The 2005 - 2006 Guide to Eating Ontario Sport Fish

The 2005-2006 Guide to Eating Ontario Sport Fish is substantially different from previous editions. It now contains important information on consumption of sport fish from Ontario waters for both the general population and the sensitive population of women of child-bearing age and children under 15.

We recommend that you discard previous editions of the Guide and either download the 2005-2006 Guide or request a paper copy by contacting the Sport Fish Contaminant Monitoring Program.

The Guide to Eating Ontario Sport Fish is published every other year by the Ministry of the Environment in co-operation with the Ministry of Natural Resources. Staff at the Ministry of Natural Resources and Ministry of the Environment collect fish and send them to the Ministry of the Environment laboratory in Toronto. The fish are analyzed for a variety of substances, including mercury, PCBs, mirex, DDT and dioxins. The results are used to develop the tables in the Guide, which give size-specific consumption advice for each species tested from each location. This advice is based on health protection guidelines developed by Health Canada.

The Sport Fish Contaminant Monitoring Program is the largest testing and advisory program of its kind in North America. Fish have been tested from approximately 1,700 locations in Ontario's inland lakes and rivers and Great Lakes. Between 4,000 and 6,000 fish per year are tested through the program, which has been testing Ontario sport fish for more than 25 years.

For further information on the program or results in the Guide, contact:

Sport Fish Contaminant Monitoring Program
Ministry of the Environment
Environmental Monitoring and Reporting Branch
125 Resources Road
Etobicoke, ON M9P 3V6
Telephone: (416) 327-6816
Hotline: 1-800-820-2716
e-mail: sportfish@ene.gov.on.ca

Women of child-bearing age and children under 15 are more sensitive to the effects of contaminants found in some sport fish. The Ontario Ministry of the Environment issues more stringent advice for women of child-bearing age and children under 15 in the Guide to Eating Ontario Sport Fish. More information is available in:

5005b [Contaminants in Sport Fish Important information for women of child-bearing age and parents of children under 15](#)

The Guide

Preface

This 23rd edition of the *Guide to Eating Ontario Sport Fish* gives consumption advice for sport and game fish found at more than 1,700 locations in the province. The format of the 2005 *Guide* has changed significantly from previous editions in the way in which consumption advisories are presented.

The advisories continue to be based on health protection guidelines provided by Health Canada. However, advisories are now provided separately for the general population and for the sensitive population of women of child-bearing age and children under 15. This is the result of long-term epidemiological studies on mercury intake which have found developmental effects on young children at levels lower than previously thought. Since there is no evidence of any adverse effects on adults at similarly low levels, Health Canada provides two health protection guidelines, which have been incorporated into the *Guide*.

All users of the *Guide* are advised to read the *Instructions* section prior to proceeding to the consumption tables. This is especially important for families with women of child-bearing age and children under 15.

The *Guide* is published every other year. An electronic copy of the *Guide* is available on the Ministry of the Environment Web site at www.ene.gov.on.ca. In alternate years any major changes in consumption advice are made public by the Ministry of the Environment through the Public Information Centre and on the ministry Web site. Media are also notified. Consumers with questions on the status of specific consumption advisories should call the

Sport Fish Contaminant Monitoring Program at (416) 327-6816 or 1-800-820-2716 or e-mail sportfish@ene.gov.on.ca

Staff at the Ministry of Natural Resources and Ministry of the Environment collect the fish and send them to the Ministry of the Environment laboratory in Toronto where they are analyzed for a variety of substances, including mercury, PCBs, mirex, DDT and dioxins. The results are used to develop the tables in this *Guide*, which give size-specific consumption advice for each species tested from each location. This advice is based on health protection guidelines developed by Health Canada.

To report pollution or fish kills, contact the nearest office of the Ministry of the Environment or the Ministry's Spills Action Centre (see page 21).

Anyone requiring information on fishing licences, angling regulations, limits of catch, open seasons, provincial parks, maps or hunting should contact a Ministry of Natural Resources office (see page 22) or visit the Ministry of Natural Resources Web site at www.mnr.gov.on.ca

To obtain detailed data for a specific location tested under the Sport Fish Contaminant Monitoring Program or further information on the results in this and previous *Guides*, please contact:

Sport Fish Contaminant Monitoring Program
Ministry of the Environment
125 Resources Road
Etobicoke, ON M9P 3V6
Telephone: (416) 327-6816
or 1-800-820-2716
E-mail: sportfish@ene.gov.on.ca

It is highly recommended that you read the text of the *Guide* before referring to the advisory tables. Should you choose not to, please read the following two sections entitled “Instructions on use of the *Guide*” and “Summary of critical information” with page references for more detail.

Instructions on use of the *Guide*

To determine how much fish you can consume:

- Find the table for the water body where the fish was caught. The *Guide* tables are divided into Southern Ontario (south of the French River), Northern Ontario and the Great Lakes.

		Length/ Longueur

Barbotte brune ⁵				8																					

General population/population générale

Sensitive population/population sensible – *Women of child-bearing age and children under 15/Les femmes en âge de procréer et les enfants de moins de 15 ans*

- Measure the total length of the fish (tip of nose to tip of tail) and refer to the appropriate length range at the top of the table.
- The upper line (*no shading*) is for the general population and the lower line (*grey shading*) is for women of child-bearing age and children under 15 (sensitive population).
- The number that appears in the consumption advice box represents the maximum number of meals of that size fish from that location that can be consumed each month. The number of meals per month (categories) may be 8, 4, 2, 1, or 0 as indicated.
- Women of child-bearing age and children under 15 are advised to consume fish only in the eight and four meals per month categories.
- Sport fish consumption advice is based on a combination of fish size, species and location. You may eat fish from different categories and locations as long as you take care to track your consumption accordingly. Track each fish meal as a fraction of your monthly intake total (as shown in the following chart), the sum of which should not exceed 1.

Category (Fish meals per month)	Fraction of monthly intake total
8	1/8
4	1/4
2	1/2
1	1

For example:

If you eat:

- Two meals in the four-meal-per-month category, each meal will represent one-quarter of your maximum monthly allotment for a total of one-half your maximum monthly allotment (2 meals x 1/4 = 1/2).

and also eat

- One meal in the two-meal-per-month category, that meal will represent one-half of your monthly allotment (1 meal x 1/2 = 1/2).

The total from these two groups equals one. Therefore, you would have used your total monthly allotment.

- Women of child-bearing age and children under 15 should reduce their consumption of sport fish if they consume commercial fish more than four times per month. As a general guideline, reduce sport fish consumption by one meal per month for every two meals of store-bought fish.
- If you have any questions on determining your consumption, contact the Sport Fish Contaminant Monitoring Program at 1-800-820-2716 or sportfish@ene.gov.on.ca

As an added level of precaution, women of child-bearing age and children under 15 are advised to consume fish only from the categories of eight meals per month and four meals per month.

Summary of critical information

- Young children and developing fetuses are affected by contaminants at lower levels than the general population (pg. 5).
- The maximum recommended number of meals of sport fish per month is eight (pg. 7). Determine exactly what you can consume using the methods described in the “Instructions on use of the *Guide*.”
- Consumption advice in the tables is based on an average meal size of 227 grams (eight ounces) for an average size adult weighing 70 kilograms (155 pounds). It is assumed that smaller individuals will consume a smaller portion and larger individuals will consume a larger portion.

- If you are an average size adult and your average meal size is substantially less than 227 grams (eight ounces), you may consume more meals than recommended. Conversely, if your meal size is substantially more than 227 grams (eight ounces), you should consume fewer than the recommended number of meals. Contact the Sport Fish Contaminant Monitoring Program for more specific advice.
- Do not harvest dead or dying fish as they may contain harmful microorganisms or toxins (pg. 12).
- Always follow proper food handling and storage techniques, as you would with any fresh meat product, to prevent the growth of harmful bacteria (pg. 12).
- Consumption advice is based on the skinless, boneless dorsal fillet (pg. 14). Do not eat organs of any fish. Fish organs can be high in both heavy metals and pesticides (pg. 6).
- Great Lakes salmon and trout are more likely to have high levels of contaminants such as PCBs and pesticides. Check the consumption tables and consume only the skinless, boneless dorsal fillet of these fish (pg. 6). The flesh on the lower portion of the fish (belly) can have higher levels of PCBs and pesticides.
- At inland locations, mercury is the major contaminant. Because mercury is distributed evenly throughout the fillet, in most cases the full side fillet can be consumed (pg. 6) Check the consumption tables.
- Top predators, such as walleye and pike, usually have the highest mercury levels. Smaller, younger fish and fish that are not top predators, such as panfish and yellow perch, are lower in contaminants. You can reduce your contaminant intake by choosing these fish to eat (pg. 10).
- If in doubt, contact the Sport Fish Contaminant Monitoring Program (1-800-820-2716 or sportfish@ene.gov.on.ca).

Additional information

An educational brochure for women of child-bearing age is available, either individually or in bulk, free of charge by contacting the Sport Fish Contaminant Monitoring Program.

A two page summary of the *Guide* is available in the languages listed below. Please call or e-mail the Sport Fish Contaminant Monitoring Program for copies or visit the Web site at www.ene.gov.on.ca

Cambodian	Cantonese	Cree	English	Filipino	French	German

Portuguese	Russian	Spanish	Ukrainian	Vietnamese		

Important advice for women of child-bearing age and children under 15

It is important that women of child-bearing age and children under 15 follow the advice in this *Guide*. Scientific studies clearly show that developing fetuses and young children are affected by contaminants at lower levels than the general population. Women of child-bearing age, including pregnant women and nursing mothers, can affect the health of their offspring through a diet elevated in contaminants such as mercury and PCBs.

Women of child-bearing age and children under 15 are advised to eat only those fish in the 8 and 4 meals per month categories.

The exact number of meals that can be consumed can be calculated by following the directions in the “Instructions on use of the Guide” section (page 2).

These individuals should further reduce their consumption of sport fish if they consume commercial fish regularly (four times per month or more often) and should not consume sport fish if they are regular consumers of shark, swordfish, fresh or frozen tuna (not canned tuna).

As a general guideline, reduce consumption of sport fish by one meal per month for every two meals of store-bought fish. This does not apply to the general population. More detailed information is included in the section “Advice for women of child-bearing age and children” (see page 7).

Contaminants in Ontario sport fish

Ontario is not unique in having consumption restrictions on sport fish. Most jurisdictions in North America also have them. An extensive review of consumption restrictions on sport fish in North America is available on the Internet at www.epa.gov/ost/fish

Contaminants found in sport fish originate not only from local sources, but some are transported thousands of kilometres in the atmosphere before being deposited with rainfall. Mercury, PCBs and toxaphene are a few of the contaminants that are known to be transported long distances and can cause low-level contamination even in isolated lakes and rivers.

The basis for fish consumption advisories

Fish consumption advisories are based on guidelines developed by Health Canada which, through research and review of toxicological data, has determined safe dosages for an extensive list of contaminants. This amount is referred to as a tolerable daily intake. It is then determined what proportion of the tolerable daily intake comes from each of the environmental pathways such as air, water and different types of food, including sport fish. The safe dosage is the same for everyone for all contaminants except mercury, which is lower for the sensitive population of women of child-bearing age and children under 15.

A series of estimates and calculations is then done by the Ministry of the Environment to determine if fish are suitable for consumption. Fish represented in the eight-meals-per-month category have very low contaminant levels. If eight meals per month of these fish were consumed, an individual's tolerable daily intake would not be exceeded for any contaminant. Conversely, fish designated as zero (0) meals per month have high contaminant levels and the consumption of any meals of these fish would result in

individuals exceeding their tolerable daily intake for one or more contaminants.

What part of the fish can be safely consumed

Laboratory analyses are carried out on the lean, dorsal, skinless, boneless muscle tissue of the fish (as shown on page 13) and the consumption guidelines are based on the results of this portion. Consuming any other portion may increase exposure to contaminants. Please follow the advice below.

1. Do not eat organs of any fish regardless of location. Organs can be high in both heavy metals and pesticides.
2. Consume only the skinless boneless dorsal fillets of salmon, trout, carp and channel catfish, especially if they are from the Great Lakes. Follow the advice in this *Guide* on how to "Clean and cook fish to reduce contaminants." Consumption advisories on these species in the Great Lakes are usually based on PCBs, mirex, toxaphene or dioxins. Because these contaminants are attracted to fat, the highest concentration of contaminants is present in the fat deposits under the skin and in the belly region.
3. You may consume the whole side fillet of lean species such as walleye, pike, bass, perch, and panfish from inland locations. Consumption advisories on these species are based almost exclusively on mercury. Mercury is uniformly distributed in the fillet and is not associated with deposits of fat.

Consumption advisory tables

Contaminant levels for all fish of a given size and species are usually similar within most small or medium sized lakes or rivers which

means that one set of consumption advice is all that is normally required. In large lakes and major river systems, however, contaminant levels can vary widely within the water body.

Fish consumption advisory tables for the Great Lakes, connecting waterways, large lakes and major river systems are provided in blocks or regions. Contaminant levels for all fish of a given size and species should be similar throughout a block. The boundaries of the blocks are established in consultation with fisheries biologists familiar with local fish populations after comparing contaminant levels in fish from several adjacent locations.

If minor differences are found in contaminant levels in fish within a block, the fish with the highest contamination levels are used to set the consumption advisory for that block. Separate consumption advice is provided for localized areas within a block where the fish community or the contaminant levels are different from the remainder of the block. Periodic testing is undertaken at several locations within a block to ensure that there are no major differences in contaminant levels. Detailed maps and written descriptions of the Great Lakes' blocks are provided at the front of each of the Great Lakes' tables.

How to use the *Guide*

To whom does this *Guide* apply?

