Guide to Eating Ontario Sport Fish

www.ontario.ca/fishguide

Check advisories on the new interactive map at
www.ontario.ca/fishguide

Key to using guide tables

For certain locations, consumption advice may be given for specific species and/or size ranges which are not legal to possess under Ontario's fishing regulations. Check the *Fishing Ontario, Recreational Fishing Regulations Summary* to ensure that the particular water body is open to fishing or that all fish which are kept are legal to possess. Copies can be obtained from the Ministry of Natural Resources (1-800-667-1940 or www.mnr.gov.on.ca). To report a fishing violation, call 1-877-TIPS-MNR (847-7667) toll-free any time or call Crime Stoppers anonymously at 1-800-222-8477.

Location identifiers

- 1 The tables are divided into three sections by region: Southern Ontario, Northern Ontario and the Great Lakes, as noted along the side of each page. The location index is on page 276.
- 2 Water body name.
- 3 The latitude and longitude; for example, 4537/7942 refers to 45°37'N 79°42'W
- 4 The township, county, territorial district or geographical description of the water body.

Fish species

- 5 Name of fish species tested (see "Selection of fish species for testing section," page 9). The table does not contain all species present at that particular location.

Fish length

- 6, 7 The total length of the fish is measured, from the tip of the nose to the tip of the tail. The length is expressed in centimetres (cm) and inches (") at the top and bottom of the tables.

Number of meals

- 8 Recommended number of meals per month.
- 9 Advice for general population.
- 10 Advice for women of child-bearing age and children under 15 (sensitive population).
- 11, 12 No advice provided for these lengths (page 5).

Contaminants

- 13 The number identifies the contaminant or group of contaminants for which the fish was tested (page 4).

Preface

About the guide

This 26th edition of the Guide to Eating Ontario Sport Fish gives advice for eating sport fish found at more than 1,950 locations around the province including over 100 new locations.

The format of the guide is unchanged from the previous edition. However, there are many updates to the advisory tables reflecting revised guidelines for some contaminants as well as approximately 60,000 test results performed on about 10,000 fish.

All users of the guide are advised to read the introduction prior to proceeding to the consumption tables. This is especially important for the sensitive population: women of child-bearing age and children under 15, for which separate advisories are provided.

Staff from the Ontario Ministry of Natural Resources and Ministry of the Environment collect the fish which are then analyzed for a variety of substances, including mercury, PCBs, mirex, DDT and dioxins. The results are used to develop the advisory tables which give size-specific consumption advice for each species tested from each location.

The guide is published every other year. A new interactive version of the guide is available at www.ontario.ca/fishguide.

New interactive map

A new interactive and user-friendly searchable map is also available on the website and displays all water bodies from the guide with their corresponding consumption advisories. The map can be searched for consumption advice by:

- lake, river or stream name
- address, community, township, or city
- fish species

The interactive map will help anglers identify species and angling destinations with lower contaminant levels.

Updates

Any major changes in consumption advice that arise between guide publications are made public on our website.

Report pollution or spills

To report pollution and/or related fish kills, contact your nearest Ministry of the Environment office or the Ministry's Spills Action Centre (see page 23).

Online survey

In the past, valuable feedback has been provided by users of the guide. We continue to welcome any comments you may have and invite you to complete a short survey available on our website.

Questions?

Consumers with questions on the status of specific consumption advisories should contact the Sport Fish Contaminant Monitoring Program.

Anyone requiring information on fishing licenses, angling regulations, limits of catch, open seasons, provincial parks, maps or hunting should contact a Ministry of Natural Resources office (see page 24) or visit their web site at www.mnr.gov.on.ca.

To obtain detailed data for a specific location tested under the Sport Fish Contaminant Monitoring Program or for additional information on the results in this and previous guides, please contact:

Sport Fish Contaminant Monitoring Program
Ministry of the Environment
125 Resources Road
Etobicoke, ON M9P 3V6
Telephone: 416-327-6816 or
1-800-820-2716
E-mail: sportfish.moe@ontario.ca

It is highly recommended that you read the entire introduction to the guide before referring to the advisory tables. Should you choose not to, please read the following two sections entitled “Summary of critical information” and “Instructions on use of the guide” with page references for more detail.

Summary of critical information

- Young children and developing fetuses are affected by contaminants at lower levels than the general population (page 6).
- Consumption advice is based on the skinless, boneless dorsal fillet (page 10). Do not eat organs of any fish. Fish organs can be high in both heavy metals and pesticides (page 7).
- Consumption advice in the tables is based on an average meal size of 227 grams (eight ounces; approximately the length of a dinner plate) for an average size adult weighing 70 kilograms (154 pounds). It is assumed that smaller individuals will consume a smaller portion and larger individuals will consume a larger portion. If you are an average size adult and your average meal size is substantially less than 227 grams (eight ounces), you may consume more meals than recommended. Conversely, if your meal size is substantially more than 227 grams (eight ounces), you should consume fewer than the recommended number of meals. Contact the Sport Fish Contaminant Monitoring Program for more specific advice.
- Do not harvest dead or dying fish as they may contain harmful microorganisms or toxins (page 14).
- Always follow proper food handling and storage techniques, as you would with any fresh meat product, to prevent the growth of harmful bacteria (page 14).
- Great Lakes salmon and trout are more likely to have high levels of contaminants such as PCBs and dioxins/furans. Check the consumption tables and consume only the skinless, boneless dorsal fillet of these fish (page 7). The flesh on the lower portion of the fish (belly) has a higher fat content and therefore can have higher levels of some contaminants.
- At inland locations mercury is the major contaminant. Because mercury is distributed evenly throughout the fillet, in most cases the full side fillet can be consumed (page 7). Refer to the consumption tables.
- Top predators, such as walleye and pike, usually have the highest mercury levels. Smaller, younger fish and fish that are not top predators, such as panfish and yellow perch, are lower in contaminants. You can reduce your contaminant intake by choosing these fish to eat (page 11).
- If in doubt, contact the Sport Fish Contaminant Monitoring Program (416-327-6816, 1-800-820-2716 or sportfish.moe@ontario.ca).
- Before going fishing, ensure that it is legal to fish in the area and that you have the required license (www.mnr.gov.on.ca).

Instructions on use of the guide

Key to using guide tables

The guide provides sport fish consumption advice based on the level of contaminants found in fish according to their location, species and length. The water body names and locations were obtained from the Gazetteer of Canada (Ontario) or the Canadian Geographical Names Service. The location description includes latitude and longitude, enabling anglers to refer to the Ontario Official Road Map (which is marked accordingly) to determine the general location of the body of water. Larger scale topographical maps can then be used if necessary to pinpoint the exact location. The following is a key to the various components of the tables, using a hypothetical example called *Lake*.

Location identifiers

- 1 The tables are divided into three sections by region: Southern Ontario, Northern Ontario and the Great Lakes, as noted along the side of each page. The alphabetical location index is on page 276.
- 2 Water body name.
- 3 The latitude and longitude; for example, 4537/7942 refers to 45°37'N 79°42'W
- 4 The township, county, territorial district or geographical description of the water body.

Fish species

- 5 Name of fish species tested (see "Selection of fish species for testing" section, page 9). The table does not contain all species present at that particular location, only those that have been tested for contaminants.

Fish length

- 6, 7 The total length of the fish is measured, from the tip of the nose to the tip of the tail. The fish length is expressed in both centimetres (cm) and inches (") at the top and bottom of the tables.

Number of meals

- 8 Recommended number of meals per month
- 9 Advice for general population
- 10 Advice for women of child-bearing age and children under 15 (sensitive population)
- 11, 12 No advice provided for these lengths (page 5)

Contaminants

- 13 The number identifies the contaminant or group of contaminants for which the fish was tested:

1. Mercury
2. Mercury, PCBs, mirex/photomirex and pesticides
3. PCBs, mirex/photomirex and pesticides
4. Mercury, PCBs and mirex
5. Mercury, other metals, PCBs, mirex/photomirex and pesticides
6. Mercury and other metals
7. Dioxins and furans
8. Chlorinated phenols and chlorinated benzenes
9. Polycyclic aromatic hydrocarbons (PAHs)
10. Dioxins, furans and dioxin-like PCBs
11. PCB congeners
12. Polybrominated diphenyl ethers (PBDEs) and polychlorinated naphthalenes (PCNs)
13. Perfluorinated compounds (PFCs)

The fact that fish were tested for a particular group of contaminants does not mean that the fish will contain any or all of these contaminants. For example, fish analyzed for contaminant group 2 may contain only mercury and not PCBs, mirex/photomirex or pesticides.

In a number of locations, particularly inland locations, fish are analyzed only for mercury as this is likely to be the only contaminant to cause consumption restrictions.

For more details on the contaminants listed above, see the "Contaminants in fish" section on page 16.

To determine how much fish you can consume:

Step 1: Find the table for the water body where the fish was caught. The guide tables are divided into Southern Ontario (south of

the French River), Northern Ontario and the Great Lakes. The alphabetical location index is on page 276.

Step 2: Identify the type of fish caught. Refer to the centre pages for more information on how to identify fish generally found in Ontario waterbodies.

Step 3: Measure the total length of the fish (tip of nose to tip of tail) and refer to the appropriate length range at the top or bottom of the table.

Step 4: Check for the advisory. The upper row of advice (no shading) is for the general population and the lower row (grey shading) is for women of child-bearing age and children under 15 (sensitive population). The number that appears in the consumption advice box represents the maximum number of meals of that size fish from that location that can be consumed each month, provided that sport fish are not consumed from any other category. The number of meals per month (categories) may be 8, 4, 2, 1, or 0 as indicated.

Example

An angler catches a 33 cm (13 in.) walleye from Lake and wants to determine the suitability of that fish for consumption. The angler should:

- Find Lake in the guide tables

		Length/ Longueur													
		15	20	25	30	35	40	45	50	55	60	65			
		6"	8"	10"	12"	14"	16"	18"	20"	22"	24"	26"			
Lake / Lac														4537/7942	
Township/Canton, County/Cité															
Walleye ² Doré ²						8		4							
						4		0							

- General population:

For the general population the advice given for walleye in the 30-35 cm (12-14 in.) range is 8, indicating that eight meals per month of that fish can be safely consumed by the general population.

• Sensitive population:

For women of child-bearing age and children under 15 the advice given for walleye in the 30-35 cm (12-14 in.) range is 4, indicating that four meals per month of that fish can be safely consumed by women of child-bearing age and children under 15.

Consumption of fish outside the advisory table range

Advisories are provided only for the size ranges of fish that were tested. Since it is well known that contaminant levels generally increase with fish length, the following rules can be applied:

- For fish smaller than the advisory table range: Follow the advice for the smallest tested range.
- For fish larger than the advisory table range: Consumption advice cannot be predicted, except that it is likely to be more restrictive than the largest tested range.

Step 5: Keep track of your total monthly intake. Sport fish consumption advice is based on a combination of fish size, species and location. You may eat fish from different categories and locations as long as you track your consumption accordingly. Track each fish meal as a fraction or percentage of your total monthly intake (as shown in the following chart), the sum of which should not exceed 1 (for the fraction) or 100%.

Category (Fish meals per month)	Fraction of monthly intake total	Percentage of monthly intake total
8	1/8	12.5
4	1/4	25
2	1/2	50
1	1	100

For example:

If you eat:

- Two meals in the four-meal-per-month category, each meal will represent one-quarter or 25% of your maximum monthly advised consumption for a total of one-half or 50% of your maximum monthly advised consumption (2 meals x 1/4 = 1/2 or 50%).

and also eat

- One meal in the two-meal-per-month category, that meal will represent one-half or 50% of your monthly advised consumption (1 meal x 1/2 = 1/2 or 50%).

The total from these two groups equals 1 or 100%. Therefore, you would have reached your total monthly advised consumption.

If you have any questions on determining a safe level of consumption, contact the Sport Fish Contaminant Monitoring Program at 416-327-6816, 1-800-820-2716 or sportfish.moe@ontario.ca.

Contaminants in Ontario sport fish

Ontario is not unique in having consumption restrictions on sport fish. Most jurisdictions in North America also have them. An extensive review of consumption restrictions on sport fish in North America is available on the Internet at www.epa.gov/waterscience/fish/.

Contaminants found in sport fish originate not only from local sources, but some are transported thousands of kilometres in the atmosphere before being deposited with rainfall. Mercury, PCBs and toxaphene are a few of the contaminants that are known to be transported long distances and can cause low-level contamination even in isolated lakes and rivers.

The basis for fish consumption advisories

Fish consumption advisories are based on guidelines developed by the Food Directorate of Health Canada which, through research and review of toxicological data, has determined safe dosages for an extensive list of contaminants. This amount is referred to as a tolerable daily intake. It is then determined what proportion of the tolerable daily intake comes from each of the environmental pathways such as air, water and different types of food, including sport fish. The safe dosage for mercury is lower for the sensitive population of women of child-bearing age and children under 15. For the other contaminants, the safe dosage is the same for both populations, but as an added precaution, it is advised that the sensitive population consume fish only in the 8 and 4 meal per month categories, as reflected in the consumption advisory tables.

