% HST rebate'. Should read instead: including 8% Provincial HST".

**Commented [EK3]:** 2015: DRC was $10.50 per month before tax for a consumer using 1,500 kWh per month. Total electricity bill before OCEB is $279 + $10.50(+tax) = $289.50. Therefore, OCEB amount is $29.

Is there a source for there being 1.2 million urban households at an income level of $75,000?

In general, the total number of similar households for the examples in this document seems high. According to the values in this document the total number of households represented in the four examples is six million. There are about five million households in Ontario, which would include other household types not represented by the examples given in this document.



**Source: Ministry of Finance estimates**

**NOTES:**

1. Case example assumes the couple rents an apartment in Brampton, ON with a separate meter with Hydro One Brampton Network Inc.
2. Monthly electricity costs based on OEB bill calculator, with a 'time-of-use' pattern (off-peak 75%, mid-peak 20% and on-peak 5%) [what's the assumption behind this off-mid-on peak distribution of consumption] and total electricity usage of 1,000 kWh [what is the justification for 1,000 kWh]. Sensitivity analysis on 'time-of-use' patterns and electricity usage shows minimal differences in monthly costs.
3. ~~According to the Ontario Energy Board (OEB), a similar family type to the case example~~A consumer using 1,000 kWh paid ~~about~~ $~~6~~7 per month in 2015 for the DRC.
4. Case example family receives full OCEB benefits in 2015. The OCEB provided a 10% rebate on the first 3,000 kWh of electricity usage
5. For 2016 and 2017, the case example family is entitled to higher ~~high-intensity~~ OESP payments as an energy intensive user.
6. The OSTC and OEPTC [please confirm] is not fully attributable to offsetting the impact of ~~increasing~~ electricity prices.
7. OEPTC estimate is based on property tax information of similar families living in Brampton with similar incomes and household sizes.
8. Case example family does not receive the Northern Ontario Energy Credit (NOEC) as they live in Brampton, ON; nor the Ontario Senior Homeowners' Property Tax Grant (OSHPTG) as they are renters and do not directly pay property taxes.

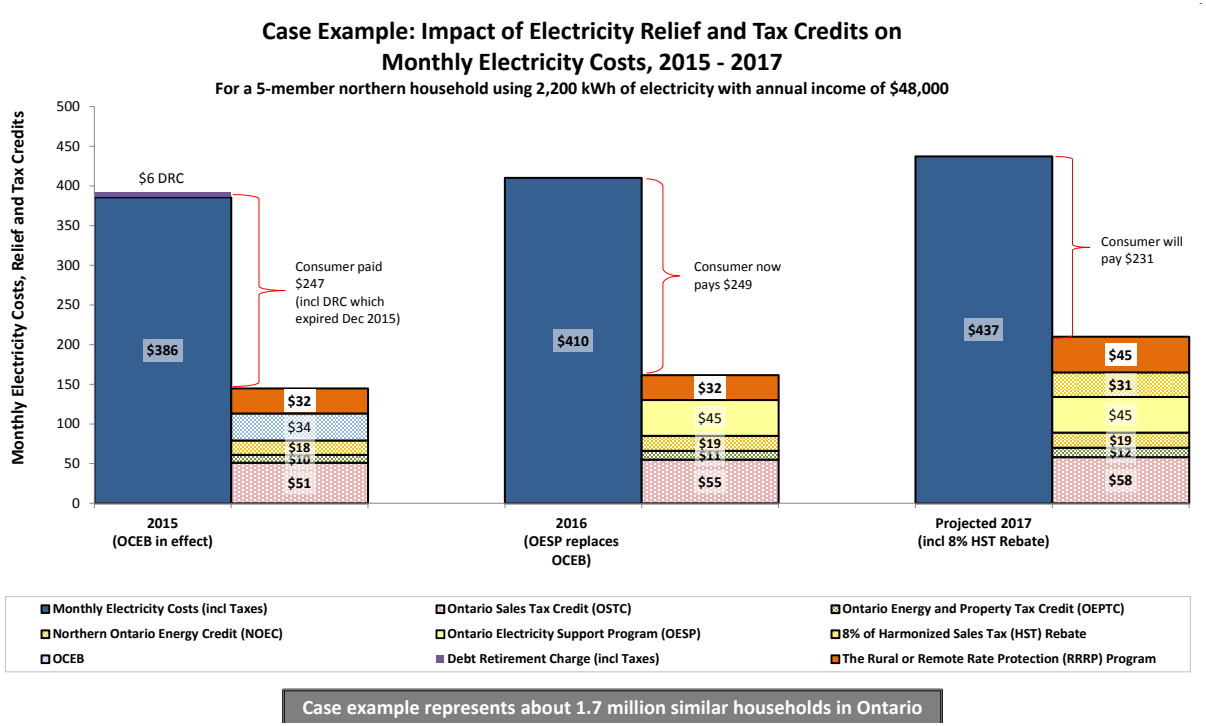
**Commented [SK24]:** **Same issues for all four charts:**
Is there any desire to distinguish taxpayer funded benefits and ratepayer funded benefits? (Just a suggestion)

**Commented [SK25]:**
**Same issues for all four charts:**
OSTC, and OEPTC are not fully attributable to offsetting electricity costs. It's distortionary to indicate that consumers are 'only' paying $30, or $1 or over-compensated by $3.

**Commented [EK6]:** 2015: DRC was $7 per month before tax for a consumer using 1,000 kWh per month. Total electricity bill before OCEB is $163 + $7(+tax) = $170. Therefore, OCEB amount is $17.

What is the source for 1.4 million low-income urban households which qualify for higher OESP payments?

Higher OESP payments are only available to households with electric heating, or that use medical devices requiring a lot of power, or First Nations and Métis households. Assuming the higher OESP payments limits the generality of this example. There wouldn't be 1.4 million households that qualify for higher OESP payments.



**Source: Ministry of Finance estimates**

**NOTES:**

1. Case example assumes the family lives in northern Ontario, owns a house that is heated with electricity. In low density, rural areas, reliance on electricity for home heating is more common.
2. Case example family is a ~~client~~ customer of the Northern Ontario Wires Inc. [Suggest using Hydro One Year-Round Low Density, R2 example instead of Northern Ontario Wires Inc.]
3. Monthly electricity costs based on OEB bill calculator, with a 'time-of-use' pattern (off-peak 65%, mid-peak 15% and on-peak 20%) [whats the reason for this TOU distribution?] and total electricity usage of 2,200 kWh [where does this come from?]. Sensitivity analysis on 'time-of-use' patterns and electricity usage shows minimal differences in monthly costs.
4. ~~According to the Ontario Energy Board (OEB), a similar family type to the case example~~ A consumer using 2,200 kWh paid ~~about~~ $~~6~~15.40 per month in 2015 for the DRC.
5. Case example family receives full OCEB benefits in 2015. The OCEB provided a 10% rebate on the first 3,000 kWh of electricity usage
6. For 2016 and 2017, the case example family is entitled to higher ~~high-intensity~~ OESP payments as an energy intensive user.
7. The OSTC, NOEC and OEPTC is not fully attributable to offsetting the impact of ~~increasing~~ electricity prices.
8. OEPTC estimate is based on property tax information of similar families living in northern Ontario with similar incomes and household sizes.

**Commented [SK27]:** Just a minor suggestion, but using more distinctive colours would make it easier to attribute the benefit amount/bar chart with legend. There are 3 yellow-beige colours (particularly in the 3rd bar) that are almost indistinguishable.

**Commented [SK28]:** RRRP in 2017 should be ~$60/month.

The news releases mentioned $45 when referencing the benefit caused by BOTH the 8% rebate (assuming 1000kWh/month) and RRRP expansion.

**Commented [SK29]:** The discount Provided by RRRP is already embedded in the price of the bill (ie. if it wasn't for the RRRP reducing the bill, the blue chart would otherwise be higher).

In other words, by adding the orange bar, the impact of RRRP is being counted twice in these illustrations.

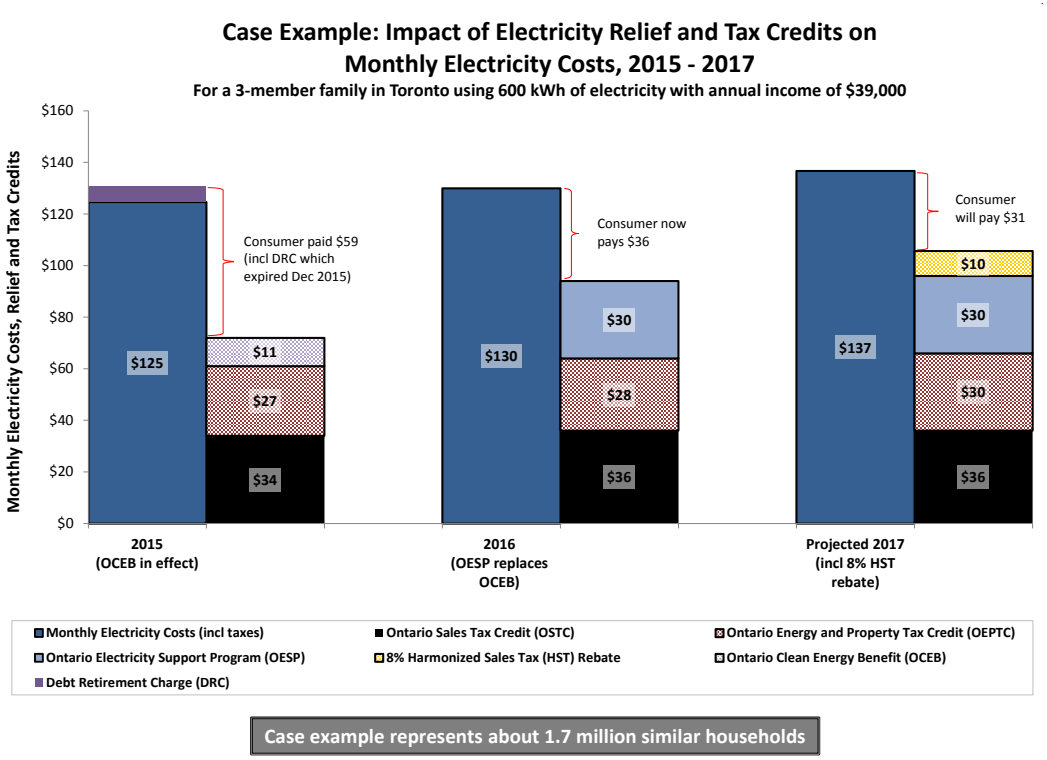
**Commented [SK210]:** Northern Ontario Wires customers not eligible for increased RRRP payments, only Hydro One R2 customers.

See Northern Ontario Wires rate application:
http://www.rds.ontarioenergyboard.ca/webdrawer/webdrawer.dll/webdrawer/rec/520947/view/dec_ro_NOW_20160317.PDF

Vs Hydro One
http://www.rds.ontarioenergyboard.ca/webdrawer/webdrawer.dll/webdrawer/rec/512951/view/Rate_Order_HONI_Dx_20160114.PDF (pg 10 of PDF)

**Commented [EK11]:** 2015: DRC was $15.40 per month before tax for a consumer using 2,200 kWh per month. Total electricity bill before OCEB is $386 + $15.40(+tax) = $401.40. Therefore, OCEB amount is $40.

What is the source for 1.7 million northern households?



**Source: Ministry of Finance estimates**

**NOTES:**

1. Case example assumes the family lives in Toronto, owns a house and pays about $2,800 in property taxes.
2. Case example family is a ~~client~~ customer of ~~the~~ Toronto Hydro.
3. Monthly electricity costs based on OEB bill calculator, with a 'time-of-use' pattern (off-peak 70%, mid-peak 17% and on-peak 10%) [whats the source of this amount?] and total electricity usage ~~-~~of ~~-~~600 kWh [Whats the source of this amount]. Sensitivity analysis on 'time-of-use' patterns and electricity usage shows minimal differences in monthly costs.
4. ~~According to the Ontario Energy Board (OEB), a similar family type to the case example~~ A consumer using 600 kWh paid ~~about~~ $~~6~~4.20 per month in 2015 for the DRC.
5. Case example family receives full OCEB benefits in 2015. The OCEB provided a 10% rebate on the first 3,000 kWh of electricity usage
6. For 2016 and 2017, the case example family is entitled to regular OESP payments.
7. The OSTC and OEPTC is not fully attributable to offsetting the impact of ~~increasing~~ electricity prices.
8. OEPTC estimate is based on property tax information of similar families living in Toronto with similar incomes and household sizes.

**Commented [SK212]:** Just a suggestion, if the benefit doesn't apply in this scenario, remove it from the legend.

**Commented [SK213]:** Just a suggestion, use similar colours as above for the same credit/benefit. Eg. if OSTC is black here, it should be black in all charts above.

**Commented [SK214]:** What is the source for the 1.7 similar households.

Also what is the definition of 'similar'? (3-member family, in Toronto, 600kWh, $39K).

**Commented [EK15]:** 2015: DRC was $4.20 per month before tax for a consumer using 2,200 kWh per month. Total electricity bill before OCEB is $125 + $4.20(+tax) = $401.40. Therefore, OCEB amount is $13.

Hi Ron,

Pls. see attached updated note.

Thanks,

John.

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Rate Mitigation Plan Options"

The Ministry of Energy (Energy) is providing potential price mitigation initiatives.

## CONTEXT

- As outlined in Energy's deck, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g., GEIA renegotiation with Samsung consortium, decreasing FIT prices, etc.).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs or risks from the rate base to the tax base. The fiscal exposure could be well over $2 billion in 2017-18.
- The largest impacts on rates and largest potential fiscal exposures are from the deferred recovery of Global Adjustment costs ($2 bn per year or more) and an enhanced, tax-base-funded 5% rebate for Regulated Price Plan (RPP) customers (about $700 million per year).
    - Significant fiscal exposure comes from proposals not yet fully costed by Energy (e.g., the Global Adjustment, with Energy to benefit from consulting with OPCD and KPMG on accounting).
    - Energy also presents other proposals where costs and impacts are not shown or "TBD".
    - Energy does not show OPG efficiencies as a fiscal risk in its table on slide 8. It is estimated at a $240 million per year exposure on slide 33.
- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,535 | 1,225 | 2,035 |

1. 2016-17, 2017-18 based on forecasted numbers

2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit NIERP – Northern Industrial Electricity Rate program DRC – Debt etirement Charge
OREC – Ont. Rebate for Electricity Consumers NOEC – Northern Ontario Energy Credit OEPTC – Ont. Energy & Property Tax Credit

**ENERGY'S BROAD POLICY THEMES / RATIONALES**

- In recognition of the costs borne by ratepayers related to the to decarbonizing and modernizing the province's electricity sector:
    1. Provide significant and immediate rate relief through cost deferral of the global adjustment (GA).
    2. Provide a greater focus on vulnerable consumers by funding electricity support programs, such as the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Protection, (RRRP) through the tax-base. In addition, provide greater support for lower income Ontarians by enhancing the OESP, etc.
    3. Empower energy agencies to increase cost effectiveness and improve efficiency by having – Independent Electricity System Operator (IESO) modernize Ontario's electricity market through electricity market renewal initiatives, the Ontario Energy Board (OEB) identify opportunities for future LDC cost reductions/efficiencies and work with Ontario Power Generation (OPG) to find further efficiencies in operations and pass on savings to ratepayers.
    4. Enhance the existing 8% rebate that went into effect January 1, 2017.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not fully address the fiscal impact/accounting treatment, or implementation<br>o Based on preliminary discussions with KPMG, Energy has identified key steps (presumably for there not to be a fiscal impact):<br>▪ need to be able to create an asset<br>▪ Need to identify an entity that could hold such an asset (e.g. OEFC, IESO or LDCs?)<br>o Energy is said to be working with LSB, IESO, MOF, TBS and external accountants on legislative, regulatory and accounting requirements<br>o Energy's deck clearly identify that under the current legal framework, the GA would not be able to recover interest costs of the deferral<br>• Likely will lead to significant annual fiscal impact and increase in net debt (illustrated as $9 Bn on slide 9, or $23 Bn on slides 11 & 12 scenarios; previously estimated by Energy to be up to $65 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement. | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • Furthermore, likely entails significant legal / Constitutional Law risks | |
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by $0.83 based on current OESP charge.**<br><br>**Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈ $1.60 in 2017, increasing to ≈ $1.80 in 2022.** | • Would provide on-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households.<br>• There may be a risk that expanding OESP or RRRP may change the view of the federal government that it is not a taxable benefit. When OESP was created, TPD worked with Finance Canada and Energy to ensure that it was not considered a taxable benefit.<br>• RRRP expansion that subsidised high-cost distribution systems may create a disincentive effect on achieving efficiencies ~~é~~and cost reductions in those LDCs (or Toronto, as the benchmark). Energy and OEB would need to address this through the regulatory system or other measures such as eligibility conditions. | <u>OESP</u><br>• 2017-18: $162 M<br>• Increasing to $323 M in 2020-21.<br><br><u>Conservation</u><br>• 2017-18: $457 M<br>• Increasing to $493 M in 2020-21 |
| **Create a new low income conservation benefit program that would build on existing programs.** | • Conservation programs provide electricity system benefits. Fiscal-funding would result in a cross-subsidisation from tax-base.<br>• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan. | • $60 million per year. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Enhance Tax-base RPP Rebat by 5%, to 13%** | • This proposal would increase the funding requirement of the newly established Ontario Rebate for Electricity Consumers (OREC) by about $700 million per fiscal year, to reduce an average residential bill by about $7 each month or $84 annually.<br>• The current OREC provides average savings of about $11 each month or $130 annually. | • About $700 per year |

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

**DETAIL ON ENERGY PROPOSALS INCLUDED IN THE JANUARY 18th DECK**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 1a, 1b, and low GA Financing scenario), or more (e.g., about $5.5 bn in 2017 under high GA Financing scenario), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under the high GA Financing scenario, now discussed in the Appendix of the latest deck, net debt could rise by $65 Bn over time, as estimated by Energy, and the cost pressure could be up to $51 per month by 2047. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

**Commented [GH1]:** This option has been moved to the appendix section, not sure if need to be mentioned.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
    - Option 1a: Moderate GA financing, paying $3.2 and $3.4 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 1b: Moderate GA financing, paying $1.1 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 3: Low / GA financing – paying $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off, with limits of no more than $2 billion above the true cost of GA.
    - Option 4: High / GA financing – paying $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively, with no limits above the true cost of GA.
- It should be noted that under any of these options the relief period is quite limited when compare to the period under where future ratepayers will have to pay the cost of the deferral. Chart 1a and 1b (slides 10 and 11) illustrate that the impact of the relief would not last beyond 2022 (1a) and 2024 (1b) whill the higher cost caused by the deferral would hit electricity bills until 2042 at the least.
- Impact of the Level of Financing on Large Industrial Electricity Consumers provided in the deck was based on previous scenarios. It should be updated using above scenarios.
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].
- Preliminary discussions between CEFD and OPCD staff suggest that there are material fiscal and reporting risk associated with this proposal.

OESP & RRRP ($0.51-0.62 bn in 2017 to $0.80-0.92 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Low Income Conservation Benefit Program

- A new low income conservation benefit program would build on existing programs.
  - Existing low income programs delivered by local distribution companies and IESO help qualified homeowners and social and/or assisted housing providers improve the energy efficiency of their homes.
  - With respect to a new program Energy notes that participants could receive incentives for conservation measures not currently covered, increased incentive amounts, and targeted education and awareness initiatives.

- Energy notes an illustrative budget of $60 million per year, but states that further analysis is required on costing and implementation details, including alignment with the existing conservation framework.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
  - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.

  - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
  - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
  - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
  - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
  - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
  - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
  - If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

**SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION –JANUARY 18 DECK**

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |
|---|---|---|---|---|---|
| ENERGY'S Recommended Initiatives* | | | | | |
| Amortize and Debt-Finance Global Adjustment Costs | TBD | TBD | TBD | TBD | TBD |
| RRRP | | 457 | 469 | 479 | 493 |
| OESP – Enhance Benefit | | 162 | 225 | 279 | 323 |
| Low Income Conservation Program | | 60 | 60 | 60 | 60 |
| First Nations Rate | | 18 | 18 | 18 | 18 |
| Risk Exposure: OPG Operational Efficiencies | 60 | 240 | 240 | 240 | 240 |
| Enhanced RPP Rebate | 169 | 699 | 679 | 732 | 724 |
| Proposed Program Total:[3] | **229 + GA** | **1,636 + GA** | **1,691 + GA** | **1,808 + GA** | **1,858 + GA** |
| | | | | | |

1. Based on estimated / forecasted numbers [May have some variations from the January 18 deck.]
2. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

3. Total would be significantly larger with the TBDs crystalized.

## Appendix: Options not currently recommended by Energy

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | • $260 million annually from 2017-18 to 2020-21. |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion. | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC]. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | |

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.

- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).
- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

Hi all, I added on the TT per Ron's comment.

Francisco

On Jan 15, 2017, at 6:56 PM, Ronald Kwan <Ronald.Kwan@ofina.on.ca> wrote:

Hi,

Just started to review.  Looks good.

On the table, I marked out some requests – split OESP and RRRP into separate rows, and add a 17-18 fiscal cost / exposure column (including commenting more on and adding in the fiscal risk of the OPG efficiencies related proposal).  On the Trillium Trust, it might be fair to point out that Energy raises the prospect of investing in projects that would not otherwise be viewed by the OEB as projects that meet a system benefits test – so not really a rate saving if the projects would not have been done on the rate base.  Really a tax-based subsidisation for other policy reasons.

I'll review more later this evening.

Thanks,
Ron

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

<Comments on Electricity Sector Transformation Proposals v9 (CEFD)_Markup2.docx>

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs from the rate base to the tax base.
- While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about $2 billion in 2017-18).
- Additional fiscal exposure comes from proposals not yet costed by Energy (e.g., conservation costs, with Energy consulting OPCD on accounting). Energy also presents other proposals where costs and impacts are "TBD".
- In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,5~~32~~25 | 1,225 | 2,~~005~~035 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

## ENERGY'S BROAD POLICY THEMES / RATIONALES

A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ≈ $0.55 in 2017, increasing to ≈ $1.45 in 2022.** | • Would provide on-bill benefits.<br><br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. | • 2017-18: $162 M<br><br>• Increasing to $322 M in 2020-21. |
| **Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈** | | • 2017-18: $666 M<br><br>• Increasing to $719 M in 2020-21 |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **$1.55 in 2017, increasing to ≈ $1.75 in 2022.** | | |
| | | |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC] |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax". | • $260 million annually from |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | 2017-18 to 2020-21. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding the Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • Current legislated March 31, 2018 end of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end.<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant annual fiscal impact and increase in net debt (estimated by Energy to be up to $66 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Annual fiscal impact not yet determined. |

**DETAIL ON ENERGY PROPOSALS**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
    - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

<u>Expanding the scope of the Trillium Trust to invest in energy infrastructure:</u>

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

<u>Departure Tax</u>:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.

- If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 2&3), or more (e.g., about $5.5 bn in 2017 under option 4), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year
  - Option 2: Moderate short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 3: Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 4: Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

## SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

Hi,

I made a couple more changes to the table at the end of the BN.

Ron

Hi All,

I made some additional changes. Revised version attached. Please review ASAP in the morning.

Thanks,
Ron

Hi,

Just started to review.  Looks good.

On the table, I marked out some requests – split OESP and RRRP into separate rows, and add a 17-18 fiscal cost / exposure column (including commenting more on and adding in the fiscal risk of the OPG efficiencies related proposal).  On the Trillium Trust, it might be fair to point out that Energy raises the prospect of investing in projects that would not otherwise be viewed by the OEB as projects that meet a system benefits test – so not really a rate saving if the projects would not have been done on the rate base.  Really a tax-based subsidisation for other policy reasons.

I'll review more later this evening.

Thanks,
Ron

Subject: Fwd: Rate Mitigation

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

<Comments on Electricity Sector Transformation Proposals v9 (CEFD)_Markup2.docx>

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs from the rate base to the tax base.
- While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about $2 billion in 2017-18).
- Additional fiscal exposure comes from proposals not yet costed by Energy (e.g., conservation costs, with Energy consulting OPCD on accounting). Energy also presents other proposals where costs and impacts are "TBD".
- In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,225 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

## ENERGY'S BROAD POLICY THEMES / RATIONALES

A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ≈ $0.55 in 2017, increasing to ≈ $1.45 in 2022.** | • Would provide on-bill benefits.<br><br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. | • 2017-18: $162 M<br><br>• Increasing to $322 M in 2020-21. |
| **Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈** | | • 2017-18: $666 M<br><br>• Increasing to $719 M in 2020-21 |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **$1.55 in 2017, increasing to ≈ $1.75 in 2022.** | | |
| | | |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC] |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax". | • $260 million annually from |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | 2017-18 to 2020-21. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding the Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • Current legislated March 31, 2018 end of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end.<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant annual fiscal impact and increase in net debt (estimated by Energy to be up to $66 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Annual fiscal impact not yet determined. |

**DETAIL ON ENERGY PROPOSALS**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
    - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

<u>Expanding the scope of the Trillium Trust to invest in energy infrastructure:</u>

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

<u>Departure Tax</u>:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.