The advice in this *Guide* is designed to apply to anglers (and their families) who consume moderate quantities of fish. The consumption advice will protect individuals who follow the advice in the *Guide* and consume no more than eight meals per month of the fish they catch. Many of the fish in the eight-meals-per-month consumption category can be safely consumed more frequently than this. The maximum recommended consumption level was based on the results of questionnaires indicating that most anglers do not consume sport fish more frequently than eight meals per month. Anyone who does consume sport fish

more frequently is advised to contact the Sport Fish Contaminant Monitoring Program at the number given in the preface.

Advice for women of child-bearing age and children

Health Canada guidelines have been developed to protect the health of everyone, including the most sensitive individuals. Generally the most sensitive individuals are considered to be women of child-bearing age, pregnant women and children. Consequently, consumption advice for these sensitive individuals is more restrictive than that for the general population and is provided separately in the consumption tables.

Women of child-bearing age (pregnant women, women who are intending to become pregnant or breast-feeding mothers) and children under 15 are advised to consume only the least contaminated fish which are in the eight and four meals per month categories. Sport fish consumption should be restricted even further if store-bought fish are regularly consumed. Women of child-bearing age and children under 15 are advised to reduce their consumption of sport fish if they consume store-bought fish four times per month or more often. As a general rule, reduce sport fish consumption by one meal per month for every two meals of store-bought fish.

Furthermore, Health Canada has issued a warning that women of child-bearing age and children should not consume more than one meal per month of shark, swordfish, fresh or frozen tuna as these fish are known to contain higher levels of mercury. This advice does not apply to canned tuna as it usually has low levels of mercury. As well, women of child-bearing age and children under 15 who are regular consumers of shark, swordfish, fresh or frozen tuna are advised not to consume sport fish. For further advice, contact Health Canada or the Canadian Food Inspection Agency (see page 22).

Key to using *Guide* tables

The *Guide* provides sport fish consumption advice based on the level of contaminants found in fish according to their species, length and location. The water body names and locations were obtained from the *Gazetteer of Canada* (Ontario). The location description includes latitude and longitude, enabling anglers to refer to the *Ontario Official*

Road Map (which is marked accordingly) to determine the general location of the body of water. Larger scale topographical maps can then be used if necessary to pinpoint the exact location. An alphabetical listing of all locations is contained in the index. The following is a key to the various components of the tables, using a hypothetical example called Emily Lake.

The diagram shows a table for 'Emily Lake / Lac Emily' with various callouts:

- 1: Southern Ontario/Sud de l'Ontario (Region)
- 2: Water body name (Emily Lake / Lac Emily)
- 3: Township/County (Sauger Twp./Canton de Sauger, Sturgeon Co./Clé de Sturgeon)
- 4: Township/County (Sauger Twp./Canton de Sauger, Sturgeon Co./Clé de Sturgeon)
- 5: Species (Northern Pike, Brochet, Walleye, Doré)
- 6: Latitude (4537)
- 7: Longitude (7942)
- 8: Length/Longueur (15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, >75 cm)
- 9: Number of meals (8, 4, 0)
- 10: Advice for women of child-bearing age and children under 15 (8, 4, 0)
- 11: No advice provided for these lengths (8, 4, 0)
- 12: No advice provided for these lengths (8, 4, 0)
- 13: The number identifies the contaminant or group of contaminants for which the fish was tested (8, 4, 0)

Location identifiers

- 1 The tables are divided into three sections by region: Southern Ontario, Northern Ontario and the Great Lakes, as noted at the top of each page.
- 2 Water body name.
- 3 The latitude and longitude
- 4 The township, county, territorial district or geographical description of the water body.

Fish species

- 5 The most popular species and (or) the most likely to indicate elevated levels of contaminants are tested (see section "**Selection of fish species for testing**," page 12).

Fish length

- 6, 7 The total length of the fish is measured, from the tip of the nose to the tip of the tail. The fish length is expressed in the tables in both centimetres and inches (at the top and bottom of the tables).

Number of meals

- 8 Acceptable number of meals per month
- 9 Advice for general population
- 10 Advice for women of child-bearing age and children under 15
- 11, 12 No advice provided for these lengths (page 9)

Contaminants

- 13 The number identifies the contaminant or group of contaminants for which the fish was tested:
 1. Mercury
 2. Mercury, PCBs, mirex/photomirex and pesticides
 3. PCBs, mirex/photomirex and pesticides
 4. Mercury, PCBs and mirex
 5. Mercury, other metals, PCBs, mirex/photomirex and pesticides
 6. Mercury and other metals
 7. Dioxins and furans

- 8. Chlorinated phenols and chlorinated benzenes
- 9. Polycyclic aromatic hydrocarbons (PAHs)
- 10. Dioxins, furans and dioxin-like PCBs
- 11. PCB congeners

The fact that fish were tested for a particular group of contaminants does not mean that the fish will contain any or all of these contaminants. For example, fish analyzed for contaminant group 2 may contain only mercury and not PCBs, mirex/photomirex or pesticides.

In a number of locations, particularly inland locations, fish are analyzed only for mercury as this is likely to be the only contaminant to cause consumption restrictions.

Fish consumption tables

The advice provided in the tables is based on Health Canada’s health protection guidelines for the intake of various contaminants tested in sport fish. The number in each box represents the maximum number of meals per month which can be safely consumed provided that sport fish are not consumed from any other category. If, during the month, fish are consumed from more than one category or location, please refer to the “Instructions on using the *Guide*” section (page 2).

The consumption advice is provided on two lines. The advice on the top line (*no shading*) is provided for the general population. The advice on the bottom line (*grey shading*) is provided for the sensitive population (women of child-bearing age and children under 15).

Please note that a meal is considered to be 227 grams (eight ounces) for an average-sized adult, weighing 70 kilograms (155 pounds). It would be more for larger individuals and less for smaller individuals.

Example

An angler catches a 33 cm (13 in.) walleye from Emily Lake and wants to determine

the suitability of that fish for consumption. The angler should:

- Find Emily Lake in the *Guide* tables

		Length/ longueur															
		15	20	25	30	35	40	45	50	55	60	65	cm				
		6"	8"	10"	12"	14"	16"	18"	20"	22"	24"	26"					
Emily Lake / Lac Emily																	
Sauger twp./Canton de Sauger, Sturgeon Co./Cité de Sturgeon 4537/7942																	
Walleye ⁵ Doré ⁵						8		4									
						4		0									

- General population:
For the general population the advice given for walleye in the 30-35 cm (12-14 in.) range is 8 indicating that eight meals per month of that fish may be consumed by the general population.
 - Sensitive population:
For women of child-bearing age and children under 15 the advice given for walleye in the 30-35 cm (12-14 in.) range is 4 indicating that four meals per month of that fish may be consumed by women of child-bearing age and children under 15.
- Consumption of fish outside the advisory table range**
- Advisories are provided only for the size ranges of fish that were tested. Since it is well known that contaminant levels increase with fish length, the following rules can be applied:
- For fish smaller than the advisory table range:
Follow the advice for the smallest tested range.
 - For fish larger than the advisory table range:
Consumption advice cannot be predicted, except that it is likely to be more restrictive than the largest tested range.

Consumption advisories for spawning locations of salmon and trout

Please note that many rivers and streams near the Great Lakes are closed to fishing during salmon and trout spawning runs. However, sections of certain rivers and streams do remain open to permit fishing for these species. While salmon and trout from the Great Lakes

spend most of their lives there, they spawn in many of the rivers and streams which flow into them. In this *Guide*, consumption advisories are provided for some of the major spawning rivers such as the Credit and Ganaraska rivers on Lake Ontario and the Nottawasaga River on Georgian Bay. Spawning runs in many smaller rivers have not been sampled. If you catch salmon or trout in the legal fishing areas of these smaller rivers, please follow the consumption advisories for the Great Lakes advisory block into which the river flows. Maps and descriptions are provided at the beginning of each Great Lakes section of this *Guide*.

As an example, for salmon and trout caught in Duffins Creek, follow the advisories for block 6, Northwestern Lake Ontario.

Reducing the risk from contaminants in sport fish

Fish are a healthy part of any diet. They are high in protein and low in fat and offer substantial health benefits when they replace a protein source that is higher in fat. However, it is always prudent to minimize your contaminant intake. Consult the advisory table and the following tips to achieve this:

Eat less contaminated species

- Keep smaller fish for eating. Besides tasting better, smaller fish tend to be much less contaminated than larger fish of the same species.
- Species such as perch, sunfish and crappie tend to have much lower contaminants than large predator fish such as walleye and pike.
- In the Great Lakes, species such as bass, pike, walleye, perch and panfish tend to have much lower contaminants than fatty species such as salmon and trout.

Clean and cook fish to reduce contaminants

PCBs, pesticides and dioxins concentrate to the highest levels in fish with fatty flesh such as salmon, trout, carp and catfish. Before cooking, remove the skin, trim off the fatty

areas and discard the flesh around the belly area (as shown in figure below). Further reduction in contaminants can be achieved by allowing fat to drip away during cooking.

Mercury is the cause of most consumption advisories in inland water bodies. Mercury is evenly distributed in fish flesh and there is nothing you can do to reduce or remove it.

Muskellunge

Consumption tables in this *Guide* do not normally provide advisories for muskellunge. To maintain healthy muskellunge populations, the Sport Fish Contaminant Monitoring Program encourages catch and release of this species as it generally cannot sustain heavy fishing pressure. If you do wish to keep a legal-sized muskellunge for consumption, it will likely have elevated mercury levels, and should not be consumed by women of child-bearing age and children under 15. Trophy-sized muskellunge usually have very high mercury levels and should not be consumed by anyone.

Fish parasites

Anglers sometimes catch fish which contain worms, grubs, cysts or nodules in the flesh. When cleaning fish, anglers may notice worms in or around the intestines of the fish or fungus growths on the skin, fins or gills. These parasites are a normal part of the ecosystem in which the fish lives. While not aesthetically pleasing, the edible portions containing

parasites do not present a health hazard if properly and thoroughly cooked. Some of the most commonly seen parasites associated with fish are black spot, yellow grub, leeches, lamprey, fish lice and gill flukes.

Following is a description of black spot and yellow grub:

a) Black spot

Black spot, one of the most frequently observed parasites of fish, appears as small black spots or cysts in the skin, fins and flesh of fish. In the black spot life cycle, fish-eating birds such as herons and kingfishers eat an infected fish. The larval stage, which is inside the black cyst, develops into an adult in the bird. Eggs are laid by the adult and pass into the water where they hatch and infect snails. Eventually they leave the snail host and burrow through the skin of fish and form cysts, which the fish surrounds with a black pigment. This organism does little harm to the fish, but gives the fish an unsightly appearance. Infected fish can be consumed with proper cooking.

b) Yellow Grub

Yellow grub is closely related to black spot and has a similar life cycle. It appears as yellow or white spots in the flesh, sometimes over ½ cm long. Smallmouth bass and yellow perch tend to be the species most commonly inflicted with yellow grub in Ontario. There are no external signs on a fish to indicate that the flesh contains yellow grub. If only a few grubs are found in a fillet, they can be easily removed with a knife tip. Otherwise, infected fish can be consumed with proper cooking.

Tumours in fish

Occasionally, anglers catch fish with external growths, tumours, sores or other lesions. Such abnormalities generally result from viral or bacterial infections. Abnormalities in the liver or intestine are sometimes seen in coarse fish such as white suckers and brown bullhead, and can be caused by parasites or tumours. Concern about the potential effects of these

diseases on the fish themselves and the possible role of pollution in causing tumours in some coarse fish has prompted ongoing investigations into these abnormalities. Growths on game fish caused by viruses include lymphocystis, dermal sarcoma and lymphosarcoma.

Lymphocystis, a viral disease affecting walleye and perch, is common throughout Canada. Viruses infect the fish's skin through contact with infected fish during the spring spawning run, forming pale or white cauliflower-like growths. Lymphocystis does not kill affected fish. Tagging studies have shown that these fish can lose the growths by the following spring.

Dermal sarcoma, another viral disease affecting walleye, is caused by viruses which infect cells and cause growths just under the skin. These growths can be removed by skinning the fish. A study by the Ministry of the Environment and the Ministry of Natural Resources has shown that walleye with external skin lesions such as lymphocystis and dermal sarcoma do not have higher contaminant levels than unaffected fish.

Lymphosarcoma is a viral disease affecting muskellunge and northern pike. This virus is transmitted at spawning, but the lesions caused by it can vary depending on the season and stage of the disease. In the spring, affected fish have thick white patches on their skin from which viruses are shed and these in turn infect other fish. Later in the year these patches may heal, forming blotchy red sores or even normal skin. The virus causing lymphosarcoma infects the white blood cells of the fish and can spread throughout the body during the summer or over several years. This disease can kill infected fish.

Other Growths. Coarse fish in various parts of the Great Lakes have been found to have lip and skin growths similar to human warts in appearance. Growths on coarse fish kept in the laboratory often disappear and new

ones can develop very quickly, suggesting that viruses likely cause these tumours. Studies on Canadian and American areas of the Great Lakes have found an increased rate of lip and skin growth on coarse fish captured in polluted areas; in some extremely polluted areas, liver and intestinal tumours have been found in these fish. Studies suggest that pollution may cause the liver tumours and may indirectly cause skin growths – warmer water often found in polluted areas attracts larger numbers of fish, thus increasing their risk of becoming infected with viruses. Considerable research, much of it conducted or funded by the Ontario and Canadian governments, has been undertaken to determine whether pollution is a cause of these tumours. While the appearance of viral or bacterial infections in fish is unsightly, there is no known health risk from consuming an infected fish that meets the consumption guidelines.

Clams

Although freshwater clams are often readily available in many Ontario water bodies, it is advised that they not be consumed. Clams are filter feeders and therefore they are usually low in chemical contaminants, but for the same reason, they can harbour harmful bacteria and other pathogens. If they are not sufficiently cooked, they may cause health problems, such as food poisoning.