A series of estimates and calculations is then done by the Ministry of the Environment to determine if fish are suitable for consumption based on measured contaminant levels. Fish represented in the eight-meals-per-month category have very low contaminant levels. Conversely, fish designated as zero (0) meals per month have high contaminant levels and the consumption of any meals of these fish would result in individuals exceeding their tolerable daily intake for one or more contaminants. If sport fish are consumed as advised in this guide, an individual's tolerable daily intake would not be exceeded for any contaminant measured.

Important advice for women of child-bearing age and children under 15

It is important that women of child-bearing age and children under 15 (sensitive population) follow the advice in this guide.

Scientific studies show that developing fetuses and young children are affected by contaminants at lower levels than the general population. Women of child-bearing age, including pregnant women and nursing mothers, can affect the health of their offspring through a diet elevated in contaminants such as mercury and PCBs. As such, this sensitive population is advised to eat only the least contaminated fish (in the 8 and 4 meals per month categories), as reflected in the consumption advisory tables. The exact number of meals that can be consumed can be calculated by following the directions in the "Instructions on use of the guide" section (page 3).

These individuals should further reduce their consumption of sport fish if they regularly consume (i.e. four times per month or more often) commercial fish including canned fish, and should not consume sport fish if they are consumers of shark, swordfish, fresh or frozen tuna. Health Canada suggests that predatory fish such as shark, swordfish, fresh and frozen tuna (not canned) should be consumed only occasionally. As a general guideline, reduce consumption of sport fish by one meal per month for every two meals of store-bought fish. This does not apply to the general population. For further advice on store-bought fish, contact the Canadian Food Inspection Agency or Health Canada (see page 24).

What part of the fish can be safely consumed?

Laboratory analyses are carried out on the lean, dorsal, skinless, boneless muscle tissue of the fish (as shown on page 10) and the consumption guidelines are based on the results of this portion. Consuming any other portion may increase exposure to contaminants. Please follow the advice below.

1. Do not eat organs of any fish regardless of location. Organs can be high in both heavy metals and pesticides.
2. Consume only the skinless boneless dorsal fillets of salmon, trout, carp and channel catfish, especially if they are from the Great Lakes. Consumption advisories on these species in the Great Lakes are usually based on PCBs, mirex, toxaphene or dioxins. Because these contaminants are attracted to fat, the highest concentration of contaminants is present in the fat deposits under the skin and in the belly region. Follow the advice in this guide on how to “Clean and cook fish to reduce contaminants” (page 11).
3. Do not eat the eggs (roe) of fish, especially in spawning salmon species (e.g. chinook and coho salmon), as they may contain higher levels of PCBs and other organic contaminants (for more details refer to the “Fish Eggs” section on page 12).
4. You may consume the whole side fillet of lean species such as walleye, pike, bass, perch, and panfish from inland locations. Consumption advisories on these species are based almost exclusively on mercury. Mercury is uniformly distributed in the fillet and is not associated with deposits of fat.

Consumption advisory tables

Contaminant levels for all fish of a given size and species are usually similar within most small or medium sized lakes or rivers which means that one set of consumption advice is all that is normally required. In large lakes and major river systems, however, contaminant levels can vary widely within the water body.

Fish consumption advisory tables for the Great Lakes, connecting waterways, large lakes and major river systems are provided in blocks or regions. Contaminant levels for all fish of a given size and species should be similar throughout a block. The boundaries of the blocks are established in consultation with fisheries biologists familiar with local fish populations after comparing contaminant levels in fish from several adjacent locations.

Separate consumption advice is provided for localized areas within a block where the fish community or the contaminant levels are different from the remainder of the block. Periodic testing is undertaken at several locations within a block to ensure that there are no major differences in contaminant levels. Maps and detailed descriptions of the Great Lakes’ blocks are provided at the front of each of the Great Lakes’ tables.

Who should use this guide?

The advice in this guide is designed for anglers (and their families) who consume moderate quantities of fish. The consumption advice is intended to protect individuals who follow the advice in the guide and consume no more than eight meals per month of the fish they catch. This maximum recommended consumption frequency was based on the results of surveys indicating that most anglers do not consume sport fish more frequently than

eight meals per month. However, many of these fish can be safely consumed more frequently. Anyone who consumes sport fish more frequently is advised to contact the Sport Fish Contaminant Monitoring Program at the number given in the preface.

Consumption advisories for spawning locations of salmon and trout

Please note that many rivers and streams near the Great Lakes are closed to fishing during salmon and trout spawning runs. However, sections of certain rivers and streams do remain open to permit fishing for these species. While salmon and trout from the Great Lakes spend most of their lives there, they spawn in many of the rivers and streams which flow into them. In this guide, consumption advisories are provided for some of the major spawning rivers such as the Credit and Ganaraska Rivers on Lake Ontario and the Nottawasaga River on Georgian Bay. Spawning runs in many smaller rivers have not been sampled. If you catch salmon or trout in the legal fishing areas of these smaller rivers, please follow the consumption advisories for the Great Lakes advisory block into which the river flows. Maps and descriptions are provided at the beginning of each Great Lakes section of this guide. As an example, for salmon and trout caught in Duffins Creek, follow the advisories for block 6, Northwestern Lake Ontario.

Species not included

Muskellunge

Consumption tables in this guide do not provide advisories for muskellunge. To maintain healthy muskellunge populations,

the Ministry of Natural Resources encourages catch and release of this species as it generally cannot sustain heavy fishing pressure. If you do wish to keep a legal-sized muskellunge for consumption, it will likely have elevated mercury levels, and should not be consumed by women of child-bearing age and children under 15. Trophy-sized muskellunge usually have very high mercury levels and should not be consumed by anyone.

Lake sturgeon

Consumption advice for sturgeon is no longer provided in the guide. In October 2009, the Ministry of Natural Resources closed recreational fishing for lake sturgeon in areas where populations are listed as Threatened under the Endangered Species Act. Catch and release of sturgeon is still permitted in areas where populations are not identified as Threatened. For more information, search for Lake Sturgeon Season Closure on the MNR website (www.mnr.gov.on.ca/). For consumption information for traditional or subsistence harvest, please contact the Sport Fish Contaminant Monitoring Program (416-327-6816 or 1-800-820-2716, sportfish.moe@ontario.ca).

American eel

All American eel are part of a single breeding population that spawns in only one place in the world – the Sargasso Sea in the

Atlantic Ocean. From there, young eels drift with ocean currents and then migrate inland into streams, rivers and lakes. The number of young eel returning to Ontario waters has been declining dramatically since the 1980s due to turbines at hydro electric facilities, physical barriers (e.g. hydro dams), harvesting, deteriorating habitat quality and habitat loss, changing ocean conditions, and an exotic, parasitic worm that affects their health and survival. The Ontario government has increased protection for the province's American eel populations by banning recreational and commercial harvest of American eel since 2004. If you catch an American eel, you are required by law to release it back to the waters from which it was collected.

The Sport Fish Contaminant Monitoring Program

Selection of locations for testing

With more than 250,000 lakes, innumerable rivers and streams and many local areas in the Great Lakes, it would not be practical or economical to test fish from every water body.

A location may be selected for testing for one or more of the following reasons:

- It is a popular angling area
- There is a known or suspected source of pollution nearby
- It is a major source of food for local inhabitants (usually lakes in the vicinity of First Nations' communities)
- It is being opened for recreational development
- It is part of a monitoring program for long-term studies of contaminants in fish

The selection of testing sites is an ongoing process and public input is welcomed.

Selection of fish species for testing

Most lakes and rivers contain a variety of fish species. When selecting appropriate species for contaminant testing, the fact that not all species accumulate a particular contaminant at the same rate has to be taken into account. One kind of fish of a certain size may have a much lower contaminant concentration than another species of the same size. This is due to the fact that different fish feed on different things, prefer different habitats, grow at different rates and are physiologically different.

For example, walleye (pickerel) and northern pike are likely to contain higher levels of mercury than whitefish of the same size since walleye and pike are top predators, and feed on smaller fish which may also contain elevated mercury levels. Whitefish on the other hand, feed lower down in the food chain, on aquatic insects and invertebrates which contain less mercury than do small fish.

When testing fish for mercury in a specific area, the practice is to initially select those species which are top predators, as they likely indicate the highest mercury levels. If low levels of mercury are found in predators, the testing of other species may not be necessary.

In testing for organic contaminants such as PCBs and mirex, species with high fat levels, such as salmon, trout, carp and catfish, are selected since organic chemicals tend to accumulate in fatty tissue.

Again, if these species do not contain excessive levels of organic contaminants, then species with less fat from the same location may not have to be tested.

Collection of fish for testing

The fish are collected by staff from the Ministry of Natural Resources and the Ministry of the Environment using various methods. Whenever possible, the selection includes 10 or more fish of each species with lengths and weights representative of the size range of that species in the locations being tested. The length, weight and sex of each fish collected are recorded.

A skinless, boneless fillet of dorsal muscle flesh is removed from the fish (see illustration), packaged and frozen for shipment to the Ministry of the Environment laboratory in Toronto. The table does not contain all species present at a particular location, only those that were tested for contaminants.

Retesting of locations

Since the mid-1970s the Sport Fish Contaminant Monitoring Program has continued to add new locations each year, as well as retest many lakes and rivers when necessary. In areas remote from human activity, where fish are relatively unaffected by pollution, any consumption restrictions are usually limited to elevated mercury levels in the larger and older predatory species such as walleye and northern pike. The source of mercury in these areas can be natural or from long-range transport. Consequently, concentrations in fish may not change substantially over time.

However, in areas directly affected by human sources of pollution, the number of possible contaminants may be much larger and the levels found in fish can be significantly affected by changes in the levels of pollution.

Retested locations are divided into three general groups:

- Areas where contaminant levels for one or more pollutants are either unusually elevated or change substantially. These locations are retested every one to three years, depending on their angling popularity or whether they are a major food source for local communities.
- Areas that show no signs of substantial changes in contaminant levels but are very popular angling areas. These locations are retested approximately every five years.
- All other areas – usually relatively remote locations with no major sources of pollution nearby and no indication of changing contaminant levels in fish. These locations are retested approximately every 10-20 years.

Testing of fish

The fish tissue is analyzed for contaminants at the Ministry of the Environment laboratory using a variety of methods depending on the contaminant.

Benefits versus risks of eating fish

We are regularly advised to eat more fish as they are an excellent source of protein, vitamins and minerals. Fish also contain Omega-3 polyunsaturated fatty acids that are essential for optimal brain and cardiovascular development. Therefore, fish can be important for healthy development of children and babies during pregnancy and breast-feeding. Eating fish on a regular basis also reduces the risk of heart disease in adults because fish are low in saturated fat. Health Canada and the American Heart Association recommend eating fish twice a week, especially species high in Omega-3 such as salmon and trout. For more information on nutrients in fish, contact Health Canada (www.hc-sc.gc.ca or info@hc-sc.gc.ca).

At the same time, there is a risk of exposing ourselves and our families to contaminants in fish, such as mercury. Numerous chemicals are commonly used in our society and provide considerable benefits to us. Many of these substances are persistent, bioaccumulative and toxic in nature, and eventually end up in lakes, rivers and the fish that we eat. The levels of the contaminants found in most Ontario fish do not cause immediate health effects. However, eating contaminated fish regularly may result in accumulation of contaminants in the body to levels that can become a health concern.

It is clear that fish consumption can present both benefits and risks. So the real question is: do the benefits of eating fish outweigh the risks to our health? The answer to this question is “it depends”, which is unfortunately very vague. This is because various factors such as the contaminant of concern, its level in fish, and the levels of various nutrients (e.g., Omega-3, vitamins) in fish influence the answer. All these factors vary widely from one fish species and size to another, and are location-specific. Further, although scientific studies have begun to evaluate the health benefits against risks of eating contaminated fish, our understanding is still very limited due to differences in benefits of various nutrients and health risks from different contaminants. This makes it challenging to compare benefits and risks in every case.

Because of current limitations in the risk versus benefit method, it was not possible to incorporate this into the fish consumption advisories provided in this guide, and the guide continues to be based only on contaminant risk. This helps in ensuring that adequate measures are taken while issuing advisories. Nevertheless, you can reduce your contaminant exposure, and thereby health risk, and continue enjoying the benefits of eating fish, by following the tips listed below.

Reducing the risk from contaminants in sport fish

Eat less contaminated species

- Keep smaller fish for eating. Smaller fish tend to be much less contaminated than larger fish of the same species.
- Species such as perch, sunfish and crappie tend to have much lower contaminants than large predator fish, such as walleye and pike.
- In the Great Lakes, species such as bass, pike, walleye, perch and panfish tend to have much lower contaminants than fatty species such as salmon and trout.

Clean and cook fish to reduce contaminants

PCBs, pesticides and dioxins concentrate to the highest levels in fish with fatty flesh such as salmon, trout, carp and catfish. Before cooking, remove the skin, trim off the fatty areas and discard the flesh around the belly area (as shown in the figure below). Further reductions in contaminants can be achieved by allowing fat to drip away during cooking (e.g. grilling, broiling or baking). If you deep fry fish, do not re-use the oil.

Mercury is the cause of most consumption advisories in inland water bodies. Mercury is evenly distributed in fish flesh so there is nothing you can do to reduce or remove it.

Follow advisories in this guide

Since contaminant levels are highly dependent on location, species and size of a fish, always follow the consumption advisories provided in this guide.

