Perhaps this is something that could be handled by a call with the rating agency, opg and Jeannette and George? OPG would like to get you on a call but I think they can handle? Of course would need a prep call with opg to ensure alignment?

Thx

Here is what our involvement has been in this regard.
In the course of supporting the government on the development of the plan we were asked to provide OPG with some history regarding OPA/IESO previous forecasts, the historical actuals outcomes and “projections” beyond our normal 20 year view. Their analysis was already based on the OPO reference case that was posted by the IESO which extended out the usual 20 years to 2035. We accompanied our input with the caveat below.

In general our planning process does look at a number of scenarios to test the sensitivity of the demand/supply picture for reliability, overall costs, environmental etc. These scenarios represent a number of factors that alone and in combination could lead to higher or lower forecasts. These scenarios contribute to informing the recommendations that are made to manage the resource base and risks around those key factors.

Our input was caveated with the following (per advice from Michael Boli):

Please be aware that the IESO does not perform forward monthly forecasts, nor do we have any kind of projections out beyond 2035. The IESO does however perform 20-year projections on an annual (not monthly) basis. I enclose the IESO's most recent projection for the period to 2035.

Please note that the IESO's 20-year projections and its other projections are prepared for electricity system planning purposes, not for commercial or other purposes, and are premised on a number of material assumptions. The IESO is not providing an opinion, nor any representation or warranty, regarding the accuracy or reasonableness of the projections, nor any of the assumptions underpinning the projections. Similarly, with respect to actual data, the IESO has not reviewed such data for accuracy and has generated it for the IESO's own internal purposes. We therefore make no representation or warranty regarding the accuracy or completeness of such data.

Accordingly, we are providing the enclosed data and projections to OPG for informational purposes only and OPG and others, including banks, other financial institutions and rating agencies, are not permitted to rely, or make any claim of reliance, upon the projections or data for any purpose whatsoever. OPG specifically confirms that the projections and data are not being provided to OPG to induce it to invest in, or enter into any transaction with the IESO, or to pursue any commercial or financial activities that do not relate to IESO. OPG acknowledges that it will be conducting its own independent reviews and investigations as it believes is prudent and that the projections are not a substitute for such reviews and investigations. OPG further acknowledges and agrees that the IESO has no liability or obligation to OPG whatsoever by virtue of OPG receiving or reviewing the projections or data and that you will not hold the IESO responsible or liable (and OPG hereby waives any and all rights, claims or actions against the IESO) with respect to any loss, liability, damage or expense as a result of, in respect of, connected with, or arising out of, under or pursuant to such receipt or review.

OPG agrees that it will provide the above disclaimers and statements to any banks, other financial institutions or rating agencies to which this data or the projections are provided.

Planning has previously provided load forecast data to OPG related to this. George – can you comment?

To be clear, I said "in the past, the job of a system operator was simple and straightforward," said Leonard Kula, the chief operating officer of Ontario's Independent Electricity System Operator, the agency that controls the power system. Those easy days are now gone and the future promises to be ever more complicated. "

I have just provided OPG details on historical RPP MWs too because Moody's wants confidence in the numbers used in OPG modelling for similar reasons. They want sensitivity analysis to reflect what happens if prescribed consumers are significantly reduced in the future.

Welcome back Kim. Please spread some of the Bahamas’ sunshine in TO!

I don’t know if you’ve seen the email below from DBRS, but they are asking for OPG and the IESO’s strategies for collecting the CEA if electricity demand decreases. They’re referencing comments made by Leonard Kula and a Senior Advisor at EY regarding the impact of technology on electricity demand. Do you know the context around Leonard’s comments? How is the IESO treating the impact of technological changes on its demand forecast?

Good morning,

Once again, thank you to IESO representatives for the
opportunity to understand your role in the Ontario Hydro
market and specifically as it relates to the Fair Hydro
Act. Prior to the meeting I mentioned to some of you an
article that was published (attached) earlier Tuesday
morning discussing the future of hydro in Ontario.

Follow up question for IESO and OPG:

While we recognize that the semi-annual true-up is a
significant mitigant to demand forecast error our sensitivity
and stress analysis needs to incorporate the potential for a
loss of ratepayers which will potentially over-burden any
remaining ratepayers. Of particular interest is the rapid
technological changes that are anticipated (including by
Leonard Kula, Chief Operating Officer of IESO) and the
potential for a significant loss of ratepayers as the article’s
title suggests “costs of leaving the grid decline”.

Given the timing of the transaction which contemplates all of
the borrowing up front, our stress needs to incorporate the
potential changes to the market as the bonds are
issued. This results in a significant exposure to technological
change (and consequently rate payers leaving the grid) given
the very long repayment horizon which needs to be
considered as part of our initial rating analysis.

Request: Please provide additional information on IESO
and OPG strategies to manage the technological changes
with respect to maintaining an acceptable scale of ratepayers
over the repayment period and how these risks are
incorporated into the repayment (demand) forecast in the
financial modeling. And the impact on the LDC’s.

<https://www.theglobeandmail.com/news/national/in-ontario-hydros-future-gets-murkier-as-costs-of-leaving-the-grid-decline/article36962354/>

Once an idea limited to isolated cottages and the
environmentally zealous, making your own electricity and
storing it in your garage could be cheaper than the
traditional way of buying power within a decade. Benoit

Laclau, Ernst and Young's adviser on power and utilities, has guidance for politicians and utility leaders around the world who employ the accounting firm: Exercise caution on any big projects that will require more than a decade to pay off. On a piece of paper, he can draw a graph with two lines. One starts low and represents the slowly increasing cost of electricity provided by a traditional electricity company; the second starts higher but is going down "really rapidly" and reflects the cost of people producing power on their own roof. "Those two lines cross, and they are going to cross soon, a lot sooner than we had expected," he said.