E. coli bacteria

E. coli is a type of bacteria that is found in warm-blooded animals. It is not normally associated with fish. Therefore, in a water body that has elevated levels of *E. coli*, and may be closed for swimming, fish can still be consumed provided they are properly cooked

and the advice in the consumption tables is followed.

Botulism E

Fish and bird “die-offs,” attributed to Type E botulism, have been occurring during the summer and fall along the shorelines of the Great Lakes. Concern has been expressed that handling and consuming fish from these lakes may pose a health hazard.

Health Canada has concluded that there is no concern from consuming fish from these lakes, as long as normal practices are adhered to, including appropriate handling and storage of the fish and adequate cooking. Anglers are also advised not to keep any fish that appear to be sick, are dying or already dead when caught.

The Sport Fish Contaminant Monitoring Program

Selection of locations for testing

With more than 250,000 lakes, innumerable rivers and streams and many local areas in the Great Lakes, it would not be practical or economical to test fish from every water body.

A location may be selected for testing for one or more of the following reasons:

- It is a popular angling area
- There is a known or suspected source of pollution nearby
- It is a major source of food for local inhabitants (usually lakes in the vicinity of First Nations' communities)
- It is being opened for recreational development
- It is part of a monitoring program for long-term studies of contaminants in fish

The selection of testing sites is an ongoing process and public input is welcomed.

Selection of fish species for testing

Most lakes and rivers contain a variety of fish species. When selecting appropriate species for contaminant testing, the fact that not all

species accumulate a particular contaminant at the same rate has to be taken into account. One kind of fish of a certain size may have a much lower contaminant concentration than another species of the same size. This is due to the fact that different fish feed on different things, prefer different habitats, grow at different rates and are physiologically different.

For example, walleye (yellow pickerel) and northern pike are likely to contain higher levels of mercury than whitefish of the same size since walleye and pike are top predators, feeding on smaller fish which may also contain elevated mercury levels. Whitefish on the other hand, feed lower down in the food chain, on aquatic insects and invertebrates which contain less mercury than do small fish.

When testing fish for mercury in a specific area, the practice is to initially select those species which are top predators, as they likely indicate the highest mercury levels. If low levels of mercury are found in predators, the testing of other species may not be necessary.

In testing for organic contaminants such as PCBs and mirex, species with high fat levels, such as salmon, trout, carp and catfish, are selected since organic chemicals tend to accumulate in fatty tissue.

Again, if these species do not contain excessive levels of organic contaminants, then species with less fat from the same location may not have to be tested.

Collection of fish for testing

The fish are collected by staff from the Ministry of Natural Resources and the Ministry of the Environment using various methods. Whenever possible, the selection includes 10 or more fish of each species with lengths and weights representative of the size range of that species in the locations being tested. The length, weight and sex of each fish collected are recorded.

A boneless, skinless fillet of dorsal muscle flesh is removed from the fish (see illustration), packaged and frozen for shipment to the Ministry of the Environment laboratory in Toronto.

Retesting of locations

Since the mid-1970s the Sport Fish Contaminant Monitoring Program has continued to add new locations each year, as well as retesting many lakes and rivers when necessary. In areas remote from human activity, where fish are relatively unaffected by pollution, any consumption restrictions are usually limited to elevated mercury levels in the larger and older predatory species such as walleye and northern pike. The source of mercury in these areas can be natural or from long-range transport. Consequently, concentrations in fish do not change substantially over time.

However, in areas directly affected by human sources of pollution, the number of possible contaminants may be much larger and the levels found in fish can be significantly affected by changes in the levels of pollution.

Retesting locations are divided into three general groups:

- Areas where contaminant levels for one or more pollutants are either unusually elevated or change substantially. These locations are retested every one to three years, depending on their angling popularity or whether they are a major food source for local inhabitants.
- Areas that show no signs of substantial changes in contaminant levels but are very popular angling areas. These locations are retested at least every five years.

- All other areas – usually relatively remote locations with no major sources of pollution nearby and no indication of changing contaminant levels in fish. These locations are retested approximately every 10 years.

Testing of fish

A boneless, skinless dorsal fillet sample not only provides the most consistent test results, but is also the most edible portion of the majority of sport fish.

The fish tissue is analyzed for contaminants at the Ministry of the Environment laboratory using a variety of methods depending on the contaminant.

Preserving and preparing your fish for cooking

If you decide to keep and eat your catch, you should keep it in the best possible condition until it reaches the table. Freshly caught fish should be chilled on ice or in a refrigerator as soon as possible to avoid spoilage. Then, at the earliest opportunity, the fish should be cleaned, dressed and refrigerated or preserved for future use.

The following is one of the procedures commonly used for gutting, filleting and skinning fish:

1. Slit open the belly from the vent (anal opening) and remove the internal organs.
2. Trim away the head and fins.
3. Lay the fish on its side on a cutting board.
With a thin sharp knife, cut through the skin and flesh just behind the head down to the backbone. Turn the knife blade along the backbone and, with a sawing motion of the blade, follow the backbone down to the tail, keeping as close to the backbone as possible.
4. Repeat for the fillet on the other side of the fish.
5. Laying each fillet skin-side down on the board, remove the rib bones by inserting the knife blade just under the ribs and separate them from the fillet with as little flesh left

on as possible. Trim away the pelvic fin and any belly fat from the ventral portion of the fillet.

6. Lay the fillets skin-side down and, starting at the tail with the knife blade parallel to the skin and as close to it as possible, slice forward with a sawing motion to separate the skin from the fillet. You are then left with skinless, boneless fillets. Wash in clean cold water and cook, refrigerate, freeze or preserve as desired.

Note: if the fish you are cleaning are fatty fish caught in the Great Lakes, please follow the advice in the section “Clean and cook fish to reduce contaminants” on page 10.

The Ministry of Natural Resources has specific requirements for transport or storage of fish to ensure that a Conservation Officer can determine the number, size and species of fish in your possession. This includes leaving a piece of skin on the fillet. Refer to the *Recreational Fishing Regulations Summary* for details.

How to release fish

A number of anglers fish for the thrill of the catch, and release their fish to allow them to be caught again. If you decide not to keep a particular fish, here are some tips to apply to safely return the fish to the water:

1. Time is essential, so quickly play and release the fish. A fish played for too long will be too exhausted to recover. A fish hooked in deep water should be brought up slowly to prevent stress due to pressure and temperature changes.
2. Keep the fish in the water as much as possible, since fish out of water will suffocate. Do not allow the fish to flop on the ground or on the rocks. Just a few centimetres of water under a thrashing fish will act as a protective cushion.
3. Gentle handling of the fish is essential and hands should be kept wet at all times while handling any fish. Do not put your fingers in the gills or in the eye sockets. Small fish

- should not be squeezed but should only be lifted by the lower lip. A net is helpful while handling fish, but keep it in the water.
4. Remove hooks quickly using needle-nosed pliers. If the fish is deeply hooked, cut the line and leave the hook in, as it will dissolve and will not harm the fish. Do not try to tear out hooks.
 5. To revive an unconscious fish, hold it upright in the water. If there is a current, hold it heading upstream. Apply artificial respiration by moving the fish forward and backward so that water runs through the gills. It may take a few minutes for the fish to revive. When the fish does begin to struggle, release it.

Contaminants in fish

There are many naturally occurring substances such as mercury, which at levels normally found in air, water and food, pose no hazard to the environment or to human health. A number of synthetic substances, such as PCBs, mirex and dioxins, may also be found in the environment.

The following section describes some of the broad range of substances which may be tested in Ontario sport fish and the levels which result in consumption restrictions. Consumption guidelines developed for use by Ontario anglers are based on tolerable daily intake guidelines provided by Health Canada. For more information on these substances and their health implications, please contact the office of the Sport Fish Contaminant Monitoring Program at the number listed in the preface.

Inorganic substances

Mercury

Mercury is a naturally occurring metal which is found in very low levels in air, water, rocks, soil, and plant and animal matter.

At one time mercury was widely used in industry; however, government and industry took action to reduce its use in the late 1960s and early 1970s and direct discharges

of mercury from major industrial sources have been virtually eliminated. Residual contamination from these point sources is still evident in fish in a few locations in Ontario. Significant quantities of mercury still enter the aquatic environment from the atmosphere from both man-made and natural sources.

Mercury is attracted to particles in the water and settles to the bottom sediments where it can be converted by microorganisms into methylmercury. Methylmercury is rapidly absorbed by a fish either directly from water passing over its gills or ingested with its diet. Since fish eliminate mercury at a very slow rate, concentrations of this substance gradually accumulate.

Health Canada recently reduced the tolerable daily intake for mercury for women of child-bearing age and children, but not for the general population. The new tolerable daily intake is temporary, pending the completion of a long-term study of people in the Seychelle Islands who eat large quantities of fish.

As a result, for women of child-bearing age and children under 15, consumption restrictions for sport fish containing mercury begin at levels of 0.26 parts per million with total restriction advised for levels above 0.52 parts per million. For the general population, consumption restrictions begin at levels above 0.61 parts per million with total restriction advised for levels above 1.84 parts per million.

Other metals

Lead, copper, nickel, zinc, cadmium, manganese, chromium, arsenic and selenium are found in fish tissue but not at levels that would suggest a need for consumption restrictions.

Industrial chemicals

Polychlorinated biphenyls (PCBs)

PCBs are a group of chlorinated organic compounds first commercially developed in the late 1920s. They are not formed naturally in the environment, so their presence is always attributed to human activity.

PCBs persist for years in the natural environment and bioaccumulate readily in the aquatic ecosystem. As a result, top predator species of fish with a high fat content such as salmon and trout (but not walleye and pike which have a low fat content) have accumulated PCBs in some Ontario waters to levels which restrict consumption. PCBs have been banned in all new products and are now only found as an insulating fluid in existing closed electrical power transformers and capacitors. Strict regulations for the storage and disposal of PCBs and PCB-contaminated equipment minimize the chance of further releases of PCBs into the environment and have resulted in declining levels of PCBs in the aquatic environment.

Health Canada has two guidelines for PCBs, one based on the total of all PCBs present in a sample and the other based on a select few PCBs with toxicological properties similar to dioxins. The dioxin-like PCBs are found at extremely low levels and for consumption advisory purposes are included with the dioxins. Refer to the following section "Dioxins, furans and dioxin-like PCBs". Consumption restrictions for total PCBs in sport fish begin at levels of 0.153 parts per million with total restriction advised for levels above 1.22 parts per million.

Dioxins, furans and dioxin-like PCBs

Dioxins and furans are byproducts of several industrial processes and in some cases, incomplete combustion. They have never been intentionally manufactured.

There are 210 different dioxins and furans but only 17 are toxic enough to be of concern. Studies have shown that there are also 12 forms of PCBs, usually referred to as dioxin-like PCBs which have toxicological properties similar to toxic forms of dioxins. The Ministry of the Environment monitors the 17 toxic forms of dioxins and furans and 12 dioxin-like PCBs in sport fish. The concentration of each of the 29 forms is multiplied by an equivalency factor to convert it to a number referred to

as a toxic equivalent which represents its toxicity relative to the most toxic form of dioxins – 2,3,7,8-TCDD. The sum of the 29 toxic equivalents is the total toxic equivalent and is compared to the dioxin guideline.

Consumption restrictions for sport fish begin at levels of 1.62 parts per trillion, with total restriction advised for levels above 12.96 parts per trillion for toxicity equivalents of 2,3,7,8-TCDD.

Mirex/photomirex

Mirex is a chlorinated carbon compound that was used as a pesticide in the southern United States but never registered for such use in Canada.

Mirex has been detected in fish primarily from Lake Ontario. The sources were found to be a former processor of mirex in Niagara Falls, New York and a manufacturing plant in Oswego, New York. This problem is being addressed through the binational Niagara River Toxics Management Plan. Some mirex is modified and transformed in the environment into a similar compound called photomirex. The behaviour of mirex and photomirex in the aquatic environment is similar to that of PCBs in that they remain in the environment for a long period of time and have a high affinity for fats.

Separate consumption guidelines have been developed by Health Canada for mirex and photomirex. Consumption restrictions for mirex in sport fish begin at 0.082 parts per million with total restriction advised for levels above 0.657 parts per million. Photomirex consumption restrictions begin at 0.015 parts per million with total restriction advised for levels above 0.122 parts per million.

Pesticides

DDT

DDT, which was developed during World War II, gained widespread use as an insecticide for agricultural and public health purposes. DDT, like PCBs and mirex, is only slowly broken down in the natural environment.

However, levels of this substance in fish flesh have declined in the three decades since the use of DDT was severely restricted and today there are no cases where DDT is a consumption-limiting contaminant.

Toxaphene

Toxaphene is an insecticide that is extremely persistent in the aquatic environment. It was removed from general use in Canada in 1974 and restricted in the United States in 1982.

Consumption restrictions for sport fish containing toxaphene begin at levels above 0.235 parts per million, with total restriction advised at levels above 1.877 parts per million.

Toxaphene is found at levels which restrict the consumption of sport fish from Lake Superior and some parts of northern Lake Huron.

Other pesticides

As part of the Sport Fish Contaminant Monitoring Program, a number of pesticides and other chlorinated organic compounds used widely in the past throughout North America are routinely analyzed. These substances are lindane, heptachlor, aldrin, and chlordane. In Ontario they have not been detected at levels which would require any restrictions on the consumption of fish.

Other contaminants

The Sport Fish Contaminant Monitoring Program tests for all known substances for which there is a reasonable probability that levels of the substance are of concern to the health of consumers. The chlorinated organic compounds hexachlorobenzene and octachlorostyrene have been tested in sport fish since the early 1980s. Other substances added to the list in recent years include chlorinated phenols, chlorinated benzenes and polycyclic aromatic hydrocarbons (PAHs). Based on the results, these substances are only found occasionally in fish and at such low levels that they would not affect consumption.

Recently, the Ministry of the Environment laboratory has developed the methods

to analyse the levels of brominated flame retardants, fluorinated surfactants, polychlorinated naphthalenes and dioxin-like PCBs in fish.