A smart choice would be not to exceed the monthly allotment of safe meals and to maximize your nutrient intake. So, choose a fish that is high in nutrients such as Omega-3 from relatively cleaner locations with low consumption restrictions (i.e., 8 or 4 meals per month), over a fish from a contaminated location with severe consumption restrictions (i.e., 0, 1 or 2 meals per month).

Other consumption concerns

Gobies

Two goby species, the round goby and the tubenose goby, were introduced into the St. Clair River in the late 1980s. Both were likely brought to North America from Eastern Europe in the ballast waters of ships. Since then, they have spread rapidly to other areas of the Great Lakes basin. It is currently illegal in Ontario to possess round or tubenose goby alive or to use them as bait as they pose a threat to native fish, such as mottled sculpin.

Goby samples from selected locations in the Great Lakes have shown elevated levels of PCBs. It is recommended that women of child-bearing age and children under 15 do not consume these fish; for the general population, consumption of these fish should be limited to 2 meals per month.

Fish eggs

Data collected by the Ministry of Environment show that contaminants are elevated in fish eggs. Spawning chinook salmon, coho salmon, brown trout and rainbow trout were collected from two rivers in Ontario to compare the contaminant levels in the

skinless boneless dorsal fillet versus the eggs. In most samples, PCBs and other organic contaminants, such as DDT and mirex, were elevated in the eggs, likely due to the fact that the eggs have a higher fat content. It is recommended that the consumption of eggs from any fish species, especially from the Great Lakes, be avoided due to elevated contaminant levels.

Clams

Although freshwater clams are often readily available in many Ontario water bodies, consumption is not recommended. Clams are filter feeders and therefore they are usually low in chemical contaminants, but for the same reason, they can harbour harmful bacteria and other pathogens. If they are not sufficiently cooked, they may cause health problems, such as food poisoning.

Snapping turtles

Snapping turtles may contain high levels of contaminants in their fat, liver, eggs and, to a lesser extent, muscle. If you plan to consume snapping turtles, trim away the fat prior to cooking the meat or preparing soup. Also, avoid eating the liver and eggs of the turtle. Women of child-bearing age and children under 15 should avoid eating any part of snapping turtles, including soups made with their meat.

Fish parasites

Anglers sometimes catch fish which contain worms, grubs, cysts or nodules in the flesh. When cleaning fish, anglers may notice worms in or around the intestines of the fish or fungus growths on the skin, fins or gills. These parasites are a normal part of the ecosystem in which the fish lives. While not aesthetically pleasing, the edible portions containing parasites do not present a health hazard if properly and thoroughly cooked. Some of the most commonly seen parasites associated with fish are black spot, yellow grub, leeches, lamprey, fish lice and gill flukes.

Following is a description of black spot and yellow grub:

a) Black spot

Black spot, one of the most frequently observed parasites of fish, appears as small black spots or cysts in the skin, fins and flesh of fish. In the black spot life cycle, fish-eating birds such as herons and kingfishers eat an infected fish. The larval stage, which is inside the black cyst, develops into an adult in the bird. Eggs are laid by the adult and pass into the water where they hatch and infect snails. Eventually they leave the snail host and burrow through the skin of fish and form cysts, which the fish surrounds with a black pigment. This organism does little harm to the fish, but gives the fish an unsightly appearance. Infected fish can be consumed with proper cooking.

b) Yellow grub

Yellow grub is closely related to black spot and has a similar life cycle. It appears as yellow or white spots in the flesh, sometimes over one-half cm long. Smallmouth bass and yellow perch tend to be the species most commonly inflicted with yellow grub in Ontario. There are no external signs on a fish to indicate that the flesh contains yellow grub. If only a few grubs are found in a fillet, they can be easily removed with a knife tip. Otherwise, infected fish can be consumed with proper cooking.

Tumours in fish

Occasionally, anglers catch fish with external growths, tumours, sores or other lesions. Such abnormalities generally result from viral or bacterial infections. Abnormalities in the liver or intestine are sometimes seen in coarse fish such as white sucker and brown bullhead, and can be caused by parasites or tumours. Growths on game fish caused by viruses include lymphocystis, dermal sarcoma and lymphosarcoma.

Lymphocystis, a viral disease affecting walleye and perch, is common throughout Canada. Viruses infect the skin of the fish through contact with infected fish during the spring spawning run, forming pale or white cauliflower-like growths. Lymphocystis does not kill affected fish. Tagging studies have shown that these fish can lose the growths by the following spring.

Dermal sarcoma, another viral disease affecting walleye, is caused by viruses which infect cells and cause growths just under the skin. These growths can be removed by skinning the fish. A study by the Ministry of the Environment and the Ministry of Natural Resources has shown that walleye with external skin lesions such as lymphocystis and dermal sarcoma do not have higher contaminant levels than unaffected fish.

Lymphosarcoma is a viral disease affecting muskellunge and northern pike. This virus is transmitted at spawning, but the lesions caused by it can vary depending on the season and stage of the disease. In the spring, affected fish have thick white patches on their skin from which viruses are shed and these in turn infect other fish. Later in the year these patches may heal, forming blotchy red sores or even normal skin. The virus causing lymphosarcoma infects the white blood cells of the fish and can spread throughout the body during the summer or over several years. This disease can kill infected fish.

Other growths. Coarse fish in various parts of the Great Lakes have been found to have lip and skin growths similar to human warts in appearance. Growths on coarse fish kept in the laboratory often disappear and new ones can develop very quickly, suggesting that viruses likely cause these tumours. Studies on Canadian and American areas of the Great Lakes have found an increased rate of lip and skin growth on coarse fish captured in polluted areas; in some extremely polluted areas, liver and intestinal

tumours have been found in these fish. Studies suggest that pollution may cause the liver tumours and may indirectly cause skin growths – warmer water often found in polluted areas attracts larger numbers of fish, thus increasing their risk of becoming infected with viruses. While the appearance of viral or bacterial infections in fish is unsightly, there is no known health risk from consuming an infected fish that meets the consumption guidelines as long as they are prepared properly.

Viral hemorrhagic septicemia (VHS)

Viral hemorrhagic septicemia is an infectious disease found in both fresh and salt water fish species. Outbreaks can occur anytime, but mainly take place during the spring when the temperatures fluctuate and fish are reproducing. It was first identified in Ontario in 2005 after a fish die-off in the Bay of Quinte in Lake Ontario. The virus has now been found in more than 25 species of fish in the Great Lakes. VHS does not affect humans, and fish carrying the virus are safe to handle and eat. Again, as a precaution, avoid fish that appear to be sick or are dead or dying when caught. The Ministry of Natural Resources recommends various methods of slowing the spread of VHS, including using locally harvested bait, and refraining from moving fish from one location to another. For more information contact the Natural Resources Information Centre (1-800-667-1940).

Botulism E

Fish and bird “die-offs,” attributed to Type E botulism, have been occurring during the summer and fall along the shorelines of the Great Lakes. Concern has been expressed that handling and consuming fish from these lakes may pose a health hazard. Health Canada has concluded that there is no concern from consuming fish from these lakes, as long as normal practices are adhered to, including appropriate handling

and storage of the fish and adequate cooking. Anglers are also advised not to keep any fish that appear to be sick, are dying or already dead when caught.

***E. coli* bacteria**

E. coli is a type of bacteria that is found in warm-blooded animals. It is not normally associated with fish. Therefore, in a water body that has elevated levels of *E. coli*, and may be closed for swimming, fish can still be consumed provided they are properly cooked and the advice in the consumption tables is followed. As a general rule, however, avoid fish that appear to be sick or are dead or dying when caught.

Microcystins

Microcystins, toxins produced by some species of blue-green algae, can accumulate in fish, particularly in the viscera or organs (liver, kidney, etc.). Levels in fish tissue depend upon a number of factors including the severity and duration of the bloom in the area where the fish is caught. In general, caution should be taken when considering the consumption of fish caught from a water body where major blue-green algal blooms occur. When possible, avoid eating fish and/or fish organs caught from these areas.

Fish “die-offs”

In recent years, several large fish die-offs have occurred in Ontario lakes. Fish die-offs can impact one or more species of fish at the same time and may be caused by a combination of factors including fluctuating temperature, spawning stress, bacterial or viral infections, which are generally not a threat to humans. To report a recent fish kill, call the Ministry of Natural Resources (1-866-929-0994) or visit their website for more information (www.ontario.ca/fishhealth). If it appears that the fish die-off has been caused by a chemical spill, contact the Ministry of Environment Spills Action Centre (1-800-268-6060). Contact your local Health Unit regarding any safety concerns

(e.g. regular water activities) during a fish kill, and do not drink untreated water or touch dead fish with your bare hands. For information on fish disposal after a fish kill, contact your local municipality.

Fish information

How to release fish

A number of anglers fish for the thrill of the catch, and release their fish to allow them to be caught again. If you decide not to keep a particular fish, here are some tips to apply to safely return the fish to the water:

1. Time is essential, so quickly play and release the fish. A fish played for too long will be too exhausted to recover. A fish hooked in deep water should be brought up slowly to prevent stress due to pressure and temperature changes.
2. Keep the fish in the water as much as possible, since fish out of water will suffocate. Do not allow the fish to flop on the ground or on the rocks. Just a few centimetres of water under a thrashing fish will act as a protective cushion.
3. Gentle handling of the fish is essential and hands should be kept wet at all times while handling any fish. Do not put your fingers in the gills or in the eye sockets. Small fish should not be squeezed but should only be lifted by the lower lip. A net is helpful while handling fish, but keep it in the water.
4. Remove hooks quickly using needle-nosed pliers. If the fish is deeply hooked, cut the line and leave the hook in, as it will dissolve and will not harm the fish. Do not try to tear out hooks.
5. To revive an unconscious fish, hold it upright in the water. If there is a current, hold it heading upstream. Apply artificial respiration by moving the fish forward and backward so that water runs through the gills. It may take a few minutes for the fish to revive. When the fish does begin to struggle, release it.

Preserving and preparing your fish for cooking

If you decide to keep and eat your catch, you should keep it in the best possible condition until it reaches the table. Freshly caught fish should be chilled on ice or in a refrigerator as soon as possible to avoid spoilage. Then, at the earliest opportunity, the fish should be cleaned, dressed and refrigerated or preserved for future use.

The following is one of the procedures commonly used for gutting, filleting and skinning fish:

1. Slit open the belly from the vent (anal opening) and remove the internal organs.
2. Trim away the head and fins.
3. Lay the fish on its side on a cutting board. With a thin sharp knife, cut through the skin and flesh just behind the head down to the backbone. Turn the knife blade along the backbone and, with a sawing motion of the blade, follow the backbone down to the tail, keeping as close to the backbone as possible.
4. Repeat for the fillet on the other side of the fish.
5. Laying each fillet skin-side down on the board, remove the rib bones by inserting the knife blade just under the ribs and separate them from the fillet with as little flesh left on as possible. Trim away the pelvic fin and any belly fat from the ventral portion of the fillet.
6. Lay the fillets skin-side down and, starting at the tail with the knife blade parallel to the skin and as close to it as possible, slice forward with a sawing motion to separate the skin from the fillet. You are then left with skinless, boneless fillets. Wash in clean cold water and cook, refrigerate, freeze or preserve as desired.

Note: if the fish you are cleaning are fatty fish caught in the Great Lakes, please follow the advice in the section "Clean and cook fish to reduce contaminants" on page 11.

The Ministry of Natural Resources has specific requirements for transport or storage of fish to ensure that a Conservation Officer can determine the number, size and species of fish in your possession. This includes leaving a piece of skin on the fillet. Refer to *Fishing Ontario, Recreational Fishing Regulations Summary* for details.

Contaminants in fish

There are many naturally occurring substances, which at levels normally found in air, water and food, pose no hazard to the environment or to human health. A number of naturally occurring substances such as mercury, and synthetic compounds, such as PCBs, mirex and dioxins, may also be found in the environment at levels that are hazardous.

The following section describes some of the broad range of substances which may be tested in Ontario sport fish and the levels which result in consumption restrictions. Consumption guidelines developed for use by Ontario anglers are based on tolerable daily intake guidelines provided by the Food Directorate of Health Canada. For more information on these substances and their health implications, please contact the office of the Sport Fish Contaminant Monitoring Program at the number listed in the preface.

Inorganic substances

Mercury

Mercury is a naturally occurring metal which is found in very low levels in air, water, rocks, soil, and plant and animal matter.

At one time mercury was widely used in industry; however, government and industry took action to reduce its use in the late 1960s and early 1970s and direct discharges of mercury from major industrial sources have been virtually eliminated. Residual contamination from these point sources is still evident in fish in a few locations in Ontario. Significant quantities of mercury

still enter the aquatic environment from the atmosphere from both man-made and natural sources.

Mercury is attracted to particles in the water and settles to the bottom sediments where it can be converted by microorganisms into methylmercury. Methylmercury is rapidly absorbed by a fish either directly from water passing over its gills or ingested with its diet. Since fish eliminate mercury at a very slow rate, concentrations of this substance gradually accumulate.

For women of child-bearing age and children under 15, consumption restrictions for sport fish containing mercury begin at levels of 0.26 parts per million with total restriction advised for levels above 0.52 parts per million. For the general population, consumption restrictions begin at levels above 0.61 parts per million with total restriction advised for levels above 1.84 parts per million.