- If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 2&3), or more (e.g., about $5.5 bn in 2017 under option 4), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year
  - Option 2: Moderate short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 3: Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 4: Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

## SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

Hi All,

I made some additional changes. Revised version attached. Please review ASAP in the morning.

Thanks,
Ron

> On the table, I marked out some requests – split OESP and RRRP into separate rows, and add a 17-18 fiscal cost / exposure column (including commenting more on and adding in the fiscal risk of the OPG efficiencies related proposal). On the Trillium Trust, it might be fair to point out that Energy raises the prospect of investing in projects that would not otherwise be viewed by the OEB as projects that meet a system benefits test – so not really a rate saving if the projects would not have been done on the rate base. Really a tax-based subsidisation for other policy reasons.

I'll review more later this evening.

Thanks,
Ron

**Subject:** RE: Rate Mitigation

Hi Ron,

Please find attached updated notes and Energy's deck with proposed edits and comments from SIFB, EFB, and SPFB.

The files are also saved under below folder:
S:\Users\CEF\Hydro 2017\Electricity Prices\Mitigation Proposals\Energy_Jan16

Thanks,
Gavin He

Subject: Fwd: Rate Mitigation

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

<Comments on Electricity Sector Transformation Proposals v9 (CEFD)_Markup2.docx>

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs from the rate base to the tax base.
- While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about $2 billion in 2017-18).
- Additional fiscal exposure comes from proposals not yet costed by Energy (e.g., conservation costs, with Energy consulting OPCD on accounting). Energy also presents other proposals where costs and impacts are "TBD".
- In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,225 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

## ENERGY'S BROAD POLICY THEMES / RATIONALES

A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ≈ $0.55 in 2017, increasing to ≈ $1.45 in 2022.** | • Would provide on-bill benefits.<br><br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. | • 2017-18: $162 M<br><br>• Increasing to $322 M in 2020-21. |
| **Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈** | | • 2017-18: $666 M<br><br>• Increasing to $719 M in 2020-21 |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **$1.55 in 2017, increasing to ≈ $1.75 in 2022.** | | |
| | | |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC] |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax". | • $260 million annually from |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | 2017-18 to 2020-21. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding the Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • Current legislated March 31, 2018 end of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end.<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant annual fiscal impact and increase in net debt (estimated by Energy to be up to $66 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Annual fiscal impact not yet determined. |

**DETAIL ON ENERGY PROPOSALS**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
    - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

<u>Expanding the scope of the Trillium Trust to invest in energy infrastructure:</u>

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

<u>Departure Tax</u>:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.

- If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 2&3), or more (e.g., about $5.5 bn in 2017 under option 4), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year
  - Option 2: Moderate short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 3: Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 4: Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

## SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

Hi,

I separated OESP and RRRP in the table and added a fiscal impact column to the table. I wasn't sure what to put for the section on empowering energy agencies to increase cost effectiveness and improve efficiency.

The current version of the note is attached.

Emily

On the Trillium Trust, it might be fair to point out that Energy raises the prospect of

investing in projects that would not otherwise be viewed by the OEB as projects that meet a system benefits test – so not really a rate saving if the projects would not have been done on the rate base.  Really a tax-based subsidisation for other policy reasons.

I'll review more later this evening.

Thanks,
Ron

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

<Comments on Electricity Sector Transformation Proposals v9 (CEFD)_Markup2.docx>

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which ~~will~~is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has ~~taken steps to~~ expanded the Rural or Remote Electricity Rate Protection program, ~~expected to~~ saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

A significant number of Energy's proposals ~~generally~~ involve shifting costs from the rate base to the tax base. While the subset of costed proposals may have a fairly limited residential rate payer impact (e.g. about $~~5~~6-~~6~~7/month for residential, less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about $~~1~~2 billion ~~to $1.3 billion~~in 2017-18), with some proposals not costed (e.g., conservation costs, with Energy consulting OPCD on accounting). ~~Note these impacts are lower than those presented in an earlier deck ($1.3 billion to $1.9 billion).~~ Energy also presents other proposals where costs and impacts are "TBD".

In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts of ~~up to over~~ more than $2 billion annually during the period that GA costs are deferred depending on the scenario.. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

**Commented [GH1]:** This was included in the debt-financing GA section below, so not sure if we need to mention it here.

Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,225 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**Energy's Broad Policy Themes / Rationales**

A key theme / rationale cited by Energy is to no longer use rate-base to pay for "social programs" by shifting cost of OESP, RRRP and proposed First Nation Rate to tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Fiscal Cost |
|---|---|---|
| **Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility~~, and provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.~~** | • Would provide ~~Significant fiscal exposure – $0.4-0.45 bn at current levels, higher if enhanced.~~ oOn-bill benefits.<br>• Funding programs through tax base estimated to reduce average monthly residential bill by approximately $0.55 in 2017, increasing to approximately $1.45 in 2022.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. | • 2017-18: $162 M<br>• Increasing to $322 M in 2020-21. |
| **Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.** | • Funding programs through tax base estimated to reduce average monthly residential bill by approximately $1.55 in 2017, increasing to approximately $1.75 in 2022.<br>• Could contemplate phase-in to manage fiscal impact. | • 2017-18: $666 M<br>• Increasing to $719 M in 2020-21 |

**Formatted Table**

**Commented [RK3]:** Could we add in a fiscal cost columbn instead, to show Energy's estimated 17-18 fiscal cost, or what we think is the exposure (accounting TBC can be footnoted).

**Commented [EK4]:** Updated based on slide 12 in Energy's updated deck.

**Formatted:** Indent: Left: 0.1", No bullets or numbering

**Commented [RK2]:** Can we split the OESP and RRRP into two rows,

**Formatted:** Indent: Left: 0.1", No bullets or numbering

| | | |
|---|---|---|
| **Amortize ~~Fund~~ conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account. ~~programs through the tax base for the remaining term of the existing CDM framework and transition costs to the new "green bank entity" over time~~** | • It is unclear whether consevation costs could be amortized according to accounting standards. If this option was pursued without establishing Provincial Controller agreement on accounting, there could be a fiscal risk. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base. ~~Potentially significant fiscal impact – current program costs are about $0.45 bn~~<br>o Conservation programs do provide an electricity system benefits, but ~~would now be~~ fiscal~~ly~~-funding~~ed, so~~ would result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the diccal plan | • If amortization is not permitted, 2017-18 fiscal impact of $450 M. |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term impact, unless TT funding displaces near-term, non-incremental projects coming onto service<br>• Could lower utility value (share price) and impact fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• In the case of projects located in First Nation territories it could have an upfront fiscal impact if Province is not able to amortize those projects (TBC with OPCD).<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a windfall. It was fiscally neutral, it represented revenue to OEFC and an expense to Hydro One.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the | • $260 million annually from 2017-18 to 2020-21. |

**Formatted:** Indent: Left: 0.06", Hanging: 0.18"

| | | |
|---|---|---|
| | deffered tax benefit recognized by Hydro One to ratepayers. | |
| **Empower Energy Agencies to Increase Cost Effectiveness and Improve Efficiency** | • IESO to modernize the electricity market through market renewal<br>• OEB to identify opportunities for future LDC efficiencies/rates<br>• OEB to work with OPG operational efficiencies and pass on to ratepayers | • |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding th Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • End of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end April 1, 2018.<br>• End of the DRC had previously been linked to retirement of residual stranded debt<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant fiscal impact due to creation of large liability item (estimated to be up to $66Bn) either directly on the Province's books or upon consolidation<br>• Furthermore, likely entails significant legal / Constitutional Law risks. | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Fiscal impact not yet determined. |

**Detail on Proposals**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022~~Total of about $0.4 to 0.45 Billion/year~~):

~~This w~~Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), ~~-~~and ~~the~~ Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal

impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs. ~~Energy notes that~~
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
  - ~~The programs could provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility (e.g., by 50% in the table).~~
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- ~~o~~ The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

~~Fund~~ Amortize Conservation Program~~s~~ Costs ~~through the Tax Base~~:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller (OPC) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.
- If amortization of conservation costs was not permitted, a fiscal impact could result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

**Formatted:** Indent: Left: 0.25"

**Formatted:** Font: 11.5 pt

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

~~This would be for the remaining term of the existing Conservation and Demand Management framework. Over time, the costs would be transitioned to the new "green bank entity", to shift cost recovery from ratepayers to cap and trade revenues.~~

- ~~Energy's rationale for the cost shift would be in recognition of the burden borne by ratepayers in phasing out coal generation.~~

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects,
  - in effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that projects that the OEB does not currently consider eligible (as system benefits probably don't exceed investment costs) could be considered. This would mean moving forward projects for other policy objectives rather than rate mitigation.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

**Formatted:** List Paragraph, Bulleted + Level: 1 + Aligned at: 0" + Indent at: 0.25"

**Formatted:** List Paragraph, Indent: Left: 0.25", Bulleted + Level: 2 + Aligned at: 0.5" + Indent at: 0.75"

**Formatted:** Font: 11.5 pt

- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province as the income (revenue) to the OEFC was fully offset by a reduction in ESDI resulting from reduced net income (expense) of Hydro One.
- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase. [As the departure tax paid was fiscally neutral, OEFC's uplift was primarily the result of the related deferred tax benefit, as well as the s.50.3 benefit under the *Electricity Act, 1998*.]
- Having OEFC help implement this measure may require introducing changes to OEFC's objects as is legal mandate is to help reduce and pay down stranded debt.
- This would be a one-time measure, potentially spread out over a few years, and fiscal impact, as the departure tax amount was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).

**Commented [JK5]:** Not sure what exactly the single schedule system means...stayed away from mentioning as a result.

**Commented [JK6]:** http://www.ieso.ca/Pages/Participate/Stakeholder-Engagement/SE-114.aspx

- The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
- If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost~~delay recovery of part~~ of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments.~~by~~ This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts of up to or more than $2 billion annually during the period that GA costs are deferred, depending on the scenario.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year
  - Option 2: Moderate short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 3: Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 4: Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact, such as having to book a large deficit amount.

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.

- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

Hi John,

I was updating the table but it seems Emily already got this updated. I just reviewed her edits and they look fine to me.

Regards,
Gavin He

Hi,

I separated OESP and RRRP in the table and added a fiscal impact column to the table. I wasn't sure what to put for the section on empowering energy agencies to increase cost effectiveness and improve efficiency.

The current version of the note is attached.

Emily

On the table, I marked out some requests – split OESP and RRRP into separate rows, and add a 17-18 fiscal cost / exposure column (including commenting more on and adding in the fiscal risk of the OPG efficiencies related proposal). On the Trillium Trust, it might be fair to point out that Energy raises the prospect of investing in projects that would not otherwise be viewed by the OEB as projects that meet a system benefits test – so not really a rate saving if the projects would not have been done on the rate base. Really a tax-based subsidisation for other policy reasons.

I'll review more later this evening.

Thanks,
Ron

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

<Comments on Electricity Sector Transformation Proposals v9 (CEFD)_Markup2.docx>

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which ~~will~~is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has ~~taken steps to~~ expanded the Rural or Remote Electricity Rate Protection program, ~~expected to~~ saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

A significant number of Energy's proposals ~~generally~~ involve shifting costs from the rate base to the tax base. While the subset of costed proposals may have a fairly limited residential rate payer impact (e.g. about $~~5~~6-~~6~~7/month for residential, less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about $~~1~~2 billion ~~to $1.3 billion~~in 2017-18), with some proposals not costed (e.g., conservation costs, with Energy consulting OPCD on accounting). ~~Note these impacts are lower than those presented in an earlier deck ($1.3 billion to $1.9 billion).~~ Energy also presents other proposals where costs and impacts are "TBD".

In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts of ~~up to over~~ more than $2 billion annually during the period that GA costs are deferred depending on the scenario.. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

**Commented [GH1]:** This was included in the debt-financing GA section below, so not sure if we need to mention it here.

Over the past five years, the existing fiscally--funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,225 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**Energy's Broad Policy Themes / Rationales**

A key theme / rationale cited by Energy is to no longer use rate-base to pay for "social programs" by shifting cost of OESP, RRRP and proposed First Nation Rate to tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Fiscal Cost |
|---|---|---|
| **Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility~~, and provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.~~** | • Would provide ~~Significant fiscal exposure – $0.4-0.45 bn at current levels, higher if enhanced.~~ oOn-bill benefits.<br>• Funding programs through tax base estimated to reduce average monthly residential bill by approximately $0.55 in 2017, increasing to approximately $1.45 in 2022.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. | • 2017-18: $162 M<br>• Increasing to $322 M in 2020-21. |
| Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program. | • Would provide on-bill benefits.<br>• Funding programs through tax base estimated to reduce average monthly residential bill by approximately $1.55 in 2017, increasing to approximately $1.75 in 2022.<br>• Could contemplate phase-in to manage fiscal impact. | • 2017-18: $666 M<br>• Increasing to $719 M in 2020-21 |

**Formatted Table**

**Commented [RK3]:** Could we add in a fiscal cost columbn instead, to show Energy's estimated 17-18 fiscal cost, or what we think is the exposure (accounting TBC can be footnoted).

**Commented [EK4]:** Updated based on slide 12 in Energy's updated deck.

**Formatted:** Indent: Left: 0.1", No bullets or numbering

**Commented [RK2]:** Can we split the OESP and RRRP into two rows,

**Formatted:** Indent: Left: 0.1", No bullets or numbering

| | | |
|---|---|---|
| **Amortize ~~Fund~~ conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account. ~~programs through the tax base for the remaining term of the existing CDM framework and transition costs to the new "green bank entity" over time~~** | • It is unclear whether consevation costs could be amortized according to accounting standards. If this option was pursued without establishing Provincial Controller agreement on accounting, there could be a fiscal risk. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base. ~~Potentially significant fiscal impact – current program costs are about $0.45 bn~~<br>o Conservation programs do provide an electricity system benefits, but ~~would now be~~ fiscal~~ly~~-funding~~ed, so~~ would result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the diccal plan | • If amortization is not permitted, 2017-18 fiscal impact of $450 M. |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term impact, unless TT funding displaces near-term, non-incremental projects coming onto service<br>• Could lower utility value (share price) and impact fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• In the case of projects located in First Nation territories it could have an upfront fiscal impact if Province is not able to amortize those projects (TBC with OPCD).<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a windfall. It was fiscally neutral, it represented revenue to OEFC and an expense to Hydro One.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the | • $260 million annually from 2017-18 to 2020-21. |

**Formatted:** Indent: Left: 0.06", Hanging: 0.18"

| | | |
|---|---|---|
| | deffered tax benefit recognized by Hydro One to ratepayers. | |
| **Empower Energy Agencies to Increase Cost Effectiveness and Improve Efficiency** | • IESO to modernize the electricity market through market renewal<br>• OEB to identify opportunities for future LDC efficiencies/rates<br>• OEB to work with OPG operational efficiencies and pass on to ratepayers | • |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding th Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • End of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end April 1, 2018.<br>• End of the DRC had previously been linked to retirement of residual stranded debt<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant fiscal impact due to creation of large liability item (estimated to be up to $66Bn) either directly on the Province's books or upon consolidation<br>• Furthermore, likely entails significant legal / Constitutional Law risks. | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Fiscal impact not yet determined. |

**Detail on Proposals**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022~~Total of about $0.4 to 0.45 Billion/year~~):

~~This w~~Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), ~~-~~and ~~the~~ Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal

impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs. ~~Energy notes that~~
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
  - ~~The programs could provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility (e.g., by 50% in the table).~~
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- ~~o~~ The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

~~Fund~~ Amortize Conservation Program~~s~~ Costs ~~through the Tax Base~~:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller (OPC) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.
- If amortization of conservation costs was not permitted, a fiscal impact could result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

**Formatted:** Indent: Left: 0.25"

**Formatted:** List Paragraph, Indent: Left: 0.25"
**Formatted:** Font: 11.5 pt

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

~~This would be for the remaining term of the existing Conservation and Demand Management framework. Over time, the costs would be transitioned to the new "green bank entity", to shift cost recovery from ratepayers to cap and trade revenues.~~

- ~~Energy's rationale for the cost shift would be in recognition of the burden borne by ratepayers in phasing out coal generation.~~

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects,
  - in effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that projects that the OEB does not currently consider eligible (as system benefits probably don't exceed investment costs) could be considered. This would mean moving forward projects for other policy objectives rather than rate mitigation.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

**Formatted:** List Paragraph, Bulleted + Level: 1 + Aligned at: 0" + Indent at: 0.25"

**Formatted:** List Paragraph, Indent: Left: 0.25", Bulleted + Level: 2 + Aligned at: 0.5" + Indent at: 0.75"

**Formatted:** Font: 11.5 pt

- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province as the income (revenue) to the OEFC was fully offset by a reduction in ESDI resulting from reduced net income (expense) of Hydro One.
- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase. [As the departure tax paid was fiscally neutral, OEFC's uplift was primarily the result of the related deferred tax benefit, as well as the s.50.3 benefit under the *Electricity Act, 1998*.]
- Having OEFC help implement this measure may require introducing changes to OEFC's objects as is legal mandate is to help reduce and pay down stranded debt.
- This would be a one-time measure, potentially spread out over a few years, and fiscal impact, as the departure tax amount was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).

**Commented [JK5]:** Not sure what exactly the single schedule system means...stayed away from mentioning as a result.

**Commented [JK6]:** http://www.ieso.ca/Pages/Participate/Stakeholder-Engagement/SE-114.aspx

- The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
- If OPG is unable to meet more aggressive cost targets, this could impact net income, and the Province's fiscal plan.

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost~~delay recovery of part~~ of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments.~~by~~ This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts of up to or more than $2 billion annually during the period that GA costs are deferred, depending on the scenario.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year
  - Option 2: Moderate short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 3: Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 4: Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact, such as having to book a large deficit amount.

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.

- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

Hi,

This is a file dump of the earlier work….I need to start going through but figured I shred the template we are working with.

John.

**COMMERCIALLY SENSITIVE AND CONFIDENTIAL**

## Comments on Proposed Initiatives to Transform Ontario's Electricity Sector

The Ministry of Energy is providing an update on progress related to transforming the province's electricity sector by elaborating on the potential initiatives, as outlined in its deck.

**CONTEXT**

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e. meeting goals towards decarbonize) and modernize the electricity infrastructure (i.e. more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One in Hydro One transmission and distribution systems.

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers which will provide a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2018 for eligible small businesses, farms and residential consumer and has taken steps to expand the Rural or Remote Electricity Rate Protection program, expected to save eligible RRRP customers about $45 per month.

**COMMENTS**

Energy's proposals generally involve shifting some costs from the rate base to the tax base. A general comment on the proposals would be that while the proposals may have a fairly limited impact, e.g. a little over $8/month for residentia (about little over 5% of the average monthly bill), the proposals would not come at a non-material incremental fiscal cost ($1.3 billion to $1.9 billion).

Over the past five years, the fiscally funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| **TOTAL** | **1,530** | **1,544** | **1,564** | **1,639** | **1,525** | **1,195** | **2,005** |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt etirement Charge
NIERP – Northern Ontario Electricity Rate program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

OESP & RRRP (Total of about $0.4 Billion/year):

This includes shifting the cost of the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Program (RRRP) to the tax base. Note that the fiscal exposure is larger if the OESP take up rate is larger, faster than assumed.

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Energy noted in previous drafts of its price mitigation deck that
  - OESP credits could be increased to address concerns from low income electricity consumers improvements to OESP could be implemented by increasing credits (could be up to double the current credits).
  - The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined.

**Formatted:** Indent: Left: 0", Bulleted + Level: 1 + Aligned at: 0.25" + Indent at: 0.5"

**Formatted:** Indent: Left: 0.25", Bulleted + Level: 2 + Aligned at: 0.75" + Indent at: 1"

Industrial Conservation Initiative (ICI -- About $900+ Million/year):

Energy also shows, as a potential residential price mitigation measure, the cancellation of the ICI.

- Energy is not initially proposing it be continued instead as taxpayer funded, but notes that about 30% price increase (from $85/MWh to $110), if ICI is cancelled, for the large Class A customers benefiting from ICI currently.
- As this cost estimate is for 2016, prior to the planned expansion of the ICI, this could further increase the fiscal exposure by about $100 million).

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation.

- This was paid to the Ontario Electricity Financial Corporation and helped reduce stranded debt.
- Using some or all of it for price mitigation would change the net stranded debt paydown by OEFC resulting from the IPO. This would also be a one-time measure (potentially over a few years), and fiscal impact, as the departure tax amount was one-time.

Other fiscal cost risks (Total of about $0.8+ Bn):

- Amortisation of conservation costs also poses a fiscal risk (about $0.4 bn/yr),
- Ending the DRC early for Class B customers (commercial, small industrial) (about $0.4 bn/yr to 2017-18)
- Lowering of the debt interest paid by OPG (about $30 – 70 million/yr between 2017 and 2021),

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

Hi John – I have added our initial markups to your latest staff note and have made a few markups to the deck (both attached). Sending to assist with the consolidation. Happy to discuss, but please let us know before sending anything to Ron. Francisco was able to take a quick look, but should be able to take a more thorough look once home. Saved here.

# Comments on Proposed Initiatives to Transform Ontario's Electricity Sector

The Ministry of Energy is providing an update on progress related to transforming the province's electricity sector by elaborating on the potential initiatives, as outlined in its deck.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e. meeting goals towards decarbonize) and modernize the electricity infrastructure (i.e. more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in ~~Hydro One~~ transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers which will provide a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting ~~January~~ January 1, 2018 for eligible small businesses, farms and residentials consumer and has taken steps to expand the Rural or Remote Electricity Rate Protection program, expected to save eligible RRRP customers about $45 per month.

## COMMENTS

Energy's proposals generally involve shifting some costs from the rate base to the tax base. ~~A general comment on the proposals would be that w~~While these proposals may have a fairly limited residential rate payer impact (~~,~~e.g. about $5-6/month for residential, ~~(~~less than 5% of the average monthly bill), the proposals would come at a material incremental fiscal cost ($1 billion to $1.3 billion)~~,~~. Note these impacts are lower than ~~somewhat down from the impacts from an~~ those prestend in an earlier deck ($1.3 billion to $1.9 billion).

Over the past five years, the fiscally funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,225 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

NIERP – Northern Ontario Electricity Rate program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

## Proposals

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP (Total of about $0.4 to 0.45 Billion/year):

This ~~includes~~ would shift~~ing~~ the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), ~~as well as an additional 50% increase,~~ and the Rural or Remote Electricity Rate Program (RRRP), to the tax base.

*Note: that the fiscal exposure ~~is larger~~ would increase if the OESP take up rate is larger, and faster than assumed.*

Fund Conservation Programs through the Tax-Base:

This would be for the remaining term of the existing Conservation and Demand Management framework. Over time the costs would transition ~~and to transition costs~~ to the new "green bank ~~eneity~~entity" ~~over time~~.

- Energy's rationale for t~~T~~he cost shift would be in recognition of the burden borne by ratepayers in phasing out coal generation.

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward.

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects. Incremental investments would have negative fiscal impacts once the assets are in-service and amortized.
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.) May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
- Unless applied to existing projects, this measure would have little or no near-term rate impact.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy is proposed using some or all of this departure tax for price mitigation.

- This was paid to the Ontario Electricity Financial Corporation (OEFC) and help~~ed~~ reduce stranded debt.
- ~~—~~
- Using some or all of it for price mitigation would change the net stranded debt paydown by OEFC resulting from the IPO.
- This would ~~also~~ be a one-time measure, ~~(~~potentially spread out over a few years~~)~~, and fiscal impact, as the departure tax amount was one-time.

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) ~~(~~would have an impact of about $0.45 billion~~/year~~ in 2017-18 ~~to 2017-18)~~.

- The end of the DRC had previously been linked with the end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the proposed end date of the DRC.

---

Hi,

I'm not sure the note is correct with respect to stranded debt. Maybe is a wording thing, but please review.

Francisco

Hi John – I have added our initial markups to your latest staff note and have made a few markups to the deck (both attached). Sending to assist with the consolidation. Happy to discuss, but please let us know before sending anything to Ron. Francisco was able to take a quick look, but should be able to take a more thorough look once home. Saved here.

Latest….asked Shajee to have a look but here it is.