Causes of fish consumption advisories

Although fish from many locations listed in the *Guide* have been tested for a wide variety of contaminants, most of the consumption restrictions are caused by four contaminants or groups of contaminants. The four contaminants are mercury, PCBs, toxaphene and dioxins (including furans and dioxin-like PCBs). Mirex/photomirex remains elevated in some Lake Ontario fish, but with recent changes to Health Canada guidelines for PCBs and dioxins, it is no longer a consumption-limiting contaminant.

The pie charts following illustrate the percentage of the consumption restrictions caused by each of the contaminants in the four Ontario Great Lakes and their connecting channels and inland locations. These statistics are for the general population. The sensitive population has a higher percentage of restrictions caused by mercury.

Lake Superior

Consumption restrictions on lake trout, whitefish and chinook salmon are usually caused by dioxins, PCBs, and toxaphene, while consumption restrictions on northern pike and walleye are caused by mercury. In total, 36.8 per cent of the advice given for sport fish from Lake Superior results in some level of consumption restriction.

Lake Huron (including Georgian Bay, North Channel and St. Marys River)

Generally, the restrictions on trout, salmon, carp and channel catfish are caused by dioxins and PCBs. The restrictions on other species are usually caused by mercury. In total, 41.1 per cent of the advice given for sport fish from Lake Huron results in some level of consumption restriction.

Lake St. Clair and St. Clair and Detroit rivers

In total, 36.6 per cent of the advice given for sport fish from these locations results in some level of consumption restriction.

Lake Erie

In total, 50.0 per cent of the advice given for sport fish from Lake Erie results in some level of consumption restriction. The majority of consumption restrictions are due to PCBs.

Lake Ontario (including Niagara and St. Lawrence rivers)

In the various species of trout and salmon found in Lake Ontario, PCBs, mirex/photomirex, and dioxins often occur together in the same fish at levels that restrict consumption. In the majority of cases, PCBs are the consumption-limiting contaminant. Consumption of species such as walleye, pike, bass and perch is usually restricted because of mercury. In total, 57.3 per cent of the advice given for sport fish from Lake Ontario results in some level of consumption restriction.

Inland locations

Very few inland locations have been exposed to discharges of pesticides and other organic compounds which cause the majority of consumption restrictions on Great Lakes fish. Consequently, 92.6 per cent of all consumption restrictions on sport fish from inland locations are as a result of mercury. In total, 31.9 per cent of the advice given for sport fish from inland locations results in some level of consumption restriction.

The History of Sport Fish Contaminant Monitoring in Ontario

The deaths of 90 people in Minamata, Japan between 1954 and 1965 from the consumption of fish contaminated with methylmercury, and reproductive failure and deformities in fish-eating wildlife from the combined effects of mercury, PCBs, DDT and other pesticides in North America and elsewhere, awakened us to the potential threat of contaminants in the fish we eat.

In the 1960s in Ontario, several industries were discharging large quantities of mercury into the environment. Forty years of the manufacture, widespread use and inappropriate disposal of PCBs and the widespread application of persistent pesticides such as DDT, aldrin and dieldrin was taking a toll on fish and wildlife, especially in and around the Great Lakes.

Studies undertaken in the 1960s in two areas – Lake St. Clair in southern Ontario and the English-Wabigoon River system in northwestern Ontario – found disturbingly high levels of mercury in fish. Commercial fisheries in these areas were immediately closed. Since that time, direct discharges of mercury from major industrial sources have been virtually eliminated. Other studies in the 1960s and early 1970s found high levels of contaminants such as PCBs and DDT in fish. Action was immediately taken to ban or severely restrict the use of contaminants such as DDT, PCBs, toxaphene, aldrin and mirex. Investigations continue to this day to track down and eliminate the residual sources of some of these chemicals.

Despite ongoing activities to eliminate residual sources of these chemicals, it was apparent that immediate action had to be taken to protect human health. The public needed to be informed of the health risks of consuming sport fish.

In 1976, the Sport Fish Contaminant Monitoring Program was formed. In 1977, the first edition of the *Guide* was published and consisted of a brochure listing the 170 locations where data had been collected. Consumption advisories for individual water bodies were mailed out on request. By 1979, the database had grown considerably and the annual *Guide* consisted of data from over 600 locations. It was distributed widely through government offices and beer and liquor stores.

Starting in 1993, the *Guide* was published every other year and since then, to meet growing demand, production has been increased from 200,000 to 350,000 copies. In this, the 23rd edition of the *Guide*, consumption advisories are available for over 1700 locations and the contaminant database consists of nearly 1.5 million records.

As the program has grown, so has the list of contaminants monitored in fish. The list now includes contaminants such as dioxins, furans, polycyclic aromatic hydrocarbons as well as more recent contaminants of concern such as brominated flame retardants. This latter group has been increasing in the aquatic environment but has not reached critical levels in fish. However, monitoring such contaminants in fish and in other parts of the environment has resulted in measures being taken to control their manufacture and use in North America and Europe. Despite the fact that fish are being tested for more and more contaminants, consumption advisories continue to be caused by the same chemicals – mercury, PCBs, toxaphene, mirex/photomirex and dioxins. Many of the new chemicals on the market, especially pesticides, tend to break down rapidly in the environment and do not bioaccumulate.

Over time, methods used to calculate consumption advisories have changed. Originally, advisories for most contaminants were based on limits imposed on commercial

fish. For example, when the *Guide* was first published, the PCB limit on fish for sale was 2 parts per million. This limit was also applied to sport fish. Eventually, the health protection guidelines developed by Health Canada were used. These guidelines are usually referred to as “tolerable daily intakes” which are the amounts of contaminants that can be safely consumed on a daily basis for a lifetime, with reasonable assurance that an individual’s health will not be threatened. These methods are described in some detail in the section “The basis for fish consumption advisories.”

Over the years most health protection guidelines have been revised, usually downwards. Revisions result from toxicological investigations becoming far more sophisticated in identifying both subtle and low probability effects. As well, analytical equipment and technology has improved so smaller amounts can be detected and quantified. Many people have expressed concern that what was acceptable for consumption last year is unacceptable this year. However, safety margins built into the fish consumption guidelines should alleviate this concern.

We expect that the *Guide* will continue to change in the future to incorporate new health protection guidelines and new methods of evaluation so that we can continue to provide the best available advice to the public.

A message from the Ontario Provincial Police and the Canadian Coast Guard on Boating Safety

Did you know that, when it comes to recreational boating fatalities, anglers are among the most at risk groups in Canada?

The two most common factors in boating deaths are failure to use life jackets and alcohol consumption.

Responsible fishing includes knowing and following Ontario’s rules for boating and liquor consumption. For more information contact your local Ontario Provincial Police detachment.

Ontario has safety regulations concerning the age of the operator and boat horsepower, as well as proof of competency requirements. To find out more about these regulations contact the Canadian Coast Guard at 1-800-267-6687, or visit their Web site at www.ccg-gcc.gc.ca

Fish Consumption Tables

Tableaux de consommation des poissons

An index of the locations listed in these tables is found on page 244.

Voir la liste des emplacements à la page 244.

Fish Identification

The consumption advice provided in the Guide is related to specific species of fish and, in order to use the information properly, it is important to correctly identify the species of fish caught.

On the following pages are illustrations of the species of fish most commonly caught in Ontario. Accompanying each illustration is a description of characteristics of the species that will aid in its identification (Scott, W. B. and E. J. Crossman. 1998. *Freshwater Fishes of Canada*. Galt House Publications Ltd. 966 pages). The length represents the typical range for the species in Ontario waters, although much larger specimens may be caught as indicated by the Ontario record. Features can be used to separate a species from similar species. Additional information on habitat and spawning is provided to assist in confirming the identification.

The fish illustrations are from several sources. We would like to thank the following individuals and organizations for allowing us to reproduce these illustrations: Acart Communications and Department of Fisheries and Oceans Canada – Goldeye, Lake Sturgeon, White Perch; Curtis Atwater – Bluegill, Bowfin, Brown Trout, Rainbow Trout, White Crappie; Department of Environmental Conservation, New York State – American Eel, Round Whitefish; Ohio Department of Natural Resources, Division of Wildlife – Freshwater Drum, Sauger; Royal Ontario Museum – Mooneye; Ted Walke, Pennsylvania Fish and Boat Commission – Redhorse Sucker; and Ministry of Natural Resources – all remaining illustrations.

Identification des poissons

Les mises en garde relatives à la consommation de ce guide concernent des espèces précises de poissons. Pour que les données soient utiles, il est donc important d'identifier correctement l'espèce des poissons capturés.

Les pages suivantes montrent des espèces de poissons qui sont couramment pêchés en Ontario. Les caractéristiques de chaque espèce sont précisées pour faciliter l'identification des poissons (Scott, W. B. et E. J. Crossman. 1998. *Freshwater Fishes of Canada*. Galt House Publications Ltd. 966 pages). La longueur des poissons représente la longueur moyenne de l'espèce dans les eaux ontariennes, bien qu'il existe des spécimens beaucoup plus gros, comme l'indiquent les annales de pêches de l'Ontario. Les caractéristiques servent à séparer deux espèces similaires. D'autres renseignements sur l'habitat et le frai sont fournis pour faciliter l'identification des poissons.

Les illustrations proviennent de plusieurs sources. Nous souhaitons remercier les personnes et les organisations suivantes de nous avoir permis de reproduire ces illustrations : Acart Communications et Pêches et Océans Canada – laquaiche aux yeux d'or, esturgeon de lac, baret; Curtis Atwater – crapet arlequin, poisson-castor, truite brune, truite arc-en-ciel, marigane blanche; Département de la conservation environnementale, État de New York – anguille d'Amérique, ménomini rond; Département des ressources naturelles de l'Ohio, division de la faune – malachigan, doré noir; Musée royal de l'Ontario – laquaiche argentée; Ted Walke, Pennsylvania Fish and Boat Commission – suceur rouge; et ministère des Richesses naturelles – toutes les autres illustrations.

Walleye (Pickerel, Pike-perch)
Doré (doré jaune, doré commun)

Length/longueur : 25-85 cm (10-33 in/po)
Record (Ontario) : 92.7 cm/10.1 kg
36.5 in/po/22.25 lbs

Features: elongated body;
many sharp teeth and large
opaque eyes; white tip on
lower part of tail fin; no
distinct blotches or bands on bodies of adults

Similar Species: Sauger, Yellow Perch

Habitat: prefers large, shallow, turbid lakes

Spawning: spring in rivers and gravelly shoals of lakes

Caractéristiques : corps allongé; nombreuses dents pointues et grands yeux
opaques; nageoire caudale à extrémité blanche dans la partie inférieure; pas de
taches ou bandes distinctives sur le corps des adultes

Espèces semblables : doré noir, perchaude

Habitat : préfère les grands lacs peu profonds aux eaux troubles

Zone de frai : fraie au printemps dans les rivières et les hauts-fonds de gravier
des lacs

Sauger
Doré noir

Length/longueur : 25-41 cm (10-16 in/po)
Record (Ontario) : 56.4 cm/2.0 kg
22.2 in/po/4.4 lbs

Features: elongated body;
many sharp teeth and large
opaque eyes; no white tip
on tail fin; distinct blotches or bands on
body of adults; spots on dorsal fin

Northern Pike (Great Northern Pike, Jackfish)
Brochet (grand brochet)

Length/longueur : 45-100 cm (18-39 in/po)
Record (Ontario) : 19.1 kg/42.12 lbs

Features: long, dark
green body with white or
yellowish oval spots; ten pores on the
undersides of lower jaw

Similar Species: Muskellunge

Habitat: prefers quiet, shallow, vegetated waters

Spawning: spring on heavily vegetated floodplains of rivers, marshes and lakes

Caractéristiques : long corps vert foncé avec taches ovales blanches ou jaunâtres;
dix pores sous la mâchoire inférieure

Espèces semblables : maskinongé

Habitat : préfère les eaux calmes, peu profondes avec de la végétation

Zone de frai : fraie au printemps dans les plaines d'inondation de rivières, de marais
et de lacs comportant beaucoup de végétation

Muskellunge (Musky, Lunge, Maskinonge)
Maskinongé

Length/longueur : 71-117 cm (28-46 in/po)
Record (Ontario) : 147.3 cm/29.5 kg
58.0 in/po/65.0 lbs

Features: long, light coloured
body with dark vertical bands or
spotting; twelve to eighteen pores on the
undersides of lower jaw

Similar Species: Northern Pike

Habitat: prefers quiet, shallow, vegetated waters

Spawning: spring on heavily vegetated floodplains of rivers, marshes and lakes

Similar Species: Walleye, Yellow Perch

Habitat: prefers large, shallow, turbid lakes

Spawning: spawns in spring in rivers and gravelly shoals of lakes

Caractéristiques : corps allongé; nombreuses dents pointues et grands yeux opaques; pas d'extrémité blanche sur la partie inférieure de la nageoire caudale; taches ou bandes distinctives sur le corps des adultes; taches sur la nageoire dorsale

Espèces semblables : doré, perchaude

Habitat : préfère les grands lacs peu profonds aux eaux troubles

Zone de frai : fraie au printemps dans les rivières et les hauts-fonds de gravier des lacs

Yellow Perch

Perchaude

Length/longueur : 15-30 cm (6-12 in/po)

Record (Ontario) : 38.4 cm/1.1 kg

15.1 in/po/2.42 lbs

Features: dark back with yellow sides; vertical bands of green and yellow on sides

Similar Species: Walleye, Sauger, White Perch

Habitat: prefers clear, vegetated lakes and rivers

Spawning: spring in shallows of lakes and rivers usually near rooted vegetation or submerged brush

Caractéristiques : dos noir et flancs jaunes; bandes verticales vertes et jaunes sur les flancs