Other metals

Lead, copper, nickel, zinc, cadmium, manganese, chromium, arsenic and selenium are found in fish tissue but rarely at levels that would suggest a need for consumption restrictions.

Organic substances

Polychlorinated biphenyls (PCBs)

PCBs are a group of chlorinated organic compounds first commercially developed in the late 1920s. They are not formed naturally in the environment, so their presence is always attributed to human activity.

PCBs persist for years in the natural environment and bioaccumulate readily in the aquatic ecosystem. As a result, top predator species of fish with a high fat content such as salmon and trout (but not walleye and pike which have a low fat content) have accumulated PCBs in some Ontario waters to levels which restrict consumption. PCBs have been banned

in all new products since 1977, and their levels have generally declined in Ontario fish. PCBs are now only found as an insulating fluid in existing closed electrical power transformers and capacitors, which are being removed through federal PCB regulations that came into effect in 2008.

The Food Directorate of Health Canada has two guidelines for PCBs, one based on the total of all PCBs present in a sample and the other based on a select few PCBs with toxicological properties similar to dioxins. The dioxin-like PCBs are found at extremely low levels and for consumption advisory purposes are included with the dioxins and furans. Refer to the following section "Dioxins, furans and dioxin-like PCBs" for more information. The ministry derives two sets of consumption restriction values from Health Canada's two guidelines for PCBs, and adopts the lower values. Accordingly, consumption restrictions for total PCBs begin at 0.105 parts per million with complete restriction advised for levels above 0.211 parts per million for the sensitive population and 0.844 parts per million for the general population.

Dioxins, furans and dioxin-like PCBs

Dioxins and furans are unintentional by-products of several industrial processes and in some cases, incomplete combustion. There are 210 different dioxins and furans but only 17 are toxic enough to be of concern. Studies have shown that there are also 12 forms of PCBs, usually referred to as dioxin-like PCBs which have toxicological properties similar to toxic forms of dioxins. The Ministry of the Environment monitors the 17 toxic forms of dioxins and furans and 12 dioxin-like PCBs in sport fish. The concentration of each of the 29 forms is multiplied by an equivalency factor to convert it to a number referred to as a toxic equivalent which represents its toxicity relative to the most toxic form of dioxins – 2,3,7,8-TCDD. The sum of the 29 toxic

equivalents is the total toxic equivalent and is compared to the dioxin guideline.

Recent studies have found that the amount of dioxin-like PCBs in fish can be estimated from a much less expensive analysis of total PCBs. Starting with the 2007-2008 guide, at locations where dioxin-like PCBs have not been analyzed, toxic equivalents from dioxin-like PCBs have been estimated from total PCBs and added to dioxin and furan toxic equivalents to give the total toxic equivalent.

Consumption restrictions for sport fish begin at levels of 2.7 parts per trillion, with total restriction advised for levels above 5.4 and 21.6 parts per trillion for toxicity equivalents of 2,3,7,8-TCDD for the sensitive and general population, respectively.

Mirex/photomirex

Mirex is a chlorinated carbon compound that was used as a pesticide in the southern United States but never registered for such use in Canada.

Mirex has been detected in fish primarily from Lake Ontario. The sources were found to be a former processor of mirex in Niagara Falls, New York and a manufacturing plant in Oswego, New York. Although all uses of mirex in the U.S. and Canada were banned in the 1970s, residual environmental contamination remains. Some mirex is modified and transformed in the environment into a similar compound called photomirex. The behaviour of mirex and photomirex in the aquatic environment is similar to that of PCBs in that they remain in the environment for a long period of time and have a high affinity for fats.

Separate consumption guidelines have been developed by the Food Directorate of Health Canada for mirex and photomirex. Consumption restrictions for mirex in sport fish begin at 0.082 parts per million with total restriction advised for levels above 0.164 and 0.657 parts per million for the sensitive and

general population, respectively. Photomirex consumption restrictions begin at 0.015 parts per million with total restriction advised for levels above 0.031 and 0.122 parts per million for the sensitive and general population, respectively.

Pesticides

DDT

Dichlorodiphenyltrichloroethane (DDT), which was developed during World War II, gained widespread use as an insecticide for agricultural and public health purposes (i.e. for the reduction of malaria spreading mosquitoes). DDT, like PCBs and mirex, is only slowly broken down in the natural environment.

However, levels of this substance in fish flesh have declined in the three decades since the use of DDT was severely restricted and today there are no cases where DDT is a consumption-limiting contaminant.

Toxaphene

Toxaphene is an insecticide that is extremely persistent in the aquatic environment. It was removed from general use in Canada in 1974 and restricted in the United States in 1982. Consumption restrictions for sport fish containing toxaphene begin at levels above 0.235 parts per million, with total restriction advised at levels above 0.469 and 1.877 parts per million for the sensitive and general population, respectively.

Toxaphene is found at levels which restrict the consumption of some species of sport fish from some parts of Lake Superior. In most cases, other contaminants, such as PCBs and dioxins, result in more restrictive consumption advice.

Other pesticides

As part of the Sport Fish Contaminant Monitoring Program, a number of pesticides and other chlorinated organic compounds used widely in the past throughout

North America are routinely analyzed. These substances are lindane, heptachlor, aldrin, and chlordane. In Ontario they have not been detected at levels which would require any restrictions on the consumption of fish.

Other contaminants

The Sport Fish Contaminant Monitoring Program tests for all known substances for which there is a reasonable probability that levels of the substance are of concern to the health of consumers. The chlorinated organic compounds hexachlorobenzene and octachlorostyrene have been tested in sport fish since the early 1980s. Other substances added to the list include chlorinated phenols, chlorinated benzenes and polycyclic aromatic hydrocarbons (PAHs). Based on the results, these substances are only found occasionally in fish and at such low levels that they would not restrict consumption.

Recently, the Ministry of the Environment laboratory has begun to analyze polybrominated diphenyl ethers (PBDEs) and polychlorinated naphthalenes (PCNs) in fish. Fish samples from selected locations from the Great Lakes and inland lakes are being analyzed for these contaminants. The results obtained so far have not resulted in consumption restrictions. The Ministry will continue monitoring levels of these contaminants in sport fish to provide the best available advice to the public.

Similarly, a method to analyze perfluorinated compounds (PFCs) has become available during the last few years. Perfluorinated compounds (PFCs) are a family of fluorine-containing chemicals with unique properties which make materials water, stain and oil repellent and have been in a wide array of consumer products since the 1950s. PFCs are very resistant to breakdown and are turning up in unexpected locations around the world. Currently, there are four locations where concentrations have

resulted in consumption restrictions. The restrictions were attributed to a high level of Perfluorooctanesulfonic acid (PFOS), a chemical in the PFC group. Consumption restrictions for PFOS begin at 0.080 parts per million with complete restriction advised for levels above 0.160 parts per million for the sensitive population and 0.640 parts per million for the general population.

Causes of fish consumption advisories

Although fish from many locations listed in the guide have been tested for a wide variety of contaminants, most of the consumption restrictions are caused by mercury, dioxins, furans and PCBs. In general, other contaminants, such as mirex, photomirex, toxaphene, and chlordane are no longer consumption-limiting contaminants.

The following pie charts illustrate the percentage of the consumption restrictions caused by each of the contaminants in the four Ontario Great Lakes and their connecting channels and inland locations. These statistics are for the general population. The sensitive population has a higher percentage of restrictions caused by mercury.

Lake Superior

Consumption restrictions on fatty species, such as lake trout, whitefish and chinook salmon are mainly caused by PCBs, and in some cases, toxaphene. Restrictions on northern pike and walleye are caused by mercury. In total 36.2% of the advice given for sport fish from Lake Superior results in some level of restriction.

Lake Huron (including Georgian Bay, North Channel and St. Marys River)

Consumption restrictions on trout, salmon, whitefish, carp and channel catfish are mainly caused by PCBs. In total 42.4% of the advice given for sport fish from Lake Huron results in some level of restriction.

Lake St. Clair and St. Clair and Detroit Rivers

In total, 41.5% of the advice given for sport fish from these locations results in some level of consumption restriction.

Lake Erie

In total, 59.8% of the advice given for sport fish from these locations results in some level of restriction. The majority of restrictions are caused by PCBs.

Lake Ontario (including Niagara and St. Lawrence rivers)

In the various species of trout and salmon found in Lake Ontario, dioxins, furans, dioxin-like PCBs, mirex, photomirex, toxaphene and chlordane can be elevated in the same fish. However, PCBs are the consumption-limiting contaminants. Consumption of species such as walleye, pike, bass and perch is usually restricted because of mercury. In total, 58.6% of the advice given for sport fish from Lake Ontario results in some level of consumption restriction.

Inland locations

Very few inland locations have been exposed to discharges of pesticides and other organic compounds which cause the majority of consumption restrictions on Great Lakes fish. Consequently, 86.3% of all consumption restrictions on sport fish from inland locations are as a result of mercury. In total, 33.7% of the advice given for sport fish from inland locations results in some level of consumption restriction.

The history of sport fish contaminant monitoring in Ontario

The deaths of 90 people in Minamata, Japan between 1954 and 1965 from the consumption of fish contaminated with methylmercury, and reproductive failure and deformities in fish-eating wildlife from the combined effects of mercury, PCBs, DDT and other pesticides in North America and elsewhere, awakened us to the potential threat of contaminants in the fish we eat.

In the 1960s in Ontario, several industries were discharging large quantities of mercury into the environment. Forty years of the manufacture, widespread use and inappropriate disposal of PCBs and the widespread application of persistent pesticides such as DDT, aldrin and dieldrin was taking a toll on fish and wildlife, especially in and around the Great Lakes.

Studies undertaken in the 1960s in two areas – Lake St. Clair in southern Ontario and the English-Wabigoon River system in northwestern Ontario – found disturbingly high levels of mercury in fish. Commercial fisheries in these areas were immediately closed. Since that time, direct discharges of mercury from major industrial sources have been virtually eliminated. Other studies in the 1960s and early 1970s found high levels of contaminants such as PCBs and DDT in fish. Action was immediately taken to ban or severely restrict the use of contaminants such as DDT, PCBs, toxaphene, aldrin and mirex.

Despite ongoing activities to track and eliminate residual sources of these chemicals, it was apparent that immediate action had to be taken to protect human health. The public needed to be informed of the health risks of consuming sport fish.

In 1976, the Sport Fish Contaminant Monitoring Program was formed. In 1977, the first fish consumption advisories were published and consisted of a brochure listing the 170 locations where data had been collected. Consumption advisories for individual water bodies were mailed out upon request. The first version of the guide was published in 1978, and consisted of three separate editions (Great Lakes, Northern Ontario and Southern Ontario). By 1979, the database had grown considerably and the annual guide consisted of data from over 600 locations. It was distributed widely through government offices and beer and liquor stores.

Starting in 1993, the guide was published every other year and between then and 2005, to meet growing demand, production increased from 200,000 to 350,000 copies. With increasing availability of the data in electronic format, production has been reduced to 100,000 copies. In this, the 26th edition of the guide, consumption advisories are available for more than 1,950 locations and the contaminant database consists of nearly 2 million records. An interactive online searchable map has also been made available, allowing users to quickly find the consumption advice they require.

As the program has grown, so has the list of contaminants monitored in fish. The list now includes contaminants such as dioxins, furans, polycyclic aromatic hydrocarbons as well as more recent contaminants of concern such as brominated flame retardants and perfluorinated compounds. The levels of these newer groups of chemicals have been increasing in the aquatic environment but have generally not reached critical levels in fish. However, monitoring such contaminants in fish and in other parts of the environment has resulted in measures being taken to control their manufacture and use in North America and

Europe. Despite the fact that fish are being tested for more and more contaminants, consumption advisories continue to be caused by the same chemicals – mercury, PCBs, dioxins, furans, and toxaphene.

Over time, methods used to calculate consumption advisories have changed. Originally, advisories for most contaminants were based on limits imposed on commercial fish. For example, when the guide was first published, the PCB limit on fish for sale was 2 parts per million. This limit was also applied to sport fish. Eventually, the health protection guidelines developed by the Food Directorate of Health Canada were adopted. These guidelines are usually referred to as “tolerable daily intakes” which are the amounts of contaminants that can be safely consumed on a daily basis for a lifetime, with reasonable assurance that an individual’s health will not be threatened. These methods are described in some detail in the section “The basis for fish consumption advisories” (page 6).

Over the years most health protection guidelines have been revised, usually downwards, making consumption advice more restrictive. Revisions result from toxicological investigations becoming far more sophisticated in identifying both subtle and low probability effects. As well, analytical equipment and technology has improved so smaller amounts can be detected and quantified. Many people have expressed concern that what was acceptable for consumption last year is unacceptable this year. However, safety margins built into the fish consumption guidelines should alleviate this concern. In the 2007–2008 guide there was a change in the opposite direction. The toxicity equivalency factors for dioxins, which includes dioxins, furans and dioxin-like PCBs (see section on dioxins) were changed after an expert panel of the World Health Organization evaluated

new and existing toxicity data. The toxicity was found to be less than originally estimated for some of these compounds and greater for others. The result was that the overall dioxin toxicity in fish is about 20 per cent less than previously estimated.