**COMMERCIALLY SENSITIVE AND CONFIDENTIAL**

## Comments on Proposed Initiatives to Transform Ontario's Electricity Sector

The Ministry of Energy is providing an update on progress related to transforming the province's electricity sector by elaborating on the potential initiatives, as outlined in its deck.

**CONTEXT**

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e. meeting goals towards decarbonize) and modernize the electricity infrastructure (i.e. more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One in Hydro One transmission and distribution systems.

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers which will provide a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2018 for eligible small businesses, farms and residential consumer and has taken steps to expand the Rural or Remote Electricity Rate Protection program, expected to save eligible RRRP customers about $45 per month.

**COMMENTS**

Energy's proposals generally involve shifting ~~some~~ costs from the rate base to the tax base. A general comment on the proposals would be that while the~~e~~ proposals may have a fairly limited bill impact, e.g. about $5-6/month for residential (less than 5% of the average monthly bill), the proposals would come at a material incremental fiscal cost ($1 billion to $1.3 billion), somewhat down from the impacts from an earlier deck ($1.3 billion to $1.9 billion).

Over the past five years, the fiscally funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,195 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt etirement Charge
NIERP – Northern Ontario Electricity Rate program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

OESP & RRRP (Total of about $0.4 to 0.45 Billion/year):

This includes shifting the cost of the Ontario Electricity Support Program (OESP), as well as an additional 50% increase, and the Rural or Remote Electricity Rate Program (RRRP) to the tax base. Note that the fiscal exposure is larger if the OESP take up rate is larger, faster than assumed.

Fund Conservation Programs through the Tax-Base:

This would be for the remaining term of the existing Conservation and Demand Management framework and to transition costs to the new "green bank eneity" over time.

- The cost shift would be in recognition of the burden borne by ratepayers in phasing out coal generation.

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward.

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects. Incremental investments would have negative fiscal impacts once the assets are in-service and amortized.
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.) May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
- Unless applied to existing projects, this measure would have little or no near-term rate impact.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation.

- ~~This was paid to the Ontario Electricity Financial Corporation and helped reduce stranded debt.~~ The departure tax payment was fiscally neutral to the Province as it represented income to OEFC fully offset by reduction in ESDI from Hydro One.
- Using some or all of it for price mitigation would change the net stranded debt paydown by OEFC resulting from the IPO. This would also be a one-time measure (potentially over a few years), and fiscal impact, as the departure tax amount was one-time.

**Commented [FC1]:** This is not correct. The DT represented revenue to OEFC fully offset by a reduction in ESDI from H1.

**Commented [FC2]:** What are we trying to say here? OEFC only got an uplift at consolidation of the deferred tax benefit and because of the 50.3 payment. The DT on itself didn't cause a reduction in stranded debt.

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):

- Ending the DRC early for Class B customers (commercial, small industrial) (about $0.45 billion/year to 2017-18)

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

Hi Ron,

Pls. see attached updated note.

Thanks,

John.

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Rate Mitigation Plan Options"

The Ministry of Energy (Energy) is providing potential price mitigation initiatives.

## CONTEXT

- As outlined in Energy's deck, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g., GEIA renegotiation with Samsung consortium, decreasing FIT prices, etc.).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs or risks from the rate base to the tax base. The fiscal exposure could be well over $2 billion in 2017-18.
- The largest impacts on rates and largest potential fiscal exposures are from the deferred recovery of Global Adjustment costs ($2 bn per year or more) and an enhanced, tax-base-funded 5% rebate for Regulated Price Plan (RPP) customers (about $700 million per year).
    - Significant fiscal exposure comes from proposals not yet fully costed by Energy (e.g., the Global Adjustment, with Energy to benefit from consulting with OPCD and KPMG on accounting).
    - Energy also presents other proposals where costs and impacts are not shown or "TBD".
    - Energy does not show OPG efficiencies as a fiscal risk in its table on slide 8. It is estimated at a $240 million per year exposure on slide 33.
- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,535 | 1,225 | 2,035 |

1. 2016-17, 2017-18 based on forecasted numbers

2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit NIERP – Northern Industrial Electricity Rate program DRC – Debt etirement Charge
OREC – Ont. Rebate for Electricity Consumers NOEC – Northern Ontario Energy Credit OEPTC – Ont. Energy & Property Tax Credit

**ENERGY'S BROAD POLICY THEMES / RATIONALES**

- In recognition of the costs borne by ratepayers related to the to decarbonizing and modernizing the province's electricity sector:
    1. Provide significant and immediate rate relief through cost deferral of the global adjustment (GA).
    2. Provide a greater focus on vulnerable consumers by funding electricity support programs, such as the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Protection, (RRRP) through the tax-base. In addition, provide greater support for lower income Ontarians by enhancing the OESP, etc.
    3. Empower energy agencies to increase cost effectiveness and improve efficiency by having – Independent Electricity System Operator (IESO) modernize Ontario's electricity market through electricity market renewal initiatives, the Ontario Energy Board (OEB) identify opportunities for future LDC cost reductions/efficiencies and work with Ontario Power Generation (OPG) to find further efficiencies in operations and pass on savings to ratepayers.
    4. Enhance the existing 8% rebate that went into effect January 1, 2017.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not fully address the fiscal impact/accounting treatment, or implementation<br>o Based on preliminary discussions with KPMG, Energy has identified key steps (presumably for there not to be a fiscal impact):<br>▪ need to be able to create an asset<br>▪ Need to identify an entity that could hold such an asset (e.g. OEFC, IESO or LDCs?)<br>o Energy is said to be working with LSB, IESO, MOF, TBS and external accountants on legislative, regulatory and accounting requirements<br>o Energy's deck clearly identify that under the current legal framework, the GA would not be able to recover interest costs of the deferral<br>• Likely will lead to significant annual fiscal impact and increase in net debt (illustrated as $9 Bn on slide 9, or $23 Bn on slides 11 & 12 scenarios; previously estimated by Energy to be up to $65 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement. | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • Furthermore, likely entails significant legal / Constitutional Law risks | |
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by $0.83 based on current OESP charge.**<br><br>**Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈ $1.60 in 2017, increasing to ≈ $1.80 in 2022.** | • Would provide on-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households.<br>• There may be a risk that expanding OESP or RRRP may change the view of the federal government that it is not a taxable benefit. When OESP was created, TPD worked with Finance Canada and Energy to ensure that it was not considered a taxable benefit.<br>• RRRP expansion that subsidised high-cost distribution systems may create a disincentive effect on achieving efficiencies é cost reductions in those LDCs (or Toronto, as the benchmark). Energy and OEB would need to address this through the regulatory system or other measures such as eligibility conditions. | <u>OESP</u><br>• 2017-18: $162 M<br>• Increasing to $323 M in 2020-21.<br><br><u>Conservation</u><br>• 2017-18: $457 M<br>• Increasing to $493 M in 2020-21 |
| **Create a new low income conservation benefit program that would build on existing programs.** | • Conservation programs provide electricity system benefits. Fiscal-funding would result in a cross-subsidisation from tax-base.<br>• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan. | • $60 million per year. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Enhance Tax-base RPP Rebat by 5%, to 13%** | • This proposal would increase the funding requirement of the newly established Ontario Rebate for Electricity Consumers (OREC) by about $700 million per fiscal year, to reduce an average residential bill by about $7 each month or $84 annually.<br>• The current OREC provides average savings of about $11 each month or $130 annually. | • About $700 per year |

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

**DETAIL ON ENERGY PROPOSALS INCLUDED IN THE JANUARY 18th DECK**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 1a, 1b, and low GA Financing scenario), or more (e.g., about $5.5 bn in 2017 under high GA Financing scenario), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under the high GA Financing scenario, now discussed in the Appendix of the latest deck, net debt could rise by $65 Bn over time, as estimated by Energy, and the cost pressure could be up to $51 per month by 2047. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

**Commented [GH1]:** This option has been moved to the appendix section, not sure if need to be mentioned.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
    - Option 1a: Moderate GA financing, paying $3.2 and $3.4 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 1b: Moderate GA financing, paying $1.1 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 3: Low / GA financing – paying $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off, with limits of no more than $2 billion above the true cost of GA.
    - Option 4: High / GA financing – paying $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively, with no limits above the true cost of GA.
- It should be noted that under any of these options the relief period is quite limited when compare to the period under where future ratepayers will have to pay the cost of the deferral. Chart 1a and 1b (slides 10 and 11) illustrate that the impact of the relief would not last beyond 2022 (1a) and 2024 (1b) whill the higher cost caused by the deferral would hit electricity bills until 2042 at the least.
- Impact of the Level of Financing on Large Industrial Electricity Consumers provided in the deck was based on previous scenarios. It should be updated using above scenarios.
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].
- Preliminary discussions between CEFD and OPCD staff suggest that there are material fiscal and reporting risk associated with this proposal.

OESP & RRRP ($0.51-0.62 bn in 2017 to $0.80-0.92 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Low Income Conservation Benefit Program

- A new low income conservation benefit program would build on existing programs.
  - Existing low income programs delivered by local distribution companies and IESO help qualified homeowners and social and/or assisted housing providers improve the energy efficiency of their homes.
  - With respect to a new program Energy notes that participants could receive incentives for conservation measures not currently covered, increased incentive amounts, and targeted education and awareness initiatives.

- Energy notes an illustrative budget of $60 million per year, but states that further analysis is required on costing and implementation details, including alignment with the existing conservation framework.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
  - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.

  - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
  - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
  - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
  - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
  - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
  - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
  - If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

**SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION –JANUARY 18 DECK**

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

1. Based on estimated / forecasted numbers [May have some variations from the January 18 deck.]
2. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

3. Total would be significantly larger with the TBDs crystalized.

## Appendix: Options not currently recommended by Energy

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | • $260 million annually from 2017-18 to 2020-21. |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion. | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC]. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | |

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.

- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).
- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

Hi John – I have added our initial markups to your latest staff note and have made a few markups to the deck (both attached). Sending to assist with the consolidation. Happy to discuss, but please let us know before sending anything to Ron. Francisco was able to take a quick look, but should be able to take a more thorough look once home. Saved here.

**Subject:** Comments on Electricity Sector Transformation Proposals.doc

Latest….asked Shajee to have a look but here it is.

**COMMERCIALLY SENSITIVE AND CONFIDENTIAL**

## Comments on Proposed Initiatives to Transform Ontario's Electricity Sector

The Ministry of Energy is providing an update on progress related to transforming the province's electricity sector by elaborating on the potential initiatives, as outlined in its deck.

**CONTEXT**

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e. meeting goals towards decarbonize) and modernize the electricity infrastructure (i.e. more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One in Hydro One transmission and distribution systems.

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers which will provide a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2018 for eligible small businesses, farms and residential consumer and has taken steps to expand the Rural or Remote Electricity Rate Protection program, expected to save eligible RRRP customers about $45 per month.

**COMMENTS**

Energy's proposals generally involve shifting some costs from the rate base to the tax base. A general comment on the proposals would be that while thee proposals may have a fairly limited impact, e.g. about $5-6/month for residential (less than 5% of the average monthly bill), the proposals would come at a material incremental fiscal cost ($1 billion to $1.3 billion), somewhat down from the impacts from an earlier deck ($1.3 billion to $1.9 billion).

Over the past five years, the fiscally funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,195 | 2,005 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt etirement Charge
NIERP – Northern Ontario Electricity Rate program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

OESP & RRRP (Total of about $0.4 to 0.45 Billion/year):

This includes shifting the cost of the Ontario Electricity Support Program (OESP), as well as an additional 50% increase, and the Rural or Remote Electricity Rate Program (RRRP) to the tax base. Note that the fiscal exposure is larger if the OESP take up rate is larger, faster than assumed.

Fund Conservation Programs through the Tax-Base:

This would be for the remaining term of the existing Conservation and Demand Management framework and to transition costs to the new "green bank eneity" over time.

- The cost shift would be in recognition of the burden borne by ratepayers in phasing out coal generation.

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward.

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects. Incremental investments would have negative fiscal impacts once the assets are in-service and amortized.
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.) May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
- Unless applied to existing projects, this measure would have little or no near-term rate impact.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation.

- This was paid to the Ontario Electricity Financial Corporation and helped reduce stranded debt.
- Using some or all of it for price mitigation would change the net stranded debt paydown by OEFC resulting from the IPO. This would also be a one-time measure (potentially over a few years), and fiscal impact, as the departure tax amount was one-time.

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):

- Ending the DRC early for Class B customers (commercial, small industrial) (about $0.45 billion/year to 2017-18)

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |
|---|---|---|---|---|---|
| OCEB | - | - | - | - | - |
| OREC | 300 | 1,100* | 1,100* | 1,200* | 1,200* |
| Ending DRC[2] | 330 | 330 | -- | -- | -- |

| | | | | | |
|---|---|---|---|---|---|
| **NIERP** | 120 | 120 | 120 | 120 | 120 |
| **NOEC** | 25 | 25 | 25 | 25 | 25 |
| **OEPTC**[3] | 450 | 460 | 470 | 481 | 481 |
| **CURRENT TOTAL** | **1,195** | **2,005** | **1,715** | **1,826** | **1,826** |
| **1. OESP, RRRP, First Nation rate** | | 398 | 419 | 433 | 447 |
| **2. Conservation Programs through Tax Base** | 110 | 450 | 450 | 450 | 450 |
| **4. Departure Tax** | | TBD | TBD | TBD | TBD |
| **7. DRC Ended for Class B** | 110 | 450 | | | |
| **TOTAL** | **1,415** | **3,303** | **2,584** | **2,709** | **2,723** |

**Commented [DS1]:** Can add TBDs for a new Trillium Trust row, but just wanted to check in case you are updating / changing the order of items based on the latest deck

MINISTRY OF
ENERGY

# Proposed Initiatives to Transform Ontario's Electricity Sector – Update

## Working Draft

December 2016

CONFIDENTIAL DRAFT

# Context

- Electricity costs are increasing as the necessary investments are made to decarbonize and modernize the province's electricity infrastructure (i.e., $35 billion+ investment in cleaner generation and $15.5 billion investment in Hydro One transmission and distribution systems).

- Ontario has taken a number of actions to lower electricity cost for all consumers by:
  - Deferring investments in generation (e.g., new build nuclear), improving market efficiency (e.g., wind dispatch) and decreasing the cost of renewable procurements (e.g., GEIA renegotiation, decreasing FIT prices).
  - Increasing cost effectiveness and improving efficiency by adopting new electricity market approaches (e.g., competitive LRP, no new NUG contracting).

- Following the 2016 Throne Speech, actions were announced to further reduce electricity costs by:
  - Providing an 8%  per cent rebate ($11/month savings), updating RRRP ($45/month savings), expanding ICI (up to one-third savings for participants), suspending the LRP II and the EFWSOP (up to $3.8 billion in cost savings) and recycling proceeds to industrial/ commercial consumers.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured,  the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP),  which provides an opportunity to consider a range of policy changes to  how the Ontario energy sector operates.

# Broad Policy Themes / Rationale

- No longer use rate-base to pay for social programs by shifting cost of OESP, RRRP and proposed First Nation Rate to tax-base.
- Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.
- Fund conservation programs through the tax-base for the remaining term of the existing CDM framework and transition costs to the new "green bank entity" over time. Costs would be shifted in recognition of the burden borne by ratepayers in phasing out coal generation.
- Expand the scope of the "Trillium Trust" beyond the Moving Ontario Forward initiative to make certain investments in energy infrastructure eligible for funding, such as remote electrification, large transmission projects, new or expanded interties ~~and expansion of natural gas to rural areas~~, etc. (note that expanding access to natural gas is already included under Moving Ontario Forward.)
- Empower energy agencies to increase cost effectiveness and improve efficiency by having – IESO modernize Ontario's electricity market through electricity market renewal initiatives, the OEB identify opportunities for future LDC cost reductions/efficiencies and work with OPG to find further efficiencies in operations and pass on savings to ratepayers.
- Give consumers more choice by allowing households to "opt into" a single rate plan as an interim measure as the Ontario Energy Board (OEB) develops more pricing options over time.
- Help small business manage their electricity costs and provide relief for cap and trade until proceeds recycling is fully operational by ending the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers.

# Proposed Initiatives – Potential Savings for Typical Residential Electricity Consumers

| *$/750kWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| **Recommended Initiatives** | | | | | | | |
| 1. No Longer Fund Social Programs Through the Rate-Base (i.e., OESP, RRRP, First Nations rate) | 2.16 | 2.31 | 2.41 | 2.49 | 2.54 | 2.58 | Immediate |
| 2. Expand the OESP (i.e., 50% increase) | - | - | - | - | - | - | n/a |
| 3. Fund Conservation Programs Through The Tax-Base | 3.40 | 3.68 | 2.98 | 3.09 | 2.58 | 2.58 | Immediate |
| 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (e.g., Transmission upgrade, etc) | TBD | TBD | TBD | TBD | TBD | TBD | TBD |
| 5. Empower Energy Agencies to Increase Cost Effectiveness and Improve efficiency* | | | | | | | |
| a. IESO – Market Renewal | - | - | - | - | 1.00 | 1.03 | Long-Term |
| b. OEB – LDC efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| c. OPG – Operational efficiencies | TBD | TBD | TBD | TBD | TBD | TBD | Medium-Term |
| 6. Give Residential Consumers More Rate Choices | - | - | - | - | - | - | n/a |
| 7. Help Small Business Manage Their Electricity Costs (i.e., End DRC early for Class B electricity consumers)** | - | - | - | - | - | - | n/a |
| 8. Cancel / Adjust FIT | - | - | 0.13 | 0.13 | 0.14 | 0.14 | Long-Term |
| 9. Dedicate Departure Tax | TBD | TBD | TBD | TBD | TBD | TBD | Immediate |
| **Considered but not Recommended** | | | | | | | |
| 1. Eliminate the Industrial Conservation Initiative (ICI) | 4.40 | 4.24 | 4.10 | 4.24 | 3.73 | 3.58 | Immediate |
| 2. Cancel LRP I | - | - | TBD | TBD | TBD | TBD | Medium-Term |

**Note:** The above initiatives will provide similar benefits for non-RPP Class B electricity consumers. Proposal 1 assumes OESP participation of 50% and 5-year maturity. *Assessing the range of ratepayer impacts will be done through the LTEP development and implementation process in conjunction with the OEB. **Class B includes small-medium enterprises (SMEs).

# Proposed Initiatives – Potential Savings for Average Industrial Electricity Consumers

| *$/MWh* | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Timing of Benefit |
|---|---|---|---|---|---|---|---|
| **Recommended Initiatives** | | | | | | | |
| 1. No Longer Fund Social Programs Through the Rate-Base (i.e., OESP, RRRP, First Nations rate) | 2.88 | 3.08 | 3.21 | 3.33 | 3.39 | 3.44 | Immediate |
| 2. Expand the OESP (i.e., 50% increase) | - | - | - | - | - | - | n/a |
| 3. Fund Conservation Programs Through The Tax-Base | 2.82 | 3.05 | 2.47 | 2.56 | 2.13 | 2.14 | Immediate |
| 4. Expand the Scope of Trillium Trust to Make Investments in Energy Infrastructure (e.g., Transmission upgrade, etc) | TBD | TBD | TBD | TBD | TBD | TBD | TBD |
| 5. Empower Energy Agencies to Increase Cost Effectiveness and Improve efficiency* | | | | | | | |

**Source:** Ministry of Finance, Energy

# Considerations / Outcomes

- The proposed initiatives provide the following opportunities to:
  - Lower the cost of electricity for all consumers;
  - Re-set how electricity programs and energy infrastructure is funded (i.e., shifting costs to the tax-base from rate-base);
  - Provide electricity consumers with greater choices (i.e., signal rate plan);
  - Provide system benefits (e.g., market renewal); and
  - Increase cost effectiveness and improve efficiency.

- The timing of the impact of these rate mitigation initiatives varies.
  - Immediate and near-term impacts can be achieved by shifting costs to the tax-base or changing how certain costs are recovered from consumers or eliminating certain programs.
  - Over the longer term, changes to the electricity supply mix and achieving efficiencies in the electricity market could yield system savings.

- Pursuing the initiatives would require regulatory amendments and working with the electricity sector agencies, LDCs and other stakeholders to implement the initiatives.

John.

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Rate Mitigation Plan Options"

The Ministry of Energy (Energy) is providing potential price mitigation initiatives.

**CONTEXT**

- As outlined in Energy's deck, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g., GEIA renegotiation with Samsung consortium, decreasing FIT prices, etc.).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

**COMMENTS**

- A significant number of Energy's proposals involve shifting costs or risks from the rate base to the tax base. The fiscal exposure could be well over $2 billion in 2017-18.
- The largest impacts on rates and largest potential fiscal exposures are from the deferred recovery of Global Adjustment costs ($2 bn per year or more) and an enhanced, tax-base-funded 5% rebate for Regulated Price Plan (RPP) customers (about $700 million per year).
    - Significant fiscal exposure comes from proposals not yet fully costed by Energy (e.g., the Global Adjustment, with Energy to benefit from consulting with OPCD and KPMG on accounting).
    - Energy also presents other proposals where costs and impacts are not shown or "TBD".
    - Energy does not show OPG efficiencies as a fiscal risk in its table on slide 8. It is estimated at a $240 million per year exposure on slide 33.

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| **TOTAL** | **1,530** | **1,544** | **1,564** | **1,639** | **1,535** | **1,225** | **2,035** |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**ENERGY'S BROAD POLICY THEMES / RATIONALES**

- In recognition of the costs borne by ratepayers related to the to decarbonizing and modernizing the province's electricity sector:
    1. Provide significant and immediate rate relief through cost deferral of the global adjustment (GA).
    2. Provide a greater focus on vulnerable consumers by funding electricity support programs, such as the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Protection, (RRRP) through the tax-base. In addition, provide greater support for lower income Ontarians by enhancing the OESP, etc.
    3. Empower energy agencies to increase cost effectiveness and improve efficiency by having – Independent Electricity System Operator (IESO) modernize Ontario's electricity market through electricity market renewal initiatives, the Ontario Energy Board (OEB) identify opportunities for future LDC cost reductions/efficiencies and work with Ontario Power Generation (OPG) to find further efficiencies in operations and pass on savings to ratepayers.
    4. Enhance the existing 8% rebate that went into effect January 1, 2017.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not fully address the fiscal impact/accounting treatment, or implementation<br>o Based on preliminary discussions with KPMG, Energy has identified key steps (presumably for there not to be a fiscal impact):<br>▪ need to be able to create an asset<br>▪ Need to identify an entity that could hold such an asset (e.g. OEFC, IESO or LDCs?)<br>o Energy is said to be working with LSB, IESO, MOF, TBS and external accountants on legislative, regulatory and accounting requirements<br>o Energy's deck clearly identify that under the current legal framework, the GA would not be able to recover interest costs of the deferral<br>• Likely will lead to significant annual fiscal impact and increase in net debt (illustrated as $9 Bn on slide 9, or $23 Bn on slides 11 & 12 scenarios; previously estimated by Energy to be up to $65 Bn, depending on | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | |
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by $0.83 based on current OESP charge.**<br><br>**Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈ $1.60 in 2017, increasing to ≈ $1.80 in 2022.** | • Would provide on-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households.<br>• There may be a risk that expanding OESP or RRRP may change the view of the federal government that it is not a taxable benefit. When OESP was created, TPD worked with Finance Canada and Energy to ensure that it was not considered a taxable benefit.<br>• RRRP expansion that subsidised high-cost distribution systems may create a disincentive effect on achieving efficiencies é cost reductions in those LDCs (or Toronto, as the benchmark). Energy and OEB would need to address this through the regulatory system or other measures such as eligibility conditions. | <u>OESP</u><br>• 2017-18: $162 M<br>• Increasing to $323 M in 2020-21.<br><br><u>Conservation</u><br>• 2017-18: $457 M<br>• Increasing to $493 M in 2020-21 |
| **Create a new low income conservation benefit program that would build on existing programs.** | • Conservation programs provide electricity system benefits. Fiscal-funding would result in a cross-subsidisation from tax-base.<br>• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan. | • $60 million per year. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Enhance Tax-base RPP Rebat by 5%, to 13%** | • This proposal would increase the funding requirement of the newly established Ontario Rebate for Electricity Consumers (OREC) by about $700 million per fiscal year, to reduce an average residential bill by about $7 each month or $84 annually.<br>• The current OREC provides average savings of about $11 each month or $130 annually. | • About $700 per year |

**DETAIL ON ENERGY PROPOSALS INCLUDED IN THE JANUARY 18th DECK**

Formatted: Keep with next

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 1a, 1b, and low GA Financing scenario), or more (e.g., about $5.5 bn in 2017 under high GA Financing scenario), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under the high GA Financing scenario, now discussed in the Appendix of the latest deck, net debt could rise by $65 Bn over time, as estimated by Energy, and the cost pressure could be up to $51 per month by 2047. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

Commented [GH1]: This option has been moved to the appendix section, not sure if need to be mentioned.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
    - Option 1a: Moderate GA financing, paying $3.2 and $3.4 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 1b: Moderate GA financing, paying $1.1 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 3: Low / GA financing – paying $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off, with limits of no more than $2 billion above the true cost of GA.
    - Option 4: High / GA financing – paying $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively, with no limits above the true cost of GA.
- It should be noted that under any of these options the relief period is quite limited when compare to the period under where future ratepayers will have to pay the cost of the deferral. Chart 1a and 1b (slides 10 and 11) illustrate that the impact of the relief would not last beyond 2022 (1a) and 2024 (1b) whill the higher cost caused by the deferral would hit electricity bills until 2042 at the least.
- Impact of the Level of Financing on Large Industrial Electricity Consumers provided in the deck was based on previous scenarios. It should be updated using above scenarios.
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].
- Preliminary discussions between CEFD and OPCD staff suggest that there are material fiscal and reporting risk associated with this proposal.