Espèces semblables : doré, doré noir, baret

Habitat : préfère les lacs et rivières claires avec de la végétation

Zone de frai : fraie au printemps dans les parties peu profondes des lacs et rivières, habituellement près de végétation enracinée ou de broussailles submergées

Caractéristiques : long corps de couleur claire avec des bandes verticales ou taches sombres; de douze à dix-huit pores sous la mâchoire inférieure

Espèces semblables : brochet

Habitat : préfère les eaux calmes, peu profondes avec de la végétation

Zone de frai : fraie au printemps dans les plaines d'inondation de rivières, de marais et de lacs comportant beaucoup de végétation

Smallmouth Bass (Black Bass, Bronzeback)

Achigan à petite bouche

Length/longueur : 25-50 cm (10-20 in/po)

Record (Ontario) : 61.0 cm/4.5 kg

24.0 in/po/9.84 lbs

Features: dark green to golden body with dark vertical bars; upper jaw does not extend beyond eye

Similar Species: Largemouth Bass, Rock Bass

Habitat: clear, rocky waters with little vegetation

Spawning: late spring and early summer over sand, gravel and rocky substrate in shallow water

Caractéristiques : corps sombre de vert à doré avec barres verticales sombres; la mâchoire supérieure ne dépasse pas le niveau de l'oeil

Espèces semblables : achigan à grande bouche, crapet de roche

Habitat : eaux claires et rocheuses avec peu de végétation

Zone de frai : fraie à la fin du printemps et au début de l'été dans l'eau peu profonde sur du sable, du gravier et du substrat rocheux

Largemouth Bass (Black Bass, Green Bass, Bucketmouth)
Achigan à grande bouche

Length/longueur : 25-55 cm (10-22 in/po)
Record (Ontario) : 55.9 cm/4.7 kg
22.0 in/po/10.43 lbs

Features: green body with horizontal black band;
upper jaw extends beyond eye

Similar Species: Smallmouth Bass, Rock Bass

Habitat: warm, weedy and shallow waters often near cover

Spawning: late spring and early summer over mud, sand and gravel in shallow water

Caractéristiques : corps vert avec une bande noire horizontale; la mâchoire supérieure dépasse le niveau de l'œil

Espèces semblables : achigan à petite bouche, crapet de roche

Habitat : eaux chaudes, peu profondes avec des herbes souvent près des arbres

Zone de frai : fraie à la fin du printemps et au début de l'été dans de l'eau peu profonde, sur de la vase, du sable et du gravier

Rock Bass (Redeye)
Crapet de roche

Length/longueur : 15-20 cm (6-8 in/po)
Record (Ontario) : 1.4 kg/3.0 lbs

Features: olive, golden brown body with rows of dark spots; dark bars or blotches on sides; large, red eye

Similar Species: Black Crappie, Pumpkinseed, Bluegill

Habitat: warm, shallow waters with rocky bottoms

Spawning: late spring and early summer over mud, sand and gravel in shallow water

Caractéristiques : corps olive brun doré avec des rangées de taches sombres; barres sombres ou taches sur les flancs, grands yeux rouges

Espèces semblables : marigane noire, crapet-soleil, crapet arlequin

Habitat : eaux chaudes peu profondes à fond rocheux

Zone de frai : fraie à la fin du printemps et au début de l'été dans de l'eau peu profonde, sur de la vase, du sable et du gravier

Coho Salmon (Silver Salmon, Blue-back)
Saumon coho (coho)

Length/longueur : 30-75 cm (12-30 in/po)
Record (Ontario) : 106.7 cm/13.0 kg
42.0 in/po/28.64 lbs

Features: dark mouth, whitish gums;
spots on upper part of tail

Similar Species: Chinook Salmon,
Pink Salmon, Atlantic Salmon, Rainbow Trout, Brown Trout

Habitat: depths of 10-60 m, near shore and rivers in late summer and fall

Spawning: swims up rivers to spawn in fall on gravel beds; dies after spawning

Caractéristiques : bouche foncée, gencives blanchâtres, taches sur une partie de la queue

Espèces semblables : saumon quinnat, saumon rose, saumon de l'Atlantique, truite arc-en-ciel, truite brune

Habitat : profondeur de 10-60 m, près des rives et dans les rivières à la fin de l'été et à l'automne

Zone de frai : remonte les rivières pour frayer à l'automne sur des lits de gravier; meurt après le frai

Atlantic Salmon
Saumon de l'Atlantique

Length/longueur : 25-70 cm (10-28 in/po)
Record (Ontario) : 88.9 cm/11.0 kg
35.0 in/po/24.3 lbs

Features: white mouth and gums;
a few large black spots on gill cover and back; no spots on tail

Similar Species: Chinook Salmon, Coho Salmon, Pink Salmon,
Rainbow Trout, Brown Trout

Habitat: deep offshore waters, near shore and rivers in late summer and fall

Spawning: may enter rivers in summer; spawns in fall on gravel beds

Chinook Salmon (King Salmon)**Saumon quinnat (saumon chinook, saumon royal, saumon du Pacifique)**

Length/longueur : 30-100 cm (12-39 in/po)**Record (Ontario) :** 119.4 cm/21.0 kg
47.0 in/po/46.38 lbs**Features:** black mouth lining and
black gums; tail entirely spotted**Similar Species:** Coho Salmon, Pink Salmon,
Atlantic Salmon, Rainbow Trout, Brown Trout**Habitat:** depths of 10-60 m, near shore and rivers in late summer and fall**Spawning:** swims up rivers to spawn in fall on gravel beds; dies after spawning**Caractéristiques :** intérieur de la bouche et gencives noirs; queue entièrement tachetée**Espèces semblables :** saumon coho, saumon rose, saumon de l'Atlantique,
truite arc-en-ciel, truite brune**Habitat :** profondeur de 10-60 m, près des rives et dans les rivières à la fin de l'été et
à l'automne**Zone de frai :** remonte les rivières pour frayer à l'automne sur des lits de gravier;
meurt après le frai**Caractéristiques :** bouche et gencives blanches, quelques grosses taches noires sur
les branchies et le dos; pas de taches sur la queue**Espèces semblables :** saumon quinnat, saumon coho, saumon rose,
truite arc-en-ciel, truite brune**Habitat :** eau profonde du large, près des rives et dans les rivières à la fin de l'été
et à l'automne**Zone de frai :** peut pénétrer dans les rivières en été; fraie à l'automne sur des lits
de gravier

Pink Salmon**Saumon rose**

Length/longueur : 36-46 cm (14-18 in/po)**Record (Ontario) :** 83.0 cm/5.9 kg
32.7 in/po/
13.06 lbs.**Features:** large black spots on back and
tail, but not on dorsal fin; forked tail**Similar Species:** Chinook Salmon, Coho
Salmon, Atlantic Salmon, Rainbow Trout, Brown Trout**Habitat:** deep offshore waters, near shore and rivers in late summer and fall**Spawning:** swims up rivers to spawn in fall on gravel beds; dies after spawning**Caractéristiques :** grosses taches sur le dos et la queue mais pas sur la nageoire
dorsale; queue fourchue**Espèces semblables :** saumon quinnat, saumon coho, saumon de l'Atlantique,
truite arc-en-ciel, truite brune**Habitat :** eau profonde du large, près des rives et dans les rivières à la fin de l'été
et à l'automne**Zone de frai :** remonte les rivières pour frayer à l'automne sur des lits de gravier;
meurt après le frai

Rainbow Trout (Steelhead)
Truite arc-en-ciel (saumon arc-en-ciel)

Length/longueur : 15-75 cm (6-30 in/po)
Record (Ontario) : 97.8 cm/13.2 kg
38.5 in/po/
29.12 lbs

Features: heavily spotted on sides as well as dorsal fin and tail; Great Lakes fish usually silver; pink lateral stripe on spawning fish and inland fish
Similar Species: Chinook Salmon, Coho Salmon, Pink Salmon, Atlantic Salmon, Brown Trout
Habitat: deep offshore waters, near shore and rivers in fall and spring
Spawning: may enter rivers in fall; spawns in spring on gravel beds

Caractéristiques : beaucoup de taches sur les côtés ainsi que sur la nageoire dorsale et la queue; poisson des Grands Lacs habituellement argenté; bande latérale rose sur les poissons en frai et des plans d'eau intérieurs
Espèces semblables : saumon quinnat, saumon coho, saumon rose, saumon de l'Atlantique, truite brune
Habitat : eau profonde du large, près des rives et dans les rivières à l'automne et au printemps
Zone de frai : peut pénétrer dans les rivières à l'automne; fraie au printemps sur des lits de gravier

Lake Trout (Grey Trout, Mackinaw Trout)
Touladi, Truite de lac

Length/longueur : 30-80 cm (12-31 in/po)
Record (Ontario) : 130.8 cm/28.6 kg
51.5 in/po/63.12 lbs

Features: dark body with light spots and markings (none red); deeply forked tail; leading edge of lower fins often white, but no black line
Similar Species: Brook Trout, Rainbow Trout, Brown Trout

Brook Trout (Speckled Trout)
Omble de fontaine (truite mouchetée, truite de ruisseau, truite saumonée)

Length/longueur : 15-40 cm (6-16 in/po)
Record (Ontario) : 80.0 cm/6.6 kg
31.5 in/po/14.5 lbs

Features: light wormlike markings and spots, some red and blue, on a dark body; square tail; leading edge of lower fins white, set off by black line
Similar Species: Lake Trout, Rainbow Trout, Brown Trout
Habitat: cold, clear, well-oxygenated streams and lakes
Spawning: fall on gravel beds in streams

Caractéristiques : marques vermiformes et taches claires rouges et bleues sur un corps sombre; queue carrée; nageoires inférieures à bord blanc et striées de lignes noires
Espèces semblables : touladi, truite arc-en-ciel, truite brune
Habitat : cours d'eau et lacs où l'eau est froide, claire et bien oxygénée
Zone de frai : fraie à l'automne sur des lits de gravier dans les cours d'eau

Lake Whitefish
Grand corégone (poisson blanc, pointu)

Length/longueur : 30-65 cm (12-26 in/po)
Record (Ontario) : 74.9 cm/6.7 kg
29.5 in/po/14.77 lbs

Features: overall colouration silvery; mouth overhung by snout
Similar Species: Lake Herring, Round Whitefish
Habitat: cold waters of deep lakes
Spawning: fall on rocky shoals and occasionally in rivers

Caractéristiques : couleur argentée; bouche sous le museau
Espèces semblables : cisco, ménomini rond

Habitat: cold waters of deep lakes
Spawning: spawns in fall on lake shoals

Caractéristiques : corps foncé avec des taches et des marques claires (aucune rouge); queue très fourchue; bord des nageoires inférieures souvent blanc mais pas de ligne noire

Espèces semblables : omble de fontaine, truite arc-en-ciel, truite brune

Habitat : eaux froides des lacs profonds

Zone de frai : fraie à l'automne sur les hauts-fonds

Brown Trout

Truite brune

Length/longueur : 15-65 cm (6-26 in/po)

Record (Ontario) : 96.5 cm/15.6 kg

38.0 in/po/34.38 lbs

Features: golden brown body with dark

spots, often surrounded by lighter ring;

may also have red spots; orange adipose fin; Great Lakes fish usually silver

Similar Species: Chinook Salmon, Coho Salmon, Pink Salmon,

Atlantic Salmon, Rainbow Trout, Brook Trout

Habitat: deep offshore waters, near shore and rivers in fall and spring

Spawning: fall on gravel beds in streams

Caractéristiques : corps brun doré avec des taches foncées souvent entourées d'un anneau plus clair; peut avoir des taches rouges; nageoire adipeuse orange; les poissons des Grands Lacs sont habituellement argentés

Espèces semblables : saumon quinnat, saumon coho, saumon rose, saumon de l'Atlantique, truite arc-en-ciel, omble de fontaine

Habitat : eau profonde du large, près des rives et dans les rivières à l'automne et au printemps

Zone de frai : fraie à l'automne sur des lits de gravier dans les cours d'eau

Habitat : eaux froides des lacs profonds

Zone de frai : fraie à l'automne sur les hauts-fonds rocheux et à l'occasion dans les rivières

Lake Herring (Cisco)

Cisco de lac (cisco)

Length/longueur : 20-30 cm (8-12 in/po)

Record (Ontario) : 59.7 cm/1.9 kg

23.5 in/po/4.33 lbs

Features: overall colouration silvery; mouth not overhung by snout

Similar Species: Lake Whitefish, Round Whitefish, Rainbow Smelt

Habitat: cold waters of deep lakes

Spawning: fall on gravel or rocky shoals

Caractéristiques : couleur argentée; bouche au bout du museau

Espèces semblables : corégone, ménomini rond, éperlan arc-en-ciel

Habitat : eaux froides des lacs profonds

Zone de frai : fraie à l'automne sur les hauts-fonds de gravier ou rocheux

Round Whitefish (Menominee)
Ménomini rond (ménomini d'Amérique)

Length/longueur : 20-40 cm (8-16 in/po)
Record (Ontario) : none reported/
aucun déclaré

Features: overall colouration silvery; mouth overhung by snout; body slender and cylindrical
Similar Species: Lake Whitefish, Lake Herring
Habitat: cold waters of deep lakes
Spawning: fall in gravelly shallows and occasionally in rivers

Caractéristiques : couleur argentée; bouche sous le museau; corps mince et cylindrique
Espèces semblables : corégone, cisco
Habitat : eaux froides des lacs profonds
Zone de frai : fraie à l'automne sur les hauts-fonds rocheux et à l'occasion dans les rivières

White Sucker (Common Sucker, Mullet)
Meunier noir (castotome noir, carpe noire)

Length/longueur : 30-50 cm (12-20 in/po)
Record (Ontario) : 57.9 cm/2.4 kg
22.8 in/po/5.39 lbs

Features: dark gold to brown back with silvery sides; overhanging, thick lipped mouth; torpedo shaped
Similar Species: Redhorse Sucker
Habitat: warm, shallow bays of lakes and rivers
Spawning: spring in gravelly streams and rivers