We expect that the guide will continue to change in the future to incorporate new health protection guidelines and new methods of evaluation so that we can continue to provide the best available advice to the public.

Additional information

An educational brochure for women of child-bearing age is available, either individually or in bulk, free of charge on the website or by contacting the Sport Fish Contaminant Monitoring Program.

A two page summary of the guide is available in the languages listed below. Please call or e-mail the Sport Fish Contaminant Monitoring Program for copies or visit the website at www.ontario.ca/fishguide.

Fish Identification

The consumption advice provided in the guide is related to specific species of fish and, in order to use the information properly, it is important to correctly identify the species of fish caught.

On the following pages are illustrations of the species of fish most commonly caught in Ontario. Accompanying each illustration is a description of characteristics of the species that will aid in its identification (Scott, W. B. and E. J. Crossman. 1998. *Freshwater Fishes of Canada*. Galt House Publications Ltd. 966 pages). The length represents the typical range for the species in Ontario waters, although much larger specimens may be caught as indicated by the Ontario record. Features can be used to separate a species from similar species. Additional information on habitat and spawning is provided to assist in confirming the identification.

All illustrations were provided courtesy of the Ministry of Natural Resources, with the exception of the following, provided by Curtis Atwater: American Eel, Bluegill, Bowfin, Brown Trout, Freshwater Drum, Goldeye, Lake Sturgeon, Mooneye, Rainbow Trout, Redhorse Sucker, Round Whitefish, Sauger, White Crappie, and White Perch.

Identification des poissons

Les mises en garde relatives à la consommation de ce guide concernent des espèces précises de poissons. Pour que les données soient utiles, il est donc important d'identifier correctement l'espèce des poissons capturés.

Les pages suivantes montrent des espèces de poissons qui sont couramment pêchés en Ontario. Les caractéristiques de chaque espèce sont précisées pour faciliter l'identification des poissons (Scott W. B. et E. J. Crossman. 1998. *Freshwater Fishes of Canada*. Galt House Publications Ltd., 966 pages). La longueur des poissons représente la longueur moyenne de l'espèce dans les eaux ontariennes, bien qu'il existe des spécimens beaucoup plus gros, comme l'indiquent les annales de pêches de l'Ontario. Les caractéristiques servent à séparer deux espèces similaires. D'autres renseignements sur l'habitat et le frai sont fournis pour faciliter l'identification des poissons.

Toutes les illustrations ont été généreusement fournies par le ministère des Richesses naturelles, à l'exception des illustrations suivantes, qui proviennent de M. Curtis Atwater : anguille d'Amérique, crapet arlequin, poisson-castor, truite brune, malachigan, laquaiche aux yeux d'or, esturgeon de lac, laquaiche argentée, truite arc-en-ciel, suceur rouge, ménomini rond, doré noir, marigane blanche et baret.

Walleye (Pickerel, Pike-perch)
Doré (doré jaune, doré commun)

Length/longueur : 25-85 cm (10-33 in./po)
Record (Ontario) : 92.7 cm/10.1 kg
36.5 in./po/22.25 lb.

Features: elongated body;
many sharp teeth and large
opaque eyes; white tip on
lower part of tail fin; no
distinct blotches or bands on bodies of adults

Similar Species: Sauger, Yellow Perch

Habitat: prefers large, shallow, turbid lakes

Spawning: spring in rivers and gravelly shoals of lakes

Caractéristiques : corps allongé; nombreuses dents pointues et grands yeux
opaques; nageoire caudale à extrémité blanche dans la partie inférieure; pas de
taches ou bandes distinctives sur le corps des adultes

Espèces semblables : doré noir, perchaude

Habitat : préfère les grands lacs peu profonds aux eaux troubles

Zone de frai : fraie au printemps dans les rivières et les hauts-fonds de gravier
des lacs

Sauger
Doré noir

Length/longueur : 25-41 cm (10-16 in./po)
Record (Ontario) : 56.4 cm/2.0 kg
22.2 in./po/4.4 lb.

Features: elongated body;
many sharp teeth and large
opaque eyes; no white tip
on tail fin; distinct blotches or bands on
body of adults; spots on dorsal fin

Northern Pike (Great Northern Pike, Jackfish)
Brochet (grand brochet)

Length/longueur : 45-100 cm (18-39 in./po)
Record (Ontario) : 19.1 kg/42.12 lb.

Features: long, dark
green body with white or
yellowish oval spots; ten pores on the
undersides of lower jaw

Similar Species: Muskellunge

Habitat: prefers quiet, shallow, vegetated waters

Spawning: spring on heavily vegetated floodplains of rivers, marshes and lakes

Caractéristiques : long corps vert foncé avec taches ovales blanches ou jaunâtres;
dix pores sous la mâchoire inférieure

Espèces semblables : maskinongé

Habitat : préfère les eaux calmes, peu profondes avec de la végétation

Zone de frai : fraie au printemps dans les plaines d'inondation de rivières, de marais
et de lacs comportant beaucoup de végétation

Muskellunge (Musky, Lunge, Maskinonge)
Maskinongé

Length/longueur : 71-117 cm (28-46 in./po)
Record (Ontario) : 147.3 cm/29.5 kg
58.0 in./po/65.0 lb.

Features: long, light coloured
body with dark vertical bands or
spotting; twelve to eighteen pores on the
undersides of lower jaw

Similar Species: Northern Pike

Habitat: prefers quiet, shallow, vegetated waters

Spawning: spring on heavily vegetated floodplains of rivers, marshes and lakes

Similar Species: Walleye, Yellow Perch

Habitat: prefers large, shallow, turbid lakes

Spawning: spawns in spring in rivers and gravelly shoals of lakes

Caractéristiques : corps allongé; nombreuses dents pointues et grands yeux opaques; pas d'extrémité blanche sur la partie inférieure de la nageoire caudale; taches ou bandes distinctives sur le corps des adultes; taches sur la nageoire dorsale

Espèces semblables : doré, perchaude

Habitat : préfère les grands lacs peu profonds aux eaux troubles

Zone de frai : fraie au printemps dans les rivières et les hauts-fonds de gravier des lacs

Yellow Perch

Perchaude

Length/longueur : 15-30 cm (6-12 in./po)

Record (Ontario) : 38.4 cm/1.1 kg
15.1 in./po/2.42 lb.

Features: dark back with yellow sides;
vertical bands of green and yellow on sides

Similar Species: Walleye, Sauger, White Perch

Habitat: prefers clear, vegetated lakes and rivers

Spawning: spring in shallows of lakes and rivers usually near rooted vegetation or submerged brush

Caractéristiques : dos noir et flancs jaunes; bandes verticales vertes et jaunes sur les flancs

Espèces semblables : doré, doré noir, baret

Habitat : préfère les lacs et rivières claires avec de la végétation

Zone de frai : fraie au printemps dans les parties peu profondes des lacs et rivières, habituellement près de végétation enracinée ou de broussailles submergées

Caractéristiques : long corps de couleur claire avec des bandes verticales ou taches sombres; de douze à dix-huit pores sous la mâchoire inférieure

Espèces semblables : brochet

Habitat : préfère les eaux calmes, peu profondes avec de la végétation

Zone de frai : fraie au printemps dans les plaines d'inondation de rivières, de marais et de lacs comportant beaucoup de végétation

Smallmouth Bass (Black Bass, Bronzeback)

Achigan à petite bouche

Length/longueur : 25-50 cm (10-20 in./po)

Record (Ontario) : 61.0 cm/4.5 kg
24.0 in./po/9.84 lb.

Features: dark green to golden body with dark vertical bars; upper jaw does not extend beyond eye

Similar Species: Largemouth Bass, Rock Bass

Habitat: clear, rocky waters with little vegetation

Spawning: late spring and early summer over sand, gravel and rocky substrate in shallow water

Caractéristiques : corps sombre de vert à doré avec barres verticales sombres; la mâchoire supérieure ne dépasse pas le niveau de l'oeil

Espèces semblables : achigan à grande bouche, crapet de roche

Habitat : eaux claires et rocheuses avec peu de végétation

Zone de frai : fraie à la fin du printemps et au début de l'été dans l'eau peu profonde sur du sable, du gravier et du substrat rocheux

Largemouth Bass (Black Bass, Green Bass, Bucketmouth)
Achigan à grande bouche

Length/longueur : 25-55 cm (10-22 in./po)
Record (Ontario) : 55.9 cm/4.7 kg
22.0 in./po/10.43 lb.

Features: green body with horizontal black band; upper jaw extends beyond eye
Similar Species: Smallmouth Bass, Rock Bass
Habitat: warm, weedy and shallow waters often near cover
Spawning: late spring and early summer over mud, sand and gravel in shallow water

Caractéristiques : corps vert avec une bande noire horizontale; la mâchoire supérieure dépasse le niveau de l'oeil
Espèces semblables : achigan à petite bouche, crapet de roche
Habitat : eaux chaudes, peu profondes avec des herbes souvent près des arbres
Zone de frai : fraie à la fin du printemps et au début de l'été dans de l'eau peu profonde, sur de la vase, du sable et du gravier

Rock Bass (Redeye)
Crapet de roche

Length/longueur : 15-20 cm (6-8 in./po)
Record (Ontario) : 1.4 kg/3.0 lb.

Features: olive, golden brown body with rows of dark spots; dark bars or blotches on sides; large, red eye
Similar Species: Black Crappie, Pumpkinseed, Bluegill
Habitat: warm, shallow waters with rocky bottoms
Spawning: late spring and early summer over mud, sand and gravel in shallow water

Caractéristiques : corps olive brun doré avec des rangées de taches sombres; barres sombres ou taches sur les flancs, grands yeux rouges
Espèces semblables : marigane noire, crapet-soleil, crapet arlequin
Habitat : eaux chaudes peu profondes à fond rocheux
Zone de frai : fraie à la fin du printemps et au début de l'été dans de l'eau peu profonde, sur de la vase, du sable et du gravier

Coho Salmon (Silver Salmon, Blue-back)
Saumon coho (coho)

Length/longueur : 30-75 cm (12-30 in./po)
Record (Ontario) : 106.7 cm/13.0 kg
42.0 in./po/28.64 lb.

Features: dark mouth, whitish gums; spots on upper part of tail
Similar Species: Chinook Salmon, Pink Salmon, Atlantic Salmon, Rainbow Trout, Brown Trout
Habitat: depths of 10-60 m, near shore and rivers in late summer and fall
Spawning: swims up rivers to spawn in fall on gravel beds; dies after spawning

Caractéristiques : bouche foncée, gencives blanchâtres, taches sur une partie de la queue
Espèces semblables : saumon quinnat, saumon rose, saumon de l'Atlantique, truite arc-en-ciel, truite brune
Habitat : profondeur de 10-60 m, près des rives et dans les rivières à la fin de l'été et à l'automne
Zone de frai : remonte les rivières pour frayer à l'automne sur des lits de gravier; meurt après le frai

Atlantic Salmon
Saumon de l'Atlantique

Length/longueur : 25-70 cm (10-28 in./po)
Record (Ontario) : 88.9 cm/11.0 kg
35.0 in./po/24.3 lb.

Features: white mouth and gums; a few large black spots on gill cover and back; no spots on tail
Similar Species: Chinook Salmon, Coho Salmon, Pink Salmon, Rainbow Trout, Brown Trout
Habitat: deep offshore waters, near shore and rivers in late summer and fall
Spawning: may enter rivers in summer; spawns in fall on gravel beds

Chinook Salmon (King Salmon)**Saumon quinnat (saumon chinook, saumon royal, saumon du Pacifique)**

Length/longueur : 30-100 cm (12-39 in./po)

Record (Ontario) : 119.4 cm/21.0 kg
47.0 in./po/46.38 lb.

Features: black mouth lining and black gums; tail entirely spotted

Similar Species: Coho Salmon, Pink Salmon, Atlantic Salmon, Rainbow Trout, Brown Trout

Habitat: depths of 10-60 m, near shore and rivers in late summer and fall

Spawning: swims up rivers to spawn in fall on gravel beds; dies after spawning

Caractéristiques : intérieur de la bouche et gencives noirs; queue entièrement tachetée

Espèces semblables : saumon coho, saumon rose, saumon de l'Atlantique, truite arc-en-ciel, truite brune

Habitat : profondeur de 10-60 m, près des rives et dans les rivières à la fin de l'été et à l'automne

Zone de frai : remonte les rivières pour frayer à l'automne sur des lits de gravier; meurt après le frai

Caractéristiques : bouche et gencives blanches, quelques grosses taches noires sur les branchies et le dos; pas de taches sur la queue

Espèces semblables : saumon quinnat, saumon coho, saumon rose, truite arc-en-ciel, truite brune

Habitat : eau profonde du large, près des rives et dans les rivières à la fin de l'été et à l'automne

Zone de frai : peut pénétrer dans les rivières en été; fraie à l'automne sur des lits de gravier

Pink Salmon**Saumon rose**

Length/longueur : 36-46 cm (14-18 in./po)

Record (Ontario) : 83.0 cm/5.9 kg
32.7 in./po/
13.06 lb.

