On 'Reforming the Governance of Energy Planning'

*...the IESO is conducting a review of the electricity market design through its Market Renewal initiative, which is attempting to strengthen the use of market signals and competition in the procurement of resources. However, the ability of Market Renewal to succeed is uncertain because of the risks associated with future government interventions in the energy marketplace. A predictable energy planning framework is needed that retains the government's capacity to set policies that are of critical importance to Ontarians, such as those for climate change. This framework should take advantage of the competitive pressures of the marketplace to ensure that all sector participants have the confidence to invest and deliver customers the choices they desire at the lowest cost.*

## And on Stakeholder Consultation in the sector

*Currently, there appears to be a lack of coordination and scheduling between energy sector institutions regarding their policy consultation process as well as a high volume of initiatives requiring input. As a result, utilities and stakeholders are often put into the position of dealing with multiple processes simultaneously, making it difficult to participate effectively because of time and human resource constraints. For example, at the time of writing, the following policy and regulatory consultations are taking place: the IESO's Market Renewal Process and its Conservation Framework Mid-Term Review; the OEB's consultations on a cyber security framework and its review of customer service rules; and, electric utilities are working with government to implement the Fair Hydro Plan. As illustrated above, the volume of consultations is becoming overwhelming with policies and regulations in a constant state of flux. Utilities and stakeholders would be better able to contribute to consultations if they had more advance notice of consultations coupled with better coordination across and among sector agencies.*