OESP & RRRP ($0.51-0.62 bn in 2017 to $0.80-0.92 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Low Income Conservation Benefit Program

- A new low income conservation benefit program would build on existing programs.
  - Existing low income programs delivered by local distribution companies and IESO help qualified homeowners and social and/or assisted housing providers improve the energy efficiency of their homes.
  - With respect to a new program Energy notes that participants could receive incentives for conservation measures not currently covered, increased incentive amounts, and targeted education and awareness initiatives.

- Energy notes an illustrative budget of $60 million per year, but states that further analysis is required on costing and implementation details, including alignment with the existing conservation framework.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
  - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.

**Formatted:** Keep with next, Tab stops: 4.46", Left

**Formatted:** Keep with next

  - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
  - Moving to “technology-agnostic” procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
  - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
  - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
  - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
  - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
  - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister’s Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG’s current rate application.
  - If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province’s fiscal plan (Energy estimates it at $240 million per year).

~~Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):~~
~~Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.~~

- ~~The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.~~
- ~~Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.~~

**SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION –JANUARY 18 DECK**

3. Total would be significantly larger with the TBDs crystalized.

Formatted Table

Formatted Table

## Appendix: Options not currently recommended by Energy

| | | |
|---|---|---|
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • **Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects**<br>• **Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small**<br>• **May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle**<br>• **Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return**<br>• **Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].**<br>• **Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms.** | • **Up to $390 million annually from 2017-18 to 2020-21.** |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | • $260 million annually from 2017-18 to 2020-21. |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion. | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC]. |

- Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.
  - Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base
- Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

Hi Ron,

Pls. see attached updated note.

Thanks,

John.

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Rate Mitigation Plan Options"

The Ministry of Energy (Energy) is providing potential price mitigation initiatives.

## CONTEXT

- As outlined in Energy's deck, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g., GEIA renegotiation with Samsung consortium, decreasing FIT prices, etc.).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs or risks from the rate base to the tax base. The fiscal exposure could be well over $2 billion in 2017-18.
- The largest impacts on rates and largest potential fiscal exposures are from the deferred recovery of Global Adjustment costs ($2 bn per year or more) and an enhanced, tax-base-funded 5% rebate for Regulated Price Plan (RPP) customers (about $700 million per year).
    - Significant fiscal exposure comes from proposals not yet fully costed by Energy (e.g., the Global Adjustment, with Energy to benefit from consulting with OPCD and KPMG on accounting).
    - Energy also presents other proposals where costs and impacts are not shown or "TBD".
    - Energy does not show OPG efficiencies as a fiscal risk in its table on slide 8. It is estimated at a $240 million per year exposure on slide 33.

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| **TOTAL** | **1,530** | **1,544** | **1,564** | **1,639** | **1,535** | **1,225** | **2,035** |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**ENERGY'S BROAD POLICY THEMES / RATIONALES**

- In recognition of the costs borne by ratepayers related to the to decarbonizing and modernizing the province's electricity sector:
    1. Provide significant and immediate rate relief through cost deferral of the global adjustment (GA).
    2. Provide a greater focus on vulnerable consumers by funding electricity support programs, such as the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Protection, (RRRP) through the tax-base. In addition, provide greater support for lower income Ontarians by enhancing the OESP, etc.
    3. Empower energy agencies to increase cost effectiveness and improve efficiency by having – Independent Electricity System Operator (IESO) modernize Ontario's electricity market through electricity market renewal initiatives, the Ontario Energy Board (OEB) identify opportunities for future LDC cost reductions/efficiencies and work with Ontario Power Generation (OPG) to find further efficiencies in operations and pass on savings to ratepayers.
    4. Enhance the existing 8% rebate that went into effect January 1, 2017.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not fully address the fiscal impact/accounting treatment, or implementation<br>o Based on preliminary discussions with KPMG, Energy has identified key steps (presumably for there not to be a fiscal impact):<br>▪ need to be able to create an asset<br>▪ Need to identify an entity that could hold such an asset (e.g. OEFC, IESO or LDCs?)<br>o Energy is said to be working with LSB, IESO, MOF, TBS and external accountants on legislative, regulatory and accounting requirements<br>o Energy's deck clearly identify that under the current legal framework, the GA would not be able to recover interest costs of the deferral<br>• Likely will lead to significant annual fiscal impact and increase in net debt (illustrated as $9 Bn on slide 9, or $23 Bn on slides 11 & 12 scenarios; previously estimated by Energy to be up to $65 Bn, depending on | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |

When OESP was created, TPD worked with Finance Canada and Energy to ensure that it was not considered a taxable benefit.<br>• RRRP expansion that subsidised high-cost distribution systems may create a disincentive effect on achieving efficiencies é cost reductions in those LDCs (or Toronto, as the benchmark). Energy and OEB would need to address this through the regulatory system or other measures such as eligibility conditions. | <u>OESP</u><br>• 2017-18: $162 M<br>• Increasing to $323 M in 2020-21.<br><br><u>Conservation</u><br>• 2017-18: $457 M<br>• Increasing to $493 M in 2020-21 |
| **Create a new low income conservation benefit program that would build on existing programs.** | • Conservation programs provide electricity system benefits. Fiscal-funding would result in a cross-subsidisation from tax-base.<br>• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan. | • $60 million per year. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Enhance Tax-base RPP Rebat by 5%, to 13%** | • This proposal would increase the funding requirement of the newly established Ontario Rebate for Electricity Consumers (OREC) by about $700 million per fiscal year, to reduce an average residential bill by about $7 each month or $84 annually.<br>• The current OREC provides average savings of about $11 each month or $130 annually. | • About $700 per year |

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

**DETAIL ON ENERGY PROPOSALS INCLUDED IN THE JANUARY 18th DECK**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 1a, 1b, and low GA Financing scenario), or more (e.g., about $5.5 bn in 2017 under high GA Financing scenario), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under the high GA Financing scenario, now discussed in the Appendix of the latest deck, net debt could rise by $65 Bn over time, as estimated by Energy, and the cost pressure could be up to $51 per month by 2047. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

**Commented [GH1]:** This option has been moved to the appendix section, not sure if need to be mentioned.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
    - Option 1a: Moderate GA financing, paying $3.2 and $3.4 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 1b: Moderate GA financing, paying $1.1 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 3: Low / GA financing – paying $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off, with limits of no more than $2 billion above the true cost of GA.
    - Option 4: High / GA financing – paying $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively, with no limits above the true cost of GA.
- It should be noted that under any of these options the relief period is quite limited when compare to the period under where future ratepayers will have to pay the cost of the deferral. Chart 1a and 1b (slides 10 and 11) illustrate that the impact of the relief would not last beyond 2022 (1a) and 2024 (1b) whill the higher cost caused by the deferral would hit electricity bills until 2042 at the least.
- Impact of the Level of Financing on Large Industrial Electricity Consumers provided in the deck was based on previous scenarios. It should be updated using above scenarios.
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].
- Preliminary discussions between CEFD and OPCD staff suggest that there are material fiscal and reporting risk associated with this proposal.

OESP & RRRP ($0.51-0.62 bn in 2017 to $0.80-0.92 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

<u>Low Income Conservation Benefit Program</u>

- A new low income conservation benefit program would build on existing programs.
  - Existing low income programs delivered by local distribution companies and IESO help qualified homeowners and social and/or assisted housing providers improve the energy efficiency of their homes.
  - With respect to a new program Energy notes that participants could receive incentives for conservation measures not currently covered, increased incentive amounts, and targeted education and awareness initiatives.

- Energy notes an illustrative budget of $60 million per year, but states that further analysis is required on costing and implementation details, including alignment with the existing conservation framework.

<u>Energy Agencies' Cost Effectiveness and Efficiencies</u>:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
  - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
  - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."

  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
  - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
  - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
  - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
  - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
  - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
  - If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

<u>Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18)</u>:
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

**SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION –JANUARY 18 DECK**

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

1. Based on estimated / forecasted numbers [May have some variations from the January 18 deck.]
2. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

3. Total would be significantly larger with the TBDs crystalized.

## Appendix: Options not currently recommended by Energy

| | | |
|---|---|---|
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • **Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects**<br>• **Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small**<br>• **May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle**<br>• **Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return**<br>• **Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].**<br>• **Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms.** | • **Up to $390 million annually from 2017-18 to 2020-21.** |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | • $260 million annually from 2017-18 to 2020-21. |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion. | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC]. |

- Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.
  - Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base
- Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

**Subject:** Comments on Electricity Sector Transformation Proposals v14a_markup3.docx

Hi Ron,

Pls. see attached updated note.

Thanks,

John.

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "~~Proposed Initiatives to Transform Ontario's Electricity Sector~~Rate Mitigation Plan Options"

The Ministry of Energy (Energy) is providing ~~an update on progress related to transforming the province's electricity sector by elaborating on~~ potential price mitigation initiatives~~, as outlined in its decks~~.

**CONTEXT**

- As outlined in Energy's ~~update~~deck, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g., GEIA renegotiation with Samsung consortium, decreasing FIT prices, etc.).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- ~~On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.~~

- ~~The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.~~

**COMMENTS**

- A significant number of Energy's proposals involve shifting costs or risks from the rate base to the tax base. The fiscal exposure could be well over $2 billion in 2017-18.
- ~~While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about potentially more than $2 billion in 2017-18 if including yet-to-be-costed items)~~ The largest impacts on rates and largest potential fiscal exposures are from the deferred recovery of Global Adjustment costs ($2 bn per year or more) and an enhanced, tax-base-funded 5% rebate for Regulated Price Plan (RPP) customers (about $700 million per year).
    - ~~Additional~~Significant fiscal exposure comes from proposals not yet fully costed by Energy (e.g., ~~conservation costs~~the Global Adjustment, with Energy to benefit from consulting with OPCD and KPMG on accounting).
    - Energy also presents other proposals where costs and impacts are not shown or "TBD".
    - Energy does not show OPG efficiencies as a fiscal risk in its table on slide 8. It is estimated at a $240 million per year exposure on slide 33.

Formatted

- ~~In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.~~

Formatted: Font: 11.5 pt

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,535 | 1,225 | 2,035 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**ENERGY'S BROAD POLICY THEMES / RATIONALES**

- In recognition of the costs borne by ratepayers related to the to decarbonizing and modernizing the province's electricity sector:

Formatted: Indent: Left: 0", Tab stops: 0.25", List tab + Not at 0.5"

1. Provide significant and immediate rate relief through cost deferral of the global adjustment (GA).

Formatted: Indent: Left: 0.5", Space Before: 6 pt, Tab stops: 0.75", List tab + Not at 1"

2. Provide a greater focus on vulnerable consumers by funding electricity support programs, such as the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Protection, (RRRP) through the tax-base. In addition, provide greater support for lower income Ontarians by enhancing the OESP, etc.
3. Empower energy agencies to increase cost effectiveness and improve efficiency by having – Independent Electricity System Operator (IESO) modernize Ontario's electricity market through electricity market renewal initiatives, the Ontario Energy Board (OEB) identify opportunities for future LDC cost reductions/efficiencies and work with Ontario Power Generation (OPG) to find further efficiencies in operations and pass on savings to ratepayers.
4. Enhance the existing 8% rebate that went into effect January 1, 2017.

~~A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.~~

- ~~Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.~~
- ~~Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.~~

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not fully address the fiscal impact/accounting treatment, or implementation<br>o Based on preliminary discussions with KPMG, Energy has identified key steps (presumably ~~-~~for there not to be a fiscal impact):<br>▪ ~~the~~ need to be able to create an asset ~~[to offset the creation of the liability]~~<br>▪ Need to identify ~~to be held by~~ an entity that could hold such an asset ~~yet to be determined,~~ (e.g. OEFC, IESO or LDCs?)<br>o Energy is said to be working with LSB, IESO, MOF, TBS and external accountants on legislative, regulatory and accounting requirements<br>o Energy's deck clearly identify that under the current legal framework, the GA would not be able to recover interest costs of the deferral<br>• Likely will lead to significant annual fiscal impact and increase in net debt (illustrated as $9 Bn on slide 9, or $23 Bn on slides 11 & 12 scenarios; previously estimated by Energy to be up to $~~66~~ 65 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |

**Formatted:** Indent: Left: 0.24"

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ~~≈ $0.55 in 2017, increasing to ~ $1.45 in 2022.~~$0.83 based on current OESP charge.**<br><br>**Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>**Estimated to reduce average monthly residential bill by ≈ $~~1.55~~1.60 in 2017, increasing to ≈ $~~1.75~~1.80 in 2022.**<br>• | • Would provide on-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households.<br>• There may be a risk that expanding OESP or RRRP may change the view of the federal government that it is not a taxable benefit. When OESP was created, TPD worked with Finance Canada and Energy to ensure that it was not considered a taxable benefit.<br>• RRRP expansion that subsidised high-cost distribution systems may create a disincentive effect on achieving efficiencies é cost reductions in those LDCs (or Toronto, as the benchmark). Energy and OEB would need to address this through the regulatory system or other measures such as eligibility conditions. | OESP<br>• 2017-18: $162 M<br>• Increasing to $32~~23~~ M in 2020-21.<br><br>Conservation<br>• 2017-18: $~~666~~457 M<br>• Increasing to $~~719~~493 M in 2020-21 |
| ~~**Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.**~~<br>**Create a new low income conservation benefit program that would build on existing programs.** | ~~• Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.~~<br>~~• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.~~<br>~~o~~• Conservation programs provide electricity system benefits. Fiscal-funding would result in a cross-subsidisation from tax-base.<br>~~o~~• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan. | • ~~[If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC]~~$60 million per year. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| ~~Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding~~ | • ~~Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects~~<br>• ~~Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small~~<br>• ~~May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle~~<br>• ~~Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return~~<br>• ~~Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].~~<br>• ~~Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms.~~ | • ~~Up to $390 million annually from 2017-18 to 2020-21.~~ |
| ~~Dedicate the Departure Tax~~ | • ~~In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".~~<br>• ~~The departure tax was not a fiscal windfall. It was net fiscally neutral – while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.~~<br>• ~~Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.~~<br>• ~~The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers.~~ | • ~~$260 million annually from 2017-18 to 2020-21.~~ |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| ~~Give consumers more choice by allowing to "opt into" alternate rate plan~~ | • ~~Start with the option of flat electricity rate option~~<br>• ~~OEB to develop more options over time~~ | • ~~No expected fiscal impact.~~ |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • ~~Provide more details regarding the Global Adjustment (GA)~~ | |
| ~~End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers~~ | • ~~Current legislated March 31, 2018 end of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt~~<br>• ~~Provides only temporary incremental mitigation, as DRC legislated to end.~~<br>• ~~Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported~~ | • ~~$450 M in 2017-18~~ |
| | • | • |
| ~~Tax Relief for Solar and Wind~~ | • ~~Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process~~<br>• ~~Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit~~ | • ~~Annual fiscal impact not yet determined.~~ |
| Enhance Tax-base RPP Rebat by 5%, to 13% | • This proposal would increase the funding requirement of the newly established Ontario Rebate for Electricity Consumers (OREC) by about $700 million per fiscal year, to reduce an average residential bill by about $7 each month or $84 annually.<br>• The current OREC provides average savings of about $11 each month or $130 annually. | • About $700 per year |

**DETAIL ON ENERGY PROPOSALS INCLUDED IN THE JANUARY 18th DECK**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 1a~~2~~, ~~&~~1b~~3~~, and low GA Financing scenario), or more (e.g., about $5.5 bn in 2017 under ~~option 4~~high GA Financing scenario), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under the high GA Financing scenario~~option 4~~, now discussed in the Appendix of the latest deck, net debt could rise by $6~~5~~6 Bn over time, as estimated by Energy, and the cost pressure could be up to $51 per month by 2047. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

**Formatted:** Superscript

**Formatted:** Font: 11.5 pt

**Commented [GH1]:** This option has been moved to the appendix section, not sure if need to be mentioned.

**Formatted:** Default Paragraph Font, Font: 11.5 pt

**Formatted:** Font: 11.5 pt

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - ~~o Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year~~
  - o Option 1a~~2~~: Moderate ~~short-term cost reductions~~GA financing, paying $3.2 and $3.4 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
  - o Option 1b: Moderate GA financing, paying $1.1 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
  - o Option 3: Low / GA financing – paying $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off, with limits of no more than $2 billion above the true cost of GA.~~Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA~~
  - o Option 4: High / GA financing – paying $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively, with no limits above the true cost of GA.~~Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years~~
- It should be noted that under any of these options the relief period is quite limited when compare to the period under where future ratepayers will have to pay the cost of the deferral. Chart 1a and 1b (slides 10 and 11) illustrate that the impact of the relief would not last beyond 2022 (1a) and 2024 (1b) whill the higher cost caused by the deferral would hit electricity bills until 2042 at the least.
- Impact of the Level of Financing on Large Industrial Electricity Consumers provided in the deck was based on previous scenarios. It should be updated using above scenarios.
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].
- Preliminary discussions between CEFD and OPCD staff suggest that there are material fiscal and reporting risk associated with this proposal.

OESP & RRRP ($0.5142-0.~~85~~62 bn in 2017 to $0.~~62~~80-~~1~~0.~~18~~92 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - o Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - o OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by

the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Low Income Conservation Benefit Program

- A new low income conservation benefit program would build on existing programs.
  - Existing low income programs delivered by local distribution companies and IESO help qualified homeowners and social and/or assisted housing providers improve the energy efficiency of their homes.
  - With respect to a new program Energy notes that participants could receive incentives for conservation measures not currently covered, increased incentive amounts, and targeted education and awareness initiatives.

- Energy notes an illustrative budget of $60 million per year, but states that further analysis is required on costing and implementation details, including alignment with the existing conservation framework.

~~Amortize Conservation Program Costs:~~

~~Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.~~

- ~~Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.~~
  - ~~Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.~~
  - ~~Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.~~
  - ~~Rate-regulated accounting is currently under review by international accounting standard-setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.~~

- ~~If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.~~

- ~~Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.~~
  - ~~Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.~~

~~Expanding the scope of the Trillium Trust to invest in energy infrastructure:~~

~~The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).~~

- ~~Expanding access to natural gas is already included under Moving Ontario Forward.~~
- ~~Using the Trillium Trust for additional energy projects would require either~~
  - ~~squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or~~
  - ~~additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.~~
- ~~In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.~~
  - ~~Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).~~
- ~~Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).~~
  - ~~May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.~~
  - ~~This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.~~
- ~~Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.~~
- ~~Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.~~

~~Departure Tax:~~

~~As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.~~

- ~~This would have a dollar-for-dolar fiscal impact.~~
- ~~This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).~~
- ~~The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.~~
- ~~Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.~~
- ~~Having OEFC help implement this measure may require introducing changes to OEFC's objects.~~
- ~~This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.~~

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
    - If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):

Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate base to the tax base.

Formatted Table

Formatted Table

**Formatted:** Normal, Indent: Left: 0"

## Appendix: Options not currently recommended by Energy

Formatted: Normal, Indent: Left: 0"

Formatted: Font: Bold

| | | |
|---|---|---|
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • **Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects**<br>• **Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small**<br>• **May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle**<br>• **Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return**<br>• **Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].**<br>• **Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms.** | • **Up to $390 million annually from 2017-18 to 2020-21.** |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | • $260 million annually from 2017-18 to 2020-21. |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion. | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC]. |

- Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.
  - Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base
- Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan

**Formatted:** Normal, Indent: Left: 0"

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Formatted: Normal, Indent: Left: 0"

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

Hi,

I made some changes in the attached version of the note.

John – I will drop by to go over what I changed.

Emily

**Subject:** RE: Comments on Electricity Sector Transformation Proposals v14a.docx

Hi,

I freelanced a bit on the GA piece. Feel free to discard if you don't agree. I also moved the TT and DT sections to an appendix. I think is confusing to keep measures not being recommended in this deck in the main section.

Thanks,

Francisco

---

**Subject:** Comments on Electricity Sector Transformation Proposals v14a.docx

Good morning. I quickly put an initial marker down so that it could be turned around reasonably quickly. Also saved in the folder.

Thanks,

John.

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

**CONTEXT**

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

**COMMENTS**

- A significant number of Energy's proposals involve shifting costs from the rate base to the tax base.
- While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (~~about~~ potentially more than $2 billion in 2017-18 if including yet-to-be-costed items).
- Additional fiscal exposure comes from proposals not yet costed by Energy (e.g., conservation costs, with Energy consulting OPCD on accounting). Energy also presents other proposals where costs and impacts are "TBD".
- In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

**Formatted:** Font: 11.5 pt

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |

NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**ENERGY'S BROAD POLICY THEMES / RATIONALES**

A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ~~≈ $0.55 in 2017, increasing to ≈ $1.45 in 2022,~~$0.83 based on current OESP charge.**<br><br>**Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.** | • Would provide on-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households.<br>• There may be a risk that expanding OESP or RRRP may change the view of the federal government that it is not a taxable benefit. When OESP was created, TPD worked with Finance Canada and Energy to ensure that it was not considered a taxable benefit. | OESP<br>• 2017-18: $162 M<br>• Increasing to $32~~2~~3 M in 2020-21.<br><br>Conservation<br>• 2017-18: $~~666~~457 M |

| **Enhance Tax-base RPP Rebat by 5%, to 13%** | • This proposal would increase the funding requirement of the newly established Ontario Rebate for Electricity Consumers (OREC) by about $700 million per fiscal year, to reduce an average residential bill by about $7 each month or $84 annually.<br>• The current OREC provides average savings of about $11 each month or $130 annually. | • About $700 per year |

**DETAIL ON ENERGY PROPOSALS INCLUDED IN THE JANUARY 18th DECK**

Formatted: Superscript

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.5142-0.8562 bn in 2017 to $0.6280-10.1892 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and

  - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Formatted: No bullets or numbering

Low Income Conservation Benefit Program

- A new low income conservation benefit program would build on existing programs.
  - Existing low income programs delivered by local distribution companies and IESO help qualified homeowners and social and/or assisted housing providers improve the energy efficiency of their homes.
  - With respect to a new program Energy notes that participants could receive incentives for conservation measures not currently covered, increased incentive amounts, and targeted education and awareness initiatives.

Formatted: List Paragraph, Bulleted + Level: 1 + Aligned at: 0" + Indent at: 0.25"

Formatted: List Paragraph, Indent: Left: 0.25", Bulleted + Level: 2 + Aligned at: 0.5" + Indent at: 0.75"

- Energy notes an illustrative budget of $60 million per year, but states that further analysis is required on costing and implementation details, including alignment with the existing conservation framework.

~~Amortize Conservation Program Costs:~~

~~Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.~~

- ~~Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.~~
  - ~~Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.~~
  - ~~Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.~~
  - ~~Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.~~

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not proceeding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

~~by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).~~

- ~~The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.~~
- ~~Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.~~
- ~~Having OEFC help implement this measure may require introducing changes to OEFC's objects.~~
- ~~This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.~~

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.

- If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 1a~~2~~, ~~&~~1b~~3~~, and low GA Financing scenario), or more (e.g., about $5.5 bn in 2017 under ~~option 4~~high GA Financing scenario), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under the high GA Financing scenario~~option 4~~, now discussed in the Appendix of the latest deck, net debt could rise by $6~~5~~6 Bn over time, as estimated by Energy, and the cost pressure could be up to $51 per month by 2047. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - ~~Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year~~
  - Option 1a~~2~~: Moderate ~~short-term cost reductions~~GA financing, paying $3.2 and $3.4 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
  - Option 1b: Moderate GA financing, paying $1.1 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
  - Option 3: Low / GA financing – paying $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off, with limits of no more than $2 billion above the true cost of GA.~~Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA~~
  - Option 4: High / GA financing – paying $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively, with no limits above the true cost of GA.~~Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years~~
- It should be noted that under any of these options the relief period is quite limited when compare to the period under where future ratepayers will have to pay the cost of the deferral. Chart 1a and 1b (slides 10 and 11) illustrate that the impact of the relief would not last beyond 2022 (1a) and 2024 (1b) whill the higher cost caused by the deferral would hit electricity bills until 2042 at the least.