Features: large black spots on back and tail, but not on dorsal fin; forked tail

Similar Species: Chinook Salmon, Coho Salmon, Atlantic Salmon, Rainbow Trout, Brown Trout

Habitat: deep offshore waters, near shore and rivers in late summer and fall

Spawning: swims up rivers to spawn in fall on gravel beds; dies after spawning

Caractéristiques : grosses taches sur le dos et la queue mais pas sur la nageoire dorsale; queue fourchue

Espèces semblables : saumon quinnat, saumon coho, saumon de l'Atlantique, truite arc-en-ciel, truite brune

Habitat : eau profonde du large, près des rives et dans les rivières à la fin de l'été et à l'automne

Zone de frai : remonte les rivières pour frayer à l'automne sur des lits de gravier; meurt après le frai

Rainbow Trout (Steelhead)
Truite arc-en-ciel (saumon arc-en-ciel)

Length/longueur : 15-75 cm (6-30 in./po)
Record (Ontario) : 99.4 cm/18.4 kg
39.1 in./po/
40.68 lb.

Features: heavily spotted on sides as well as dorsal fin and tail; Great Lakes fish usually silver; pink lateral stripe on spawning fish and inland fish

Similar Species: Chinook Salmon, Coho Salmon, Pink Salmon, Atlantic Salmon, Brown Trout

Habitat: deep offshore waters, near shore and rivers in fall and spring

Spawning: may enter rivers in fall; spawns in spring on gravel beds

Caractéristiques : beaucoup de taches sur les côtés ainsi que sur la nageoire dorsale et la queue; poisson des Grands Lacs habituellement argenté; bande latérale rose sur les poissons en frai et des plans d'eau intérieurs

Espèces semblables : saumon quinnat, saumon coho, saumon rose, saumon de l'Atlantique, truite brune

Habitat : eau profonde du large, près des rives et dans les rivières à l'automne et au printemps

Zone de frai : peut pénétrer dans les rivières à l'automne; fraie au printemps sur des lits de gravier

Lake Trout (Grey Trout, Mackinaw Trout)
Touladi, Truite de lac

Length/longueur : 30-80 cm (12-31 in./po)
Record (Ontario) : 130.8 cm/28.6 kg
51.5 in./po/63.12 lb.

Features: dark body with light spots and markings (none red); deeply forked tail; leading edge of lower fins often white, but no black line

Similar Species: Brook Trout, Rainbow Trout, Brown Trout

Brook Trout (Speckled Trout)
Omble de fontaine (truite mouchetée, truite de ruisseau, truite saumonée)

Length/longueur : 15-40 cm (6-16 in./po)
Record (Ontario) : 80.0 cm/6.6 kg
31.5 in./po/14.5 lb.

Features: light wormlike markings and spots, some red and blue, on a dark body; square tail; leading edge of lower fins white, set off by black line

Similar Species: Lake Trout, Rainbow Trout, Brown Trout

Habitat: cold, clear, well-oxygenated streams and lakes

Spawning: fall on gravel beds in streams

Caractéristiques : marques vermiformes et taches claires rouges et bleues sur un corps sombre; queue carrée; nageoires inférieures à bord blanc et striées de lignes noires

Espèces semblables : touladi, truite arc-en-ciel, truite brune

Habitat : cours d'eau et lacs où l'eau est froide, claire et bien oxygénée

Zone de frai : fraie à l'automne sur des lits de gravier dans les cours d'eau

Lake Whitefish
Grand corégone (poisson blanc, pointu)

Length/longueur : 30-65 cm (12-26 in./po)
Record (Ontario) : 74.9 cm/6.7 kg
29.5 in./po/14.77 lb.

Features: overall colouration silvery; mouth overhung by snout

Similar Species: Lake Herring, Round Whitefish

Habitat: cold waters of deep lakes

Spawning: fall on rocky shoals and occasionally in rivers

Caractéristiques : couleur argentée; bouche sous le museau

Espèces semblables : cisco, ménomini rond

Habitat: cold waters of deep lakes
Spawning: spawns in fall on lake shoals

Caractéristiques : corps foncé avec des taches et des marques claires (aucune rouge); queue très fourchue; bord des nageoires inférieures souvent blanc mais pas de ligne noire
Espèces semblables : omble de fontaine, truite arc-en-ciel, truite brune
Habitat : eaux froides des lacs profonds
Zone de frai : fraie à l'automne sur les hauts-fonds

Brown Trout
Truite brune

Length/longueur : 15-65 cm (6-26 in./po)
Record (Ontario) : 96.5 cm/15.6 kg
38.0 in./po/34.38 lb.

Features: golden brown body with dark spots, often surrounded by lighter ring; may also have red spots; orange adipose fin; Great Lakes fish usually silver
Similar Species: Chinook Salmon, Coho Salmon, Pink Salmon, Atlantic Salmon, Rainbow Trout, Brook Trout
Habitat: deep offshore waters, near shore and rivers in fall and spring
Spawning: fall on gravel beds in streams

Caractéristiques : corps brun doré avec des taches foncées souvent entourées d'un anneau plus clair; peut avoir des taches rouges; nageoire adipeuse orange; les poissons des Grands Lacs sont habituellement argentés
Espèces semblables : saumon quinnat, saumon coho, saumon rose, saumon de l'Atlantique, truite arc-en-ciel, omble de fontaine
Habitat : eau profonde du large, près des rives et dans les rivières à l'automne et au printemps
Zone de frai : fraie à l'automne sur des lits de gravier dans les cours d'eau

Habitat : eaux froides des lacs profonds
Zone de frai : fraie à l'automne sur les hauts-fonds rocheux et à l'occasion dans les rivières

Lake Herring (Cisco)
Cisco de lac (cisco)

Length/longueur : 20-30 cm (8-12 in./po)
Record (Ontario) : 59.7 cm/1.9 kg
23.5 in./po/4.33 lb.

Features: overall colouration silvery; mouth not overhung by snout
Similar Species: Lake Whitefish, Round Whitefish, Rainbow Smelt
Habitat: cold waters of deep lakes
Spawning: fall on gravel or rocky shoals

Caractéristiques : couleur argentée; bouche au bout du museau
Espèces semblables : corégone, ménomini rond, éperlan arc-en-ciel
Habitat : eaux froides des lacs profonds
Zone de frai : fraie à l'automne sur les hauts-fonds de gravier ou rocheux

Round Whitefish (Menominee)
Ménomini rond (ménomini d'Amérique)

Length/longueur : 20-40 cm (8-16 in./po)
Record (Ontario) : none reported/
aucun déclaré

Features: overall colouration silvery; mouth overhung by snout; body slender and cylindrical
Similar Species: Lake Whitefish, Lake Herring
Habitat: cold waters of deep lakes
Spawning: fall in gravelly shallows and occasionally in rivers

Caractéristiques : couleur argentée; bouche sous le museau; corps mince et cylindrique
Espèces semblables : corégone, cisco
Habitat : eaux froides des lacs profonds
Zone de frai : fraie à l'automne sur les hauts-fonds rocheux et à l'occasion dans les rivières

White Sucker (Common Sucker, Mullet)
Meunier noir (castotome noir, carpe noire)

Length/longueur : 30-50 cm (12-20 in./po)
Record (Ontario) : 57.9 cm/2.4 kg
22.8 in./po/5.39 lb.

Features: dark gold to brown back with silvery sides; overhanging, thick lipped mouth; torpedo shaped
Similar Species: Redhorse Sucker
Habitat: warm, shallow bays of lakes and rivers
Spawning: spring in gravelly streams and rivers

Caractéristiques : dos doré foncé à brun et flancs argentés; bouche à lèvres épaisses sous la tête; en forme de torpille
Espèces semblables : suceur rouge
Habitat : baies chaudes et peu profondes de lacs et rivières
Zone de frai : fraie au printemps dans des cours d'eau et rivières tapissés de gravier

Brown Bullhead (Common Catfish, Mudcat, Mudpout)
Barbotte brune (poisson-chat)

Length/longueur : 20-36 cm (8-14 in./po)
Record (Ontario) : 41.6 cm/1.1 kg
16.4 in./po/2.37 lb.

Features: body coloured yellow-brown, olive, grey to almost black; square tail
Similar Species: Channel Catfish
Habitat: prefer warm, shallow water near mud and sandy bottoms with abundant aquatic vegetation
Spawning: late spring and summer in mud, sand or roots of aquatic vegetation

Caractéristiques : corps jaune-brun, olive, gris pouvant presque aller au noir; queue carrée
Espèces semblables : barbus de rivière
Habitat : préfère les eaux chaudes et peu profondes aux fonds vaseux et sablonneux avec beaucoup de végétation aquatique
Zone de frai : fraie à la fin du printemps et en été dans de la vase, du sable ou les racines de la végétation aquatique

Carp
Carpe

Length/longueur : 30-75 cm (12-30 in./po)
Record (Ontario) : 99.1 cm/17.5 kg
39.0 in./po/38.46 lb.

Features: olive-green to yellowish body with very large scales; barbels on each side of the mouth
Similar Species: Freshwater Drum
Habitat: prefers shallow, warm, heavily vegetated water bodies
Spawning: spring and early summer in weedy or grassy shallows

Redhorse Sucker
Suceur rouge

Length/longueur : 30-45 cm (12-18 in./po)
Record (Ontario) : 77.5 cm/5.47 kg
30.5 in./po/12.05 lb.

Features: several species in Ontario; generally bronze to olive-green body with large scales; fins red on some species

Similar Species: White Sucker

Habitat: often found in streams and rivers with sand and gravel bottoms
Spawning: spring and summer in gravelly streams and rivers

Caractéristiques : plusieurs espèces en Ontario; corps généralement bronze à olive avec de grandes écailles; nageoires rouges chez certaines espèces

Espèces semblables : meunier noir

Habitat : souvent dans les cours d'eau et rivières au fond sablonneux et de gravier

Zone de frai : fraie au printemps et en été dans des cours d'eau et rivières au fond de gravier

Channel Catfish
Barbue de rivière

Length/longueur : 36-53 cm (14-21 in./po)
Record (Ontario) : 88.9 cm/13.2 kg
35.0 in./po/29.0 lb.

Features: body coloured from olive, slate-grey to steely blue; deeply forked tail

Similar Species: Brown Bullhead

Habitat: prefers cool, clear, deeper water with sand, gravel or rubble bottoms
Spawning: late spring and summer in holes, undercut banks, log jams or rocks

Caractéristiques : corps de couleur allant de l'olive, au gris ardoise en passant par le bleu acier; queue très fourchue

Espèces semblables : barbotte brune

Habitat : préfère les eaux fraîches, claires et profondes au fond sablonneux, de gravier ou rocailloux

Zone de frai : fraie à la fin du printemps et en été dans des trous, des enfoncements de bancs, des embâcles de billes de bois ou des rochers

Caractéristiques : corps vert olive à jaunâtre avec de très grosses écailles; barbillons de chaque côté de la bouche

Espèces semblables : malachigan

Habitat : préfère les eaux peu profondes, chaudes avec beaucoup de végétation

Zone de frai : fraie au printemps et au début de l'été dans de l'eau herbeuse

White Bass (Silver Bass)
Bar blanc

Length/longueur : 20-30 cm (8-12 in./po)
Record (Ontario) : 1.3 kg/2.87 lb.

Features: silvery coloured body with dark spots in horizontal lines; two dorsal fins not connected

Similar Species: White Perch

Habitat: prefers clear, cool water with gravel and rock shoals

Spawning: spring on shoals and in river mouths

Caractéristiques : corps argenté avec des taches sombres en lignes horizontales; deux nageoires dorsales non reliées

Espèces semblables : baret

Habitat : préfère les eaux claires et fraîches avec des hauts-fonds de gravier et de roche

Zone de frai : fraie au printemps dans les hauts-fonds et à l'embouchure des rivières

White Perch (Silver Perch)
Baret

Length/longueur : 15-25 cm (6-10 in./po)
Record (Ontario) : 0.68 kg
1.5 lb.

Features: silvery green to pale olive sides with darker back; often with a bluish lustre on the head and lower jaw; two dorsal fins connected by a thin membrane

Similar Species: White Bass, Yellow Perch

Habitat: prefers warm waters of varying habitats

Spawning: spring in shallow water

Caractéristiques : flancs vert argenté à olive clair et dos noir; souvent avec un lustre bleuâtre sur la tête et la mâchoire inférieure; deux nageoires dorsales reliées par une mince membrane

Espèces semblables : bar blanc, perchaude

Habitat : préfère les eaux chaudes d'habitats divers

Zone de frai : fraie au printemps dans de l'eau peu profonde

Freshwater Drum (Sheepshead)
Malachigan (tambour)

Length/longueur : 45-50 cm (18-20 in./po)
Record (Ontario) : 88.9 cm/9.77 kg
35.0 in./po/21.53 lb.

Features: silvery coloured sides with a dark green or olive back; tail slightly rounded; small mouth overhung by blunt snout

Similar Species: Carp

Habitat: prefers large, shallow water bodies

Spawning: spring and early summer

Black Crappie (Calico Bass, Crawpie)
Marigane noire

Length/longueur : 18-25 cm (7-10 in./po)
Record (Ontario) : 43.2 cm/1.7 kg
17.0 in./po/3.78 lb.