Caractéristiques : dos doré foncé à brun et flancs argentés; bouche à lèvres épaisses sous la tête; en forme de torpille
Espèces semblables : suceur rouge
Habitat : baies chaudes et peu profondes de lacs et rivières
Zone de frai : fraie au printemps dans des cours d'eau et rivières tapissés de gravier

Brown Bullhead (Common Catfish, Mudcat, Mudpout)
Barbotte brune (poisson-chat)

Length/longueur : 20-36 cm (8-14 in/po)
Record (Ontario) : 41.6 cm/1.1 kg
16.4 in/po/2.37 lbs

Features: body coloured yellow-brown, olive, grey to almost black; square tail
Similar Species: Channel Catfish
Habitat: prefer warm, shallow water near mud and sandy bottoms with abundant aquatic vegetation
Spawning: late spring and summer in mud, sand or roots of aquatic vegetation

Caractéristiques : corps jaune-brun, olive, gris pouvant presque aller au noir; queue carrée
Espèces semblables : barbu de rivière
Habitat : préfère les eaux chaudes et peu profondes aux fonds vaseux et sablonneux avec beaucoup de végétation aquatique
Zone de frai : fraie à la fin du printemps et en été dans de la vase, du sable ou les racines de la végétation aquatique

Carp
Carpe

Length/longueur : 30-75 cm (12-30 in/po)
Record (Ontario) : 99.1 cm/17.5 kg
39.0 in/po/38.46 lbs

Features: olive-green to yellowish body with very large scales; barbels on each side of the mouth
Similar Species: Freshwater Drum
Habitat: prefers shallow, warm, heavily vegetated water bodies
Spawning: spring and early summer in weedy or grassy shallows

Redhorse Sucker
Suceur rouge

Length/longueur : 30-45 cm (12-18 in(po))

Record (Ontario) : 77.5 cm/4.7 kg
30.5 in(po)/10.25 lbs

Features: several species in Ontario; generally bronze to olive-green body with large scales; fins red on some species

Similar Species: White Sucker

Habitat: often found in streams and rivers with sand and gravel bottoms

Spawning: spring and summer in gravelly streams and rivers

Caractéristiques : plusieurs espèces en Ontario; corps généralement bronze à olive avec de grandes écailles; nageoires rouges chez certaines espèces

Espèces semblables : meunier noir

Habitat : souvent dans les cours d'eau et rivières au fond sablonneux et de gravier

Zone de frai : fraie au printemps et en été dans des cours d'eau et rivières au fond de gravier

Channel Catfish
Barbue de rivière

Length/longueur : 36-53 cm (14-21 in(po))

Record (Ontario) : 88.9 cm/13.2 kg
35.0 in(po)/29.0 lbs

Features: body coloured from olive, slate-grey to steely blue; deeply forked tail

Similar Species: Brown Bullhead

Habitat: prefers cool, clear, deeper water with sand, gravel or rubble bottoms

Spawning: late spring and summer in holes, undercut banks, log jams or rocks

Caractéristiques : corps de couleur allant de l'olive, au gris ardoise en passant par le bleu acier; queue très fourchue

Espèces semblables : barbotte brune

Habitat : préfère les eaux fraîches, claires et profondes au fond sablonneux, de gravier ou rocaillieux

Zone de frai : fraie à la fin du printemps et en été dans des trous, des enfoncements de bancs, des embâcles de billes de bois ou des rochers

Caractéristiques : corps vert olive à jaunâtre avec de très grosses écailles; barbillons de chaque côté de la bouche

Espèces semblables : malachigan

Habitat : préfère les eaux peu profondes, chaudes avec beaucoup de végétation

Zone de frai : fraie au printemps et au début de l'été dans de l'eau herbeuse

White Bass (Silver Bass)
Bar blanc

Length/longueur : 20-30 cm (8-12 in(po))

Record (Ontario) : 1.3 kg/2.87 lbs

Features: silvery coloured body with dark spots in horizontal lines; two dorsal fins not connected

Similar Species: White Perch

Habitat: prefers clear, cool water with gravel and rock shoals

Spawning: spring on shoals and in river mouths

Caractéristiques : corps argenté avec des taches sombres en lignes horizontales; deux nageoires dorsales non reliées

Espèces semblables : baret

Habitat : préfère les eaux claires et fraîches avec des hauts-fonds de gravier et de roche

Zone de frai : fraie au printemps dans les hauts-fonds et à l'embouchure des rivières

White Perch (Silver Perch)**Baret**

Length/longueur : 15-25 cm (6-10 in/po)

Record (Ontario) : 38.4 cm/1.1 kg

15.1 in/po/2.42 lbs

Features: silvery green to pale olive sides with darker back; often with a bluish lustre on the head and lower jaw; two dorsal fins connected by a thin membrane

Similar Species: White Bass, Yellow Perch

Habitat: prefers warm waters of varying habitats

Spawning: spring in shallow water

Caractéristiques : flancs vert argenté à olive clair et dos noir; souvent avec un lustre bleuâtre sur la tête et la mâchoire inférieure; deux nageoires dorsales reliées par une mince membrane

Espèces semblables : bar blanc, perchaude

Habitat : préfère les eaux chaudes d'habitats divers

Zone de frai : fraie au printemps dans de l'eau peu profonde

Freshwater Drum (Sheepshead)**Malachigan (tambour)**

Length/longueur : 45-50 cm (18-20 in/po)

Record (Ontario) : 78.7 cm/9.3 kg

31.0 in/po/20.6 lbs

Features: silvery coloured sides with a dark green or olive back; tail slightly rounded; small mouth overhung by blunt snout

Similar Species: Carp

Habitat: prefers large, shallow water bodies

Spawning: spring and early summer

Black Crappie (Calico Bass, Crawpie)**Marigane noire**

Length/longueur : 18-25 cm (7-10 in/po)

Record (Ontario) : 43.2 cm/1.7 kg

17.0 in/po/3.78 lbs

Features: silvery coloured sides with dark irregular spots and blotches; dark green back

Similar Species: White Crappie, Rock Bass

Habitat: clear, quiet, warm water areas of lakes and slow flowing rivers with abundant vegetation

Spawning: late spring and early summer over mud, sand or gravel in shallow water where there is some vegetation

Caractéristiques : flancs argentés avec des taches sombres irrégulières; dos vert foncé

Espèces semblables : marigane blanche, crapet de roche

Habitat : eaux claires, calmes et chaudes des lacs et de rivières coulant doucement et ayant une végétation abondante

Zone de frai : fraie à la fin du printemps et au début de l'été sur de la vase, du sable ou du gravier dans de l'eau peu profonde où il y a un peu de végétation

Pumpkinseed (Common Sunfish, Sunny)**Crapet-soleil**

Length/longueur : 18-23 cm (7-9 in/po)

Record (Ontario) : 25.4 cm/0.5 kg

10.0 in/po/1.0 lbs

Features: golden brown body with spots of olive, orange or red; lower sides of head and body with irregular, wavy, blue-green lines; red or orange spot on posterior edge of gill cover

Similar Species: Bluegill, Rock Bass

Habitat: clear, shallow, weedy waters

Spawning: late spring and early summer over clay, sand, gravel or rock in shallow water

Caractéristiques : flancs argentés et dos vert foncé ou olive; queue légèrement arrondie; petite bouche surplombée par un museau pointu

Espèces semblables : carpe

Habitat : préfère les grands plans d'eau peu profonds

Zone de frai : fraie au printemps et au début de l'été

White Crappie (Crawpie)

Marigane blanche

Length/longueur : 20-30 cm (8-12 in/po)

Record (Ontario) : 39.1 cm/1.2 kg

15.4 in/po/2.71 lbs

Features: silvery coloured body with faint, dark, vertical bands; dorsal, anal and tail fins with rows of black spots

Similar Species: Black Crappie, Rock Bass

Habitat: warm, weedy, sheltered bays; often in silted streams, lakes and ponds

Spawning: late spring and early summer over mud, sand or gravel in shallow water where there is some vegetation

Caractéristiques : corps argenté avec de légères bandes verticales sombres; nageoires dorsale, anale et caudale comportant des rangées de taches noires

Espèces semblables : marigane noire, crapet de roche

Habitat : baies chaudes et abritées comportant de la végétation; souvent dans les cours d'eau, lacs et étangs limoneux

Zone de frai : fraie à la fin du printemps et au début de l'été sur de la vase, du sable ou du gravier dans de l'eau peu profonde où il y a un peu de végétation

Caractéristiques : corps brun doré avec des taches olive, orange ou rouges; lignes bleu-vert, ondulées et irrégulières au bas des côtés de la tête et du corps; taches

rouges ou orange à l'extrémité postérieure des branchies

Espèces semblables : crapet arlequin, crapet de roche

Habitat : eaux claires, peu profondes et herbeuses

Zone de frai : fraie à la fin du printemps et au début de l'été dans de l'eau peu profonde, sur de l'argile, du sable, du gravier ou de la roche

Bluegill

Crapet arlequin

Length/longueur : 15-30 cm (6-12 in/po)

Record (Ontario) : 28.2 cm/0.8 kg

11.1 in/po/1.83 lbs

Features: green to olive body with faint vertical bands along sides; posterior edge of gill cover dark blue to black; black spot at rear edge of dorsal fin

Similar Species: Pumpkinseed, Rock Bass

Habitat: warm, vegetated, quiet waters

Spawning: late spring and early summer over mud, sand or gravel in shallow water

Caractéristiques : corps vert à olive avec de légères bandes verticales sur les flancs; extrémité postérieure des branchies bleue à noire; taches noires sur le bord postérieur de la nageoire dorsale

Espèces semblables : crapet-soleil, crapet de roche

Habitat : eaux calmes et chaudes avec de la végétation

Zone de frai : fraie à la fin du printemps et au début de l'été dans de l'eau peu profonde sur de la vase, du sable ou du gravier

Goldeye
Laquaiche aux yeux d'or

Length/longueur : 25-38 cm (10-15 in/po)

Record (Ontario) : 37.2 cm/0.5 kg
14.7 in/po/1.19 lbs

Features: bluish-green colouration on back with silvery sides; forward scales have a golden lustre; large eye with bright yellow pupils

Similar Species: Mooneye

Habitat: often found in quiet turbid water of large rivers and the small lakes, ponds and marshes connected to them

Spawning: spring in pools of turbid rivers or in backwater lakes and ponds

Caractéristiques : coloration bleu-gris sur le dos et flancs argentés; les écailles de l'avant ont un lustre doré; grands yeux à pupilles jaune clair

Espèces semblables : laquaiche argentée

Habitat : souvent dans les eaux troubles et calmes des grandes rivières et des petits lacs, étangs et marais connexes

Zone de frai : fraie au printemps dans des bassins de rivières troubles ou dans les bras morts de lacs et d'étangs

Mooneye
Laquaiche argentée

Length/longueur : 25-30 cm (10-12 in/po)

Record (Ontario) : 40.0 cm/0.7 kg
15.7 in/po/1.43 lbs

Features: pale olive to brown colouration on back with silvery sides; faint steel-blue lustre; eyes golden

Similar Species: Goldeye

Habitat: clear rivers and shallow waters of lakes

Spawning: spring in large streams

American Eel (Eel)
Anguille d'Amérique (anguille commune, anguille argentée)

Length/longueur : 60-90 cm (24-36 in/po)

Record (Ontario) : 97.8 cm/2.3 kg
38.5 in/po/5.1 lbs

Features: very long slender body; continuous dorsal, tail and anal fins

Similar Species: Burbot, Bowfin

Habitat: prefer water over muddy, silty bottoms which they often burrow into

Spawning: migrate to the Atlantic Ocean to spawn

Caractéristiques : corps très allongé et mince; nageoires dorsale, caudale et anales continues

Espèces semblables : lotte, poisson-castor

Habitat : préfère les fonds vaseux et limoneux dans lesquels ils s'enfoncent souvent

Zone de frai : migre dans l'océan Atlantique pour frayer

Bowfin (Dogfish)
Poisson-castor

Length/longueur : 46-60 cm (18-24 in/po)

Record (Ontario) : 80.0 cm/6.9 kg
31.5 in/po/15.1 lbs

Features: dark olive coloured body; no barbel on tip of chin; short, deep anal fin

Similar Species: Burbot

Habitat: prefer swampy, vegetated bays of warm lakes and rivers

Spawning: spring in shallow vegetated bays

Caractéristiques : corps olive foncée; pas de barbillon à la pointe du menton; nageoire anale courte et profonde

Espèces semblables : lotte

Habitat : préfère les baies marécageuses des lacs et rivières chauds avec de la végétation

Zone de frai : fraie au printemps dans des baies peu profondes avec de la végétation

Caractéristiques : dos olive clair à brun et flancs argentés; léger lustre bleu acier; yeux dorés

Espèces semblables : laquaiche aux yeux d'or

Habitat : rivières à l'eau claire et eaux peu profondes des lacs

Zone de frai : fraie au printemps dans de grands cours d'eau

**Burbot (Ling, Eelpout, Freshwater Cod)
Lotte (loche)**

Length/longueur : 30-50 cm (12-20 in/po)

Record (Ontario) : 95.3 cm/6.7 kg
37.5 in/po/14.75 lbs

Features: long, brownish body; barbel on tip of chin; long thin anal fin

Similar Species: Bowfin

Habitat: prefer cool waters of lakes and rivers

Spawning: winter under the ice over sand or gravel

Caractéristiques : corps allongé brunâtre; barbillon à la pointe du menton; longue et fine nageoire anale

Espèces semblables : poisson-castor

Habitat : préfère les eaux fraîches des lacs et rivières

Zone de frai : fraie en hiver sous la glace sur du sable ou du gravier

**Lake Sturgeon (Common Sturgeon)
Esturgeon (de lac) (esturgeon jaune)**

Length/longueur : 90-145 cm (36-60 in/po)

Record (Ontario) : 175.3 cm/76.2 kg
69.0 in/po/168.0 lbs

Features: barbels ahead of underslung mouth; bony plates on sides

Similar Species: none

Habitat: shoal areas of large lakes and rivers over mud or gravel

Spawning: spring in swift flowing water over gravel and rocks

Caractéristiques : bouche précédée de barbillons située sous la tête; plaques osseuses sur les flancs

Espèces semblables : aucune

Habitat : hauts-fonds de grands lacs et rivières constitués de vase ou de gravier

Zone de frai : fraie au printemps dans des courants rapides sur du gravier et des roches

**Rainbow Smelt
Éperlan arc-en-ciel**

Length/longueur : 15-25 cm (6-10 in/po)

Record (Ontario) : 27.3 cm/0.2 kg
10.8 in/po/0.33 lbs

Features: slender silvery fish; tongue with prominent teeth

Similar Species: Lake Herring

Habitat: cooler waters of deep lakes

Spawning: spring in streams, off-shore gravel shoals and sandy beaches

Caractéristiques : poisson argenté mince; dents proéminentes

Espèces semblables : cisco

Habitat : eaux fraîches des lacs profonds

Zone de frai : fraie au printemps dans les cours d'eau, les hauts-fonds de gravier du large et les plages sablonneuses

The Lake Simcoe Story: An ecosystem under stress

Lake Simcoe has long been known for its excellent fishery. As early as 1615, Champlain noted that the Huron Indians captured large quantities of fish in the narrows at the north end of the lake. Between 1868 and 1952 the total commercial catch exceeded 2,500 tonnes. During the 20th century, commercial fishing gradually declined, in favour of sport fishing. Ice fishing became increasingly popular and by 1970 it was estimated that there were about 5,000 fishing huts on the ice each winter. Although the near shore waters supported a good sport fishery for species such as yellow perch, the mainstay of the winter fishery was centred on the cold water fish community (depicted in the illustration) consisting of the abundant lake whitefish and lake trout.