**Formatted:** Font: 11.5 pt

**Commented [GH1]:** This option has been moved to the appendix section, not sure if need to be mentioned.

**Formatted:** Default Paragraph Font, Font: 11.5 pt

**Formatted:** Font: 11.5 pt

- Impact of the Level of Financing on Large Industrial Electricity Consumers provided in the deck was based on previous scenarios. It should be updated using above scenarios.
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].
- Preliminary discussions between CEFD and OPCD staff suggest that there are material fiscal and reporting risk associated with this proposal.

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

Formatted Table

**Formatted:** Normal, Indent: Left: 0"

## Appendix: Options not currently recommended by Energy

Formatted: Normal, Indent: Left: 0"

Formatted: Font: Bold

| | | |
|---|---|---|
| Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | • $260 million annually from 2017-18 to 2020-21. |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion. | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC]. |

- Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.
  - Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base
- Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan

**Formatted:** Normal, Indent: Left: 0"

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Formatted: Normal, Indent: Left: 0"

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

---

Hi,

I freelanced a bit on the GA piece. Feel free to discard if you don't agree. I also moved the TT and DT sections to an appendix. I think is confusing to keep measures not being recommended in this deck in the main section.

Thanks,

Francisco

Good morning. I quickly put an initial marker down so that it could be turned around reasonably quickly. Also saved in the folder.

Thanks,

John.

**DRAFT: COMMERCIALLY SENSITIVE AND CONFIDENTIAL ADVICE TO MINISTERS**

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

**CONTEXT**

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

**COMMENTS**

- A significant number of Energy's proposals involve shifting costs from the rate base to the tax base.
- While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (~~about~~ potentially more than $2 billion in 2017-18 if including yet-to-be-costed items).
- Additional fiscal exposure comes from proposals not yet costed by Energy (e.g., conservation costs, with Energy consulting OPCD on accounting). Energy also presents other proposals where costs and impacts are "TBD".
- In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

**Formatted:** Font: 11.5 pt

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |

OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

**ENERGY'S BROAD POLICY THEMES / RATIONALES**

A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ≈ $0.55 in 2017, increasing to ≈ $1.45 in 2022.**<br><br>**Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈** | • Would provide on-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households.<br>• There may be a risk that expanding OESP or RRRP may change the view of the federal government that it is not a taxable benefit. When OESP was created, TPD worked with Finance Canada and Energy to ensure that it was not considered a taxable benefit. | • 2017-18: $162 M<br>• Increasing to $322 M in 2020-21.<br><br>• 2017-18: $666 M<br>• Increasing to $719 M in 2020-21 |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **$1.55 in 2017, increasing to ≈ $1.75 in 2022.** | | |
| | | |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC] |
| ~~**Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding**~~ | • ~~Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects~~<br>• ~~Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small~~<br>• ~~May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle~~<br>• ~~Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return~~<br>• ~~Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].~~<br>• ~~Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms.~~ | • ~~Up to $390 million annually from 2017-18 to 2020-21.~~ |
| ~~**Dedicate the Departure Tax**~~ | • ~~In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".~~ | • ~~$260 million annually from~~ |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | ~~• The departure tax was not a fiscal windfall. It was net fiscally neutral – while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.~~<br>~~• Repurposing the departure tax to provide rate mitigation would have a dollar-per-dollar fiscal impact and could trigger an increase in OEFC's stranded debt.~~<br>~~• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers.~~ | ~~2017-18 to 2020-21.~~ |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding the Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • Current legislated March 31, 2018 end of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end.<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not fully address the fiscal impact/accounting treatment, or implementation<br>o Based on preliminary discussions with KPMG, Energy has identified the need to create an asset [to offset the creation of the liability] to be held by an entity yet to be determined, e.g. OEFC, IESO or LDCs<br>o Energy is said to be working with LSB, IESO, MOF, TBS and external accountants on legislative, regulatory and accounting requirements<br>o Energy's deck clearly identify that under the current legal framework the GA would not be able to recover interest costs of the deferral<br>• Likely will lead to significant annual fiscal impact and increase in net debt (estimated by Energy to be up to $~~66~~ 65 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Annual fiscal impact not yet determined. |
| **Enhance Tax-base RPP Rebat by 5%, to 13%** | • This proposal would increase the funding requirement of the newly established Ontario Rebate for Electricity Consumers (OREC) by about $700 million per fiscal year, to reduce an average residential bill by about $7 each month or $84 annually.<br>• The current OREC provides average savings of about $11 each month or $130 annually. | • About $700 per year |

**DETAIL ON ENERGY PROPOSALS INCLUDED IN THE JANUARY 18th DECK**

Formatted: Superscript

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

~~Expanding the scope of the Trillium Trust to invest in energy infrastructure:~~

~~The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).~~

- ~~Expanding access to natural gas is already included under Moving Ontario Forward.~~
- ~~Using the Trillium Trust for additional energy projects would require either~~
  - ~~squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or~~
  - ~~additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.~~
- ~~In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in service and amortized.~~
  - ~~Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).~~
- ~~Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase~~

~~growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).~~
  - ~~May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.~~
  - ~~This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.~~
- ~~Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.~~
- ~~Energy also suggests that investments could be made into projects that are currently not proceeding due to cost barriers under the OEB's beneficiary pays principle.~~

~~Departure Tax:~~

~~As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.~~
- ~~This would have a dollar-for-dolar fiscal impact.~~
- ~~This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).~~
- ~~The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.~~
- ~~Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.~~
- ~~Having OEFC help implement this measure may require introducing changes to OEFC's objects.~~
- ~~This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.~~

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
  - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
  - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
  - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
  - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.

- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.
    - If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 1a~~2~~, ~~&~~1b~~3~~, and low GA Financing scenario), or more (e.g., about $5.5 bn in 2017 under ~~option 4~~high GA Financing scenario), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under the high GA Financing scenario~~option 4~~, now discussed in the Appendix of the latest deck, net debt could rise by $6~~5~~6 Bn over time, as estimated by Energy, and the cost pressure could be up to $51 per month by 2047. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

**Formatted:** Font: 11.5 pt

**Commented [GH1]:** This option has been moved to the appendix section, not sure if need to be mentioned.

**Formatted:** Default Paragraph Font, Font: 11.5 pt

**Formatted:** Font: 11.5 pt

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - ~~o Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year~~
  - o Option 1a~~2~~: Moderate ~~short-term cost reductions~~GA financing, paying $3.2 and $3.4 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
  - o Option 1b: Moderate GA financing, paying $1.1 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
  - o Option 3: Low / GA financing – paying $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off, with limits of no more than $2 billion above the true cost of GA.~~Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA~~
  - o Option 4: High / GA financing – paying $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively, with no limits above the true cost of GA.~~Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years~~
- It should be noted that under any of these options the relief period is quite limited when compare to the period under where future ratepayers will have to pay the cost of the deferral. Chart 1a and 1b (slides 10 and 11) illustrate that the impact of the relief would not last beyond 2022 (1a) and 2024 (1b) whill the higher cost caused by the deferral would hit electricity bills until 2042 at the least.
- Impact of the Level of Financing on Large Industrial Electricity Consumers provided in the deck was based on previous scenarios. It should be updated using above scenarios.
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].
- Preliminary discussions between CEFD and OPCD staff suggest that there are material fiscal and reporting risk associated with this proposal.

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

Formatted: Font: Bold

| | | |
|---|---|---|
| Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | • $260 million annually from 2017-18 to 2020-21. |

Formatted: Normal, Indent: Left: 0"

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
  - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
  - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
  - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
  - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
  - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).
- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

On the Trillium Trust, it might be fair to point out that Energy raises the prospect of investing in projects that would not otherwise be viewed by the OEB as projects that meet a system benefits test – so not really a rate saving if the projects would not have been done on the rate base. Really a tax-based subsidisation for other policy reasons.

Subject: Fwd: Rate Mitigation

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

<Comments on Electricity Sector Transformation Proposals v9 (CEFD)_Markup2.docx>

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs from the rate base to the tax base.
- While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about $2 billion in 2017-18).
- Additional fiscal exposure comes from proposals not yet costed by Energy (e.g., conservation costs, with Energy consulting OPCD on accounting). Energy also presents other proposals where costs and impacts are "TBD".
- In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,535 | 1,225 | 2,035 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

## ENERGY'S BROAD POLICY THEMES / RATIONALES

A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ≈ $0.55 in 2017, increasing to ≈ $1.45 in 2022.** | • Would provide on-bill benefits.<br><br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. | • 2017-18: $162 M<br><br>• Increasing to $322 M in 2020-21. |
| **Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈** | | • 2017-18: $666 M<br><br>• Increasing to $719 M in 2020-21 |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **$1.55 in 2017, increasing to ≈ $1.75 in 2022.** | | |
| | | |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC] |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax". | • $260 million annually from |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | 2017-18 to 2020-21. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding the Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • Current legislated March 31, 2018 end of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end.<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant annual fiscal impact and increase in net debt (estimated by Energy to be up to $66 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Annual fiscal impact not yet determined. |

**DETAIL ON ENERGY PROPOSALS**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
    - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

<u>Expanding the scope of the Trillium Trust to invest in energy infrastructure:</u>

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

<u>Departure Tax</u>:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.

- If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 2&3), or more (e.g., about $5.5 bn in 2017 under option 4), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under option 4, net debt could rise by $66 Bn over time, as estimated by Energy. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year
  - Option 2: Moderate short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 3: Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 4: Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.

- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

**SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION**

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs from the rate base to the tax base.
- While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about $2 billion in 2017-18).
- Additional fiscal exposure comes from proposals not yet costed by Energy (e.g., conservation costs, with Energy consulting OPCD on accounting). Energy also presents other proposals where costs and impacts are "TBD".
- In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,535 | 1,225 | 2,035 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

## ENERGY'S BROAD POLICY THEMES / RATIONALES

A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ≈ $0.55 in 2017, increasing to ≈ $1.45 in 2022.** | • Would provide on-bill benefits.<br><br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. | • 2017-18: $162 M<br><br>• Increasing to $322 M in 2020-21. |
| **Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈** | | • 2017-18: $666 M<br><br>• Increasing to $719 M in 2020-21 |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **$1.55 in 2017, increasing to ≈ $1.75 in 2022.** | | |
| | | |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC] |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax". | • $260 million annually from |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | 2017-18 to 2020-21. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding the Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • Current legislated March 31, 2018 end of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end.<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant annual fiscal impact and increase in net debt (estimated by Energy to be up to $66 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Annual fiscal impact not yet determined. |

**DETAIL ON ENERGY PROPOSALS**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
    - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

<u>Expanding the scope of the Trillium Trust to invest in energy infrastructure:</u>

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

<u>Departure Tax</u>:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.

- If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 2&3), or more (e.g., about $5.5 bn in 2017 under option 4), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under option 4, net debt could rise by $66 Bn over time, as estimated by Energy. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year
  - Option 2: Moderate short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 3: Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 4: Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.

- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

**SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION**

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

On the Trillium Trust, it might be fair to point out that Energy raises the prospect of investing in projects that would not otherwise be viewed by the OEB as projects that meet a system benefits test – so not really a rate saving if the projects would not have been done on the rate base. Really a tax-based subsidisation for other policy reasons.

Subject: Fwd: Rate Mitigation

Hi,

There's a meeting on Monday on Energy's rate mitigation decks.

Would you be able to review over the weekend -- perhaps updating the materials from December, as applicable -- so comments can get to the DMO Sunday night?

Apologies on the timing.

Thanks,
Ron

<Comments on Electricity Sector Transformation Proposals v9 (CEFD)_Markup2.docx>

# Comments on Ministry of Energy's Draft "Proposed Initiatives to Transform Ontario's Electricity Sector"

The Ministry of Energy (Energy) is providing an update on progress related to transforming the province's electricity sector by elaborating on potential price mitigation initiatives, as outlined in its decks.

## CONTEXT

- As outlined in Energy's update, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).

- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g. GEIA renegotiation, decreasing FIT prices, etc).

- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

- On November 28, 2016, the Minister of Energy announced the need for changes in how electricity resources are procured, the need for wholesale market renewal and greater electricity consumer choice.

- The Ministry of Energy is currently updating its Long-Term Energy Plan (LTEP), which provides an opportunity to consider a range of policy changes to how the Ontario energy sector operates.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs from the rate base to the tax base.
- While the subset of proposals costed by Energy may have a fairly limited residential rate payer impact (e.g. about $6-7/month for residential, or less than 5% of the average monthly bill), those proposals would come at a material incremental fiscal cost (about $2 billion in 2017-18).
- Additional fiscal exposure comes from proposals not yet costed by Energy (e.g., conservation costs, with Energy consulting OPCD on accounting). Energy also presents other proposals where costs and impacts are "TBD".
- In addition to the fiscal costs above, Energy is also presenting a preliminary proposal to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA). While details of this proposal have not been developed, there is a risk of significant fiscal impacts (e.g., of about $5.5 Bn in calendar 2017) during the period that GA costs are deferred, depending on the scenario. ENERGY has approached the Ontario Provincial Controller Division (OPCD) for accounting advice.

- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,535 | 1,225 | 2,035 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

## ENERGY'S BROAD POLICY THEMES / RATIONALES

A key theme / rationale cited by Energy is to no longer use the rate-base to pay for "social programs" by shifting the cost of OESP, RRRP and a proposed First Nation Rate to the tax-base.

- Energy has typically in the past provided a constitutional law assessment on these programs, providing support for these programs to be ratepayer-supported programs as they provide electricity system benefits / are part of a comprehensive regulatory framework.
- Switching messaging may risk criticism and legal challenges on these and other remaining rate-base funded programs.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by ≈ $0.55 in 2017, increasing to ≈ $1.45 in 2022.** | • Would provide on-bill benefits.<br><br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households. | • 2017-18: $162 M<br><br>• Increasing to $322 M in 2020-21. |
| **Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈** | | • 2017-18: $666 M<br><br>• Increasing to $719 M in 2020-21 |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **$1.55 in 2017, increasing to ≈ $1.75 in 2022.** | | |
| | | |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion.<br>• Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>o Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC] |
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax". | • $260 million annually from |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | 2017-18 to 2020-21. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Give consumers more choice by allowing to "opt into" alternate rate plan** | • Start with the option of flat electricity rate option<br>• OEB to develop more options over time<br>• Provide more details regarding the Global Adjustment (GA) | • No expected fiscal impact. |
| **End the Debt Retirement Charge (DRC) early for commercial and small industrial Class B electricity consumers** | • Current legislated March 31, 2018 end of the DRC had previously been linked with a balance between rate mitigation and managing stranded debt<br>• Provides only temporary incremental mitigation, as DRC legislated to end.<br>• Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported | • $450 M in 2017-18 |
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation<br>• Likely will lead to significant annual fiscal impact and increase in net debt (estimated by Energy to be up to $66 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |
| **Tax Relief for Solar and Wind** | • Consider funding the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process<br>• Energy's estimation of the NPV benefit to the ratepayers at about $3.3 billion, which would be funded through the tax base, a significant fiscal hit | • Annual fiscal impact not yet determined. |

**DETAIL ON ENERGY PROPOSALS**

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

OESP & RRRP ($0.42-0.85 bn in 2017 to $0.62-1.18 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
    - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

<u>Expanding the scope of the Trillium Trust to invest in energy infrastructure:</u>

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

<u>Departure Tax</u>:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.
- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset

by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).

- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
    - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.
    - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
    - Moving to "technology-agnostic" procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
    - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
    - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
    - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
    - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
    - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister's Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG's current rate application.

- If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province's fiscal plan (Energy estimates it at $240 million per year).

Debt Retirement Charge (Total of about $0.45 Billion in annualized rate to 2017-18):
Ending the DRC early for Class B customers (commercial, small industrial) would have an impact of about $0.45 billion in 2017-18.

- The end of the DRC had previously been linked with balancing mitigation and progress on stranded debt reductionthe end retirement of the residual stranded debt.
- Removing additional DRC revenue from the OEFC would call into question the position that the debt and liabilities of the old Ontario Hydro can continue to be supported.

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 2&3), or more (e.g., about $5.5 bn in 2017 under option 4), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
  - Option 1: Status Quo – ratepayers continue to pay the full cost of GA each year
  - Option 2: Moderate short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 3: Maximized short-term cost reductions with limits of no more than $2 billion above the true cost of GA
  - Option 4: Maximized short-term cost reductions with no limits on the ratepayer GA over-payments in later years
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].

Tax Relief for Solar and Wind Contracts :
Energy's proposal would use the tax-base to fund the portion of FIT pricing that is above the cost of wind and solar generation procured through a competitive process.

- From 2017 onward, the estimated value of the more than 1,800 MW of large wind projects in commercial operation under the FIT 1 program at a price of $135/MWh is approximately $9.4 billion (NPV 2017).
- The weighted average price for large wind projects over the RES I, II and III competitive procurements was $95.1/MWh.
- If the competitive RES wind pricing were applied to the 1,800 MW of FIT 1 large wind projects, total program value would be estimated at $6.1 billion (NPV 2017).
- The $3.3 billion (NPV) difference could be considered the value of above competitive procurement pricing and could be shifted from the rate-base to the tax-base.

## SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

Hi,

I just made formatting changes on page 1 so that the footnotes of the table would be entirely on page 1. I also fixed a typo on page 3.

---

Hi Ron,

Pls. see attached updated note.

Thanks,

John.

# Comments on Ministry of Energy's Draft "Rate Mitigation Plan Options"

The Ministry of Energy (Energy) is providing potential price mitigation initiatives.

## CONTEXT

- As outlined in Energy's deck, electricity costs have been increasing following investments to transform towards cleaner generation (i.e., meeting goals to decarbonize) and modernize the electricity infrastructure (e.g., more than $35 billion in cleaner generation and $15.5 billion investment by Hydro One alone in transmission and distribution systems).
- The government has taken action to lower electricity cost pressures to all consumers by taking actions, including deferring investments in generation (e.g., new build nuclear, LRP II), improving market efficiency and decreasing costs related to renewable procurement (e.g., GEIA renegotiation with Samsung consortium, decreasing FIT prices, etc.).
- The government introduced the Ontario Rebate for Electricity Consumers (OREC), which is providing a rebate equal to the 8% provincial portion of the Harmonized Sales Tax, saving $11 per month starting January 1, 2017, for eligible small businesses, farms and residential consumers, and has expanded the Rural or Remote Electricity Rate Protection program, saving eligible RRRP customers about $45 per month, when combined with OREC.

## COMMENTS

- A significant number of Energy's proposals involve shifting costs or risks from the rate base to the tax base. The fiscal exposure could be well over $2 billion in 2017-18.
- The largest impacts on rates and largest potential fiscal exposures are from the deferred recovery of Global Adjustment costs ($2 bn per year or more) and an enhanced, tax-base-funded 5% rebate for Regulated Price Plan (RPP) customers (about $700 million per year).
    - Significant fiscal exposure comes from proposals not yet fully costed by Energy (e.g., the Global Adjustment, with Energy to benefit from consulting with OPCD and KPMG on accounting).
    - Energy also presents other proposals where costs and impacts are not shown or "TBD".
    - Energy does not show OPG efficiencies as a fiscal risk in its table on slide 8. It is estimated at a $240 million per year exposure on slide 33.
- Over the past five years, the existing fiscally-funded electricity price mitigation efforts have averaged about $1.5 billion and is already expected to increase to about $2 billion with the introduction of OREC. The existing program costs are summarized in the table below:

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,100* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,535 | 1,225 | 2,035 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

OCEB – Ontario Clean Energy Benefit
OREC – Ont. Rebate for Electricity Consumers
NIERP – Northern Industrial Electricity Rate program
NOEC – Northern Ontario Energy Credit
DRC – Debt etirement Charge
OEPTC – Ont. Energy & Property Tax Credit

## ENERGY'S BROAD POLICY THEMES / RATIONALES

- In recognition of the costs borne by ratepayers related to the to decarbonizing and modernizing the province's electricity sector:
    1. Provide significant and immediate rate relief through cost deferral of the global adjustment (GA).
    2. Provide a greater focus on vulnerable consumers by funding electricity support programs, such as the Ontario Electricity Support Program (OESP) and the Rural or Remote Electricity Rate Protection, (RRRP) through the tax-base. In addition, provide greater support for lower income Ontarians by enhancing the OESP, etc.
    3. Empower energy agencies to increase cost effectiveness and improve efficiency by having – Independent Electricity System Operator (IESO) modernize Ontario's electricity market through electricity market renewal initiatives, the Ontario Energy Board (OEB) identify opportunities for future LDC cost reductions/efficiencies and work with Ontario Power Generation (OPG) to find further efficiencies in operations and pass on savings to ratepayers.
    4. Enhance the existing 8% rebate that went into effect January 1, 2017.

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Consider options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the global adjustment (GA)** | • Incurring debt to pay the generators their contracted or regulated payments<br>• Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not fully address the fiscal impact/accounting treatment, or implementation<br>o Based on preliminary discussions with KPMG, Energy has identified key steps (presumably for there not to be a fiscal impact):<br>▪ need to be able to create an asset<br>▪ Need to identify an entity that could hold such an asset (e.g. OEFC, IESO or LDCs?)<br>o Energy is said to be working with LSB, IESO, MOF, TBS and external accountants on legislative, regulatory and accounting requirements<br>o Energy's deck clearly identify that under the current legal framework, the GA would not be able to recover interest costs of the deferral<br>• Likely will lead to significant annual fiscal impact and increase in net debt (illustrated as $9 Bn on slide 9, or $23 Bn on slides 11 & 12 scenarios; previously estimated by Energy to be up to $65 Bn, depending on Energy's scenario) – Energy to consult with OPCD on accounting treatment<br>• Likely requires legislation to implement.<br>• Furthermore, likely entails significant legal / Constitutional Law risks | • Risk of fiscal impact of more than $2 billion in 2017-18 and ongoing during period GA costs are derferred. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Fund cost-shifting through Tax base.**<br><br>**Provide greater support for lower income Ontarians by enhancing the OESP or expanding eligibility.**<br>• **Estimated to reduce average monthly residential bill by $0.83 based on current OESP charge.**<br><br>**Provide further support for rural consumers by expanding the Rural or Remote Rate Protection (RRRP) program.**<br>• **Estimated to reduce average monthly residential bill by ≈ $1.60 in 2017, increasing to ≈ $1.80 in 2022.** | • Would provide on-bill benefits.<br>• Could contemplate phase-in to manage fiscal impact.<br>• Could look at phasing out existing fiscal-funded programs also targeted to low income or identified groups (e.g., OEPTC, NOEC).<br>o Not on the bill, so less direct and visible electricity cost mitigation.<br>o Phase-out to reflect time to increase application based OESP reaching an increasing portion of eligible households.<br>• There may be a risk that expanding OESP or RRRP may change the view of the federal government that it is not a taxable benefit. When OESP was created, TPD worked with Finance Canada and Energy to ensure that it was not considered a taxable benefit.<br>• RRRP expansion that subsidised high-cost distribution systems may create a disincentive effect on achieving efficiencies and cost reductions in those LDCs (or Toronto, as the benchmark). Energy and OEB would need to address this through the regulatory system or other measures such as eligibility conditions. | <u>OESP</u><br>• 2017-18: $162 M<br>• Increasing to $323 M in 2020-21.<br><br><u>Conservation</u><br>• 2017-18: $457 M<br>• Increasing to $493 M in 2020-21 |
| **Create a new low income conservation benefit program that would build on existing programs.** | • Conservation programs provide electricity system benefits. Fiscal-funding would result in a cross-subsidisation from tax-base.<br>• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan. | • $60 million per year. |
| **OPG to Increase Cost Effectiveness and Improve Efficiency** | • Provide expectation that OPG meet more aggressive cost targets, improving efficiency by ~$3/Megawatt hour (MWh), with OPG regulated rates set on this basis.<br>• Dollar-for-dollar fiscal exposure if OPG is not able to meet the targeted lower cost targets. | • $240 million per year. |
| **Enhance Tax-base RPP Rebat by 5%, to 13%** | • This proposal would increase the funding requirement of the newly established Ontario Rebate for Electricity Consumers (OREC) by about $700 million per fiscal year, to reduce an average residential bill by about $7 each month or $84 annually.<br>• The current OREC provides average savings of about $11 each month or $130 annually. | • About $700 per year |

## DETAIL ON ENERGY PROPOSALS INCLUDED IN THE JANUARY 18th DECK

Energy has outlined the following rate mitigation proposals with significant bearing on the fiscal plan:

Debt Financing of the Global Adjustment Proposal :
In a draft Energy deck shared with the Ministry of Finance, Energy considers a number of electricity price mitigation options to defer the pass-through to ratepayers of some generation supply costs by partially financing the cost of the Global Adjustment (GA) and incurring debt to pay the generators their contracted or regulated payments. This will involve debt financing and recovering over a 25 to 30 year period.