Features: silvery coloured sides with dark irregular spots and blotches; dark green back

Similar Species: White Crappie, Rock Bass

Habitat: clear, quiet, warm water areas of lakes and slow flowing rivers with abundant vegetation

Spawning: late spring and early summer over mud, sand or gravel in shallow water where there is some vegetation

Caractéristiques : flancs argentés avec des taches sombres irrégulières; dos vert foncé

Espèces semblables : marigane blanche, crapet de roche

Habitat : eaux claires, calmes et chaudes des lacs et de rivières coulant doucement et ayant une végétation abondante

Zone de frai : fraie à la fin du printemps et au début de l'été sur de la vase, du sable ou du gravier dans de l'eau peu profonde où il y a un peu de végétation

Pumpkinseed (Common Sunfish, Sunny)
Crapet-soleil

Length/longueur : 18-23 cm (7-9 in./po)
Record (Ontario) : 25.4 cm/0.5 kg
10.0 in./po/1.0 lb.

Features: golden brown body with spots of olive, orange or red; lower sides of head and body with irregular, wavy, blue-green lines; red or orange spot on posterior edge of gill cover

Similar Species: Bluegill, Rock Bass

Habitat: clear, shallow, weedy waters

Spawning: late spring and early summer over clay, sand, gravel or rock in shallow water

Caractéristiques : flancs argentés et dos vert foncé ou olive; queue légèrement arrondie; petite bouche surplombée par un museau pointu

Espèces semblables : carpe

Habitat : préfère les grands plans d'eau peu profonds

Zone de frai : fraie au printemps et au début de l'été

White Crappie (Crawpie)

Marigane blanche

Length/longueur : 20-30 cm (8-12 in./po)

Record (Ontario) : 39.1 cm/1.2 kg
15.4 in./po/2.71 lb.

Features: silvery coloured body with faint, dark, vertical bands; dorsal, anal and tail fins with rows of black spots

Similar Species: Black Crappie, Rock Bass

Habitat: warm, weedy, sheltered bays; often in silted streams, lakes and ponds

Spawning: late spring and early summer over mud, sand or gravel in shallow water where there is some vegetation

Caractéristiques : corps argenté avec de légères bandes verticales sombres; nageoires dorsale, anale et caudale comportant des rangées de taches noires

Espèces semblables : marigane noire, crapet de roche

Habitat : baies chaudes et abritées comportant de la végétation; souvent dans les cours d'eau, lacs et étangs limoneux

Zone de frai : fraie à la fin du printemps et au début de l'été sur de la vase, du sable ou du gravier dans de l'eau peu profonde où il y a un peu de végétation

Caractéristiques : corps brun doré avec des taches olive, orange ou rouges; lignes bleu-vert, ondulées et irrégulières au bas des côtés de la tête et du corps; taches rouges ou orange à l'extrémité postérieure des branchies

Espèces semblables : crapet arlequin, crapet de roche

Habitat : eaux claires, peu profondes et herbeuses

Zone de frai : fraie à la fin du printemps et au début de l'été dans de l'eau peu profonde, sur de l'argile, du sable, du gravier ou de la roche

Bluegill

Crapet arlequin

Length/longueur : 15-30 cm (6-12 in./po)

Record (Ontario) : 28.2 cm/0.8 kg
11.1 in./po/1.83 lb.

Features: green to olive body with faint vertical bands along sides; posterior edge of gill cover dark blue to black; black spot at rear edge of dorsal fin

Similar Species: Pumpkinseed, Rock Bass

Habitat: warm, vegetated, quiet waters

Spawning: late spring and early summer over mud, sand or gravel in shallow water

Caractéristiques : corps vert à olive avec de légères bandes verticales sur les flancs; extrémité postérieure des branchies bleue à noire; taches noires sur le bord postérieur de la nageoire dorsale

Espèces semblables : crapet-soleil, crapet de roche

Habitat : eaux calmes et chaudes avec de la végétation

Zone de frai : fraie à la fin du printemps et au début de l'été dans de l'eau peu profonde sur de la vase, du sable ou du gravier

Goldeye
Laquaiche aux yeux d'or

Length/longueur : 25-38 cm (10-15 in./po)
Record (Ontario) : 37.2 cm/0.5 kg
14.7 in./po/1.19 lb.

Features: bluish-green colouration on back with silvery sides; forward scales have a golden lustre; large eye with bright yellow pupils

Similar Species: Mooneye

Habitat: often found in quiet turbid water of large rivers and the small lakes, ponds and marshes connected to them

Spawning: spring in pools of turbid rivers or in backwater lakes and ponds

Caractéristiques : coloration bleu-gris sur le dos et flancs argentés; les écailles de l'avant ont un lustre doré; grands yeux à pupilles jaune clair

Espèces semblables : laquaiche argentée

Habitat : souvent dans les eaux troubles et calmes des grandes rivières et des petits lacs, étangs et marais connexes

Zone de frai : fraie au printemps dans des bassins de rivières troubles ou dans les bras morts de lacs et d'étangs

Mooneye
Laquaiche argentée

Length/longueur : 25-30 cm (10-12 in./po)
Record (Ontario) : 40.0 cm/0.7 kg
15.7 in./po/1.43 lb.

Features: pale olive to brown colouration on back with silvery sides; faint steel-blue lustre; eyes golden

Similar Species: Goldeye

Habitat: clear rivers and shallow waters of lakes

Spawning: spring in large streams

American Eel (Eel)
Anguille d'Amérique (anguille commune, anguille argentée)

Length/longueur : 60-90 cm (24-36 in./po)
Record (Ontario) : 97.8 cm/2.3 kg
38.5 in./po/5.1 lb.

Features: very long slender body; continuous dorsal, tail and anal fins

Similar Species: Burbot, Bowfin

Habitat: prefer water over muddy, silty bottoms which they often burrow into

Spawning: migrate to the Atlantic Ocean to spawn

Caractéristiques : corps très allongé et mince; nageoires dorsale, caudale et anales continues

Espèces semblables : lotte, poisson-castor

Habitat : préfère les fonds vaseux et limoneux dans lesquels ils s'enfoncent souvent

Zone de frai : migre dans l'océan Atlantique pour frayer

Bowfin (Dogfish)
Poisson-castor

Length/longueur : 46-60 cm (18-24 in./po)
Record (Ontario) : 80.0 cm/6.9 kg
31.5 in./po/15.1 lb.

Features: dark olive coloured body; no barbel on tip of chin; short, deep anal fin

Similar Species: Burbot

Habitat: prefer swampy, vegetated bays of warm lakes and rivers

Spawning: spring in shallow vegetated bays

Caractéristiques : corps olive foncée; pas de barbillon à la pointe du menton; nageoire anale courte et profonde

Espèces semblables : lotte

Habitat : préfère les baies marécageuses des lacs et rivières chauds avec de la végétation

Zone de frai : fraie au printemps dans des baies peu profondes avec de la végétation

Caractéristiques : dos olive clair à brun et flancs argentés; léger lustre bleu acier; yeux dorés

Espèces semblables : laquaiche aux yeux d'or

Habitat : rivières à l'eau claire et eaux peu profondes des lacs

Zone de frai : fraie au printemps dans de grands cours d'eau

Burbot (Ling, Eelpout, Freshwater Cod)

Lotte (loche)

Length/longueur : 30-50 cm (12-20 in./po)

Record (Ontario) : 92.7 cm/7.20 kg
36.5 in./po/15.88 lb.

Features: long, brownish body; barbel on tip of chin; long thin anal fin

Similar Species: Bowfin

Habitat: prefer cool waters of lakes and rivers

Spawning: winter under the ice over sand or gravel

Caractéristiques : corps allongé brunâtre; barbillon à la pointe du menton; longue et fine nageoire anale

Espèces semblables : poisson-castor

Habitat : préfère les eaux fraîches des lacs et rivières

Zone de frai : fraie en hiver sous la glace sur du sable ou du gravier

Lake Sturgeon (Common Sturgeon)

Esturgeon (de lac) (esturgeon jaune)

Length/longueur : 90-145 cm (36-60 in./po)

Record (Ontario) : 175.3 cm/76.2 kg
69.0 in./po/168.0 lb.

Features: barbels ahead of underslung mouth; bony plates on sides

Similar Species: none

Habitat: shoal areas of large lakes and rivers over mud or gravel

Spawning: spring in swift flowing water over gravel and rocks

Caractéristiques : bouche précédée de barbillons située sous la tête; plaques osseuses sur les flancs

Espèces semblables : aucune

Habitat : hauts-fonds de grands lacs et rivières constitués de vase ou de gravier

Zone de frai : fraie au printemps dans des courants rapides sur du gravier et des roches

Rainbow Smelt

Éperlan arc-en-ciel

Length/longueur : 15-25 cm (6-10 in./po)

Record (Ontario) : 27.3 cm/0.2 kg
10.8 in./po/0.33 lb.

Features: slender silvery fish; tongue with prominent teeth

Similar Species: Lake Herring

Habitat: cooler waters of deep lakes

Spawning: spring in streams, off-shore gravel shoals and sandy beaches

Caractéristiques : poisson argenté mince; dents proéminentes

Espèces semblables : cisco

Habitat : eaux fraîches des lacs profonds

Zone de frai : fraie au printemps dans les cours d'eau, les hauts-fonds de gravier du large et les plages sablonneuses

Great Lakes fish and your health

Today it is safer to eat sport fish because of government actions to reduce contaminants in the Great Lakes over the past 40 years.

A history of protecting the Great Lakes

The Great Lakes form the world's largest freshwater body and are often called inland seas. They are of significant economic importance to both Canada and the U.S. as they:

- supply drinking water to tens of millions of people
- provide water for industries
- are a major route for transporting bulk goods
- are a recreational resource for fishing, boating and swimming.

Over the past 100 years, increased population growth, agricultural and industrial activities on both sides of the border put stresses on the Great Lakes. During this time, contaminants from industrial processes and pesticides from agriculture entered our waterways and degraded lake water quality – and in some cases, led to the closure of fisheries.

Once in the water, contaminants passed along the food chain from plants to small fish to large predator fish such as lake trout and salmon. While contaminants may be present in surface waters at low concentrations, some of these chemicals can accumulate to high levels in bigger fish over time.

Actions taken

To combat this situation, governments on both sides of the border took action to clean up the Great Lakes including:

- banning the use of contaminants such as DDT
- implementing strict regulations for the discharge of pollutants and pesticides

- developing stringent emission standards
- voluntary phasing out of contaminant use by industries
- working together among all levels of government
- monitoring progress and ongoing research.

Achievements

Efforts to reduce contaminants in the Great Lakes have seen dramatic results. Since the 1970s:

- Total PCB concentrations in Great Lakes sport fish declined by as much as 90 per cent.
- Dioxin levels in lake trout declined by 50 to 80 per cent.
- Mercury levels in fish have declined by as much as 75 per cent.

Moving Forward

We've made a great deal of progress over the years but there is still work to do to make the Great Lakes even safer. This guide is an important tool to help you plan what sport fish to eat and how often.

We launched this guide over 30 years ago to help anglers decide how much fish they can safely eat from Ontario's lakes, rivers and streams.

While fresh fish can be an important and healthy part of anyone's diet, they can contain varying levels of contaminants. By using the consumption levels recommended in the guide, anglers and others who consume those fish are making healthy choices when eating fish.

We all benefit from actions taken to protect the Great Lakes. So, use this 26th edition of the Guide to Eating Ontario Sport Fish to find a fishing spot and enjoy eating fish from the Great Lakes!

Les poissons des Grands Lacs et votre santé

Aujourd'hui, du fait des mesures que le gouvernement prend depuis 40 ans pour réduire les contaminants des Grands Lacs, consommer du poisson gibier présente moins de risques qu'auparavant.

Historique de la protection des Grands Lacs

Les Grands Lacs, qui forment le plan d'eau douce le plus grand du monde, sont souvent appelés « mers intérieures ». Ils revêtent une grande importance économique tant pour le Canada que pour les États-Unis, car ils :

- fournissent de l'eau potable à des dizaines de millions de gens
- fournissent de l'eau aux industries
- sont une grande voie de transport des marchandises en vrac
- sont une ressource récréative pour la pêche, la navigation de plaisance et la natation.

Au cours des cent dernières années, la hausse de la croissance démographique et des activités agricoles et industrielles des deux côtés de la frontière éprouve les Grands Lacs. Pendant cette période, les contaminants des processus industriels et les pesticides de l'agriculture ont pénétré dans nos voies navigables, dégradé la qualité de l'eau des lacs et, dans certains cas, conduit à la fermeture d'établissements de pêche.

Une fois dans l'eau, les contaminants se sont transmis, dans la chaîne alimentaire, des végétaux aux petits poissons et aux poissons prédateurs comme le touladi et le saumon. Des contaminants peuvent être présents à de faibles concentrations dans les eaux de surface, mais, avec le temps, certains de ces produits chimiques peuvent s'accumuler à de plus forts niveaux dans les gros poissons.

Mesures prises

Pour remédier à cette situation, les gouvernements des deux côtés de la frontière ont pris des mesures pour nettoyer les Grands Lacs, mesures consistant par exemple à :

- interdire l'utilisation de contaminants comme le DDT
- mettre en application des règlements stricts relatifs à la décharge de polluants et de pesticides
- concevoir des normes strictes en matière d'émissions
- éliminer, de façon progressive et volontaire, l'utilisation de contaminants par les industries
- collaborer parmi tous les ordres de gouvernement
- surveiller l'évolution de la situation et la recherche courante.