In the early 1970s, it became obvious that not all was right with the fishery. Lake whitefish, lake herring and lake trout were still fairly common but their numbers were declining and only larger, older fish were being caught. There was recruitment failure in these three species.

Subsequent investigations suggested that invasive species, persistent toxic contaminants, excessive nutrients or some combination of these three factors may have contributed to the decline of Lake Simcoe's cold-water fish.

During the period when the cold-water fish community was declining, an invasive species, rainbow smelt, was increasing in abundance in the deep waters of Lake Simcoe. Rainbow smelt were introduced to Crystal Lake in Michigan in 1912, rapidly expanded their range and by 1961 reached Lake Simcoe. They are voracious predators of young lake whitefish and lake herring and can have a serious effect on their populations.

Illustration by/Illustration de Curtis Atwater

Lake Simcoe sport fish have been monitored for contaminants since 1967. Generally, contaminant levels in Lake Simcoe sport fish are low, certainly lower than in many water bodies with healthy fish communities. The only exception was the insecticide DDT which was high in fish tissue when monitoring commenced in the late 1960s and early 1970s. High levels of DDT can reduce fish egg viability, but we do not have enough information to determine if concentrations were high enough to impact Lake Simcoe fish. Current levels of DDT and other persistent toxic contaminants should not be adversely affecting Lake Simcoe fish communities.

The third possible reason for the decline of the cold-water fish is late summer oxygen depletion in deep water caused by excessive nutrient inputs. Lake Simcoe is a typical deep water lake. In the late spring, as the surface water temperatures increase, the lake becomes thermally stratified, so that there is little mixing of the warm surface waters and cold deeper waters. Because there is virtually no photosynthesis taking place in the deep water, oxygen is not replenished and levels slowly decline through the summer and into the autumn when surface and bottom waters are the same temperature and complete mixing takes place.

Oxygen depletion results from excessive nutrient inputs with phosphorus usually being the critical nutrient. Increased nutrients cause an increase in the growth of algae and other plant life. The algae and microscopic animals that graze on them eventually die and sink to the deep waters where they decompose, consuming oxygen in the process.

Before there was development in the Lake Simcoe watershed, inputs of phosphorus were about 30 metric tons per year which would have maintained late summer oxygen levels in deep water at 8 parts per million. Inputs of

phosphorus are currently approximately 100 metric tons per year. Oxygen concentrations in late summer are currently only about 3 parts per million, not high enough to sustain a healthy deep water fish community. Efforts are continuing towards reducing phosphorus inputs to 75 metric tons per year and so improve the deep-water habitat of the cold-water fish community.

If you are interested in the work currently being undertaken to improve and protect the health of the Lake Simcoe watershed ecosystem and improve associated recreational opportunities, please visit the Lake Simcoe Environmental Management Strategy website at www.lsems.info.

L'histoire du lac Simcoe – Un écosystème sous pression

Le lac Simcoe est depuis longtemps réputé pour l'excellence de la pêche dans ses eaux. Déjà en 1615, Champlain avait remarqué que les Hurons prenaient de grandes quantités de poissons dans le détroit au nord du lac. Entre 1868 et 1952, les prises commerciales totalisaient plus de 2 500 tonnes. Au XX^e siècle, la pêche commerciale a graduellement décliné pour laisser la place à la pêche sportive. La pêche sous la glace a gagné en popularité et, en 1970, on évaluait à environ 5 000 le nombre de cabanes de pêche installées sur la glace chaque hiver. Quoique du rivage, les amateurs pouvaient fort bien pêcher des espèces comme la perchaude, la pêche hivernale se concentrait sur la population de poissons d'eau froide (voir l'illustration) qui regorgeait de grands corégones et de touladis.

Au début des années 70, il était devenu évident que la pêche n'était plus ce qu'elle était. Les grands corégones, les ciscos et les touladis étaient encore assez communs mais leur nombre baissait et les pêcheurs ne prenaient que

de gros poissons adultes. Ces trois espèces ne se renouvelaient pas.

Des enquêtes menées par la suite ont suggéré que des espèces envahissantes, des contaminants toxiques persistants, des excès de nutriments ou une combinaison de ces trois facteurs avaient pu contribuer à la disparition des poissons d'eau froide du lac Simcoe.

Pendant cette période de déclin, une espèce envahissante, l'éperlan, a pris de plus en plus de place dans les profondeurs du lac. Ce poisson, introduit dans le lac Crystal, au Michigan, en 1912, a rapidement étendu son territoire pour arriver au lac Simcoe en 1961. Ce prédateur vorace des jeunes grands corégones et ciscos peut avoir des conséquences sérieuses sur leurs populations.

La contamination du poisson gibier du lac Simcoe est surveillée depuis 1967. En général, les concentrations de contaminants sont faibles, certainement inférieures à celles relevées dans de nombreux plans d'eau abritant des populations de poissons sains. La seule exception était l'insecticide DDT dont la concentration était élevée dans la chair des poissons lorsque la surveillance a commencé à la fin des années 60 et au début des années 70. La forte concentration de DDT peut réduire la viabilité des œufs des poissons mais nous n'avons pas assez de renseignements pour déterminer si elle était assez élevée pour avoir une influence sur les poissons du lac Simcoe. Les concentrations actuelles de DDT et d'autres contaminants toxiques persistants ne devraient pas avoir d'effets néfastes sur les communautés halieutiques du lac.

La troisième raison possible du déclin des poissons d'eau froide est la réduction de l'oxygène dans les profondeurs à la fin de l'été, à cause de la présence d'une quantité excessive de nutriments. Le lac Simcoe est un lac profond typique. À la fin du printemps, lorsque la température augmente à la surface,

les eaux se réchauffent par couches de sorte que les eaux chaudes de la surface et les eaux froides des profondeurs ne se mélangent pas. Étant donné que la photosynthèse est virtuellement absente dans les profondeurs, l'oxygène ne se régénère pas et le niveau baisse lentement tout au long de l'été et à l'automne jusqu'à ce que les eaux de la surface et du fond soient à la même température et se mélangent complètement.

La réduction de l'oxygène entraîne une production excessive de nutriments où le phosphore occupe habituellement la plus grande place. L'augmentation des nutriments intensifie la croissance des algues et d'autres plantes aquatiques. Les algues et les animaux microscopiques qui s'en nourrissent finissent par mourir et coulent au fond où ils se décomposent, processus qui consomme de l'oxygène.

Avant le développement du bassin du lac Simcoe, l'apport en phosphore était d'environ 30 tonnes métriques par an, ce qui maintenait le niveau d'oxygène dans les profondeurs à la fin de l'été à 8 parties par million. L'apport en phosphore se chiffre actuellement à environ 100 tonnes métriques par an et la concentration en oxygène à la fin de l'été est d'environ 3 parties par million, ce qui n'est pas assez élevé pour maintenir la santé de la population des poissons des profondeurs. Les efforts se poursuivent pour réduire l'apport en phosphore à 75 tonnes métriques par an et améliorer ainsi l'habitat en profondeur des poissons d'eau froide.

Si le travail entrepris pour améliorer et protéger la santé de l'écosystème du bassin lac Simcoe et pour rehausser les possibilités connexes de loisir vous intéressent, visitez le site Web de la Stratégie de gestion environnementale du lac Simcoe à www.lsems.info.

Fish Names¹
Noms des poissons¹

English Common Name	Nom français	Scientific Name Nom scientifique
Alewife	Gaspereau	<i>Alosa pseudoharengus</i> (Wilson)
American Eel, Eel, Common Eel	Anguille d'Amérique	<i>Anguilla rostrata</i> (LeSueur)
Atlantic Salmon	Saumon de l'Atlantique	<i>Salmo salar</i> (Linnaeus)
Black Crappie, Crappie, Calico Bass	Marigane noire	<i>Pomoxis nigromaculatis</i> (LeSueur)
Bloater, Hoy's Cisco	Cisco de fumage	<i>Coregonus hoyi</i> (Gill)
Bluegill, Bluegill Sunfish, Bream	Crapet arlequin	<i>Lepomis machrochirus</i> (Rafinesque)
Bowfin, dogfish, lawyer	Poisson-castor	<i>Amia calva</i> (Linnaeus)
Brook Trout, Speckled Trout, Square-tail, Aurora Trout	Omble de fontaine	<i>Salvelinus fontinalis</i> (Mitchill)
Brown Bullhead, Common	Barbotte brune	<i>Ameiurus nebulosus</i> (LeSueur)
Brown Trout	Truite brune	<i>Salmo trutta</i> (Linnaeus)
Burbot, Ling, Maria, Freshwater Cod, Lawyer	Lotte	<i>Lota lota</i> (Linnaeus)
Carp, Mirror Carp	Carpe	<i>Cyprinus carpio</i> (Linnaeus)
Channel Catfish, Channel Cat	Barbue de rivière	<i>Ictalurus punctatus</i> (Rafinesque)

English Common Name	Nom français	Scientific Name Nom scientifique
Pink Salmon	Saumon rose	<i>Oncorhynchus gorbuscha</i> Walbaum)
Pumpkinseed, Common Sunfish	Crapet-soleil	<i>Lepomis gibbosus</i> (Linnaeus)
Quillback Carpsucker, Quillback, Drum	Couette	<i>Carpiodes cyprinus</i> (LeSueur)
Rainbow Smelt, Smelt	Éperlan arc-en-ciel, Éperlan du nord	<i>Osmerus mordax</i> (Mitchill)
Rainbow Trout, Steelhead Trout	Truite arc-en-ciel	<i>Oncorhynchus mykiss</i> (Walbaum)
Redhorse Sucker, Northern Redhorse, Common Mullet	Suceur rouge	<i>Moxostoma macrolepidotum</i> (LeSueur)
Rock Bass, Redeye	Crapet de roche	<i>Ambloplites rupestris</i> (Rafinesque)
Round Whitefish, Menominee	Ménomini rond	<i>Prosopium cylindraceum</i> (Pallas)
Sauger, Sand Pickerel, Sand Pike	Doré noir	<i>Stizostedion canadense</i> (Smith)
Siscowet, fat Lake Trout, fat	Siscowet	<i>Salvelinus namaycush siscowet</i> (Agaissiz)
Smallmouth Bass, Black Bass	Achigan à petite bouche	<i>Micropterus dolomieu</i> (Lacépède)
Splake, Wendigo	Truite moulac	Hybrid of <i>Salvelinus namaycush</i> (Walbaum) and <i>Salvelinus fontinalis</i> (Mitchill)

Chinook Salmon (Walbaum)	Saumon quinnat	<i>Oncorhynchus tshawytscha</i>	Sturgeon, Lake Sturgeon	Esturgeon de lac charbonnier	<i>Acipenser fulvescens</i> (Rafinesque)
Cisco, Lake Herring	Cisco, Cisco de lac	<i>Coregonus artedii</i> (LeSueur)	Walleye, Yellow Walleye, Pickerel, Yellow Pickerel, Walleyed Pike, Pike-Perch	Doré	<i>Stizostedion vitreum</i> (Mitchill)
Coho Salmon	Saumon coho	<i>Oncorhynchus kisutch</i> (Walbaum)	White Bass, Silver Bass	Bar blanc	<i>Morone chrysops</i> (Rafinesque)
Freshwater Drum, Sheepshead, Drum	Malachigan	<i>Aplodinotus grunniens</i> (Rafinesque)	White Crappie, Crappie	Marigane blanche	<i>Pomoxis annularis</i> (Rafinesque)
Gizzard shad, Shad, sawbelly	Alose à gésier	<i>Dorosoma cepedianum</i> (LeSueur)	Whitefish, Lake Whitefish	Grand corégone	<i>Coregonus clupeaformis</i> (Mitchill)
Goldeye, Winnipeg Goldeye	Laquaiche aux yeux d'or	<i>Hiodon alosoides</i> (Rafinesque)	White Perch, Silver Perch	Baret	<i>Morone americana</i> (Gmelin)
Goldfish, Golden Carp	Poisson doré	<i>Carassius auratus</i> (Linnaeus)	White Sucker, Common Sucker	Meunier noir	<i>Catostomus commersoni</i> (Lacépède)
Lake Trout, Grey Trout Laker, Namaycush	Truite de lac, touladi	<i>Salvelinus namaycush</i> (Walbaum)	Yellow Perch, Perch, Lake Perch	Perchaude	<i>Perca flavescens</i> (Mitchill)
Largemouth Bass, Largemouth, Black Bass, Green Bass	Achigan à grande bouche	<i>Micropterus salmoides</i> (Lacépède)			
Longnose Gar	Lépisosté osseux	<i>Lepisosteus osseus</i> (Linnaeus)			
Longnose Sucker	Meunier rouge	<i>Catostomus catostomus</i> (Forster)			
Mooneye	Laquaiche argentée	<i>Hiodon tergisus</i> (LeSueur)			
Muskie, Muskellunge, Maskinonge, Lunge	Maskinongé	<i>Esox masquinongy</i> (Mitchill)			
Northern Pike, Great Northern Pike, Jack	Brochet, grand brochet	<i>Esox lucius</i> (Linnaeus)			

1. The names of fish are as contained in «Freshwater Fishes of Canada» by W.B. Scott and E.J. Crossman, Bulletin 184, Fisheries Research Board of Canada, 1973.