While details of this proposal have not been developed, there is a risk of significant fiscal impacts, e.g., of up to $2 billion annually (under options 1a, 1b, and low GA Financing scenario), or more (e.g., about $5.5 bn in 2017 under high GA Financing scenario), as estimated by Energy, during the period that GA costs are deferred, depending on the scenario.

Under the high GA Financing scenario, now discussed in the Appendix of the latest deck, net debt could rise by $65 Bn over time, as estimated by Energy, and the cost pressure could be up to $51 per month by 2047. There would be significant interest rate exposure to the fiscal impact and accumulated debt estimates. The size of the deficit and debt impacts could affect the Province's credit rating and cost of debt.

- Energy's deck analyzes the system cost and ratepayer impacts of the option, but does not address the fiscal impact/accounting treatment, or implementation. There are four options considered:
    - Option 1a: Moderate GA financing, paying $3.2 and $3.4 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 1b: Moderate GA financing, paying $1.1 billion below the true cost of GA, with limits of no more than $2 billion above the true cost of GA
    - Option 3: Low / GA financing – paying $2.5 billion below the true cost of GA and increases in each subsequent year until the total amount of money borrowed is paid off, with limits of no more than $2 billion above the true cost of GA.
    - Option 4: High / GA financing – paying $4.4 and $5 billion below the true cost of GA and increases at 2% in each subsequent year until the total amount of money borrowed is paid off in 25 and 30 years respectively, with no limits above the true cost of GA.
- It should be noted that under any of these options the relief period is quite limited when compare to the period under where future ratepayers will have to pay the cost of the deferral. Chart 1a and 1b (slides 10 and 11) illustrate that the impact of the relief would not last beyond 2022 (1a) and 2024 (1b) whill the higher cost caused by the deferral would hit electricity bills until 2042 at the least.
- Impact of the Level of Financing on Large Industrial Electricity Consumers provided in the deck was based on previous scenarios. It should be updated using above scenarios.
- While the details of the proposal would need to be analyzed prior to a decision to proceed with further consideration of the proposal, the Office of the Provincial Controller Division's (OPCD) preliminary assessment is that this would lead to a negative fiscal impact [TBC].
- Preliminary discussions between CEFD and OPCD staff suggest that there are material fiscal and reporting risk associated with this proposal.

OESP & RRRP ($0.51-0.62 bn in 2017 to $0.80-0.92 bn in 2022):

Would shift the cost of the current and proposed expanded Ontario Electricity Support Program (OESP), and Rural or Remote Electricity Rate Program (RRRP), to the tax base. Lower range of fiscal impat estimate is based on current programs. *Note: that the fiscal exposure would increase if the OESP take up rate is larger, and faster than assumed.*

- The fiscal impact from shifting OESP and RRRP to the tax base may also be larger if future changes are made to the programs. Upper range of fiscal impact estimate includes the following changes to the programs.
  - Current RRRP mostly supports Hydro One rural consumers. RRRP could be expanded to mitigate delivery costs for not only Hydro One customers but other high-cost LDCs.
  - OESP program benefits could be increased across the board by 50 per cent, which would mean:
    - Single low income consumers would see an increase from $30 to $45/ month ($540/year); and
    - Families of four with electric heat could see an increase from $55 to $82.50/month ($990/year).
- Energy also notest that if moved to the tax base, OESP could be broadened to include all potential low-income households, despite whether they directly pay for electricity. Broadening OESP in this way could result in a further fiscal impact.
- The RRRP regulation provides a funding mechanism for transmission infrastructure required to grid connect remote First Nation communities. Considerations for how that funding will be supported by the tax base will need to be determined. [The current deck links Trillium Trust for remote electrification.]

Low Income Conservation Benefit Program

- A new low income conservation benefit program would build on existing programs.
  - Existing low income programs delivered by local distribution companies and IESO help qualified homeowners and social and/or assisted housing providers improve the energy efficiency of their homes.
  - With respect to a new program Energy notes that participants could receive incentives for conservation measures not currently covered, increased incentive amounts, and targeted education and awareness initiatives.

- Energy notes an illustrative budget of $60 million per year, but states that further analysis is required on costing and implementation details, including alignment with the existing conservation framework.

Energy Agencies' Cost Effectiveness and Efficiencies:

By empowering energy agencies to continue to move forward with various programs, the initiative is expected to lead to cost effectiveness and efficiencies that could be passed through to the benefit of the rate payers. These initiatives, other than the tax incentives for consolidations, are generally not considered to have fiscal impacts. [Check.]

- IESO's Market Renewal Initiatives – the current "two-schedule price setting system", which is used to settle and dispatch resources in the IESO- administered market, is under review by the IESO.
  - This review is part of a series of consultations launched by the IESO to consider the efficiency and effectiveness of various aspects of the electricity market, and will focus on the energy market pricing system.

  - As part of this review, potential design alternatives will be compared against the status quo with an overall objective of providing "an efficient dispatch and pricing process that produces transparent prices."
  - Moving to “technology-agnostic” procurements will provide new opportunities for innovation and modernization and ensure ratepayers receive the best prices possible.
  - IESO estimates that the total implementation cost – including a 15% contingency and net of avoided costs – will be $150 million. The bulk of the costs (capital) would only be recovered once the project has been implemented and as the benefits are being realized.
- LDC Efficiencies and Rates – reducing osts and having LDCs become more efficient could result in a reduction of Distribution costs on electricity bills, now accounting for about 20% of the total bill.
  - The OEB has a mandate to regulate the electricity distribution sector in the public interest, ensuring the financial viability of the sector while promoting reliable service to customers at just and reasonable rates.
  - Since 2012, the OEB has taken action – through the Renewed Regulatory Framework for Energy – to more closely link rate regulation with performance measures and outcomes.
  - In 2012, the government asked the Ontario Distribution Sector Review Panel to review the distribution sector and make recommendations about how it could become more efficient. While the Panel concluded that a $1.2 billion net present value in savings could be achieved by consolidating LDCs into 8-12 regional entities, the government response was to pursue voluntary consolidation and put in place tax incentives for consolidation.
- OPG Operational Efficiencies – provide expectation that OPG meet more aggressive cost targets, improving efficiency by about $3/Megawatt hour (MWh).
  - The Province could provide instructions to OPG to focus on its stretch target as part of the Minister’s Concurrence letter. This would be a public document that would likely be reviewed by OEB and, if adopted by OEB, would be incorporated as part of OPG’s current rate application.
  - If OPG is unable to meet more aggressive cost targets, this could affect its net income and payments-in-lieu of taxes to OEFC, and the Province’s fiscal plan (Energy estimates it at $240 million per year).

**SUMMARY: TAXPAYER FUNDED ELECTRICITY PRICE MITIGATION –JANUARY 18 DECK**

| ($M) | 2016-17[1] | 2017-18[1] | 2018-19[1] | 2019-20[1] | 2020-21[1] |

2. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from Energy PRRT submission

3. Total would be significantly larger with the TBDs crystalized.

## Appendix: Options not currently recommended by Energy

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| **Expand the scope of the "Trillium Trust" to make investments in energy infrastructure eligible for funding** | • Would require either squeezing out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source; or additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects<br>• Would have little near-term rate impact, even if TT funding displaces near-term, non-incremental projects coming onto service – amortised annual costs are small<br>• May have no rate mitigation impact in some cases if, as indicated by Energy, investments are made in incremental projects that would not have been built due to cost barriers under the OEB's beneficiaries pay principle<br>• Could lower utility value (share price) and affect fiscal contributions from the electricity sector (net income), including Hydro One, by removing projects, currently and prospectively, that they might have been able to add to their ratebase and earn a return<br>• Could have an upfront fiscal impact if Province does not own the asset and is not able to amortize those projects [TBC with OPCD].<br>• Energy has indicated that if these investments are provided from the OEB there would be a need to develop oversight mechanisms as is not the OEB's role to review cost prudence of tax-based mechanisms. | • Up to $390 million annually from 2017-18 to 2020-21. |
| **Dedicate the Departure Tax** | • In connection with the 2015 IPO of Hydro One shares, Hydro One paid OEFC a $2.6 billion "departure tax".<br>• The departure tax was not a fiscal windfall. It was net fiscally neutral -- while it represented revenue to OEFC, it was an expense to Hydro One and to the Province on consolidation into Public Accounts.<br>• Repurposing the departure tax to provide rate mitigation would have a dollar-per dollar fiscal impact and could trigger an increase in OEFC's stranded debt.<br>• The Province would remain exposed to a negative fiscal impact (lower share price and lower net income) if the OEB decides to allocate all or part of the deffered tax benefit recognized by Hydro One to ratepayers. | • $260 million annually from 2017-18 to 2020-21. |
| **Amortize conservation program costs to smooth recovery of costs from ratepayer. Alternatively, rate smooth conservation costs through an IESO deferral account.** | • Ministry of Energy is consulting OPCD on whether consevation costs can be amortized according to accounting standards. Without the ability under accounting standards to amortise the cost, there would be a fiscal impact. Energy states total remaining 2017-2020 electricity conservation program costs are expected to be approximately $2.1 billion. | • [If amortization is not permitted, 2017-18 fiscal impact of $450 M.] [TBC]. |

| Energy Theme / Rationale | Key Staff Comments | Estimated Fiscal Cost |
|---|---|---|
| | • Energy notes that an alternative to amortizing conservation costs would be to fund these costs through tax base.<br>o Conservation programs provide electricity system benefits. Fiscal-fundingwould result in a cross-subsidisation from tax-base<br>• Accessing the cap & trade amount in the GGRA would crowd-out other GGRA programs, affecting overall GHG reductions and negatively affect the fiscal plan | |

Expanding the scope of the Trillium Trust to invest in energy infrastructure:

The Province is currently targeting $5.7 billion from asset optimization to dedicate to the Trillium Trust for investment in infrastructure under Moving Ontario Forward. The $5.7 billion target already includes all fiscal benefits expected from the sale of Hydro One common shares (this includes net gains from shares and the Provincial portion of the deferred tax benefit recognized by Hydro One in 2015).

- Expanding access to natural gas is already included under Moving Ontario Forward.
- Using the Trillium Trust for additional energy projects would require either
    - squeeze out existing Moving Ontario Forward project funding from the Trillium Trust, requiring funding from another source, or
    - additional funding from asset optimization, given that the government is committed to using the targeted $5.7 billion to fund across Moving Ontario Forward projects.
- In effect, in both cases above, incremental investments for energy infrastructure from the Trillium Trust would have negative fiscal impacts once the assets are in-service and amortized.
    - Inclusion of investments in First Nation communities that are not in provincial lands would trigger an upfront fiscal impact as the Province may not be able to amortize these projects (TBC with OPCD).
- Investments through the Trillium Trust instead of through other electricity sector entities (Hydro One, OPG, LDCs) could have additional negative fiscal impacts as these entities could see reduced ratebase growth, lowering the revenues that the Province realizes from these entities (e.g., consolidated net income, payments-in-lieu of taxes, etc.).
    - May also negatively impact Hydro One share price if the measure is perceived by the market as reducing Hydro One's potential ratebase growth.
    - This could also question the government's policy rationale for selling Hydro One shares when it would be effectively investing back into the electricity sector through a different vehicle.
- Unless applied to existing projects, to displace ratepayer-supported costs, this measure would have little or no near-term rate impact.
- Energy also suggests that investments could be made into projects that are currently not preceding due to cost barriers under the OEB's beneficiary pays principle.

Departure Tax:

As a result of the IPO, Hydro One paid a "departure tax" payment in lieu of tax (PIL) of $2.6 billion, as a final true-up of its PILs tax obligation. Energy lists using some or all of this departure tax for price mitigation.

- This would have a dollar-for-dolar fiscal impact.

- This was paid to the Ontario Electricity Financial Corporation (OEFC). The departure tax payment was fiscally neutral to the Province on consolidation, as the income (revenue) to the OEFC was fully offset by a reduction in the Province's revenue from net income of Hydro One (dollar-for-dollar lower due to the departure tax expense).
- The payment was also cash neutral, the $2.6 billion were funded from a capital contribution made by the Province into Hydro One and received back by the Province in OEFC as the departure tax payment was made in cash.
- Using some or all of it for price mitigation would require restating the net stranded debt paydown by OEFC related to the IPO. It would be the first time since 2004 that stranded debt would increase.
- Having OEFC help implement this measure may require introducing changes to OEFC's objects.
- This would be a one-time measure, potentially spread out over a few years, as the departure tax was one-time.

Amortize Conservation Program Costs:

Certain conservation costs are proposed to be amortized over the lifetime of the benefits resulting from the funded conservation measures. Energy proposes that this would involve IESO borrowing funds from the Ontario Financing Authority (OFA) on an annual basis to fund program incentives (non-administrative costs). Energy estimates this would produce a benefit for electricity ratepayers in excess of $1/month from 2017 to 2020.

- Energy would seek an opinion from IESO's external auditor and from the Ontario Provincial Controller Division (OPCD) to determine whether conservation costs could be amortized according to rate-regulated accounting standards.
  - Under Public Sector Accounting Board (PSAB) accounting standards, used by both the Province and IESO, only certain assets can be amortized. Conservation costs would not meet this criteria. Rate-regulated accounting was developed to recognize the unique nature of regulated entities (e.g., electricity generators, LDCs). Under rate-regulated accounting certain costs can be treated as amortizable assets that would not normally be considered assets under accounting principles.
  - Over the past several years, the Auditor General (AG) has expressed concerns about the appropriateness of recognizing rate-regulated assets in the Province's consolidated financial statements.
  - Rate-regulated accounting is currently under review by international accounting standard setting bodies and is currently permitted only on an interim basis, so its future is unclear at present.

- If amortization accounting of conservation costs is not permitted, a fiscal impact would result from this proposal. Energy also notes directly funding conservation costs from the tax base as an alternative option.

- Alternatively, Energy proposes that a regulatory amendment could allow IESO to establish a deferral account for conservation costs.
  - Energy notes that this option would not require approval of the Provincial Controller. However, choosing this option as an alternative to amortization may open Energy to criticism by the Controller and/or Auditor General since the rate impact is the same.

Looks good. Thanks for updating the table with the 1.2B.

I made minor changes, adding '~' for the NOEC and OEPTC table amounts.

Saved in the same version, also re-attached.

MINISTRY OF
ENERGY

# Cost Shifts in Ontario's Electricity Sector

## Working Draft

November 2016

CONFIDENTIAL DRAFT

# Context

- Necessary investments in Ontario's electricity system have led to increased prices, prompting government to introduced a number of price mitigation programs for all consumer types.
  - In addition to existing rate mitigation programs, the 2016 Throne Speech announced a package of rate mitigation initiatives to address electricity prices for residential, commercial and industrial consumers.

- Ontario has a number of programs in place to manage residential electricity prices, including:
  - Ontario Electricity Support Program (OESP);
  - Rural or Remote Rate Protect (RRRP);
  - Northern Ontario Energy Credit (NOEC);
  - Ontario Energy and Property Tax Credit (OEPTC);
  - Ontario Rebate for Electricity Customers (OREC); and
  - Ending the Debt Retirement Charge (DRC) from residential bills.

- Ontario also has a number of programs in place to manage industrial electricity prices, including:
  - Industrial Conservation Initiative (ICI);
  - Industrial Electricity Incentive (IEI);
  - Industrial Accelerator Program (IAP);
  - Northern Industrial Electricity Rate Program (NIERP);
  - saveONenergy for Business Program; and
  - Demand Response.

# Context (cont'd)

- Several programs in the electricity sector “shift costs” from one group of electricity consumers to another:
  - **Rural or Remote Rate Protect** (**RRRP)** is a longstanding program that reduces the delivery charge for rural electricity consumers and is paid for by all consumers in Ontario through a regulatory charge on bills.
  - **Ontario Electricity Support Program (OESP)** is funded via a regulatory charge on consumer bills and provides support for qualifying low income electricity consumers.
  - **Industrial Conservation Initiative (ICI)** empowers large consumers to lower their costs by reducing their demand during peak hours. In the process, ICI shifts costs from large electricity consumers to all other consumers in Ontario.
  - **Industrial Electricity Incentive** (**IEI**) program, offers reduced electricity prices for companies starting or expanding operations in Ontario. All electricity consumers in Ontario pay for the price reduction that IEI participants receive.

# Cost Shifts in Ontario's Electricity Sector

- The tables on the right show the estimated cost shifts that result from existing government programs.
- ICI has had the largest cost shift of all the programs, due to the large size of Global Adjustment (GA) and the way that it is recovered from consumer classes.
- RRRP and OESP impact the regulatory line on consumer bills, while ICI, IEI and conservation affect GA (i.e., Electricity line on bills of Regulated Price Plan consumers).

**Cost Shift Impacts - Residential Bill**

*Typical 750 kWh/month Toronto Hydro consumer*

| *$/month* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 2.65 | 3.25 | 3.88 | 3.53 | 4.75 | 4.77 |
| RRRP | 0.90 | 0.82 | 0.84 | 0.92 | 0.93 | 0.94 |
| OESP | - | - | - | - | - | 0.84 |
| Conservation | 1.85 | 1.92 | 2.00 | 1.58 | 2.43 | 2.45 |
| IEI | - | - | 0.08 | 0.09 | 0.11 | 0.12 |
| **Total** | **5.41** | **5.99** | **6.81** | **6.13** | **8.21** | **9.12** |

**Cost Shift Impacts - Industrial Bill**

*Typical Class A consumer*

| *$/MWh* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | -22.17 | -26.36 | -30.29 | -25.91 | -33.79 | -33.92 |
| RRRP | 1.20 | 1.10 | 1.12 | 1.23 | 1.24 | 1.25 |
| OESP | - | - | - | - | - | 1.13 |
| Conservation | 1.53 | 1.59 | 1.66 | 1.31 | 2.01 | 2.02 |
| IEI | - | - | 0.07 | 0.08 | 0.09 | 0.10 |
| **Total** | **-19.43** | **-23.67** | **-27.44** | **-23.29** | **-30.45** | **-29.43** |

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Cost Shifts in Ontario's Electricity Sector (cont'd)

- The table on the right shows the total cost for various government electricity programs. These programs are currently funded through the electricity system ratebase.

- Funding of these programs through the fiscal plan would remove these costs from the electricity system (i.e., Placing these costs on the taxbase).

**Cost of Programs**

*By government program*

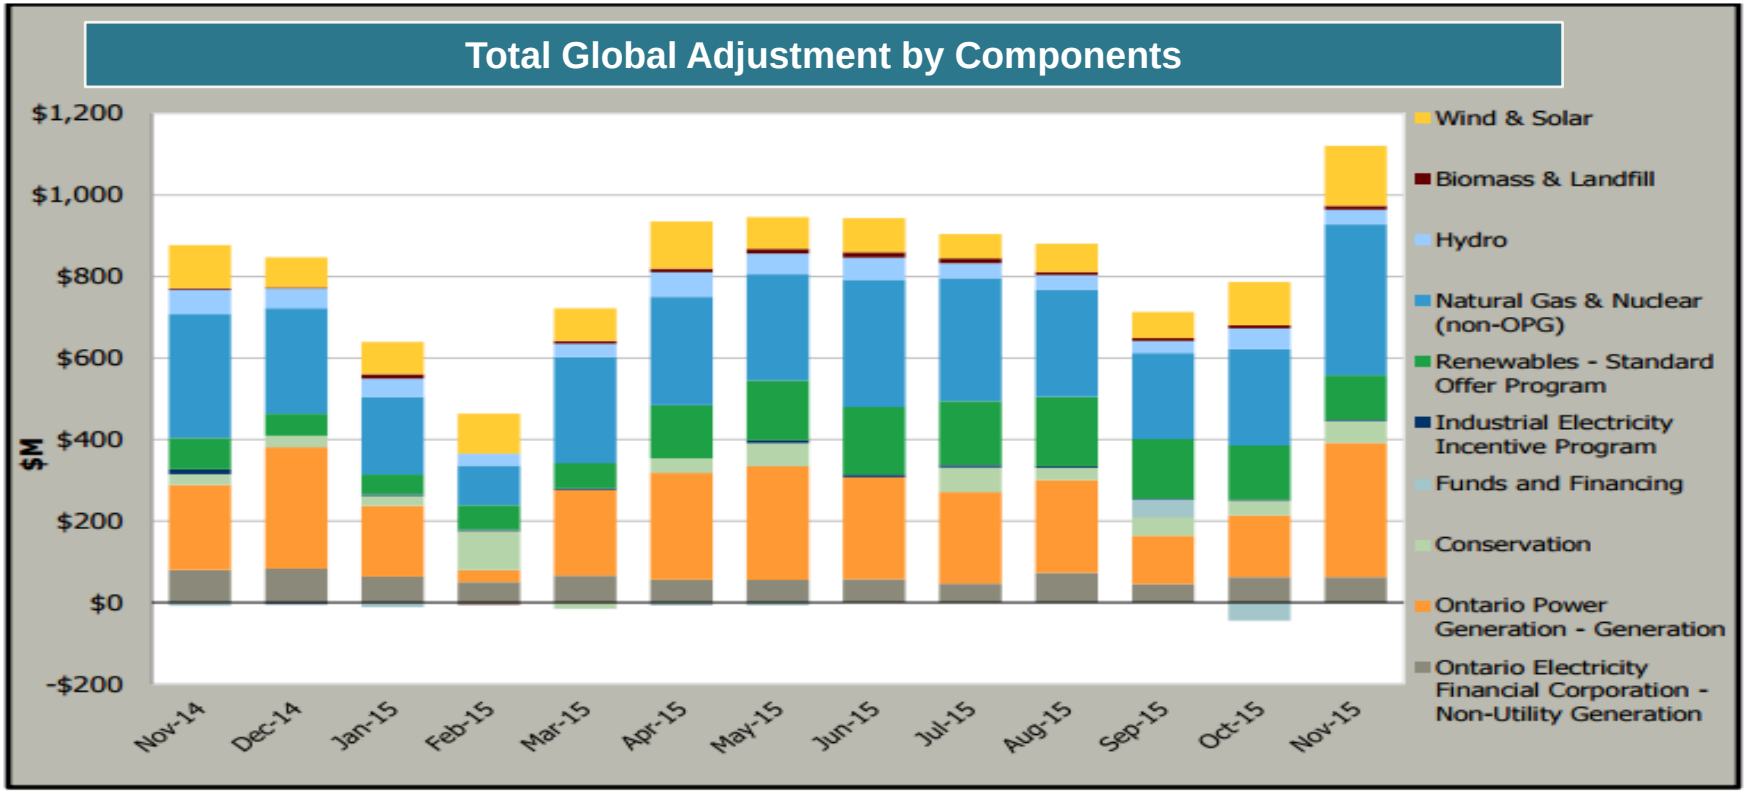
| *$M* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 506 | 615 | 736 | 670 | 890 | 893 |
| RRRP | 172 | 156 | 159 | 176 | 174 | 176 |
| OESP | - | - | - | - | - | 158 |
| Conservation | 329 | 339 | 354 | 280 | 425 | 428 |
| IEI | - | - | 15 | 16 | 18 | 19 |

- For example, removing the roughly $900 million of program cost from the Industrial Conservation Initiative (ICI) program would save the typical residential electricity consumer $4.77 per month in 2016.

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Total Components of Global Adjustment

- Global Adjustment (GA) is a market mechanism that recovers costs from electricity consumers, including the cost of almost all conservation programs in the province (i.e., approximately half a billion dollars in 2016).



**Source:** IESO Monthly Market Report (November 2015)

DRAFT

# Potential Fiscal Impact to the Electricity Sector

- The electricity sector has a significant impact on the Province's fiscal position; through both the revenue and expense sides of the Province's fiscal position.
  - Electricity Rate mitigation programs funded through the tax base have a direct fiscal impact on the province's finances.
  - Alternatively, electricity rate mitigation programs funded by the **rate base** shift costs from one group of ratepayers to another.
- The Province's electricity sector agencies and corporations are each consolidated into the government's financial statements, and directly affect the Province's surplus/deficit position.
  - Ontario Power Generation (OPG) financial results have a dollar-for-dollar impact on the Province.
    - Electricity price mitigation strategies involving OPG would lead to a direct fiscal impact.
  - Hydro One financial results have a direct impact on the Province, based on the Province's proportionate ownership.
    - The Province currently holds about 70 per cent of Hydro One.