Réalisations

Les efforts visant à réduire les contaminants des Grands Lacs ont donné des résultats spectaculaires. Depuis les années 1970 :

- Le total des concentrations de PCB dans le poisson gibier des Grands Lacs a baissé jusqu'à 90 pour cent.
- Les niveaux de dioxine dans le touladi ont baissé de 50 à 80 pour cent.
- Les niveaux de mercure dans le poisson ont baissé jusqu'à 75 pour cent.

Nous allons de l'avant

Au cours des ans, nous avons accompli beaucoup de progrès, mais il reste du travail à faire pour réduire les risques présentés par les Grands Lacs. Le guide est un outil important, destiné à vous aider à sélectionner le poisson gibier à consommer et établir la fréquence de sa consommation.

Nous avons lancé ce guide il y a plus de 30 ans, afin d'aider les pêcheurs à décider de la quantité de poisson des lacs et cours d'eau de l'Ontario qu'ils peuvent manger.

Les poissons d'eau douce peuvent constituer une partie importante et saine du régime de n'importe qui, mais ils peuvent renfermer diverses concentrations de contaminants. En se reportant aux niveaux de consommation recommandés dans le guide, les pêcheurs et d'autres personnes qui consomment ces poissons peuvent opérer des choix santé.

Nous bénéficions tous des mesures prises pour protéger les Grands Lacs. Pour trouver un lieu de pêche et pouvoir savourer du poisson des Grands Lacs, consultez donc cette 26^e édition du Guide de consommation du poisson gibier de l'Ontario!

Lake Huron Lac Huron

Lake Huron Block Descriptors

Lake Huron

- H1** open water south of Manitoulin Island – from Cockburn Island to just west of Fitzwilliam Island
- H2** from Fitzwilliam Island to Stokes Bay
- H3** from south of Stokes Bay to Point Clark
- H4** from south of Point Clark to north of Grand Bend
- H5** from Grand Bend to Point Edward

Georgian Bay

- GB1** area bounded on the west side by Bold Point to Fitzwilliam Island and on the east side by south of Killarney Bay to the French River mouth.
- GB2** area bounded on the west side by south of Fitzwilliam Island to Lion's Head and on the east side to the middle of the Bay.
- GB3** area bounded on the west side by the middle of the Bay and on the east side from south of the French River mouth to the Moon River mouth.
- GB4** southern Georgian Bay from south of Lion's Head to south of the Moon River mouth.
- GB4a** Collingwood Harbour – harbour area.

North Channel

- NC1** north side of Manitoulin Island from St. Joseph Island to Serpent Harbour on the north side and Barrie Island on the south side.
- NC2** north side of Manitoulin Island from east of Serpent Harbour to Killarney Bay on the north side and from Barrie Island to Bold Point on the south side.

St. Marys River

St. Marys River from Lake Superior to St. Joseph Channel

Lac Huron–Blocs descriptifs

Lac Huron

- H1** Eaux libres au sud de l'île Manitoulin – entre l'île Cockburn et l'ouest de l'île Fitzwilliam
- H2** Entre l'île Fitzwilliam et la baie Stokes
- H3** Entre le sud de la baie Stokes et la pointe Clark
- H4** Entre le sud de la pointe Clark et le nord de Grand Bend
- H5** Entre Grand Bend et la pointe Edward

Baie Georgienne

- GB1** Zone délimitée à l'ouest par la pointe Bold jusqu'à l'île Fitzwilliam, et à l'est par le sud de la baie Killarney jusqu'à l'embouchure de la rivière des Français.
- GB2** Zone délimitée à l'ouest par le sud de l'île Fitzwilliam jusqu'à Lion's Head, et à l'est par le centre de la baie.
- GB3** Zone délimitée à l'ouest par le centre de la baie, et à l'est par le sud de l'embouchure de la rivière des Français jusqu'à l'embouchure de la rivière Moon.
- GB4** Zone du sud de la baie Georgienne qui s'étend du sud de Lion's Head jusqu'au sud de l'embouchure de la rivière Moon.
- GB4a** Port de Collingwood – région du port.

Chenal Nord

- NC1** Zone au nord de l'île Manitoulin entre l'île St-Joseph et le havre Serpent au nord, et l'île Barrie au sud.
- NC2** Zone au nord de l'île Manitoulin entre l'est du havre Serpent et la baie Killarney au nord, et entre l'île Barrie et la pointe Bold au sud.

Lake Superior Lac Supérieur

Lake Superior Block Descriptors

1. **Border/Pie Island area** – from U.S. border to west of Pie Island
2. **Thunder Bay Outer Harbour area** – open waters of Thunder Bay, North of Pie Island to Thunder Cape
3. **Thunder Bay Inner Harbour** – inner Harbour within the breakwall and in the vicinity of the Kaministiquia River Delta
4. **Black Bay area** – Black Bay from north of Edward Island
5. **Pie Island/Schreiber Point area** – open water from Pie Island to Schreiber Point
6. **Nipigon Bay** – bay area from north of Simpson Island to Nipigon River mouth
7. **Schreiber Point/Sewell Point area** – open water from Schreiber Point to Sewell Point
8. **Jackfish Bay** – including Moberly and Tunnel bays
- 8a. **Peninsula Harbour** – Harbour and immediate vicinity
9. **Michipicoten Island area** – open water from Sewell Point to Cape Gargantua
10. **Agawa Bay/Batchawana Bay area** – open water from south of Cape Gargantua to Batchawana Bay
11. **Goulais Bay area** – from south of Batchawana Bay to the St. Marys River

Lac Supérieur–Blocs descriptifs

1. **Environs de la frontière Ontario-États-Unis et de l'île Pie** – entre la frontière et l'ouest de l'île Pie
2. **Environs de l'avant-port de Thunder Bay** – eaux libres de Thunder Bay, au nord de l'île Pie jusqu'au cap Thunder
3. **Arrière-port de Thunder Bay** – arrière-port à l'intérieur de la digue, près de l'embouchure de la rivière Kaministiquia
4. **Environs de la baie Black** – partie de la baie Black au nord de l'île Edward
5. **Environs de l'île Pie et de la pointe Schreiber** – eaux libres entre l'île Pie et la pointe Schreiber
6. **Baie Nipigon** – partie de la baie entre le nord de l'île Simpson et l'embouchure de la rivière Nipigon
7. **Environs de la pointe Schreiber et de la pointe Sewell** – eaux libres entre les pointes Schreiber et Sewell
8. **Baie Jackfish** – y compris les baies Moberly et Tunnel
- 8a. **Port de Peninsula** – environs immédiats
9. **Environs de l'île Michipicoten** – eaux libres entre la pointe Sewell et le cap Gargantua
10. **Environs des baies Agawa et Batchawana** – eaux libres entre le sud du cap Gargantua et la baie Batchawana
11. **Environs de la baie Goulais** – entre le sud de la baie Batchawana et la rivière St. Marys

Location Index

Index des emplacements

This index not only lists the page numbers of all the locations listed in this guide, but also provides a cross-index of lakes with more than one local name. The location names are lakes unless otherwise indicated (e.g. Abitibi R. is Abitibi River). Where there is more than one water body with the same name, the county or district where each water body is located is indicated in brackets beside the name (e.g. Bark (Renfrew)). As well, where there is more than one location sampled for the same water body, the total number of locations is indicated in brackets [e.g. Abitibi R. (7)].

L'index donne, en plus du numéro de page où l'on peut trouver les divers emplacements figurant dans ce guide, un index croisé des cours d'eau connus sous plusieurs noms. Les noms d'emplacements se rapportent aux lacs, sauf indications contraires (p.ex. Abitibi R. signifie rivière Abitibi). Lorsque le même nom désigne plus d'un cours d'eau, le comté ou le district où se trouve chaque cours d'eau est donné entre parenthèses (p.ex. Bark (Renfrew)). De même, lorsque plus d'un emplacement est donné pour le même cours d'eau, on donne le nombre total d'emplacements entre parenthèses (p.ex. Abitibi R. (7)).

Fish Names¹

Noms des poissons¹

English Common Name	Nom français	Scientific Name Nom scientifique
Alewife	Gaspereau	<i>Alosa pseudoharengus</i> (Wilson)
American Eel, Eel, Common Eel	Anguille d'Amérique	<i>Anguilla rostrata</i> (LeSueur)
Atlantic Salmon	Saumon de l'Atlantique	<i>Salmo salar</i> (Linnaeus)
Bigmouth Buffalo	Buffalo à grande bouche	<i>Ictiobus cyprinellus</i> (Valenciennes)
Black Crappie, Crappie, Calico Bass	Marigane noire	<i>Pomoxis nigromaculatus</i> (LeSueur)
Bloater, Hoy's Cisco	Cisco de fumage	<i>Coregonus hoyi</i> (Gill)
Bluegill, Bluegill Sunfish, Bream	Crapet arlequin	<i>Lepomis macrochirus</i> (Rafinesque)
Bowfin, Dogfish, Lawyer	Poisson-castor	<i>Amia calva</i> (Linnaeus)
Brook Trout, Speckled Trout, Square-tail, Aurora Trout, Brookie	Omble de fontaine	<i>Salvelinus fontinalis</i> (Mitchill)
Brown Bullhead, Common Catfish, Mudcat	Barbotte brune	<i>Ameiurus nebulosus</i> (LeSueur)
Brown Trout, German Brown Trout	Truite brune	<i>Salmo trutta</i> (Linnaeus)
Burbot, Ling, Maria, Freshwater Cod, Lawyer	Lotte	<i>Lota lota</i> (Linnaeus)
Carp, Mirror Carp	Carpe	<i>Cyprinus carpio</i> (Linnaeus)

English Common Name	Nom français	Scientific Name Nom scientifique
Northern Pike, Great Northern Pike, Jack, Pike	Brochet, grand brochet	<i>Esox lucius</i> (Linnaeus)
Pink Salmon	Saumon rose	<i>Oncorhynchus gorbuscha</i> (Walbaum)
Pumpkinseed, Common Sunfish	Crapet-soleil	<i>Lepomis gibbosus</i> (Linnaeus)
Quillback Carpsucker, Quillback, Drum	Couette	<i>Carpiodes cyprinus</i> (LeSueur)
Rainbow Smelt, Smelt	Éperlan arc-en-ciel, Éperlan du nord	<i>Osmerus mordax</i> (Mitchill)
Rainbow Trout, Steelhead	Truite arc-en-ciel	<i>Oncorhynchus mykiss</i> (Walbaum)
Redhorse Sucker, Northern Redhorse, Common Mullet	Suceur rouge	<i>Moxostoma macrolepidotum</i> (LeSueur)
Rock Bass, Redeye	Crapet de roche	<i>Ambloplites rupestris</i> (Rafinesque)
Round Whitefish, Menominee	Ménomini rond	<i>Prosopium cylindraceum</i> (Pallas)
Sauger, Sand Pickerel, Sand Pike	Doré noir	<i>Stizostedion canadense</i> (Smith)
Siscowet, fat Lake Trout, fat	Siscowet	<i>Salvelinus namaycush siscowet</i> (Agaissiz)
Smallmouth Bass, Black Bass	Achigan à petite bouche	<i>Micropterus dolomieu</i> (Lacépède)

Channel Catfish, Channel Cat	Barbue de rivière	<i>Ictalurus punctatus</i> (Rafinesque)	Splake, Wendigo	Truite moulac	Hybrid of <i>Salvelinus namaycush</i> (Walbaum) and <i>Salvelinus fontinalis</i> (Mitchill)
Chinook Salmon Chinook, King Salmon	Saumon quinnat	<i>Oncorhynchus tshawytscha</i> (Walbaum)	Lake Sturgeon, Sturgeon	Esturgeon de lac charbonnier	<i>Acipenser fulvescens</i> (Rafinesque)
Cisco, Lake Herring	Cisco, Cisco de lac	<i>Coregonus artedii</i> (LeSueur)	Walleye, Yellow Walleye, Pickerel, Yellow Pickerel, Walleyed Pike, Pike-Perch	Doré	<i>Stizostedion vitreum</i> (Mitchill)
Coho Salmon	Saumon coho	<i>Oncorhynchus kisutch</i> (Walbaum)	White Bass, Silver Bass	Bar blanc	<i>Morone chrysops</i> (Rafinesque)
Freshwater Drum, Sheepshead, Drum	Malachigan	<i>Aplodinotus grunniens</i> (Rafinesque)	White Crappie, Crappie	Marigane blanche	<i>Pomoxis annularis</i> (Rafinesque)
Gizzard Shad, Shad, Sawbelly	Alose à gésier	<i>Dorosoma cepedianum</i> (LeSueur)	Lake Whitefish, Whitefish	Grand corégone	<i>Coregonus clupeaformis</i> (Mitchill)
Goldeye, Winnipeg Goldeye	Laquaiche aux yeux d'or	<i>Hiodon alosoides</i> (Rafinesque)	White Perch, Silver Perch	Baret	<i>Morone americana</i> (Gmelin)
Goldfish, Golden Carp	Poisson doré	<i>Carassius auratus</i> (Linnaeus)	White Sucker, Common Sucker	Meunier noir	<i>Catostomus commersoni</i> (Lacépède)