1. Les noms des poissons sont tirés de «Freshwater Fishes of Canada» par W.B. Scott et E.J. Crossman, Bulletin 184 de l'Office des recherches sur les pêcheries du Canada, 1973.

Location Index

Index des emplacements

This index not only lists the page numbers of all the locations listed in this guide, but also provides a cross-index of lakes with more than one local name. The location names are lakes unless otherwise indicated (e.g. Abitibi R. is Abitibi River). Where there is more than one water body with the same name, the county or district where each water body is located is indicated in brackets beside the name (e.g. Bark (Renfrew)). As well, where there is more than one location sampled for the same water body, the total number of locations is indicated in brackets [e.g. Abitibi R. (7)].

L'index donne, en plus du numéro de page où l'on peut trouver les divers emplacements figurant dans ce guide, un index croisé des cours d'eau connus sous plusieurs noms. Les noms d'emplacements se rapportent aux lacs, sauf indications contraires (p.ex. Abitibi R. signifie rivière Abitibi). Lorsque le même nom désigne plus d'un cours d'eau, le comté ou le district où se trouve chaque cours d'eau est donné entre parenthèses (p.ex. Bark (Renfrew)). De même, lorsque plus d'un emplacement est donné pour le même cours d'eau, on donne le nombre total d'emplacements entre parenthèses (p.ex. Abitibi R. (7)).

UPDATE

Check Before You Eat

New data received after the release of the ministry’s 2005–06 *Guide to Eating Ontario Sport Fish* show high levels of Polychlorinated Biphenyls (PCBs) in sport fish from Nepahwin Lake. The Ministry of the Environment (MOE) recommends that you follow the

updated consumption advice for the species in the chart below. The MOE will continue to monitor Nepahwin Lake for fish contaminants. It is recommended that any fish species, other than those listed below, not be consumed by women of child-bearing age and children under 15.

To receive a free copy of the English/French *Guide*, please contact:
 Ministry of the Environment
 Phone: 416.327.6816 or 800.820.2716
 E-mail: sportfish@ene.gov.on.ca
 Web site: www.ene.gov.on.ca

Summary information is available in 19 languages.

For more information, contact the Sudbury MOE District Office at 705.564.3237.

1. Identify your fish species.
2. Measure the total length of the fish.
3. Refer to length and species in the charts below for consumption advice. For fish outside size ranges, see page 9 of the *Guide*.
4. If you intend to eat fish from other than this location, please consult the *Guide*.

MISE À JOUR

Vérifiez votre poisson avant de le manger

Selon de nouvelles données, qui n’ont été disponibles qu’après la publication du *Guide de consommation du poisson gibier de l’Ontario de 2005–2006* du ministère, les poissons du lac Nepahwin contiennent une teneur élevée en biphényles polychlorés (BPC). Le ministère recommande de suivre

les mises en garde ci-dessous. Le ministère continuera de mesurer les contaminants dans les poissons du lac Nepahwin. Il est conseillé aux femmes en âge de procréer et aux enfants de moins de 15 ans de ne pas manger de poisson qui a été pêché dans ce lac, quelle que soit l’espèce.

Pour obtenir une copie gratuite du guide bilingue, contactez le ministère de l’Environnement :
 416-327-6816
 800-820-2716
sportfish@ene.gov.on.ca
www.ene.gov.on.ca

Une brochure d’information sur le *Guide* est disponible en 19 langues.

Pour plus de renseignements, appelez le Bureau du district de Sudbury du ministère de l’Environnement au 705-564-3237.

1. Identifiez l’espèce de poisson.
2. Mesurez la longueur du poisson.
3. Suivez les mises en garde (ci-dessous) relatives à la consommation selon la longueur et l’espèce. Pour les poissons plus petits ou plus grands, consultez la page 9 du *Guide*.
4. Si vous comptez manger aussi du poisson provenant d’autres plans d’eau, consultez le *Guide*.

Great Lakes Grand Lacs

Lake Ontario Lac Ontario

*St. Lawrence River/Fleuve Saint-Laurent –
see/voir page 220.

Lake Ontario Block Descriptors

- 1a. **Upper Niagara River** – Canadian waters from Fort Erie to above the falls
- 1b. **Lower Niagara River** – Canadian waters from below the falls to Lake Ontario
2. **Western Lake Ontario** – open water from Niagara River to Clarkson Harbour
- 2a. **Jordan Harbour** – harbour area
3. **Hamilton Harbour** – harbour area
4. **Toronto Offshore Area** – open water from east of Clarkson Harbour to Scarborough Bluffs
- 4a. **Toronto Waterfront Area** – nearshore area from the west side of Humber Bay Park to the east side of Ashbridges Bay Park (including Toronto Islands)
5. **Credit River** – spawning runs from the river mouth to below the Streetsville Dam
6. **Northwestern Lake Ontario** – from east of Scarborough Bluffs to Colborne
- 6a. **Frenchman Bay** – bay area only
- 6b. **Whitby Harbour** – harbour area only
7. **Ganaraska River** – from the river mouth to the Port Hope fish ladder
8. **Northeastern Lake Ontario** – from east of Colborne to south of the area from Main Duck Island across to Point Traverse
9. **Upper Bay of Quinte** – from Trenton to Deseronto
10. **Middle Bay of Quinte** – from south of Deseronto to Glenora
11. **Lower Bay of Quinte/Eastern Lake Ontario** – from east of Glenora to Kingston as well as the open water from north of Main Duck Island to Wolfe Island and from across the Main Duck sill to Point Traverse

Lac Ontario–Blocs descriptifs

- 1a. **Cours supérieur de la rivière Niagara** – eaux canadiennes entre Fort Erie et le haut des chutes
- 1b. **Cours inférieur de la rivière Niagara** – eaux canadiennes entre le bas des chutes et le lac Ontario
2. **Partie ouest du lac Ontario** – eaux libres entre la rivière Niagara et le havre Clarkson
- 2a. **Port de Jordan** – région du port
3. **Port de Hamilton** – région du port
4. **Zone extracôtière de Toronto** – eaux libres entre le havre Clarkson et les falaises de Scarborough
- 4a. **Secteur riverain de Toronto** – zone littorale entre le secteur ouest du parc Humber Bay et le secteur est du parc Ashbridges Bay (incluant les îles de Toronto)
5. **Rivière Credit** – frayères entre l'embouchure de la rivière et le pied du réservoir de Streetsville
6. **Partie nord-ouest du lac Ontario** – entre l'est des falaises de Scarborough et Colborne
- 6a. **Baie Frenchman** – région de la baie uniquement
- 6b. **Port de Whitby** – région du port uniquement
7. **Rivière Ganaraska** – entre l'embouchure de la rivière et l'échelle à poissons de Port Hope
8. **Partie nord-est du lac Ontario** – entre l'est de Colborne, le sud de l'île Main Duck et Pointe Traverse
9. **Partie supérieure de la baie de Quinte** – entre Trenton et Deseronto
10. **Partie centrale de la baie de Quinte** – entre le sud de Deseronto et Glenora
11. **Partie inférieure de la baie de Quinte/partie est du lac Ontario** – entre Glenora et Kingston, y compris les eaux libres entre la partie nord de l'île Main Duck et l'île Wolfe, et du seuil de l'île Main Duck jusqu'à Pointe Traverse

Lake Huron Lac Huron

Lake Huron Block Descriptors

Lake Huron

- H1** open water south of Manitoulin Island – from Cockburn Island to just west of Fitzwilliam Island
- H2** from Fitzwilliam Island to Stokes Bay
- H3** from south of Stokes Bay to Point Clark
- H4** from south of Point Clark to north of Grand Bend
- H5** from Grand Bend to Point Edward

Georgian Bay

- GB1** area bounded on the west side by Bold Point to Fitzwilliam Island and on the east side by south of Killarney Bay to the French River mouth.
- GB2** area bounded on the west side by south of Fitzwilliam Island to Lion's Head and on the east side to the middle of the Bay.
- GB3** area bounded on the west side by the middle of the Bay and on the east side from south of the French River mouth to the Moon River mouth.
- GB4** southern Georgian Bay from south of Lion's Head to south of the Moon River mouth.
- GB4a** Collingwood Harbour – harbour area.

North Channel

- NC1** north side of Manitoulin Island from St. Joseph Island to Serpent Harbour on the north side and Barrie Island on the south side.
- NC2** north side of Manitoulin Island from east of Serpent Harbour to Killarney Bay on the north side and from Barrie Island to Bold Point on the south side.

St. Marys River

St. Marys River from Lake Superior to St. Joseph Channel

Lac Huron–Blocs descriptifs

Lac Huron

- H1** Eaux libres au sud de l'île Manitoulin – entre l'île Cockburn et l'ouest de l'île Fitzwilliam
- H2** Entre l'île Fitzwilliam et la baie Stokes
- H3** Entre le sud de la baie Stokes et la pointe Clark
- H4** Entre le sud de la pointe Clark et le nord de Grand Bend
- H5** Entre Grand Bend et la pointe Edward

Baie Georgienne

- GB1** Zone délimitée à l'ouest par la pointe Bold jusqu'à l'île Fitzwilliam, et à l'est par le sud de la baie Killarney jusqu'à l'embouchure de la rivière des Français.
- GB2** Zone délimitée à l'ouest par le sud de l'île Fitzwilliam jusqu'à Lion's Head, et à l'est par le centre de la baie.
- GB3** Zone délimitée à l'ouest par le centre de la baie, et à l'est par le sud de l'embouchure de la rivière des Français jusqu'à l'embouchure de la rivière Moon.
- GB4** Zone du sud de la baie Georgienne qui s'étend du sud de Lion's Head jusqu'au sud de l'embouchure de la rivière Moon.
- GB4a** Port de Collingwood – région du port.

Chenal Nord

- NC1** Zone au nord de l'île Manitoulin entre l'île St-Joseph et le havre Serpent au nord, et l'île Barrie au sud.
- NC2** Zone au nord de l'île Manitoulin entre l'est du havre Serpent et la baie Killarney au nord, et entre l'île Barrie et la pointe Bold au sud.

Rivière St. Marys

Rivière St. Marys – entre lac Supérieur et le chenal St. Joseph

Lake Superior Lac Supérieur

Lake Superior Block Descriptors

1. **Border/Pie Island area** – from U.S. border to west of Pie Island
2. **Thunder Bay Outer Harbour area** – bay area north of Pie Island/Thunder Cape – excluding Inner Harbour area
3. **Thunder Bay Inner Harbour** – inner harbour area around Kam and Mission River mouths
4. **Black Bay area** – Black Bay from north of Edward Island
5. **Pie Island/Schreiber Point area** – open water from Pie Island to Schreiber Point
6. **Nipigon Bay** – bay area from north of Simpson Island to Nipigon River mouth
7. **Schreiber Point/Sewell Point area** – open water from Schreiber Point to Sewell Point
8. **Jackfish Bay** – including Moberly and Tunnel bays
- 8a. **Peninsula Harbour** – Harbour and immediate vicinity
9. **Michipicoten Island area** – open water from Sewell Point to Cape Gargantua
10. **Agawa Bay/Batchawana Bay area** – open water from south of Cape Gargantua to Batchawana Bay
11. **Goulais Bay area** – from south of Batchawana Bay to the St. Marys River

Lac Supérieur–Blocs descriptifs

1. **Environs de la frontière Ontario-États-Unis et de l'île Pie** – entre la frontière et l'ouest de l'île Pie
2. **Environs de l'avant-port de Thunder Bay** – partie de la baie au nord de l'île Pie et du cap Thunder – à l'exclusion de l'arrière-port
3. **Arrière-port de Thunder Bay** – près de l'embouchure des rivières Kam et Mission
4. **Environs de la baie Black** – partie de la baie Black au nord de l'île Edward
5. **Environs de l'île Pie et de la pointe Schreiber** – eaux libres entre l'île Pie et la pointe Schreiber
6. **Baie Nipigon** – partie de la baie entre le nord de l'île Simpson et l'embouchure de la rivière Nipigon
7. **Environs de la pointe Schreiber et de la pointe Sewell** – eaux libres entre les pointes Schreiber et Sewell
8. **Baie Jackfish** – y compris les baies Moberly et Tunnel
- 8a. **Port de Peninsula** – environs immédiats
9. **Environs de l'île Michipicoten** – eaux libres entre la pointe Sewell et le cap Gargantua
10. **Environs des baies Agawa et Batchawana** – eaux libres entre le sud du cap Gargantua et la baie Batchawana
11. **Environs de la baie Goulais** – entre le sud de la baie Batchawana et la rivière St. Marys