DRAFT

# Taxpayer Funded Electricity Price Mitigation

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,200* |
| Ending DRC[2] | - | - | - | - | 75 | 300 | 300 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,195 | 2,105 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from November LRC Submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt Retirement Charge
NIERP – Northern Ontario Electricity Rate Program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

- The table above shows the annual amount of taxpayer funded electricity price mitigation from 2011-12 to 2017-18.
- From 2011-12 to 2015-16 there has been an annual fiscal impact of approximately $1.6 billion due to electricity price mitigation programs.
- In 2016-17, the fiscal impact due to electricity price mitigation programs is estimated at approximately $1.2 billion.
- In 2017-18, due primarily to the start of the Ontario Rebate for Electricity Consumers, the expected fiscal impact due to electricity price mitigation programs is approximately $2.1 billion.

DRAFT

# Additional Background on Taxpayer funded Electricity Price Mitigation

| Program | Annual Fiscal Impacts ($M) | Date | Details |
|---|---|---|---|
| **Ontario Clean Energy Benefit (OCEB)** | ~1,000 | Jan 1 2011 to Dec 31, 2015 | OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax. Effective September 1, 2012, electricity consumption eligible for the 10 per cent benefit was capped at the first 3,000 kWh of electricity consumed per month, and provided a full 10 per cent benefit to almost all residential customers and most small retail businesses.<br><br>OCEB expired December 31, 2015, as planned. OCEB was put in place following the implementation of the Harmonised Sales Tax (HST). Unlike the previous provincial Retail Sales Tax (RST), the HST (and GST) included electricity in the taxable base. |
| **Ending DRC from Residential Bills** | ~300 | Jan 1, 2016 to Mar 31, 2018 | The government removed the Debt Retirement Charge (DRC) from residential electricity users' bills as of January 1, 2016.<br><br>This is saving a typical residential user about $70 each year and meant ending the DRC earlier for these users than otherwise provided for in the *Electricity Act, 1998*. |
| **Ontario Rebate for Electricity Consumers (OREC)** | ~1,200 | Jan 1, 2017 onward | This ongoing program will rebate -- directly on consumers' residential electricity bills -- an amount equal to the provincial portion of the Harmonized Sales Tax (HST), an eight per cent savings. |
| **Northern Industrial Electricity Rate Program** | 120 | March 2010 | As announced in 2015 Budget, the government committed to ongoing support for northern industrials with $120 million allocated annually.<br><br>The Northern Industrial Electricity Rate (NIER) was previously extended in 2012 for an additional three-year term, effective April 1, 2013 and also for a year effective April 1, 2016, with an allocation up to $120 million per year. Qualifying participants receive a rebate of two cents per kilowatt-hour (kWh) up to a maximum of $20 million per year per company.<br><br>NIER was initially established as a three-year program in Budget 2010 and effective as of April 1, 2010, to provide an estimated $150 million per year to eligible large industrial companies in northern Ontario. |
| **Northern Ontario Energy Credit** | ~25 | Budget 2010 Announcement | Delivered as part of the Ontario Trillium Benefit, provides individuals living in northern Ontario with a credit of up to $146 per year for the 2016 benefit year, and families up to $224.[1] |
| **Ontario Energy Property Tax Credit** | ~445 | Budget 2010 Announcement | Delivered as part of the Ontario Trillium Benefit, provides up to $1,008 per year for low-to moderate-income individuals and families, and up to $1,148 for qualifying seniors. [1] |

1. Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and NOEC were introduced/enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).

DRAFT

# Timeline - Taxpayer funded Electricity Price Mitigation

**Budget 2010: OEPTC, NOEC Proposed as part of the Ontario Trillium Benefit**

*In the 2011 Budget, the government combined the payments of three existing tax credits — the Ontario Sales Tax Credit, the Ontario Energy and Property Tax Credit, and the Northern Ontario Energy Credit — to create the OTB.*
*The OTB is paid in monthly instalments throughout the year, which helps people meet their expenses as bills arrive.*

**Ontario Clean Energy Benefit** (Jan 1 2011 to Dec 31 2015)

*The OCEB was introduced in the 2010 Ontario Economic Outlook and Fiscal Review to help consumers transition to a cleaner electricity system. As set out in legislation, the OCEB ended on December 31, 2015. The Province has introduced rate mitigation measures to be implemented after December 31, 2015.*

*OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax, for the first 3,000 kilowatt-hours (kWh) of monthly electricity consumption.*

**Removing DRC from Residential Bills** (Jan 1 2016 to Mar 31 2018)

*As part of its commitment to reduce electricity cost pressures, the government has removed the Debt Retirement Charge (DRC) from residential electricity users' bills beginning on January 1, 2016. This will save a typical residential user about $70 each year and will mean ending the DRC earlier for these users than otherwise provided for in the Electricity Act, 1998.*

**Ontario Rebate for Electricity Consumers**

*As of January 1, 2017, OREC will reduce electricity costs by an amount equal to the provincial portion of the HST for about five million residential consumers, farms and small businesses.*

2010 2011 2012 2013 2014 2015 2016 2017

**Northern Industrial Electricity Rate Program**

## History of Northern Industrial Relief

**November 2006**
*The Ontario government announced the Northern Pulp and Paper Electricity Transition Program (NPPETP), a three-year $140 million, to be effective retroactively to October 1, 2006*

**Budget 2009**
*The government announced extension of the NPPETP by one year providing about $58 million with electricity price rebates of 1.8 cents/kWh.*

**Budget 2010**
*The government announced the NIER program, with a projected fiscal cost of $150 million per year, to provide electricity price rebates for qualifying large industrial facilities in Northern Ontario. An additional $21.8 million allocated for existing NPPETP in 2010-11 to be integrated with NIER.*

**September 2010**
*Transition from NPPETP to NIER: pulp and paper mills participating in NPPETP continued to receive the NPPETP rebate of 1.8 cents/kWh until September 30, 2010, with those qualifying for NIER receiving a top-up rebate of 0.2 cents/kWh.*

**December 2012**
*The government announced the extension of the NIER for three years, capping the rebates to a maximum of 2011-12 consumptions levels or $20 million, whichever is lower.*

Hi John,

I made some edits (not marked) on the added CEFD slides (as excerpted).

Any way to estimate the 2017 costs and impacts of the ratepayer programs in the Energy slides?

Thanks,
Ron

Thanks.

We should be able to get some historical year-by-year OEPTC and NOEC and NIER numbers.

DRC amount forgone I think was a little higher in the original submission. And the OREC amount in the LRC submission earlier this month is now at $1.2.

Can we do comments/markups of Energy's slides too?

Ron

# Taxpayer Funded Electricity Price Mitigation

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,200* |
| Ending DRC[2] | - | - | - | - | 85 | 330 | 330 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| **TOTAL** | **1,530** | **1,544** | **1,564** | **1,639** | **1,525** | **1,195** | **2,105** |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from November LRC Submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt Retirement Charge
NIERP – Northern Ontario Electricity Rate Program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

- The table above shows the annual amount of taxpayer funded electricity price mitigation from 2011-12 to 2017-18.
- From 2011-12 to 2015-16 there has been an annual fiscal impact of approximately $1.6 billion due to electricity price mitigation programs.
- In 2016-17, the fiscal impact due to electricity price mitigation programs is estimated at approximately $1.2 billion.
- In 2017-18, due primarily to the start of the Ontario Rebate for Electricity Consumers, the expected fiscal impact due to electricity price mitigation programs is approximately $2.1 billion.

DRAFT

# Background on Taxpayer-funded Electricity Price Mitigation

| Program | Annual Fiscal Impacts ($M) | Date | Details |
|---|---|---|---|
| **Ontario Clean Energy Benefit (OCEB)** | ~1,000 | Jan 1 2011 to Dec 31, 2015 | OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax. Effective September 1, 2012, electricity consumption eligible for the 10 per cent benefit was capped at the first 3,000 kWh of electricity consumed per month, and provided a full 10 per cent benefit to almost all residential customers and most small retail businesses.<br><br>OCEB expired December 31, 2015, as planned. OCEB was put in place following the implementation of the Harmonised Sales Tax (HST). Unlike the previous provincial Retail Sales Tax (RST), the HST (and GST) included electricity in the taxable base. |
| **Ending DRC from Residential Bills** | ~330 | Jan 1, 2016 to Mar 31, 2018 | The government removed the Debt Retirement Charge (DRC) from residential electricity users' bills as of January 1, 2016.<br><br>This is saving a typical residential user about $70 each year and meant ending the DRC earlier for these users than otherwise provided for in the *Electricity Act, 1998*. |
| **Ontario Rebate for Electricity Consumers (OREC)** | ~1,200 | Jan 1, 2017 onward | This ongoing program will rebate -- directly on consumers' residential electricity bills -- an amount equal to the provincial portion of the Harmonized Sales Tax (HST). |
| **Northern Industrial Electricity Rate Program** | 120 | March 2010 | As announced in 2015 Budget, the government committed to ongoing support for northern industrials with $120 million allocated annually.<br>The Northern Industrial Electricity Rate (NIER) was previously extended in 2012 for an additional three-year term, effective April 1, 2013 and also for a year effective April 1, 2016, with an allocation up to $120 million per year. Qualifying participants receive a rebate of two cents per kilowatt-hour (kWh) up to a maximum of $20 million per year per company.<br>NIER was initially established as a three-year program in Budget 2010, effective April 1, 2010,. |
| **Northern Ontario Energy Credit** | ~25 | Budget 2010 | Delivered as part of the Ontario Trillium Benefit, provides individuals living in northern Ontario with a credit of up to $146 per year for the 2016 benefit year, and families up to $224.[1] |
| **Ontario Energy Property Tax Credit** | ~445 | Budget 2010 | Delivered as part of the Ontario Trillium Benefit, provides up to $1,008 per year for low-to moderate-income individuals and families, and up to $1,148 for qualifying seniors. [1] |

1. Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and NOEC were introduced/enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).

DRAFT

# Timeline – Taxpayer-funded Electricity Price Mitigation

**Budget 2010: OEPTC, NOEC Proposed as part of the Ontario Trillium Benefit**

*In the 2011 Budget, the government combined the payments of three existing tax credits — the Ontario Sales Tax Credit, the Ontario Energy and Property Tax Credit, and the Northern Ontario Energy Credit — to create the OTB. The OTB is paid in monthly instalments throughout the year, which helps people meet their expenses as bills arrive.*

**Ontario Clean Energy Benefit** (Jan 1 2011 to Dec 31 2015)

*The OCEB was introduced in the 2010 Ontario Economic Outlook and Fiscal Review to help consumers transition to a cleaner electricity system. As set out in legislation, the OCEB ended on December 31, 2015. The Province has introduced rate mitigation measures to be implemented after December 31, 2015.*

*OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax, for the first 3,000 kilowatt-hours (kWh) of monthly electricity consumption.*

**Removing DRC from Residential Bills** (Jan 1 2016 to Mar 31 2018)

*The government removed the DRC from residential electricity users' bills beginning on January 1, 2016. This saves a typical residential user about $70 each year and ends the DRC earlier for these users than otherwise provided for in the Electricity Act, 1998.*

**Ontario Rebate for Electricity Consumers**

*As of January 1, 2017, OREC will reduce electricity costs by an amount equal to the provincial portion of the HST for about five million residential consumers, farms and small businesses.*

2010 2011 2012 2013 2014 2015 2016 2017

## History of Northern Industrial Electricity Price Relief

**November 2006**

*The Ontario government announced the Northern Pulp and Paper Electricity Transition Program (NPPETP), a three-year $140 million, to be effective retroactively to October 1, 2006*

**Budget 2009**

*The government announced extension of the NPPETP by one year providing about $58 million with electricity price rebates of 1.8 cents/kWh.*

**Budget 2010**

*NIER program announced, with a projected fiscal cost of $150 M per year, to provide electricity price rebates for qualifying large industrial facilities in northern Ontario. An additional $21.8 million allocated for existing NPPETP in 2010-11 to be integrated with NIER.*

**September 2010**

*Transition from NPPETP to NIER: pulp and paper mills participating in NPPETP continued to receive the NPPETP rebate of 1.8 cents/kWh until September 30, 2010, with those qualifying for NIER receiving a top-up rebate of 0.2 cents/kWh.*

**December 2012**

*The government announced the extension of the NIER for three years, capping the rebates to a maximum of 2011-12 consumptions levels or $20 million, whichever is lower.*

DRAFT

# Potential Fiscal Impact to the Electricity Sector

- The electricity sector has a significant impact on the Province's fiscal position; through both the revenue and expense sides of the Province's fiscal position.
  - Electricity Rate mitigation programs funded through the tax base have a direct fiscal impact on the Province's finances.
  - Alternatively, electricity rate mitigation programs funded by the rate base shift costs from one group of ratepayers to another.
- The Province's electricity sector agencies and corporations are each consolidated into the government's financial statements, and directly affect the Province's surplus/deficit position.
  - Ontario Power Generation (OPG) financial results have a dollar-for-dollar impact on the Province.
    - Electricity price mitigation strategies involving OPG would lead to a direct fiscal impact.
  - Hydro One financial results have a direct impact on the Province, based on the Province's proportionate ownership.
    - The Province currently holds about 70 per cent of Hydro One.

Thanks for this.

I updated the note, and added a slide to provide some overview on the electricity sector. Also I included the "Closed System" slide of the electricity sector.

Not sure what the thinking is with Salman's slides, but we can throw that in too if we want.

**Subject:** RE: Cost Shifts in the Electricity Sector

Thanks.

We should be able to get some historical year-by-year OEPTC and NOEC and NIER numbers.

DRC amount forgone I think was a little higher in the original submission. And the OREC amount in the LRC submission earlier this month is now at $1.2.

Can we do comments/markups of Energy's slides too?

Ron

Ontario

MINISTRY OF
ENERGY

# Cost Shifts in Ontario's Electricity Sector

## Working Draft

November 2016

CONFIDENTIAL DRAFT

# Context

- Necessary investments in Ontario's electricity system have led to increased prices, prompting government to introduced a number of price mitigation programs for all consumer types.
  - In addition to existing rate mitigation programs, the 2016 Throne Speech announced a package of rate mitigation initiatives to address electricity prices for residential, commercial and industrial consumers.

- Ontario has a number of programs in place to manage residential electricity prices, including:
  - Ontario Electricity Support Program (OESP);
  - Rural or Remote Rate Protect (RRRP);
  - Northern Ontario Energy Credit (NOEC);
  - Ontario Energy and Property Tax Credit (OEPTC);
  - Ontario Rebate for Electricity Customers (OREC); and
  - Ending the Debt Retirement Charge (DRC) from residential bills.

- Ontario also has a number of programs in place to manage industrial electricity prices, including:
  - Industrial Conservation Initiative (ICI);
  - Industrial Electricity Incentive (IEI);
  - Industrial Accelerator Program (IAP);
  - Northern Industrial Electricity Rate Program (NIERP);
  - saveONenergy for Business Program; and
  - Demand Response.

# Context (cont'd)

- Several programs in the electricity sector “shift costs” from one group of electricity consumers to another:
  - **Rural or Remote Rate Protect** (**RRRP)** is a longstanding program that reduces the delivery charge for rural electricity consumers and is paid for by all consumers in Ontario through a regulatory charge on bills.
  - **Ontario Electricity Support Program (OESP)** is funded via a regulatory charge on consumer bills and provides support for qualifying low income electricity consumers.
  - **Industrial Conservation Initiative (ICI)** empowers large consumers to lower their costs by reducing their demand during peak hours. In the process, ICI shifts costs from large electricity consumers to all other consumers in Ontario.
  - **Industrial Electricity Incentive** (**IEI**) program, offers reduced electricity prices for companies starting or expanding operations in Ontario. All electricity consumers in Ontario pay for the price reduction that IEI participants receive.

# Cost Shifts in Ontario's Electricity Sector

- The tables on the right show the estimated cost shifts that result from existing government programs.
- ICI has had the largest cost shift of all the programs, due to the large size of Global Adjustment (GA) and the way that it is recovered from consumer classes.
- RRRP and OESP impact the regulatory line on consumer bills, while ICI, IEI and conservation affect GA (i.e., Electricity line on bills of Regulated Price Plan consumers).

**Cost Shift Impacts - Residential Bill**

*Typical 750 kWh/month Toronto Hydro consumer*

| *$/month* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 2.65 | 3.25 | 3.88 | 3.53 | 4.75 | 4.77 |
| RRRP | 0.90 | 0.82 | 0.84 | 0.92 | 0.93 | 0.94 |
| OESP | - | - | - | - | - | 0.84 |
| Conservation | 1.85 | 1.92 | 2.00 | 1.58 | 2.43 | 2.45 |
| IEI | - | - | 0.08 | 0.09 | 0.11 | 0.12 |
| **Total** | **5.41** | **5.99** | **6.81** | **6.13** | **8.21** | **9.12** |

**Cost Shift Impacts - Industrial Bill**

*Typical Class A consumer*

| *$/MWh* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | -22.17 | -26.36 | -30.29 | -25.91 | -33.79 | -33.92 |
| RRRP | 1.20 | 1.10 | 1.12 | 1.23 | 1.24 | 1.25 |
| OESP | - | - | - | - | - | 1.13 |
| Conservation | 1.53 | 1.59 | 1.66 | 1.31 | 2.01 | 2.02 |
| IEI | - | - | 0.07 | 0.08 | 0.09 | 0.10 |
| **Total** | **-19.43** | **-23.67** | **-27.44** | **-23.29** | **-30.45** | **-29.43** |

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Cost Shifts in Ontario's Electricity Sector (cont'd)

- The table on the right shows the total cost for various government electricity programs. These programs are currently funded through the electricity system ratebase.

- Funding of these programs through the fiscal plan would remove these costs from the electricity system (i.e., Placing these costs on the taxbase).

**Cost of Programs**

*By government program*

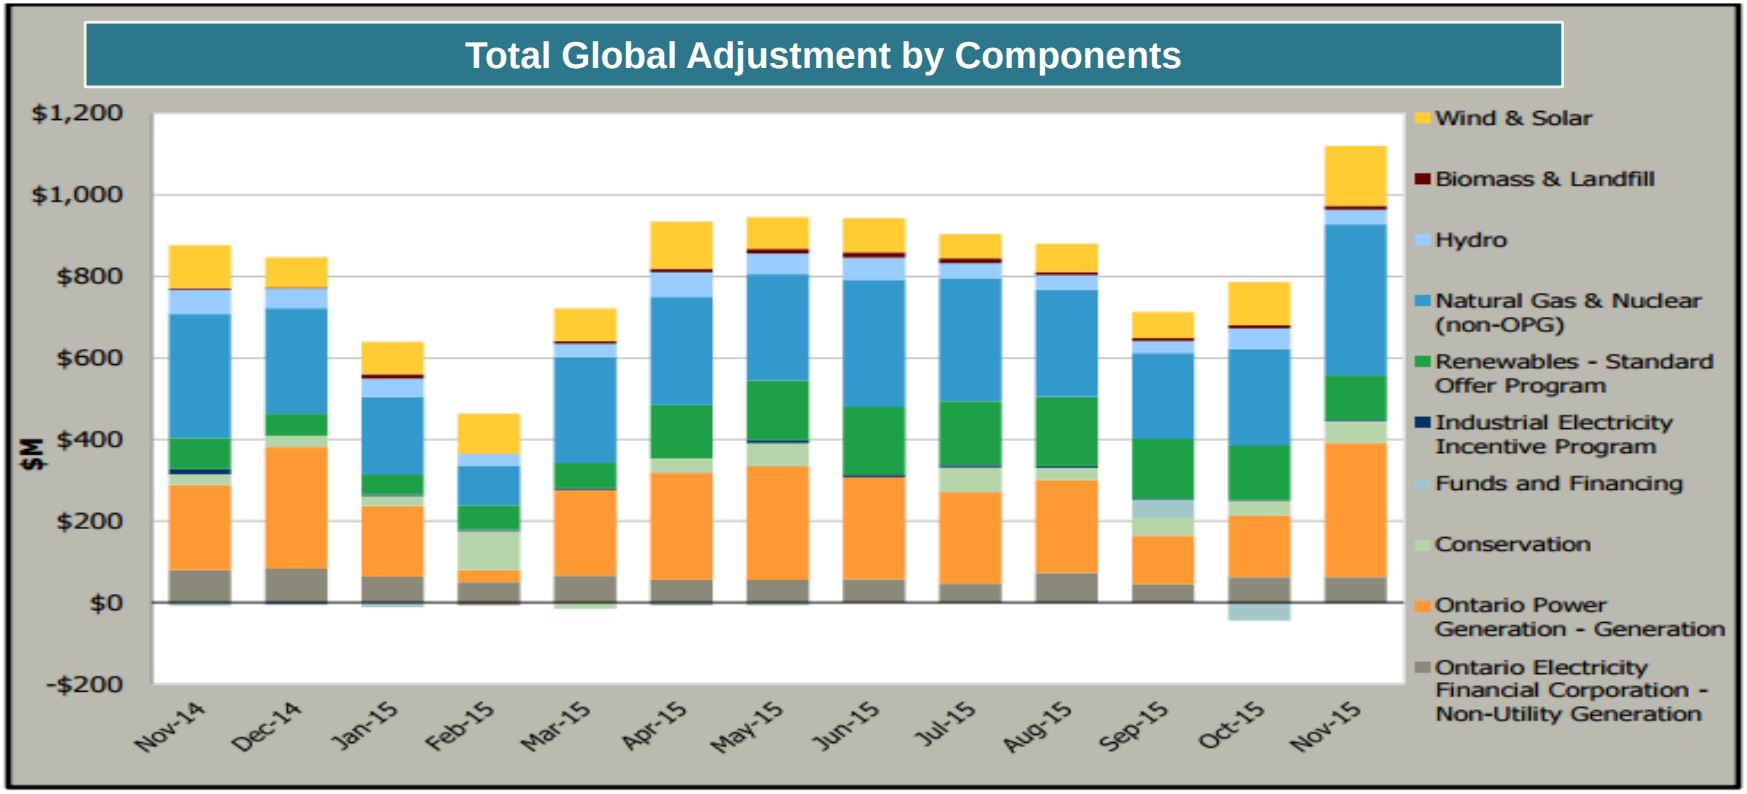
| *$M* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 506 | 615 | 736 | 670 | 890 | 893 |
| RRRP | 172 | 156 | 159 | 176 | 174 | 176 |
| OESP | - | - | - | - | - | 158 |
| Conservation | 329 | 339 | 354 | 280 | 425 | 428 |
| IEI | - | - | 15 | 16 | 18 | 19 |

- For example, removing the roughly $900 million of program cost from the Industrial Conservation Initiative (ICI) program would save the typical residential electricity consumer $4.77 per month in 2016.

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Total Components of Global Adjustment

- Global Adjustment (GA) is a market mechanism that recovers costs from electricity consumers, including the cost of almost all conservation programs in the province (i.e., approximately half a billion dollars in 2016).



**Source:** IESO Monthly Market Report (November 2015)

DRAFT

# Taxpayer Funded Electricity Price Mitigation

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from November LRC Submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt Retirement Charge
NIERP – Northern Ontario Electricity Rate Program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

- The table above shows the annual amount of taxpayer funded electricity price mitigation from 2011-12 to 2017-18.
- From 2011-12 to 2015-16 there has been an annual fiscal impact of approximately $1.6 billion due to electricity price mitigation programs.
- In 2016-17, the fiscal impact due to electricity price mitigation programs is estimated at approximately $1.2 billion.
- In 2017-18, due primarily to the start of the Ontario Rebate for Electricity Consumers, the expected fiscal impact due to electricity price mitigation programs is approximately $2.1 billion.

DRAFT

# Additional Background on Taxpayer funded Electricity Price Mitigation

| Program | Annual Fiscal Impacts ($M) | Date | Details |
|---|---|---|---|
| **Ontario Clean Energy Benefit (OCEB)** | ~1,000 | Jan 1 2011 to Dec 31, 2015 | OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax. Effective September 1, 2012, electricity consumption eligible for the 10 per cent benefit was capped at the first 3,000 kWh of electricity consumed per month, and provided a full 10 per cent benefit to almost all residential customers and most small retail businesses.<br><br>OCEB expired December 31, 2015, as planned. OCEB was put in place following the implementation of the Harmonised Sales Tax (HST). Unlike the previous provincial Retail Sales Tax (RST), the HST (and GST) included electricity in the taxable base. |
| **Ending DRC from Residential Bills** | ~300 | Jan 1, 2016 to Mar 31, 2018 | The government removed the Debt Retirement Charge (DRC) from residential electricity users' bills as of January 1, 2016.<br><br>This is saving a typical residential user about $70 each year and meant ending the DRC earlier for these users than otherwise provided for in the *Electricity Act, 1998*. |
| **Ontario Rebate for Electricity Consumers (OREC)** | ~1,000 | Jan 1, 2017 onward | This ongoing program will rebate -- directly on consumers' residential electricity bills -- an amount equal to the provincial portion of the Harmonized Sales Tax (HST), an eight per cent savings. |
| **Northern Industrial Electricity Rate Program** | 120 | March 2010 | The Northern Industrial Electricity Rate (NIER) was extended in 2012 for an additional three-year term, effective April 1, 2013, and expiring March 31, 2016, with an allocation up to $120 million per year.<br><br>Qualifying participants receive a rebate of two cents per kilowatt-hour (kWh) up to a maximum of $20 million per year per company.<br><br>NIER was initially established as a three-year program in Budget 2010 and effective as of April 1, 2010, to provide an estimated $150 million per year to eligible large industrial companies in northern Ontario. |
| **Northern Ontario Energy Credit** | 25 | Budget 2010 Announcement | Delivered as part of the Ontario Trillium Benefit, provides individuals living in northern Ontario with a credit of up to $146 per year for the 2016 benefit year, and families up to $224.[1] |
| **Ontario Energy Property Tax Credit** | 445 | Budget 2010 Announcement | Delivered as part of the Ontario Trillium Benefit, provides up to $1,008 per year for low-to moderate-income individuals and families, and up to $1,148 for qualifying seniors. [1] |

1. Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and NOEC were introduced/enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).

DRAFT

# Timeline - Taxpayer funded Electricity Price Mitigation

**Budget 2010: OEPTC, NOEC Proposed as part of the Ontario Trillium Benefit**

*In the 2011 Budget, the government combined the payments of three existing tax credits — the Ontario Sales Tax Credit, the Ontario Energy and Property Tax Credit, and the Northern Ontario Energy Credit — to create the OTB.*
*The OTB is paid in monthly instalments throughout the year, which helps people meet their expenses as bills arrive.*

**Ontario Clean Energy Benefit** (Jan 1 2011 to Dec 31 2015)

*The OCEB was introduced in the 2010 Ontario Economic Outlook and Fiscal Review to help consumers transition to a cleaner electricity system. As set out in legislation, the OCEB ended on December 31, 2015. The Province has introduced rate mitigation measures to be implemented after December 31, 2015.*

*OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax, for the first 3,000 kilowatt-hours (kWh) of monthly electricity consumption.*

**Removing DRC from Residential Bills** (Jan 1 2016 to Mar 31 2018)

*As part of its commitment to reduce electricity cost pressures, the government has removed the Debt Retirement Charge (DRC) from residential electricity users' bills beginning on January 1, 2016. This will save a typical residential user about $70 each year and will mean ending the DRC earlier for these users than otherwise provided for in the Electricity Act, 1998.*

**Ontario Rebate for Electricity Consumers**

*As of January 1, 2017, OREC will reduce electricity costs by an amount equal to the provincial portion of the HST for about five million residential consumers, farms and small businesses.*

2010 2011 2012 2013 2014 2015 2016 2017

**Northern Industrial Electricity Rate Program**

## History of Northern Industrial Relief

**November 2006**
*The Ontario government announced the Northern Pulp and Paper Electricity Transition Program (NPPETP), a three-year $140 million, to be effective retroactively to October 1, 2006*

**Budget 2009**
*The government announced extension of the NPPETP by one year providing about $58 million with electricity price rebates of 1.8 cents/kWh.*

**Budget 2010**
*The government announced the NIER program, with a projected fiscal cost of $150 million per year, to provide electricity price rebates for qualifying large industrial facilities in Northern Ontario. An additional $21.8 million allocated for existing NPPETP in 2010-11 to be integrated with NIER.*

**September 2010**
*Transition from NPPETP to NIER: pulp and paper mills participating in NPPETP continued to receive the NPPETP rebate of 1.8 cents/kWh until September 30, 2010, with those qualifying for NIER receiving a top-up rebate of 0.2 cents/kWh.*

**December 2012**
*The government announced the extension of the NIER for three years, capping the rebates to a maximum of 2011-12 consumptions levels or $20 million, whichever is lower.*

# Fiscal Implications of the Electricity Sector

- The electricity sector has a significant impact on the Province's fiscal position; through both the revenue and expense sides of the provinces financial statements.
- Electricity Rate mitigation programs funded through the **tax base** have a direct fiscal impact on the province's finances.
  - Alternatively, electricity rate mitigation programs funded by the **rate base** shift costs from one group of rate payers to another.
- The Province's electricity sector agencies and corporations are each consolidated into the government's financial statements, and directly affect the Province's surplus/deficit position.
  - Ontario Power Generation (OPG) financial results have a dollar-for-dollar impact on the Province.
  - Hydro One financial results have a direct impact on the Province, based on the Province's proportionate ownership.
    - The Province currently holds about 70 per cent of Hydro One.
  - Ontario Electricity Financial Corporation (OEFC), an agency of the Ministry of Finance, is consolidated line-by-line into the Province's accounts.
    - OEFC receives certain revenues from within the electricity sector, including the Debt Retirement Charge (DRC) and payments-in-lieu of taxes, to manage the debt and liabilities of the old Ontario Hydro, including the stranded portion of the debt.
    - ~~The Minister of Finance also has authority under the Electricity Act with respect to the DRC.~~

DRAFT

# Electricity Sector Revenues: Part of a "Closed System" via OEFC

- OEFC manages certain dedicated Provincial electricity sector revenues and expenses, and services and pays down its electricity debt to reduce the stranded debt of the electricity sector

## Ontario Revenues

- Taxation Revenue
  - Personal Income Tax, Sales Tax, etc.
  - Electricity Payments-In-Lieu of Taxes (PILs)
  - Hydro One Provincial Corp Tax
- Federal Transfers
- Government Business Enterprises
  - OLG & LCBO
  - OPG & Hydro One
- Other Non-Tax Revenue
  - Electricity Debt Retirement Charge (DRC)

## Ontario Expenses

- Interest on Debt
  - Interest on Hydro Debt
  - Interest on Other Debt
- Education, Energy, Transportation, etc.

Thanks for this.

I updated the note, and added a slide to provide some overview on the electricity sector. Also I included the "Closed System" slide of the electricity sector.

Not sure what the thinking is with Salman's slides, but we can throw that in too if we want.

**Subject:** RE: Cost Shifts in the Electricity Sector

Thanks.

We should be able to get some historical year-by-year OEPTC and NOEC and NIER numbers.

DRC amount forgone I think was a little higher in the original submission. And the OREC amount in the LRC submission earlier this month is now at $1.2.

Can we do comments/markups of Energy's slides too?

Ron

ENERGY

# Cost Shifts in Ontario's Electricity Sector

## Working Draft

November 2016

CONFIDENTIAL DRAFT

# Context

- Necessary investments in Ontario's electricity system have led to increased prices, prompting government to introduced a number of price mitigation programs for all consumer types.
  - In addition to existing rate mitigation programs, the 2016 Throne Speech announced a package of rate mitigation initiatives to address electricity prices for residential, commercial and industrial consumers.

- Ontario has a number of programs in place to manage residential electricity prices, including:
  - Ontario Electricity Support Program (OESP);
  - Rural or Remote Rate Protect (RRRP);
  - Northern Ontario Energy Credit (NOEC); and
  - Ontario Energy and Property Tax Credit (OEPTC).

- Ontario also has a number of programs in place to manage industrial electricity prices, including:
  - Industrial Conservation Initiative (ICI);
  - Industrial Electricity Incentive (IEI);
  - Industrial Accelerator Program (IAP);
  - saveONenergy for Business Program; and
  - Demand Response.

# Context (cont'd)

- Several programs in the electricity sector “shift costs” from one group of electricity consumers to another:
  - **Rural or Remote Rate Protect** (**RRRP)** is a longstanding program that reduces the delivery charge for rural electricity consumers and is paid for by all consumers in Ontario through a regulatory charge on bills.
  - **Ontario Electricity Support Program (OESP)** is funded via a regulatory charge on consumer bills and provides support for qualifying low income electricity consumers.
  - **Industrial Conservation Initiative (ICI)** empowers large consumers to lower their costs by reducing their demand during peak hours. In the process, ICI shifts costs from large electricity consumers to all other consumers in Ontario.
  - **Industrial Electricity Incentive** (**IEI**) program, offers reduced electricity prices for companies starting or expanding operations in Ontario. All electricity consumers in Ontario pay for the price reduction that IEI participants receive.

# Cost Shifts in Ontario's Electricity Sector

- The tables on the right show the estimated cost shifts that result from existing government programs.
- ICI has had the largest cost shift of all the programs, due to the large size of Global Adjustment (GA) and the way that it is recovered from consumer classes.
- RRRP and OESP impact the regulatory line on consumer bills, while ICI, IEI and conservation affect GA (i.e., Electricity line on bills of Regulated Price Plan consumers).

**Cost Shift Impacts - Residential Bill**

*Typical 750 kWh/month Toronto Hydro consumer*

| *$/month* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 2.65 | 3.25 | 3.88 | 3.53 | 4.75 | 4.77 |
| RRRP | 0.90 | 0.82 | 0.84 | 0.92 | 0.93 | 0.94 |
| OESP | - | - | - | - | - | 0.84 |
| Conservation | 1.85 | 1.92 | 2.00 | 1.58 | 2.43 | 2.45 |
| IEI | - | - | 0.08 | 0.09 | 0.11 | 0.12 |
| **Total** | **5.41** | **5.99** | **6.81** | **6.13** | **8.21** | **9.12** |

**Cost Shift Impacts - Industrial Bill**

*Typical Class A consumer*

| *$/MWh* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | -22.17 | -26.36 | -30.29 | -25.91 | -33.79 | -33.92 |
| RRRP | 1.20 | 1.10 | 1.12 | 1.23 | 1.24 | 1.25 |
| OESP | - | - | - | - | - | 1.13 |
| Conservation | 1.53 | 1.59 | 1.66 | 1.31 | 2.01 | 2.02 |
| IEI | - | - | 0.07 | 0.08 | 0.09 | 0.10 |
| **Total** | **-19.43** | **-23.67** | **-27.44** | **-23.29** | **-30.45** | **-29.43** |

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Cost Shifts in Ontario's Electricity Sector (cont'd)

- The table on the right shows the total cost for various government electricity programs. These programs are currently funded through the electricity system ratebase.

- Funding of these programs through the fiscal plan would remove these costs from the electricity system (i.e., Placing these costs on the taxbase).

**Cost of Programs**

*By government program*

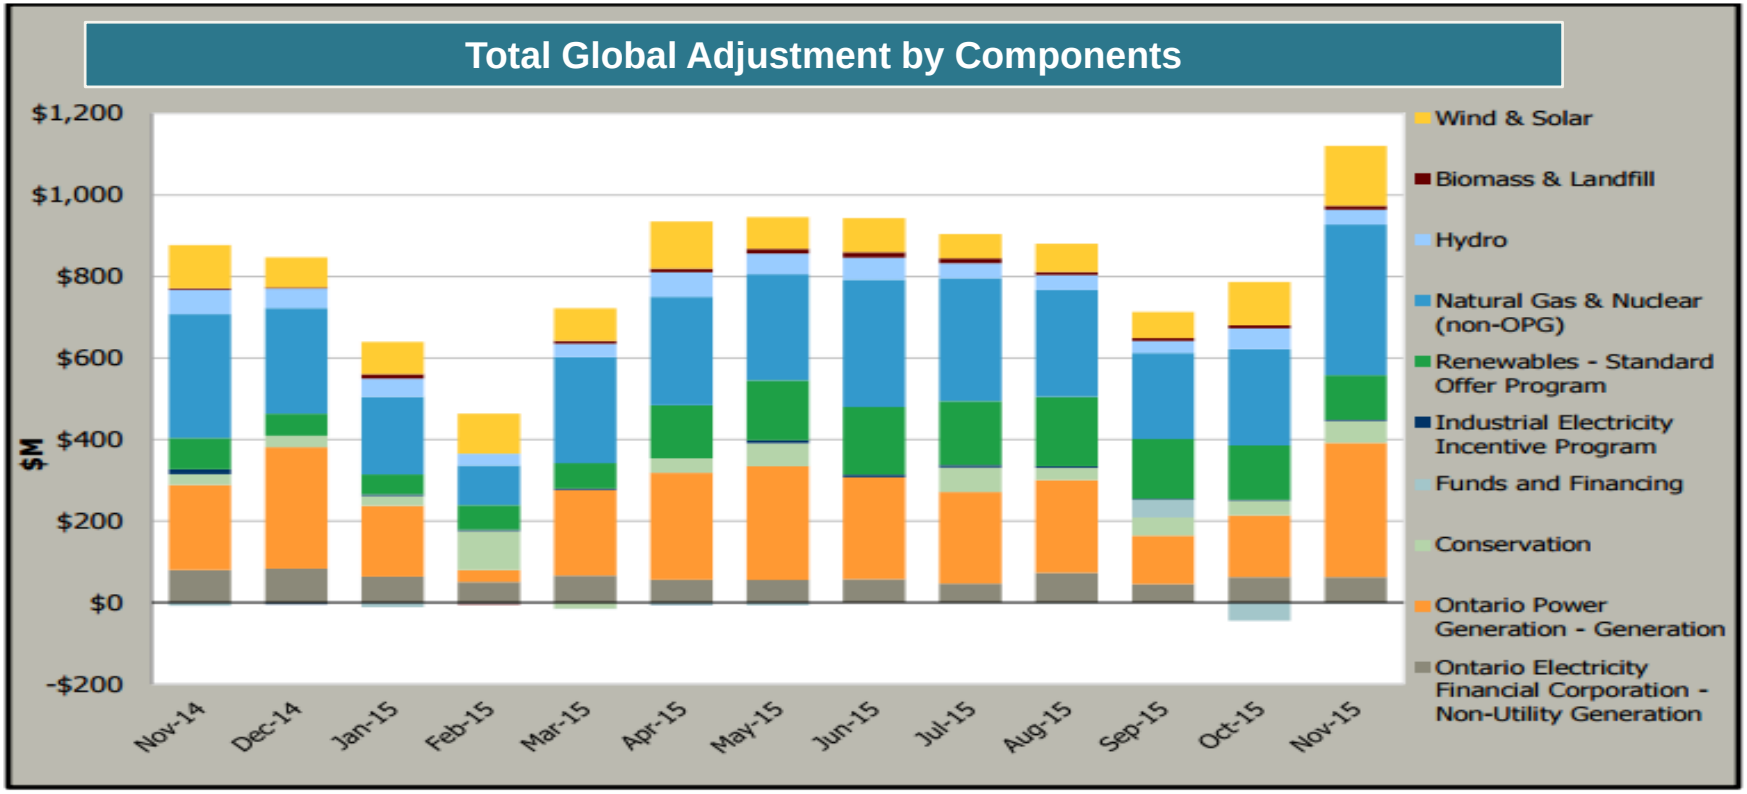
| *$M* | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| ICI | 506 | 615 | 736 | 670 | 890 | 893 |
| RRRP | 172 | 156 | 159 | 176 | 174 | 176 |
| OESP | - | - | - | - | - | 158 |
| Conservation | 329 | 339 | 354 | 280 | 425 | 428 |
| IEI | - | - | 15 | 16 | 18 | 19 |

- For example, removing the roughly $900 million of program cost from the Industrial Conservation Initiative (ICI) program would save the typical residential electricity consumer $4.77 per month in 2016.

**Note:** OESP did not come into effect until 2016. The 2016 values represent forecasts and are subject to change.

# Total Components of Global Adjustment

- Global Adjustment (GA) is a market mechanism that recovers costs from electricity consumers, including the cost of almost all conservation programs in the province (i.e., approximately half a billion dollars in 2016).



**Source:** IESO Monthly Market Report (November 2015)

DRAFT

# Taxpayer Funded Electricity Price Mitigation

| ($M) | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17[1] | 2017-18[1] |
|---|---|---|---|---|---|---|---|
| OCEB | 1,033 | 994 | 1,006 | 1,078 | 860 | - | - |
| OREC | - | - | - | - | - | 300 | 1,200* |
| Ending DRC[2] | - | - | - | - | 75 | 300 | 300 |
| NIERP | 120 | 120 | 115 | 108 | 120 | 120 | 120 |
| NOEC | 23 | 24 | 25 | 24 | 26 | 25 | 25 |
| OEPTC[3] | 354 | 406 | 418 | 429 | 444 | 450 | 460 |
| TOTAL | 1,530 | 1,544 | 1,564 | 1,639 | 1,525 | 1,195 | 2,105 |

1. 2016-17, 2017-18 based on forecasted numbers
2. 2015-16 estimated for 3 months of reduced DRC revenue
3. OEPTC amounts in all years based on energy component of the rebate.

* Sourced from November LRC Submission

OCEB – Ontario Clean Energy Benefit
OREC – Ontario Rebate for Electricity Consumers
DRC – Debt Retirement Charge
NIERP – Northern Ontario Electricity Rate Program
NOEC – Northern Ontario Energy Credit
OEPTC – Ontario Energy and Property Tax Credit

- The table above shows the annual amount of taxpayer funded electricity price mitigation from 2011 – 2017.
- From 2011-12 to 2015-16 there has been an annual fiscal impact of approximately $1.6 billion due to electricity price mitigation programs.
- In 2016-17, the fiscal impact due to electricity price mitigation programs is estimated at approximately $1.2 billion.
- In 2017-18, due primarily to the start of the Ontario Rebate for Electricity Consumers, the expected fiscal impact due to electricity price mitigation programs is approximately $2.1 billion.

DRAFT

# Additional Background on Taxpayer funded Electricity Price Mitigation

| Program | Annual Fiscal Impacts ($M) | Date | Details |
|---|---|---|---|
| **Ontario Clean Energy Benefit (OCEB)** | ~1,000 | Jan 1 2011 to Dec 31, 2015 | OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax. Effective September 1, 2012, electricity consumption eligible for the 10 per cent benefit was capped at the first 3,000 kWh of electricity consumed per month, and provided a full 10 per cent benefit to almost all residential customers and most small retail businesses.<br><br>OCEB expired December 31, 2015, as planned. OCEB was put in place following the implementation of the Harmonised Sales Tax (HST). Unlike the previous provincial Retail Sales Tax (RST), the HST (and GST) included electricity in the taxable base. |
| **Ending DRC from Residential Bills** | ~300 | Jan 1, 2016 to Mar 31, 2018 | The government removed the Debt Retirement Charge (DRC) from residential electricity users' bills as of January 1, 2016.<br><br>This is saving a typical residential user about $70 each year and meant ending the DRC earlier for these users than otherwise provided for in the *Electricity Act, 1998*. |
| **Ontario Rebate for Electricity Consumers (OREC)** | ~1,000 | Jan 1, 2017 onward | This ongoing program will rebate -- directly on consumers' residential electricity bills -- an amount equal to the provincial portion of the Harmonized Sales Tax (HST), an eight per cent savings. |
| **Northern Industrial Electricity Rate Program** | 120 | March 2010 | The Northern Industrial Electricity Rate (NIER) was extended in 2012 for an additional three-year term, effective April 1, 2013, and expiring March 31, 2016, with an allocation up to $120 million per year.<br><br>Qualifying participants receive a rebate of two cents per kilowatt-hour (kWh) up to a maximum of $20 million per year per company.<br><br>NIER was initially established as a three-year program in Budget 2010 and effective as of April 1, 2010, to provide an estimated $150 million per year to eligible large industrial companies in northern Ontario. |
| **Northern Ontario Energy Credit** | 25 | Budget 2010 Announcement | Delivered as part of the Ontario Trillium Benefit, provides individuals living in northern Ontario with a credit of up to $146 per year for the 2016 benefit year, and families up to $224.[1] |
| **Ontario Energy Property Tax Credit** | 445 | Budget 2010 Announcement | Delivered as part of the Ontario Trillium Benefit, provides up to $1,008 per year for low-to moderate-income individuals and families, and up to $1,148 for qualifying seniors. [1] |

1. Both the energy portion of the Ontario Energy and Property Tax Credit (OEPTC) and NOEC were introduced/enhanced following the introduction of the HST and have a significant annual fiscal cost (totalling about $500 million annually).

DRAFT

# Timeline - Taxpayer funded Electricity Price Mitigation

**Budget 2010: OEPTC, NOEC Proposed as part of the Ontario Trillium Benefit**

*In the 2011 Budget, the government combined the payments of three existing tax credits — the Ontario Sales Tax Credit, the Ontario Energy and Property Tax Credit, and the Northern Ontario Energy Credit — to create the OTB.*
*The OTB is paid in monthly instalments throughout the year, which helps people meet their expenses as bills arrive.*

**Ontario Clean Energy Benefit** (Jan 1 2011 to Dec 31 2015)

*The OCEB was introduced in the 2010 Ontario Economic Outlook and Fiscal Review to help consumers transition to a cleaner electricity system. As set out in legislation, the OCEB ended on December 31, 2015. The Province has introduced rate mitigation measures to be implemented after December 31, 2015.*

*OCEB provided over four million residential customers, and over 400,000 farm, small business and other small users with a benefit equal to 10 per cent of the total cost of electricity on their bills, including tax, for the first 3,000 kilowatt-hours (kWh) of monthly electricity consumption.*

**Removing DRC from Residential Bills** (Jan 1 2016 to Mar 31 2018)

*As part of its commitment to reduce electricity cost pressures, the government has removed the Debt Retirement Charge (DRC) from residential electricity users' bills beginning on January 1, 2016. This will save a typical residential user about $70 each year and will mean ending the DRC earlier for these users than otherwise provided for in the Electricity Act, 1998.*

**Ontario Rebate for Electricity Consumers**

*As of January 1, 2017, OREC will reduce electricity costs by an amount equal to the provincial portion of the HST for about five million residential consumers, farms and small businesses.*

2010 2011 2012 2013 2014 2015 2016 2017

**Northern Industrial Electricity Rate Program**

## History of Northern Industrial Relief

**November 2006**
*The Ontario government announced the Northern Pulp and Paper Electricity Transition Program (NPPETP), a three-year $140 million, to be effective retroactively to October 1, 2006*

**Budget 2009**
*The government announced extension of the NPPETP by one year providing about $58 million with electricity price rebates of 1.8 cents/kWh.*

**Budget 2010**
*The government announced the NIER program, with a projected fiscal cost of $150 million per year, to provide electricity price rebates for qualifying large industrial facilities in Northern Ontario. An additional $21.8 million allocated for existing NPPETP in 2010-11 to be integrated with NIER.*

**September 2010**
*Transition from NPPETP to NIER: pulp and paper mills participating in NPPETP continued to receive the NPPETP rebate of 1.8 cents/kWh until September 30, 2010, with those qualifying for NIER receiving a top-up rebate of 0.2 cents/kWh.*

**December 2012**
*The government announced the extension of the NIER for three years, capping the rebates to a maximum of 2011-12 consumptions levels or $20 million, whichever is lower.*

DRAFT

# Fiscal Implications of the Electricity Sector

- The electricity sector has a significant impact on the Province's fiscal position; through both the revenue and expense sides of the provinces financial statements.
- Electricity Rate mitigation programs funded through the tax base have a direct fiscal impact on the province's finances.
- The Province's electricity sector agencies and corporations are each consolidated into the government's financial statements, and directly affect the Province's surplus/deficit position.
  - Ontario Power Generation (OPG) financial results have a dollar-for-dollar impact on the Province.
  - Hydro One financial results have a direct impact on the Province, based on the Province's proportionate ownership.
    - The Province currently holds about 70 per cent of Hydro One.
  - Ontario Electricity Financial Corporation (OEFC), an agency of the Ministry of Finance, is consolidated line-by-line into the Province's accounts.
    - OEFC receives certain revenues from within the electricity sector, including the Debt Retirement Charge (DRC) and payments-in-lieu of taxes, to manage the debt and liabilities of the old Ontario Hydro, including the stranded portion of the debt.
    - ~~The Minister of Finance also has authority under the Electricity Act with respect to the DRC.~~

DRAFT

# Electricity Sector Revenues: Part of a "Closed System" via OEFC

- OEFC manages certain dedicated Provincial electricity sector revenues and expenses, and services and pays down its electricity debt to reduce the stranded debt of the electricity sector

## Ontario Revenues

- Taxation Revenue
  - Personal Income Tax, Sales Tax, etc.
  - Electricity Payments-In-Lieu of Taxes (PILs)
  - Hydro One Provincial Corp Tax
- Federal Transfers
- Government Business Enterprises
  - OLG & LCBO
  - OPG & Hydro One
- Other Non-Tax Revenue
  - Electricity Debt Retirement Charge (DRC)

## Ontario Expenses

- Interest on Debt
  - Interest on Hydro Debt
  - Interest on Other Debt
- Education, Energy, Transportation, etc.

Sure, I'll give him a call.

Though, I'm not sure why Ron has an issue with the NIER, NOEC numbers; those were from Public Accounts.

Will call Bruno for the OEPTC numbers.

Thanks,
Shajee

Tomorrow, could you do the additional setup slide and the requests in Ron's email?

Could you also give Bruno Amara a call and ask to see if he has the NOEC and OEPTC figures?
